The type of the evaluation (in percent or absolute) is defined in the TypeToleranceLow property.

Monitoring of the limit value only takes effect when the CheckToleranceLow property is set to "True".

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the limit values. In this example the limit value for "Tolerance Low" will be configured.

```
Sub BarGraphLimitConfiguration()
'VBA743
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeToleranceLow = False
'Activate monitoring
.CheckToleranceLow = True
'Set barcolor = "red"
.ColorToleranceLow = RGB(255, 0, 0)
'Set lower limit to "40"
.ToleranceLow = 40
End With
End Sub
```

See also

TypeToleranceLow Property (Page 3798)

CheckToleranceLow Property (Page 3538)

BarGraph Object (Page 3286)

ToolbarItems Property

Description

Returns a listing containing all the elements (icons and separation lines) of a user-defined toolbar.

Example

In the following example a user-defined toolbar with two icons is created in the active picture. These icons are separated by a dividing line:

```
Sub AddDocumentSpecificCustomToolbar()
'VBA744
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Set objToolbar = ActiveDocument.CustomToolbars.Add("DocToolbar")
'
'Add symbol-icon to userdefined toolbar
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "My first
symbol-icon")
```

```
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(3, "tItem1_3", "My second
symbol-icon")
Set objToolbarItem = objToolbar.ToolbarItems.InsertSeparator(2, "tSeparator1_2")
End Sub
```

See also

ToolbarItem Object (Page 3448)

Toolbar Object (Page 3445)

ToolbarItemType property

Description

Returns the type of the "HMIToolbarItem" object of a user-defined toolbar as a "string".

Returned Value	Type in the toolbar
0	Separator
1	Icon

Example

In the following example the type of the first object in the first user-defined toolbar in the active picture is output:

```
Sub ShowFirstObjectOfCollection()
'VBA353
Dim strType As String
strType = ActiveDocument.CustomToolbars(1).ToolbarItems(1).ToolbarItemType
MsgBox strType
End Sub
```

ToolTipText Property

Description

Defines or returns the text that will be displayed as a Tooltip when you run the mouse over an object (HMIObject, icon).

Example:

The "RectangleConfiguration()" procedure accesses the properties of the Rectangle object. In this example a tool tip text will be assigned to the rectangle:

```
Sub RectangleConfiguration()
'VBA745
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.ToolTipText = "This is a rectangle"
End With
End Sub
```

The following example shows how you have to initialize the property prior to dynamization:

```
Sub Dyn()
'VBA823
Dim objCircle As HMICircle
Dim doc As Document
Dim objDynDialog As HMIDynamicDialog
Set doc = ActiveDocument
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle","HMICircle")
objCircle.ObjectName = "Circle1"
objCircle.BorderColor = RGB(255, 0, 0)
objCircle.BackColor = RGB(0, 255, 0)
objCircle.ToolTipText = "Text"
Set objDynDialog =
objCircle.ToolTipText.CreateDynamic(hmiDynamicCreationTypeDynamicDialog, "'Var'")
End Sub
```

See also

ToolbarItem Object (Page 3448)

HMIObject Object (Page 3357)

How to dynamize a property with the Dynamic dialog (Page 3084)

Top Property

Description

Defines or returns the Y-coordinate of an object (measured from the top left edge of the picture) in pixels. The Y-coordinate relates to the top left corner of the rectangle enclosing the object.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the Rectangle object. In this example the rectangle will be set to position 10/40:

```
Sub RectangleConfiguration()
'VBA746
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.Left = 10
.Top = 40
End With
End Sub
```

See also

View Object (Page 3466)

HMIObject Object (Page 3357)

TopConnectedObjectName Property

Description

Returns the name of the end object to which the connector is connected. Read only access.

Example:

An example showing how to use the BottomConnectedObjectName property can be found in this documentation under the heading "ObjConnection Object".

See also

ObjConnection object (Page 3388)

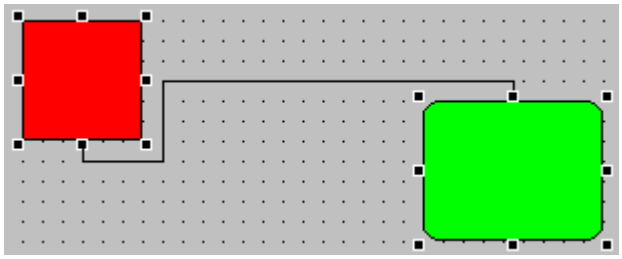
TopConnectedConnectionPointIndex Property

Description

Returns the connection point on the object to which the connector is connected.

Connection Point	Assigned Value
Up	0
Right	1

Connection Point	Assigned Value
Down	2
Left	3



Example:

An example showing how to use the BottomConnectedObjectName property can be found in this documentation under the heading "ObjConnection Object".

See also

ObjConnection object (Page 3388)

Transparency property

Description

Defines the degree of transparency of the object display. Values between 0 and 100 indicate the transparency as a percentage. In the case of a semi-transparent objects other objects shine through. A 100% transparent object is invisible. An invisible object can also be controlled in Runtime.

Example

```
Sub addTransparentObject()
    'VBA849
    Dim objHMICircle As HMICircle
    Set objHMICircle = ActiveDocument.HMIObjects.AddHMIObject("Circle", "HMICircle")
    objHMICircle.Transparency = 40
End Sub
```

Trend Property

Description

TRUE if the trend or tendency of the measured value being monitored (rising or falling) is to be indicated by a little arrow. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example the trend of the measured value will be indicated:

```
Sub BarGraphConfiguration()
'VBA747
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.trend = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

trend property

Description

Is used for the "Graphic Object Update Wizard" tool and is not evaluated for the "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay" objects.

TrendColor Property

Description

Defines or returns the color of the trend display.

The trend display indicates the tendency (rising or falling) of the measuring value being monitored by a small arrow. In order to activate the trend display, the Trend property must be set to "True". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphConfiguration()" procedure configures In this example the trend in the measured value will be indicated. The trend display will be set to "Red":

```
Sub BarGraphConfiguration()
'VBA748
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.trend = True
.TrendColor = RGB(255, 0, 0)
End With
End Sub
```

See also

Trend Property (Page 3788)

BarGraph Object (Page 3286)

Trigger Property

Description

Returns a Trigger object. Use the Trigger property when making a property dynamic with the aid of a script.

Example:

In this example the "Radius" property of a circle will be made dynamic with the aid of a C script (the output value sets the radius):

```
Sub AddDynamicAsCSkriptToProperty()
'VBA749
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle

Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("myCircle", "HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
.Trigger.Type = hmiTriggerTypeStandardCycle
.Trigger.CycleType = hmiCycleType_2s
.Trigger.Name = "Trigger1"
End With
```

```
End Sub
```

See also

Trigger Object (Page 3452)

ScriptInfo Object (Page 3424)

Type Property

Description

Returns or defines the type of an object.

The object type is returned as either a string or and integer.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the Rectangle object. In this example the object type will be output:

```
Sub RectangleConfiguration()
'VBA750
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
MsgBox "Objecttype: " & .Type
End With
End Sub
```

DestLink Object (Page 3316)

TypeAlarmHigh Property

Description

TRUE, when the upper limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "50".

```
Sub BarGraphLimitConfiguration()
'VBA751
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeAlarmHigh = False
'Activate monitoring
.CheckAlarmHigh = True
'Set barcolor = "yellow"
.ColorAlarmHigh = RGB(255, 255, 0)
'Set upper limit = "50"
.AlarmHigh = 50
End With
End Sub
```

BarGraph Object (Page 3286)

TypeAlarmLow Property

Description

TRUE, when the lower limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "10".

```
Sub BarGraphLimitConfiguration()
'VBA752
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeAlarmLow = False
'Activate monitoring
.CheckAlarmLow = True
'Set barcolor = "yellow"
.ColorAlarmLow = RGB(255, 255, 0)
'Set lower limit = "10"
.AlarmLow = 10
End With
End Sub
```

BarGraph Object (Page 3286)

TypeLimitHigh4 Property

Description

TRUE, when the "Reserve 4" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "70".

```
Sub BarGraphLimitConfiguration()
'VBA753
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
```

```
'Set analysis = absolute
.TypeLimitHigh4 = False
'Activate monitoring
.CheckLimitHigh4 = True
'Set barcolor = "red"
.ColorLimitHigh4 = RGB(255, 0, 0)
'Set upper limit = "70"
.LimitHigh4 = 70
End With
End Sub
```

TypeLimitHigh5 Property

Description

TRUE, when the "Reserve 5" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "80".

```
Sub BarGraphLimitConfiguration()
'VBA754
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeLimitHigh5 = False
'Activate monitoring
.CheckLimitHigh5 = True
'Set barcolor = "black"
.ColorLimitHigh5 = RGB(0, 0, 0)
'Set upper limit = "70"
.LimitHigh5 = 70
End With
End Sub
```

TypeLimitLow4 Property

Description

TRUE, when the "Reserve 4" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "5".

```
Sub BarGraphLimitConfiguration()
'VBA755
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeLimitLow4 = False
'Activate monitoring
.CheckLimitLow4 = True
'Set barcolor = "green"
.ColorLimitLow4 = RGB(0, 255, 0)
'Set lower limit = "5"
.LimitLow4 = 5
End With
End Sub

TypeLimitLow5 Property

Description

TRUE, when the "Reserve 5" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "0".

```
Sub BarGraphLimitConfiguration()
'VBA756
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeLimitLow5 = False
'Activate monitoring
.CheckLimitLow5 = True
'Set barcolor = "white"
.ColorLimitLow5 = RGB(255, 255, 255)
'Set lower limit = "0"
.LimitLow5 = 0
End With
End Sub

TypeToleranceHigh Property

Description

TRUE, when the "Tolerance high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the limit values. In this example the limit value for "Tolerance High" will be configured:

```
Sub BarGraphLimitConfiguration()
'VBA757
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeToleranceHigh = False
'Activate monitoring
.CheckToleranceHigh = True
'Set barcolor = "yellow"
.ColorToleranceHigh = RGB(255, 255, 0)
'Set upper limit = "40"
.ToleranceHigh = 40
End With
End Sub
```

TypeToleranceLow Property

Description

TRUE, when the "Tolerance low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the limit values. In this example the limit value for "Tolerance Low" will be configured:

```
Sub BarGraphLimitConfiguration()
'VBA758
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeToleranceLow = False
'Activate monitoring
.CheckToleranceLow = True
```

```
'Set barcolor = "red"
.ColorToleranceLow = RGB(255, 0, 0)
'Set lower limit = "10"
.ToleranceLow = 10
End With
End Sub
```

TypeWarningHigh Property

Description

TRUE, when the "Warning high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "75".

```
Sub BarGraphLimitConfiguration()
'VBA759
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeWarningHigh = False
'Activate monitoring
.CheckWarningHigh = True
'Set barcolor = "red"
.ColorWarningHigh = RGB(255, 0, 0)
'Set upper limit = "75"
.WarningHigh = 75
End With
End Sub
```

U

Underlined Property

Description

TRUE if the font attribute "Underline" is set for the language-dependent text in the object.
BOOLEAN write-read access.

Example:

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA761
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "DefText"
Set colLangFonts = objButton.LDFonts
'
'Set font-properties for french:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'
'Set font-properties for english:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

UnselBGColor Property

Description

Defines or returns the background color of entries in the text list object which are not selected. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the colors will be defined for entries that are not selected in the selection list:

```
Sub TextListConfiguration()
'VBA762
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.UnselBGColor = RGB(255, 0, 0)
.UnselTextColor = RGB(0, 0, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

UnselTextColor Property

Description

In the case of the TextList object, defines or returns the color of text in the selection list for entries that are not selected. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the colors will be defined for entries that are not selected in the selection list:

```
Sub TextListConfiguration()
'VBA763
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.UnselBGColor = RGB(255, 0, 0)
.UnselTextColor = RGB(0, 0, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

UpdateCycle Property

Description

Defines or returns the type and frequency of updates to the picture window in Runtime.

Update Cycle	Assigned Value
Upon change	0
250 ms	1
500 ms	2
1 s	3
2 s	4
5 s	5
10 s	6
1 min	7
5 min	8
10 min	9
1 h	10
User cycle 1	11
User cycle 2	12
User cycle 3	13
User cycle 4	14

Update Cycle	Assigned Value
User cycle 5	15
Picture cycle	255

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be updated every 5 seconds in Runtime:

```
Sub PictureWindowConfig()
'VBA764
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.UpdateCycle = 5
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

UseEventState property

Description

Specifies for the "HMIAdvancedStateDisplay" object whether the group value is evaluated for the representation of the states.

If the group value is used, you can assign pictures for the individual alarm statuses.

UsedLanguage property

Description

Use the UsedLanguage property to set the code page that matches the character set used.

LONG write-read access.

Example

The "UsedLanguage" property and language ID "1033" are used in the following example to set the code page to English US.

```
Sub AddDynamicAsCSkriptToProperty()
```

```
'VBA856
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
Dim strCode As String
strCode = "long lHeight;" & vbCrLf & "int check;" & vbCrLf
strCode = strCode & "GetHeight (""events.PDL"", ""myCircle""); & vbcrlf"
strCode = strCode & "lHeight = lHeight+5;" & vbCrLf
strCode = strCode & "check = SetHeight(""events.PDL"", ""myCircle"",lHeight);"
strCode = strCode & vbCrLf & "//Return-Type: BOOL" & vbCrLf
strCode = strCode & "return check;"
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
'Create dynamic for Property "Radius":
Set objCScript = objCircle.Height.CreateDynamic(hmiDynamicCreationTypeCScript)
'set Sourcecode and cycletime:
  With objCScript
    .SourceCode = strCode
    .Trigger.Type = hmiTriggerTypeStandardCycle
    .Trigger.CycleType = hmiCycleType_2s
    .Trigger.Name = "Trigger1"
'Set language English-US
.UsedLanguage = 1033
  End With
End Sub
```

UseGlobalAlarmClasses property

Description

Defines whether to use globally configured alarm classes to visualize message events. The property is only relevant for PCS7 projects.

Value	Description
TRUE	Activates the global settings made in PCS7 alarm editor for visualizing the message events.
FALSE	Visualization of the message events is defined locally for each message class.

UseGlobalSettings property

Description

Specify whether to use global settings to assign message events to the buttons visualized in the group view. The display of the message events is configured using the "MessageClass" properties. The property is only relevant for PCS7 projects.

Value	Description
TRUE	Activates the settings made in the PCS7 alarm editor for the assignment of message events to the buttons in the group display. The bit numbers in the group value are assigned to the respective buttons.
FALSE	The message types are assigned locally to the buttons in the group display.

UserValue1 Property

Description

Defines or returns any value in the case of the GroupDisplay object.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example four different user values will be assigned:

```
Sub GroupDisplayConfiguration()
'VBA765
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.UserValue1 = 0
.UserValue2 = 25
.UserValue3 = 50
.UserValue4 = 75
End With
End Sub
```

See also

UserValue4 Property (Page 3808)

UserValue3 Property (Page 3807)

UserValue2-Eigenschaft (Page 3807)

GroupDisplay Object (Page 3350)

UserValue2-Eigenschaft

Description

Defines or returns any value in the case of the GroupDisplay object.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example four different user values will be assigned:

```
Sub GroupDisplayConfiguration()
'VBA766
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.UserValue1 = 0
.UserValue2 = 25
.UserValue3 = 50
.UserValue4 = 75
End With
End Sub
```

UserValue1 Property (Page 3804)

GroupDisplay Object (Page 3350)

UserValue3 Property

Description

Defines or returns any value in the case of the GroupDisplay object.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example four different user values will be assigned:

```
Sub GroupDisplayConfiguration()
'VBA767
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.UserValue1 = 0
.UserValue2 = 25
.UserValue3 = 50
.UserValue4 = 75
End With
End Sub
```

GroupDisplay Object (Page 3350)

UserValue4 Property

Description

Defines or returns any value in the case of the GroupDisplay object.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example four different user values will be assigned:

```
Sub GroupDisplayConfiguration()
'VBA768
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.UserValue1 = 0
.UserValue2 = 25
```

```
.UserValue3 = 50
.UserValue4 = 75
End With
End Sub
```

UserValue1 Property (Page 3804)

GroupDisplay Object (Page 3350)

UseValueText property

Description

Specifies whether a text tag is used instead of a formatted analog value.

V

Value

Value Property

Description

Returns or defines the value of an object property.

Example:

Use the Value property if you wish to return or define a value with the aid of the Properties listing. In this example the property of an ActiveX Control will be accessed via the Value property:

```
Sub AddActiveXControl()
'VBA769
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge2",
"XGAUGE.XGaugeCtrl.1")
'
'Move ActiveX-Control:
objActiveXControl.Top = 40
objActiveXControl.Left = 60
```

```
'
'Modify individual properties:
objActiveXControl.Properties("BackColor").value = RGB(255, 0, 0)
End Sub
```

Property Object (Page 3409)

VALUE_ACCESS_FAULT Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Access to tag not permitted" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle is given dynamics with the The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
```

```
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

VariableStateValue Object (Page 3461)

VALUE_ADDRESS_ERROR Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Addressing error" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA771
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:

QualityCodeStateValue Object (Page 3411)

VALUE_BAD_CONFERROR Property

Description

Specifies the value assigned to a dynamized property if quality code "bad, no communication, value not accepted" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_BAD_MISCSTATES Property

Description

Specifies the value assigned to a dynamized property if quality code "bad miscellaneous states" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60

VALUE_BAD_NONSPECIFIC Property

Description

Specifies the value assigned to a dynamized property if quality code "bad, non-specific" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140

VALUE_BAD_NOTCONNECTED Property

Description

Specifies a value assigned to a dynamized property if quality code "bad, not connected" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
```

```
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60

VALUE_BAD_OUTOFSERV Property

Description

Specifies a value assigned to a dynamized property if quality code "bad, out of service" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
```

```
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20

VALUE_BAD_PROCRELNOM Property

Description

Specifies the value assigned to a dynamized property if quality code "bad, process related, no maintenance" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
```

```
'define a value for every state:

VALUE_BAD_PROCRELSUB Property

Description

Specifies the value assigned to a dynamized property if quality code "bad, process related, substitute value" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_CONVERSION_ERROR Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Conversion error" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA772
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40

VALUE_HIGHLIMITED Property

Description

Specifies the value assigned to a dynamized property if quality code "high limited" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
```

```
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_INVALID_KEY Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Tag not found" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA775
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
```

```
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

VALUE_LOWLIMITED Property

Description

Specifies the value assigned to a dynamized property if quality code "low limited" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20

VALUE_MAX_LIMIT Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Upper limit exceeded" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA776
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

VariableStateValue Object (Page 3461)

VALUE_MAX_RANGE Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Format upper limit exceeded" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA777
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
```

```
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

VALUE_ACCESS_FAULT Property (Page 3808)

VariableStateValue Object (Page 3461)

VALUE_NOT_ESTABLISHED Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "No check-back message from the channel" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA780
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:

VALUE_SERVERDOWN Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Server not available" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA781
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20

VALUE_TIMEOUT Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "No connection" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA783
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:

VariableStateValue Object (Page 3461)

VALUE_UNCERT_ENGVHIGHLIM Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, engineering unit range violation, high limit set" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140

VALUE_UNCERT_ENGVLOWLIM Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, engineering unit range violation, low limit set" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
```

```
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60

VALUE_UNCERT_ENGVONLIM Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, engineering unit range violation, on limits set" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
```

```
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20

VALUE_UNCERT_INITVAL Property

Description

Specifies a value assigned to a dynamized property if quality code "uncertain, initial value" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
```

```
'define a value for every state:

VALUE_UNCERT_LUV Property

Description

Specifies a value assigned to a dynamized property if quality code "uncertain, last usable value" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_UNCERT_MISCSTATES Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain miscellaneous states" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_UNCERT_NONSPECIFIC Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, non-specific" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_UNCERT_PROCRELNOM Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, process related, no maintenance" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

VALUE_UNCERT_SIMVAL Property

Description

Specifies a value assigned to a dynamized property if quality code "uncertain, simulated value" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
```

```
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60

VALUE_UNCERT_SUBSTSET Property

Description

Specifies a value assigned to a dynamized property if quality code "uncertain, substitute set" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
```

```
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

QualityCodeStateValue Object (Page 3411)

VariablesExist Property

Description

TRUE when all the tags used in the source code of a DynamicDialog object are defined. Read only access.

You can use this property to check whether all the tags that you have defined in the source code of the Dynamic dialog are created in WinCC.

Example:

--

See also

DynamicDialog Object (Page 3325)

VariableStateChecked Property

Description

TRUE if the status of the specified tag is used in the dynamic dialog for dynamization. BOOLEAN write-read access.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If a tag does not return

a status, a substitute value (ElseCase property) is defined, a tag name is issued and three analog value ranges are created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA785
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

See also

DynamicDialog Object (Page 3325)

VariableStateType Property

Description

Returns the type of tag monitoring used to dynamize a property or an event: No monitoring, quality code, or tag status. Read only access.

Index	VariableStateType
0	hmiNoVariableState
1	hmiVariableQCState
2	hmiVariableState

Example:

The procedure "GetVariableStateType()" reads the type of monitoring from the current document. In this example, the type of monitoring is output in a message:

```
Sub GetVariableStateType()
'VBA819
Dim objDyn As HMIDynamicDialog
Set objDyn =
ActiveDocument.Properties("Width").CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'TestVal'")
MsgBox objDyn.VariableStateType
objDyn.Delete
End Sub
```

See also

DynamicDialog Object (Page 3325)

VariableStateValues Property

Description

Returns the VariableStateValues listing. Use the VariableStateValues property with the Item property to assign a value to the tag status to be used for dynamization.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If a tag does not return

a status, a substitute value (ElseCase property) is defined, a tag name is issued and three analog value ranges are created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA786
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

See also

VariableStateValues Object (Listing) (Page 3462)

DynamicDialog Object (Page 3325)

VariableTriggers Property

Description

Returns the VariableTriggers listing. Use the VariableTriggers property in order to add a tag trigger to a VB action or C action.

Example:

In the following example the radius of a circle is made dynamic with the aid of a VB script. A tag trigger is used as the trigger:

```
Sub DynamicWithVariableTrigger()
'VBA787
Dim objVBScript As HMIScriptInfo
Dim objVarTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VariableTrigger",
"HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
'Triggername and cycletime are defined by add-methode
Set objVarTrigger = .Trigger.VariableTriggers.Add("VarTrigger", hmiVariableCycleType_10s)
.SourceCode = ""
End With
End Sub
```

See also

VariableTriggers Object (Listing) (Page 3465)

VarName Property

Description

Defines the tag whose status is to be used in the Dynamic dialog for the purpose of dynamics, or returns the name.

Example:

In this example the name of the trigger tag used for creating dynamics in the radius of a circle will be output:

```
Sub GetVarName()
'VBA788
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.Item("Circle_VariableTrigger")
Set objVBScript = objCircle.Radius.Dynamic
With objVBScript
'Reading out of variablename
MsgBox "The radius is dynamicabled with: " & .Trigger.VariableTriggers.Item(1).VarName
End With
End Sub
```

See also

VariableStateValue Object (Page 3461)

VBAVersion Property

Description

Returns the VBA version number. Read only access.

Example:

In the following example the current VBA version number is output:

```
Sub ShowVBAVersion()
'VBA789
MsgBox Application.VBAVersion
End Sub
```

See also

Application Object (Page 3282)

VBE Property

Description

Returns the VB Extensibility object. Read access.

Example:

--

See also

Application Object (Page 3282)

Version Property

Description

Returns the version number of the specified application. Read only access.

Example:

In the following example the version number of the Graphics Designer is output:

```
Sub ShowVersionOfGraphicsDesigner()
'VBA791
MsgBox Application.Version
End Sub
```

See also

Application Object (Page 3282)

Views Property

Description

Returns the Views listing. Use the Views listing to create a new copy of a picture, for instance.

Example:

In the following example a copy of the active picture is created and then activated:

```
Sub AddView()
'VBA792
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

See also

Views Object (Listing) (Page 3468)

Visible Property

Description

TRUE if the specified object is intended to be visible. BOOLEAN write-read access.

Example:

In the following example a circle will be inserted into the active picture. This circle is not intended to be visible in Runtime:

```
Sub HideCircleInRuntime()
'VBA793
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("myCircle", "HMICircle")
objCircle.Visible = False
End Sub
```

WarningHigh Property

Description

Defines or returns the high limit value "Warning High" in the case of the BarGraph object.

The "CheckWarningHigh" property must be set to "True" in order for the limit value to be monitored.

The display on reaching the limit value and the type of evaluation are defined via the properties ColorWarningHigh and TypeWarningHigh.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "75".

```
Sub BarGraphLimitConfiguration()
'VBA794
```

```
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeWarningHigh = False
'Activate monitoring
.CheckWarningHigh = True
'Set barcolor = "red"
.ColorWarningHigh = RGB(255, 0, 0)
'Set upper limit = "75"
.WarningHigh = 75
End With
End Sub
```

See also

TypeWarningHigh Property (Page 3797)

ColorWarningHigh Property (Page 3552)

CheckWarningHigh Property (Page 3539)

BarGraph Object (Page 3286)

WarningLow Property

Description

Defines or returns the low limit value "Warning Low" in the case of the BarGraph object.

The "CheckWarningLow" property must be set to "True" in order for the limit value to be monitored.

The display on reaching the limit value and the type of evaluation are defined via the properties ColorWarningLow and TypeWarningLow.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "12".

```
Sub BarGraphLimitConfiguration()
'VBA795
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeWarningLow = False
'Activate monitoring
.CheckWarningLow = True
```

```
'Set barcolor = "magenta"
.ColorWarningLow = RGB(255, 0, 255)
'Set lower limit = "12"
.WarningLow = 75
End With
End Sub
```

See also

TypeWarningLow Property (Page 3798)

ColorWarningLow Property (Page 3553)

CheckWarningLow Property (Page 3539)

BarGraph Object (Page 3286)

Width Property

Description

Defines or returns the width of an object in pixels.

Example:

In the following example three objects of different sizes will be inserted in the active picture. Then all objects will be selected and set to the same width:

```
Sub ApplySameWidthToSelectedObjects()
'VBA796
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Width = 15
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Width = 40
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
```

```
.Width = 120
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.SameWidth
End Sub
```

See also

HMIObject Object (Page 3357)

WinCCStyle property

Description

Defines the style in which the object is displayed.

User-defined	Shows the object according to the respective settings.
global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

Example

WindowBorder Property

Description

TRUE if it is intended that the application window or picture window shall be displayed with a border in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will

```
Sub ApplicationWindowConfig()
'VBA797
Dim objAppWindow As HMIApplicationWindow
```

```
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow",
"HMIApplicationWindow")
With objAppWindow
.Caption = True
.CloseButton = False
.Height = 200
.Left = 10
.MaximizeButton = True
.Moveable = False
.OnTop = True
.Sizeable = True
.Top = 20
.Visible = True
.Width = 250
.WindowBorder = True
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ApplicationWindow Object (Page 3284)

WindowMonitorNumber property

Description

Defines the monitor on which the picture window is displayed. This requires that the system supports more than one monitor. The attribute is only effective if the "Independent window" attribute is set to "Yes".

1-n The number of the monitor in the operating system on which the picture window is displayed.

Example

WindowPositionMode property

Description

Defines the position and scaling of the picture window on the screen. The property is only effective if the "Independent window" attribute is set to "Yes".

Standard	The picture window is positioned in its original size in the configured position on the screen.
Center	The picture window is positioned in its original size, centered on the screen.
Maximize	The picture window is scaled to the size of the screen.

Example

WindowsStyle property

Description

Defines whether the object is displayed in the Windows style of WinCC version 6.2. It can only be selected if "WinCC Classic" is chosen as the current design.

yes	Shows the object using the Windows style from WinCC version 6.2.
No	Shows the object not using the Windows style from WinCC version 6.2.

Example

WindowState Property

Description

Returns the status of the window containing the specified application. READ access.

WindowState	Assigned Value
Maximized	0
Minimized	1
Custom sized	2

Example:

In the following example the window status of the Graphics Designer is output:

```
Sub ShowWindowState()
'VBA798
Dim strState As String
Select Case Application.WindowState
Case 0
strState = "The application-window is maximized"
Case 1
strState = "The applicationwindow is minimized"
Case 2
strState = "The application-window has a userdefined size"
End Select
MsgBox strState
End Sub
```

See also

Application Object (Page 3282)

ZeroPoint Property

Description

Defines or returns the position of the zero point on the bar in the case of the BarGraph object.

Specify the value as a %age of the total bar height. The zero point can also be outside of the range represented.

The "ScalingType" property must be set to "2" and "Scaling" must be set to "True".

Example:

The "BarGraphConfiguration()" procedure configures In this example the zero point is located halfway up the bar height:

```
Sub BarGraphConfiguration()
'VBA799
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScalingType = 2
.ZeroPoint = 50
.ZeroPointValue = 0
End With
End Sub
```

See also

ZeroPointValue Property (Page 3888)

ScalingType Property (Page 3750)

Scaling Property (Page 3749)

BarGraph Object (Page 3286)

ZeroPointValue Property

Description

Defines or returns the absolute value for the zero point.

Example:

The "BarGraphConfiguration()" procedure configures In this example the absolute value of the zero point will be set to "0".

```
Sub BarGraphConfiguration()
'VBA800
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScalingType = 2
.ZeroPointValue = 0
End With
End Sub
```

ScalingType Property (Page 3750)

Scaling Property (Page 3749)

BarGraph Object (Page 3286)

3DBarGraph Object (Page 3267)

Zoom Property

Description

Defines or returns the zoom factor.

Example:

In this example a copy of the active picture is created and the zoom factor is set to 50%:

```
Sub CreateViewFromActiveDocument()
'VBA801
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Zoom = 50
End Sub
```

5.5.2 VBA in Other WinCC Editors

5.5.2.1 VBA in Other WinCC Editors

Introduction

In addition to Graphics Designer, you can automate the following WinCC editors with VBA:

- Tag Management
- Tag Logging

- Text library
- Alarm Logging

The functions for accessing the editors are contained in the "HMIGO" class.

Requirement

- The "HMIGenObjects.dll" file is referenced. This happens automatically during WinCC installation.

Principle

For access to the "HMIGO" class with VBA, you must reference the "HMI GeneralObjects 1.0 Type Library" in the VBA editor via the "Tools > References" menu. You must create a new instance of this class in the program code, e.g.:

```
'Dim HMIGOObject As New HMIGO
```

Create several different objects of this class if access several objects at the same time. Two instances of the "HMIGO" class are required, for example, in Tag Logging: The first instance is required for access to the archive tags, the second instance for access to the process value archive.

Application

To enable you to use the functions and properties of the editors in VBA, you must have opened a project in WinCC.

You can then, for example, do the following directly from the program code:

- Create several tags and change the values
- Edit text entries in the TextLibrary
- Adapt messages.

Querying Object State

The "HMIGO" class has the enumeration "HMIGO_OBJECT_STATE" which returns the state of the specified object. The enumeration can return the following values:

- OBJECT_EMPTY (2): Connection to the object is not available.
- OBJECT_OPENED (3): Connection to objects exists. You can change and read its parameters.
- OBJECT_MODIFIED (4): An object's parameters have been changed. If the corresponding Commit function is not called, the changes are not saved.
- WINCC_CONNECTED (1): The object is connected to the WinCC project. By default this connection is established when a function is called the first time. To release the connection, use the instruction "HMIGO = nothing", for example.

Error Handling

Errors can occur when you use the "HMIGO" class. Use the "OnError" statement to respond to these error messages. The "OnError" statement must come before the call of a function from the HMIGeneralObjects class:

```
Sub CreateTag()
'HMIGO_000
Dim hmiGOTag as New HMIGO
On Error GoTo ErrorHandlerHMIGO
hmiGOTag.CreateTag "NewTag", TAG_BINARY_TAG, "ExistingConnection", "DB1,DD0,QC",
"NewOrExistingGroupName"

'...
Exit Sub
ErrorHandlerHMIGO:
MsgBox ("Error: " & Err.Number & " " & Err.Description & " " & Err.Source)
Resume Next
End Sub
```

As a result, an error text returned by the interface is output.

5.5.2.2 VBA in Tag Management

VBA in Tag Management

Introduction

VBA can be used to:

- Create tags directly from the program code
- Modify and delete tags
- Read out and change the properties of the tags
- Read out and change the types of the tags
- Read out and change the values of the tags

Note

The tags may not be open or opened in tag management when editing with VBA.
If you wish to change the data type of a tag, you must first delete the tag and then regenerate it. You must save the parameters first in order to be able to transfer them following the generation of tags.

Principle

When you have created the instance of the "HMIGO" class, the following functions are available to you to access the tag management facility:

- CloseTag
- CommitTag
- CreateTag
- DeleteTag
- GetTag
- ListTag

The following enumerations are available for the parameter supply of these functions:

- HMIGO_TAG_TYPE
- HMIGO_TAG_LIST_TYPE

Note

If you set the start value to a binary tag, use the values "0" or "1". Do not use the values "False" or "True". These values are no longer valid for VBA programming in WinCC and will result in an error message.

Replace the values "False" and "True" with "0" and "1" in your existing VBA code.

Access to the Object Properties

You can also access the parameters of the above-mentioned functions directly in VBA by means of the following object properties:

Object property	Description	Read/Write
ObjectStateTag	Returns the object state via the enumeration HMIGO_OBJECT_STATE. Further information on this enumeration can be found in this documentation under "VBA in other WinCC Editors".	Yes/no
TagName	Name of the tag	Yes/no
TagGroupName	Name of a group in which the tag is inserted. If the group does not yet exist, it is created. If no group name is specified, the tag is created outside all groups.	Yes/no

Object property	Description	Read/Write
TagConnection	Name of a connection in which the tag and/or group is to be created. The connection must already be in existence, otherwise a tag cannot be created. If the name is omitted, an internal tag is created.	Yes/no
TagMaximum	Sets the new value of the upper limit	Yes/yes
TagMinimum	Sets the new value of the lower limit	Yes/yes
TagStart	Sets the new start value	Yes/yes
TagS5S7Address	Address of the S7 or S5 PLC to which the tag is connected. If no address is specified, a blank entry is passed.	Yes/yes
TagType (Enum)	Data type of the tag. The possible types are: • TAG_BINARY_TAG (1) • TAG_SIGNED_8BIT_VALUE (2) • TAG_UNSIGNED_8BIT_VALUE (3) • TAG_SIGNED_16BIT_VALUE (4) • TAG_UNSIGNED_16BIT_VALUE (5) • TAG_SIGNED_32BIT_VALUE (6) • TAG_UNSIGNED_32BIT_VALUE (7) • TAG_FLOATINGPOINT_NUMBER_32BIT_IEEE_754 (8) • TAG_FLOATINGPOINT_NUMBER_64BIT_IEEE_754 (9) • TAG_TEXT_TAG_8BIT_CHARACTER_SET (10) • TAG_TEXT_TAG_16BIT_CHARACTER_SET (11) • TAG_RAW_DATA_TYPE (12) • TAG_STRUCT (14) • TAG_TEXT_REFERENCE (18)	Yes/no
TagUpdate (Enum)	Defines whether the tag is updated on the local computer or for the entire project. (For internal tag only.) • TAG_COMPUTER_LOCAL (1) • TAG_PROJECT_WIDE (2)	Yes/yes
LengthText	Length of a text tag (0...255) "LengthText" can also be used for the length of the raw data tag. A testing of the correctness of the length will not be conducted. Observe the instructions of the communication channels.	yes/yes (only for external tag of type text)
TagScaleValid	Defines a linear scaling.	Yes/yes
TagScaleParam1	Sets the value1 for the value range process.	Yes/yes
TagScaleParam2	Sets the value2 for the value range process.	Yes/yes
TagScaleParam3	Sets the value1 for the value range tag.	Yes/yes
TagScaleParam4	Sets the value2 for the value range tag.	Yes/yes
TagStartvaluePersistence	Defines whether an internal tag is set as persistent.	Yes/yes
TagSubst	Replacement value (only for external variables)	Yes/yes
UseSubstValueOnCommonError	Set the replacement value for connection errors.	Yes/yes
UseSubstValueOnMaxLimit	Set the replacement value for upper limit.	Yes/yes

Object property	Description	Read/Write
UseSubstValueOnMinLimit	Set the replacement value for lower limit.	Yes/yes
UseSubstValueOnStartValue	Set the replacement value for the start value.	Yes/yes

You will find a description of the properties under the parameter descriptions for the corresponding functions.

Note

The "Tag synchronization" point in the property dialog of tags is not addressable with VBA. Tag synchronization is only available for internal tags.

For external tags, the "Type Conversion" point is not addressable with VBA.

CreateTag Function (Page 3897)

CommitTag Function (Page 3896)

CloseTag Function (Page 3894)

VBA in Other WinCC Editors (Page 3887)

CloseTag Function

Description

Closes the open tag.

Note

Modified parameters are not saved.

Syntax

```
Expression.CloseTag()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CloseTag()
' HMIGO_001
' procedure to close a variable
' tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'open a tag
  objHMIGO.GetTag strVariableName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'open a tag
  objHMIGO.CloseTag
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"

  Set objHMIGO = Nothing
End Sub
```

CreateTag Function (Page 3897)

CommitTag Function (Page 3896)

VBA in Tag Management (Page 3889)

CommitTag Function

Description

Writes the changed parameters of the open tag to WinCC.

Note

If further parameters are changed after a CommitTag call, write the changes to WinCC by calling this function again.

syntax

```
Expression.CommitTag()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CommitTag()
' HMIGO_002
' procedure to change a property of a variable
' tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'open a tag
  objHMIGO.GetTag strVariableName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'change a property
  objHMIGO.TagStart = 10
 'current status is "MODIFIED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'commit a tag
  objHMIGO.CommitTag
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"

  Set objHMIGO = Nothing
```

```
End Sub
```

DeleteTag Function (Page 3899)

CreateTag Function (Page 3897)

CloseTag Function (Page 3892)

VBA in Tag Management (Page 3889)

CreateTag Function

Description

Creates a new tag.

syntax

```
Expression.CreateTag(TagName,TagType,[Connection],[S7S5Address],
[GroupName])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
TagName (string)	Name of the tag to be created.
TagType (HMIGO_TAG_TYPE)	Data type of the tag. The possible types are: TAG_BINARY_TAG TAG_SIGNED_8BIT_VALUE TAG_UNSIGNED_8BIT_VALUE TAG_SIGNED_16BIT_VALUE TAG_UNSIGNED_16BIT_VALUE TAG_SIGNED_32BIT_VALUE TAG_UNSIGNED_32BIT_VALUE TAG_FLOATINGPOINT_NUMBER_32BIT_IEEE_754 TAG_FLOATINGPOINT_NUMBER_64BIT_IEEE_754 TAG_TEXT_TAG_8BIT_CHARACTER_SET TAG_TEXT_TAG_16BIT_CHARACTER_SET TAG_RAW_DATA_TYPE TAG_TEXT_REFERENCE

Parameter (Data Type)	Description
Connection (String, optional)	Name of a connection in which the tag and/or group is to be created. The connection must already be in existence, otherwise a tag cannot be created. If the name is omitted, an internal tag and/or group is recreated.
S7S5Address (String, optional)	Address of the S7 or S5 PLC to which the tag is connected. Without an address indication, an empty entry will be handed over. The parameter "S7S5Address" must be supplemented by the string ",QC"for the configuration of the Quality Code, for example: "DB1,DD0,QC". If the Quality Code of the tag is no longer to be monitored, the string ",QC" must be deleted.
GroupName (String, optional)	Name of a group in which the tag is inserted. If the group does not exist, it will be newly created. If the group name is not indicated, the tag will be created outside all groups.

Example:

```
Sub CreateTag()
' HMIGO_003
' procedure to create a variable
' tag must not be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'create a tag
  objHMIGO.CreateTag strVariableName, TAG_SIGNED_32BIT_VALUE
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
  Set objHMIGO = Nothing
End Sub
```

CloseTag Function (Page 3892)

VBA in Tag Management (Page 3889)

DeleteTag Function

Description

Deletes the specified tag.

syntax

```
Expression.DeleteTag(TagName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
TagName (string)	Name of the tag to be deleted.

Example:

```
Sub DeleteTag()
' HMIGO_004
' procedure to delete a variable
' tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"

 'delete a tag
  objHMIGO.DeleteTag strVariableName
  Set objHMIGO = Nothing
End Sub
```

GetTag Function

Description

Reads in the parameters of the specified tag.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in Tag Management".

syntax

```
Expression.GetTag(TagName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
TagName (string)	Name of the tag whose values are to be read in.

Example:

```
Sub GetTag()
' HMIGO_005
' procedure to open a variable
' tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'open/ get a tag
  objHMIGO.GetTag strVariableName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
  Set objHMIGO = Nothing
End Sub
```

DeleteTag Function (Page 3897)

CreateTag Function (Page 3895)

CommitTag Function (Page 3894)

CloseTag Function (Page 3892)

VBA in Tag Management (Page 3889)

ListTag function

Description

Alternatively, the ListTag function returns the following contents of the Tag Management as a list:

- All the channel units created
- All the channels created
- All the connections created
- All the tag groups created
- All the tags created

syntax

```
Expression.ListTag(ListType,pListArray,[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_TAG_LIST_TYPE)	Defines which content should be returned as a list. Possibilities are: • TAG_CHANNEL_UNITS (0) all channel units created • TAG_CHANNELS (2) all channels created • TAG_CONNECTIONS (3) all connections created • TAG_GROUPS (4) all tag groups created • TAG_NAMES (5) all tags created
pListArray (Variant)	List with the requested content.
Filter (String)	Filters can be set optionally. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether the list with the connections created is empty because no connections have been set up:

```
Sub ReadTagByConnection()
'HMIGO_027
'read content in data manager by connections
'no conections are implemented
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
'read all connections
  objHMIGO.ListTag TAG_CONNECTIONS, arrContent
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because no connections are implemented"
  End If
End Sub
```

5.5.2.3 VBA im Tag Logging

VBA in Tag Logging

Introduction

VBA allows you to create process value archives, archive tags and triggers directly from the program code, modify them, and delete them.

Note

You should not have or should not open the "Tag Logging" editor when editing with VBA.

Principle

When you have created the instance of the "HMIGO" class, the following functions are available to you to access Tag Logging:

- CloseTlgArchive
- CloseTlgTag
- CloseTlgTrigger
- CommitTlgArchive
- CommitTlgTag
- CommitTlgTrigger
- CreateTlgArchive
- CreateTlgTag
- CreateTlgTrigger
- DeleteTlgArchive
- DeleteTlgTag
- DeleteTlgTrigger
- GetTlgArchive
- GetTlgTag
- GetTlgTrigger
- ListTlgArchive
- ListTlgTag
- ListTlgTrigger

The following enumerations are available for the parameter supply of these functions:

- HMIGO_TLG_ARCHIVE_TYPE
- HMIGO_TLG_ARCHIVE_LIST_TYPE
- HMIGO_TLG_TAG_TYPE
- HMIGO_TLG_TAG_LIST_TYPE
- HMIGO_TLG_TRIGGER_BASE
- HMIGO_TLG_TRIGGER_LIST_TYPE

Direct Access to the Object Properties

You can also access the parameters of the above-mentioned functions directly in VBA by means of the following object properties. The column "is used in" will display whether you will

be able to access the object property in the process value archive (P) and/or in the compressed archive (V).

Object property	Description	Read/ Write	is used in
ObjectStateTlgArchive	Returns the object state for the archive via the enumeration "HMIGO_OBJECT_STATE". Further information on this enumeration can be found in this documentation under "VBA in other WinCC Editors".	Yes/no	P, V
ObjectStateTlgTag	Returns the object state for the archive tag via the enumeration "HMIGO_OBJECT_STATE".	Yes/no	P, V
TlgArchiveAccessLevelRead	The authorization level for reading.	Yes/no	P, V
TlgArchiveAccessLevelWrite	The authorization level for writing.	Yes/no	P, V
TlgArchiveArchiveState	Specifies whether archiving is disabled or enabled at system startup. Possible values of the enum "HMIGO_TLG_ARCHIVE_STATE": • TLG_ARCHIVE_STATE_LOCKED (1) • TLG_ARCHIVE_STATE_ACTIVATED (0)	Yes/yes	P, V
TlgArchiveBufferSize	Specifies the number of records for a short-term archive.	Yes/yes	P
TlgArchiveBufferType	Specifies the tag storage location. The possible types of the enum "HMIGO_TLG_ARCHIVE_BUFFER_TYPE": • TLG_ARCHIVE_BUFFER_TYPE_DISK (2) • TLG_ARCHIVE_BUFFER_TYPE_RAM (1)	Yes/yes	P
TlgArchiveCompressRange	Specifies the compression time period. Name of the timer, greater than or equal to 1, defined under "Times" in the Tag Logging editor. Since the format is a string, it is language dependent. Can be determined via the function "ListTlgArchive(TLG_ARCHIVE_TRIGGER_NAMES, arrTrigger)"	Yes/yes	V
TlgArchiveCompressType	Specifies the algorithm for compressing the values. The possible types of the enum "HMIGO_TLG_ARCHIVE_COMPRESS_TYPE": • TLG_COMPRESS_TYPE_CALC (1) • TLG_COMPRESS_TYPE_CALC_COPY (2) • TLG_COMPRESS_TYPE_CALC_DEL (3) • TLG_COMPRESS_TYPE_CALC_COPY_DEL (4)	Yes/yes	V
TlgArchiveFlags	Used internally.		
TlgArchiveName	Name of the process value archive or compressed archive.	Yes/no	P, V

Object property	Description	Read/ Write	is used in
TlgArchiveQCRActive	Specifies for the compressed archive whether weighted quality codes are used during archiving. The possible types of the enum "HMIGO_TLG_QCR_ACTIVE_FLAGS": • TLG_QCR_ALL (15) • TLG_QCR_BAD (1) • TLG_QCR_GOOD_CASCADED (8) • TLG_QCR_GOOD_NONCASCADED (4) • TLG_QCR_OFF (0) • TLG_QCR_UNCERTAIN (2)		V
TlgArchiveQCRBad	If weighted quality codes are used and the "Bad" option is activated, you define for the compression archive the percentage as of which the "Bad" state of process values is archived in the compression tag.		V
TlgArchiveQCRGoodCascade	If weighted quality codes are used and the "Good (Cascade)" option is activated, you define for the compression tag the percentage as of which the "Good (Cascade)" state of process values is archived in the compression tag.		V
TlgArchiveQCRGoodNonCascade	If weighted quality codes are used and the "Good (Non-Cascade)" option is activated, you define for the compression archive the percentage as of which the "Good (Non-Cascade)" state of process values is archived in the compression tag.		V
TlgArchiveQCRUncertain	If weighted quality codes are used and the "Uncertain" option is activated, you define for the compression archive the percentage as of which the "Uncertain" state of process values is archived in the compression tag.		V
TlgArchiveType	Specifies whether the archive is a process value archive or a compressed archive.	Yes/no	P, V
TlgTagAliasName	The alternative name by means of which the tag can be addressed (alias).	Yes/yes	P
TlgTagArchiveName	Name of the archive.	Yes/no	P, V
TlgTagArchiving	Specifies the acquisition type. Possible values of the enum "HMIGO_TLG_TAG_ARCHIVING": • TLG_TAG_ACYCLIC (8388609) • TLG_TAG_CYCLIC_CONTINUOUS (8388610) • TLG_TAG_CYCLIC_SELECTIVE (8388612) • TLG_TAG_ON_EVERY_CHANGE (8388616)	Yes/yes	P
TlgTagArchivingState	Specifies whether archiving is enabled or disabled at system startup. Possible values of the enum "HMIGO_TLG_TAG_ARCHIVING_STATE": • TLG_TAG_LOCKED (1) • TLG_TAG_ACTIVATED (0)	Yes/yes	P, V
TlgTagConvertModule	Name of the conversion DLL used for data conversion.	Yes/yes	P

Object property	Description	Read/ Write	is used in
TlgTagFlags	Possible values of the enum "HMIGO_TLG_TAG_FLAGS": • TLG_TAG_LONGTERM_DISABLED (1) • TLG_TAG_NOFLAGS (0)		
TlgTagHysterese	Value for the hysteresis by means of which a check is carried out to establish whether a value has changed.	Yes/yes	P
TlgTagLowerLimit	Value for the scaling of the tag's lower limit.	Yes/yes	P
TlgTagMethodType	Specifies the method by which the value is edited before archiving. Possible values of the enum "HMIGO_TLG_TAG_METHOD_TYPE": • TLG_TAG_ACTUAL (1) • TLG_TAG_SUM (3) • TLG_TAG_MaxValue (5) • TLG_TAG_MinValue (4) • TLG_TAG_AVERAGE (2)	Yes/yes	P, V
TlgTagName	Name of the archive tag.	Yes/no	P, V
TlgTagNameCompressArchive	In the case of compressed archives, contains the name of the source archive.	Yes/yes	V
TlgTagNameCompressTag	In the case of compressed archives, contains the name of the source tag.	Yes/yes	V
TlgTagNameProcTag	Name of the process tag from which the value to be acquired is taken.	Yes/yes	P
TlgTagNameRawValue	In the cast of process-controlled archives, contains the name of the raw-data tag.	Yes/yes	P
TlgTagOnChange	Specifies whether archiving is to be carried out in the event of a change. Possible values of the enum "HMIGO_TLG_TAG_ON_CHANGE": • TLG_TAG_EVERY_VALUE (0) • TLG_TAG_RELATIVE_HYSTERESE (1) • TLG_TAG_ABSOLUTE_HYSTERESE (2)	Yes/yes	P
TlgTagOnError	Specifies whether, in the event of a problem, the most recently acquired value or the substitute value is saved. Possible values of the enum "HMIGO_TLG_TAG_ON_ERROR": • TLG_TAG_LAST_VALUE (1) • TLG_TAG_SUBSTITUTE (2)	Yes/yes	P
TlgTagPreviousOSGUID	Used internally.		

Object property	Description	Read/ Write	is used in
TlgTagQCRActive	Specifies for the compression tag whether weighted quality codes are used during archiving. The possible types of the enum "HMIGO_TLG_QCR_ACTIVE_FLAGS": • TLG_QCR_ALL (15) • TLG_QCR_BAD (1) • TLG_QCR_GOOD_CASCADED (8) • TLG_QCR_GOOD_NONCASCADED (4) • TLG_QCR_OFF (0) • TLG_QCR_UNCERTAIN (2)		V
TlgTagQCRBad	If weighted quality codes are used and the "Bad" option is activated, you define for the compression tag the percentage as of which the "Bad" state of process values is archived in the compression tag.		V
TlgTagQCRGoodCascade	If weighted quality codes are used and the "Good (Cascade)" option is activated, you define for the compression tag the percentage as of which the "Good (Cascade)" state of process values is archived in the compression tag.		V
TlgTagQCRGoodNonCascade	If weighted quality codes are used and the "Good (Non-Cascade)" option is activated, you define for the compression tag the percentage as of which the "Good (Non-Cascade)" state of process values is archived in the compression tag.		V
TlgTagQCRUncertain	If weighted quality codes are used and the "Uncertain" option is activated, you define for the compression tag the percentage as of which the "Uncertain" state of process values is archived in the compression tag.		V
TlgTagSDCompressDeviation	Specifies the absolute or relative value of the deviation, which is permitted for the calculation of the increase by the algorithm. Basic value is the process value saved last.		P
TlgTagSDCompression	Specifies whether the swinging door compression is activated.		P
TlgTagSDLowLimit	Specifies the low limit of the swinging door compression distribution when a relative deviation is activated.		P
TlgTagSDRelativeDecision	Specifies whether the relative value of the deviation is taken into consideration at the swinging door algorithm.		P
TlgTagSDtMax	Specifies the maximum duration between two archived values as the detection limit for swinging door compression.		P
TlgTagSDtMin	Specifies the minimum duration between two archived values as the detection limit for swinging door compression.		P
TlgTagSDUpperLimit	Specifies the upper limit of the swinging door compression distribution when a relative deviation is activated.		P
TlgTagStartEvent	Name of the tag by means of which the start of archiving is checked.	Yes/yes	P

Object property	Description	Read/ Write	is used in
TlgTagStartTriggerFunction	Specifies the name of a script function by means of which a check is carried out for a start event for the start of archiving.	Yes/yes	P
TlgTagStartTriggerModule	Specifies the name of a DLL from which the script function is called for the checking of a start event.	Yes/yes	P
TlgTagStopEvent	Name of the tag by means of which the stopping of archiving is checked.	Yes/yes	P
TlgTagStopTriggerFunction	Specifies the name of a script function by means of which a check is carried out for a stop event for the start of archiving.	Yes/yes	P
TlgTagTriggerArchiving	Name of the timer for the archiving cycle.	Yes/yes	P
TlgTagTriggerFactor	Contains the factor for the display cycle as a multiple of the archiving cycle.	Yes/yes	P
TlgTagTriggerFunction	Specifies the name of a script function for the dynamic switching of the acquisition and archiving cycles.	Yes/yes	P
TlgTagTriggerScan	Name of the timer for the acquisition cycle	Yes/yes	P
TlgTagTriggerType	Specifies how archiving is carried out at a signal change. Possible values of the enum "HMIGO_TLG_TAG_TRIGGER_TYPE": • TLG_TAG_FROM_0_TO_1 (2) • TLG_TAG_FROM_1_TO_0 (3) • TLG_TAG_ALWAYS (4) • TLG_TAG_EVERY_CHANGE (1)	Yes/yes	P
TlgTagType	Specifies the tag type. The possible types of the enum "HMIGO_TLG_TAG_TYPE": • TLG_TAG_TYP_ANALOG (65537) • TLG_TAG_TYP_BINARY (65538) • TLG_TAG_TYP_PROCESS (65544) • TLG_TAG_TYP_COMPRESS (65540)	Yes/yes	P, V
TlgTagUpperLimit	Value for the scaling of the tag's upper limit.	Yes/yes	P
TlgTriggerBase	Time base for the trigger. Possible values of the enum "HMIGO_TLG_TRIGGER_BASE": • TLG_TRIGGER_BASE_250MS (250) • TLG_TRIGGER_BASE_500MS (500) • TLG_TRIGGER_BASE_DAY (&H5265C00) • TLG_TRIGGER_BASE_HOUR (&H36EE80) • TLG_TRIGGER_BASE_MIN (&HEA60) • TLG_TRIGGER_BASE_SEC (&H3E8)		P
TlgTriggerCreatorID	Used internally.		P
TlgTriggerFactor	Integer factor that is taken into consideration for the trigger together with the time base.		P
TlgTriggerName	Name of the trigger.		P
TlgTriggerScheduleDayOfMonth	Specifies the day for the trigger for the "Monthly" time series.		P

Object property	Description	Read/ Write	is used in
TlgTriggerScheduleDaysOfWeek	Specifies the days for the trigger for the "Weekly" time series. Possible values of the enum "HMIGO_TLG_TRIGGER_SCHEDULE_DAYSOFWEEK": • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_EVERY_DAY (127) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_FRIDAY (32) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_MONDAY (2) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_NO_DAY (0) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_SATURDAY (64) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_SUNDAY (1) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_THURSDAY (16) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_TUESDAY (4) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_WEDNESDAY (8)		P
TlgTriggerScheduleInterval	Specifies the interval for the trigger for the calendar times.		P
TlgTriggerScheduleMonthOfYear	Specifies the month for the trigger for the "Yearly" time series.		P
TlgTriggerScheduleType	Defines the type of trigger. Possible time series of the enum "HMIGO_TLG_TRIGGER_SCHEDULE_TYPE": • TLG_TRIGGER_SCHEDULE_TYPE_CYCLIC (0) • TLG_TRIGGER_SCHEDULE_TYPE_DAILY (1) • TLG_TRIGGER_SCHEDULE_TYPE_MONTHLY (3) • TLG_TRIGGER_SCHEDULE_TYPE_WEEKLY (2) • TLG_TRIGGER_SCHEDULE_TYPE_YEARLY (4)		P
TlgTriggerStartByShutdown	The trigger is initiated additionally when the system is shut down regardless of the configured triggers.		P
TlgTriggerStartByStartup	The trigger is initiated additionally when the system is started up regardless of the configured triggers.		P
TlgTriggerStartDay	Specifies the day for the starting point of the trigger.		P
TlgTriggerStartHour	Specifies the hour for the starting point of the trigger.		P
TlgTriggerStartMilliSecond	Specifies the milliseconds for the starting point of the trigger.		P
TlgTriggerStartMinute	Specifies the minute for the starting point of the trigger.		P
TlgTriggerStartMonth	Specifies the month for the starting point of the trigger.		P
TlgTriggerStartSecond	Specifies the seconds for the starting point of the trigger.		P
TlgTriggerStartYear	Specifies the year for the starting point of the trigger.		P

CloseTlgArchive Function

Description

Closes the process value or compressed archive which is open.

Note

Modified parameters are not saved.

syntax

```
Expression.CloseTlgArchive()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CloseTlgArchive()
' HMIGO_006
' procedure to close an archive
' the archive need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'open archive
  objHMIGO.GetTlgArchive strArchiveName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'close archive
  objHMIGO.CloseTlgArchive
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"

  Set objHMIGO = Nothing
End Sub
```

CloseTlgTag Function

Description

Closes the archive tag which is open.

Note

Modified parameters are not saved.

syntax

```
Expression.CloseTlgTag()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CloseTlgTag()
' HMIGO_007
' procedure to close a tag logging tag
' the archive need to be created before
' the tag logging tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Dim strTlgTagName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
  strTlgTagName = "NewTag"

 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Tag"
 'open/ get tag logging tag
  objHMIGO.GetTlgTag strArchiveName, strTlgTagName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
 'close tag logging tag
  objHMIGO.CloseTlgTag
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
  Set objHMIGO = Nothing
End Sub
```

CloseTlgTrigger function

Description

Closes the opened trigger.

Note

Modified parameters are not saved.

Syntax

```
Expression.CloseTlgTrigger()
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

--

CommitTlgArchive Function

Description

Writes the changed parameters of the specified archive to WinCC.

Note

If further parameters are changed after a CommitTlgArchive call, write the changes to WinCC by calling this function again.

syntax

```
Expression.CommitTlgArchive()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CommitTlgArchive()
' HMIGO_008
' procedure to change a property of an archive
' the archive need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'open archive
  objHMIGO.GetTlgArchive strArchiveName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'change a property
  objHMIGO.TlgArchiveArchiveState = TLG_STATE_LOCKED
 'current status is "MODIFIED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'commit archive
  objHMIGO.CommitTlgArchive
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"

  Set objHMIGO = Nothing
```

```
End Sub
```

CommitTlgTrigger function

Description

Writes the changed parameters of the specified trigger to WinCC.

Note

If further parameters are changed after a CommitTlgTrigger call, write the changes to WinCC by calling this function again.

Syntax

```
Expression.CommitTlgTrigger()
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

--

CreateTlgArchive Function

Description

Creates a process value archive or compressed archive.

syntax

```
Expression.CreateTlgArchive(ArchiveName,ArchiveType)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive to be created
ArchiveType (HMIGO_TLG_ARCHIVE_TYPE)	Type of the archive. The possible types are: • TLG_PROCESSARCHIVE (131073) for a process value archive • TLG_COMPRESSARCHIVE (131074) for a compressed archive

Default Values when Creating a New Tag Archive

The following table indicates the default values that are entered when a new process value archive or compressed archive is created. These values can be modified later and written using the CommitTlgArchive function.

Property	Default Value (Enum Name => Value)	Comment
TlgArchiveAccessLevelRead	0	Without authorization level
TlgArchiveAccessLevelWrite	0	Without authorization level
TlgArchiveArchiveState	TLG_ARCHIVE_STATE_ACTIVATED (0)	Archiving is started at start of Runtime.
TlgArchiveBufferSize	1000	Number of data records
TlgArchiveBufferType	TLG_ARCHIVE_BUFFER_TYPE_DISK (2)	The values are stored on hard disk in the database.
TlgArchiveCompressRange	"1 Tag". This string must be created individually for each language (e.g. English: "1 day")	Corresponds to exactly one day. Only relevant in the case of compressed tags. Special Feature: the user is responsible for values >= 1 minute
TlgArchiveCompressType	TLG_COMPRESS_TYPE_CALC (1)	Only calculate compression values. Only relevant in the case of compressed tags.

Enum HMIGO_TLG_ARCHIVE_STATE

Parameters	Description
TLG_ARCHIVE_STATE_LOCKED (1)	Archiving is disabled at system startup.
TLG_ARCHIVE_STATE_ACTIVATED (0)	Archiving is started at start of Runtime.

Enum HMIGO_TLG_ARCHIVE_BUFFER_TYPE

Parameters	Description
TLG_ARCHIVE_BUFFER_TYPE_DISK (2)	The values are archived on hard disk.
TLG_ARCHIVE_BUFFER_TYPE_RAM (1)	The values are only archived in working memory.

Enum HMIGO_TLG_ARCHIVE_COMPRESS_TYPE

Parameters	Description
TLG_COMPRESS_TYPE_CALC (1)	Only the compression values are calculated.
TLG_COMPRESS_TYPE_CALC_COPY (2)	The compression values are calculated and the original values copied.

Parameters	Description
TLG_COMPRESS_TYPE_CALC_DEL (3)	The compression values are calculated and the original values then deleted.
TLG_COMPRESS_TYPE_CALC_COPY_DEL (4)	The compression values are calculated and the original values copied and then deleted.

Example:

```
Sub CreateTlgArchive()
' HMIGO_010
' procedure to create an archive
' the archive must not be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'create tag logging archive
  objHMIGO.CreateTlgArchive strArchiveName, TLG_PROCESSARCHIVE
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
  Set objHMIGO = Nothing
End Sub
```

CreateTlgTag Function

Description

Creates a new archive tag.

syntax

```
Expression.CreateTlgTag(ArchiveName,TagName,[TagType])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of an existing archive in which the tag is to be entered
TagName (string)	Name of the tag to be created
TagType (HMIGO_TLG_TAG_TYPE, optional)	Specifies the type of the tag. If no type is specified, the default value TLG_VAR_TYP_ANALOG is entered. The possible types are: • TLG_VAR_TYP_ANALOG (65537) for an analog tag. • TLG_VAT_TYP_BINARY (65538) for a binary tag. • TLG_VAR_TYP_PROCESS (65544) for a process tag. • TLG_VAT_TYP_COMPRESS (65540) for a compression tag.

Default Values When a New Archive Tag Is Created

The following table indicates the default values that are entered when a new archive tag is created. These values can be modified later and written using the CommitTlgTag function.

Property	Default Value (Enum Name => Value)	Comment
TlgTagType	TLG_VAR_TYP_ANALOG (65537)	Acquired by means of an analog data manager tag
TlgTagArchiving	TLG_TAG_CYCLIC_CONTINUOUS (8388610)	Cyclic, continuous acquisition
TlgTagArchivingState	TLG_TAG_ACTIVATED (0)	Archiving is started at start of Runtime.
TlgTagTriggerScan	1 second	Please note that "1 second" is only the name of the trigger. You must ensure yourself that the trigger exists and actually has a cycle of 1 s.

Property	Default Value (Enum Name => Value)	Comment
TlgTagTriggerArchiving	1 second	Please note that "1 second" is only the name of the trigger. You must ensure yourself that the trigger exists and actually has a cycle of 1 s.
TlgTagTriggerFactor	1	The display cycle and archiving cycle are identical.
TlgTagOnError	TLG_TAG_LAST_VALUE (1)	The last valid value is taken as the substitute value.
TlgTagTriggerType	TLG_TAG_ALWAYS (4)	Every value is archived.
TlgTagMethodType	TLG_TAG_ACTUAL (1)	No editing. The value is accepted immediately.
TlgTagStartTriggerFunction	No function specified	--
TlgTagStopTriggerFunction	No function specified	--
TlgTagTriggerFunction	No function specified	--
TlgTagUpperLimit	No value specified	--
TlgTagLowerLimit	No value specified	--
TlgTagNameCompressArchive	No archive name specified	--
TlgTagNameCompressTag	No tag name specified	--
TlgTagNameRawValue	No raw-data tag specified	--
TlgTagStartTriggerModule	No DLL name specified	--
TlgTagNameProcTag	Corresponds to "TagName"	--
TlgTagOnChange	TLG_TAG_EVERY_VALUE (0)	Every value will be archived.
TlgTagHysterese	0	No check is carried out by means of hysteresis.
TlgTagAliasName	No value specified	--
TlgTagStartEvent	No tag specified	--
TlgTagStopEvent	No tag specified	--

List of the enumerators for Tag Logging

Enum types	Description
TLG_TAG_TYPE	The passed parameter specifies the type of the tag. The possible types are in the table Enum HMIGO_TLG_TAG_TYPE.
TLG_TAG_ARCHIVING	The passed parameter specifies the acquisition type. The possible values are in the table Enum HMIGO_TLG_TAG_ARCHIVING.
TLG_TAG_ARCHIVING_STATE	The passed parameter specifies whether archiving is disabled or enabled at system startup. The possible values are in the table Enum HMIGO_TLG_TAG_ARCHIVING_STATE.

Enum types	Description
TLG_TAG_ON_ERROR	The passed parameter specifies which value is stored in the event of a problem: the most recently acquired value or the substitute value. The possible values are in the table Enum HMIGO_TLG_TAG_ON_ERROR.
TLG_TAG_TRIGGER_TYPE	The passed parameter specifies how archiving is carried out at a signal change. The possible values are in the table Enum HMIGO_TLG_TAG_TRIGGER_TYPE.
TLG_TAG_METHOD_TYPE	The passed parameter specifies the method by which the value is edited before archiving. The possible values are in the table Enum HMIGO_TLG_TAG_METHOD_TYPE.
TLG_TAG_ON_CHANGE	The passed parameter specifies whether archiving is to be carried out in the event of a change. The possible values are in the table Enum HMIGO_TLG_TAG_ON_CHANGE.

Enum HMIGO_TLG_TAG_TYPE

Values	Description
TLG_TAG_TYP_ANALOG (65537)	Analog tag
TLG_TAG_TYP_BINARY (65538)	Binary Tags
TLG_TAG_TYP_PROCESS (65544)	Process tag
TLG_TAG_TYP_COMPRESS (65540)	Compressed archive tag

Enum HMIGO_TLG_TAG_ARCHIVING

Values	Description
TLG_TAG_ACYCLIC (8388609)	Acyclic acquisition
TLG_TAG_CYCLIC_CONTINUOUS (8388610)	Cyclic-continuous acquisition
TLG_TAG_CYCLIC_SELECTIVE (8388612)	Cyclic-selective acquisition
TLG_TAG_ON_EVERY_CHANGE (8388616)	Acquisition only in the event of a change

Enum HMIGO_TLG_TAG_ARCHIVING_STATE

Values	Description
TLG_TAG_LOCKED (1)	Acquisition disabled at system startup
TLG_TAG_ACTIVATED (0)	Acquisition enabled at system startup

Enum HMIGO_TLG_TAG_ON_ERROR

Values	Description
TLG_TAG_LAST_VALUE (1)	The most recently acquired value is used.
TLG_TAG_SUBSTITUTE (2)	A substitute value is entered.

Enum HMIGO_TLG_TAG_TRIGGER_TYPE

Values	Description
TLG_TAG_FROM_0_TO_1 (2)	Signal change from the value 0 to 1
TLG_TAG_FROM_1_TO_0 (3)	Signal change from the value 1 to 0
TLG_TAG_ALWAYS (4)	Always archive.
TLG_TAG_EVERY_CHANGE (1)	Archive at every signal change.

Enum HMIGO_TLG_TAG_METHOD_TYPE

Values	Description
TLG_TAG_ACTUAL (1)	The current value is accepted.
TLG_TAG_SUM (3)	The sum is formed.
TLG_TAG_MaxValue (5)	The greatest value is saved.
TLG_TAG_MinValue (4)	The smallest value is saved.
TLG_TAG_AVERAGE (2)	The average value is saved.

Enum HMIGO_TLG_TAG_ON_CHANGE

Values	Description
TLG_TAG_EVERY_VALUE (0)	The current value is accepted.
TLG_TAG_RELATIVE_HYSTERESE (1)	A hysteresis specified as a percentage is used for the calculation as to whether the value is to be archived.
TLG_TAG_ABSOLUTE_HYSTERESE (2)	A hysteresis specified as an absolute value is used for the calculation as to whether the value is to be archived.

Example:

```
Sub CreateTlgTag()
' HMIGO_011
' procedure to create a tag logging tag
' the archive need to be created before
' the tag logging tag must not be created before
' declarations
  Dim objHMIGO As HMIGO
```

```
   Dim strArchiveName As String
   Dim strTlgTagName As String
   Set objHMIGO = New HMIGO
   strArchiveName = "NewArchive"
   strTlgTagName = "NewTag"

  'current status is "EMPTY"
   MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Tag"
  'create tag logging tag
   objHMIGO.CreateTlgTag strArchiveName, strTlgTagName, TLG_TAG_TYPE_ANALOG
  'current status is "OPENED"
   MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
   Set objHMIGO = Nothing
End Sub
```

CreateTlgTrigger function

Description

Creates a new trigger that is used as a timer for the acquisition and archiving cycle.

Syntax

```
Expression.CreateTlgTrigger(TriggerName,TriggerBase,TriggerFactor)
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

Parameter (Data Type)	Description
TriggerName (String)	Name of the trigger to be created
TriggerBase (HMIGO_TLG_TRIGGER_BASE)	Time base of the trigger. Possible values: • TLG_TRIGGER_BASE_250MS (250) • TLG_TRIGGER_BASE_500MS (500) • TLG_TRIGGER_BASE_DAY (&H5265C00) • TLG_TRIGGER_BASE_HOUR (&H36EE80) • TLG_TRIGGER_BASE_MIN (&HEA60) • TLG_TRIGGER_BASE_SEC (&H3E8)
TriggerFactor	Integer factor that is taken into consideration for the trigger together with the time base.

Enum HMIGO_TLG_TRIGGER_BASE

Parameter	Description
TLG_TRIGGER_BASE_250MS (250)	The time base is "250 ms".
TLG_TRIGGER_BASE_500MS (500)	The time base is "500 ms".
TLG_TRIGGER_BASE_DAY (&H5265C00)	The time base is "1 day".
TLG_TRIGGER_BASE_HOUR (&H36EE80)	The time base is "1 hour".
TLG_TRIGGER_BASE_MIN (&HEA60)	The time base is "1 minute".
TLG_TRIGGER_BASE_SEC (&H3E8)	The time base is "1 second".

Enum HMIGO_TLG_TRIGGER_SCHEDULE_DAYSOFWEEK

Parameter	Description
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_EVERY_DAY (127)	Every day is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_FRIDAY (32)	Friday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_MONDAY (2)	Monday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_NO_DAY (0)	No day is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_SATURDAY (64)	Saturday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_SUNDAY (1)	Sunday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_THURSDAY (16)	Thursday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_TUESDAY (4)	Tuesday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_WEDNESDAY (8)	Wednesday is used for the "Weekly" trigger.

Enum HMIGO_TLG_TRIGGER_SCHEDULE_TYPE

Parameter	Description
TLG_TRIGGER_SCHEDULE_TYPE_CYCLIC (0)	The time series "Standard (cyclic)" is used for the trigger.
TLG_TRIGGER_SCHEDULE_TYPE_DAILY (1)	The time series "Daily" is used for the trigger.
TLG_TRIGGER_SCHEDULE_TYPE_MONTHLY (3)	The time series "Monthly" is used for the trigger.

Parameter	Description
TLG_TRIGGER_SCHEDULE_TYPE_WEEKLY (2)	The time series "Weekly" is used for the trigger.
TLG_TRIGGER_SCHEDULE_TYPE_YEARLY (4)	The time series "Yearly" is used for the trigger.

DeleteTlgArchive Function

Description

Deletes the specified archive.

Syntax

```
Expression.DeleteTlgArchive(ArchiveName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive to be deleted. Archive tags contained in the archive are also deleted.

Example:

```
Sub DeleteTlgArchive()
' HMIGO_012
' procedure to delete an archive
' the archive need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"

 'delete tag logging archive
  objHMIGO.DeleteTlgArchive strArchiveName
  Set objHMIGO = Nothing
End Sub
```

DeleteTlgTag Function

Description

Deletes the specified archive tag.

syntax

```
Expression.DeleteTlgTag(ArchiveName,TagName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive containing the archive tag to be deleted
TagName (string)	Name of the archive tag to be deleted.

Example:

```
Sub DeleteTlgTag()
' HMIGO_013
' procedure to delete a tag logging tag
' the archive need to be created before
' the tag logging tag need to be created before
```

```
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Dim strTlgTagName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
  strTlgTagName = "NewTag"

DeleteTlgTrigger function

Description

Deletes the specified trigger.

Syntax

```
Expression.DeleteTlgTrigger(TriggerName)
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

Parameter (Data Type)	Description
TriggerName (String)	Name of the trigger that is deleted.

GetTlgArchive Function

Description

Reads in the parameters of the specified archive.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in TagLogging".

syntax

```
Expression.GetTlgArchive(ArchiveName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive whose values are to be read in.

Example:

```
Sub GetTlgArchive()
' HMIGO_014
' procedure to open an archive
' the archive need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'open/ get tag logging archive
  objHMIGO.GetTlgArchive strArchiveName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
  Set objHMIGO = Nothing
End Sub
```

GetTlgTag Function

Description

Reads in the parameters of the specified archive tag.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in TagLogging".

syntax

```
Expression.GetTlgTag(ArchiveName,TagName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive containing the archive tag.
TagName	Name of the archive tag whose parameters are to be read in.

Example:

```
Sub GetTlgTag()
```

```
' HMIGO_015
' procedure to close a tag logging tag
' the archive need to be created before
' the tag logging need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Dim strTlgTagName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
  strTlgTagName = "NewTag"

 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Tag"
 'open/ get tag logging tag
  objHMIGO.GetTlgTag strArchiveName, strTlgTagName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
  Set objHMIGO = Nothing
End Sub
```

GetTlgTrigger function

Description

Reads in the parameters of the specified trigger.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in TagLogging".

Syntax

```
Expression.GetTlgTrigger(TriggerName)
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

Parameter (Data Type)	Description
TriggerName (String)	Name of the trigger whose values are read in.

ListTlgArchive Function

Description

Alternatively, the ListTlgArchive function returns the following Tag Logging values in a list:

- All existing Tag Logging archives
- All existing cycles / timers

syntax

```
Expression.ListTlgArchive(ListType,pListArray,[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_TLG_ARCHIVE_LIST_TYPE)	Defines which content should be returned in a list. Possibilities are: • TLG_ARCHIVE_NAMES (1) All created Tag Logging archives • TLG_ARCHIVE_TRIGGER_NAMES (2) All created cycles / timers
pListArray (Variant)	List with the requested content.
Filter (String)	Filters can be set optionally. A trigger name can be used as a filter. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether archives are configured:

```
Sub ReadTlgArchives()
'HMIGO_028
'read content in tag logging
'no archives are implemented
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
'read all tlg archives
  objHMIGO.ListTlgArchive TLG_ARCHIVE_NAMES, arrContent
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because no tag logging archives are implemented"
  End If
End Sub
```

VBA in Tag Logging (Page 3900)

ListTlgTag Function

Description

The ListTlgTag function returns all the tags created in a Tag Logging archive in a list.

syntax

```
Expression.ListTlgTag(ListType,ListArray,[ArchiveName],[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_TLG_TAG_LIST_TYPE)	Defines which content should be returned in a list. Possibilities are: TLG_TG_NAMES (1) All tags created in a Tag Logging archive
ListArray (Variant)	List with the requested content.
ArchiveName (String)	Name of the archive in Tag Logging (optional). If the name of the archive is not specified, all,archive tags are returned.
Filter (String)	Filters can be set optionally. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether the archive tags are configured in the "Process Archive":

```
Sub ReadTlgTag()
'HMIGO_029
'read content in tag logging
'no tags within archives are implemented
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
  Dim strArchive as String
'set tlg archive name
  strArchive = "processarchive"
'read all tlg tags in specified archive
  objHMIGO.ListTlgTag TLG_TAG_NAMES, arrContent, strArchive
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because no tag logging tags in specified archive are implemented"
End If
End Sub
```

ListTlgTrigger function

Description

The function returns all created triggers in a list.

Syntax

```
Expression.ListTlgTrigger(ListType,ListArray,[Filter])
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

Parameter (Data Type)	Description
ListType (HMIGO_TLG_TRIGGER_LIST_TYPE)	Defines the content that is to be returned in a list. Possibilities are: • TLG_TRIGGER_NAMES (1) all created triggers
ListArray (Variant)	List with the requested content.
Filter (String)	Filters can be set optionally. A trigger name can be used as a filter. Wildcards "*" and "?" are also possible.

5.5.2.4 VBA in the Text Library

VBA in the Text Library

Introduction

VBA allows you to generate Text Library texts directly from the program code, modify and delete them, and display text IDs and texts.

Note

You should not have or should not open the "TextLibrary" editor when editing with VBA.

Principle

When you have created the instance of the "HMIGO" class, the following functions are available to you to access the TextLibrary:

- CreateTextLanguage
- CreateText
- DeleteText
- DeleteTextLanguage
- GetText
- GetTextID
- ListText
- ModifyText

The following enumerations are available for the parameter supply of these functions:

- HMIGO_TEXT_CREATE_MODE
- HMIGO_TEXT_LIST_TYPE

DeleteText Function (Page 3939)

CreateText Function (Page 3938)

CreateTextLanguage Function (Page 3936)

VBA in Other WinCC Editors (Page 3887)

CreateTextLanguage Function

Description

Creates a language in the Text Library.

syntax

```
Expression.CreateTextLanguage(LanguageID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID for the language to be created (e.g. 1031 for German, 1033 for English, etc.) For a table of all language codes refer to the WinCC online help on "Language Identifiers".

Example:

```
Sub CreateTextLanguage()
' HMIGO_016
' procedure to create a language in text library
' language must not be created before
' LanguageID german = 1031
' LanguageID english(US) = 1033
' LanguageID spanish = 1034
' LanguageID french = 1040
' LanguageID farsi= 1065
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLangugeNumber As Long
  Set objHMIGO = New HMIGO
  lngLangugeNumber = 1065     'farsi
 'create new language
  objHMIGO.CreateTextLanguage lngLangugeNumber
  Set objHMIGO = Nothing
End Sub
```

DeleteTextLanguage Function (Page 3941)
DeleteText Function (Page 3939)
CreateText Function (Page 3938)
VBA in the Text Library (Page 3933)

CreateText Function

Description

Creates a new text for the language specified. Text input for other languages can be added using ModifyText.

syntax

```
Expression.CreateText(LanguageID,Text,CreateMode,TextID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language for which the text will be created.
Text (string)	Text to be created.
CreateMode (HMIGO_TEXT_CREATE_MODE)	Mode of text creation: • TEXT_ADD_REFCOUNT (0) only increases the reference counter when an identical text already exists. • TEXT_CREATE_ALWAYS (1) always sets up a new text line and inserts the text in it.
TextID (long)	Returns the TextID assigned to the new text or the TextID whose reference counter is increased. This ID is required for processing the text in other functions.

Example:

```
Sub CreateText()
' HMIGO_017
' procedure to create a new text
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextCreateMode As Long
  Dim lngTextID As Long         'return value of ".CreateText"
  Dim strText As String
  Set objHMIGO = New HMIGO
    strText = "new text"
  'LanguageID = english
  lngLanguageID = 1033
  '"TEXT_ADD_REFCOUNT" check if text exists, if not create new text
  lngTextCreateMode = 0
```

```
   '"TEXT_CREATE_ALWAYS" create always a new text (for messages)
'   lngTextCreateMode = 1

  'create new text
   objHMIGO.CreateText lngLanguageID, strText, lngTextCreateMode, lngTextID
  'show TextID of created text
   MsgBox "TextID: " & lngTextID, vbOKOnly, "Result CreateText"
   Set objHMIGO = Nothing
End Sub
```

CreateTextLanguage Function (Page 3934)

VBA in the Text Library (Page 3933)

DeleteText Function

Description

Deletes a line of text. All the languages for the corresponding line of text and the line of text itself are deleted.

syntax

```
Expression.DeleteText(TextID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
TextID (long)	ID of the line of text to be deleted

Example:

```
Sub DeleteText()
' HMIGO_018
' procedure to delete a text
' text will be searched and deleted
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextID As Long         'return value of GetTextID
  Dim strText As String
On Error GoTo ErrorHandler
  Set objHMIGO = New HMIGO
  strText = "new text"
  lngLanguageID = 1033

 'first: find text in text library and return TextID
  objHMIGO.GetTextID 1033, strText, lngTextID

 'if searched text exists: delete this text
  If Not lngTextID = -1 Then
    objHMIGO.DeleteText lngTextID
    MsgBox "Text : """ & strText & """ found in TextID: " & lngTextID & vbNewLine & _
           "TextID is deleted!", vbOKOnly, "Result DeleteText"
  Else
    MsgBox "Text : """ & strText & """ not found." & vbNewLine & _
           "No Text deleted!", vbOKOnly, "Result DeleteText"
End If
  Set objHMIGO = Nothing
  Exit Sub
ErrorHandler:
 'if lngText = (-1),searched text does not exit
  If lngTextID = -1 Then
    'reset errorhandler
    Err.Clear
    Resume Next
End If
  MsgBox "ErrNr. : " & Err.Number & vbNewLine & _
         "ErrDes.: " & Err.Description, vbOKOnly, "Error ocurred"
  'reset errorhandler
  Err.Clear
End Sub
```

GetText Function (Page 3942)

DeleteTextLanguage Function (Page 3941)

CreateText Function (Page 3936)

CreateTextLanguage Function (Page 3934)

DeleteTextLanguage Function

Description

Enables a language to be deleted from the TextLibrary. In this case, all the texts in this language are also deleted.

syntax

```
Expression.DeleteTextLanguage(LanguageID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language to be deleted

Example:

In the following example, a check is made whether the language '1036' exists. If it does, it will be deleted.

```
Sub DeleteLanguage()
'HMIGO_030
' delete an existing languages in TextLibrary
' language '1036'/spanish has to exist
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
  Dim intLanguage As Long
  Dim lngPointer As Long
' get all existing languages
  objHMIGO.ListText TEXT_LANGUAGE_IDS, arrContent
' check requested list for language '1036'/ spanish and delete
  For lngPointer = LBound(arrContent) To UBound(arrContent)
    intLanguage = arrContent(lngPointer) + Val("&H400")
    If intLanguage = 1036 Then
     'delete language
      objHMIGO.DeleteTextLanguage intLanguage
    End If
  Next lngPointer
End Sub
```

DeleteText Function (Page 3937)
CreateText Function (Page 3936)
CreateTextLanguage Function (Page 3934)
VBA in the Text Library (Page 3933)

GetText Function

Description

Returns the text for the selected text ID in the selected language.

syntax

```
Expression.GetText(LanguageID,TextID,Text)
```

Expression

Necessary. An expression that returns an object of the type "HMIGeneralObjects".

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language of the text to be read
TextID (long)	ID of the line of text from which text is to be read
Text (string)	Returns the text of the selected line of text and language.

Example:

```
Sub GetText()
' HMIGO_019
' procedure to get a text
' text with TextID = '69' need to be created
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextID As Long
  Dim strText As String         'return value of GetText
```

```
   Set objHMIGO = New HMIGO
   lngTextID = 69
   lngLanguageID = 1033

  'find text text library
   objHMIGO.GetText lngLanguageID, lngTextID, strText

  'show found text
   MsgBox "Read Text in TextID : " & lngTextID & " is """ & strText & """ !", _
                                vbOKOnly, "Result GetText"
   Set objHMIGO = Nothing
End Sub
```

CreateTextLanguage Function (Page 3934)

VBA in the Text Library (Page 3933)

GetTextID Function

Description

Returns the ID of the text searched for in the selected language.

If there are several texts with the same contents, only the line of text with the lowest ID is returned. Whether there are several lines of text with the same contents depends on the CreateMode of the CreateText function.

syntax

```
Expression.GetTextID(LanguageID,Text,TextID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language of the text searched for
Text (string)	The text searched for
TextID (long)	ID of the line of text in which the text searched for was found

Example:

```
Sub GetTextID()
' HMIGO_020
' procedure to search a TextID
' text will be searched and a TextID will be returned
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextID As Long         'return value of GetTextID
  Dim strText As String
On Error GoTo ErrorHandler
  Set objHMIGO = New HMIGO
  strText = "old text"
  lngLanguageID = 1033

 'first: find text in text library and return TextID
  objHMIGO.GetTextID 1033, strText, lngTextID

 'if searched text exists: delete this text
  If Not lngTextID = -1 Then
    MsgBox "Text : """ & strText & """ found in TextID: " & lngTextID, _
                vbOKOnly, "Result GetTextID"
Else
    MsgBox "Text : """ & strText & """ not found!", vbOKOnly, "Result GetTextID"
End If
  Set objHMIGO = Nothing
  Exit Sub
ErrorHandler:
 'if lngText = (-1),searched text does not exit
  If lngTextID = -1 Then
  'reset errorhandler
Err.Clear
Resume Next
End If
  MsgBox "ErrNr. : " & Err.Number & vbNewLine & _
         "ErrDes.: " & Err.Description, vbOKOnly, "Error ocurred"
  'reset errorhandler
Err.Clear
End Sub
```

DeleteText Function (Page 3937)

CreateText Function (Page 3936)

CreateTextLanguage Function (Page 3934)

VBA in the Text Library (Page 3933)

ListText Function

Description

Alternatively, the ListText function returns the following contents of the TextLibrary as a list:

- All languages created
- All text IDs
- All texts in a specific language

syntax

```
Exoression.ListText(ListType,pListArray,[LanguageID],[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_TEXT_LIST_TYPE)	Defines which content should be returned as a list. Possibilities are: • TEXT_LANGUAGE_IDS (1) All the created languages. The result still has to be converted by adding 400hex. • TEXT_IDS (2) All text IDs. • TEXT_TEXTS (3) All texts in a language.
pListArray (Variant)	List with the requested content.
LanguageID (Long)	The language ID whose text is to be returned.
Filter (String)	Filters can be set optionally. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether the list with the text of a language is empty because the language does not exist:

```
Sub ReadTextsByLanguage()
'HMIGO_031
'read content in textLibrary by language
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
  Dim intLanguage As Integer
'set invalid language ID
  intLanguage = 1051 'language does not exist
'read all texts
  objHMIGO.ListText TEXT_TEXTS, arrContent, intLanguage
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because wrong language selection"
End If
End Sub
```

Description

Modifies the text for the selected language with the ID specified.

syntax

```
Expression.ModifyText(LanguageID,TextID,Text)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language of the text to be changed.
TextID (long)	ID of the language of the text to be changed.
Text (string)	New text to be inserted.

Example:

```
Sub ModifyText()
' HMIGO_021
' procedure to modify a text
' text will be searched and replaced
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextID As Long         'return value of GetTextID
  Dim strOldText As String
  Dim strNewText As String
On Error GoTo ErrorHandler
  Set objHMIGO = New HMIGO
  strOldText = "old text"
  strNewText = "new text"
  lngLanguageID = 1033

 'first: find text in text library and return TextID

5.5.2.5 VBA in Alarm Logging

VBA in Alarm Logging

Introduction

VBA allows you to create messages directly from the program code, modify them, and delete them.

Note

You should not have or should not open the "Alarm Logging" editor when editing with VBA.

Principle

When you have created the instance of the "HMIGO" class, the following functions are available to you to access Alarm Logging:

- CloseSingleAlarm
- CommitSingleAlarm
- CreateSingleAlarm
- DeleteSingleAlarm
- GetSingleAlarm
- ListSingleAlarm

The following enumerations are available for the parameter supply of these functions:

- HMIGO_SINGLE_ALARM_CLASS_IDS
- HMIGO_SINGLE_ALARM_LIST_TYPE

Access to the Object Properties

You can also access the parameters of the above-mentioned functions directly in VBA by means of the following object properties:

Object property	Description	Read/Write
ObjectStateSingleAlarm	Returns the object state via the enumeration HMIGO_OBJECT_STATE. Further information on this enumeration can be found in this documentation under "VBA in other WinCC Editors".	Yes/no
SingleAlarmMessageNumber	Number of the message	Yes/no
SingleAlarmAGNumber	AS Number	Yes/yes
SingleAlarmCPUNumber	CPU number of the AGs.	Yes/yes
SingleAlarmClassID	Message class of the message. Possible values of the Enum SINGLE_ALARM_CLASS_IDS: • SINGLE_ALARM_ERROR (1) • SINGLE_ALARM_CLASS_2 (2) • SINGLE_ALARM_CLASS_3 (3) • SINGLE_ALARM_CLASS_4 (4) • SINGLE_ALARM_CLASS_5 (5) • SINGLE_ALARM_CLASS_6 (6) • SINGLE_ALARM_CLASS_7 (7) • SINGLE_ALARM_CLASS_8 (8) • SINGLE_ALARM_CLASS_9 (9) • SINGLE_ALARM_CLASS_10 (10) • SINGLE_ALARM_CLASS_11 (11) • SINGLE_ALARM_CLASS_12 (12) • SINGLE_ALARM_CLASS_13 (13) • SINGLE_ALARM_CLASS_14 (14) • SINGLE_ALARM_CLASS_15 (15) • SINGLE_ALARM_CLASS_16 (16) • SINGLE_ALARM_CLASS_SYSTEM_REQUIRE_ACKNOWLEDGEMENT (17) • SINGLE_ALARM_CLASS_SYSTEM_WITHOUT_ACKNOWLEDGEMENT (18)	Yes/yes
SingleAlarmMessageTypeID	Type ID of the message. The permissible values depend on the message class: • Class 1: Values from 1 to 16 • Class 2: Values from 17 to 32 • Class 3: Values from 33 to 48 • ... • Class 18: 273 and 274	Yes/yes
SingleAlarmTextXXID XX = 1...10	The properties SingleAlarmText1ID to SingleAlarmText10ID exist for the user texts 1 to 10.	Yes/yes

Object property	Description	Read/Write
SingleAlarmTagNameProcessValueXX XX = 1...10	For the process values there are the properties SingleAlarmTagNameProcessValue1 through 10 If you want to delete a configured process value, you must describe this parameter with a tag of the type "Long", which has the value "0".[1)]	Yes/yes
SingleAlarmTagName	Tag name for event	Yes/yes
SingleAlarmMessageBit	Bits for bit reporting procedure	Yes/yes
SingleAlarmQuitTag	Tag name for acknowledgment status	Yes/yes
SingleAlarmQuitBits	Bit for bit reporting procedure	Yes/yes
SingleAlarmStateTag	Tag for status query	Yes/yes
SingleAlarmStateBits	Bit for status tag	Yes/yes
SingleAlarmNormDLL	Name of the conversion DLL	Yes/yes
SingleAlarmQuitSingle	Acknowledgment of the messages, TRUE or FALSE possible	Yes/yes
SingleAlarmHornActivate	Activation of the horn, TRUE or FALSE possible	Yes/yes
SingleAlarmArchiving	Archiving of the message, TRUE or FALSE possible	Yes/yes
SingleAlarmProtocol	Logging of the message, TRUE or FALSE possible	Yes/yes
SingleAlarmFlankInvert	Triggering of message at falling edge, TRUE or FALSE possible	Yes/yes
SingleAlarmLockedOnStart	Message is disabled at system startup, TRUE or FALSE possible	Yes/yes
SingleAlarmGlobalAPFunction	Forward message to global AP function, TRUE or FALSE possible	Yes/yes
SingleAlarmActionName	Name of the action	Yes/yes
SingleAlarmActionParams	Parameters of the action	Yes/yes
SingleAlarmInfoText	Information text for message	Yes/yes
SingleAlarmGroup	Name of the user-defined group message assigned to a message.	Yes/yes

1)

```
Sub DeleteSingleAlarmTagNameProcessValue1()
     'HMIGO_033
     Dim objGO as HMIGO
     Dim var as Long
     var = 0
     Set objGO = new HMIGO
     'message 1 will be modified
       objGO.GetSingleAlarm 1
       objGO.SingleAlarmTagNameProcessValue1 = var
       objGO.CommitSingleAlarm
     Set objGO = nothing
   End Sub
```

CreateSingleAlarm Function (Page 3953)

CommitSingleAlarm Function (Page 3952)

CloseSingleAlarm Function (Page 3951)
VBA in Other WinCC Editors (Page 3887)

CloseSingleAlarm Function

Description

Closes the message which is open.

Note

Modified parameters are not saved. If the current value should be saved, execute the CommitSingleAlarm() function again.

syntax

```
Expression.CloseSingleAlarm()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CloseSingleAlarm()
' HMIGO_22
' procedure to open a singlealarm
' message #100 need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim lngMsgNumber As Long
  Set objHMIGO = New HMIGO
  lngMsgNumber = 100
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'open a singlealarm
  objHMIGO.GetSingleAlarm lngMsgNumber
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'close a singlealarm
  objHMIGO.CloseSingleAlarm
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
```

```
  Set objHMIGO = Nothing
End Sub
```

DeleteSingleAlarm Function (Page 3956)

CreateSingleAlarm Function (Page 3953)

CommitSingleAlarm Function (Page 3952)

VBA in Alarm Logging (Page 3946)

CommitSingleAlarm Function

Description

Writes the changed parameters of the open message to WinCC.

Note

To change further parameters after a CommitSingleAlarm call, write these changes to WinCC by calling the function again.

syntax

```
Expression.CommitSingleAlarm()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CommitSingleAlarm()
' HMIGO_023
' procedure to change a property of a singlealarm
' message #100 need to be created before
' declarations
  Dim objHMIGO As HMIGO
```

```
  Dim lngMsgNumber As Long
  Dim lngMsgBitNumber As Long
  Set objHMIGO = New HMIGO
  lngMsgNumber = 100
  lngMsgBitNumber = 10
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'open a singlealarm
  objHMIGO.GetSingleAlarm lngMsgNumber
 'current status is "OPENED" for changes
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'change a property
  objHMIGO.SingleAlarmMessageBit = lngMsgBitNumber
 'current status is "MODIFIED" for changes
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'commit a single alarm
  objHMIGO.CommitSingleAlarm
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"

  Set objHMIGO = Nothing
End Sub
```

CreateSingleAlarm Function (Page 3953)

CloseSingleAlarm Function (Page 3949)

VBA in Alarm Logging (Page 3946)

CreateSingleAlarm Function

Description

Creates a new message.

syntax

```
Expression.CreateSingleAlarm(MessageNumber,ClassID,MessageTypeID,Tex
t1ID,MessageTagName,MessageBit)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
MessageNumber (long)	Number of the message. • If an unused message number is specified here, it is accepted. • If the value "0" is entered, the message number is freely assigned by the system. In this case, the message number is given back here.
ClassID (HMIGO_SINGLE_ALARM_CLASS_IDS)	Message class. The possible values are in the table Enum HMIGO_SINGLE_ALARM_CLASS_IDS.
MessageTypeID (Integer)	The permissible values depend on the message class: • Class 1: Values from 1 to 16 • Class 2: Values from 17 to 32 • Class 3: Values from 33 to 48 • ... • Class 18: Values from 263 to 288
Text1ID (Long)	ID for the first user text. The ModifySingleAlarm function can be used to define nine further user texts (1-10).
MessageTagName (String)	Tag name for the event.
MessageBit (integer)	Bit in bit reporting process (0...31)

Default Values When a New Message Is Created

The following table indicates the default values that are entered when a new message is created. These properties can be modified. The modifications are saved using the ModifySingleAlarm function.

Parameters	Default Value (Enum Name => Value)	Comment
SingleAlarmAGNumber	0	--
SingleAlarmCPUNumber	0	--
SingleAlarmTextXXID	No text entered	--
SingleAlarmTagNameProcessValueXX	No tag entered	--
SingleAlarmQuitTag	No tag entered	--
SingleAlarmQuitBits	0	No bits set.
SingleAlarmStateTag	No tag entered	Corresponds to exactly one day. Only relevant in the case of compressed tags.
SingleAlarmStateBits	0	No bits set.
SingleAlarmNormDLL	No name entered	--
SingleAlarmQuitSingle	FALSE	Single acknowledgment, no group acknowledgment
SingleAlarmHornActivate	FALSE	Horn Not active.

Parameters	Default Value (Enum Name => Value)	Comment
SingleAlarmArchiving	TRUE	Message will be archived.
SingleAlarmProtocol	TRUE	Message is logged.
SingleAlarmFlankInvert	FALSE	Not activated.
SingleAlarmLockedOnStart	FALSE	Message is not disabled.
SingleAlarmGlobalAPIFunction	FALSE	Message is not forwarded.
SingleAlarmActionName	No name entered	--
SingleAlarmActionParams	No parameters entered for the action	--
SingleAlarmInfoText	No text entered	--
SingleAlarmGroup	No text entered	--

Enum HMIGO_SINGLE_ALARM_CLASS_IDS

The following message classes are available for selection:

Values	Description
SINGLE_ALARM_ERROR (1)	--
SINGLE_ALARM_CLASS_2 (2)	--
SINGLE_ALARM_CLASS_3 (3)	--
SINGLE_ALARM_CLASS_4 (4)	--
SINGLE_ALARM_CLASS_5 (5)	--
SINGLE_ALARM_CLASS_6 (6)	--
SINGLE_ALARM_CLASS_7 (7)	--
SINGLE_ALARM_CLASS_8 (8)	--
SINGLE_ALARM_CLASS_9 (9)	--
SINGLE_ALARM_CLASS_10 (10)	--
SINGLE_ALARM_CLASS_11 (11)	--
SINGLE_ALARM_CLASS_12 (12)	--
SINGLE_ALARM_CLASS_13 (13)	--
SINGLE_ALARM_CLASS_14 (14)	--
SINGLE_ALARM_CLASS_15 (15)	--
SINGLE_ALARM_CLASS_16 (16)	--
SINGLE_ALARM_CLASS_SYSTEM_REQUIRE_ACKNOWLEDGEMENT (17)	--
SINGLE_ALARM_CLASS_SYSTEM_WITHOUT_ACKNOWLEDGEMENT (18)	--

Example:

```
Sub CreateSingleAlarm()
' HMIGO_024
' procedure to create a SingleAlarm
' message must not be created before
```

```
' message Text ID need to be created before in text library
' declarations
  Dim objHMIGO As HMIGO
  Dim strMsgText As String      'message text
  Dim strMsgTagName As String   'message variable
  Dim lngMsgNumber As Long      'message number
  Dim lngMsgBitNumber As Long   'bit number within the message variable
  Dim lngMsgTypeID As Long      'message type
  Dim lngMsgClassID             'SINGLE_ALARM_ERROR
  Dim lngMsgTextID As Long      'message text ID from textlibrary
  Set objHMIGO = New HMIGO
  strMsgText = "NewText"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'preset reqiured parameter
  lngMsgNumber = 50
  lngMsgClassID = 1
  lngMsgTypeID = 2
  lngMsgTextID = 69
  strMsgText = "new text message"
  strMsgTagName = "NewVariable"
  lngMsgBitNumber = 5

 'create a tag
  objHMIGO.CreateSingleAlarm lngMsgNumber,SINGLE_ALARM_ERROR, lngMsgTypeID,lngMsgTextID,
strMsgTagName, lngMsgBitNumber

 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
  Set objHMIGO = Nothing
End Sub
```

DeleteSingleAlarm Function

Description

Deletes the specified message.

syntax

```
Expression.DeleteSingleAlarm(MessageNumber)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
MessageNumber (long)	Number of the message to be deleted.

Example:

```
Sub DeleteSingleAlarm()
' HMIGO_025
' procedure to delete a singlealarm
' message #100 need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim lngMsgNumber As Long

  Set objHMIGO = New HMIGO
  lngMsgNumber = 100
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"

 'delete a singlealarm
  objHMIGO.DeleteSingleAlarm lngMsgNumber
  Set objHMIGO = Nothing
End Sub
```

GetSingleAlarm Function

Description

Reads in the parameters of the message entered.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in Alarm Logging".

syntax

```
Expression.GetSingleAlarm(MessageNumber)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
MessageNumber (long)	The message number of the message to be read in.

Example:

```
Sub GetSingleAlarm()
' HMIGO_026
' procedure to open a singlealarm
' message #100 need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim lngMsgNumber As Long
  Set objHMIGO = New HMIGO
  lngMsgNumber = 100
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'open/ get a tag
  objHMIGO.GetSingleAlarm lngMsgNumber
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
  Set objHMIGO = Nothing
End Sub
```

VBA in Alarm Logging (Page 3946)

ListSingleAlarm Function

Description

The ListSingleAlarm function returns the content of Alarm Logging in a list:

- All actions created which are linked to messages
- All message class IDs created
- All info texts created
- All message numbers created
- All message type IDs created
- All message classes created
- All group messages created

syntax

```
Expression.ListSingleAlarm(ListType,pListArray,[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_SINGLE_ALARM_LIST_TYPE)	Defines which content should be returned in a list. Possibilities are: • SINGLE_ALARM_ACTION_NAMES (1) All actions created for Loop In Alarm when the parameter is set in the configuration as a string • SINGLE_ALARM_CLASS_IDS (2) All message class IDs created • SINGLE_ALARM_INFO_TEXTS (3) All info texts created • SINGLE_ALARM_MESSAGE_NUMBERS (4) All message numbers created • SINGLE_ALARM_MESSAGE_TYPE_IDS (5) All message type IDs created • SINGLE_ALARM_GROUP_MESSAGE_CLASSES (6) All message classes created • SINGLE_ALARM_GROUP_MESSAGE_USER_DEFINED (7) All group messages created
pListArray (Variant)	List with the requested content.
Filter (String)	Filters can be set optionally. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether info texts have been configured:

```
Sub ReadSingleAlarm()
'HMIGO_032
'read content in alarm logging
'no info texts are implemented
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
'read all info texts
  objHMIGO.ListSingleAlarm SINGLE_ALARM_INFO_TEXTS, arrContent
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because no info texts are implemented"
End If
End Sub
```

6.1.5 Events

6.1.5.1 A-D

Activated event

Description

Occurs when a picture is activated in the Graphics Designer. This happens when you switch between two pictures, for example.

syntax

```
Document_Activated(CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when the picture is activated:

```
Private Sub Document_Activated(CancelForwarding As Boolean)
'VBA76
MsgBox "The document got the focus." & vbCrLf &_
"This event (Document_Activated) is raised by the document itself"
End Sub
```

See also

VBA Reference (Page 3124)

Event Handling (Page 3103)

BeforeClose Events

Description

Occurs immediately before a picture is closed.

syntax

```
Document_BeforeClose(Cancel As Boolean, CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
Cancel (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output before the picture is closed:

```
Private Sub Document_BeforeClose(Cancel As Boolean, CancelForwarding As Boolean)
'VBA77
MsgBox "Event Document_BeforeClose is raised"
End Sub
```

See also

VBA Reference (Page 3124)

BeforeDocumentClose Event

Description

Occurs immediately before the picture is closed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeDocumentClose(Document As HMIDocument, Cancel
As Boolean)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that is going to be closed.
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output before the picture is closed:

```
Private Sub objGDApplication_BeforeDocumentClose(ByVal Document As IHMIDocument, Cancel As
Boolean)
'VBA78
MsgBox "The document " & Document.Name & " will be closed after press ok"
End Sub
```

See also

VBA Reference (Page 3124)

BeforeDocumentSave event

Description

Occurs immediately before the picture is saved.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeDocumentSave(Document As HMIDocument, Cancel
As Boolean)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that is going to be closed.
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output before the picture is closed:

```
Private Sub objGDApplication_BeforeDocumentSave(ByVal Document As IHMIDocument, Cancel As
Boolean)
'VBA79
MsgBox Document.Name & "-saving will start after press ok."
End Sub
```

See also

VBA Reference (Page 3124)

BeforeHMIObjectDelete-Ereignis

Description

Occurs immediately before an object in a picture is deleted.

syntax

```
BeforeHMIObjectDelete(ByVal HMIObject As IHMIObject, Cancel As
Boolean, CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
HMIObject (IHMIObject)	Identifies the object to be deleted.
Cancel (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the object to be deleted:

```
Private Sub Document_BeforeHMIObjectDelete(ByVal HMIObject As IHMIObject, Cancel As
Boolean, CancelForwarding As Boolean)
'VBA80
Dim strObjName As String
Dim strAnswer As String
'
'"strObjName" contains the name of the deleted object
strObjName = HMIObject.ObjectName
strAnswer = MsgBox("Are you sure to delete " & strObjName & "?", vbYesNo)
If strAnswer = vbNo Then
'if pressed "No" -> set Cancel to true for prevent delete
Cancel = True
End If
End Sub
```

See also

VBA Reference (Page 3124)

BeforeLibraryFolderDelete event

Description

Occurs immediately before a folder in the components library is deleted.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeLibraryFolderDelete(LibObject As
HMIFolderItem, Cancel As Boolean)
```

Parameter (Optional)

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The folder that is going to be deleted.
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output before a folder in the components library is deleted:

```
Private Sub objGDApplication_BeforeLibraryFolderDelete(ByVal LibObject As HMIFolderItem,
Cancel As Boolean)
'VBA81
MsgBox "The library-folder " & LibObject.Name & " will be delete..."
End Sub
```

See also

VBA Reference (Page 3124)

BeforeLibraryObjectDelete event

Description

Occurs immediately before an object in the components library is deleted.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeLibraryObjectDelete(LibObject As
HMIFolderItem, Cancel As Boolean)
```

Parameter (Optional)

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The object that is going to be deleted.
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output before a folder in the components library is deleted:

```
Private Sub objGDApplication_BeforeLibraryObjectDelete(ByVal LibObject As HMIFolderItem,
Cancel As Boolean)
'VBA82
MsgBox "The object " & LibObject.Name & " will be delete..."
End Sub
```

VBA Reference (Page 3124)

BeforeQuit Event

Description

Occurs immediately before the Graphics Designer is closed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeQuit(Cancel As Boolean)
```

Parameters

Parameter (Data Type)	Description
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In this example a message is output shortly before the Graphics Designer is closed.

```
Private Sub objGDApplication_BeforeQuit(Cancel As Boolean)
'VBA83
MsgBox "The Graphics Designer will be shut down"
End Sub
```

See also

VBA Reference (Page 3124)

BeforeSave Event

Description

Occurs immediately before a picture is saved.

syntax

```
Document_BeforeSave(Cancel As Boolean, CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
Cancel (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output before the picture is saved:

```
Private Sub Document_BeforeSave(Cancel As Boolean, CancelForwarding As Boolean)
'VBA84
MsgBox "The document will be saved..."
End Sub
```

See also

VBA Reference (Page 3124)

BeforeVisibleFalse event

Description

Occurs immediately before the Graphics Designer application is set from Visible to Invisible.

syntax

```
Document_BeforeVisibleFalse(Cancel As Boolean, CancelForwarding As
Boolean)
```

Parameters

Parameter (Data Type)	Description
Cancel (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

--

See also

VBA Reference (Page 3124)

ConnectionEvent Event

Description

Occurs when two objects are connected via the connector.

syntax

```
ConnectionEvent(eConnEventType, HMIConnector, HMIConnectedObject,
CancelProcess, CancelForwarding)
```

Parameter (Optional)

Parameter (Data Type)	Description
eConnEventType (HMIConnectionEventType)	--
HMIConnector (HMIObject)	--
HMIConnectedObject (HMIObject)	--
CancelProcess (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

--

See also

VBA Reference (Page 3124)

DataLanguageChanged Event

Description

Occurs when the project language has been changed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DataLanguageChanged(lCID As Long)
```

Parameters

Parameter (Data Type)	Description
lCID (Long)	The project language identifier

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the newly set project language is output:

```
Private Sub objGDApplication_DataLanguageChanged(ByVal lCID As Long)
'VBA87
MsgBox "The datalanguage is changed to " & Application.CurrentDataLanguage & "."
End Sub
```

See also

Language-Dependent Configuration with VBA (Page 3018)

DesktopLanguageChanged event

Description

Occurs when the user interface language has been changed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DesktopLanguageChanged(lCID As Long)
```

Parameters

Parameter (Data Type)	Description
lCID (Long)	The user interface language identifier

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the newly set desktop language is output:

```
Private Sub objGDApplication_DesktopLanguageChanged(ByVal lCID As Long)
'VBA88
MsgBox "The desktop-language is changed to " & Application.CurrentDesktopLanguage & "."
End Sub
```

VBA Reference (Page 3124)

Language-Dependent Configuration with VBA (Page 3018)

DocumentActivated Event

Description

Occurs when a picture is activated in the Graphics Designer. This happens when you switch between two pictures, for example.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DocumentActivated(Document As HMIDocument)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that is to be activated.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output identifying the picture that has been activated:

```
Private Sub objGDApplication_DocumentActivated(ByVal Document As IHMIDocument)
'VBA89
MsgBox "The document " & Document.Name & " got the focus." & vbCrLf &_
"This event is raised by the application."
End Sub
```

See also

VBA Reference (Page 3124)

DocumentCreated Event

Description

Occurs when a new picture has been created in the Graphics Designer.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DocumentCreated(Document As HMIDocument)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that has been created.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the name of the newly created picture is output:

```
Private Sub objGDApplication_DocumentCreated(ByVal Document As IHMIDocument)
'VBA90
MsgBox Document.Name & " will be created."
End Sub
```

See also

VBA Reference (Page 3124)

DocumentOpened Event

Description

Occurs when a picture has been opened.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DocumentOpened(Document As HMIDocument)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that has been opened.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output identifying the picture that has been opened:

```
Private Sub objGDApplication_DocumentOpened(ByVal Document As IHMIDocument)
'VBA91
MsgBox Document.Name & " is opened."
End Sub
```

See also

VBA Reference (Page 3124)

DocumentSaved Event

Description

Occurs when a picture has been saved in the Graphics Designer.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DocumentSaved(Document As HMIDocument)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that has been saved.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output identifying the picture that has been saved:

```
Private Sub objGDApplication_DocumentSaved(ByVal Document As IHMIDocument)
'VBA92
MsgBox Document.Name & " is saved."
End Sub
```

VBA Reference (Page 3124)

DocumentPropertyChanged event

Description

Occurs when a picture property is changed.

syntax

```
Document_DocumentPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
Property (IHMIProperty)	Identifies the changed property.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the picture property being changed:

```
Private Sub Document_DocumentPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
'VBA93
Dim strPropName As String
'"strPropName" contains the name of the modified property
strPropName = Property.Name
MsgBox "The picture-property " & strPropName & " is modified..."
End Sub
```

VBA Reference (Page 3124)

6.1.5.2 F-Z

HMIObjectAdded Event

Description

Occurs when an object is added.

syntax

```
Document_HMIObjectAdded(ByVal HMIObject As IHMIObject,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
HMIObject (IHMIObject)	Identifies the object being added.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the object that has been added:

```
Private Sub Document_HMIObjectAdded(ByVal HMIObject As IHMIObject, CancelForwarding As
Boolean)
'VBA94
Dim strObjName As String
'
'"strObjName" contains the name of the added object
strObjName = HMIObject.ObjectName
MsgBox "Object " & strObjName & " is added..."
End Sub
```

See also

VBA Reference (Page 3124)

HMIObjectMoved Event

Description

Occurs when an object is moved.

syntax

```
Document_HMIObjectMoved(ByVal HMIObject As IHMIObject,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
HMIObject (IHMIObject)	Identifies the object being moved.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the object that has been moved:

```
Private Sub Document_HMIObjectMoved(ByVal HMIObject As IHMIObject, CancelForwarding As
Boolean)
'VBA95
Dim strObjName As String
'
'"strObjName" contains the name of the moved object
strObjName = HMIObject.ObjectName
MsgBox "Object " & strObjName & " was moved..."
End Sub
```

See also

VBA Reference (Page 3124)

HMIObjectPropertyChanged Event

Description

Occurs when an object property is changed.

syntax

```
Document_HMIObjectPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
Property (IHMIProperty)	Identifies the changed property.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the object property that has been changed:

```
Private Sub Document_HMIObjectPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
'VBA96
Dim strObjProp As String
Dim strObjName As String
Dim varPropValue As Variant
'
'"strObjProp" contains the name of the modified property
'"varPropValue" contains the new value
strObjProp = Property.Name
varPropValue = Property.value
'
'"strObjName" contains the name of the selected object,
'which property is modified
strObjName = Property.Application.ActiveDocument.Selection(1).ObjectName
MsgBox "The property " & strObjProp & " of object " & strObjName & " is modified... " &
vbCrLf & "The new value is: " & varPropValue
End Sub
```

See also

VBA Reference (Page 3124)

HMIObjectResized Event

Description

Occurs when the size of an object is changed.

syntax

```
Document_HMIObjectResized(ByVal HMIObject As IHMIObject,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
HMIObject (IHMIObject)	Identifies the object that is being resized.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when an object has been resized:

```
Private Sub Document_HMIObjectResized(ByVal HMIObject As IHMIObject, CancelForwarding As
Boolean)
'VBA97
Dim strObjName As String
'
'"strObjName" contains the name of the modified object
strObjName = HMIObject.ObjectName
MsgBox "The size of " & strObjName & " was modified..."
End Sub
```

VBA Reference (Page 3124)

LibraryFolderRenamed Event

Description

Occurs when a folder in the components library has been renamed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_LibraryFolderRenamed(LibObject As HMIFolderItem,
OldName As String)
```

Parameters

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The renamed folder.
OldName (String)	The original name of the renamed folder.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the old and new folder names are output:

```
Private Sub objGDApplication_LibraryFolderRenamed(ByVal LibObject As HMIFolderItem, ByVal
OldName As String)
'VBA98
MsgBox "The Library-folder " & OldName & " is renamed in: " & LibObject.DisplayName
End Sub
```

LibraryObjectRenamed Event

Description

Occurs when an object in the components library has been renamed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_LibraryObjectRenamed(LibObject As HMIFolderItem,
OldName As String)
```

Parameters

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The renamed object.
OldName (String)	The original name of the renamed object.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the old and new object names are output:

```
Private Sub objGDApplication_LibraryObjectRenamed(ByVal LibObject As IHMIFolderItem, ByVal
OldName As String)
'VBA99
MsgBox "The object " & OldName & " is renamed in: " & LibObject.DisplayName
End Sub
```

See also

VBA Reference (Page 3124)

LibraryObjectAdded Event

Description

Occurs when an object has been added to the components library.

syntax

```
HMIObjectPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
LibObject (IHMIFolderItem)	Identifies the library object.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when an object has been added to the components library:

```
Private Sub Document_LibraryObjectAdded(ByVal LibObject As IHMIFolderItem,
CancelForwarding As Boolean)
'VBA100
Dim strObjName As String
'
'"strObjName" contains the name of the added object
strObjName = LibObject.DisplayName
MsgBox "Object " & strObjName & " was added to the picture."
End Sub
```

VBA Reference (Page 3124)

MenuItemClicked Event

Description

Occurs when an entry in a user-defined menu is clicked.

Note

This event is both application-specific and document-specific.

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

syntax

```
Document_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
```

Parameters

Parameter (Data Type)	Description
MenuItem (IHMIMenuItem)	Identifies the user-defined menu.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output when the first entry in a user-defined menu is clicked:

```
Private Sub Document_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
'VBA101
Dim objMenuItem As HMIMenuItem
Dim varMenuItemKey As Variant
Set objMenuItem = MenuItem
'
'"objMenuItem" contains the clicked menu-item
'"varMenuItemKey" contains the value of parameter "Key"
'from the clicked userdefined menu-item
```

```
varMenuItemKey = objMenuItem.Key
Select Case MenuItem.Key
Case "mItem1_1"
MsgBox "The first menu-item was clicked!"
End Select
End Sub
```

NewLibraryFolder Event

Description

Occurs when a folder has been created in the components library.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_NewLibraryFolder(LibObject As HMIFolderItem)
```

Parameters

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The newly created folder.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the new folder name is output:

```
Private Sub objGDApplication_NewLibraryFolder(ByVal LibObject As IHMIFolderItem)
'VBA102
MsgBox "The library-folder " & LibObject.DisplayName & " was added."
End Sub
```

See also

VBA Reference (Page 3124)

NewLibraryObject Event

Description

Occurs when an object has been created in the components library.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_NewLibraryObject(LibObject As HMIFolderItem)
```

Parameters

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The newly created object.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
```

```
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the new object name is output:

```
Private Sub objGDApplication_NewLibraryObject(ByVal LibObject As IHMIFolderItem)
'VBA103
MsgBox "The object " & LibObject.DisplayName & " was added."
End Sub
```

See also

VBA Reference (Page 3124)

Opened Event

Description

Occurs when a picture is opened.

syntax

```
Document_Opened(CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when the picture is opened:

```
Private Sub Document_Opened(CancelForwarding As Boolean)
'VBA104
MsgBox "The Document is open now..."
End Sub
```

See also

VBA Reference (Page 3124)

Saved Event

Description

Occurs after a picture has been saved.

syntax

```
Document_Saved(CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when the picture has been saved:

```
Private Sub Document_Saved(CancelForwarding As Boolean)
'VBA105
MsgBox "The document is saved..."
End Sub
```

See also

VBA Reference (Page 3124)

SelectionChanged Event

Description

Occurs when the selection has been changed.

syntax

```
Document_SelectionChanged(CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when a new object has been selected:

```
Private Sub Document_SelectionChanged(CancelForwarding As Boolean)
'VBA106
MsgBox "The selection is changed..."
End Sub
```

See also

VBA Reference (Page 3124)

Started Event

Description

Occurs when the Graphics Designer has been started.

Syntax

```
objGDApplication_Started()
```

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

Parameters

--

Example

Declare application.

```
Dim WithEvents objGDApplication As grafexe.Application
```

Set event tag.

```
Private Sub Document_Opened(CancelForwarding As Boolean)
 Set objGDApplication = Me.Application
End Sub
```

Query "Started" event and output message.

```
Private Sub objGDApplication_Started()
'VBA107
'This event is raised before objGDApplication_Started()
 MsgBox "The Graphics Designer is started!"
End Sub
```

See also

VBA Reference (Page 3124)

ToolbarItemClicked Event

Description

Occurs when an icon in a user-defined toolbar has been clicked

Note

This event is both application-specific and document-specific.

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

syntax

```
Document_ToolbarItemClicked(ByVal ToolbarItem As IHMIToolbarItem)
```

Parameters

Parameter (Data Type)	Description
ToolbarItem (IHMIToolbarItem)	Identifies the symbol.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output when the first user-defined icon is clicked:

```
Private Sub Document_ToolbarItemClicked(ByVal ToolbarItem As IHMIToolbarItem)
'VBA108
Dim objToolbarItem As HMIToolbarItem
Dim varToolbarItemKey As Variant
Set objToolbarItem = ToolbarItem
'
'"varToolbarItemKey" contains the value of parameter "Key"
'from the clicked userdefined toolbar-item
varToolbarItemKey = objToolbarItem.Key
'
Select Case varToolbarItemKey
Case "tItem1_1"
MsgBox "The first Toolbar-Icon was clicked!"
End Select
End Sub
```

ViewCreated Event

Description

Occurs when a copy of a picture has been created.

Note

This event is both application-specific and document-specific.

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

syntax

```
Document_ViewCreated(ByVal pView As IHMIView, CancelForwarding As
Boolean)
```

Parameters

Parameter (Data Type)	Description
pView (IHMIView)	Identifies the copy of the picture.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the number of copy pictures is output when a new copy of the picture has been created.

```
Private Sub Document_ViewCreated(ByVal pView As IHMIView, CancelForwarding As Boolean)
'VBA109
Dim iViewCount As Integer
'
'To read out the number of views
iViewCount = pView.Application.ActiveDocument.Views.Count
```

```
MsgBox "A new copy of the picture (number " & iViewCount & ") was created."
End Sub
```

VBA Reference (Page 3124)

WindowStateChange Event

Description

Occurs when the window size is changed (e.g. from "Minimized" to "Maximized").

syntax

```
objGDApplication_WindowStateChanged()
```

Parameter (Optional)

--

Example:

In the following example a message is output when the window size is changed:

```
Private Sub objGDApplication_WindowStateChanged()
'VBA110
MsgBox "The state of the application-window is changed!"
End Sub
```

VBA Reference (Page 3124)

6.1.6 Methods

6.1.6.1 A-C

Activate Method

Description

Activates the specified object.

syntax

Expression.`Activate()`

Expression

Necessary. An expression or element which returns an object of the "Application" or "View" type.

Parameters

--

Example:

In the following example a copy of the active picture is created and then activated:

```
Sub CreateAndActivateView()
'VBA111
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

Add Method

Description

Adds another element to a listing.

The following table shows you the listings to which the Add method can be applied. The parameters and syntax for the respective Add methods can be found under "Methods".

Listing	Application for the Add Method
AnalogResultInfos Listing	Adds a new, analog value range in the Dynamic dialog.
Documents Listing	Creates a new picture in the Graphics Designer
GroupedObjects Listing	Adds a new object to a group object.
Toolbars Listing	Creates a new, user-defined toolbar.
Tag Triggers Listing	Creates a new tag trigger.
Views Listing	Creates a copy of the specified picture.

See also

Add Method (Views Listing) (Page 3173)
Add Method (TagTriggers Listing) (Page 3172)
Add Method (CustomToolbars Listing) (Page 3168)
Add Method (GroupedObjects Listing) (Page 3170)
Add Method (Documents Listing) (Page 3169)
Add Method (AnalogResultInfos Listing) (Page 3166)

Add Method (AnalogResultInfos Listing)

Description

Adds a new, analog value range in the Dynamic dialog.

syntax

Expression.`Add(RangeTo, ResultValue)`

Expression

Necessary. An expression or element which returns an object of the "AnalogResultInfos" type.

Parameters

Parameter (Data Type)	Description
RangeTo (Variant)	The value range to which the change of property gives rise.
ResultValue (Variant)	The value to which the object property is assigned when the value range is reached.

Example:

In the following example the radius of a circle is given dynamics with the In the following example a tag name is assigned and three analog value ranges are created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA112
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

The diagram shows the Dynamic dialog after the procedure has been carried out:

AnalogResultInfos Object (Listing) (Page 3281)

CreateDynamic Method (Page 3204)

How to dynamize a property with the Dynamic dialog (Page 3084)

Add Method (CustomToolbars Listing)

Description

Creates a new, user-defined toolbar. There is a difference between application-specific and picture-specific user-defined toolbars:

- Application-specific toolbar: This is linked to the Graphics Designer and is also only visible when all the pictures in the Graphics Designer are closed. "Place the VBA code in the document called "GlobalTemplateDocument" or "ProjectTemplateDocument" and use the Application property.
- Picture-specific toolbar: Is linked with a specific picture and remains visible as long as the picture is visible. Place the VBA code in the document called "ThisDocument" for the desired picture and use the ActiveDocument property.

syntax

Expression.`Add(Key)`

Expression

Necessary. An expression or element which returns an object of the "CustomToolbars" type.

Parameters

Parameter (Data Type)	Description
Key (Variant)	Identifies the user-defined toolbar. Use unique names for "Key" (e.g. "DocToolbar1")

Example:

In the following example a user-defined toolbar with two icons is created in the active picture. These icons are separated by a dividing line:

```
Sub AddDocumentSpecificCustomToolbar()
'VBA115
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
```

```
Set objToolbar = ActiveDocument.CustomToolbars.Add("DocToolbar")

'Add toolbar-items to the userdefined toolbar
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "My first
Symbol-Icon")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(3, "tItem1_3", "My second
Symbol-Icon")
'
'Insert seperatorline between the two tollbaritems
Set objToolbarItem = objToolbar.ToolbarItems.InsertSeparator(2, "tSeparator1_2")
End Sub
```

InsertSeparator Method (Page 3228)

InsertFromMenuItem Method (Page 3224)

VBA Reference (Page 3124)

Creating Customized Menus and Toolbars (Page 3021)

Add Method (Documents Listing)

Description

Creates a new picture in the Graphics Designer

syntax

Expression.`Add [HMIOpenDocumentType]`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Parameters

Parameter (Data Type)	Description
HMIOpenDocumentType (HMIDocumentType)	Defines how the picture will be opened: • HMIDocumentTypeVisible: Opens the picture for direct processing. This is the default setting if you do not specify the parameter. • HMIDocumentTypeInvisible: Opens the picture in invisible mode, i.e. it is not displayed in the Graphics Designer. You can only address the picture via the Documents listing, and make it visible again by means of the Hide property.

Example:

In the following example a new picture is created in the Graphics Designer:

```
Sub AddNewDocument()
'VBA113
Application.Documents.Add hmiOpenDocumentTypeVisible
End Sub
```

See also

Hide Property (Page 3625)

Documents Object (Listing) (Page 3322)

VBA Reference (Page 3124)

Add Method (GroupedObjects Listing)

Description

Adds an existing object to the specified group object.

syntax

Expression.`Add(Index)`

Expression

Necessary. An expression or element which returns an object of the "GroupedObjects" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	The object that is intended to be added. You can either use the index number or the object name.

Example:

In this example the group object "My Group" is created from a number of objects. An ellipse segment is then added to the group object:

```
Sub CreateGroup()
'VBA114
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipseSegment As HMIEllipseSegment
Dim objGroup As HMIGroup

Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With

MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup

'Set name for new group-object
'The name identifies the group-object
objGroup.ObjectName = "My Group"

'Add new object to active document...
Set objEllipseSegment = ActiveDocument.HMIObjects.AddHMIObject("EllipseSegment",
"HMIEllipseSegment")
Set objGroup = ActiveDocument.HMIObjects("My Group")

'...and add it to the group:
objGroup.GroupedHMIObjects.Add ("EllipseSegment")
End Sub
```

See also

GroupedObjects Object (Listing) (Page 3353)

Add Method (TagTriggers Listing)

Description

Creates a new tag trigger.

syntax

Expression.`Add(VarName, Type)`

Expression

Necessary. An expression or element which returns an object of the "TagTriggers" type.

Parameters

Parameter (Data Type)	Description
VarName (String)	The name of the tag that is intended to be used as a trigger. Please note that you have to create the tag in the Tag Selection dialog.
Type (CycleType)	This is the cycle type. Select the cycle type from a list in the VBA Editor when you use this method.

Example:

In the following example the radius of a circle is made dynamic using a trigger tag:

```
Sub DynamicWithVariableTriggerCycle()
'VBA69
Dim objVBScript As HMIScriptInfo
Dim objVarTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VariableTrigger",
"HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
Set objVarTrigger = .Trigger.VariableTriggers.Add("VarTrigger", hmiVariableCycleType_10s)
.SourceCode = ""
End With
End Sub
```

See also

VariableTriggers Object (Listing) (Page 3465)

VBA Reference (Page 3124)

Add Method (Views Listing)

Description

Creates a copy of the specified picture.

syntax

Expression.`Add()`

Expression

Necessary. An expression or element which returns an object of the "Views" type.

Parameters

--

Example:

In the following example a copy of the active picture is created and then activated:

```
Sub CreateViewAndActivateView()
'VBA117
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

See also

Views Object (Listing) (Page 3468)

VBA Reference (Page 3124)

AddAction Method

Description

Configures an action on an object or property. This action is triggered when a defined event occurs.

syntax

Expression.`Method(HMIActionCreationType)`

Expression

Necessary. An expression or element which returns an object of the "Actions" type.

Parameters

Parameter (Data Type)	Description
HMIActionCreationType (Variant)	Defines the action: • hmiActionCreationTypeCScript: Configures a C action • hmiActionCreationTypeVBScript: Configures a VBS action • hmiActionCreationTypeDirectConnection: Configures a direct connection

Example:

In the following example a VBS action for changing the radius of a circle is configured:

```
Sub AddActionToPropertyTypeVBScript()
'VBA118
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
'Create circle in picture. By changing of property "Radius"
'a VBS-action will be started:
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
Set objEvent = objCircle.Radius.Events(1)
Set objVBScript = objEvent.Actions.AddAction(hmiActionCreationTypeVBScript)
End Sub
```

See also

Event Object (Page 3336)

Actions Object (Listing) (Page 3271)

AddActiveXControl Method

Description

Adds a new ActiveXControl object to the "HMIObjects" listing. The object is inserted in the upper left corner of the specified picture.

syntax

Expression.`AddActiveXControl("ObjectName", "ProgID")`

Expression

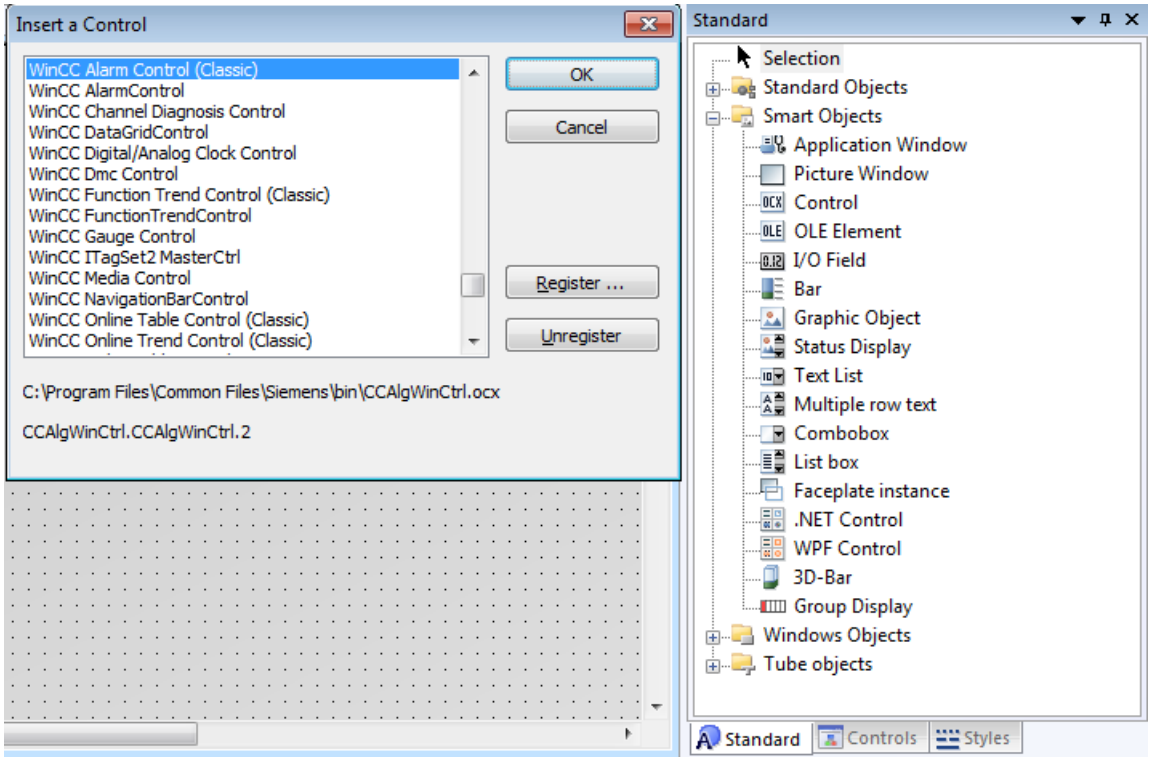
Required. An expression or element which returns an object of the "HMIObjects" type.

Parameter

Parameter (data type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ProgID (String)	The ActiveX Control that is to be inserted.

Determining the ProgID

To determine the ProgID for an ActiveX control, go to the "Object Palette" in the Graphics Designer and in the Default tab under "Smart Objects" insert the control object into the picture. The "Insert a Control" dialog displays the path and ProgID for the selected control:



The following table shows a list of ProgIDs of WinCC controls that are installed by WinCC:

Name of the WinCC control	ProgID
Siemens HMI Symbol Library	SiemensHMI.SymbolLibrary.1
WinCC AlarmControl	CCAxAlarmControl.AxAlarmControl.1
WinCC digital/analog clock control	DACLOCK.DaclockCtrl.1
WinCC FunctionTrendControl	CCAxFunctionTrendControl.AxFunctionTrendControl.1

Name of the WinCC control	ProgID
WinCC gauge control	XGAUGE.XGaugeCtrl.1
WinCC media control	CCMediaControl.CCMediaControl.1
WinCC OnlineTableControl	CCAxOnlineTableControl.AxOnlineTableControl.1
WinCC OnlineTrendControl	CCAxOnlineTrendControl.AxOnlineTrendControl.1
WinCC push button control	PBUTTON.PbuttonCtrl.1
WinCC slider control	SLIDER.SliderCtrl.1
WinCC RulerControl	CCAxTrendRulerControl.AxRulerControl.1
WinCC UserArchiveControl	CCAxUserArchiveControl.AxUserArchiveControl.1

Example:

In the following example, the ActiveX Control "WinCC Gauge Control" is inserted in the active picture.

```
Sub AddActiveXControl()
'VBA119
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
With ActiveDocument
.HMIObjects("WinCC_Gauge").Top = 40
.HMIObjects("WinCC_Gauge").Left = 40
End With
End Sub
```

Note

After executing the method, the Graphics Designer will not be fully shut down. The "Grafexe.exe" file remains in the memory. In order to restart the Graphics Designer, exit the "Grafexe.exe" application in the Task Manager.

AddDotNetControl method

Description

Adds a new ".Net-Control" object to the "HMIObjects" listing.

Syntax

```
Expression.AddDotNetControl(ObjectName, ControlType, InGAC,
AssemblyInfo)
```

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

Parameter (Data Type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ControlType (String)	The namespace of the object.
InGAC (String)	TRUE: The object is registered in the Global Assembly Cache. FALSE: The object is not registered in the Global Assembly Cache.
AssemblyInfo (String)	If "InGAC=TRUE", then the following information will be specified: Assembly Version Culture PublicKeyToken If "InGAC=FALSE", only the path of the object is specified in "Assembly".

Example

In the following example, the ".NETControl" object from the Global Assembly Cache is inserted in the active picture.

```
'VBA851
Dim DotNetControl As HMIDotNetControl
Set DotNetControl = ActiveDocument.HMIObjects.AddDotNetControl("MyVBAControl",
"System.Windows.Forms.Label", True,"Assembly=System.Windows.Forms, Version=2.0.0.0,
Culture=neutral, PublicKeyToken=b77a5c561934e089")
```

AddFolder Method

Description

Creates a new folder in the components library. The FolderItem object of the "Folder" type is added to the FolderItems listing.

The new folder created in this way receives the internal name "FolderX", where "X" stands for a consecutive number, starting with 1. Use the internal name to address the folder in the FolderItems listing.

syntax

*Expression.*AddFolder(DefaultName)

Expression

Necessary. An expression or element which returns an object of the "FolderItems" type.

Parameters

Parameter (Data Type)	Description
DefaultName (String)	The name of the folder that is to be created.

Example:

In the following example the folder "My Folder" will be created in the "Project Library":

```
Sub AddNewFolderToProjectLibrary()
'VBA120
Dim objProjectLib As HMISymbolLibrary
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder")
End Sub
```

See also

SymbolLibrary Object (Page 3440)

FolderItems Object (Listing) (Page 3343)

VBA Reference (Page 3124)

Accessing the component library with VBA (Page 3040)

AddFromClipboard Method

Description

Copies an object from the clipboard into a folder in the Components Library. The FolderItem object of the "Item" type is added to the FolderItems listing.

Note

The clipboard must contain objects from the Graphics Designer. Other contents (such as ASCII text) will not be pasted.

syntax

Expression.AddFromClipboard(DefaultName)

Expression

Necessary. An expression or element which returns an object of the "FolderItems" type.

Parameters

Parameter (Data Type)	Description
DefaultName (String)	The name to be given to the object pasted into the components library.

Example:

In the following example the object "PC" from the "Global Library" will be copied into the folder "Folder 3" in the "Project Library":

```
Sub CopyObjectFromGlobalLibraryToProjectLibrary()
'VBA121
Dim objGlobalLib As HMISymbolLibrary
Dim objProjectLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder3")
'
'copy object from "Global Library" to clipboard
With objGlobalLib
.FolderItems(2).Folder.Item(2).Folder.Item(1).CopyToClipboard
End With
'
'paste object from clipboard into "Project Library"
objProjectLib.FolderItems(objProjectLib.FindByDisplayName("My
Folder3").Name).Folder.AddFromClipBoard ("Copy of PC/PLC")
End Sub
```

AddHMIObject Method

Description

Adds a new standard, smart or Windows object to the "HMIObjects" listing. The object is inserted in the upper left corner of the specified picture.

Note

Use the AddActiveXControl method to insert an ActiveXControl.

Use the AddOLEObject method to insert an OLE Element.

syntax

Expression.`AddHMIObject("ObjectName", "ProgID")`

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

Parameter (Data Type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ProgID (String)	The object type that is to be inserted. "Obtain the "ProgID" by prefixing the VBA object name with "HMI" "(e.g. HMICircle or HMIRectangle)

Example:

In the following example a circle will be inserted into the active picture and its background color set to "Red":

```
Sub AddCircleToActiveDocument()
'VBA122
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("VBA_Circle", "HMICircle")
objCircle.BackColor = RGB(255, 0, 0)
End Sub
```

AddItem Method

Description

Copies an object from the specified picture into a folder in the Components Library. The FolderItem object of the "Item" type is added to the FolderItems listing.

syntax

Expression.`Folder.AddItem "DefaultName", pHMIObject`

Expression

Necessary. An expression or element which returns an object of the "FolderItems" type.

Parameters

Parameter (Data Type)	Description
DefaultName (String)	The name to be given to the object pasted into the components library.
pHMIObject (HMIObject)	The object that is to be inserted into the Components Library from the specified picture.

Example:

In the following example a circle will be copied into the "Project Library". For this purpose the circle will be pasted into the active picture and the folder "My Folder 2" will

```
Sub VBA123()
'VBA123
Dim objProjectLib As HMISymbolLibrary
Dim objCircle As HMICircle

Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle", "HMICircle")
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder2")
objProjectLib.FindByDisplayName("My Folder2").Folder.AddItem "ProjectLib Circle",
ActiveDocument.HMIObjects("Circle")
End Sub
```

See also

FolderItems Object (Listing) (Page 3343)

SymbolLibrary Object (Page 3440)

VBA Reference (Page 3124)

Accessing the component library with VBA (Page 3040)

AddOLEObject Method

Description

Adds a new OLE Element to the "HMIObjects" listing. The object is inserted in the upper left corner of the specified picture.

syntax

```
Expression.AddOLEObject(ObjectName, ServerName, [CreationType],
[UseSymbol])
```

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

Parameter (Data Type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ServerName (String)	The name of the application which is to contain the OLE Element, or the file name complete with path. The value for "ServerName" corresponds to the "Object Type" in the "Insert Object" dialog: CreationType (HMIOLEObjectCreation Type-)	Defines whether the OLE Element will be newly created or an existing file will be used: • HMIOLEObjectCreationTypeDirect: Corresponds to setting "Create New". This setting is used if you do not specify the parameter. • HMIOLEObjectCreationTypeByLink: Corresponds to setting "Create from File". This creates a copy of the file. Any changes made to the OLE Element have no effect on the original file. Assign a name to the file via the "ServerName" parameter. • HMIOLEObjectCreationTypeByLinkWithReference: Same as above, except that changes in OLE Element affect the original file. Assign a name to the file via the "ServerName" parameter.
UseSymbol (Boolean)	TRUE if the standard icon for the file type is to be used. Double clicking on the icon then opens the associated application. The default setting for this parameter is FALSE.

Example:

In the following example, an OLE Element containing a Wordpad document will be inserted into the active picture:

```
Sub AddOLEObjectToActiveDocument()
'VBA124
Dim objOLEObject As HMIOLEObject
Set objOLEObject = ActiveDocument.HMIObjects.AddOLEObject("MS Wordpad Document",
"Wordpad.Document.1")
End Sub
```

In the following example, the AddOLEObject method will be used and the "HMIOLEObjectCreationTypeByLink" parameter will be specified:

```
Sub AddOLEObjectByLink()
'VBA805
Dim objOLEObject As HMIOLEObject
Dim strFilename As String
'
'Add OLEObject by filename. In this case, the filename has to
'contain filename and path.
'Replace the definition of strFilename with a filename with path
'existing on your system
strFilename = Application.ApplicationDataPath & "Test.bmp"
Set objOLEObject = ActiveDocument.HMIObjects.AddOLEObject("OLEObject1", strFilename,
hmiOLEObjectCreationTypeByLink, False)
End Sub
```

In the following example, the AddOLEObject method will be used and the "HMIOLEObjectCreationTypeByLinkWithReference" parameter will be specified:

```
Sub AddOLEObjectByLinkWithReference()
'VBA806
Dim objOLEObject As HMIOLEObject
Dim strFilename As String
'
'Add OLEObject by filename. In this case, the filename has to
'contain filename and path.
'Replace the definition of strFilename with a filename with path
'existing on your system
strFilename = Application.ApplicationDataPath & "Test.bmp"
Set objOLEObject = ActiveDocument.HMIObjects.AddOLEObject("OLEObject1", strFilename,
hmiOLEObjectCreationTypeByLinkWithReference, True)
End Sub
```

See also

HMIObjects Object (Listing) (Page 3359)

VBA Reference (Page 3124)

AddWPFControl method

Description

Adds a new "WPF-Control" object to the "HMIObjects" listing.

Syntax

```
Expression.AddWPFControl(ObjectName, ControlType, InGAC,
AssemblyInfo)
```

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

Parameter (Data Type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ControlType (String)	The namespace of the object.
InGAC (String)	TRUE: The object is registered in the Global Assembly Cache. FALSE: The object is not registered in the Global Assembly Cache.
AssemblyInfo (String)	If "InGAC=TRUE", then the following information will be specified: Assembly Version Culture PublicKeyToken If "InGAC=FALSE", only the path of the object is specified in "Assembly".

Example

In the following example, the "WPF Control" object outside the Global Assembly Cache is inserted in the active picture.

```
'VBA852
Dim WPFControl As HMIWPFControl
Set WPFControl = ActiveDocument.HMIObjects.AddWPFControl("MyWPFVBAControl",
"WinCCWPFControl.TestControl", False, "Assembly=Z:\TestControl\WinCCWPFControl.dll")
```

AlignBottom Method

Description

Aligns the objects selected in the specified picture with In so doing the alignment is oriented on the first object that you select.

syntax

Expression.`AlignBottom()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then aligned with the bottom:

```
Sub AlignSelectedObjectsBottom()
'VBA125
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.AlignBottom
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

VBA Reference (Page 3124)

AlignLeft Method

Description

Left-justifies the objects selected in the specified picture. In so doing the alignment is oriented on the first object that you select.

syntax

Expression.`AlignLeft()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then aligned to the left:

```
Sub AlignSelectedObjectsLeft()
'VBA126
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.AlignLeft
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

VBA Reference (Page 3124)

AlignRight Method

Description

Right-justifies the objects selected in the specified picture. In so doing the alignment is oriented on the first object that you select.

syntax

Expression.`AlignRight()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then aligned to the right:

```
Sub AlignSelectedObjectsRight()
'VBA127
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.AlignRight
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

VBA Reference (Page 3124)

AlignTop Method

Description

Aligns the objects selected in the specified picture with In so doing the alignment is oriented on the first object that you select.

syntax

Expression.`AlignTop()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then aligned with the top:

```
Sub AlignSelectedObjectsTop()
'VBA128
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.AlignTop
End Sub
```

ArrangeMinimizedWindows Method

Description

Arranges all minimized pictures on the lower margin of the Graphics Designer.

syntax

Expression.`ArrangeMinimizedWindows()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example all minimized pictures are arranged on the lower margin of the Graphics Designer. For this example to work, you must have minimized a number of pictures in the Graphics Designer:

```
Sub ArrangeMinimizedWindows()
'VBA129
Application.ArrangeMinimizedWindows
End Sub
```

See also

Application Object (Page 3282)

VBA Reference (Page 3124)

BackwardOneLevel Method

Description

Moves the selected objects one level backward within their current layer.

syntax

Expression.`BackwardOneLevel()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted in the active picture. The object inserted last is then moved backward one level:

```
Sub MoveObjectOneLevelBackward()
'VBA173
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = False
End With
With objRectangle
.Top = 40
.Left = 40
.Width = 100
.Height = 50
.BackColor = RGB(255, 0, 255)
.Selected = True
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.BackwardOneLevel
End Sub
```

BringToFront Method

Description

Brings the selected objects right to the front within their current layer.

Note

If the "BringToFront" method is used, the sequence of HMI objects can change in the HMIObjects listing.

Syntax

Expression.`BringToFront()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted in the active picture. The object inserted last is then brought to the front:

```
Sub MoveObjectToFront()
'VBA198
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 40
.Left = 40
.Width = 100
.Height = 50
.BackColor = RGB(255, 0, 255)
.Selected = False
End With
MsgBox "The objects circle and rectangle are created" & vbCrLf & "Only the circle is
selected!"
ActiveDocument.Selection.BringToFront
MsgBox "The selection is moved to the front."
End Sub
```

CascadeWindows Method

Description

Arranges all open pictures in the Graphics Designer in a cascade (i.e. overlapping).

syntax

Expression.Methode(Parameter)

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are arranged in a cascade. For this example to work, you must have opened a number of pictures in the Graphics Designer:

```
Sub CascadeWindows()
'VBA130
Application.CascadeWindows
End Sub
```

See also

VBA Reference (Page 3124)

Application Object (Page 3282)

CenterHorizontally Method

Description

Using this method, the objects selected in the specified picture are centered horizontally.

syntax

Expression.CenterHorizontally()

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then centered horizontally:

```
Sub CenterSelectedObjectsHorizontally()
'VBA131
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.CenterHorizontally
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

CenterVertically Method

Description

Using this method, the objects selected in the specified picture are centered vertically.

syntax

Expression.`CenterVertically()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then centered vertically:

```
Sub CenterSelectedObjectsVertically()
'VBA132
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.CenterVertically
End Sub
```

CheckSyntax Method

Description

Checks whether the syntax of the specified C script is correct.

Use the CheckSyntax method in conjunction with the Compiled Property.

syntax

Expression.`CheckSyntax(CheckOK, Error)`

Expression

Necessary. An expression or element which returns an object of the "DynamicDialog" type.

Parameters

Parameter (Data Type)	Description
CheckOK (Boolean)	TRUE if the syntax of the specified C script is correct.
Error (String)	The message text that is output if the C script is incorrect.

Example:

--

See also

DynamicDialog Object (Page 3325)

VBA Reference (Page 3124)

Close Method

Description

Closes the specified picture and removes it from the document listing.

Note

Changes that have not been saved will be lost.

Syntax 1

Expression.`Close(FileName)`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Syntax 2

Expression.`Close()`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The name of the PDL file to be closed.

Example:

In the following example the picture "Test.PDL" will For this example to work, you must have opened the picture "Test.PDL":

```
Sub CloseDocumentUsingTheFileName()
'VBA134
Dim strFile As String
strFile = Application.ApplicationDataPath & "test.pdl"
Application.Documents.Close (strFile)
End Sub
In the following example the active picture in the Graphics Designer will be closed:
Sub CloseDocumentUsingActiveDocument()
'VBA135
ActiveDocument.Close
End Sub
```

VBA Reference (Page 3124)

CloseAll Method

Description

Closes all the pictures opened in the Graphics Designer and removes them from the documents listing.

Note

Changes that have not been saved will be lost.

syntax

Expression.`CloseAll()`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are closed:

```
Sub CloseAllDocuments()
'VBA136
Application.Documents.CloseAll
End Sub
```

See also

Documents Object (Listing) (Page 3322)

VBA Reference (Page 3124)

ConvertToScript Method

Description

Converts the specified Dynamic dialog into a C script.

On conversion the associated DynamicDialog object is deleted.

Note

You cannot undo the conversion.

syntax

Expression.`ConvertToScript()`

Expression

Necessary. An expression or element which returns an object of the "DynamicDialog" type.

Parameters

--

Example:

In the following example a circle will be inserted into the active picture and its radius will be dynamically configured using the Dynamic dialog. The Dynamic dialog will then be converted into a C script.

```
Sub ConvertDynamicDialogToScript()
'VBA137
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
'
'Create dynamic
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
'
'configure dynamic. "ResultType" defines the valuerange-type:
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
MsgBox "The dynamic-dialog will be changed into a C-script."
.ConvertToScript
End With
End Sub
```

See also

DynamicDialog Object (Page 3325)

VBA Reference (Page 3124)

ConvertWM method

Description

Is used internally for PowerCC.

CopySelection Method

Description

Using this method, the objects selected in the picture are copied to the clipboard.

syntax

Expression.`CopySelection()`

Expression

Necessary. An expression or element which returns an object of the "Document" or "Selection" type.

Parameters

--

Example:

In the following example two of the objects inserted in the active picture are selected. The selection is copied and pasted to a new picture:

```
Sub CopySelectionToNewDocument()
'VBA138
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim iNewDoc As Integer
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
'Instead of "ActiveDocument.CopySelection" you can also write:
'"ActiveDocument.Selection.CopySelection".
ActiveDocument.CopySelection
Application.Documents.Add hmiOpenDocumentTypeVisible
iNewDoc = Application.Documents.Count
Application.Documents(iNewDoc).PasteClipboard
End Sub
```

CopyToClipboard Method

Description

Copies an object from a folder in the Components Library to the clipboard.

Syntax

Expression.`CopyToClipboard()`

Expression

Necessary. An expression or element which returns a FolderItem object of the "Item" type.

Parameters

--

Example:

In the following example the object "PC" from the "Global Library" will be copied into the folder "My Folder3" in the "Project Library":

```
Sub CopyObjectFromGlobalLibraryToProjectLibrary()
'VBA139
Dim objGlobalLib As HMISymbolLibrary
Dim objProjectLib As HMISymbolLibrary
Dim objFolderItem As HMIFolderItem

Set objGlobalLib = Application.SymbolLibraries(1)
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder3")
'
'copy object from "Global Library" to clipboard
With objGlobalLib
.FolderItems(2).Folder.Item(2).Folder.Item(1).CopyToClipboard
End With
'
'paste object from clipboard into "Project Library"
Set objFolderItem = objProjectLib.FindByDisplayName("My Folder3")
objFolderItem.Folder.AddFromClipBoard ("Copy of PC/PLC")

End Sub
```

CreateCustomizedObject Method

Description

Creates a customized object from the objects selected in the specified picture. You then have to configure the customized object in the "Configuration Dialog".

For further information on this topic please refer to "Customized Objects" in this documentation and "Customized Object" in the WinCC documentation.

syntax

Expression.`CreateCustomizedObject()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and a customized object is then created:

```
Sub CreateCustomizedObject()
'VBA140
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objCustObject As HMICustomizedObject
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objCustObject = ActiveDocument.Selection.CreateCustomizedObject
objCustObject.ObjectName = "myCustomizedObject"
```

```
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

VBA Reference (Page 3124)

Customized Objects (Page 3074)

CreateDynamicDialog method

Description

Dynamizing properties of pictures and objects depending on specific value ranges or variable statuses.

Syntax

Expression.`CreateDynamicDialog([Code as String],iResultType as Long)`

Expression

Required. An expression or element which returns an object of the "Property" type.

Parameter

Parameter (Data Type)	Description
Code (String)	Defines the function or tag that is used for dynamic purposes. Also specify the tag name in single quotation marks: "Tag name"
iResultType (Long)	Defines the type of value range: • hmiResultTypeDirect = 0 • hmiResultTypeAnalog= 1 • hmiResultTypeBool = 2 • hmiResultTypeBit = 3

Example

In the following example the radius of a circle is given dynamics with the dynamic dialog. A tag name and a "ResultType" are assigned to the dynamic dialog.

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA820
```

```
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
'Create Object
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("myCircle","HMICircle")
'Create dynamic (Tag "myTest" must be exist")
Set objDynDialog = objCircle.Radius.CreateDynamicDialog("'myTest'",1)
End Sub
```

See also

FaceplateProperty object (Page 3341)

CreateDynamic Method

Description

Makes the specified property dynamic.

syntax

Expression.`CreateDynamic(DynamicType, [SourceCode])`

Expression

Necessary. An expression or element which returns an object of the "Property" type.

Parameters

You only need use the "SourceCode" parameter if you want to make the specified property dynamic with the aid of the Dynamic dialog.

In all other types of dynamics you can omit the parameter.

Parameter (Data Type)	Description
DynamicType (HMIDynamicCreationType)	Defines the type of dynamics: • hmiDynamicCreationTypeVariableDirect: Dynamics with a tag • hmiDynamicCreationTypeVariableIndirect: Dynamics with a tag In this type of dynamics you specify only the name of the tag whose value will be used for dynamic purposes. • hmiDynamicCreationTypeScript: Dynamics with a script (C, VB). • hmiDynamicCreationTypeDynamicDialog: Dynamizing with the dynamic dialog box:
SourceCode (String)	Defines the function or tag that will be used for dynamic purposes. Also specify the tag name in single quote marks: "Tag name"

Example:

In this example a circle property "Top" will be made dynamic with the aid of the tag "NewDynamic":

```
Sub AddDynamicAsVariableDirectToProperty()
'VBA141
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("MyCircle", "HMICircle")
'Make property "Top" dynamic:
Set objVariableTrigger = objCircle.Top.CreateDynamic(hmiDynamicCreationTypeVariableDirect,
"NewDynamic")
'
'Define cycle-time
With objVariableTrigger
.CycleType = hmiCycleType_2s
End With
End Sub
```

VBA Reference (Page 3124)

CreateGroup Method

Description

Creates a group object from the objects selected in the specified picture.

For further information on this topic please refer to "Group Objects" in this documentation and "Group Object" in the WinCC documentation.

syntax

Expression.`CreateGroup()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and a group object is then created:

```
Sub CreateGroup()
'VBA142
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
objGroup.ObjectName = "myGroup"
End Sub
```

6.1.6.2 D-M

GetDeclutterObjectSize method

Description

Reads the limits displaying and hiding objects (decluttering) in the specified picture.

Syntax

Expression.`GetDeclutterObjectSize(Min, Max)`

Expression

Required. An expression or element which returns an object of the "Document" type.

Parameter

Parameter (data type)	Description
Min (Long)	Lower size range in pixels.
Max (Long)	Upper size range in pixels.

Example

In the following example, the decluttering limits of the active picture are read and output:

```
Sub ReadSettingsOfPicture()
'VBA848
Dim objectsize_min As Long, objectsize_max As Long

ActiveDocument.GetDeclutterObjectSize objectsize_min, objectsize_max
MsgBox objectsize_min & " " & objectsize_max

End Sub
```

Delete Method

Description

Deletes the specified object and removes it from the listing.

syntax

Expression.`Delete()`

Expression

Necessary. An expression or element which returns objects of the following types.

- Assignment
- FolderItem
- LanguageText
- Menu
- MenuItem
- Object
- Toolbar
- ToolbarItem
- VariableTrigger
- View

Parameters

--

Example:

In the following example the first object in the active picture will be deleted. For this example to work, you must have created at least one object in the active picture:

```
Sub ObjectDelete()
'VBA143
ActiveDocument.HMIObjects(1).Delete
End Sub
```

DeleteAll Method

Description

Deletes all selected objects in the specified picture and removes them from the "Selection" and "HMIObjects" listings.

syntax

Expression.`DeleteAll()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then selected and deleted:

```
Sub DeleteAllSelectedObjects()
'VBA145
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
```

```
MsgBox "Objects selected!"
ActiveDocument.Selection.DeleteAll
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

VBA Reference (Page 3124)

DeleteDynamic Method

Description

Removes the dynamic characteristic from the specified property.

syntax

Expression.`DeleteDynamic`

Expression

Necessary. An expression or element which returns an object of the "Property" type.

Parameters

--

Example:

In the following example the dynamic characteristic created with the aid of the CreateDynamic Method will be

```
Sub DeleteDynamicFromObjectMeinKreis()
'VBA146
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects("MyCircle")
objCircle.Top.DeleteDynamic
End Sub
```

See also

Property Object (Page 3409)

CreateDynamic Method (Page 3204)

VBA Reference (Page 3124)

DeselectAll Method

Description

Deselects all selected objects in the specified picture and removes them from the Selection listing.

syntax

Expression.`DeselectAll()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and selected. All selected objects are then deselected:

```
Sub SelectObjectsAndDeselectThemAgain()
'VBA147
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.DeselectAll
MsgBox "Objects deselected!"
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

VBA Reference (Page 3124)

Destroy Method

Description

Ungroups the specified customized object. The objects remain intact.

Syntax

Expression.`Destroy()`

Expression

An expression or element which returns objects of the "CustomizedObject" types.

Parameters

--

Example:

An example showing how to use the Destroy Method can be found in this documentation under the heading "Editing a Customized Object with VBA".

See also

CustomizedObject Object (Page 3310)

Destroy Method (Page 3212)

Delete Method (Page 3208)

CreateCustomizedObject Method (Page 3202)

How to Edit a Customized Object with VBA (Page 3076)

DuplicateSelection Method

Description

Duplicates the objects selected in the specified picture. The objects created in this way are added to the HMIObjects listing. The names of new objects are numbered consecutively with each duplication.

For instance if you duplicate an object called "Circle", the duplicate object is called "Circle1". If you duplicate the object called "Circle" once more, the resulting object is called "Circle2" and so on.

syntax

Expression.`DuplicateSelection()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and selected. They are then duplicated:

```
Sub DuplicateSelectedObjects()
'VBA149
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.DuplicateSelection
End Sub
```

EvenlySpaceHorizontally Method

Description

Using this method, the objects selected in the specified picture are spaced horizontally at an even distance from one another.

syntax

Expression.EvenlySpaceHorizontally()

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects are inserted at different positions in the current picture and selected. They are then positioned horizontally at an even distance from one another:

```
Sub EvenlySpaceObjectsHorizontally()
'VBA150
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.EvenlySpaceHorizontally
End Sub
```

See also

VBA Reference (Page 3124)

SelectedObjects object (Listing) (Page 3426)

EvenlySpaceVertically Method

Description

Using this method, the objects selected in the specified picture are spaced vertically at an even distance from one another.

syntax

Expression.`EvenlySpaceVertically()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects are inserted at different positions in the current picture and selected. They are then positioned vertically at an even distance from one another:

```
Sub EvenlySpaceObjectsVertically()
'VBA151
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects created and selected"
ActiveDocument.Selection.EvenlySpaceVertically
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

Export Method

Description

Saves the specified picture as an EMF file.

Syntax

Expression.`Export(Type, Path)`

Expression

Required. An expression or element which returns an object of the "Document" type.

Parameter

Parameter (Data Type)	Description
Type (HMIImportExportType)	Defines the format in which the exported picture will be saved.
Path (String)	The path in which the picture is going to be exported. The path must exist.

Example

```
Sub ExportAllPicturesAsPDL()
'VBA152
Dim iPictureCounter As Integer
Dim strPath As String

strPath = "C:\WinCC_PDL_Export\"

'Count Pictures in Graphics Designer...
For iPictureCounter = 1 To grafexe.Documents.Count
    '...and export each picture as PDL-file to specified path:
    grafexe.Documents(iPictureCounter).Export hmiImportExportTypePDL,
strPath

Find Method

Description

Searches for objects in the specified picture and returns the search result as a collection object. You can search for the following object properties:

- Type
- Name
- Property

syntax

Expression.`Find([ObjectType], [ObjectName], [PropertyName])`

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

You must specify at least one of the three parameters.

Parameter (Data Type)	Description
ObjectType (String)	The object type that is to be searched for. Specify the "ProgID" of the object concerned. "Obtain the "ProgID" by prefixing the VBA object name with "HMI" "(e.g. HMICircle or HMIRectangle)
ObjectName (String)	The name of the object that is to be searched for. You can use placeholders (?,*) in the object name in order to find objects with similar names.
PropertyName (String)	The name of the object property that is to be searched for. Specify the VBA property name concerned (e.g. "BackColor" in place of "Background Color").

Example:

In the following example, objects of the "HMICircle" type will be searched for in the active picture and the search result will be output:

```
Sub FindObjectsByType()
```

```
'VBA153
Dim colSearchResults As HMICollection
Dim objMember As HMIObject
Dim iResult As Integer
Dim strName As String
Set colSearchResults = ActiveDocument.HMIObjects.Find(ObjectType:="HMICircle")
For Each objMember In colSearchResults
iResult = colSearchResults.Count
strName = objMember.ObjectName
MsgBox "Found: " & CStr(iResult) & vbCrLf & "objectname: " & strName)
Next objMember
End Sub
```

Note

Further information on using the Find Method can be found in this documentation under the heading "Editing Standard Objects, Smart Objects and Windows Objects".

VBA Reference (Page 3124)

FindByDisplayName Method

Description

Searches the entire Components Library for the specified object. A FolderItem object is returned as the search result.

Note

The display name of the object is language-dependent. Only the language currently set will be taken into account when searching. The search ends with the first object found.

syntax

Expression.`FindByDisplayName(DisplayName)`

Expression

Necessary. An expression or element which returns an object of the "SymbolLibrary" type or the "FolderItems" listing.

Parameters

Parameter (Data Type)	Description
DisplayName (String)	The display name of the object that is to be searched for in the Components Library.

Example:

In the following example the entire library will be searched for the object "PC" and its display name will be output:

```
Sub FindObjectInSymbolLibrary()
'VBA154
Dim objGlobalLib As HMISymbolLibrary
Dim objFItem As HMIFolderItem
Set objGlobalLib = Application.SymbolLibraries(1)
Set objFItem = objGlobalLib.FindByDisplayName("PC")
MsgBox objFItem.DisplayName
End Sub
```

See also

FolderItem Object (Page 3342)

Accessing the component library with VBA (Page 3040)

FireConnectionEvents method

Description

Is used internally by the Graphics Designer.

FlipHorizontally Method

Description

Mirrors the selected objects in the specified picture along the horizontal midline.

The object type determines whether it is allowed to be mirrored (for instance an OLE Element cannot be mirrored). The properties are appropriately modified when mirroring is performed. For example, if you mirror an object of the "StaticText" type along the horizontal midline, the value of the "AlignmentTop" property changes from "0" to "2".

syntax

Expression.`FlipHorizontally()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example a StaticText object will be inserted into the active picture and mirrored along the horizontal midline:

```
Sub FlipObjectHorizontally()
'VBA155
Dim objStaticText As HMIStaticText
Dim strPropertyName As String
Dim iPropertyValue As Integer
Set objStaticText = ActiveDocument.HMIObjects.AddHMIObject("Textfield", "HMIStaticText")
strPropertyName = objStaticText.Properties("Text").Name
With objStaticText
.Width = 120
.Text = "Sample Text"
.Selected = True
iPropertyValue = .AlignmentTop
MsgBox "Value of '" & strPropertyName & "' before flip: " & iPropertyValue
ActiveDocument.Selection.FlipHorizontally
iPropertyValue = objStaticText.AlignmentTop
MsgBox "Value of '" & strPropertyName & "' after flip: " & iPropertyValue
End With
End Sub
```

SelectedObjects object (Listing) (Page 3426)

VBA Reference (Page 3124)

FlipVertically Method

Description

Mirrors the selected objects in the specified picture along the vertical midline.

The object type determines whether it is allowed to be mirrored (for instance an OLE Element cannot be mirrored). The properties are appropriately modified when mirroring is performed.

For example if you mirror an object of the "StaticText" type along the vertical midline, the value of the "AlignmentLeft" property changes from "0" to "2".

syntax

Expression.`FlipVertically()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example a StaticText object will be inserted into the active picture and mirrored along the vertical midline:

```
Sub FlipObjectVertically()
'VBA156
Dim objStaticText As HMIStaticText
Dim strPropertyName As String
Dim iPropertyValue As Integer
Set objStaticText = ActiveDocument.HMIObjects.AddHMIObject("Textfield", "HMIStaticText")
strPropertyName = objStaticText.Properties("Text").Name
With objStaticText
.Width = 120
.Text = "Sample Text"
.Selected = True
.AlignmentLeft = 0
iPropertyValue = .AlignmentLeft
MsgBox "Value of '" & strPropertyName & "' before flip: " & iPropertyValue
ActiveDocument.Selection.FlipVertically
iPropertyValue = objStaticText.AlignmentLeft
MsgBox "Value of '" & strPropertyName & "' after flip: " & iPropertyValue
End With
End Sub
```

ForwardOneLevel Method

Description

Moves the selected objects one level forward within their current layer.

syntax

Expression.`ForwardOneLevel()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted in the active picture. The object inserted first is then moved forward one level:

```
Sub MoveObjectOneLevelForward()
'VBA174
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 40
.Left = 40
.Width = 100
.Height = 50
.BackColor = RGB(255, 0, 255)
.Selected = False
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.ForwardOneLevel
End Sub
```

GetItemByPath Method

Description

Returns a FolderItem object (folder or object) located on the specified internal access path in the Components Library.

Note

To obtain the internal access path, select the "Copy Path" command from The internal access path to the folder or object will then be copied to the clipboard.

syntax

Expression.`GetItemByPath(PathName)`

Expression

Necessary. An expression or element which returns an object of the "SymbolLibrary" type.

Parameters

Parameter (Data Type)	Description
PathName (String)	The internal access path on which the object is located in the Components Library.

Example:

In this example one object from the entire library will be returned and its display name will be output:

```
Sub ShowDisplayName()
'VBA157
Dim objGlobalLib As HMISymbolLibrary
Dim objFItem As HMIFolderItem
Set objGlobalLib = Application.SymbolLibraries(1)
Set objFItem = objGlobalLib.GetItemByPath("\Folder1\Folder2\Object1")
MsgBox objFItem.DisplayName
End Sub
```

Accessing the component library with VBA (Page 3040)

InsertFromMenuItem Method

Description

Inserts into an existing, user-defined toolbar a new icon that references an existing menu entry in a user-defined menu.

Use this method if you wish to set up a toolbar so that it contains the same commands as an existing user-defined menu.

Syntax

Expression.`InsertFromMenuItem(Position, Key, pMenuItem, DefaultToolTipText)`

Expression

Required. An expression or element which returns an object of the "ToolbarItems" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the icon within the user-defined toolbar.
Key (Variant)	Identifies the symbol. Use unique names for "Key" "(e.g. tItem1_1).
pMenuItem (HMIMenuItem)	The MenuItem object that is intended to be referenced.
DefaultToolTipText (String)	Defines for the icon concerned the tool tip text that will be displayed when you move the mouse over the icon.

Example:

In this example a user-defined menu and a user-defined toolbar will be inserted in the active picture. The icon calls up the menu entry "Hello World" from the user-defined menu:

```
Sub ToolbarItem_InsertFromMenuItem()
'VBA158
Dim objMenu As HMIMenu
Dim objToolbarItem As HMIToolbarItem
Dim objToolbar As HMIToolbar
Dim objMenuItem As HMIMenuItem
Set objMenu = Application.CustomMenus.InsertMenu(1, "Menu1", "TestMenu")
'
'*********************************************
'* Note:
'* The object-reference has to be unique.
'*********************************************
```

```
'
Set objMenuItem = Application.CustomMenus(1).MenuItems.InsertMenuItem(1, "MenuItem1",
"Hello World")
Application.CustomMenus(1).MenuItems(1).Macro = "HelloWorld"
Set objToolbar = Application.CustomToolbars.Add("Toolbar1")
Set objToolbarItem = Application.CustomToolbars(1).ToolbarItems.InsertFromMenuItem(1,
"ToolbarItem1", objMenuItem, "Call's Hello World of TestMenu")
End Sub

Sub HelloWorld()
MsgBox "Procedure 'HelloWorld()' is execute."
End Sub
```

InsertSeparator Method (Page 3228)

Add Method (CustomToolbars Listing) (Page 3168)

VBA Reference (Page 3124)

Creating Customized Menus and Toolbars (Page 3021)

InsertMenu Method

Description

Creates a new, user-defined menu. There is a difference between application-specific and picture-specific user-defined menus:

- Application-specific menu: This is linked to the Graphics Designer and is also only visible when all the pictures in the Graphics Designer are closed. "Place the VBA code in the document called "GlobalTemplateDocument" or "ProjectTemplateDocument" and use the Application property.
- Picture-specific menu: Is linked with a specific picture and remains visible as long as the picture is visible. Place the VBA code in the document called "ThisDocument" for the desired picture and use the ActiveDocument property.

syntax

Expression.`InsertMenu(Position, Key, DefaultLabel)`

Expression

Necessary. An expression or element which returns an object of the "CustomMenus" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the user-defined menu within the menu bar. However, picture-specific menus are always positioned to the right of application-specific menus.
Key (Variant)	Identifies the user-defined menu. Use unique names for "Key" (e.g. "DocMenu1")
DefaultLabel (String)	The name of the user-defined menu.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA159
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "First MenuItem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "Second MenuItem")
'
'Insert a dividing rule into custumized menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "First SubMenu")
'
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "First item in sub-
menu")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "Second item in sub-
menu")
End Sub
```

The diagram shows the generated menu structure.

InsertMenuItem Method

Description

Inserts a new entry in a user-defined menu.

syntax

Expression.`InsertMenuItem(Position, Key, DefaultLabel)`

Expression

Necessary. An expression or element which returns an object of the "MenuItems" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the submenu within the user-defined menu.
Key (Variant)	Identifies the submenu. Use unique names for "Key" "(e.g. dSubMenu1_4).
DefaultLabel (String)	Defines the name of the submenu.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA160
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
```

```
'
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "First MenuItem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "Second MenuItem")
'
'Insert a dividing rule into customized menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "First SubMenu")
'
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "First item in sub-
menu")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "Second item in sub-
menu")
End Sub
```

The diagram shows the menu structure.

InsertSeparator Method

Description

Inserts a dividing line in a user-defined menu or user-defined toolbar.

syntax

Expression.`InsertSeparator(Position, Key)`

Expression

Necessary. An expression or element which returns an object of the "MenuItems" or "ToolbarItems" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the dividing line within the user-defined menu or user-defined toolbar.
Key (Variant)	Identifies the dividing line. Use unique names for "Key" (e.g. "tSeparator1_2").

Example:

In the following example a user-defined toolbar with two icons is created in the active picture. These icons are separated by a dividing line:

```
Sub AddDocumentSpecificCustomToolbar()
'VBA161
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Set objToolbar = ActiveDocument.CustomToolbars.Add("DocToolbar")
'Add toolbar-item to userdefined toolbar
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "First
symbol-icon")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(3, "tItem1_3", "Second
symbol-icon")
'
'Insert dividing rule between first and second symbol-icon
Set objToolbarItem = objToolbar.ToolbarItems.InsertSeparator(2, "tSeparator1_2")
End Sub
```

InsertSubmenu Method

Description

Inserts a submenu into an existing user-defined menu.

syntax

Expression.`InsertSubmenu(Position, Key, DefaultLabel)`

Expression

Necessary. An expression or element which returns an object of the "MenuItem" type

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the submenu within the user-defined menu.
Key (Variant)	Identifies the submenu. Use unique names for "Key" "(e.g. dSubMenu1_4).
DefaultLabel (String)	Defines the name of the submenu.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA162
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "First MenuItem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "Second MenuItem")
'
'Insert a dividing rule into customized menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "First SubMenu")
'
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "First item in sub-
menu")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "Second item in sub-
menu")
End Sub
```

The diagram shows the menu structure:

InsertToolbarItem Method

Description

Inserts a new icon in an existing user-defined toolbar.

syntax

Expression.`InsertToolbarItem(Position, Key, DefaultToolTipText)`

Expression

Necessary. An expression or element which returns an object of the "ToolbarItems" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the icon within the user-defined toolbar.
Key (Variant)	Identifies the symbol. Use unique names for "Key" "(e.g. tItem1_1).
DefaultToolTipText (String)	Defines for the icon concerned the tool tip text that will be displayed when you move the mouse over the icon.

Example:

In the following example a user-defined toolbar with two icons is created in the active picture. These icons are separated by a dividing line:

```
Sub AddDocumentSpecificCustomToolbar()
'VBA163
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Set objToolbar = ActiveDocument.CustomToolbars.Add("DocToolbar")
'Add toolbar-item to userdefined toolbar
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "First
symbol-icon")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(3, "tItem1_3", "Second
symbol-icon")
'
'Insert dividing rule between first and second symbol-icon
Set objToolbarItem = objToolbar.ToolbarItems.InsertSeparator(2, "tSeparator1_2")
End Sub
```

IsCSLayerVisible Method

Description

Returns TRUE if the specified CS layer is visible.

syntax

Expression.`IsCSLayerVisible(Index)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	Defines the CS layer. Value range from 1 to 32. Layer0 corresponds to the index value "1".

Example:

The following example determines whether CS layer 1 in the copy of the active picture is visible and outputs the result:

```
Sub IsCSLayerVisible()
'VBA164
Dim objView As HMIView
Dim strLayerName As String
Dim iLayerIdx As Integer
Set objView = ActiveDocument.Views(1)
objView.Activate
iLayerIdx = 2
strLayerName = ActiveDocument.Layers(iLayerIdx).Name
If objView.IsCSLayerVisible(iLayerIdx) = True Then
MsgBox "CS " & strLayerName & " is visible"
Else
MsgBox "CS " & strLayerName & " is invisible"
End If
End Sub
```

See also

Editing Layers with VBA (Page 3050)

IsRTLayerVisible Method

Description

Returns TRUE if the specified RT layer is visible.

syntax

Expression.`IsRTLayerVisible(Index)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	Defines the RT layer. Value range from 1 to 32. Layer0 corresponds to the index value "1".

Example:

The following example determines whether RT layer 1 is visible and outputs the result:

```
Sub RTLayerVisibility()
'VBA165
Dim strLayerName As String
Dim iLayerIdx As Integer
iLayerIdx = 2
strLayerName = ActiveDocument.Layers(iLayerIdx).Name
If ActiveDocument.IsRTLayerVisible(iLayerIdx) = True Then
MsgBox "RT " & strLayerName & " is visible"
Else
MsgBox "RT " & strLayerName & " is invisible"
End If
End Sub
```

Editing Layers with VBA (Page 3050)

Item Method

Description

Returns an element from a listing.

syntax

Expression.`Item(Index)`

Expression

Necessary. An expression or element which returns an object.

Parameters

Parameter (Data Type)	Description
Index (Variant)	The name or index number of an element from the listing. You can use the Object Name as the name. As the index number you can use a numerical expression (from 1 up to the value of the Count property of the listing). If the entered value fails to match any element in the listing, this counts as an error.

Example:

Note

The Item Method is the default method for listings. Both the following examples give the same result.

In the following example the name of the first picture in the Graphics Designer is output:

```
Sub ShowDocumentNameLongVersion()
'VBA166
Dim strDocName As String
strDocName = Application.Documents.Item(3).Name
MsgBox strDocName
End Sub

Sub ShowDocumentNameShortVersion()
'VBA167
Dim strDocName As String
strDocName = Application.Documents(3).Name
MsgBox strDocName
End Sub
```

ItemByLcid Method

Description

Selects the language for which you wish to enter the font settings. Read only access.

Note

You can only select languages in which you have already configured.

Syntax

Expression.`ItemByLcid(LangID)`

Expression

Required. An expression or element which returns an object of the "LanguageFonts" type.

Parameter

Parameter (Data Type)	Description
LangID (Long)	This is the language identifier. The list of language identifiers is contained, for example, in the "Languages.csv" file that is found in the index of the WinCC documentation.

Example

The following example sets the font attributes of a button for French and English. In contrast to English, French is displayed on the button in a smaller font with a constant tracking (Courier New, 12pt):

```
Sub ExampleForLanguageFonts()
'VBA168
Dim objLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "Hello"
Set objLangFonts = objButton.LDFonts
'
'To make fontsettings for English:
With objLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
'
'To make fontsettings for French:
With objLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With

End Sub
```

LanguageFonts Object (Listing) (Page 3366)

LoadDefaultConfig Method

Description

Loads the file in which the default settings for objects are saved. The PDD file is located in the "GraCS" folder of the current project.

syntax

Expression.`LoadDefaultConfig(FileName)`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The name of the PDD file which it is intended to load.

Example:

In the following example the file "Test.PDD" will be loaded. For this example to work, you must have previously saved the file. You can do this with the aid of the SaveDefaultConfig Method:

```
Sub LoadDefaultConfig()
'VBA169
Application.LoadDefaultConfig ("Test.PDD")
End Sub
```

Application Object (Page 3282)

SaveDefaultConfig Method (Page 3255)

VBA Reference (Page 3124)

MoveOneLayerDown Method

Description

Moves the selected object in the specified picture into the next lowest layer.

syntax

Expression.MoveOneLayerDown()

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example a circle in the active picture is inserted in the third layer and then moved to the next lowest layer:

```
Sub MoveObjectOneLayerDown()
'VBA170
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
.Layer = 3
MsgBox "Circle is inserted into layer" & Str(.Layer)
ActiveDocument.Selection.MoveOneLayerDown
MsgBox "Circle is moved into layer" & Str(.Layer)
End With
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

MoveOneLayerUp Method

Description

Moves the selected object in the specified picture into the next highest layer.

syntax

Expression.MoveOneLayerUp()

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example a circle in the active picture is inserted in the third layer and then moved to the next highest layer:

```
Sub MoveObjectOneLayerUp()
'VBA171
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
.Layer = 3
MsgBox "Circle is inserted into layer" & Str(.Layer)
ActiveDocument.Selection.MoveOneLayerUp
MsgBox "Circle is moved into layer" & Str(.Layer)
End With
End Sub
```

VBA Reference (Page 3124)

MoveSelection Method

Description

Moves one or more objects selected in the picture by the specified coordinates.

Note

When you want to reposition one or more selected objects, use the properties "Left" and "Top".

syntax

Expression.MoveSelection(PosX, PosY)

Expression

Required. An expression or element which returns an object of the "Document" or "Selection" type.

Parameters

Parameter (Data Type)	Description
PosX (Long)	The number of pixels by which the selection is to be moved horizontally.
PosY (Long)	The number of pixels by which the selection is to be moved vertically.

Example:

In the following example two objects are inserted at different positions in the current picture and selected. The selection is then moved 30 pixels to the right and 40 pixels down:

```
Sub MoveSelectionToNewPostion()
'VBA172
Dim nPosX As Long
Dim nPosY As Long
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
nPosX = 30
nPosY = 40
ActiveDocument.MoveSelection nPosX, nPosY
End Sub
```

6.1.6.3 O-Z

Open Method

Description

Opens an existing picture in the Graphics Designer and adds it to the documents listing.

syntax

Expression.`Open(FileName, [HMIOpenDocumentType])`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The name of the PDL file to be opened. Unless you saved the PDL file in the "GraCS" folder of the open project, you must also specify the path at the same time.
HMIOpenDocumentType (HMIDocumentType)	Defines how the picture will be opened: • HMIDocumentTypeVisible: Opens the picture for direct processing. This is the default setting if you do not specify the parameter. • HMIDocumentTypeInvisible: Opens the picture in invisible mode, i.e. it is not displayed in the Graphics Designer. You can only address the picture via the Documents listing, and make it visible again by means of the Hide property.

Example:

In the following example the picture "Test" will be opened. For this example to work, you must have previously saved a picture with the name "Test" in the "GraCS" folder of the open project.

```
Sub OpenDocument()
'VBA175
Application.Documents.Open "Test.PDL", hmiOpenDocumentTypeVisible
```

```
End Sub
```

See also

Hide Property (Page 3625)

Documents Object (Listing) (Page 3322)

VBA Reference (Page 3124)

PasteClipboard Method

Description

Pastes the contents of the clipboard into the specified picture.

Note

The clipboard must contain objects from the Graphics Designer. Other contents (such as ASCII text) will not be pasted.

syntax

Expression.`PasteClipboard()`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

--

Example:

In the following example all the objects selected in the active picture are copied to the clipboard and then pasted into a new picture. For this example to work, you must have selected at least one object in the active picture:

```
Sub CopySelectionToNewDocument()
'VBA176
Dim iNewDoc As String
ActiveDocument.CopySelection
Application.Documents.Add hmiOpenDocumentTypeVisible
iNewDoc = Application.Documents.Count
Application.Documents(iNewDoc).PasteClipboard
End Sub
```

VBA Reference (Page 3124)

PrintDocument Method

Description

Prints the specified copy of the picture using the current printer settings.

syntax

Expression.`PrintDocument()`

Expression

Necessary. An expression or element which returns an object of the "View" type.

Parameters

--

Example:

In the following example a copy of the active picture is created and then activated and printed:

```
Sub CreateAndPrintView()
'VBA177
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
objView.PrintDocument
End Sub
```

See also

View Object (Page 3466)

VBA Reference (Page 3124)

PrintProjectDocumentation Method

Description

Prints out the project documentation for the current picture complete with all the objects it contains and their properties via the reporting system in WinCC (Report Designer).

You must first have set the print settings (such as page range) in the "Print Job Properties" dialog. To do this, go to the Graphics Designer and select the menu command "File" > "Project Documentation - Setup".

Note

The project documentation will be output on the printer that was set up in the Report Designer. You can design the print layout to suit your needs with the aid of the Report Designer.

syntax

Expression.`PrintProjectDocumentation()`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

--

Example:

In the following example the project documentation for the active picture will be printed:

```
Sub ToPrintProjectDocumentation()
'VBA178
ActiveDocument.PrintProjectDocumentation
End Sub
```

See also

Document Object (Page 3319)

VBA Reference (Page 3124)

Remove Method

Description

Removes an object from a selection of objects or from a group object.

syntax

Expression.`Remove(Index)`

Expression

Necessary. An expression or element which returns an object of the "GroupedObjects" or "Selection" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	The name or index number of the object that is intended to be removed. You can use the Object Name as the name. As the index number you can use a numerical expression (from 1 up to the value of the Count property of the listing). If the entered value fails to match any element in the listing, this counts as an error.

Example:

In the following example three objects will first be inserted in the active picture and selected. Then one object will be removed from the selection and the remaining objects will be grouped. Then the first object will be removed from the group object:

```
Sub RemoveObjectFromGroup()
'VBA179
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Selected = True
End With
With objRectangle
.Top = 80
```

```
.Left = 42
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
MsgBox "Group-object is created."
objGroup.GroupedHMIObjects.Remove ("sEllipse")
MsgBox "The ellipse is removed from group-object."
End Sub
```

See also

VBA Reference (Page 3124)

Rotate Method

Description

Rotates the object selected in the specified picture by 90° clockwise.

syntax

Expression.`Rotate()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects will be inserted in the active picture and then grouped. The group object will then be rotated once:

```
Sub RotateGroupObject()
```

```
'VBA180
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objGroup As HMIGroup
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
With objRectangle
.Top = 30
.Left = 30
.Width = 80
.Height = 40
.Selected = True
End With
With objCircle
.Top = 30
.Left = 30
.BackColor = RGB(255, 255, 255)
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
MsgBox "Group-object created."
objGroup.Selected = True
ActiveDocument.Selection.Rotate
End Sub
```

See also

VBA Reference (Page 3124)

SelectedObjects object (Listing) (Page 3426)

SameHeight Method

Description

Sets the "Height" property for all selected objects in the specified picture to the smallest available value.

syntax

Expression.`SameHeight()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects of different sizes will be inserted in the active picture. Then all objects will be selected and set to the same height:

```
Sub ApplySameHeightToSelectedObjects()
'VBA181
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Height = 15
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Height = 40
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.Height = 120
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.SameHeight
End Sub
```

SameWidth Method

Description

Sets the "Width" property for all selected objects in the specified picture to the smallest available value.

syntax

Expression.`SameWidth()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects of different sizes will be inserted in the active picture. Then all objects will be selected and set to the same width:

```
Sub ApplySameWidthToSelectedObjects()
'VBA182
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Width = 15
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Width = 40
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 120
.BackColor = RGB(255, 0, 0)
.Selected = True
```

```
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.SameWidth
End Sub
```

SameWidthAndHeight Method

Description

Sets the "Height" and "Width" properties for all selected objects in the specified picture to the smallest available value.

syntax

Expression.`SameWidthAndHeight()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects of different sizes will be inserted in the active picture. Then all objects will be selected and set to the same height:

```
Sub ApplySameWidthAndHeightToSelectedObjects()
'VBA183
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
```

```
.Height = 15
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Width = 25
.Height = 40
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.Height = 120
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.SameWidthAndHeight
End Sub
```

Save Method

Description

Saves the specified picture under its current name.

syntax

Expression.`Save()`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

--

Example:

In the following example the active picture in the Graphics Designer will be saved:

```
Sub SaveDocument()
'VBA184
ActiveDocument.Save
End Sub
```

See also

ActiveDocument Property (Page 3472)

Document Object (Page 3319)

SaveAll Method

Description

Saves all the open pictures in the Graphics Designer under their current names.

syntax

Expression.`SaveAll()`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are saved:

```
Sub SaveAllDocuments()
'VBA185
Application.Documents.SaveAll
End Sub
```

See also

Documents Object (Listing) (Page 3322)

VBA Reference (Page 3124)

SaveAs Method

Description

Saves the specified picture under a new name.

If a previously existing picture is to be overwritten, it must be ascertained prior to the SaveAs method call that this picture is permitted to be overwritten. You must inquire the LockedByCreatorID property of the picture to be overwritten to do so. Otherwise an error will be triggered in VBA.

syntax

Expression.`SaveAs(FileName)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The file name under which the picture is to be saved.

Example:

In the following example the active picture will be saved under the name "Test2.PDL":

```
Sub SaveDocumentAs()
'VBA186
ActiveDocument.SaveAs ("Test2.PDL")
End Sub
```

See also

SaveDefaultConfig Method

Description

Saves the default settings for objects to a PDD file. The file is saved to the "GraCS" folder of the current project.

syntax

Expression.`SaveDefaultConfig(FileName)`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The name of the PDD file.

Example:

In the following example the default settings for objects are saved to the file "Test.PDD".

```
Sub SaveDefaultConfig()
'VBA187
Application.SaveDefaultConfig ("Test.PDD")
End Sub
```

See also

Application Object (Page 3282)

LoadDefaultConfig Method (Page 3238)

VBA Reference (Page 3124)

SelectAll Method

Description

Selects all the objects in the specified picture and adds them to the selection listing.

syntax

Expression.`SelectAll()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects will be inserted in the active picture and then selected.

```
Sub SelectAllObjectsInActiveDocument()
'VBA188
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Height = 15
End With
With objRectangle
.Top = 80
.Left = 42
.Width = 25
.Height = 40
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.Height = 120
.BackColor = RGB(255, 0, 0)
End With
ActiveDocument.Selection.SelectAll
End Sub
```

SendToBack Method

Description

Sends the selected objects right to the back within their current layer.

Note

If the "SendToBack" method is used, the sequence of HMI objects can change in the HMIObjects listing.

Syntax

Expression.`SendToBack()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted in the active picture. The object inserted first is then sent to the back:

```
Sub SendObjectToBack()
'VBA197
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = False
End With
With objRectangle
.Top = 40
.Left = 40
.Width = 100
.Height = 50
.BackColor = RGB(255, 0, 255)
.Selected = True
End With
MsgBox "The objects circle and rectangle are created" & vbCrLf & "Only the rectangle is
selected!"
ActiveDocument.Selection.SendToBack
```

```
MsgBox "The selection is moved to the back."
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

SetCSLayerVisible Method

Description

Shows or hides the specified CS layer.

syntax

Expression.`SetCSLayerVisible(Index, Val)`

Expression

Necessary. An expression or element which returns an object of the "View" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	Defines the CS layer that is going to be shown or hidden. Value range from 1 up to 32.
Val (Boolean)	TRUE if the specified CS layer is intended to be visible.

Example:

In the following example the second CS layer in the copy of the active picture is hidden (i.e. made invisible):

```
Sub SetCSLayerVisible()
'VBA189
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
objView.SetCSLayerVisible 2, False
End Sub
```

See also

Document Object (Page 3319)

VBA Reference (Page 3124)

Editing Layers with VBA (Page 3050)

SetOpenContext method

Description

The SetOpenContext method sets the password. Password-protected process pictures or faceplate types can then be opened.

Syntax

Expression.`SetOpenContext (Password)`

Expression

Required. An expression or element which returns an object of the "Documents" type.

Parameter

Parameter (Data Type)	Description
Password (String)	Password of the available picture.

Example

Several pictures ("A.pdl", "B.pdl" und "C.pdl") are opened in the following example using the same password string "Test123". Enter the password for the pictures to open these. Terminate the SetOpenContext method with an empty string "" to prevent further access to the password.

```
Sub OpenProtectedPicture()
'VBA853
Documents.SetOpenContext ("Test123")
Documents.Open ("A.pdl")
Documents.Open ("B.pdl")
Documents.Open ("C.pdl")
Documents.SetOpenContext ("")
End Sub
```

SetDeclutterObjectSize Method

Description

Specifies the size area for fading in and out of objects in the specified picture. If height and width of the object are outside the specified size area, the objects are faded out.

The "ObjectSizeDecluttering" property must be set to TRUE.

syntax

Expression.`SetDeclutterObjectSize(Min, Max)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
Min (Long)	Lower size range in pixels.
Max (Long)	Upper size range in pixels.

Example:

In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer()
'VBA190
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'Configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
'Define decluttering of objects:
With ActiveDocument
.LayerDecluttering = True
.ObjectSizeDecluttering = True
.SetDeclutterObjectSize 50, 100
End With
End Sub
```

See also

ObjectSizeDecluttering Property (Page 3700)

SetRTLayerVisible Method

Description

Shows or hides the specified RT layer.

syntax

Expression.`SetRTLayerVisible(Index, Val)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	Defines the RT layer that is going to be shown or hidden. Value range from 1 to 32.
Val (Boolean)	TRUE if the specified RT layer is intended to be visible.

Example:

In the following example the first RT layer in the active picture will be made visible:

```
Sub SetRTLayerVisibleWithVBA()
'VBA191
ActiveDocument.SetRTLayerVisible 1, False
End Sub
```

ShowPropertiesDialog Method

Description

Opens the "Object Properties" dialog.

syntax

Expression.`ShowPropertiesDialog()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example the "Object Properties" dialog is opened:

```
Sub ShowPropertiesDialog()
'VBA192
Application.ShowPropertiesDialog
End Sub
```

See also

Application Object (Page 3282)

VBA Reference (Page 3124)

ShowSymbolLibraryDialog Method

Description

Opens the Components Library.

syntax

Expression.`ShowSymbolLibraryDialog()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example the Components Library is opened:

```
Sub ShowSymbolLibraryDialog()
'VBA193
Application.ShowSymbolLibraryDialog
End Sub
```

See also

Application Object (Page 3282)

VBA Reference (Page 3124)

ShowTagDialog Method

Description

Opens the "Tags" dialog.

syntax

Expression.`ShowTagDialog()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example the "Tags" dialog is opened:

```
Sub ShowTagDialog()
'VBA194
Application.ShowTagDialog
End Sub
```

TileWindowsHorizontally Method

Description

Arranges all open pictures in the Graphics Designer so that they are tiled horizontally.

syntax

Expression.`Methode()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are tiled horizontally. For this example to work, you must have opened a number of pictures in the Graphics Designer:

```
Sub TileWindowsHorizontally()
'VBA195
Application.TileWindowsHorizontally
End Sub
```

See also

Application Object (Page 3282)

VBA Reference (Page 3124)

TileWindowsVertically Method

Description

Arranges all open pictures in the Graphics Designer so that they are tiled vertically.

syntax

Expression.Methode()

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are tiled vertically. For this example to work, you must have opened a number of pictures in the Graphics Designer:

```
Sub TileWindowsVertically()
'VBA196
Application.TileWindowsVertically
End Sub
```

TransformDisplayCoordinate method

Description

Is used internally for PowerCC.

TransformPixelCoordinate method

Description

Is used internally for PowerCC.

Ungroup Method

Description

Ungroups a group object. The objects remain intact.

syntax

Expression.Ungroup(Parameter)

Expression

Necessary. An expression or element which returns an object of the "Group" type.

Parameters

--

Example:

In the following example three objects are created in the current picture and a group object is then created from them: The group object is then moved and ungrouped.

```
Sub DissolveGroup()
'VBA199
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
MsgBox "Group-object is created."
With objGroup
.Left = 120
.Top = 300
MsgBox "Group-object is moved."
.UnGroup
MsgBox "Group is dissolved."
End With
End Sub
```

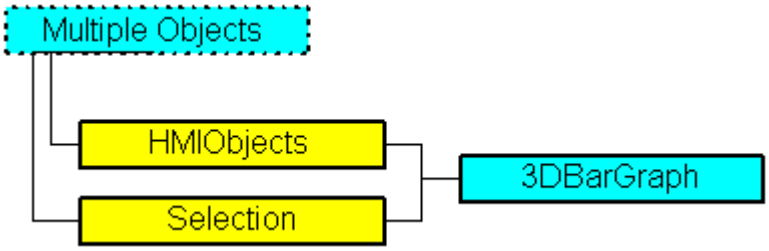
6.1.7 Objects and Lists

6.1.7.1 0-9, A-C

3DBarGraph Object

Description



Represents the "3D Bar" object. The 3DBarGraph object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMI3DBarGraph

Application

Use the Add method to create a new "3D Bar" object in a picture:

```
Sub Add3DBarGraph()
'VBA200
Dim obj3DBarGraph As HMI3DBarGraph
Set obj3DBarGraph = ActiveDocument.HMIObjects.AddHMIObject("3DBar", "HMI3DBarGraph")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub Edit3DBarGraph()
'VBA201
Dim obj3DBarGraph As HMI3DBarGraph
Set obj3DBarGraph = ActiveDocument.HMIObjects("3DBar")
obj3DBarGraph.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA202
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Object properties

The 3D Bar object possesses the following properties:

- AngleAlpha
- AngleBeta
- Application
- Axe
- BackColor
- Background
- BarDepth
- BarHeight
- BarWidth
- BaseX
- BaseY
- BorderColor
- BorderStyle
- BorderWidth
- Direction
- FillColor
- FillStyle
- GlobalColorScheme

- GlobalShadow
- GroupParent
- Height
- Layer
- Layer00Checked ... Layer10Checked
- Layer00Color ... Layer10Color
- Layer00FillColor ... Layer10FillColor
- Layer00FillStyle ... Layer10FillStyle
- Layer00Value ... Layer10Value
- Left
- LightEffect
- Max.
- Min.
- ObjectName
- Operation
- Parent
- PasswordLevel
- PredefinedAngles
- Process
- Selected
- ShowBadTagState
- TabOrderAlpha
- TabOrderSwitch
- ToolTipText
- Top
- Transparency
- Type
- Visible
- Width
- ZeroPointValue

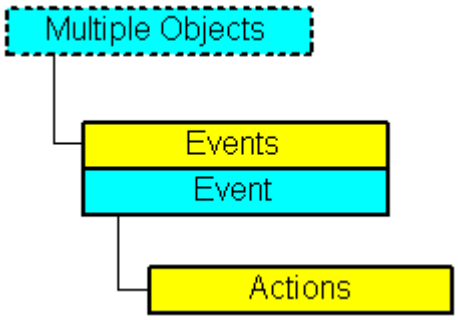
Actions Object (Listing)

Description



Displays a listing of the actions that are configured on an event.

VBA Object Name

HMIActions

Usage

Use the AddAction method to configure one or more actions on an event. In this example a button and a circle will be inserted in the active picture. In runtime the radius of the circle enlarges every time you click the button:

```
Sub CreateVBActionToClickedEvent()
'VBA203
Dim objButton As HMIButton
Dim objCircle As HMICircle
Dim objVBScript As HMIScriptInfo
Dim strVBCode As String
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VB", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircle
.Top = 100
.Left = 100
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Text = "Increase Radius"
End With
'define event and assign sourcecode to it:
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
strVBCode = "Dim myCircle" & vbCrLf & "Set myCircle = "
strVBCode = strVBCode & "HMIRuntime.ActiveScreen.ScreenItems(""Circle_VB"")"
strVBCode = strVBCode & vbCrLf & "myCircle.Radius = myCircle.Radius + 5"
With objVBScript
.SourceCode = strVBCode
End With
End Sub
```

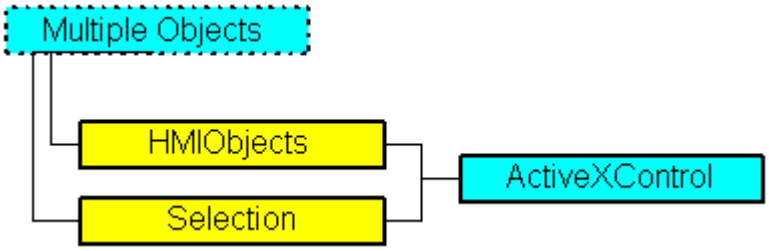
ActiveXControl Object

Description



Represents the ActiveX Control object. The ActiveXControl object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIActiveXControl

Usage

Use the AddActiveXControl method to insert an ActiveX Control in a picture, for instance. In the following example the ActiveX Control "WinCC Gauge Control" is inserted in the active picture.

```
Sub AddActiveXControl()
'VBA204
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
With ActiveDocument
.HMIObjects("WinCC_Gauge").Top = 40
.HMIObjects("WinCC_Gauge").Left = 40
End With
End Sub
```

AdvancedAnalogDisplay object

Description

Represents the "Analog Display (Advanced)" object. The "AdvancedAnalogDisplay" object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIAdvancedAnalogDisplay

Application

Use the AddHMIObject method to create a new "Analog Display (Advanced)" object in a picture:

```
Sub AddAdvancedAnalogDisplay()
'VBA857
Dim objAdvancedAnalogDisplay As HMIAdvancedAnalogDisplay
Set objAdvancedAnalogDisplay = ActiveDocument.HMIObjects.AddHMIObject("Analogdisplay1",
"HMIAdvancedAnalogDisplay")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditAdvancedAnalogDisplay()
'VBA858
Dim objAdvancedAnalogDisplay As HMIAdvancedAnalogDisplay
Set objAdvancedAnalogDisplay = ActiveDocument.HMIObjects("Analogdisplay1")
objAdvancedAnalogDisplay.BackColor_Simulation = RGB(255, 0, 0)
End Sub
```

AdvancedStateDisplay object

Description

Represents the "State Display (Advanced)" object. The "AdvancedStateDisplay" object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIAdvancedStateDisplay

Application

Use the AddHMIObject method to create a new "State Display (Advanced)" object in a picture:

```
Sub AddAdvancedStateDisplay()
'VBA859
Dim objAdvancedStateDisplay As HMIAdvancedStateDisplay
Set objAdvancedStateDisplay = ActiveDocument.HMIObjects.AddHMIObject("Statedisplay1",
"HMIAdvancedStateDisplay")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditAdvancedStateDisplay()
'VBA860
Dim objAdvancedStateDisplay As HMIAdvancedStateDisplay
Set objAdvancedStateDisplay = ActiveDocument.HMIObjects("Statedisplay1")
objAdvancedStateDisplay.PaintColor_QualityCodeBad = RGB(255, 0, 0)
End Sub
```

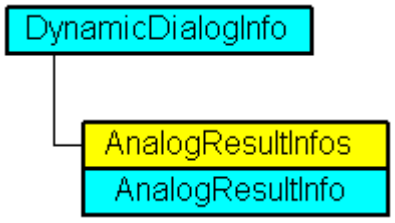
AnalogResultInfo Object

Description



Displays an analog value range and associated property value in the Dynamic dialog. The AnalogResultInfo object is an element of the AnalogResultInfos listing:

VBA Object Name

HMIAnalogResultInfo

Usage

Use the AnalogResultInfo object to return an individual value range and property value. For a detailed example, please refer to "AnalogResultInfos Object (Listing)" in this documentation.

See also

AnalogResultInfos Object (Listing) (Page 3281)

Delete Method (Page 3208)

Value Property (Page 3807)

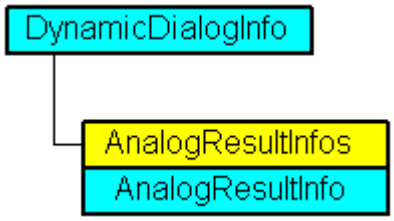
RangeTo Property (Page 3740)

Parent Property (Page 3708)

Application Property (Page 3484)

AnalogResultInfos Object (Listing)

Description



A listing of AnalogResultInfo objects that contain all the analog value ranges and the associated property value in the Dynamic dialog.

VBA Object Name

HMIAnalogResultInfos

Usage

Use the Add method to add a new value range in the Dynamic dialog. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and three analog value ranges will be created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA206
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

Use AnalogResultInfos to return the AnalogResultInfos listing. In this example the value ranges created in the above example will be output:

```
Sub ShowAnalogResultInfosOfCircleRadius()
```

```
'VBA207
Dim colAResultInfos As HMIAnalogResultInfos
Dim objAResultInfo As HMIAnalogResultInfo
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Dim iAnswer As Integer
Dim varRange As Variant
Dim varValue As Variant
Set objCircle = ActiveDocument.HMIObjects("Circle_A")
Set objDynDialog = objCircle.Radius.Dynamic
Set colAResultInfos = objDynDialog.AnalogResultInfos
For Each objAResultInfo In colAResultInfos
varRange = objAResultInfo.RangeTo
varValue = objAResultInfo.value
iAnswer = MsgBox("Ranges of values from Circle_A-Radius:" & vbCrLf & "Range of value to: "
& varRange & vbCrLf & "Value of property: " & varValue, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objAResultInfo
End Sub
```

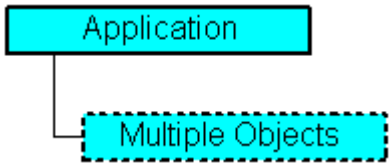
Application Object

Description



Represents the Graphics Designer editor. The Application object contains properties and methods that return objects from the top layer. For example ActiveDocument returns a Document object.

VBA Object Name

HMIApplication

Usage

Use Application to return the Application object. In the following example the application version is output:

```
Sub ShowApplicationVersion()
'VBA208
MsgBox Application.Version
End Sub
```

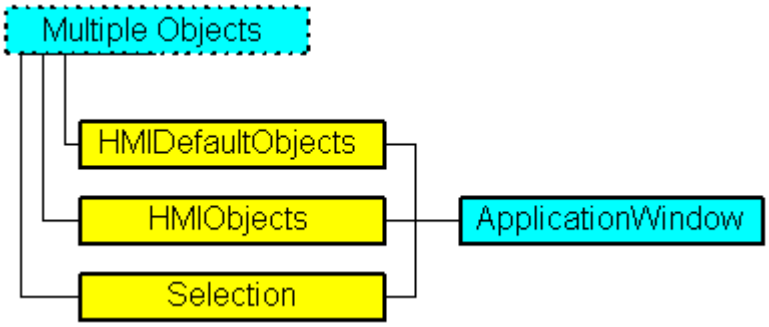
ApplicationWindow Object

Description



Represents the "Application Window" object. The ApplicationWindow object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIApplicationWindow

Usage

Use the Add method to create a new "Application Window" object in a picture:

```
Sub AddApplicationWindow()
'VBA209
Dim objApplicationWindow As HMIApplicationWindow
Set objApplicationWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow",
"HMIApplicationWindow")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditApplicationWindow()
'VBA210
Dim objApplicationWindow As HMIApplicationWindow
Set objApplicationWindow = ActiveDocument.HMIObjects("AppWindow")
objApplicationWindow.Sizeable = True
End Sub
Use "Selection"(Index) to return an object from the Selection listing:
Sub ShowNameOfFirstSelectedObject()
'VBA211
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

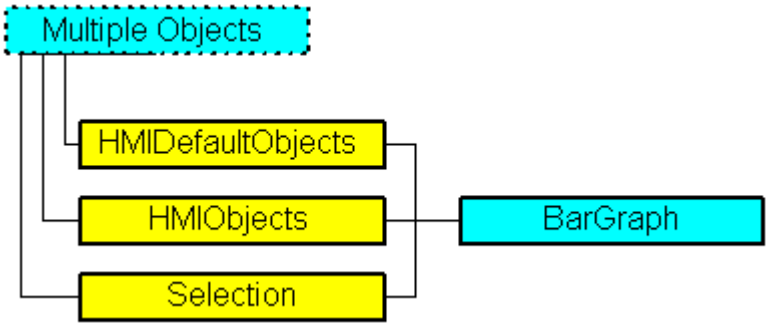
BarGraph Object

Description



Represents the "Bar" object. The BarGraph object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default settings of property values of all Standard, Windows and Smart objects.

VBA Object Name

HMIBarGraph

Application

Use the Add method to create a new "Bar" object in a picture:

```
Sub AddBarGraph()
'VBA212
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditBarGraph()
'VBA213
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects("Bar1")
objBarGraph.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA214
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

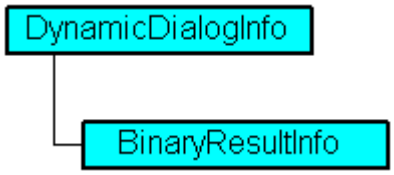
BinaryResultInfo Object

Description



Displays both the binary (boolean) value ranges and the associated property values in the Dynamic dialog.

VBA Object Name

HMIBinaryResultInfo

Usage

Use BinaryResultInfo to return the BinaryResultInfo object. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and the associated property values will be assigned to both the binary value ranges:

```
Sub AddDynamicDialogToCircleRadiusTypeBinary()
'VBA215
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBool
.BinaryResultInfo.NegativeValue = 20
.BinaryResultInfo.PositiveValue = 40
End With
End Sub
```

BitResultInfo Object

Description

Displays both the value ranges for bit set/not set and the associated property values in the Dynamic dialog.

VBA Object Name

HMIBitResultInfo

Usage

Use BitResultInfo to return a BitResultInfo object. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned, the bit to be set will be defined and the associated property values will be assigned to the "set"/"not set" states:

```
Sub AddDynamicDialogToCircleRadiusTypeBit()
'VBA216
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_B", "HMICircle")
'Tag "NewDynmic1" must exist
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBit
.BitResultInfo.BitNumber = 1
.BitResultInfo.BitSetValue = 40
.BitResultInfo.BitNotSetValue = 80
End With
End Sub
```

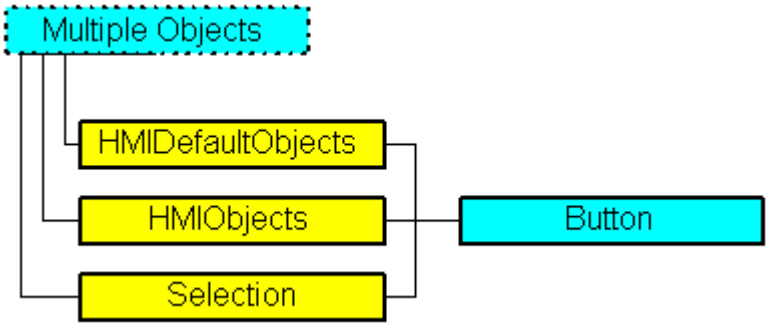
Button Object

Description



Represents the "Button" object. The Button object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default settings of property values of all Standard, Windows and Smart objects.

VBA Object Name

HMIButton

Application

Use the Add method to create a new "Button" object in a picture:

```
Sub AddButton()
'VBA217
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button", "HMIButton")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditButton()
'VBA218
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects("Button")
```

```
objButton.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA219
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

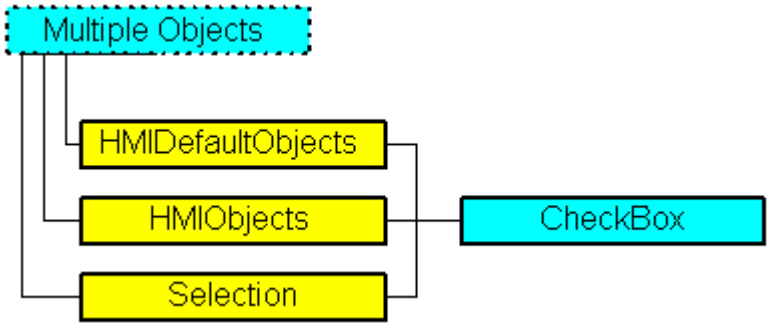
CheckBox Object

Description



Represents the "Check Box" object. The CheckBox object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default settings of property values of all Standard, Windows and Smart objects.

VBA Object Name

HMICheckBox

Application

Use the Add method to create a new "Check Box" object in a picture:

```
Sub AddCheckBox()
'VBA220
Dim objCheckBox As HMICheckBox
Set objCheckBox = ActiveDocument.HMIObjects.AddHMIObject("CheckBox", "HMICheckBox")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditCheckBox()
'VBA221
Dim objCheckBox As HMICheckBox
Set objCheckBox = ActiveDocument.HMIObjects("CheckBox")
objCheckBox.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA222
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

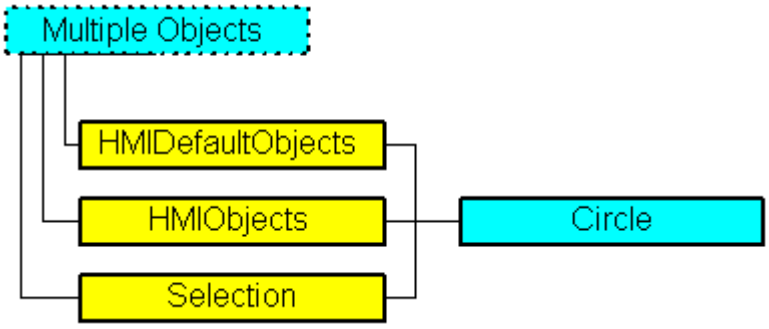
Circle Object

Description



Represents the "Circle" object. The Circle object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMICircle

Usage

Use the Add method to create a new "Circle" object in a picture:

```
Sub AddCircle()
'VBA223
```

```
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle", "HMICircle")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditCircle()
'VBA224
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects("Circle")
objCircle.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA225
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

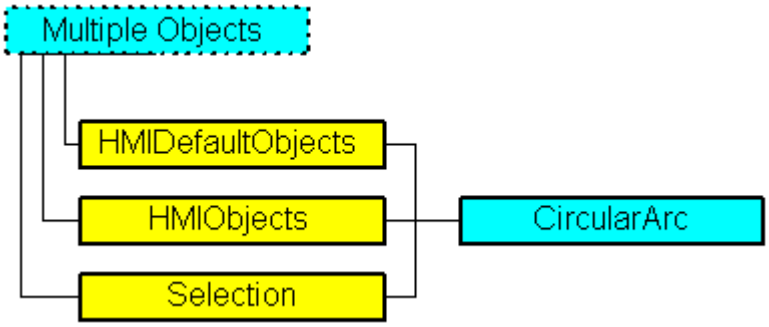
CircularArc Object

Description



Represents the "Circular Arc" object. The CircularArc object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMICircularArc

Usage

Use the Add method to create a new "Circular Arc" object in a picture:

```
Sub AddCiruclarArc()
'VBA226
Dim objCiruclarArc As HMICircularArc
Set objCiruclarArc = ActiveDocument.HMIObjects.AddHMIObject("CircularArc",
"HMICircularArc")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditCiruclarArc()
'VBA227
Dim objCiruclarArc As HMICircularArc
Set objCiruclarArc = ActiveDocument.HMIObjects("CircularArc")
objCiruclarArc.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA228
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

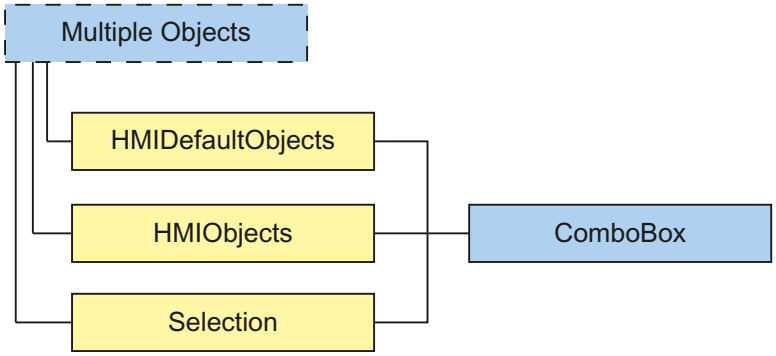
ComboBox object

Description



Represents the "ComboBox" object. The ComboBox object is an element of the following lists:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMIComboBox

Usage

Use the Add method to create a new "ComboBox" object in a picture:

```
Sub AddComboBox()
'VBA822
Dim objComboBox As HMIComboBox
Set objComboBox = ActiveDocument.HMIObjects.AddHMIObject("ComboBox", "HMIComboBox")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditComboBox()
'VBA850
Dim objComboBox As HMIComboBox
Set objComboBox = ActiveDocument.HMIObjects("ComboBox")
objComboBox.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA824
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

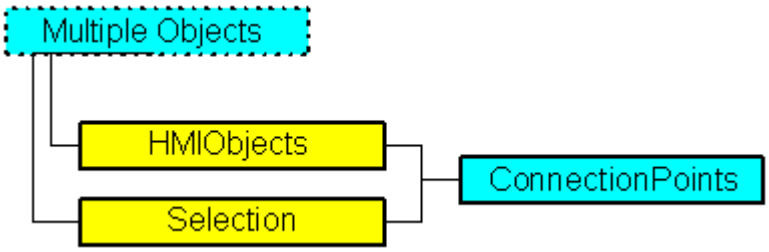
ConnectionPoints Object (Listing)

Description



The listing returns the number of points to which the connector can be appended in the specified object.

VBA object name

HMIConnectionPoints

Object properties

The ConnectionPoints object possesses the following properties:

- Application
- Count
- Item
- Parent

Example 1

In this example, a rectangle is inserted and the number of connection points is output:

```
Sub CountConnectionPoints()
'VBA229
Dim objRectangle As HMIRectangle
Dim objConnPoints As HMIConnectionPoints
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
Set objConnPoints = ActiveDocument.HMIObjects("Rectangle1").ConnectionPoints
MsgBox "Rectangle1 has " & objConnPoints.Count & " connectionpoints."
End Sub
```

Example 2:

In this example, a text field is inserted and the connection points are accessed via "ConnectionPoints.Item". The coordinates of the connection points are shown in an output window.

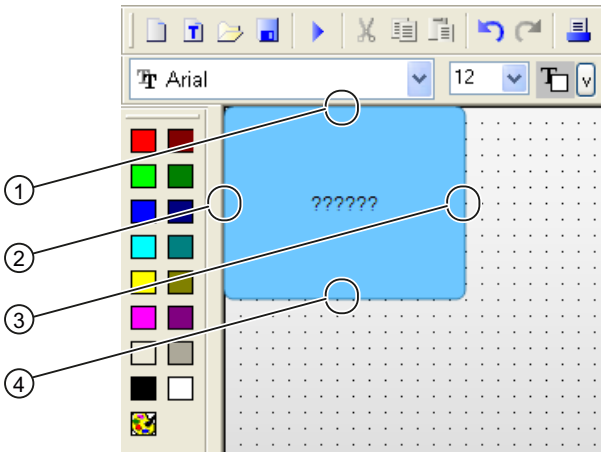
```
Sub GetConnectionPoints()
'VBA825
Dim xPos As Long
Dim yPos As Long
Dim objConnPoints As HMIConnectionPoints

Set objDoc = Application.ActiveDocument
Set objObject = objDoc.HMIObjects.AddHMIObject("Text","HMIStaticText")
Set objConnPoints = ActiveDocument.HMIObjects("Text").ConnectionPoints

For i = 1 To objConnPoints.Count
    xPos = objObject.ConnectionPoints.Item(i)(0)
    yPos = objObject.ConnectionPoints.Item(i)(1)
    MsgBox "Coordinates " & i & ". ConnectionPoint:" & Chr(13) & "x: " & xPos & Chr(13) &
"y: " & yPos
Next

   End Sub
```

The diagram below shows the positions of the 4 connection points of the text field.



Note

If you activate the connection points of a connector with VBA, the connection point index begins with "1".

If you determine the connection points in the property window of the connector in the graphical interface, the connection point index begins with "0".

The index numbers e.g. of the lower connection point in the picture are assigned as follows:

- VBA: Index = 3
- Graphical interface: Index = 2

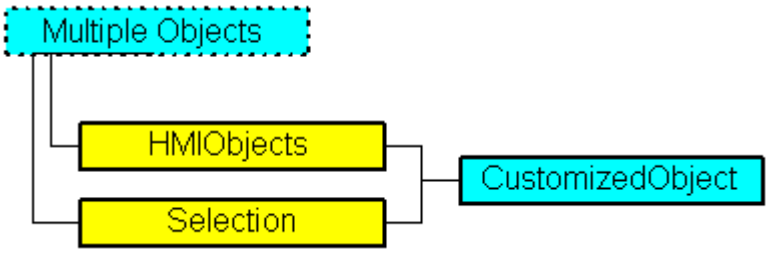
CustomizedObject Object

Description



Represents the object called "Customized Object". The CustomizedObject object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

In the case of the CustomizedObject object, the only properties that are available in the object are those that you have selected in the "Configuration" dialog for the customized object concerned.

Note

You cannot configure the CustomizedObject object with VBA.

Further information regarding customized objects can be found in the WinCC documentation under "Customized Object".

VBA Object Name

HMICustomizedObject

Application

Use the CreateCustomizedObject Method with the Selection listing to create a new "Customized Object" object in a picture:

```
Sub CreateCustomizedObject()
'VBA230
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objCustomizedObject As HMICustomizedObject
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
With objCircle
.Left = 10
.Top = 10
.Selected = True
End With
With objRectangle
.Left = 50
.Top = 50
.Selected = True
End With
MsgBox "objects created and selected!"
Set objCustomizedObject = ActiveDocument.Selection.CreateCustomizedObject
objCustomizedObject.ObjectName = "Customer-Object"
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditCustomizedObject()
'VBA231
Dim objCustomizedObject As HMICustomizedObject
Set objCustomizedObject = ActiveDocument.HMIObjects("Customer-Object")
MsgBox objCustomizedObject.ObjectName
End Sub
```

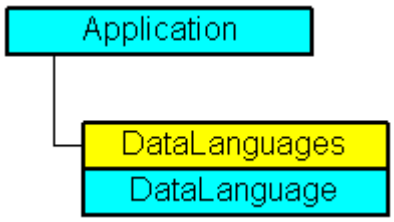
6.1.7.2 D-I

DataLanguage Object

Description



Represents the installed project language, which is identified by its name and language identifier. The DataLanguage object is an element of the DataLanguages listing:

The list of language codes is available in the WinCC documentation (Index > Language Code). The hexadecimal value specified in the list has to be converted to its equivalent decimal value.

VBA Object Name

HMIDataLanguage

Usage

Use the DataLanguages property to return an individual DataLanguage object. In the following example the first installed project language is output:

```
Sub ShowFirstObjectOfCollection()
'VBA232
Dim strName As String
strName = ActiveDocument.Application.AvailableDataLanguages(1).LanguageName
MsgBox strName
End Sub
```

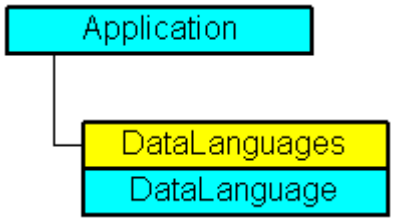
Application Property (Page 3484)

DataLanguages Object (Listing)

Description



A listing of the DataLanguage objects that represent all the installed project languages.

VBA Object Name

HMIDataLanguages

Usage

Use the AvailableDataLanguages property to return the DataLanguages listing. In the following example the installed project language is output:

```
Sub ShowDataLanguage()
'VBA233
Dim colDataLanguages As HMIDataLanguages
Dim objDataLanguage As HMIDataLanguage
Dim strLanguages As String
Dim iCount As Integer
iCount = 0
Set colDataLanguages = Application.AvailableDataLanguages
For Each objDataLanguage In colDataLanguages
If "" <> strLanguages Then strLanguages = strLanguages & "/"
strLanguages = strLanguages & objDataLanguage.LanguageName & " "
'Every 15 items of datalanguages output in a messagebox
If 0 = iCount Mod 15 And 0 <> iCount Then
MsgBox strLanguages
```

```
strLanguages = ""
End If
iCount = iCount + 1
Next objDataLanguage
MsgBox strLanguages
End Sub
```

DataSetObj object

Description

The "DataSetObj" object serves as a container for the internal storage of data of the user objects or faceplate types. The DataSetObj object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIDataSetObj

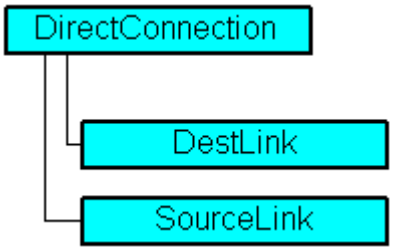
DestLink Object

Description



Represents the destination for a direct connection.

VBA Object Name

HMIDestLink

Usage

Use the DestinationLink property to return the DestLink object. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA234
```

```
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 90
.Height = 50
.Text = "SetPosition"
End With
'
'Directconnection is initiated on mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of "Rectangle_A"
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of "Rectangle_B"
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

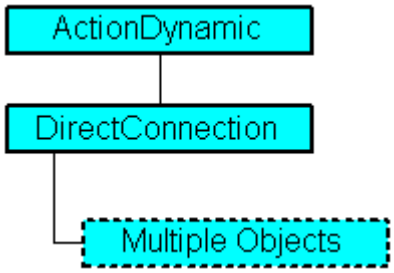
DirectConnection Object

Description



Represents a direct connection.

VBA Object Name

HMIDirectConnection

Usage

Use the DestinationLink and SourceLink properties to configure the source and destination of a direct connection. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA235
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 90
.Height = 50
.Text = "SetPosition"
```

```
End With
'
'Directconnection is initiated on mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of "Rectangle_A"
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of "Rectangle_B"
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

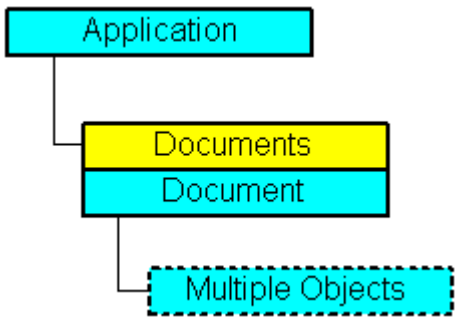
Document Object

Description



Displays a picture in Graphics Designer. The document object is an element of the documents listing.

VBA Object Name

HMIDocument

Usage

Use Documents(Index) to return an individual document object. In the following example the file name of the first picture is displayed:

```
Sub ShowFirstObjectOfCollection()
'VBA236
Dim strName As String
strName = Application.Documents(3).Name
MsgBox strName
End Sub
```

You may also use the object "Me" if you wish to address the current document:

```
Sub ShowDocumentName()
'VBA812
Dim obj As Document
set obj = Me
MsgBox obj.Name
End Sub
```

For example, use the SaveAs method to save the picture under a different name. In the following example the first picture will be saved under the name "CopyOfPicture1":

```
Sub SaveDocumentAs()
'VBA237
Application.Documents(3).SaveAs ("CopyOfPicture1")
End Sub
```

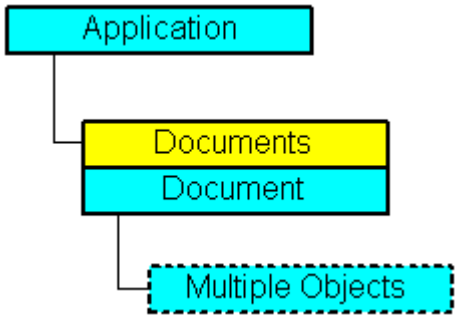
Documents Object (Listing)

Description



VBA Object Name

HMIDocuments

Usage

Note

Use the "ActiveDocument" property if you wish to refer to the active picture.

Use the Documents property to return the Documents listing. In the following example the names of all open pictures are output:

```
Sub ShowDocuments()
'VBA238
Dim colDocuments As Documents
Dim objDocument As Document
Set colDocuments = Application.Documents
For Each objDocument In colDocuments
MsgBox objDocument.Name
Next objDocument
End Sub
```

Use the Add method to add a new Document object to the Documents listing. In the following example a new picture is created:

```
Sub AddNewDocument()
'VBA239
Dim objDocument As Document
Set objDocument = Application.Documents.Add
End Sub
```

DotNetControl object

Description

Represents the "DotNetControl" object. The DotNetControl object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIDotNetControl

Application

Use the AddDotNetControl method to insert a DotNetControl in a picture.

In the following example, the ".NETControl" object from the Global Assembly Cache is inserted in the active picture.

```
'VBA851
Dim DotNetControl As HMIDotNetControl
Set DotNetControl = ActiveDocument.HMIObjects.AddDotNetControl("MyVBAControl",
"System.Windows.Forms.Label", True,"Assembly=System.Windows.Forms, Version=2.0.0.0,
Culture=neutral, PublicKeyToken=b77a5c561934e089")
```

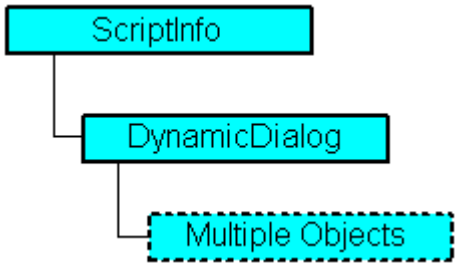
DynamicDialog Object

Description



Represents the Dynamic dialog. You can use the dynamic dialog to make the properties of pictures and objects respond dynamically to different value ranges.

Define the value range with the aid of the ResultType property.

VBA Object Name

HMIDynamicDialog

Usage

Use the DynamicDialog object to make an object property dynamic. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and three analog value ranges will be created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA240
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.Trigger.VariableTriggers.Add "NewDynamic2", hmiVariableCycleType_5s
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

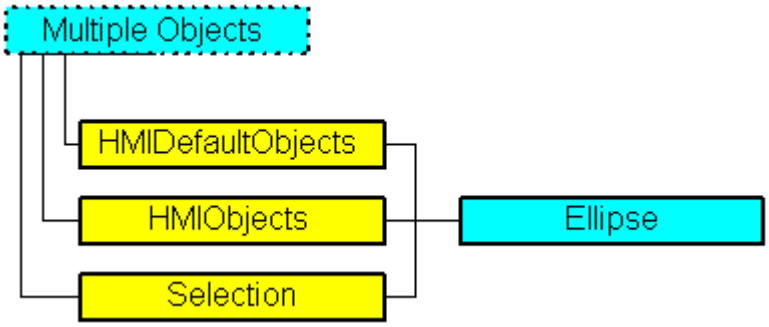
Ellipse Object

Description



Represents the "Ellipse" object. The Ellipse object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIEllipse

Usage

Use the Add method to create a new "Ellipse" object in a picture:

```
Sub AddEllipse()
'VBA241
Dim objEllipse As HMIEllipse
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("Ellipse", "HMIEllipse")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditEllipse()
'VBA242
Dim objEllipse As HMIEllipse
Set objEllipse = ActiveDocument.HMIObjects("Ellipse")
```

```
objEllipse.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing.

```
Sub ShowNameOfFirstSelectedObject()
'VBA243
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

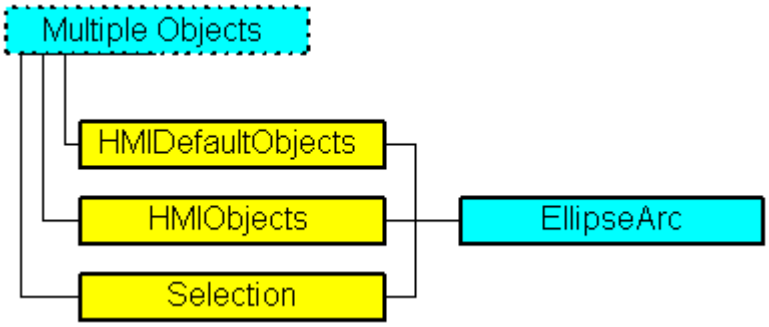
EllipseArc Object

Description



Represents the "Ellipse Arc" object. The EllipseArc object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIEllipseArc

Usage

Use the Add method to create a new "Ellipse Arc" object in a picture:

```
Sub AddEllipseArc()
'VBA244
Dim objEllipseArc As HMIEllipseArc
Set objEllipseArc = ActiveDocument.HMIObjects.AddHMIObject("EllipseArc", "HMIEllipseArc")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditEllipseArc()
'VBA245
Dim objEllipseArc As HMIEllipseArc
Set objEllipseArc = ActiveDocument.HMIObjects("EllipseArc")
objEllipseArc.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA246
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Use the "HMIDefaultObjects(Index)" to return an object from the HMIDefaultObjects Listing:

```
Sub EditDefaultPropertiesOfEllipseArc()
'VBA247
Dim objEllipseArc As HMIEllipseArc
Set objEllipseArc = Application.DefaultHMIObjects("HMIEllipseArc")
objEllipseArc.BorderColor = RGB(255, 255, 0)
'create new "EllipseArc"-object
Set objEllipseArc = ActiveDocument.HMIObjects.AddHMIObject("EllipseArc2", "HMIEllipseArc")
End Sub
```

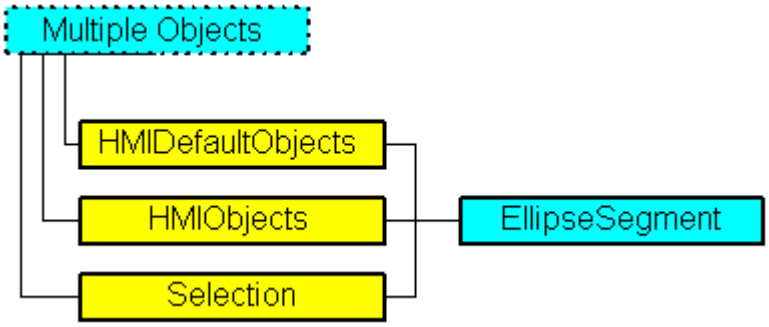
EllipseSegment Object

Description



Represents the "Ellipse Segment" object. The EllipseSegment object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIEllipseSegment

Usage

Use the Add method to create a new "Ellipse Segment" object in a picture:

```
Sub AddEllipseSegment()
'VBA248
Dim objEllipseSegment As HMIEllipseSegment
Set objEllipseSegment = ActiveDocument.HMIObjects.AddHMIObject("EllipseSegment",
"HMIEllipseSegment")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditEllipseSegment()
'VBA249
Dim objEllipseSegment As HMIEllipseSegment
Set objEllipseSegment = ActiveDocument.HMIObjects("EllipseSegment")
objEllipseSegment.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA250
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

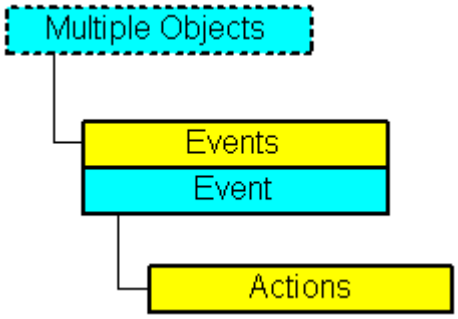
Event Object

Description



Represents an event that triggers one or more actions in Runtime (e.g. a direct connection). An event can be configured onto an object and a property.

VBA Object Name

HMIEvent

Usage

Use the AddAction method to configure an action on an event. In this example a C action is to be triggered in the event of a change of radius in Runtime:

```
Sub AddActionToPropertyTypeCScript()
'VBA251
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
'Create circle in the picture. If property "Radius" is changed,
'a C-action is added:
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
Set objEvent = objCircle.Radius.Events(1)
Set objCScript = objEvent.Actions.AddAction(hmiActionCreationTypeCScript)
End Sub
```

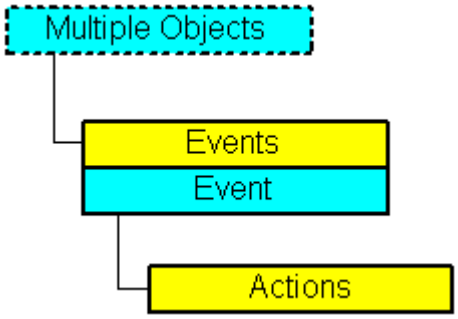
Events Object (Listing)

Description



A listing of the Event objects that represent all the events configured onto an object. Use the Item method to define the event that is intended to be configured:

- You configure an action on a property with VBA by using the "Events(1)" property, where the index "1" stands for the event "Upon change":
- To configure an action onto an object with the aid of VBA, use the "Events(Index)" property, where "Index" stands for the trigger event (see table):

Index	EventType (depending upon the object used)
0	hmiEventTypeNotDefined
1	hmiEventTypeMouseClick
2	hmiEventTypeMouseLButtonDown
3	hmiEventTypeMouseLButtonUp
4	hmiEventTypeMouseRButtonDown
5	hmiEventTypeMouseRButtonUp
6	hmiEventTypeKeyboardDown
7	hmiEventTypeKeyboardUp
8	hmiEventTypeFocusEnter
9	hmiEventTypeObjectChange
10	hmiEventTypePictureOpen

VBA Object Name

HMIEvents

Usage

Use the Item method to return an individual Event object. In this example the event names and event types of all objects in the active pictures are put out. In order for this example to work, insert some objects into the active picture and configure different events.

```
Sub ShowEventsOfAllObjectsInActiveDocument()
'VBA252
Dim colEvents As HMIEvents
Dim objEvent As HMIEvent
Dim iMax As Integer
Dim iIndex As Integer
Dim iAnswer As Integer
Dim strEventName As String
Dim strObjectName As String
Dim varEventType As Variant
iIndex = 1
iMax = ActiveDocument.HMIObjects.Count
For iIndex = 1 To iMax
Set colEvents = ActiveDocument.HMIObjects(iIndex).Events
strObjectName = ActiveDocument.HMIObjects(iIndex).ObjectName
For Each objEvent In colEvents
strEventName = objEvent.EventName
varEventType = objEvent.EventType
iAnswer = MsgBox("Objectname: " & strObjectName & vbCrLf & "Eventtype: " & varEventType &
vbCrLf & "Eventname: " & strEventName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objEvent
If vbCancel = iAnswer Then Exit For
Next iIndex
End Sub
```

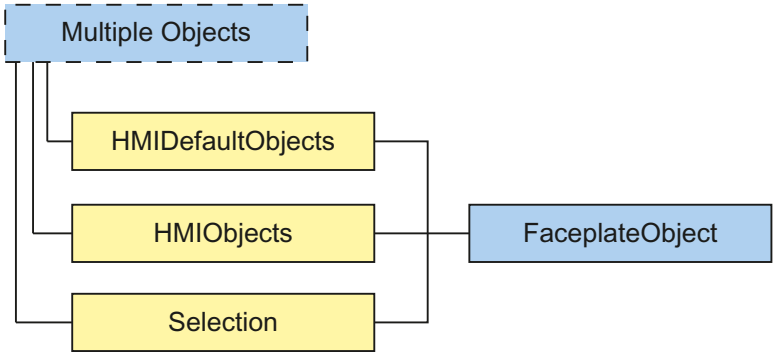
ExternalShapeInfo object

Description

Is used for internal purposes in Graphics Designer.

FaceplateObject object

Description



Represents the "faceplate instance" object. The FaceplateObject object is an element of the following lists:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMIFaceplateObject

Usage

Use the Add method to create a new "faceplate instance" object in a picture:

```
Sub AddFaceplateInstance()
'VBA826
Dim objFaceplateInstance As HMIFaceplateObject
Set objFaceplateInstance = ActiveDocument.HMIObjects.AddHMIObject("faceplate instance",
"HMIFaceplateObject")
objFaceplateInstance.Properties.Item(3).value = "Faceplate1.fpt"
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditFaceplateInstance()
'VBA827
Dim objFaceplateInstance As HMIFaceplateObject
Set objFaceplateInstance = ActiveDocument.HMIObjects("faceplate instance")
objFaceplateInstance.visible = True
```

```
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA828
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

FaceplateObjects object

Description

A listing of the HMIFaceplateObject objects that represent all faceplate objects in the picture.

VBA Object Name

HMIFaceplateObjects

See also

Parent Property (Page 3708)

OriginalPropertyName property (Page 3706)

FaceplateProperty object

Description

Represents the property of a faceplate object. In the case of the FaceplateProperty object, the use of the Value property is set as the default. For this reason you can use the following notation, for example, to assign a new value to an object property:

```
<FaceplateObject>.<FaceplateProperty> = <Value>
```

You can use the "Dynamic" property to make an object property dynamic with VBA. Use the "Events" listing to configure actions with VBA.

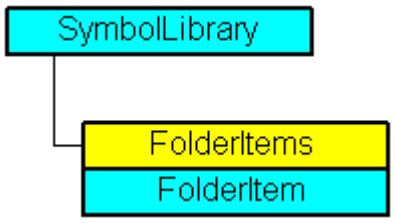
FolderItem Object

Description



Represents a folder or object in the Components Library. A FolderItem object of the "Folder" type is an element of the FolderItems listing. A FolderItem object of the "Item" type is an element of the Folder listing.

VBA Object Name

HMIFolderItem

Usage

Use the FolderItems property to return the FolderItems listing. In the following example the names of folders in the "Global Library will be output:

```
Sub ShowFolderItemsOfGlobalLibrary()
'VBA253
Dim colFolderItems As HMIFolderItems
Dim objFolderItem As HMIFolderItem
Set colFolderItems = Application.SymbolLibraries(1).FolderItems
For Each objFolderItem In colFolderItems
MsgBox objFolderItem.Name
Next objFolderItem
End Sub
```

Use the CopyToClipboard method to copy a "FolderItem" object of the "Item" type to the clipboard. In the following example the object "PC" will be copied to the clipboard.

```
Sub CopyFolderItemToClipboard()
'VBA254
Dim objGlobalLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
objGlobalLib.FolderItems("Folder2").Folder("Folder2").Folder.Item("Object1").CopyToClipboa
rd
End Sub
```

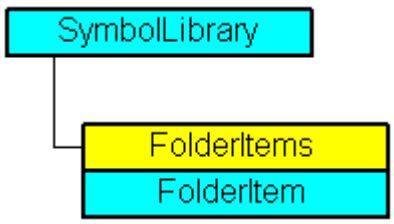
FolderItems Object (Listing)

Description



A listing of the FolderItem objects that represent all the folders and objects in the Components Library.

VBA Object Name

HMIFolderItems

Usage

Use the FolderItems property to return the FolderItems listing. In the following example the names of folders in the "Global Library will be output:

```
Sub ShowFolderItemsOfGlobalLibrary()
'VBA255
Dim colFolderItems As HMIFolderItems
Dim objFolderItem As HMIFolderItem
Set colFolderItems = Application.SymbolLibraries(1).FolderItems
For Each objFolderItem In colFolderItems
MsgBox objFolderItem.Name
Next objFolderItem
End Sub
```

Use the AddFolder method, for instance, to create a new folder in the Components Library. In the following example the folder "Project Folder" will be created in the "Project Library":

```
Sub AddNewFolderToProjectLibrary()
'VBA256
Dim objProjectLib As HMISymbolLibrary
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder")
End Sub
```

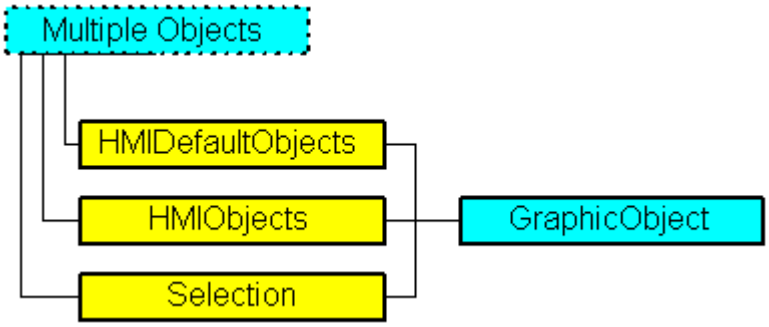
GraphicObject Object

Description



Represents the object called "Graphic Object". The GraphicObject object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIGraphicObject

Usage

Use the Add method to create a new "Graphic Object" object in a picture:

```
Sub AddGraphicObject()
'VBA257
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects.AddHMIObject("Graphic-Object",
"HMIGraphicObject")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditGraphicObject()
'VBA258
```

```
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects("Graphic-Object")
objGraphicObject.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA259
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

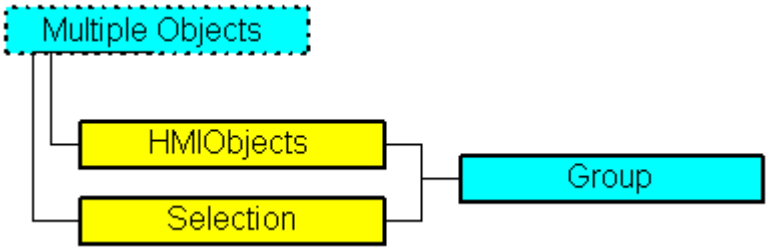
Group Object

Description



Represents the object called "Group Object". The Group Object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

A group object is created from the objects selected in a picture. The objects in the Group Object are also saved in the "GroupedHMIObjects" listing and index numbers are newly allocated.

You have unrestricted access to the properties of all objects in the Group Object.

Further information regarding group objects can be found in the WinCC documentation under "Group Object".

VBA Object Name

HMIGroup

Usage

Use the CreateGroup Method with the Selection listing to create a new "Group Object" object in a picture:

```
Sub DoCreateGroup()
'VBA260
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.Selection.CreateGroup
objGroup.ObjectName = "Group-Object"
End Sub
```

Use the following methods to edit an existing Group Object:

- Methode "Add(Index)": Adds a new object to the group object.
- Methode "Remove(Index)": Removes a object from the group object.
- "UnGroup()" method: Ungroups the group object (ungroup).
- "Delete()" Method: Deletes the group object and the objects that it contains.

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditGroup()
'VBA261
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.HMIObjects("Group-Object")
MsgBox objGroup.ObjectName
End Sub
```

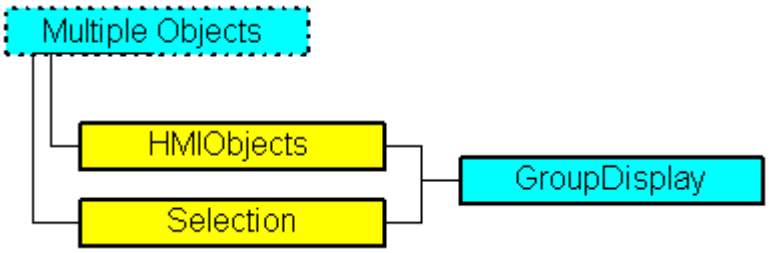
GroupDisplay Object

Description



Represents the "Group Display" object. The GroupDisplay object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIGroupDisplay

Usage

Use the Add method to create a new "Group Display" object in a picture:

```
Sub AddGroupDisplay()
'VBA262
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("Groupdisplay",
"HMIGroupDisplay")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditGroupDisplay()
'VBA263
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects("Groupdisplay")
objGroupDisplay.BackColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA264
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

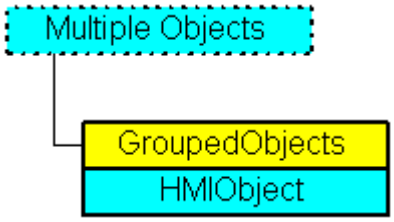
GroupedObjects Object (Listing)

Description



A listing of the HMIObject objects that represent all the objects in the group object.

VBA Object Name

HMIGroupedObjects

Usage

Use the GroupedHMIObjects property to return the GroupedObjects listing. In the following example all the objects in the first group object are output in the active picture. The group object called "Group1" must first have been created:

```
Sub ShowGroupedObjectsOfFirstGroup()
'VBA265
Dim colGroupedObjects As HMIGroupedObjects
Dim objObject As HMIObject
Set colGroupedObjects = ActiveDocument.HMIObjects("Group1").GroupedHMIObjects
For Each objObject In colGroupedObjects
MsgBox objObject.ObjectName
Next objObject
End Sub
```

Use the Remove method, for instance, to remove an object from the group object. In the following example the first object will be removed from the group object called "Group1":

```
Sub RemoveObjectFromGroup()
'VBA266
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.HMIObjects("Group1")
objGroup.GroupedHMIObjects.Remove (1)
End Sub
```

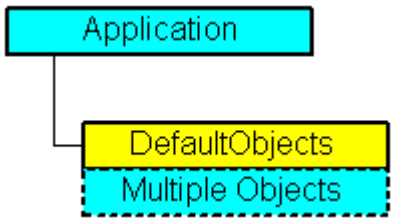
HMIDefaultObjects Object (Listing)

Description



A listing of the following HMIObject objects:

Object	VBA object name
Line	HMILine
Polygon	HMIPolygon
Polyline	HMIPolyLine
Ellipse	HMIEllipse
Circle	HMICircle
Ellipse segment	HMIEllipseSegment

Object	VBA object name
Pie segment	HMIPieSegment
Ellipse arc	HMIEllipseArc
Circular arc	HMICircularArc
Rectangle	HMIRectangle
Rounded rectangle	HMIRoundRectangle
Application window	HMIApplicationWindow
Screen Window	HMIPictureWindow
Static text	HMIStaticText
I/O Field	HMIIOField
Button	HMIButton
Check box	HMICheckBox
Radio box	HMIOptionGroup
Round button	HMIRoundButton
Bar	HMIBarGraph
Slider object	HMISlider
Graphic Object	HMIGraphicObject
Status display	HMIStatusDisplay
Text list	HMITextList
Connector	HMIObjConnection
Multiple row text	HMIMultiLineEdit
Combo box	HMIComboBox
List box	HMIListBox
Polygon tube	HMITubePolyline
T-piece	HMITubeTeeObject
Double T-piece	HMITubeDoubleTeeObject
Tube bend	HMITubeArcObject
3D bar	HMI3DBarGraph
Group display	HMIGroupDisplay
Faceplate instance	HMIFaceplateObject

VBA object name

HMIDefaultObjects

Usage

Use the DefaultHMIObjects property to change the default property values of the included objects. In this example all the objects contained in the listing will be output:

```
Sub ShowDefaultObjects()
'VBA267
Dim strType As String
Dim strName As String
```

```
Dim strMessage As String
Dim iMax As Integer
Dim iIndex As Integer
iMax = Application.DefaultHMIObjects.Count
iIndex = 1
For iIndex = 1 To iMax
With Application.DefaultHMIObjects(iIndex)
strType = .Type
strName = .ObjectName
strMessage = strMessage & "Element: " & iIndex & " / Objecttype: " & strType & " /
Objectname: " & strName
End With
If 0 = iIndex Mod 10 Then
MsgBox strMessage
strMessage = ""
Else
strMessage = strMessage & vbCrLf & vbCrLf
End If
Next iIndex
MsgBox "Element: " & iIndex & vbCrLf & "Objecttype: " & strType & vbCrLf & "Objectname: "
& strName
End Sub
```

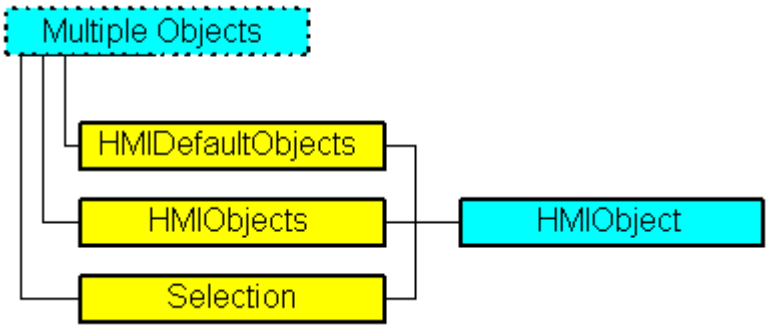
HMIObject Object

Description



Represents an object from the Object Palette of the Graphics Designer. The HMIObject object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

This object contains the object properties that apply to all standard, smart and Windows objects (incl. Width, Height, Top and Left).

VBA Object Name

HMIObject

Usage

Use HMIObjects(Index), for instance, to return an individual HMIObject object. "For Index you can use either the index number or the name of the object. In the following example the name of the first object in the active picture is output:

```
Sub ShowFirstObjectOfCollection()
'VBA268
Dim strName As String
strName = ActiveDocument.HMIObjects(1).ObjectName
MsgBox strName
End Sub
```

Use the Delete method to remove an object from the HMIObjects listing. In the following example the first object in the active picture will be removed:

```
Sub DeleteObject()
'VBA269
ActiveDocument.HMIObjects(1).Delete
End Sub
```

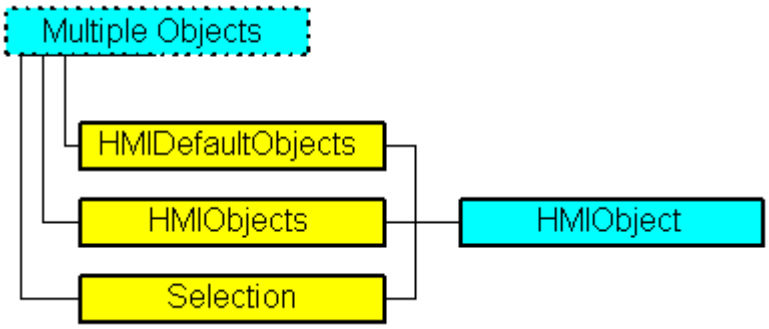
HMIObjects Object (Listing)

Description



A listing of the HMIObject objects that represent all the objects in the picture.

VBA Object Name

HMIObjects

Note

The sequence of HMI objects in the HMIObjects list can be altered by adding and/or deleting HMI objects.

The sequence of listing can also change if HMI objects are processed in the current listing. This behavior can occur if the Layers property is modified and/or if the methods "SendToBack" and "BringToFront" are used.

Usage

Use the HMIObjects property to return the HMIObjects listing. In the following example all the object names in the active picture are output:

```
Sub ShowObjectsOfDocument()
'VBA270
Dim colObjects As HMIObjects
Dim objObject As HMIObject
Set colObjects = ActiveDocument.HMIObjects
For Each objObject In colObjects
MsgBox objObject.ObjectName
Next objObject
End Sub
```

Use the AddHMIObject method to create a new object in the picture. In the following example a circle will be inserted into the active picture:

```
Sub AddCircle()
'VBA271
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_1", "HMICircle")
End Sub
```

Use the Find method to search for one or more objects in the picture. In the following example, objects of the "HMICircle" type will be searched for in the active picture:

```
Sub FindObjectsByType()
'VBA272
Dim colSearchResults As HMICollection
Dim objMember As HMIObject
Dim iResult As Integer
Dim strName As String
Set colSearchResults = ActiveDocument.HMIObjects.Find(ObjectType:="HMICircle")
For Each objMember In colSearchResults
iResult = colSearchResults.Count
strName = objMember.ObjectName
MsgBox "Found: " & CStr(iResult) & vbCrLf & "Objectname: " & strName
Next objMember
End Sub
```

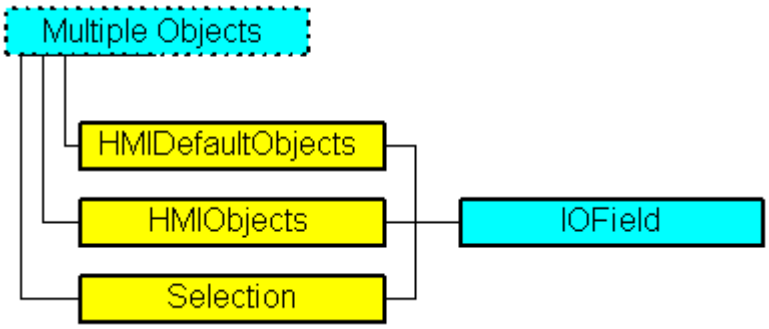
IOField Object

Description



Represents the "I/O Field" object. The IOField object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIIOField

Usage

Use the Add method to create a new "I/O Field" object in a picture:

```
Sub AddIOField()
'VBA273
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IO-Field", "HMIIOField")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditIOField()
'VBA274
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects("IO-Field")
objIOField.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA275
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Use the "HMIDefaultObjects(Index)" to return an object from the HMIDefaultObjects Listing:

```
Sub EditDefaultPropertiesOfIOField()
'VBA276
Dim objIOField As HMIIOField
Set objIOField = Application.DefaultHMIObjects("HMIIOField")
objIOField.BorderColor = RGB(255, 255, 0)
End Sub
```

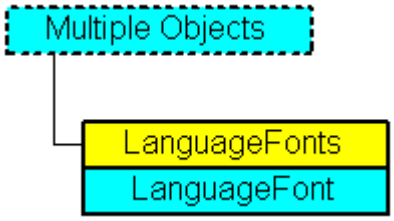
6.1.7.3 L-Q

LanguageFont Object

Description



Contains the font settings for the project language. The LanguageFont object is an element of the LanguageFonts listing.

VBA Object Name

HMILanguageFont

Usage

Use LDFonts(Index) to return an individual LanguageFont object. In the following example a Button object will be created and the name of the first configured font will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA277
Dim strName As String
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button", "HMIButton")
strName = objButton.LDFonts(1).Family
MsgBox strName
End Sub
```

Object properties

The LanguageFont object possesses the following properties:

See also

Italic Property (Page 3636)

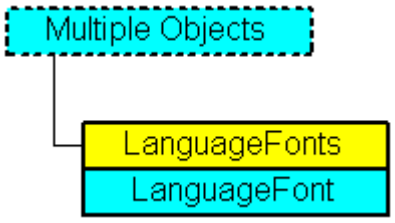
Family Property (Page 3587)

Bold Property (Page 3513)

Application Property (Page 3484)

LanguageFonts Object (Listing)

Description



A listing of the LanguageFont objects that represent all the language-dependent fonts in an object.

VBA Object Name

HMILanguageFonts

Usage

Use the LDFonts property to return the LanguageFonts listing. In the following example the language identifiers of the configured fonts will be output:

```
Sub ShowLanguageFont()
'VBA278
Dim colLanguageFonts As HMILanguageFonts
Dim objLanguageFont As HMILanguageFont
Dim objButton As HMIButton
Dim iMax As Integer
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
Set colLanguageFonts = objButton.LDFonts
iMax = colLanguageFonts.Count
For Each objLanguageFont In colLanguageFonts
MsgBox "Planned fonts: " & iMax & vbCrLf & "Language-ID: " & objLanguageFont.LanguageID
Next objLanguageFont
End Sub
```

Use the ItemByLcid method to define the language for which it is intended to enter font settings. The following example sets the font attributes of a button for French and English.

Note

For this example to work, you must already have configured in the languages concerned.

```
Sub ExampleForLanguageFonts()
'VBA279
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "DefText"
Set colLangFonts = objButton.LDFonts

'Adjust fontsettings for french:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'Adjust fontsettings for english:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

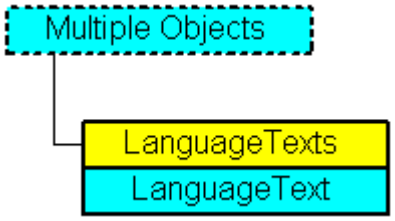
LanguageText Object

Description



Contains the multilingual labels for an object. The LanguageText object is an element of the LanguageTexts listing.

VBA Object Name

HMILanguageText

Usage

In the following example a German label and an English label will be assigned to the button called "myButton":

```
Sub AddLanguagesToButton()
'VBA280
Dim objLabelText As HMILanguageText
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
'
'Add text in actual datalanguage:
objButton.Text = "Actual-Language Text"
'
'Add english text:
Set objLabelText = ActiveDocument.HMIObjects("myButton").LDTexts.Add(1033, "English Text")
End Sub
```

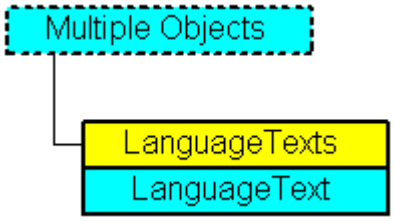
Application Property (Page 3484)

LanguageTexts Object (Listing)

Description



A listing of the LanguageText objects that represent all the multilingual texts in an object.

VBA Object Name

HMILanguageTexts

Usage

Use one of the following properties to return the LanguageTexts listing:

- LDLabelTexts Property
- LDNames Property
- LDStatusTexts Property
- LDTexts Property
- LDTooltipTexts Property

An example showing how to use the LanguageTexts listing can be found in this documentation under the heading "LDStatusTexts Property".

Use the Add method to add multilingual texts to an object. In the following example a German label and an English label will be assigned to the button called "myButton":

```
Sub AddLanguagesToButton()
'VBA281
Dim objLabelText As HMILanguageText
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
'
'Add text in actual datalanguage:
objButton.Text = "Actual-Language Text"
'
'Add english text:
Set objLabelText = ActiveDocument.HMIObjects("myButton").LDTexts.Add(1033, "English Text")
End Sub
```

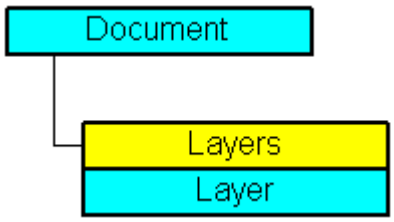
Layer Object

Description



Represents one of the 32 layers that are available in the picture.

VBA Object Name

HMILayer

Usage

Use the Layer object to define a name and the minimum and maximum zoom for a layer. You define the visibility of layers separately by CS and RT layers:

- Document Object: Controls the visibility of the RT layers.
- View Object: Controls the visibility of the RT layers.

Use the Layers listing to return a Layer object. In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer()
'VBA282
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
End Sub
```

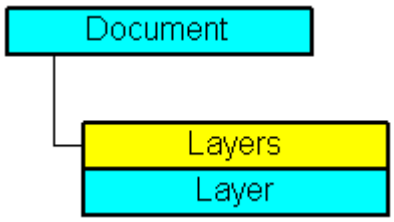
Layers Object (Listing)

Description



A listing of the Layer objects that represent the 32 layers in the picture.

VBA Object Name

HMILayer

Usage

Use the LayersCS or LayersRT property to return the Layers listing. In the following example the layer names in the copy of the active picture will be output:

```
Sub ShowLayer()
'VBA283
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim strLayerList As String
Dim iCounter As Integer
iCounter = 1
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
If 1 = iCounter Mod 2 And 32 > iCounter Then
strLayerList = strLayerList & vbCrLf
ElseIf 11 > iCounter Then
strLayerList = strLayerList & "       "
Else
strLayerList = strLayerList & "     "
End If
strLayerList = strLayerList & objLayer.Name
iCounter = iCounter + 1
Next objLayer
MsgBox strLayerList
End Sub
```

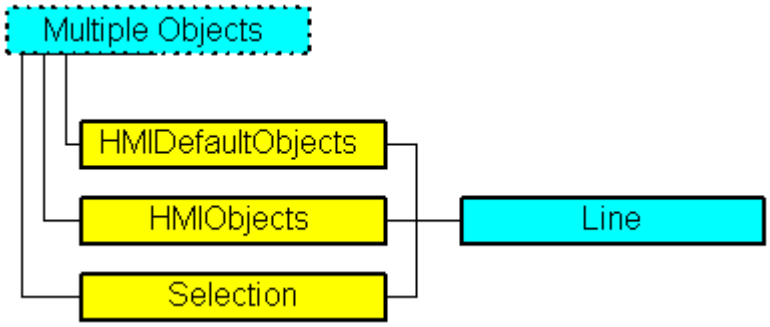
Line Object

Description



Represents the "Line" object. The Line object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMILine

Usage

Use the Add method to create a new "Line" object in a picture:

```
Sub AddLine()
'VBA285
Dim objLine As HMILine
Set objLine = ActiveDocument.HMIObjects.AddHMIObject("Line1", "HMILine")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditLine()
'VBA286
Dim objLine As HMILine
Set objLine = ActiveDocument.HMIObjects("Line1")
objLine.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA287
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

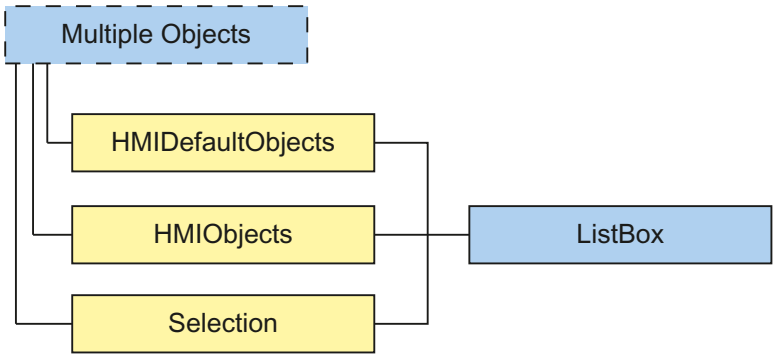
ListBox object

Description



Represents the "ListBox" object. The ListBox object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMIListBox

Usage

Use the Add method to create a new "ListBox" object in a picture:

```
Sub AddListBox()
'VBA829
Dim objListBox As HMIListBox
Set objListBox = ActiveDocument.HMIObjects.AddHMIObject("ListBox", "HMIListBox")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditListBox()
'VBA830
Dim objListBox As HMIListBox
Set objListBox = ActiveDocument.HMIObjects("ListBox")
objListBox.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA831
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

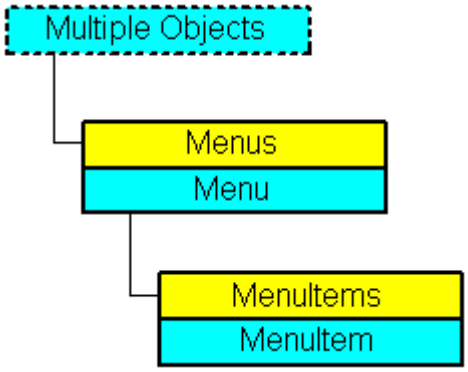
Menu Object

Description



Represents the "User Defined Menu" object. The Menu object is an element of the CustomMenus listing.

VBA Object Name

HMIMenu

Usage

Use CustomMenus(Index) to return an individual Menu object. "For Index you can use either the index number or the name of the object. In order for the following example to work, create a user defined menu. For an example of this, please refer to "Creating a New Application-Specific Menu" in this documentation. In the following example the name of the first user-defined menu in the active picture will be output:

```
Sub ShowFirstMenuOfMenucollection()
'VBA288
Dim strName As String
strName = ActiveDocument.CustomMenus(1).Label
MsgBox strName
End Sub
```

Use the Delete method to remove a "Menu" object from the "CustomMenus" listing. In the following example the first user-defined menu in the active picture will be removed:

```
Sub DeleteMenu()
'VBA289
Dim objMenu As HMIMenu
Set objMenu = ActiveDocument.CustomMenus(1)
objMenu.Delete
End Sub
```

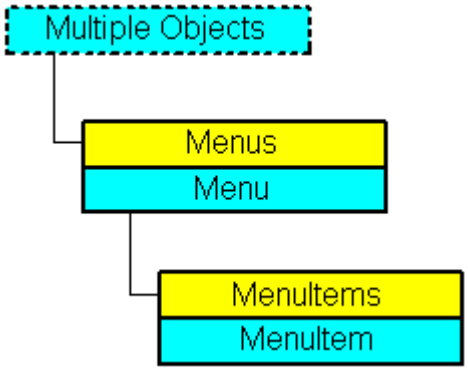
Menus Object (Listing)

Description



A listing of the Menu objects that represent all the user-defined menus in the Graphics Designer.

VBA Object Name

HMIMenus

Usage

Use the CustomMenus property to return the Menus listing. In the following example all the user-defined menus in the active picture will be output.

Note

The Menus listing does not distinguish between application-specific and picture-specific menus in the output.

```
Sub ShowCustomMenusOfDocument()
'VBA290
Dim colMenus As HMIMenus
Dim objMenu As HMIMenu
Dim strMenuList As String
Set colMenus = ActiveDocument.CustomMenus
For Each objMenu In colMenus
strMenuList = strMenuList & objMenu.Label & vbCrLf
Next objMenu
MsgBox strMenuList
End Sub
```

Use the Application property and the InsertMenu method if you want to create an application-specific menu. Create the VBA code in either the "Project Template" document or the "Global

Template" document. In the following example a user-defined menu called "myApplicationMenu" will be created:

```
Sub InsertApplicationSpecificMenu()
'VBA291
Dim objMenu As HMIMenu
Set objMenu = Application.CustomMenus.InsertMenu(1, "a_Menu1", "myApplicationMenu")
End Sub
```

Use the ActiveDocument property and the InsertMenu method if you want to create a picture-specific menu. Create the VBA code in the document called "ThisDocument": In the following example a picture-specific menu called "myDocumentMenu" will be created:;

```
Sub InsertDocumentSpecificMenu()
'VBA292
Dim objMenu As HMIMenu
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "d_Menu1", "myDocumentMenu")
End Sub
```

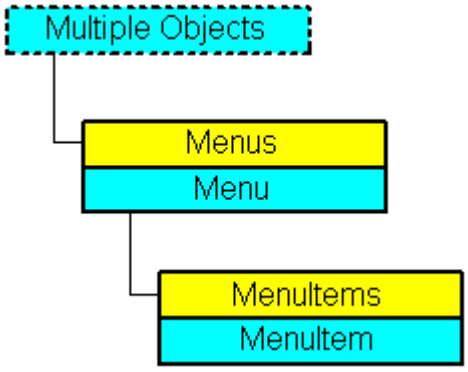
MenuItem Object

Description



Represents a menu entry for a user-defined menu in the Graphics Designer. The MenuItem object is an element of the MenuItems listing.

VBA Object Name

HMIMenuItem

Usage

Note

In order for the examples to work, first create a user-defined menu. For an example of this, please refer to "Adding a New Entry to the Menu" in this documentation.

Use MenuItems(Index) to return an individual MenuItem object. "For Index you can use either the index number or the name of the object. In the following example the first entry in the first user-defined menu in the active picture will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA293
Dim strName As String
strName = ActiveDocument.CustomMenus(1).MenuItems(1).Label
MsgBox strName
End Sub
```

Use the Delete method to remove an object from the "MenuItems" listing. In the following example the first entry in the first user-defined menu in the active picture will be deleted:

```
Sub DeleteMenuItem()
'VBA294
ActiveDocument.CustomMenus(1).MenuItems(1).Delete
```

```
End Sub
```

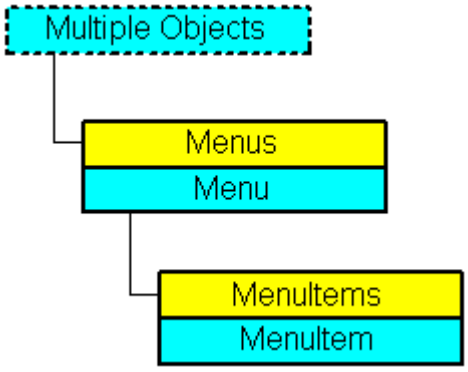
MenuItems Object (Listing)

Description



A listing of the MenuItem objects that represent all the entries in a user-defined menu.

Usage

Note

In order for the examples to work, first create a user-defined menu. For an example of this, please refer to "Adding a New Entry to the Menu" in this documentation.

Use the MenuItems property to return the MenuItems listing. In the following example all the entries in the first user-defined menu in the active picture will be output:

Note

The MenuItems listing does not distinguish between an application-specific and a picture-specific menu in the output.

```
Sub ShowMenuItems()
'VBA295
Dim colMenuItems As HMIMenuItems
Dim objMenuItem As HMIMenuItem
Dim strItemList As String
Set colMenuItems = ActiveDocument.CustomMenus(1).MenuItems
For Each objMenuItem In colMenuItems
strItemList = strItemList & objMenuItem.Label & vbCrLf
Next objMenuItem
MsgBox strItemList
End Sub
```

Use the InsertMenuItem method, for instance, to insert an entry into an existing user-defined menu. In the following example the picture-specific menu "DocMenu2" will be created in the active picture and the menu entry "MenuItem1" is inserted:

```
Sub InsertMenuItem()
'VBA296
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(2, "d_Menu2", "DocMenu2")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "m_Item2_1", "MenuItem 1")
End Sub
```

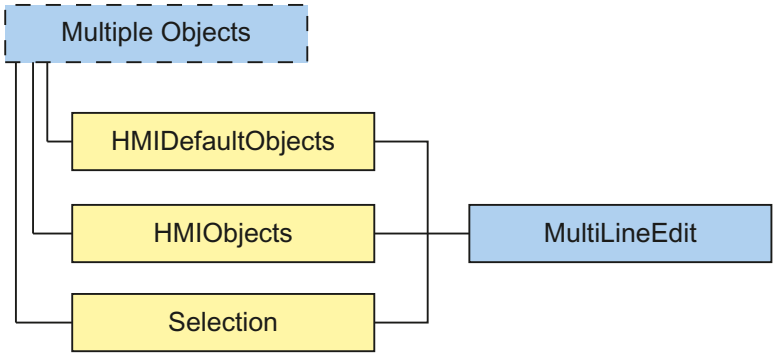
MultiLineEdit object

Description



Represents the "MultiLineEdit" object. The MultiLineEdit object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMIMultiLineEdit

Usage

Use the Add method to create a new "MultiLineEdit" object in a picture:

```
Sub AddMultiLineEdit()
'VBA832
Dim objMultiLineEdit As HMIMultiLineEdit
Set objMultiLineEdit = ActiveDocument.HMIObjects.AddHMIObject("MultiLineEdit",
"HMIMultiLineEdit")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditMultiLineEdit()
'VBA833
Dim objMultiLineEdit As HMIMultiLineEdit
Set objMultiLineEdit = ActiveDocument.HMIObjects("MultiLineEdit")
objMultiLineEdit.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA834
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

ObjConnection object

Description

Represents the "Connector" object. The ObjConnection object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

Note

You have read-only access to the properties of the ObjConnection object.

VBA Object Name

HMIObjConnection

Application

From the properties of the ObjConnection object you can find out which objects are connected.

Example

In order for the following example to work you must have connected two objects to the connector in the active picture of the Graphics Designer. You can find the Connector object in the Graphics Designer in the Object Palette under "Standard Objects". For this example to work, give the connector the name "Connector1".

In the user-defined menu "Connector Info" you can click on the "Connector Info" entry and display the objects connected via the connector:

```
Sub ShowConnectorInfo_Menu()
'VBA297
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim strDocName As String
strDocName = Application.ApplicationDataPath & ActiveDocument.Name
Set objMenu = Documents(strDocName).CustomMenus.InsertMenu(1, "ConnectorMenu",
"Connector_Info")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "ShowConnectInfo", "Info Connector")
End Sub

Sub ShowConnectorInfo()
Dim objConnector As HMIObjConnection
Dim iStart As Integer
Dim iEnd As Integer
Dim strStart As String
Dim strEnd As String
```

```
Dim strObjStart As String
Dim strObjEnd As String
Set objConnector = ActiveDocument.HMIObjects("Connector1")
iStart = objConnector.BottomConnectedConnectionPointIndex
iEnd = objConnector.TopConnectedConnectionPointIndex
strObjStart = objConnector.BottomConnectedObjectName
strObjEnd = objConnector.TopConnectedObjectName
Select Case iStart
Case 0
strStart = "top"
Case 1
strStart = "right"
Case 2
strStart = "bottom"
Case 3
strStart = "left"
End Select
Select Case iEnd
Case 0
strEnd = "top"
Case 1
strEnd = "right"
Case 2
strEnd = "bottom"
Case 3
strEnd = "left"
End Select
MsgBox "The selected connector links the objects " & vbCrLf & "'" & strObjStart & "' and '"
& strObjEnd & "'" & vbCrLf & "Connected points: " & vbCrLf & strObjStart & ": " & strStart
& vbCrLf & strObjEnd & ": " & strEnd
End Sub

Private Sub Document_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
Select Case MenuItem.Key
Case "ShowConnectInfo"
Call ShowConnectorInfo
End Select
End Sub
```

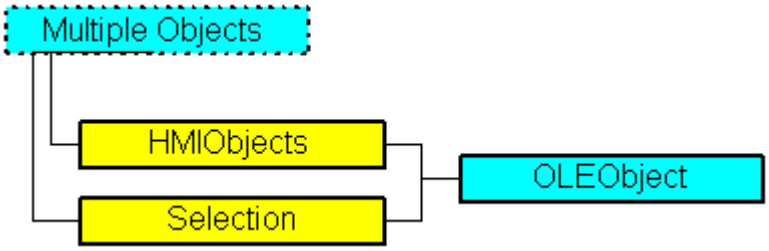
OLEObject Object

Description



Represents the object called "OLE Element". The OLEObject object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIOLEObject

Usage

Use the AddOLEObject method to create a new "OLE Element" object in a picture: In the following example an OLE Element containing a Wordpad document will be inserted into the active picture:

```
Sub AddOLEObjectToActiveDocument()
'VBA298
Dim objOleObject As HMIOLEObject
Set objOleObject = ActiveDocument.HMIObjects.AddOLEObject("Wordpad Document",
"Wordpad.Document.1")
End Sub
```

Use "HMIObjects(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name: In this example the X coordinate of the OLE Element "Wordpad Document" is set to 140:

```
Sub EditOLEObject()
'VBA299
Dim objOleObject As HMIOLEObject
Set objOleObject = ActiveDocument.HMIObjects("Wordpad Document")
objOleObject.Left = 140
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing. "For Index you can use either the index number or the name of the object. In this example the name of the first selected object will be output:

```
Sub ShowNameOfFirstSelectedObject()
'VBA300
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

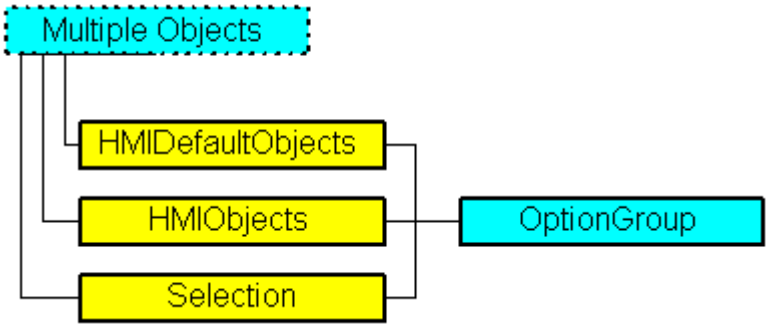
OptionGroup Object

Description



Represents the "Radio Box" object. The OptionGroup object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIOptionGroup

Usage

Use the Add method to create a new "Option Group" object in a picture:

```
Sub AddOptionGroup()
'VBA301
Dim objOptionGroup As HMIOptionGroup
Set objOptionGroup = ActiveDocument.HMIObjects.AddHMIObject("Radio-Box", "HMIOptionGroup")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditOptionGroup()
'VBA302
Dim objOptionGroup As HMIOptionGroup
Set objOptionGroup = ActiveDocument.HMIObjects("Radio-Box")
objOptionGroup.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA303
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

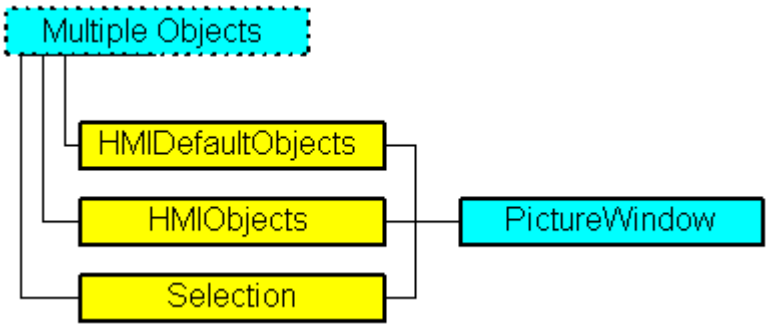
PictureWindow Object

Description



Represents the "Picture Window" object. The PictureWindow object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIPictureWindow

Usage

Use the Add method to create a new "Picture Window" object in a picture:

```
Sub AddPictureWindow()
'VBA304
Dim objPictureWindow As HMIPictureWindow
Set objPictureWindow = ActiveDocument.HMIObjects.AddHMIObject("PictureWindow1",
"HMIPictureWindow")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditPictureWindow()
'VBA305
Dim objPictureWindow As HMIPictureWindow
Set objPictureWindow = ActiveDocument.HMIObjects("PictureWindow1")
objPictureWindow.Sizeable = True
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA306
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

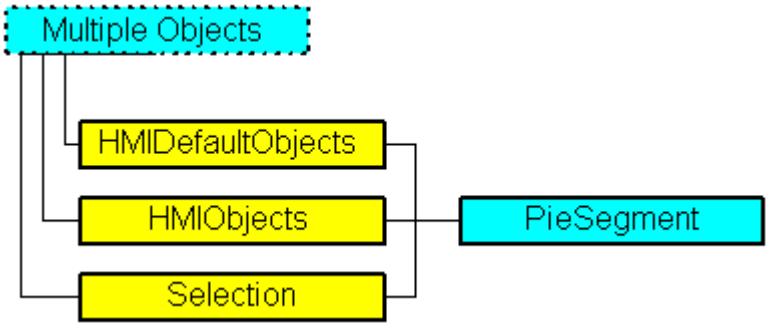
PieSegment Object

Description



Represents the "Pie Segment" object. The PieSegment object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIPieSegment

Usage

Use the Add method to create a new "Pie Segment" object in a picture:

```
Sub AddPieSegment()
'VBA307
Dim objPieSegment As HMIPieSegment
Set objPieSegment = ActiveDocument.HMIObjects.AddHMIObject("PieSegment1", "HMIPieSegment")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditPieSegment()
'VBA308
Dim objPieSegment As HMIPieSegment
Set objPieSegment = ActiveDocument.HMIObjects("PieSegment1")
objPieSegment.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA309
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

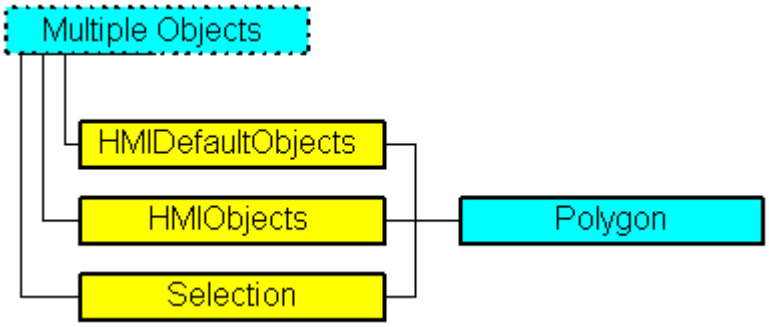
Polygon Object

Description



Represents the "Polygon" object. The Polygon object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIPolygon

Usage

Use the Add method to create a new "Polygon" object in a picture:

```
Sub AddPolygon()
'VBA310
Dim objPolygon As HMIPolygon
Set objPolygon = ActiveDocument.HMIObjects.AddHMIObject("Polygon", "HMIPolygon")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditPolygon()
'VBA311
Dim objPolygon As HMIPolygon
Set objPolygon = ActiveDocument.HMIObjects("Polygon")
objPolygon.BorderColor = RGB (255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA312
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

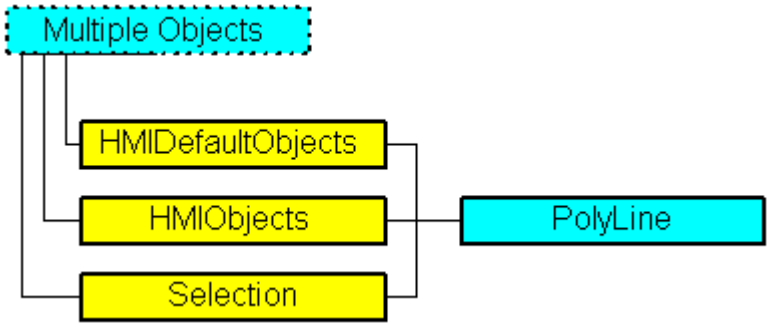
PolyLine Object

Description



Represents the "Polyline" object. The PolyLine object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIPolyLine

Usage

Use the Add method to create a new "Polyline" object in a picture:

```
Sub AddPolyLine()
'VBA313
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects.AddHMIObject("PolyLine1", "HMIPolyLine")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditPolyLine()
'VBA314
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects("PolyLine1")
objPolyLine.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA315
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Use the "HMIDefaultObjects(Index)" to return an object from the HMIDefaultObjects Listing:

```
Sub EditDefaultPropertiesOfPolyLine()
'VBA316
Dim objPolyLine As HMIPolyLine
Set objPolyLine = Application.DefaultHMIObjects("HMIPolyLine")
objPolyLine.BorderColor = RGB(255, 255, 0)
End Sub
```

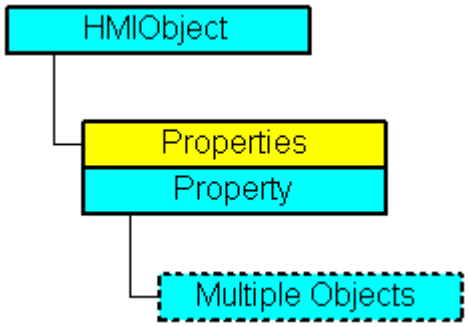
Properties Object (Listing)

Description



A listing of the Property objects that represent all the properties of an object.

VBA Object Name

HMIProperties

Usage

Use the Properties(Index) property in order to return a Property object if you cannot access an object property directly. For "Index" you can use either the index number or the VBA property name of the object. In the following example the Properties property has to be used to access the individual properties of a circle. The circle will be inserted into the picture as an HMIObject object:

```
Sub AddObject()
'VBA319
Dim objObject As HMIObject
Set objObject = ActiveDocument.HMIObjects.AddHMIObject("CircleAsHMIObject", "HMICircle")
'
'Standard properties (e.g. "Position") are available every time:
objObject.Top = 40
objObject.Left = 40
'
'Individual properties have to be called using
'property "Properties":
objObject.Properties("FlashBackColor") = True
End Sub
```

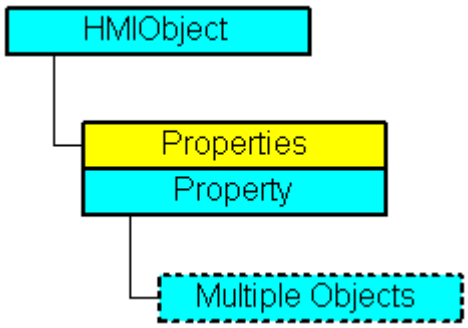
Property Object

Description



Represents the property of an object. In the case of the Property object the use of the Value property is set as the default. For this reason you can use the following notation in order for example to assign a new value to an object property:

```
<Object>.<Property> = <Value>
```

You can use the "Dynamic" property in order to make an object property dynamic with VBA. Use the "Events" listing in order to configure actions with VBA.

The Property object is an element of the Properties listing.

VBA Object Name

HMIProperty

Usage

Use Properties(Index) to return an individual Property object. For "Index" you can use either the index number or the name of the object property. In the following example the name of the first property of the Circle object will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA317
Dim objCircle As HMICircle
Dim strName As String
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle", "HMICircle")
strName = objCircle.Properties(1).Name
MsgBox strName
End Sub
```

Use the CreateDynamic method to make an object property dynamic. In the following example the "Radius" property of a circle object will be made dynamic with the aid of the tag "Otto", which is updated every two seconds:

```
Sub DynamicToRadiusOfNewCircle()
'VBA318
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects("Circle")
Set objVariableTrigger =
objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVariableDirect, "NewDynamic1")
objVariableTrigger.CycleType = hmiCycleType_2s
End Sub
```

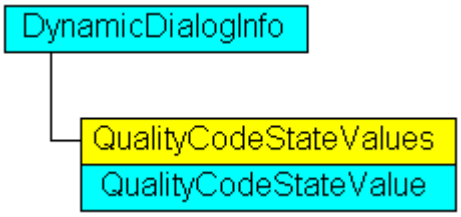
QualityCodeStateValue Object

Description



Represents the quality code of a tag which is assigned in the dynamic dialog and used for dynamization.

VBA Object Name

HMIQualityCodeStateValue

Object properties

The object QualityCodeStateValue has the following properties:

- Application
- Parent
- VALUE_BAD_COMMLUV
- VALUE_BAD_COMMLUV
- VALUE_BAD_CONFERROR
- VALUE_BAD_DEVICE
- VALUE_BAD_MISCSTATES
- VALUE_BAD_NONSPECIFIC
- VALUE_BAD_NOTCONNECTED
- VALUE_BAD_OUTOFSERV
- VALUE_BAD_PROCRELNOM
- VALUE_BAD_PROCRELSUB

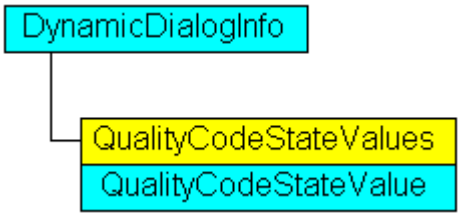
QualityCodeStateValues Object (Listing)

Description



A listing of QualityCodeStateValue objects which contain all quality codes in Dynamic dialog and are used for dynamization.

VBA Object Name

HMIQualityCodeStateValues

Application

For example, use the Item property to define values in Dynamic dialog which will be used for dynamization when the specified tag returns the configured quality code. In the following example the radius of a circle is given dynamics with the dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA813
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'Activate qualitycode-statecheck
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
```

```
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

Object properties

The object QualityCodeStateValues has the following properties:

- Application
- Count
- Item
- Parent

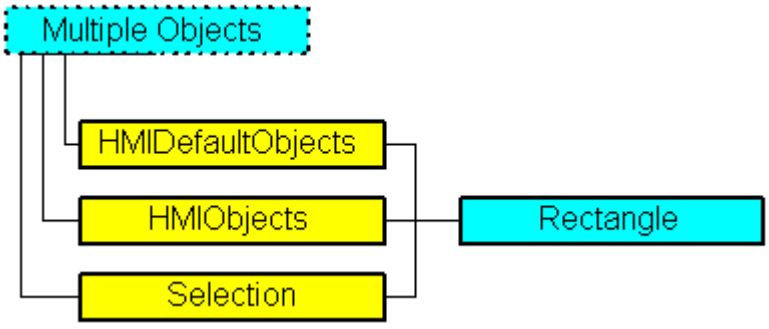
6.1.7.4 R-Z

Rectangle Object

Description



Represents the "Rectangle" object. The Rectangle object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIRectangle

Usage

Use the Add method to create a new "Rectangle" object in a picture:

```
Sub AddRectangle()
'VBA320
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditRectangle()
'VBA321
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects("Rectangle1")
objRectangle.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA322
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

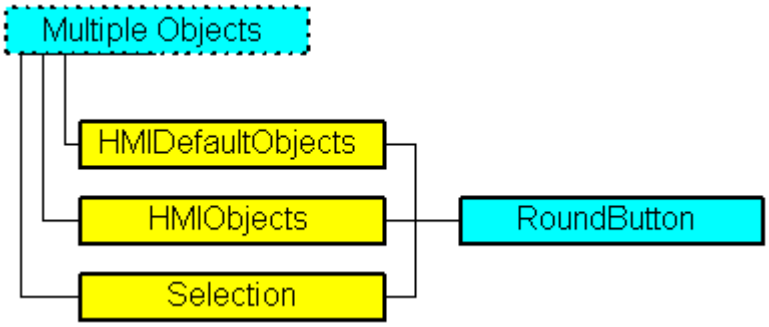
RoundButton Object

Description



Represents the "Round Button" object. The RoundButton object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIRoundButton

Usage

Use the Add method to create a new "Round Button" object in a picture:

```
Sub AddRoundButton()
'VBA323
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("Roundbutton1",
"HMIRoundButton")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditRoundButton()
'VBA324
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects("Roundbutton1")
objRoundButton.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing.:

```
Sub ShowNameOfFirstSelectedObject()
'VBA325
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

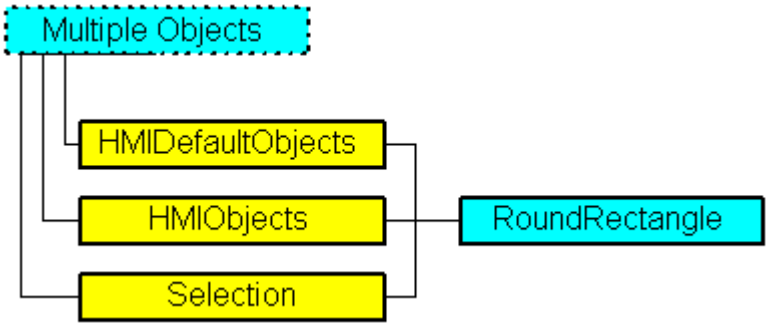
RoundRectangle Object

Description



Represents the "Rounded Rectangle" object. The RoundRectangle object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIRoundRectangle

Usage

Use the Add method to create a new "Rounded Rectangle" object in a picture:

```
Sub AddRoundRectangle()
'VBA326
Dim objRoundRectangle As HMIRoundRectangle
Set objRoundRectangle = ActiveDocument.HMIObjects.AddHMIObject("Roundrectangle1",
"HMIRoundRectangle")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditRoundRectangle()
'VBA327
Dim objRoundRectangle As HMIRoundRectangle
Set objRoundRectangle = ActiveDocument.HMIObjects("Roundrectangle1")
objRoundRectangle.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA328
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

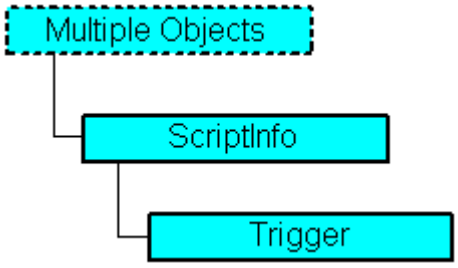
ScriptInfo Object

Description



Represents a script (C, VB) that is configured for adding dynamics to a property or action to an event.

VBA Object Name

HMIScriptInfo

Usage

Use the CreateDynamic method to make a property dynamic with the aid of a script. In the following example...

```
Sub AddDynamicAsCSkriptToProperty()
'VBA329
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
Set objCScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeCScript)
'
'Define triggertype and cycletime:
With objCScript
.SourceCode = ""
.Trigger.Type = hmiTriggerTypeStandardCycle
.Trigger.CycleType = hmiCycleType_2s
.Trigger.Name = "Trigger1"
End With
End Sub
```

Use the AddAction method to configure an action on an event. In the following example...

```
Sub AddActionToPropertyTypeCScript()
'VBA330
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
'Add circle to picture. By changing of property "Radius"
'a C-action is added:
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
Set objEvent = objCircle.Radius.Events(1)
Set objCScript = objEvent.Actions.AddAction(hmiActionCreationTypeCScript)
End Sub
```

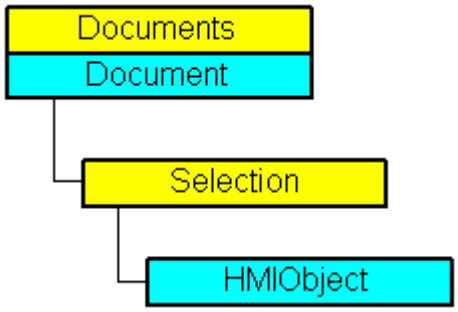
SelectedObjects object (Listing)

Description



A listing of the HMIObject objects that represent all the selected objects in a picture.

VBA Object Name

HMISelectedObjects

Usage

Use the Selection property to return the Selection listing. In the following example the names of all the selected objects in the active picture will be output:

```
Sub ShowSelectionOfDocument()
'VBA331
Dim colSelection As HMISelectedObjects
Dim objObject As HMIObject
Dim strObjectList As String
Set colSelection = ActiveDocument.Selection
If colSelection.Count <> 0 Then
strObjectList = "List of selected objects:"
For Each objObject In colSelection
strObjectList = strObjectList & vbCrLf & objObject.ObjectName
Next objObject
Else
```

```
strObjectList = "No objects selected"
End If
MsgBox strObjectList
End Sub
```

Use the SelectAll method, for example, to select all the objects in the picture. In the following example all the objects in the active picture are selected:

```
Sub SelectAllObjects()
'VBA332
ActiveDocument.Selection.SelectAll
End Sub
```

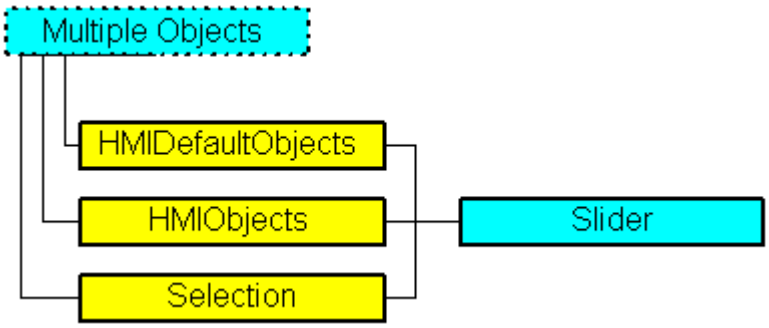
Slider object

Description



Represents the object called "Slider Object". The Slider object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMISlider

Usage

Use the Add method to create a new "Slider Object" object in a picture:

```
Sub AddSlider()
'VBA333
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("Slider1", "HMISlider")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditSlider()
'VBA334
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects("Slider1")
objSlider.ButtonColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA335
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

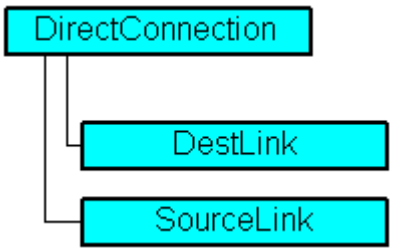
SourceLink Object

Description



Represents the source for a direct connection.

VBA Object Name

HMISourceLink

Usage

Use the SourceLink property to return the SourceLink object. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA336
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
'
'Add objects to active document:
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Text = "SetPosition"
End With
'
'Initiation of directconnection by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Top-property of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Left-property of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

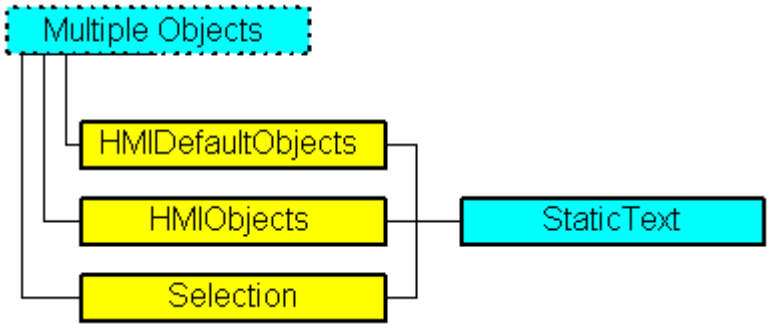
StaticText Object

Description



Represents the "Static Text" object. The StaticText object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIStaticText

Usage

Use the Add method to create a new "Static Text" object in a picture:

```
Sub AddStaticText()
'VBA337
Dim objStaticText As HMIStaticText
Set objStaticText = ActiveDocument.HMIObjects.AddHMIObject("Static_Text1", "HMIStaticText")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditStaticText()
'VBA338
Dim objStaticText As HMIStaticText
Set objStaticText = ActiveDocument.HMIObjects("Static_Text1")
objStaticText.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA339
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

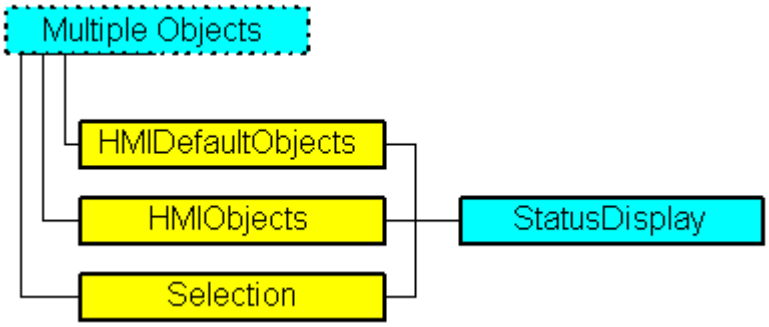
StatusDisplay Object

Description



Represents the "Status Display" object. The "StatusDisplay" object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIStatusDisplay

Usage

Use the Add method to create a new "Status Display" object in a picture:

```
Sub AddStatusDisplay()
'VBA340
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditStatusDisplay()
'VBA341
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects("Statusdisplay1")
objStatusDisplay.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA342
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

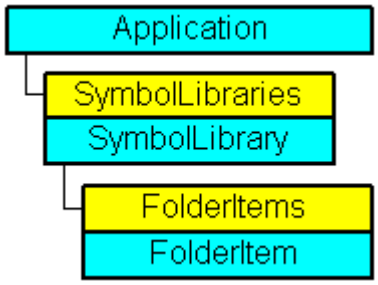
SymbolLibraries Object (Listing)

Description



A listing of the SymbolLibrary objects that represent the Components Library. The listing contains two objects: The first object is the "Global Library" and the second object is the "Project Library".

VBA Object Name

HMISymbolLibraries

Usage

Use the SymbolLibraries property to return the SymbolLibraries listing. In the following example the names of the libraries will be output:

```
Sub ShowSymbolLibraries()
'VBA344
Dim colSymbolLibraries As HMISymbolLibraries
Dim objSymbolLibrary As HMISymbolLibrary
Dim strLibraryList As String
Set colSymbolLibraries = Application.SymbolLibraries
For Each objSymbolLibrary In colSymbolLibraries
strLibraryList = strLibraryList & objSymbolLibrary.Name & vbCrLf
Next objSymbolLibrary
MsgBox strLibraryList
End Sub
```

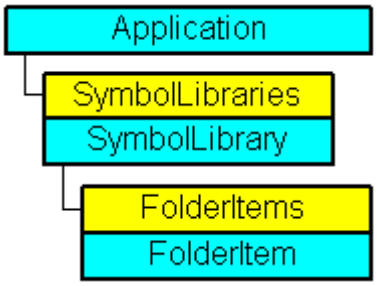
SymbolLibrary Object

Description



Represents the "Global Library" or "Project Library". The SymbolLibrary object is an element of the SymbolLibraries listing.

VBA Object Name

HMISymbolLibrary

Usage

Use SymbolLibraries(Index) to return an individual SymbolLibrary object. "For Index you can use either the index number or the name of the object. In the following example the name of the "Global Library" will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA343
Dim strName As String
strName = Application.SymbolLibraries(1).Name
MsgBox strName
End Sub
```

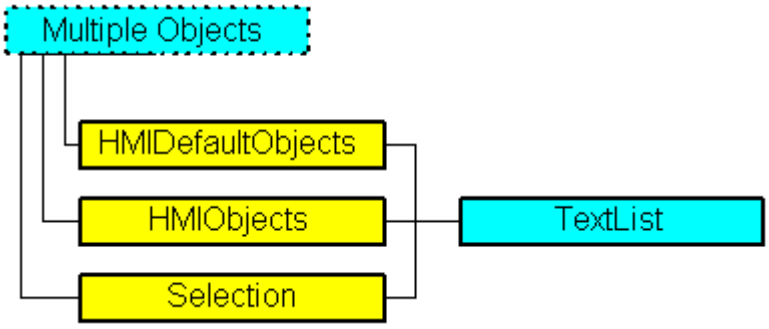
TextList Object

Description



Represents the "Text List" object. The TextList object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMITextList

Usage

Use the Add method to create a new "Text List" object in a picture:

```
Sub AddTextList()
'VBA345
```

```
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("Textlist1", "HMITextList")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTextList()
'VBA346
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects("Textlist1")
objTextList.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA347
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

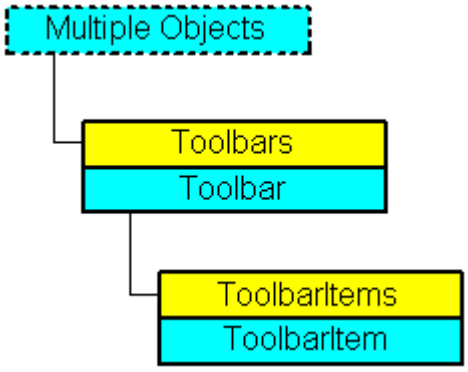
Toolbar Object

Description



Represents the "User Defined Toolbar" object. The Toolbar object is an element of the CustomToolbars listing.

VBA Object Name

HMIToolbar

Usage

Use CustomToolbars(Index) to return an individual Toolbar object. "For Index you can use either the index number or the name of the object. In the following example the "Key" parameter of the first user-defined toolbar in the active picture will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA348
Dim strName As String
strName = ActiveDocument.CustomToolbars(1).Key
MsgBox strName
End Sub
```

Use the Delete method to remove a "Toolbar" object from the "CustomToolbars" listing. In the following example the first user-defined toolbar in the active picture will be removed:

```
Sub DeleteToolbar()
'VBA349
Dim objToolbar As HMIToolbar
Set objToolbar = ActiveDocument.CustomToolbars(1)
objToolbar.Delete
End Sub
```

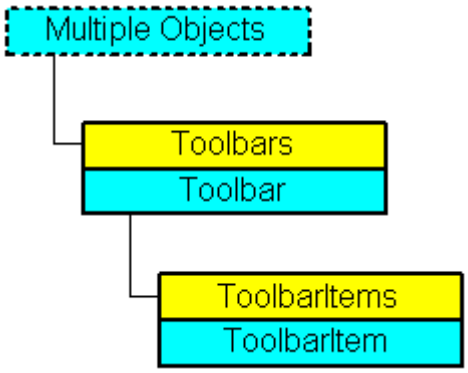
Application Property (Page 3484)

Toolbars Object (Listing)

Description



A listing of the Toolbar objects that represent all the user-defined toolbars in the Graphics Designer.

VBA Object Name

HMICustomToolbars

Usage

Note

In order for the examples to work, first create a user-defined toolbar. For an example of this, please refer to "Creating a New Application-Specific Toolbar" in this documentation.

Use the CustomToolbars property to return the Toolbars listing. In the following example, values for the "Key" property of all user-defined toolbars in the active picture will be output:

Note

The Toolbars listing does not distinguish between application-specific and picture-specific toolbars in the output.

```
Sub ShowCustomToolbarsOfDocument()
'VBA350
Dim colToolbars As HMIToolbars
Dim objToolbar As HMIToolbar
Dim strToolbarList As String
Set colToolbars = ActiveDocument.CustomToolbars
If 0 <> colToolbars.Count Then
For Each objToolbar In colToolbars
strToolbarList = strToolbarList & objToolbar.Key & vbCrLf
Next objToolbar
Else
strToolbarList = "No toolbars existing"
End If
MsgBox strToolbarList
End Sub
```

Use the Application property and the Add method if you want to create an application-specific toolbar. Create the VBA code in either the "Project Template" document or the "Global Template" document.

```
Sub InsertApplicationSpecificToolbar()
'VBA351
Dim objToolbar As HMIToolbar
Set objToolbar = Application.CustomToolbars.Add("a_Toolbar1")
End Sub
```

Use the ActiveDocument property and the Add method if you want to create a picture-specific toolbar. Create the VBA code in the document called "ThisDocument":

```
Sub InsertDocumentSpecificToolbar()
'VBA352
Dim objToolbar As HMIToolbar
Set objToolbar = ActiveDocument.CustomToolbars.Add("d_Toolbar1")
End Sub
```

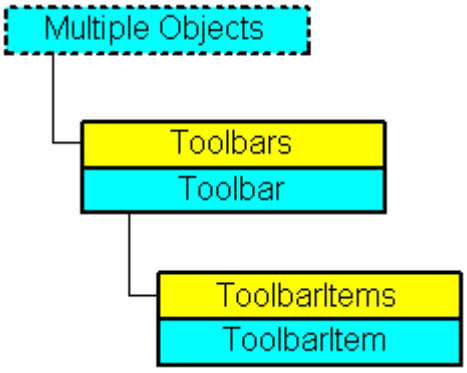
ToolbarItem Object

Description



Represents an object (icon or dividing line) in a user-defined toolbar in the GraphicsDesigner. The ToolbarItem object is an element of the ToolbarItems listing.

VBA Object Name

HMIToolbarItem

Usage

Note

In order for the examples to work, first create a user-defined toolbar. For an example of this, please refer to "Creating a New Application-Specific Toolbar" in this documentation.

Use ToolbarItems(Index) to return an individual ToolbarItem object. "For Index you can use either the index number or the name of the object. In the following example the type of the first object in the first user-defined toolbar in the active picture will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA353
Dim strType As String
strType = ActiveDocument.CustomToolbars(1).ToolbarItems(1).ToolbarItemType
MsgBox strType
End Sub
```

Use the Delete method to remove an object from the "ToolbarItems" listing. In the following example the first object will be deleted from the first user-defined toolbar in the active picture:

```
Sub DeleteToolbarItem()
'VBA354
ActiveDocument.CustomToolbars(1).ToolbarItems(1).Delete
End Sub
```

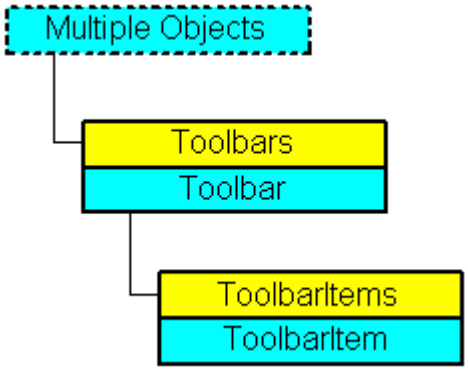
ToolbarItems Object (Listing)

Description



A listing of the ToolbarItem objects that represent all the objects in a user-defined toolbar.

VBA Object Name

HMIToolbarItems

Usage

Use the ToolbarItems property to return the ToolbarItems listing. In the following example, all object types in the first user-defined toolbar in the active picture will be output:

Note

The ToolbarItems listing does not distinguish between application-specific and picture-specific toolbars in the output.

```
Sub ShowToolbarItems()
'VBA355
Dim colToolbarItems As HMIToolbarItems
Dim objToolbarItem As HMIToolbarItem
Dim strTypeList As String
Set colToolbarItems = ActiveDocument.CustomToolbars(1).ToolbarItems
If 0 <> colToolbarItems.Count Then
For Each objToolbarItem In colToolbarItems
strTypeList = strTypeList & objToolbarItem.ToolbarItemType & vbCrLf
Next objToolbarItem
Else
strTypeList = "No Toolbaritems existing"
```

```
End If
MsgBox strTypeList
End Sub
```

Use the InsertToolbarItem method, for instance, to insert an icon into an existing user-defined toolbar. In the following example a picture-specific toolbar will be created in the active picture and an icon will be added:

```
Sub InsertToolbarItem()
'VBA356
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Set objToolbar = ActiveDocument.CustomToolbars.Add("d_Toolbar2")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "t_Item2_1",
"ToolbarItem 1")
End Sub
```

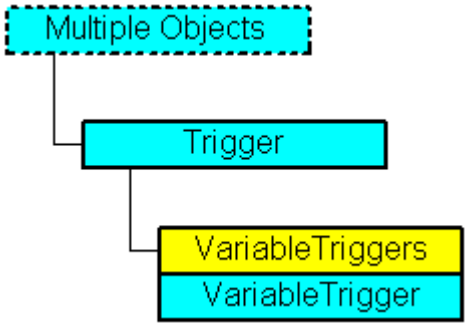
Trigger Object

Description



Represents the trigger (e.g. Picture Cycle) that is necessary for adding dynamics to properties with the aid of scripts. A trigger can possess multiple tag triggers.

VBA Object Name

HMITrigger

Usage

Use the Trigger property to return the Trigger object. In this example the "Radius" property of a circle will be made dynamic with the aid of a VB script (the output value sets the radius):

```
Sub AddDynamicAsVBSkriptToProperty()
'VBA357
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
'
'Define cycletime and sourcecode
With objVBScript
.SourceCode = ""
.Trigger.Type = hmiTriggerTypeStandardCycle
.Trigger.CycleType = hmiCycleType_2s
.Trigger.Name = "Trigger1"
End With
End Sub
```

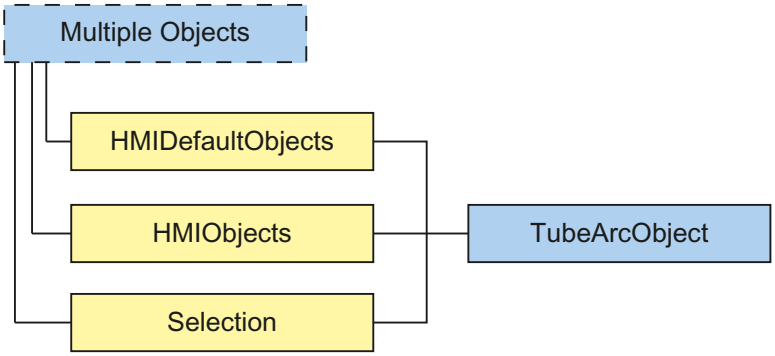
TubeArcObject object

Description



Represents the "Tube arc" object. The TubeArcObject object is an element of the following lists:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMITubeArcObject

Usage

Use the Add method to create a new "Tube arc" object in a picture:

```
Sub AddTubeArcObject()
'VBA835
Dim objTubeArcObject As HMITubeArcObject
Set objTubeArcObject = ActiveDocument.HMIObjects.AddHMIObject("TubeArcObject",
"HMITubeArcObject")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTubeArcObject()
'VBA836
Dim objTubeArcObject As HMITubeArcObject
Set objTubeArcObject = ActiveDocument.HMIObjects("TubeArcObject")
objTubeArcObject.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA837
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

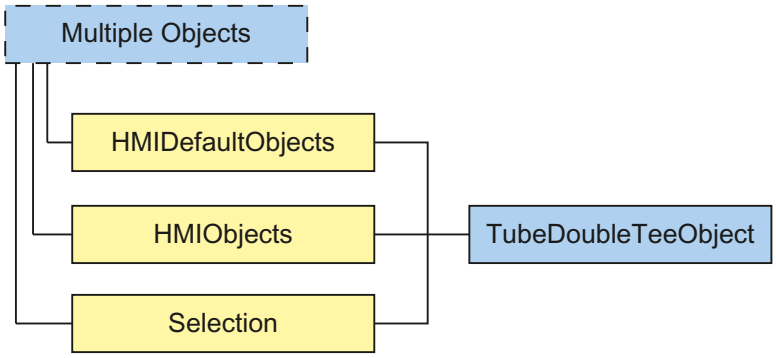
TubeDoubleTeeObject object

Description



Represents the "Double T-piece" object. The TubeDoubleTeeObject object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMITubeDoubleTeeObject

Usage

Use the Add method to create a new "Double T-piece" object in a picture:

```
Sub AddTubeDoubleTeeObject()
'VBA838
Dim objTubeDoubleTeeObject As HMITubeDoubleTeeObject
Set objTubeDoubleTeeObject = ActiveDocument.HMIObjects.AddHMIObject("Double T-piece",
"HMITubeDoubleTeeObject")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTubeDoubleTeeObject()
'VBA839
Dim objTubeDoubleTeeObject As HMITubeDoubleTeeObject
Set objTubeDoubleTeeObject = ActiveDocument.HMIObjects("Double T-piece")
objTubeDoubleTeeObject.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA840
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

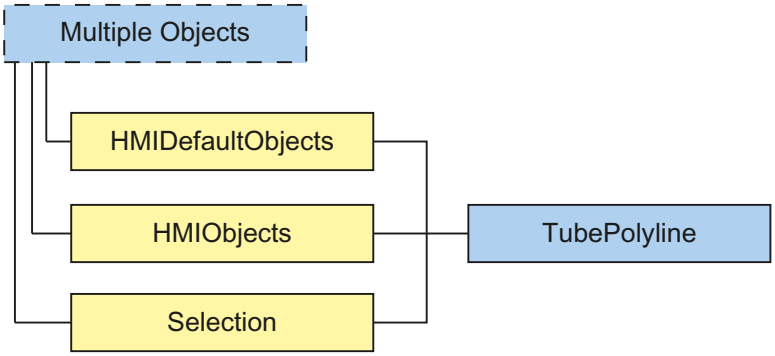
TubePolyline object

Description



Represents the "TubePolyline" object. The TubePolyline object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMITubePolyline

Usage

Use the Add method to create a new "TubePolyline" object in a picture:

```
Sub AddTubePolyline()
'VBA841
Dim objTubePolyline As HMITubePolyline
Set objTubePolyline = ActiveDocument.HMIObjects.AddHMIObject("TubePolyline",
"HMITubePolyline")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTubePolyline()
'VBA842
Dim objTubePolyline As HMITubePolyline
Set objTubePolyline = ActiveDocument.HMIObjects("TubePolyline")
objTubePolyline.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA843
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

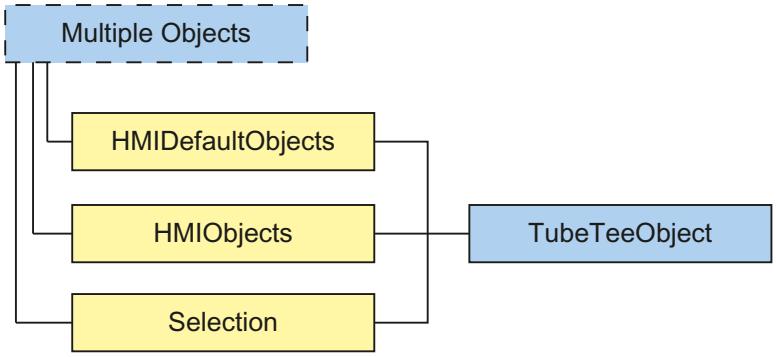
TubeTeeObject object

Description



Represents the "T-piece" object. The TubeTeeObject object is an element of the following lists:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMITubeTeeObject

Usage

Use the Add method to create a new "T-piece" object in a picture:

```
Sub AddTubeTeeObject()
'VBA844
Dim objTubeTeeObject As HMITubeTeeObject
Set objTubeTeeObject = ActiveDocument.HMIObjects.AddHMIObject("T-piece",
"HMITubeTeeObject")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTubeTeeObject()
'VBA845
Dim objTubeTeeObject As HMITubeTeeObject
Set objTubeTeeObject = ActiveDocument.HMIObjects("T-piece")
objTubeTeeObject.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA846
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Application Property (Page 3484)

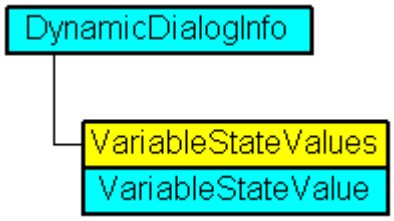
VariableStateValues Object (Listing)

Description



A listing of VariableStateValue objects containing all tag statuses in Dynamic dialog to be used for dynamization.

VBA Object Name

HMIVariableStateValues

Usage

Use the Item property in the Dynamic dialog to define values that will be used for creating dynamics when the specified tag returns the configured state. In the following example the radius of a circle is given dynamics with the The dynamization takes place be evaluating the

status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA358
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'Activate variable-statecheck
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

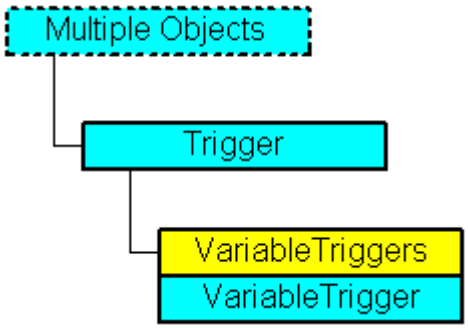
VariableTrigger Object

Description



Represents a tag trigger.

VBA Object Name

HMIVariableTrigger

Application

Use the VariableTrigger object in order to edit or delete an existing tag trigger. In this example a circle property "Top" is made dynamic with the aid of the tag "NewDynamic1":

```
Sub AddDynamicAsVariableDirectToProperty()
'VBA359
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
Set objVariableTrigger = objCircle.Top.CreateDynamic(hmiDynamicCreationTypeVariableDirect,
"'NewDynamic1'")
'
```

```
'Define cycletime
With objVariableTrigger
.CycleType = hmiCycleType_2s
End With
End Sub
```

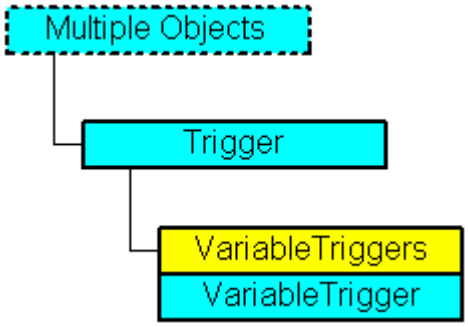
VarName Property (Page 3876)

VariableTriggers Object (Listing)

Description



A listing of the VariableTrigger objects that represent all the tag triggers in use.

VBA Object Name

HMIVariableTriggers

Usage

Use the Add method to create a new tag trigger. In the following example the radius of a circle is made dynamic with the aid of a VB script. A tag trigger is used as the trigger:

```
Sub DynamicWithVariableTriggerCycle()
'VBA360
Dim objVBScript As HMIScriptInfo
Dim objVarTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VariableTrigger",
"HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
'Definition of triggername and cycletime is to do with the Add-methode
Set objVarTrigger = .Trigger.VariableTriggers.Add("VarTrigger", hmiVariableCycleType_10s)
.SourceCode = ""
End With
End Sub
```

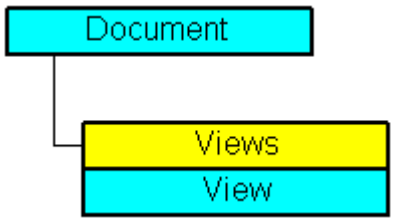
View Object

Description



Represents a copy of a picture. The View object is an element of the Views listing.

You can use the properties of the View object among other things to control the visibility of the CS layers and to define the zoom.

VBA Object Name

HMIView

Usage

Use Views(Index) to return an individual View object. In the following example the number of copies of the active picture will be output:

```
Sub ShowNumberOfExistingViews()
'VBA361
Dim iMaxViews As Integer
iMaxViews = ActiveDocument.Views.Count
MsgBox "Number of copies from active document: " & iMaxViews
End Sub
```

Use the Add method to add a new View object to the "Views" listing. In the following example a copy of the active picture is created and then activated:

```
Sub AddView()
'VBA362
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

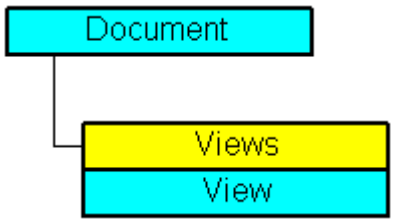
Views Object (Listing)

Description



A listing of the View objects that represent a copy of a picture.

VBA Object Name

HMIViews

Usage

Use the Views listing to return a View object. In the following example the number of existing copies of the active picture will be output:

```
Sub ShowNumberOfExistingViews()
'VBA363
Dim iMaxViews As Integer
iMaxViews = ActiveDocument.Views.Count
MsgBox "Number of copies from active document: " & iMaxViews
End Sub
```

Use the Add method to create a copy of a picture. In the following example a copy of the active picture is created and then activated:

```
Sub AddViewToActiveDocument()
'VBA364
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

WPFControl object

Description

Represents the "WPFControl" object. The WPFControl object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIWPFControl

Application

Use the AddWPFControl method to insert a WPFControl in a picture.

In the following example, the "WPF Control" object outside the Global Assembly Cache is inserted in the active picture.

```
'VBA852
Dim WPFControl As HMIWPFControl
Set WPFControl = ActiveDocument.HMIObjects.AddWPFControl("MyWPFVBAControl",
"WinCCWPFControl.TestControl", False, "Assembly=Z:\TestControl\WinCCWPFControl.dll")
```

6.1.8 Properties

6.1.8.1 A

Actions Property

Description

Returns the Actions listing. Use the Actions property to configure an event-driven action.

Example:

In this example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle enlarges every time you click the button:

```
Sub CreateVBActionToClickedEvent()
'VBA365
Dim objButton As HMIButton
Dim objCircle As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VB", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircle
.Top = 100
.Left = 100
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 120
.Text = "Increase Radius"
End With
'Define event and assign sourcecode:
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
With objVBScript
.SourceCode = "Dim myCircle" & vbCrLf & _
              "Set myCircle = HMIRuntime.ActiveScreen.ScreenItems(""Circle_VB"")" & _
              vbCrLf & "myCircle.Radius = myCircle.Radius + 5"
End With
End Sub
```

Configuring Event-Driven Actions with VBA (Page 3092)

ActionType property

Description

Only used internally.

See also

VBA Reference: ActionDynamic (Page 3126)

ActiveDocument Property

Description

Returns an object of the "Document" type which represents the active picture in the Graphics Designer. If there is no open or active picture in the Graphics Designer, you receive an error message.

Note

The "ActiveDocument" property refers to the window that possesses the input focus. If other editors (e.g. CrossReference) access a picture, the input focus can change. To prevent this situation leading to errors, reference the picture unambiguously via the Documents listing.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles").

```
Sub CreateMenuItem()
'VBA366
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
'
'Create new menu "Delete Objects":
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete Objects")
'
'Add two menuitems to the menu "Delete Objects
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
Rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete Circles")
End Sub
```

See also

Documents Object (Listing) (Page 3322)

ActiveLayer Property

Description

Defines or returns the active layer for the View object. The value range is from 0 to 31, where "0" represents the uppermost layer and "31" the lowest layer.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example a new View object is created and layer 1 is set to "Active":

```
Sub ActiveDocumentConfiguration()
'VBA367
Application.ActiveDocument.Views.Add
Application.ActiveDocument.Views(1).ActiveLayer = 2
End Sub
```

See also

View Object (Page 3466)

ActualPointLeft Property

Description

Defines or returns the X coordinate of the current corner point by reference to the picture origin (top left) for the objects "Polygon" and "Polyline". Each corner point is identified by an index which is derived from the number ("PointCount") of corner point available.

A change of the value can affect the properties "Width" (object width) and "Left" (x-coordinate of the object position).

Example:

The "PolygonCoordinatesOutput()" procedure outputs the coordinates of all the corner points in the first polyline in the current picture:

```
Sub PolygonCoordinatesOutput()
'VBA368
Dim objPolyline As HMIPolyLine
Dim iPosX As Integer
Dim iPosY As Integer
Dim iCounter As Integer
Dim strResult As String
iCounter = 1
```

```
Set objPolyline = ActiveDocument.HMIObjects.AddHMIObject("Polyline1", "HMIPolyLine")
For iCounter = 1 To objPolyline.PointCount
With objPolyline
.index = iCounter
iPosX = .ActualPointLeft
iPosY = .ActualPointTop
End With
strResult = strResult & vbCrLf & "Corner " & iCounter & ": x=" & iPosX & " y=" & iPosY
Next iCounter
MsgBox strResult
End Sub
```

ActualPointTop Property (Page 3474)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

Line Object (Page 3373)

ActualPointTop Property

Description

Defines or returns the Y coordinate of the current corner point by reference to the picture origin (top left) for the objects "Polygon" and "Polyline". Each corner point is identified by an index which is derived from the number ("PointCount") of corner point available.

A change of the value can affect the properties "Height" (object height) and "Top" (y-coordinate of the position).

Example:

The "Polygon()" procedure outputs the coordinates of all the corner points in the first polyline in the current picture:

```
Sub PolygonCoordinatesOutput()
'VBA369
Dim objPolyline As HMIPolyLine
Dim iPosX As Integer
Dim iPosY As Integer
Dim iCounter As Integer
Dim strResult As String
iCounter = 1
Set objPolyline = ActiveDocument.HMIObjects.AddHMIObject("Polyline1", "HMIPolyLine")
```

```
For iCounter = 1 To objPolyline.PointCount
With objPolyline
.index = iCounter
iPosX = .ActualPointLeft
iPosY = .ActualPointTop
End With
strResult = strResult & vbCrLf & "Corner " & iCounter & ": x=" & iPosX & " y=" & iPosY
Next iCounter
MsgBox strResult
End Sub
```

Line Object (Page 3373)

AdaptBorder Property

Description

TRUE if the field border is intended to adapt dynamically to the size of the text. BOOLEAN write-read access.

Note

Changing the contents of a field dynamically can cause pumping in the field.

Performance is improved in Runtime by using "AdaptBorder = False".

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text size is dynamically adapted to the field size.

```
Sub IOFieldConfiguration()
'VBA372
Dim objIOField As HMIIOField
'
'Add new IO-Feld to active document:
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
```

```
.AdaptBorder = True
End With
End Sub
```

Button Object (Page 3293)

AdaptPicture Property

Description

TRUE if the picture size is to be adapted to the picture window size. BOOLEAN write-read access.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA373
Dim objPicWindow As HMIPictureWindow
'
'Add new picturewindow into active document:
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
```

```
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

AdaptSize Property

Description

TRUE if the picture window size is to be adapted to the picture size. BOOLEAN write-read access.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA374
Dim objPicWindow As HMIPictureWindow
'
'Add new picturewindow into active document:
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

Application Object (Page 3282)

AlarmGoneVisible property

Description

Defines whether an outgoing state is visible.

Assigned Value	Description
True	The outgoing state is visible.
False	The outgoing state is suppressed.

AlarmHigh Property

Description

Defines the top limit value at which an alarm should be triggered or returned.

The type of the evaluation (in percent or absolute) is defined in the "TypeAlarmHigh" property.

The "CheckAlarmHigh" property defines whether the monitoring function for the limit value is activated.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "50".

```
Sub BarGraphLimitConfiguration()
'VBA375
Dim objBarGraph As HMIBarGraph
'
'Add new BarGraph to active document:
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolut
.TypeAlarmHigh = False
'Activate monitoring
```

```
.CheckAlarmHigh = True
'Set barcolor to "yellow"
.ColorAlarmHigh = RGB(255, 255, 0)
'set upper limit to "50"
.AlarmHigh = 50
End With
End Sub
```

See also

TypeAlarmHigh Property (Page 3791)

CheckAlarmHigh Property (Page 3531)

BarGraph Object (Page 3286)

AlarmLow Property

Description

Defines the bottom limit value at which an alarm should be triggered or returned.

The type of the evaluation (in percent or absolute) is defined in the "TypeAlarmLow" property.

The "CheckAlarmLow" property defines whether the monitoring function for the limit value is activated.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "10".

```
Sub BarGraphLimitConfiguration()
'VBA376
Dim objBarGraph As HMIBarGraph
'
'Add new BarGraph to active document:
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolut
.TypeAlarmLow = False
'Activate monitoring
.CheckAlarmLow = True
'Set Barcolor to "yellow"
.ColorAlarmLow = RGB(255, 255, 0)
'set lower limit to "10"
.AlarmLow = 10
End With
```

```
End Sub
```

BarGraph Object (Page 3286)

Alignment Property

Description

Defines or returns the scale display (left/right or top/bottom) depending on the position of the BarGraph object. The Scaling property must be set to TRUE for the scale to be displayed.

Display	Assigned Value
Right or bottom	TRUE
Left or top	FALSE

Example:

The "BarGraphConfiguration()" procedure configures In this example the scale is to be located to the right of the bar:

```
Sub BarGraphConfiguration()
'VBA377
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Alignment = True
.Scaling = True
End With
End Sub
```

See also

Scaling Property (Page 3749)

Direction Property (Page 3571)

BarGraph Object (Page 3286)

AlignmentLeft Property

Description

Defines or returns the horizontal alignment of the text. Value range from 0 to 2.

Horizontal Alignment	Assigned Value
Left	0
Centered	1
Right	2

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text in the I/O field will be centered horizontally:

```
Sub IOFieldConfiguration()
'VBA378
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AlignmentLeft = 1
End With
End Sub
```

AlignmentTop Property

Description

Defines or returns the vertical alignment of the text. Value range from 0 to 2.

Horizontal Alignment	Assigned Value
Up	0
Centered	1
Down	2

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text in the I/O field will be centered in the middle:

```
Sub IOFieldConfiguration()
'VBA379
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AlignmentLeft = 1
.AlignmentTop = 1
End With
End Sub

AnalogResultInfos Property

Description

Returns the AnalogResultInfos listing. Use the AnalogResultInfos property to define value ranges and property values in the Dynamic dialog.

Example:

An example showing how to use the AnalogResultInfos property can be found in this documentation under the heading "AnalogResultInfos Object (Listing)".

See also

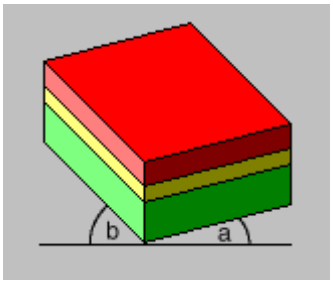
DynamicDialog Object (Page 3325)

AnalogResultInfos Object (Listing) (Page 3281)

AngleAlpha Property

Description

Defines or returns depth angle a for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.



Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example depth angles A and B will be assigned the values "15" and 45:

```
Sub HMI3DBarGraphConfiguration()
'VBA380
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
'Depth-angle a = 15 degrees
.AngleAlpha = 15
'Depth-angle b = 45 degrees
.AngleBeta = 45
End With
End Sub
```

See also

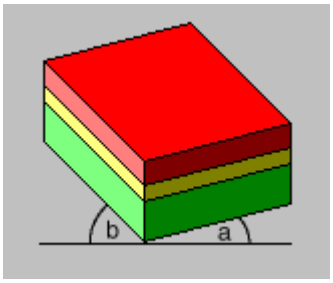
AngleBeta Property (Page 3484)

3DBarGraph Object (Page 3267)

AngleBeta Property

Description

Defines or returns depth angle b for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.



Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example depth angles A and B will be assigned the values "15" and 45:

```
Sub HMI3DBarGraphConfiguration()
'VBA381
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
'Depth-angle a = 15 degrees
.AngleAlpha = 15
'Depth-angle b = 45 degrees
.AngleBeta = 45
End With
End Sub
```

See also

AngleAlpha Property (Page 3483)

3DBarGraph Object (Page 3267)

Application Property

Description

Returns the Graphics Designer application when the application property is used without an object identifier. If the application property is used with object identifier, it returns an application object which displays the application with which the defined object was created. Read only access.

Example:

In this example an Excel object is created and the application name is output:

```
Sub CreateExcelApplication()
'VBA382
'
'Open Excel invisible
Dim objExcelApp As New Excel.Application
MsgBox objExcelApp
'Delete the reference to Excel and close it
Set objExcelApp = Nothing
End Sub
```

See also

Application Object (Page 3282)

ApplicationDataPath Property

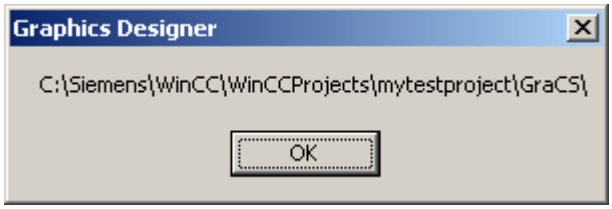
Description

Returns the complete path of the active picture in the Graphics Designer. Read-only access.

Example:

The "ShowApplicationDataPath()" procedure outputs the path of the current picture:

```
Sub ShowApplicationDataPath()
'VBA383
MsgBox Application.ApplicationDataPath
End Sub
```



See also

Application Property (Page 3484)

Application Object (Page 3282)

AssemblyInfo property

Description

Displays the information of the object registered in the Global Assembly Cache. The information is made up of "Assembly", "Version", "Culture" and "PublicKeyToken".

If the object is not registered in the Global Assembly Cache, the path of the object is only displayed in "Assembly".

Assignments Property

Description

A list which contains the assignments between the output values and the actual output texts to be output.

The assignments are dependent on the list type set. The list type is defined with the ListType property.

The number of entries depends on the total length of the string passed to the "Assignments" property. This string cannot be longer than 500,000 bytes. This may be checked prior to dropping access to the "Assignments" property by using the function LenB().

Example:

--

See also

ListType Property (Page 3664)

TextList Object (Page 3441)

AssumeOnExit Property

Description

TRUE, if the entered text is assumed after exiting the input field (by using the <TAB> key or mouse click, for example). BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text that has been entered will be taken over as input on exit from the input field.

```
Sub IOFieldConfiguration()
'VBA385
```

```
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AssumeOnExit = True
End With
End Sub
```

See also

TextList Object (Page 3441)

IOField Object (Page 3361)

AssumeOnFull Property

Description

TRUE, when the content of the input field is full (specified number of characters have been entered) and should be exited automatically and the input accepted. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text that has been entered will be taken over as input on exit from the input field.

```
Sub IOFieldConfiguration()
'VBA386
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AssumeOnFull = True
End With
End Sub
```

OutputFormat Property (Page 3706)

DataFormat Property (Page 3569)

IOField Object (Page 3361)

AutomationName Property

Description

Depending on the source and destination object types for the direct connection, either defines or returns the name of a property.

The two tables show you when you must use the AutomationName property. A "--" means that the property is assigned an empty string (") by default when the DirectConnection object is created.

Source object type (SourceLink Property)

Type Property	AutomationName Property	ObjectName Property
hmiSourceTypeConstant	--	Name of the constant (e.g. the picture name)
hmiSourceTypeProperty	Property of the source object (e.g. "Top")	Name of the source object (e.g. "Rectangle_A")
hmiSourceTypePropertyOfThisObject	--	--
hmiSourceTypeVariableDirect	--	Tag name
hmiSourceTypeVariableIndirect	--	Tag name

Destination object type (DestinationLink Property)

Type Property	AutomationName Property	ObjectName Property
hmiDestTypeProperty	Property of the destination object (e.g. "Left")	Name of the destination object (e.g. "Rectangle_A")
hmiDestTypePropertyOfThisObject	--	--
hmiDestTypePropertyOfActualWindow	Property of the destination object (e.g. "Left")	--
hmiDestTypeVariableDirect	--	Tag name
hmiDestTypeVariableIndirect	--	Tag name
hmiDestTypeDirectMessage	--	Tag name
hmiDestTypeIndirectMessage	--	Tag name

Example:

In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA387
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
```

```
Dim objDynConnection As HMIDirectConnection
'
'Add objects to active document:
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
'
'to position and configure objects:
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Text = "SetPosition"
End With
'
'Directconnection is initiate by mouseclick:
Set objDynConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDynConnection
'Sourceobject: Top-Property of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Left-Property of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

AvailableDataLanguages Property

Description

Returns a listing of the available project languages.

Example:

The "AusgabetDataLanguages()" procedure outputs all the existing project languages together with their language identifiers (as a decimal value):

```
Sub OutputDataLanguages()
'VBA388
Dim colDataLang As HMIDataLanguages
Dim objDataLang As HMIDataLanguage
Dim strLangList As String
Dim iCounter As Integer
'
'Save collection of datalanguages
'into variable "colDataLang"
Set colDataLang = Application.AvailableDataLanguages
iCounter = 1
'
'Get every languagename and the assigned ID
For Each objDataLang In colDataLang
With objDataLang
If 0 = iCounter Mod 3 Or 1 = iCounter Then
 strLangList = strLangList & vbCrLf & .LanguageID & " " & .LanguageName
Else
 strLangList = strLangList & " / " & .LanguageID & " " & .LanguageName
End If
End With
iCounter = iCounter + 1
Next objDataLang
MsgBox strLangList
End Sub
```

Average Property

Description

TRUE, if the mean value is calculated based on the last 10 values. A value change is conditional for calculation of a new mean value. The mean value is reset when you change a picture. If only one value is available when you change the picture, the following mean value is calculated: (5+0+0+0+0+0+0+0+0+0)/10=0,5.

BOOLEAN write-read access.

Example

The "BarGraphConfiguration()" procedure configures In this example, value averaging will be activated:

```
Sub BarGraphConfiguration()
'VBA389
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Average = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

Axe Property

Description

Defines or returns the axis for displaying the measured value. Value range from 0 to 2.

Axis	Assigned Value
X	0
Y	1
Z	2

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the Y axis for displaying the measured value will be defined:

```
Sub HMI3DBarGraphConfiguration()
'VBA390
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.Axe = 1
End With
End Sub
```

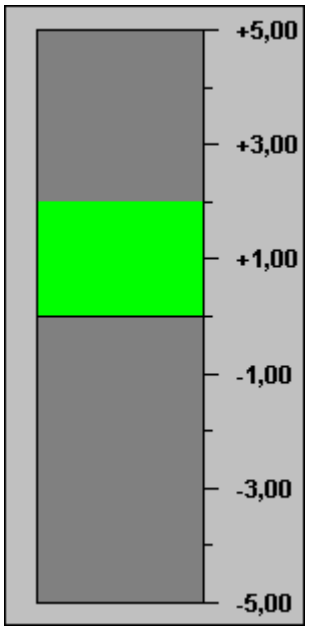
See also

3DBarGraph Object (Page 3267)

AxisSection Property

Description

Defines or returns the distance between two long axis sections. The information on the distance is given in scale units and is dependent on the minimum and maximum values configured.



BarGraph Object (Minimum/Maximum Value: -5/5; AxisSection = 2)

Example

The "BarGraphConfiguration()" procedure accesses the properties of the BarGraph object. In this example the axis section will be set to "2".

```
Sub BarGraphConfiguration()

'VBA391

Dim objBar As HMIBarGraph

Set objBar = ActiveDocument.HMIObjects.AddHMIObject("Bar1",
"HMIBarGraph")

With objBar

.AxisSection = 2

End With

   End Sub
```

6.1.8.2 B

BackBorderWidth Property

Description

Defines or returns the width of the 3D border in pixels. The value for the width is dependent on the size of the object.

Slider

Defines or returns the width of the border in pixels. BackBorderWidth = 0 prevents the border being displayed on the Slider object.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the width of the 3D border will be set to "2".

```
Sub ButtonConfiguration()
'VBA392
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.BackBorderWidth = 2
End With
End Sub
```

GroupDisplay Object (Page 3350)

Button Object (Page 3293)

BackColor Property

Description

Defines or returns the background color for the object. LONG read-write access.

The background color is not displayed if "transparent" is defined as the fill pattern.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the background color will be set to "Yellow".

```
Sub RectangleConfiguration()
'VBA393
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BackColor = RGB(255, 255, 0)
End With
End Sub
```

BackColor2 Property

Description

Defines or returns the bar color for the display of the current value. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphConfiguration()" procedure configures In this example the bar color for displaying the current value will be set to "Yellow":

```
Sub BarGraphConfiguration()
'VBA394
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.BackColor2 = RGB(255, 255, 0)
End With
End Sub
```

See also

BarGraph Object (Page 3286)

BackColor3 Property

Description

Defines or returns the color of the bar background. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphConfiguration()" procedure configures In this example the color of the bar background will be set to "Blue":

```
Sub BarGraphConfiguration()
'VBA395
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.BackColor3 = RGB(0, 0, 255)
End With
End Sub
```

See also

BarGraph Object (Page 3286)

BackColor_Alarm.._Warning property

Description

Defines the color used for the background of one of the following states or message types:

- Alarm
- Warning
- Tolerance
- AS Process Control Error
- AS Control System Fault

- Operator request
- OK
- Simulation

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

BackColorBottom Property

Description

Defines or returns the color for the bottom/right part of the slider. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the color of the bottom part of the slider will be set to "Blue":

```
Sub SliderConfiguration()
'VBA396
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.BackColorBottom = RGB(0, 0, 255)
End With
End Sub
```

See also

Slider object (Page 3428)

BackColorTop Property

Description

Defines or returns the color for the top/left part of the slider. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the color of the top part of the slider will be set to "Yellow":

```
Sub SliderConfiguration()
'VBA397
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.BackColorTop = RGB(255, 255, 0)
End With
End Sub
```

See also

Slider object (Page 3428)

BackFillColor property

Description

Defines the color with which the background is filled at an advanced analog display.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

BackFillColor_OK property

Description

Defines the color with which the background is filled at the state "OK".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

BackFillColor_Simulation property

Description

Defines the color with which the background is filled at the "Simulation" state.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

BackFillStyle property

Description

Defines the pattern with which the background is filled at an advanced analog display.

There is a choice of 50 fill patterns. The fill pattern 0 "Solid" fills the object with the set background color; the fill pattern 1 "Transparent" defines that neither a background nor a fill pattern is displayed.

BackFillStyle_OK property

Description

Defines the pattern with which the background is displayed at the state "OK".

There is a choice of 50 fill patterns. The fill pattern 0 "Solid" fills the object with the set background color; the fill pattern 1 "Transparent" defines that neither a background nor a fill pattern is displayed.

BackFillStyle_Simulation property

Description

Defines the pattern with which the background is displayed at the "Simulation" state.

There is a choice of 50 fill patterns. The fill pattern 0 "Solid" fills the object with the set background color; the fill pattern 1 "Transparent" defines that neither a background nor a fill pattern is displayed.

BackFlashColorOff Property

Description

Defines or returns the color of the object background for the flash status "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the color when the flash status is "Off" will be set to "Yellow":

```
Sub RectangleConfiguration()
'VBA398
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BackFlashColorOff = RGB(255, 255, 0)
End With
End Sub
```

BackFlashColorOn Property

Description

Defines or returns the color of the object background for the flash status "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the color when the flash status is "On" will be set to "Blue":

```
Sub RectangleConfiguration()
'VBA399
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BackFlashColorOn = RGB(0, 0, 255)
End With
End Suba
```

BarGraph Object (Page 3286)

Background Property

Description

TRUE, when the background of the 3D-bar graph object should be visible. BOOLEAN write-read access.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the background will be set to "Transparent":

```
Sub HMI3DBarGraphConfiguration()
'VBA400
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.Background = False
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BackPictureAlignment property

Description

As the "Display type" attribute, defines the position and scaling for the background image of the process picture.

normal	The background picture is centered in the original size. When opening the picture in runtime, it remains in the location.
Stretched (window)	The background picture is scaled to the runtime window and process picture of the larger of the two windows. In runtime, it is scaled to the size of the runtime window and is scaled when you resize the picture.
Tiled	Graphics Designer and process picture are exhibited with the picture in its original size.
Stretched (picture)	The background picture is scaled to the configured size of the process picture. When opening the picture in runtime, it retains its size.

BackPictureName property

Description

Defines or returns the path and name of the file used as the background image in the process picture.

Files of format EMF, WMF, DB, BMP, GIF, JPG, JPEG and ICO are suitable.

If no path is specified, the file is searched for in the subdirectory \GraCS. If you specify a different path, a copy is created in the \GraCS directory.

Path specifications

The following path specification formats are possible:

- Absolute: z.B. "C:\Siemens\WinCC\Icons\myIcon.ICO.
- Relative: The starting folder for relative path specification is the "GraCS" folder of the current project.
- <global>: Refers to the installation path for WinCC. The path specification "<global>\Icons \myIcon" is the same as the path specification under "Absolute".
- <project>: Refers to the current project directory.

BarDepth Property

Description

Defines or returns the depth of the bar in pixels.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the bar depth will be set to "40":

```
Sub HMI3DBarGraphConfiguration()
'VBA401
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BarDepth = 40
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BarHeight Property

Description

Defines or returns the height of the bar in pixels.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the bar height will be set to "60":

```
Sub HMI3DBarGraphConfiguration()
'VBA402
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BarHeight = 60
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BarWidth Property

Description

Defines or returns the width of the bar in pixels.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the bar width will be set to "80":

```
Sub HMI3DBarGraphConfiguration()
'VBA403
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BarWidth = 80
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BasePicReferenced Property

Description

TRUE, when the picture assigned in the object status display should be saved. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the picture assigned in the Status Display object is to be saved.

```
Sub StatusDisplayConfiguration()
'VBA404
Dim objStatDisp As HMIStatusDisplay
Set objStatDisp = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
With objStatDisp
```

```
.BasePicReferenced = True
End With
End Sub
```

See also

StatusDisplay Object (Page 3436)

BasePicTransColor Property

Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "BasePicUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the color "Yellow" will be set to "Transparent".

```
Sub StatusDisplayConfiguration()
'VBA405
Dim objStatDisp As HMIStatusDisplay
Set objStatDisp = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
With objStatDisp
.BasePicTransColor = RGB(255, 255, 0)
.BasePicUseTransColor = True
End With
End Sub
```

See also

BasePicUseTransColor Property (Page 3508)

StatusDisplay Object (Page 3436)

BasePicture Property

Description

Defines or returns the basic picture for the Status Display object.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

In this context, the "BasePicReferenced" property defines whether the basic picture should be saved together with the object status display or referenced.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the picture "Testpicture.BMP" will be used as the basic picture:

```
Sub StatusDisplayConfiguration()
'VBA406
Dim objStatDisp As HMIStatusDisplay
Set objStatDisp = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
With objStatDisp
'
'To use this example copy a Bitmap-Graphic
'to the "GraCS"-Folder of the actual project.
'Replace the picturename "Testpicture.BMP" with the name of
'the picture you copied
.BasePicture = "Testpicture.BMP"
End With
End Sub
```

See also

BasePicReferenced Property (Page 3505)

StatusDisplay Object (Page 3436)

BasePicture property

Description

Specifies which picture is to be displayed for the currently selected status. Pictures with the following formats can be inserted: EMF, WMF, BMP, GIF, JPG.

If no picture that you want to display is defined for a status, the symbol for the status display is shown as a placeholder.

BasePicUseTransColor Property

Description

TRUE, when the configured color ("BasePicTransColor" property) of the bitmap objects should be set to "transparent". BOOLEAN write-read access.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the color "Yellow" will be set to "Transparent":

```
Sub StatusDisplayConfiguration()
'VBA407
Dim objStatDisp As HMIStatusDisplay
Set objStatDisp = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
With objStatDisp
.BasePicTransColor = RGB(255, 255, 0)
.BasePicUseTransColor = True
End With
End Sub
```

See also

BasePicTransColor Property (Page 3506)

StatusDisplay Object (Page 3436)

BaseX Property

Description

Defines or returns for the 3DBarGraph object the horizontal distance in pixels between the right-hand border of the bar and the left-hand border of the object field.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the horizontal distance will be set to "80".

```
Sub HMI3DBarGraphConfiguration()
'VBA408
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BaseX = 80
```

```
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BaseY Property

Description

Defines or returns for the 3DBarGraph object the vertical distance in pixels between the lower border of the bar and the upper border of the object field.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the vertical distance will be set to "100".

```
Sub HMI3DBarGraphConfiguration()
'VBA409
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BaseY = 100
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BinaryResultInfo Property

Description

Returns the BinaryResultInfo object.

Example:

An example showing how to use the BinaryResultInfo property can be found in this documentation under the heading "BinaryResultInfo Object".

See also

BinaryResultInfo Object (Page 3291)

BitNotSetValue Property

Description

Defines or returns the value for the dynamic property if the specified bit of a configured tag is not set.

To define which bit must be set in order to trigger a change of value, use the BitNumber property.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned, the bit to be set will be defined and the associated property values will be assigned to the "set"/"not set" states:

```
Sub AddDynamicDialogToCircleRadiusTypeBit()
'VBA410
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_B", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBit
.Trigger.VariableTriggers(1).CycleType = hmiVariableCycleType_5s
.BitResultInfo.BitNumber = 1
.BitResultInfo.BitSetValue = 40
.BitResultInfo.BitNotSetValue = 80
End With
End Sub
```

See also

BitNumber Property (Page 3510)

BitResultInfo Object (Page 3292)

BitNumber Property

Description

Defines or returns the bit whose status must change in order to trigger a change of value. The tag used must be of the type BYTE, WORD or DWORD.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned, the bit to be set will be defined and the associated property values will be assigned to the "set"/"not set" states:

```
Sub AddDynamicDialogToCircleRadiusTypeBit()
'VBA411
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_B", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBit
.BitResultInfo.BitNumber = 1
.BitResultInfo.BitSetValue = 40
.BitResultInfo.BitNotSetValue = 80
End With
End Sub
```

See also

BitResultInfo Object (Page 3292)

VBA Reference (Page 3124)

BitPosition0..3 property

Description

Specifies the bit position of the selected tag for which the respective bit (0 to 3) of the status value is used. The content is only evaluated when a tag is selected for the respective property "BitSelect0..3". The tags are specified using "Process" and "Process1..3".

You can enter a value from "0" to "31". Each value can only be assigned once.

BitResultInfo Property

Description

Returns the BitResultInfo object.

Example:

An example showing how to use the BitResultInfo property can be found in this documentation under the heading "BitResultInfo Object".

See also

BitResultInfo Object (Page 3292)

BitSelect0..3 property

Description

Specifies the status tag for which the respective (first to fourth) bit of the status value is specified. The tags are specified using the properties "Process" and "Process1..3".

0	The respective bit of the status value is not evaluated. No status tag is used.
1	Status tag "Process" is used for the respective bit of the status value.
2	Status tag "Process1" is used for the respective bit of the status value.
3	Status tag "Process2" is used for the respective bit of the status value.
4	Status tag "Process3" is used for the respective bit of the status value.

BitSetValue Property

Description

Defines or returns the value for the dynamic property if the specified bit of a configured tag is set.

To define which bit must be set in order to trigger a change of value, use the BitNumber property.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned, the bit to be set will be defined and the associated property values will be assigned to the "set"/"not set" states:

```
Sub AddDynamicDialogToCircleRadiusTypeBit()
'VBA412
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_B", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBit
.BitResultInfo.BitNumber = 1
.BitResultInfo.BitSetValue = 40
.BitResultInfo.BitNotSetValue = 80
End With
End Sub
```

See also

BitNumber Property (Page 3510)

BitResultInfo Object (Page 3292)

Bold Property

Description

TRUE if the font attribute "Bold" is set for the language-dependent text in the object. BOOLEAN write-read access.

Example:

Note

For this example to work, you must already have configured in the languages concerned.

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA413
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "Displaytext"
Set colLangFonts = objButton.LDFonts
'Set french fontproperties:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'Set english fontproperties:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

Application Property (Page 3484)

LanguageFont Object (Page 3365)

BorderBackColor Property

Description

Defines or returns the background color of the line for the object. LONG write-read access.

The background color is only visible if the BorderStyle property is set >0.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the background color for the line will be set to "Yellow":

```
Sub RectangleConfiguration()
'VBA415
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BorderBackColor = RGB(255, 255, 0)
End With
End Sub
```

Button Object (Page 3293)

BarGraph Object (Page 3286)

BorderColor Property

Description

Defines or returns the line color for the object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the line color will be set to "Blue":

```
Sub RectangleConfiguration()
'VBA416
```

```
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BorderColor = RGB(0, 0, 255)
End With
End Sub
```

BorderColorBottom Property

Description

Defines or returns the color for the bottom right-hand part of the 3D-border. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the 3D-border color will be defined:

```
Sub ButtonConfiguration()
'VBA417
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.BorderColorBottom = RGB(255, 0, 0)
.BorderColorTop = RGB(0, 0, 255)
End With
End Sub
```

See also

RoundButton Object (Page 3418)

Button Object (Page 3293)

BorderColorTop Property

Description

Defines or returns the color for the top left-hand part of the 3D-border. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the 3D-border color will be defined:

```
Sub ButtonConfiguration()
```

```
'VBA418
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.BorderColorBottom = RGB(255, 0, 0)
.BorderColorTop = RGB(0, 0, 255)
End With
End Sub
```

RoundButton Object (Page 3418)

Button Object (Page 3293)

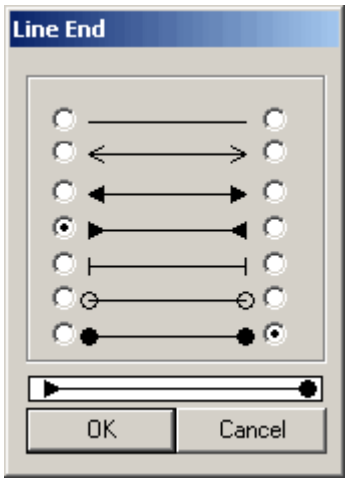
BorderEndStyle Property

Description

Defines or returns the line end style of the object. LONG read-write access.

Determination of Line End Style

Determine the line end type with the aid of a five-character hexadecimal value which you then convert into its equivalent decimal value.



To determine the line ends for the object, go to the "Line End Style" window and proceed as follows:

- Left column: Configures the start of the line. Value range (from the top down) 0 to 6. The start of the line corresponds to the first character in the hexadecimal value. In the configuration shown, the value of the first character is "3".
- Right Column: Configures the end of the line. Value range (from the top down) 0 to 6. The line end corresponds to the fifth character in the hexadecimal value. In the configuration shown, the value of the fifth character is "6".

This gives a hexadecimal value of "60003". This corresponds to a decimal value of "393219", which you then assign to the BorderEndStyle property.

Example:

The "LineConfiguration()" procedure accesses the properties of the line. In this example the type of line end will be set to the configuration illustrated above:

```
Sub LineConfiguration()
'VBA419
Dim objLine As HMILine
Set objLine = ActiveDocument.HMIObjects.AddHMIObject("Line1", "HMILine")
With objLine
.BorderEndStyle = 393219
End With
End Sub
```

PolyLine Object (Page 3405)

Line Object (Page 3373)

BorderFlashColorOff Property

Description

Defines or returns the color of the object lines for the flashing status "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the color when the flash status is "Off" will be set to "Black":

```
Sub RectangleConfiguration()
'VBA420
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
```

```
.BorderFlashColorOff = RGB(0, 0, 0)
End With
End Sub
```

BorderFlashColorOn Property

Description

Defines or returns the color of the object lines for the flashing status "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the color when the flash status is "On" will be set to "Red":

```
Sub RectangleConfiguration()
'VBA421
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BorderFlashColorOn = RGB(255, 0, 0)
End With
End Sub
```

BorderStyle Property

Description

Defines or returns the line style for the object. Value range from 0 to 4:

Line style	Assigned Value
———	0
— —	1
------	2
— · —	3
—·· —	4

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the line style will be set to "1":

```
Sub RectangleConfiguration()
'VBA422
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle

BorderWidth Property

Description

Defines or returns the line weight (in pixels) for the object.

Example:

in the following example the line weight of a newly added circle will be set to "2".

```
Sub CircleConfiguration()
'VBA423
Dim objCircle As IHMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
With objCircle
.BorderWidth = 2
End With

BottomConnectedObjectName Property

Description

Returns the name of the starting object to which the connector is Read only access.

Example:

An example showing how to use the BottomConnectedObjectName property can be found in this documentation under the heading "ObjConnection Object".

See also

ObjConnection object (Page 3388)

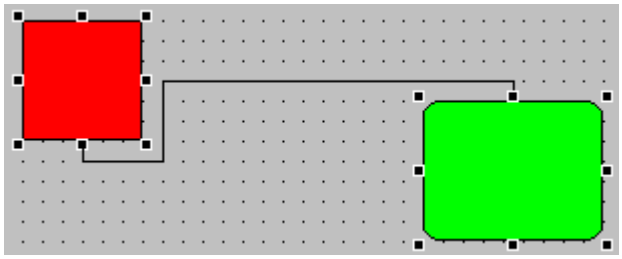
BottomConnectedConnectionPointIndex Property

Description

Returns the connection point on the object to which the connector is connected.

Connection Point	Assigned Value
Up	0
Right	1

Connection Point	Assigned Value
Down	2
Left	3



Example:

An example showing how to use the BottomConnectedObjectName property can be found in this documentation under the heading "ObjConnection Object".

See also

ObjConnection object (Page 3388)

BoxAlignment Property

Description

TRUE, when the fields are arranged aligned to the right. BOOLEAN write-read access.

Example:

The "CreateOptionGroup()" procedure creates the OptionGroup object with four option buttons. Each option button is assigned the default name "myCustomText<Nummer>":

```
Sub CreateOptionGroup()
'VBA424
Dim objRadioBox As HMIOptionGroup
Dim iCounter As Integer
Set objRadioBox = ActiveDocument.HMIObjects.AddHMIObject("RadioBox_1", "HMIOptionGroup")
iCounter = 1
With objRadioBox
.Height = 100
.Width = 180
.BoxCount = 4
.BoxAlignment = False
For iCounter = 1 To .BoxCount
.index = iCounter
.Text = "CustomText" & .index
Next iCounter
```

```
End With
End Sub
```

See also

BoxCount Property (Page 3526)

OptionGroup Object (Page 3393)

CheckBox Object (Page 3297)

BoxCount Property

Description

Defines or returns the number of fields. Value range from 1 to 32.

Example:

The "CreateOptionGroup()" procedure creates the OptionGroup object with four option buttons. Each option button is assigned the default name "myCustomText<Nummer>":

```
Sub CreateOptionGroup()
'VBA425
Dim objRadioBox As HMIOptionGroup
Dim iCounter As Integer
Set objRadioBox = ActiveDocument.HMIObjects.AddHMIObject("RadioBox_1", "HMIOptionGroup")
iCounter = 1
With objRadioBox
.Height = 100
.Width = 180
.BoxCount = 4
.BoxAlignment = True
For iCounter = 1 To .BoxCount
.index = iCounter
.Text = "CustomText" & .index
Next iCounter
End With
End Sub
```

See also

BoxAlignment Property (Page 3525)

OptionGroup Object (Page 3393)

CheckBox Object (Page 3297)

BoxType Property

Description

Defines or returns the field type. Value range from 0 to 2.

Field type	Assigned Value
Edition	0
Input	1
I/O field	2

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the field type is configured as "Input":

```
Sub IOFieldConfiguration()
'VBA426
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.BoxType = 1
End With
End Sub
```

See also

IOField Object (Page 3361)

Button1..8MessageClasses

Description

Defines one or more message events in the group display for representing the respective command button. This is done by entering the numbers of the bits in the collective value.

If you want to assign several message events, delimit the numbers with a comma. The order of assignment defines the priority. If there is more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

Button1..8Width property

Description

Defines or returns for the "Group Display" object the width of the respective button in pixels.

When the "SameSize" property is set to "TRUE", all buttons are set to the same width.

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the width of button "1" is set to "50":

```
Sub GroupDisplayConfiguration()
'VBA427
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.Button1Width = 50
End With
End Sub
```

See also

SameSize Property (Page 3747)

GroupDisplay Object (Page 3350)

ButtonColor Property

Description

Defines or returns the color of the slider for the Slider object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the color of the slider will be set to "Yellow".

```
Sub SliderConfiguration()
'VBA431
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.ButtonColor = RGB(255, 255, 0)
End With
End Sub
```

Slider object (Page 3428)

6.1.8.3 C

Caption Property

Description

TRUE, when the application or picture window has a title bar in Runtime. BOOLEAN write-read access.

The Caption property must be set to "True" if the intention is that the application window or picture window shall have Maximize and Close buttons.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will

```
Sub ApplicationWindowConfig()
'VBA432
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow",
"HMIApplicationWindow")
With objAppWindow
.Caption = True
.CloseButton = False
.Height = 200
.Left = 10
.MaximizeButton = True
.Moveable = False
.OnTop = True
```

```
.Sizeable = True
.Top = 20
.Visible = True
.Width = 250
.WindowBorder = True
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ApplicationWindow Object (Page 3284)

CaptionText Property

Description

Defines or returns the window title that will be displayed for the PictureWindow object in Runtime.

The Caption property must be set to TRUE."

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will

```
Sub PictureWindowConfig()
'VBA433
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

CBackColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Came In" which color the background of the value to be displayed assumes for flashing status "Off" (CBackColorOff) or "On" (CBackColorOn).

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

CBackFlash property

Description

Specifies for the selected message type and status "Came In" whether the background of the value to be displayed flashes when a message is received.

CheckAlarmHigh Property

Description

TRUE if the "Alarm High" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties AlarmHigh, ColorAlarmHigh and TypeAlarmHigh.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "50".

```
Sub BarGraphLimitConfiguration()
'VBA434
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
```

```
'Set analysis to absolute
.TypeAlarmHigh = False
'Activate monitoring
.CheckAlarmHigh = True
'Set barcolor to "yellow"
.ColorAlarmHigh = RGB(255, 255, 0)
'Set upper limit to "50"
.AlarmHigh = 50
End With
End Sub
```

AlarmHigh Property (Page 3478)

BarGraph Object (Page 3286)

CheckAlarmLow Property

Description

TRUE if the "Alarm Low" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties AlarmLow, ColorAlarmLow and TypeAlarmLow.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "10".

```
Sub BarGraphLimitConfiguration()
'VBA435
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeAlarmLow = False
'Activate monitoring
.CheckAlarmLow = True
'Set barcolor to "yellow"
.ColorAlarmLow = RGB(255, 255, 0)
'Set lower limit to "10"
.AlarmLow = 10
End With
```

```
End Sub
```

Checked Property

Description

TRUE if a check mark is to appear in front of the user-defined menu entry. BOOLEAN write-read access.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"): The first menu entry is also marked with a tick:

```
Sub CreateMenuItem()
'VBA436
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
'
'Add new menu "Delete objects" to menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to the new menu
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
Rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete Circles")
With objMenu.MenuItems
.Item("DeleteAllRectangles").Checked = True
End With
End Sub
```

See also

CheckLimitHigh4 Property

Description

TRUE if the "Reserve 4" high limit value of the bar graph object is to be monitored. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties LimitHigh4, ColorLimitHigh4 and TypeLimitHigh4.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "70".

```
Sub BarGraphLimitConfiguration()
'VBA437
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh4 = False
'Activate monitoring
.CheckLimitHigh4 = True
'set barcolor to "red"
.ColorLimitHigh4 = RGB(255, 0, 0)
'Set upper limit to "70"
.LimitHigh4 = 70
End With
End Sub
```

CheckLimitHigh5 Property

Description

TRUE if the "Reserve 5" high limit value of the bar graph object is to be monitored. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties LimitHigh5, ColorLimitHigh5 and TypeLimitHigh5.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "80".

```
Sub BarGraphLimitConfiguration()
'VBA438
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh5 = False
'Activate monitoring
.CheckLimitHigh5 = True
'set barcolor to "black"
.ColorLimitHigh5 = RGB(0, 0, 0)
'Set upper limit to "80"
.LimitHigh5 = 80
End With
End Sub
```

CheckLimitLow4 Property

Description

TRUE if the "Reserve 4" low limit value of the bar graph object is to be monitored. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties LimitLow4, ColorLimitLow4 and TypeLimitLow4.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "5".

```
Sub BarGraphLimitConfiguration()
'VBA439
```

```
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitLow4 = False
'Activate monitoring
.CheckLimitLow4 = True
'Set barcolor to "green"
.ColorLimitLow4 = RGB(0, 255, 0)
'set lower limit to "5"
.LimitLow4 = 5
End With
End Sub
```

LimitLow5 Property (Page 3661)

ColorLimitLow5 Property (Page 3548)

BarGraph Object (Page 3286)

CheckToleranceHigh Property

Description

TRUE if the "Tolerance High" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties ToleranceHigh, ColorToleranceHigh and TypeToleranceHigh.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "45".

```
Sub BarGraphLimitConfiguration()
'VBA441
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeToleranceHigh = False
'Activate monitoring
.CheckToleranceHigh = True
'Set barcolor to "yellow"
.ColorToleranceHigh = RGB(255, 255, 0)
'Set upper limit to "45"
.ToleranceHigh = 45
End With
End Sub
```

BarGraph Object (Page 3286)

CheckToleranceLow Property

Description

TRUE if the "Tolerance Low" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties ToleranceLow, ColorToleranceLow and TypeToleranceLow.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "15".

```
Sub BarGraphLimitConfiguration()
'VBA442
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeToleranceLow = False
'Activate monitoring
.CheckToleranceLow = True
'Set barcolor to "yellow"
.ColorToleranceLow = RGB(255, 255, 0)
'Set lower limit to "15"
.ToleranceLow = 15
End With
End Sub
```

CheckWarningHigh Property

Description

TRUE if the "Warning High" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties WarningHigh, ColorWarningHigh and TypeWarningHigh.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "75".

```
Sub BarGraphLimitConfiguration()
'VBA443
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeWarningHigh = False
'Activate monitoring
.CheckWarningHigh = True
'Set barcolor to "red"
.ColorWarningHigh = RGB(255, 0, 0)
'Set upper limit to "75"
.WarningHigh = 75
End With
End Sub
```

CheckWarningLow Property

Description

TRUE if the "Warning Low" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties WarningLow, ColorWarningLow and TypeWarningLow.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "12".

```
Sub BarGraphLimitConfiguration()
'VBA444
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeWarningLow = False
'Activate monitoring
.CheckWarningLow = True
'Set barcolor to "magenta"
.ColorWarningLow = RGB(255, 0, 255)
'Set lower limit to "12"
.WarningLow = 12
End With
End Sub
```

ClearOnError Property

Description

TRUE if the entry in the I/O field is automatically deleted when the input is incorrect. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the I/O field is to be cleared when the input is incorrect:

```
Sub IOFieldConfiguration()
'VBA445
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.ClearOnError = True
```

```
End With
End Sub
```

See also

IOField Object (Page 3361)

ClearOnNew Property

Description

TRUE if the entry in the I/O field is deleted as soon as the I/O field gets the focus. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the entry in the I/O field is deleted as soon as the field gets the focus:

```
Sub IOFieldConfiguration()
'VBA446
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.ClearOnNew = True
End With
End Sub
```

IOField Object (Page 3361)

CloseButton Property

Description

TRUE if the ApplicationWindow and PictureWindow objects possess a "Close" button in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will have a "Close" button in Runtime:

```
Sub ApplicationWindowConfig()
'VBA447
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
With objAppWindow
.CloseButton = True
End With
End Sub
```

CollectValue property

Description

The CollectValue property specifies as an initial value the current status of the active message classes in each case.

The "Relevant" property has to have the value "TRUE" so that the advanced analog display is taken into account when forming the group display .

ColorAlarmHigh Property

Description

Defines or returns the bar color for the "Alarm High" limit value. LONG write-read access.

The "CheckAlarmHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "50 " and the bar color will change to Red.

```
Sub BarGraphLimitConfiguration()
'VBA449
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeAlarmHigh = False
'Activate monitoring
.CheckAlarmHigh = True
'Set barcolor to "red"
.ColorAlarmHigh = RGB(255, 0, 0)
'Set upper limit to "50"
.AlarmHigh = 50
End With
End Sub
```

ColorAlarmLow Property

Description

Defines or returns the bar color for the "Alarm Low" limit value. LONG write-read access.

The "CheckAlarmLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "10 " and the bar color will change to Red.

```
Sub BarGraphLimitConfiguration()
'VBA450
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeAlarmLow = False
'Activate monitoring
.CheckAlarmLow = True
'Set barcolor to "red"
.ColorAlarmLow = RGB(255, 0, 0)
'Set lower limit to "10"
.AlarmLow = 10
End With
End Sub
```

CheckAlarmLow Property (Page 3532)

BarGraph Object (Page 3286)

ColorBottom Property

Description

Defines or returns the color for the bottom/right stop of the slider object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the color for the lower/right view will be set to "Red":

```
Sub SliderConfiguration()
'VBA451
```

```
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.ColorBottom = RGB(255, 0, 0)
End With
End Sub
```

Slider object (Page 3428)

ColorChangeType Property

Description

TRUE if a color change in the BarGraph object (for instance when a limit value is reached) is to take place segment by segment. If set to FALSE, it defines the change of color for the entire bar. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures In this example the color change will apply to the whole bar:

```
Sub BarGraphLimitConfiguration()
'VBA452
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.ColorChangeType = False
End With
End Sub
```

ColorLimitHigh4 Property

Description

Defines or returns the color for the "Reserve 4" upper limit value. LONG write-read access.

The "CheckLimitHigh4" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "70 " and the bar color will change to Red.

```
Sub BarGraphLimitConfiguration()
'VBA453
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh4 = False
'Activate monitoring
.CheckLimitHigh4 = True
'Set barcolor to "red"
.ColorLimitHigh4 = RGB(255, 0, 0)
'Set upper limit to "70"
.LimitHigh4 = 70
End With
End Sub
```

ColorLimitHigh5 Property

Description

Defines or returns the color for the "Reserve 5" upper limit value. LONG write-read access.

The "CheckLimitHigh5" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "80" and the bar color will change to "Black".

```
Sub BarGraphLimitConfiguration()
'VBA454
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh5 = False
'Activate monitoring
.CheckLimitHigh5 = True
'Set barcolor to "black"
.ColorLimitHigh5 = RGB(0, 0, 0)
'Set upper limit to "80"
.LimitHigh5 = 80
End With
End Sub
```

ColorToleranceHigh Property

Description

Defines or returns the color for the "Tolerance High" high limit value. LONG write-read access.

The "CheckToleranceHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "45" and the bar color will change to "Yellow".

```
Sub BarGraphLimitConfiguration()
'VBA457
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeToleranceHigh = False
'Activate monitoring
.CheckToleranceHigh = True
'Set barcolor to "yellow"
.ColorToleranceHigh = RGB(255, 255, 0)
'Set upper limit to "45"
.ToleranceHigh = 45
End With
End Sub
```

ColorWarningHigh Property

Description

Defines or returns the color for the "Warning High" high limit value. LONG write-read access.

The "CheckWarningHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "75" and the bar color will change to "Red".

```
Sub BarGraphLimitConfiguration()
'VBA460
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeWarningHigh = False
'Activate monitoring
.CheckWarningHigh = True
'Set barcolor to "red"
.ColorWarningHigh = RGB(255, 0, 0)
'Set upper limit to "75"
.WarningHigh = 75
End With
End Sub
```

CheckWarningLow Property (Page 3539)

BarGraph Object (Page 3286)

CommonVBSCode Property

Description

Defines the higher-level common declaration section of the actions for the active picture or returns it.

The action editor of the Graphics Designer is used to configure actions at events and properties. In the declaration section of the actions, you can declare tags for a process image as well as create functions and procedures. In Runtime, each VBS action can access these tags, functions and procedures if the picture is active.

If you set "CommonVBSCode", the string is copied to the "Event" and "Property" declaration sections in the action editor. Any code there is overwritten. Therefore, set "CommonVBSCode" first before setting the subordinate declaration sections with "CommonVBSEventArea" or "CommonVBSPropertyArea".

Example

In the following example, a tag that is common to all picture objects is declared in the active picture. The common declaration section is then output :

```
Sub DefineTagInActiveDocument
ActiveDocument.CommonVBSCode = "DIM actionIsdone" & vbCrLf
MsgBox ActiveDocument.CommonVBSCode
End Sub
```

See also

Document Object (Page 3319)

CommonVBSEventArea property

Description

Defines the "Event" declaration section of the actions for the active picture or returns it.

The action editor of the Graphics Designer is used to configure actions, for example, at events. To this purpose, you can declare tags for a process image as well as create functions and procedures in the "Event" declaration section of the actions. In Runtime each VBS action that was configured for an event can access these tags, functions and procedures if the picture is active.

If you set "CommonVBSEventArea", the string is copied to the "Event" declaration section in the action editor. Any code there is overwritten. Therefore, first read the code set, for example with "CommonVBSCode" before you set the declaration section with "CommonVBSEventArea".

Example

In the following example, two tags are declared in the active picture. The "Event" declaration section is the output:

```
Sub DefineTagInActiveDocument
ActiveDocument.CommonVBSCode = "DIM actionIsdone" & vbCrLf
ActiveDocument.CommonVBSEventArea = ActiveDocument.CommonVBSEventArea & "DIM
"eventHasOccurred"
MsgBox ActiveDocument.CommonVBSEventArea
End Sub
```

CommonVBSPropertyArea property

Description

Defines the "Property" declaration section of the actions for the active picture or returns it.

The action editor of the Graphics Designer is used to configure actions for example at properties. To this purpose you can declare tags for a process image as well as create functions and procedures in the "Property" declaration section of the actions. In Runtime each VBS action that was configured for a property can access these tags, functions and procedures if the picture is active.

If you set "CommonVBSPropertyArea", the string is copied to the "Property" declaration section in the action editor. Any code there is overwritten. Therefore, first read the code set, for example with "CommonVBSCode" before you set the declaration section with "CommonVBSPropertyArea".

Example

In the following example, two tags are declared in the active picture. The "Property" declaration section is then output:

```
Sub DefineTagInActiveDocument
ActiveDocument.CommonVBSCode = "DIM actionIsdone" & vbCrLf
ActiveDocument CommonVBSPropertyArea = ActiveDocument.CommonVBSPropertyArea & "DIM
propertyIsChanged"
MsgBox ActiveDocument.CommonVBSPropertyArea
End Sub
```

CommandLine Property

Description

Returns the start parameter as a string if the application is opened via Start>Execute "Grafexe.exe start parameter". Read only access.

Example:

In this example a message containing the start parameter is output on opening the document.

```
Sub Document_Opened(CancelForwarding As Boolean)
'VBA462
MsgBox Application.Commandline
End Sub
```

See also

Application Object (Page 3282)

Compiled Property

Description

TRUE if the source code of a C script or VB script was successfully compiled. BOOLEAN read access.

Example:

In the following example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle will enlarge every time you click the button. A VB script will be used for this purpose:

```
Sub IncreaseCircleRadiusWithVBScript()
'VBA463
Dim objButton As HMIButton
Dim objCircleA As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Dim strCode As String
strCode = "Dim objCircle" & vbCrLf & "Set objCircle = "
strCode = strCode & "hmiRuntime.ActiveScreen.ScreenItems(""CircleVB"")"
strCode = strCode & vbCrLf & "objCircle.Radius = objCircle.Radius + 5"
Set objCircleA = ActiveDocument.HMIObjects.AddHMIObject("CircleVB", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircleA
.Top = 100
.Left = 100
End With
With objButton
.Top = 10
.Left = 10
.Width = 200
.Text = "Increase Radius"
End With
'On every mouseclick the radius will be increased:
```

```
Set objEvent = objButton.Events(1)
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
objVBScript.SourceCode = strCode
Select Case objVBScript.Compiled
Case True
MsgBox "Compilation OK!"
Case False
MsgBox "Errors by compilation!"
End Select
End Sub
```

See also

SourceCode Property (Page 3766)

ScriptInfo Object (Page 3424)

ConfigurationFileName Property

Description

Returns the file name and full path of the configuration file for the open project. STRING read access.

Example:

The "ShowConfigurationFileName() procedure outputs the configuration file path for the current picture:

```
Sub ShowConfigurationFileName()
'VBA464
MsgBox ActiveDocument.Application.ConfigurationFileName
End Sub
```

Application Property (Page 3484)

Application Object (Page 3282)

ConnectionPoints property

Description

Returns the number of connection points of an object.

Example: Number of connection points of a rectangle

In this example, a rectangle is inserted and the number of connection points is output:

```
Sub CountConnectionPoints()
'VBA229
Dim objRectangle As HMIRectangle
Dim objConnPoints As HMIConnectionPoints
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
Set objConnPoints = ActiveDocument.HMIObjects("Rectangle1").ConnectionPoints
MsgBox "Rectangle1 has " & objConnPoints.Count & " connectionpoints."
End Sub
```

ConnectorObjects property

Description

Only used internally.

ConnectorType property

Description

Defines the type of connector:

Automatic	Both objects are connected by a polyline made up of horizontal and vertical parts.
Simple	Both objects are connected by a straight line between the connecting points.

ControlType property

Description

Returns the name range of the control.

CopyPasteSettings property

Description

Only used internally.

See also

Application Object (Page 3282)

CornerRadius property

Description

Defines the rounding radius of the rectangle which enclose objects in the advanced analog display. The values are defined in pixels.

The range of values which can be displayed for the corner radius depends on the values set for the "height" and "width" properties. The maximum corner radius value which can be displayed is equivalent to 50% of the lower one of the "height" or "width" values. The maximum value is used if higher values are entered.

Count Property

Description

Returns the number of elements in the specified listing. LONG read access

Example:

In the following example a new picture will be created and a pair of objects will be inserted. The number of inserted objects will be output at the end:

```
Sub ObjectsInActiveDocument()
'VBA465
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objDocument As Document
Set objDocument = Application.Documents.Add(hmiOpenDocumentTypeVisible)
Dim iIndex As Integer
iIndex = 1
For iIndex = 1 To 5
Set objCircle = objDocument.HMIObjects.AddHMIObject("Circle" & iIndex, "HMICircle")
Set objRectangle = objDocument.HMIObjects.AddHMIObject("Rectangle" & iIndex,
"HMIRectangle")
With objCircle
.Top = (10 * iIndex)
.Left = (10 * iIndex)
End With
With objRectangle
.Top = ((10 * iIndex) + 50)
.Left = (10 * iIndex)
End With
Next iIndex
MsgBox "There are " & objDocument.HMIObjects.Count & " objects in the document"
End Sub
```

CQBackColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Came In Acknowledged" which color the background of the value to be displayed assumes for flashing status "Off" (CBackColorOff) or "On" (CBackColorOn) when the arrival of a message is acknowledged..

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

CQBackFlash property

Description

Specifies for the selected message type and status "Came In Acknowledged" whether the background of the value to be displayed flashes when the arrival of a message is acknowledged.

CQTextColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Came In Acknowledged" which color the text of the value to be displayed assumes for flashing status "Off" (CTextColorOff) or "On" (CTextColorOn) when the arrival of a message is acknowledged..

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

CQTextFlash property

Description

Specifies for the selected message type and status "Came In Acknowledged" whether the background of the text to be displayed flashes when the arrival of a message is acknowledged.

CTextColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Came In" which color the text of the value to be displayed assumes for flashing status "Off" (CTextColorOff) or "On" (CTextColorOn).

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

CTextFlash property

Description

Specifies for the selected message type and status "Came In" whether the text of the value to be displayed flashes when a message is received.

CurrentDataLanguage Property

Description

Defines the project language or returns the language identifier as a decimal value. LONG read-write access.

Example:

The "ShowDataLanguage()" procedure outputs the currently set project language:

```
Sub ShowDataLanguage()
```

```
'VBA466
MsgBox Application.CurrentDataLanguage
End Sub
```

See also

Application Property (Page 3484)

DataLanguageChanged Event (Page 3141)

Language-Dependent Configuration with VBA (Page 3018)

CurrentDesktopLanguage Property

Description

Returns the language identifier of the currently set user interface language as a decimal value. LONG read access.

Example:

The "ShowDesktopLanguage()" procedure outputs the currently set user interface language:

```
Sub ShowDesktopLanguage()
'VBA467
MsgBox Application.CurrentDesktopLanguage
End Sub
```

See also

Application Property (Page 3484)

Language-Dependent Configuration with VBA (Page 3018)

CursorControl Property

Description

TRUE, when Alpha Cursor mode is activated, the cursor skips to the next field in the TAB sequence after exiting the field. BOOLEAN write-read access.

The CursorMode property must be set to TRUE.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the cursor will skip into the next field when another field is exited. For this to work, the Cursor mode property must first be set to TRUE.

```
Sub IOFieldConfiguration()
'VBA468
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
Application.ActiveDocument.CursorMode = True
With objIOField
.CursorControl = True
End With
End Sub
```

IOField Object (Page 3361)

CursorMode Property

Description

TRUE if the "Alpha Cursor" mode is to be activated. FALSE if the "Tab order" mode is to be activated. BOOLEAN write-read access.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the "Alpha Cursor" mode will be activated:

```
Sub ActiveDocumentConfiguration()
'VBA469
Application.ActiveDocument.CursorMode = True
End Sub
```

See also

CursorControl Property (Page 3564)

ActiveDocument Property (Page 3472)

Documents Object (Listing) (Page 3322)

CustomMenus Property

Description

Returns a listing of the available user-defined menus.

Example:

The "ShowCustomMenuInformation()" procedure outputs the Key and Label of all user-defined menus in the current picture:

```
Sub ShowCustomMenuInformation()
'VBA470
Dim strKey As String
Dim strLabel As String
Dim strOutput As String
Dim iIndex As Integer
For iIndex = 1 To ActiveDocument.CustomMenus.Count
strKey = ActiveDocument.CustomMenus(iIndex).Key
strLabel = ActiveDocument.CustomMenus(iIndex).Label
strOutput = strOutput & vbCrLf & "Key: " & strKey & "  Label: " & strLabel
Next iIndex
If 0 = ActiveDocument.CustomMenus.Count Then
strOutput = "There are no custommenus for the document created."
End If
MsgBox strOutput
End Sub
```

See also

Application Property (Page 3484)

ActiveDocument Property (Page 3472)

Menu Object (Page 3378)

CustomToolbars Property

Description

Returns a listing of the available user-defined toolbars.

Example:

The "ShowCustomToolbarInformation()" procedure outputs the Key values of all user-defined toolbars in the current picture:

```
Sub ShowCustomToolbarInformation()
'VBA471
Dim strKey As String
Dim strOutput As String
Dim iIndex As Integer
For iIndex = 1 To ActiveDocument.CustomToolbars.Count
strKey = ActiveDocument.CustomToolbars(iIndex).Key
strOutput = strOutput & vbCrLf & "Key: " & strKey
Next iIndex
If 0 = ActiveDocument.CustomToolbars.Count Then
strOutput = "There are no toolbars created for this document."
End If
MsgBox strOutput
End Sub
```

Toolbar Object (Page 3445)

CycleName Property

Description

Returns the name of the specified tag trigger. Read only access.

Example:

--

See also

VariableTrigger Object (Page 3464)

CycleTime Property

Description

Returns the cycle time of the specified tag trigger. Read only access.

Example:

--

See also

VariableTrigger Object (Page 3464)

CycleType Property

Description

Defines or returns the cycle type.

Example:

The "DynamicToRadiusOfNewCircle(hmiCircle As IHMICircle)" procedure creates a dynamic for the radius of a circle. In this example the radius of the circle will be set every two seconds:

```
Sub DynamicToRadiusOfNewCircle()
'VBA474
Dim objCircle As hmiCircle
Dim VariableTrigger As HMIVariableTrigger
Set objCircle = Application.ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
Set VariableTrigger = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVariableDirect,
"NewDynamic1")
VariableTrigger.CycleType = hmiVariableCycleType_2s
End Sub
```

See also

VariableTrigger Object (Page 3464)

Configuring Dynamics in the Properties of Pictures and Objects (Page 3080)

6.1.8.4 D

DataFormat Property

Description

Defines or returns the data type of the IOField object. Value range from 0 to 3.

Data type	Assigned Value
Binary	0
Decimal	1
String	2
Hexadecimal	3

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, data type "Decimal" will be set for the I/O field:

```
Sub IOFieldConfiguration()
'VBA475
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.DataFormat = 1
End With
End Sub
```

See also

IOField Object (Page 3361)

DefaultHMIObjects Property

Description

Returns the HMIDefaultObjects listing.

Example:

The "ShowDefaultObjectNames()" procedure outputs all the object names contained in the HMIDefaultObjects listing:

```
Sub ShowDefaultObjectNames()
'VBA476
Dim strOutput As String
Dim iIndex As Integer
For iIndex = 1 To Application.DefaultHMIObjects.Count
strOutput = strOutput & vbCrLf & Application.DefaultHMIObjects(iIndex).ObjectName
Next iIndex
MsgBox strOutput
End Sub
```

See also

HMIDefaultObjects Object (Listing) (Page 3354)

DestinationLink Property

Description

Returns the Destination object. Use the DestinationLink property to configure the destination object in the case of a direct connection.

Example:

Use the DestinationLink property to return the DestLink object. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA477
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
```

```
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 100
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

See also

AutomationName Property (Page 3488)

ObjectName Property (Page 3698)

Type Property (Page 3790)

DirectConnection Object (Page 3318)

Direction Property

Description

Defines or returns the bar direction. BOOLEAN write-read access.

Slider

Defines or returns the position of the Slider object. BOOLEAN write-read access.

Position/Bar Axis	Assigned Value
Vertical/Negative	TRUE
Horizontal/Positive	FALSE

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the position of the Slider object will be set to "Vertical":

```
Sub SliderConfiguration()
'VBA478
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.Direction = True
End With
End Sub
```

See also

Slider object (Page 3428)

3DBarGraph Object (Page 3267)

DisablePerformanceWarnings property

Description

Only used internally.

See also

Application Object (Page 3282)

DisableVBAEvents Property

Description

TRUE if Event Handling is disabled. BOOLEAN write-read access.

Example:

The "DisableVBAEvents()" procedure disables Event Handling:

```
Sub DisableVBAEvents()
'VBA479
Application.DisableVBAEvents = False
End Sub
```

See also

Application Object (Page 3282)

Event Handling (Page 3103)

Display property

Description

Only used internally.

See also

ObjConnection object (Page 3388)

DisplayName Property

Description

Returns the name of the property attribute. STRING read access.

Thus the expression "MsgBox ActiveDocument.HMIObjects("Circle_1").Properties("Height").DisplayName" would output the result "Height".

Example:

The "ShowAllObjectDisplayNames()" procedure outputs all the property attribute names of standard objects contained in the message box:

```
Sub ShowAllObjectDisplayNames()
'VBA480
Dim strOutput As String
Dim iIndex1 As Integer
iIndex1 = 1
strOutput = "List of all properties-displaynames from object """ &
Application.DefaultHMIObjects(1).ObjectName & """" & vbCrLf & vbCrLf
For iIndex1 = 1 To Application.DefaultHMIObjects(1).Properties.Count
strOutput = strOutput & Application.DefaultHMIObjects(1).Properties(iIndex1).DisplayName &
" / "
Next iIndex1
MsgBox strOutput
End Sub
```

See also

Property Object (Page 3409)

DisplayOptions Property

Description

Defines the assignment of the "Button" or "Round button" object or returns its value. Value range from 0 to 3.

Assignment	Assigned Value
Graphic or text	0
Graphic and text	1
Text only	2
Graphic only	3

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button.

In this example the button is assigned "Graphic and text":

```
Sub ButtonConfiguration()
'VBA814
Dim objbutton As HMIButton
Set objbutton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objbutton
.DisplayOptions = 1
End With
End Sub
```

See also

Button Object (Page 3293)

DisplayText Property

Description

Returns the value for the "Label" or "TooltipText" property of the following objects (STRING read access):

- Menu Object
- MenuItem Object
- ToolbarItem Object

Example:

The "ShowLabelTexts()" procedure outputs all the labels of the first user-defined menu in the current picture:

```
Sub ShowLabelTexts()
'VBA481
Dim objLangText As HMILanguageText
Dim iIndex As Integer
For iIndex = 1 To ActiveDocument.CustomMenus(1).LDLabelTexts.Count
Set objLangText = ActiveDocument.CustomMenus(1).LDLabelTexts(iIndex)
MsgBox objLangText.DisplayName
Next iIndex
End Sub
```

ToolbarItem Object (Page 3448)

LanguageText Object (Page 3368)

MenuItem Object (Page 3382)

Menu Object (Page 3378)

Documents Property

Description

Returns the Documents listing containing all open pictures. The open pictures are in chronological order.

Example:

In the following example the names of all open pictures are output:

```
Sub ShowDocuments()
'VBA482
Dim colDocuments As Documents
Dim objDocument As Document
Dim strOutput As String
Set colDocuments = Application.Documents
strOutput = "List of all opened documents:" & vbCrLf
For Each objDocument In colDocuments
strOutput = strOutput & vbCrLf & objDocument.Name
Next objDocument
MsgBox strOutput
```

```
End Sub
```

See also

Application Property (Page 3484)

Application Object (Page 3282)

DrawInsideFrame property

Description

Defines for all line thicknesses greater than "1" whether the border lines are to be drawn inside the object frame or symmetrically on the frame.

Yes	The border lines are drawn inside the object frame.
No	The border lines are drawn symmetrically on the object frame.

DropDownListStyle property

Description

Defines whether the entries in the "TextList" object are displayed in a drop-down list box.

Dynamic Property

Description

Returns the dynamics of a property.

Example:

Use the Dynamic property if you wish to return, say, an existing dynamic. In the following example all possibly available object property dynamics are output in the active picture:

```
Sub ShowPropertiesDynamicsofAllObjects()
'VBA483
Dim objObject As HMIObject
Dim colObjects As HMIObjects
Dim colProperties As HMIProperties
Dim objProperty As HMIProperty
Dim strOutput As String
Set colObjects = Application.ActiveDocument.HMIObjects
For Each objObject In colObjects
```

```
Set colProperties = objObject.Properties
For Each objProperty In colProperties
If 0 <> objProperty.DynamicStateType Then
  strOutput = strOutput & vbCrLf & objObject.ObjectName & " - " & objProperty.DisplayName
& ": Statetype " & objProperty.Dynamic.DynamicStateType
End If
Next objProperty
Next objObject
MsgBox strOutput
End Sub
```

See also

Property Object (Page 3409)

DynamicStateType property

Description

Only used internally.

See also

VBA Reference: ActionDynamic (Page 3126)

6.1.8.5 E

EditAtOnce Property

Description

TRUE, if accessing the field with the <TAB> key permits input immediately and without further action. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example it shall be possible to enter input on skipping into the I/O field:

```
Sub IOFieldConfiguration()
'VBA484
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.EditAtOnce = True
```

```
End With
End Sub
```

See also

TextList Object (Page 3441)

IOField Object (Page 3361)

ElseCase Property

Description

Defines or returns the value for the dynamic property outside of the configured value range.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and three analog value ranges will be created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA485
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

See also

AnalogResultInfos Object (Listing) (Page 3281)

AnalogResultInfo Object (Page 3280)

Add Method (AnalogResultInfos Listing) (Page 3166)

Enabled Property

Description

TRUE if the menu, the menu entry or the icon is activated and can be selected. Applies only to user-defined menus and toolbars. BOOLEAN write-read access.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"): In this example the second menu point in user-defined menu "Delete Objects" is grayed out and cannot be selected in the Graphics Designer:

```
Sub DisableMenuItem()
'VBA486
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
'
'Add a new menu "Delete objects"
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to the new menu
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete circles")
'
'Disable menuitem "Delete circles"
With ActiveDocument.CustomMenus("DeleteObjects").MenuItems("DeleteAllCircles")
.Enabled = False
End With
End Sub
```

See also

ToolbarItem Object (Page 3448)

MenuItem Object (Page 3382)

Menu Object (Page 3378)

Configuring Menus and Toolbars (Page 3020)

EnableFlashing property

Description

Specifies whether the value for status "OK" and "Simulation" appears flashing or not in the advanced analog display in Runtime.

For the flashing to be visible in Runtime, the font flashing color must be different to the background flashing color.

EndAngle Property

Description

Defines or returns the end of the object for the CircularArc, EllipseArc, EllipseSegment and PieSegment objects. The information is in counterclockwise direction in degrees, beginning at the 12:00 clock position.

Example:

The "PieSegmentConfiguration()" procedure accesses the properties of the Pie Segment. In this example the pie segment begins at 40° and ends at 180°:

```
Sub PieSegmentConfiguration()
'VBA487
Dim objPieSegment As HMIPieSegment
Set objPieSegment = ActiveDocument.HMIObjects.AddHMIObject("PieSegment1", "HMIPieSegment")
With objPieSegment
.StartAngle = 40
.EndAngle = 180
End With
End Sub
```

See also

StartAngle Property (Page 3767)

PieSegment Object (Page 3399)

EllipseSegment Object (Page 3333)

EllipseArc Object (Page 3330)

CircularArc Object (Page 3303)

EventQuitMask property

Description

The events "Operator request" and "Measuring point blocked" are not acknowledgeable events in the PCS 7 environment. Using the "@EventQuit" tag and the "EventQuitMask" property in Runtime, these events are automatically indicated as acknowledged to prevent flashing during the calculation of the group displays. The start value of the attribute is then 0x00000011 (17). The value of the "EventQuitMask" property should be identical for all group display objects, advanced analog display and advanced status display, and for the "@EventQuit" tag.

By setting further acknowledgment bits, you can indicate other events as being acknowledged as well with the display of the group display object and the advanced analog and status display.

Events Property

Description

Returns the Events listing. Use the Events property to define the event that will trigger an action. Use the index number to define the event that is intended to be configured:

- You configure an action on a property with VBA by using the "Events(9)" property, where the index "1" stands for the event "Upon change":
- To configure an action onto an object with the aid of VBA, use the "Events(Index)" property, where "Index" stands for the trigger event (see table):

Index	EventType (depending upon the object used)
0	hmiEventTypeNotDefined
1	hmiEventTypeMouseClick
2	hmiEventTypeMouseLButtonDown
3	hmiEventTypeMouseLButtonUp
4	hmiEventTypeMouseRButtonDown
5	hmiEventTypeMouseRButtonUp
6	hmiEventTypeKeyboardDown
7	hmiEventTypeKeyboardUp
8	hmiEventTypeFocusEnter
9	hmiEventTypeObjectChange
10	hmiEventTypeOpenPicture
11	hmiEventTypePictureOpen
12	hmiEventTypePictureClose
13	hmiEventTypeObjectDefined
14	hmiEventTypeFocusEnter
15	hmiEventTypeLastTriggerType
16	hmiEventTypeObjSpecificTriggerStart

Example:

In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA488
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
```

```
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 100
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

See also

Events Object (Listing) (Page 3337)

Configuring Event-Driven Actions with VBA (Page 3092)

EventName property

Description

Returns the name of the "Event" object.

Example

In this example the event names and event types of all objects in the active pictures are put out. In order for this example to work, insert some objects into the active picture and configure different events.

```
Sub ShowEventsOfAllObjectsInActiveDocument()
'VBA252
Dim colEvents As HMIEvents
Dim objEvent As HMIEvent
Dim iMax As Integer
Dim iIndex As Integer
Dim iAnswer As Integer
Dim strEventName As String
Dim strObjectName As String
Dim varEventType As Variant
iIndex = 1
iMax = ActiveDocument.HMIObjects.Count
For iIndex = 1 To iMax
Set colEvents = ActiveDocument.HMIObjects(iIndex).Events
strObjectName = ActiveDocument.HMIObjects(iIndex).ObjectName
For Each objEvent In colEvents
strEventName = objEvent.EventName
varEventType = objEvent.EventType
iAnswer = MsgBox("Objectname: " & strObjectName & vbCrLf & "Eventtype: " & varEventType &
vbCrLf & "Eventname: " & strEventName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objEvent
If vbCancel = iAnswer Then Exit For
Next iIndex
End Sub
```

EventType Property

Description

Returns the event type that is configured on the specified object.

Index	EventType (depending upon the object used)
0	hmiEventTypeNotDefined
1	hmiEventTypeMouseClick
2	hmiEventTypeMouseLButtonDown
3	hmiEventTypeMouseLButtonUp
4	hmiEventTypeMouseRButtonDown
5	hmiEventTypeMouseRButtonUp
6	hmiEventTypeKeyboardDown
7	hmiEventTypeKeyboardUp
8	hmiEventTypeFocusEnter
9	hmiEventTypeObjectChange

Index	EventType (depending upon the object used)
10	hmiEventTypeOpenPicture
11	hmiEventTypePictureOpen
12	hmiEventTypePictureClose
13	hmiEventTypeObjectDefined
14	hmiEventTypeFocusEnter
15	hmiEventTypeLastTriggerType
16	hmiEventTypeObjSpecificTriggerStart

Example:

Use the EventType property to edit a previously configured event. In the following example the event "Mouse Action" will be configured, but then changed to "Pressed":

```
Sub AddActionToObjectTypeCScript()
'VBA489
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
'
'C-action is initiated by click on object circle
Set objEvent = objCircle.Events(1)
Set objCScript = objEvent.Actions.AddAction(hmiActionCreationTypeCScript)
MsgBox "the type of the projected event is " & objEvent.EventType
End Sub
```

See also

Events Object (Listing) (Page 3337)

Configuring Event-Driven Actions with VBA (Page 3092)

Exponent Property

Description

TRUE if numbers are to be displayed on the BarGraph object using exponents (e.g. "1.00e +000"). BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example numbers are to be displayed on the bar using exponents:

```
Sub BarGraphConfiguration()
```

```
'VBA490
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Exponent = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

ExtendedOperation Property

Description

TRUE if the slider on the Slider object is set to the associated end value (minimum value/ maximum value). This is done by clicking the mouse in an area outside the current regulator setting. BOOLEAN write-read access.

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the ExtendedOperation property will be set to TRUE:

```
Sub SliderConfiguration()
'VBA491
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.ExtendedOperation = True
End With
End Sub
```

See also

Slider object (Page 3428)

ExtendedZoomingEnable Property

Description

TRUE, if the selected process picture in Runtime may be zoomed in or out using the mouse wheel. This happens by pushing the <CTRL> key while the mouse wheel is turned. If the mouse wheel is turned away from the palm of the hand, the zoom factor increases.

BOOLEAN write-read access.

Requirements for using the zoom function:

- Mouse driver by Logitech or Microsoft Intellimouse
- Mouse wheel must be set to "Autoscroll".
- In the computer properties, the "Graphics Runtime" tab control must have the "Extended zooming" function enabled for all process pictures.

Example:

The procedure "DocConfiguration()" accesses picture properties.

In this example, the property ExtendedZoomingEnable is set to TRUE:

```
Sub DocConfiguration()
'VBA815
Dim objDoc As Document
Set objDoc = ActiveDocument
With objDoc
.ExtendedZoomingEnable = True
End With
End Sub
```

6.1.8.6 F

FaceplateType property

Description

Sets the faceplate type of the faceplate instance and returns its name. The faceplate type is "Const" and can therefore only be set once.

Usage

Use the Add method to create a new "faceplate instance" object in a picture. "Properties.Item(3)" is used to access the FaceplateType property:

```
Sub FaceplateInstance_and_Properties()
'VBA847
Dim objFaceplateInstance As HMIFaceplateObject

Set objFaceplateInstance = ActiveDocument.HMIObjects.AddHMIObject("faceplate instance",
"HMIFaceplateObject")
objFaceplateInstance.Properties.Item(3).value = "Faceplate1.fpt"
MsgBox "Faceplate """ & objFaceplateInstance.Properties.Item(3).value & """ is used."
```

```
End Sub
```

Family Property

Description

Defines or returns the language-dependent font.

Example:

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA492
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Dim iStartLangID As Integer
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
iStartLangID = Application.CurrentDataLanguage
With objButton
.Text = "Command"
.Width = 100
End With
Set colLangFonts = objButton.LDFonts
'
'To do typesettings for french:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'
'To do typesettings for english:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
With objButton
Application.CurrentDataLanguage = 1036
.Text = "Command"
MsgBox "Datalanguage is changed in french"
Application.CurrentDataLanguage = 1033
.Text = "Command"
MsgBox "Datalanguage is changed in english"
Application.CurrentDataLanguage = iStartLangID
MsgBox "Datalanguage is changed back to startlanguage."
```

```
End With
End Sub
```

FillBackColor property

Description

Only used internally.

See also

Document Object (Page 3319)

FillColor Property

Description

Defines or returns the fill pattern color for the object. LONG read-write access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the background color will be set to "Yellow".

```
Sub RectangleConfiguration()
'VBA493
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FillColor = RGB(255, 255, 0)
End With
End Sub
```

3DBarGraph Object (Page 3267)

Filling Property

Description

TRUE if an object with closed frame lines (such as a Circle or Rectangle) can be filled (as in the fill level of a tank, for example). BOOLEAN write-read access.

To set the fill level of the object, use the FillingIndex property.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example a rectangle can be used to display the fill level:

```
Sub RectangleConfiguration()
'VBA494
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.Filling = True
End With
End Sub
```

Ellipse Object (Page 3327)

Circle Object (Page 3300)

CheckBox Object (Page 3297)

Button Object (Page 3293)

FillingIndex Property

Description

Defines the percentage value (relative to the height of the object) to which to fill an object with closed frame lines (such as a Circle or Rectangle).

The fill level is represented by the current background color. The unfilled background is transparent.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the rectangle will be filled to 50%:

```
Sub RectangleConfiguration()
'VBA495
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.Filling = True
.FillingIndex = 50
End With
End Sub
```

CheckBox Object (Page 3297)

Button Object (Page 3293)

FillingDirection property

Description

0 = the object enclosed in a frame line is filled from bottom to top.

1 = the object enclosed in a frame line is filled from top to bottom.

2 = the object enclosed in a frame line is filled from left to right.

3 = the object enclosed in a frame line is filled from right to left.

Write/Read access.
Use the "FillingDirection" property to set the object fill direction.

Example

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example, the object is filled from left to right.

```
Sub RectangleConfiguration()
'VBA906
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FillingDirection = 2
End With
End Sub
```

FillStyle Property

Description

Defines or returns the fill style for the object.

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
< Transparent >	65536				
< Solid >	0				
	1048576		196611		196627
	1048577		196612		196628
	1048578		196613		196629
	1048579		196614		196630

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	1048832		196615		196631
	1048833		196616		196632
	1048834		196617		196633
	1048835		196618		196634
	131072		196619		196635
	131073		196620		196636
	131074		196621		196637
	131075		196622		196638
	131076		196623		196639
	196608		196624		196640
	196609		196625		196641
	196610		196626		196642

Example

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the fill pattern will be set to the value "196642":

```
Sub RectangleConfiguration()
'VBA496
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FillStyle = 196642
End With
End Sub
```

Button Object (Page 3293)
BarGraph Object (Page 3286)

FillStyle2 Property

Description

Defines or returns the fill pattern of the bar for the BarGraph object.

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
< Transparent >	65536				
< Solid >	0				
	1048576		196611		196627
	1048577		196612		196628
	1048578		196613		196629
	1048579		196614		196630

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	1048832		196615		196631
	1048833		196616		196632
	1048834		196617		196633
	1048835		196618		196634
	131072		196619		196635
	131073		196620		196636
	131074		196621		196637
	131075		196622		196638
	131076		196623		196639
	196608		196624		196640
	196609		196625		196641
	196610		196626		196642

Example

The "BarGraphConfiguration()" procedure configures In this example the bar pattern will be set to "196642":

```
Sub BarGraphConfiguration()
'VBA497
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.FillStyle2 = 196642
End With
End Sub
```

See also

BarGraph Object (Page 3286)

FillStyleAlignment property

Description

Defines the alignment of the fill pattern for the process picture.

Normal	The fill pattern refers to the process picture. In runtime, no scaling is performed when opening the picture.
Stretched (window)	The fill pattern refers to the window in the Graphics Designer. In runtime, scaling is performed when opening the picture.

FlashBackColor Property

Description

TRUE, when flashing of the background is activated. BOOLEAN write-read access

Note

A change to the attribute does not automatically deactivate the "Windows Style" attribute.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example, background flashing is activated:

```
Sub RectangleConfiguration()
'VBA498
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FlashBackColor = True
End With
End Sub
```

CheckBox Object (Page 3297)

Button Object (Page 3293)

BarGraph Object (Page 3286)

FlashBorderColor Property

Description

TRUE, when flashing of the object lines is activated. BOOLEAN write-read access.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example, flashing of the border is activated:

```
Sub RectangleConfiguration()
'VBA499
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FlashBorderColor = True
End With
End Sub
```

FlashFlashPicture Property

Description

TRUE, when flashing of the flash picture is activated. BOOLEAN write-read access

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example, flashing of the Flash Picture is activated:

```
Sub StatusDisplayConfiguration()
'VBA500
Dim objsDisplay As HMIStatusDisplay
Set objsDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objsDisplay
.FlashFlashPicture = True
End With
End Sub
```

See also

StatusDisplay Object (Page 3436)

FlashForeColor Property

Description

TRUE, when flashing of the text is activated. BOOLEAN write-read access.

Note

A change to the attribute does not automatically deactivate the "Windows Style" attribute.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example, text flashing is activated:

```
Sub ButtonConfiguration()
'VBA501
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FlashForeColor = True
End With
End Sub
```

OptionGroup Object (Page 3393)

IOField Object (Page 3361)

CheckBox Object (Page 3297)

Button Object (Page 3293)

FlashPicReferenced Property

Description

TRUE if the Flash Picture assigned in the Status Display object is to be saved. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the picture assigned in the Status Display object is to be saved.

```
Sub StatusDisplayConfiguration()
'VBA502
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
.FlashPicReferenced = True
End With
End Sub
```

See also

StatusDisplay Object (Page 3436)

FlashPicTransColor Property

Description

Defines which color of the bitmap object (.bmp, .dib) assigned to the flash picture should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "FlashPicUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the color "Yellow" will be set to "Transparent".

```
Sub StatusDisplayConfiguration()
'VBA503
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
.FlashPicTransColor = RGB(255, 255, 0)
.FlashPicUseTransColor = True
```

```
End With
End Sub
```

See also

FlashPicUseTransColor Property (Page 3602)

StatusDisplay Object (Page 3436)

FlashPicture Property

Description

Defines or returns the Flash Picture for the Status Display object.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

The "FlashPicReferenced" property defines in this case whether the flash picture will be saved with the Status Display object or referenced.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the picture "Testpicture.BMP" will be used as the flash picture:

```
Sub StatusDisplayConfiguration()
'VBA504
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
'
'To use this example copy a Bitmap-Graphic
'to the "GraCS"-Folder of the actual project.
'Replace the picturename "Testpicture.BMP" with the name of
'the picture you copied
.FlashPicture = "Testpicture.BMP"
End With
End Sub
```

See also

FlashPicReferenced Property (Page 3599)

StatusDisplay Object (Page 3436)

FlashPicture property

Description

Specifies which flashing picture is to be displayed for the currently selected status. Pictures with the following formats can be inserted: EMF, WMF, BMP, GIF, JPG.

The flash picture should have the same picture size as the basic picture, otherwise its display is distorted.

FlashPictureState property

Description

Only used internally.

See also

AdvancedStateDisplay object (Page 3278)

FlashPicUseTransColor Property

Description

TRUE, when the configured color ("FlashPicTransColor" property) of the bitmap objects assigned to the flash picture should be set to "transparent". BOOLEAN write-read access.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the color "Yellow" will be set to "Transparent":

```
Sub StatusDisplayConfiguration()
'VBA505
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
.FlashPicTransColor = RGB(255, 255, 0)
.FlashPicUseTransColor = True
End With
End Sub
```

See also

FlashPicTransColor Property (Page 3600)

StatusDisplay Object (Page 3436)

FlashRate Property

Description

Defines or returns the flash frequency of the "GroupDisplay", "AdvancedAnalogDisplay" and "AdvancedStateDisplay" objects. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the flash frequency will be set to "Medium":

```
Sub GroupDisplayConfiguration()
'VBA506
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.FlashRate = 1
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

FlashRateBackColor Property

Description

Defines or returns the flash frequency for the object background. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the flash frequency for the background will be set to "Medium":

```
Sub ButtonConfiguration()
'VBA507
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FlashRateBackColor = 1
End With
End Sub
```

FlashRateBorderColor Property

Description

Defines or returns the flash frequency for the lines of the object. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the flash frequency for the border will be set to "Medium":

```
Sub ButtonConfiguration()
'VBA508
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FlashRateBorderColor = 1
End With
End Sub
```

FlashRateFlashPic Property

Description

Defines or returns the flash frequency for the status display. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the status display. In this example the flash frequency for the flash picture will be set to "Medium":

```
Sub StatusDisplayConfiguration()
'VBA509
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
.FlashRateFlashPic = 1
End With
End Sub
```

See also

StatusDisplay Object (Page 3436)

FlashRateForeColor Property

Description

Defines or returns the flash frequency for the object label. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.5 Hz)	0
Medium (approx. 2 Hz)	1
Fast (approx. 8 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the flash frequency for the label will be set to "Medium":

```
Sub ButtonConfiguration()
'VBA510
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FlashRateForeColor = 1
End With
End Sub
```

AdvancedAnalogDisplay object (Page 3274)

Folder Property

Description

Returns a folder from the components library.

Example:

The "ShowFolderItems()" procedure accesses the symbol libraries. In this example all the folder names in the global symbol library and project symbol library will be output:

```
Sub ShowFolderItems()
'VBA511
Dim colFolderItems As HMIFolderItems
Dim objFolderItem As HMIFolderItem
Dim iAnswer As Integer
Dim iMaxFolder As Integer
Dim iMaxSymbolLib As Integer
Dim iSymbolLibIndex As Integer
Dim iSubFolderIndex As Integer
Dim strSubFolderName As String
Dim strFolderItemName As String
'To determine the number of symbollibraries:
iMaxSymbolLib = Application.SymbolLibraries.Count
iSymbolLibIndex = 1
For iSymbolLibIndex = 1 To iMaxSymbolLib
With Application.SymbolLibraries(iSymbolLibIndex)
Set colFolderItems = .FolderItems
'
'To determine the number of folders in actual symbollibrary:
iMaxFolder = .FolderItems.Count
MsgBox "Number of FolderItems in " & .Name & " : " & iMaxFolder
'
'Output of all subfoldernames from actual folder:
For Each objFolderItem In colFolderItems
  iSubFolderIndex = 1
  For iSubFolderIndex = 1 To iMaxFolder
    strFolderItemName = objFolderItem.DisplayName
    If 0 <> objFolderItem.Folder.Count Then
      strSubFolderName = objFolderItem.Folder(iSubFolderIndex).DisplayName
      iAnswer = MsgBox("SymbolLibrary: " & .Name & vbCrLf & "act. Folder: " &
strFolderItemName & vbCrLf & "act. Subfolder: " & strSubFolderName, vbOKCancel)
      '
      'If "Cancel" is clicked, continued with next FolderItem
      If vbCancel = iAnswer Then
        Exit For
      End If
    Else
      MsgBox "There are no subfolders in " & objFolderItem.DisplayName
      Exit For
    End If
  Next iSubFolderIndex
Next objFolderItem
End With
Next iSymbolLibIndex
End Sub
```

FolderItems Property

Description

Returns a listing containing all the folders in the symbol library.

Example:

The "ShowFolderItems()" procedure accesses the symbol libraries. In this example all the folder names in the global symbol library and project symbol library will be output:

```
Sub ShowFolderItems()
'VBA512
Dim colFolderItems As HMIFolderItems
Dim objFolderItem As HMIFolderItem
Dim iAnswer As Integer
Dim iMaxFolder As Integer
Dim iMaxSymbolLib As Integer
Dim iSymbolLibIndex As Integer
Dim iSubFolderIndex As Integer
Dim strSubFolderName As String
Dim strFolderItemName As String
'To determine the number of symbollibraries:
iMaxSymbolLib = Application.SymbolLibraries.Count
iSymbolLibIndex = 1
For iSymbolLibIndex = 1 To iMaxSymbolLib
With Application.SymbolLibraries(iSymbolLibIndex)
Set colFolderItems = .FolderItems
'
'To determine the number of folders in actual symbollibrary:
iMaxFolder = .FolderItems.Count
MsgBox "Number of FolderItems in " & .Name & " : " & iMaxFolder
'
'Output of all subfoldernames from actual folder:

  iSubFolderIndex = 1
  For iSubFolderIndex = 1 To iMaxFolder
    strFolderItemName = objFolderItem.DisplayName
    If 0 <> objFolderItem.Folder.Count Then
      strSubFolderName = objFolderItem.Folder(iSubFolderIndex).DisplayName
      iAnswer = MsgBox("SymbolLibrary: " & .Name & vbCrLf & "act. Folder: " &
strFolderItemName & vbCrLf & "act. Subfolder: " & strSubFolderName, vbOKCancel)
```

```
      '
      'If "Cancel" is clicked, continued with next FolderItem
      If vbCancel = iAnswer Then
      Exit For
End If
Else
      MsgBox "There are no subfolders in " & objFolderItem.DisplayName
      Exit For
End If
  Next iSubFolderIndex
Next objFolderItem
End With
Next iSymbolLibIndex
End Sub
```

FontBold Property

Description

TRUE, when the text in the object should be assigned the "bold" attribute. BOOLEAN write-read access.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font attribute will be set to "Bold":

```
Sub ButtonConfiguration()
'VBA513
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FontBold = True
End With
End Sub
```

FontItalic Property

Description

TRUE, when the text in the object should be assigned the "italic" attribute. BOOLEAN write-read access.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font attribute will be set to "Italic":

```
Sub ButtonConfiguration()
'VBA514
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FontItalic = True
End With
End Sub
```

FontName Property

Description

Defines or returns the font name of the text in the object.

All the fonts installed in Windows are available for selection.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font is set to Arial:

```
Sub ButtonConfiguration()
'VBA515
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FontName = "Arial"
End With
End Sub
```

FontSize Property

Description

Defines or returns the font size of the text in the object in points.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font size will be set to 10 points:

```
Sub ButtonConfiguration()
'VBA516
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FONTSIZE = 10
End With
End Sub
```

FontUnderline Property

Description

TRUE, when the text in the object should be assigned the "underline" attribute. BOOLEAN write-read access.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font attribute will be set to "Underline":

```
Sub ButtonConfiguration()
'VBA517
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FontUnderline = True
End With
```

```
End Sub
```

CheckBox Object (Page 3297)

Button Object (Page 3293)

BarGraph Object (Page 3286)

ForeColor Property

Description

Defines or returns the color of the font for the text in the object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font color will be set to "Red":

```
Sub ButtonConfiguration()
'VBA518
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.ForeColor = RGB(255, 0, 0)
End With
End Sub
```

ForeColor_Alarm.._Warning property

Description

Defines the color used for the foreground of one of the following states or message types:

- Alarm
- Warning
- Tolerance
- AS Process Control Error
- AS Control System Fault
- Operator request
- OK
- Simulation

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

ForeFlashColorOff Property

Description

Defines or returns the color of the text for flash status "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font color when the flash status is "Off" will be set to "Red":

```
Sub ButtonConfiguration()
'VBA519
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.ForeFlashColorOff = RGB(255, 0, 0)
End With
End Sub
```

ForeFlashColorOn Property

Description

Defines or returns the color of the text for flash status "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font color when the flash status is "On" will be set to "White":

```
Sub ButtonConfiguration()
'VBA520
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.ForeFlashColorOn = RGB(255, 255, 255)
End With
End Sub
```

Format property

Description

Specifies the format in which the value is displayed in the advanced analog display.

No Character	Displays the number without formatting.
(0)	Displays a digit or a zero.
(#)	Displays a digit or no output.
(.)	Placeholder for decimal character.
(%)	Placeholder for percentage.
(,)	Thousand separator.
((E- E+ e- e+)	Scientific format.
- + $ ( )	Display of a literal character.
(\ )	Display the next character in the format character sequence.
("ABC")	Displays the string in inverted commas (" ").

6.1.8.7 G-H

GlobalColorScheme property

Description

Defines whether the colors defined for the current design in the global color scheme will be used for this object.

yes	Uses the colors from the global color scheme defined for this type of object.
No	Uses the colors from the color scheme defined for this type of object under "Colors".

Example

--

GlobalShadow property

Description

Defines whether the object will be displayed with the shadowing defined in the active design.

yes	Uses the global shadowing defined for this object type.
No	No shadowing.

Example

--

GNQBackColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Went Out Unacknowledged" which color the background of the value to be displayed assumes for flashing status "Off" (GNQBackColorOff) or "On" (GNQBackColorOn).

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

GNQBackFlash property

Description

Specifies for the selected message type and status "Went Out Unacknowledged" whether the background of the value to be displayed flashes when a message goes out unacknowledged.

GNQTextColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Went Out Unacknowledged" which color the text of the value to be displayed assumes for flashing status "Off" (GNQTextColorOff) or "On" (GNQTextColorOn).

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

GNQTextFlash property

Description

Specifies for the selected message type and status "Went Out Unacknowledged" whether the text of the value to be displayed flashes when a message goes out unacknowledged.

Grid Property

Description

TRUE if the grid is enabled for the active picture. BOOLEAN write-read access.

The grid is only visible during the configuration phase.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the grid for the active picture will be enabled:

```
Sub ActiveDocumentConfiguration()
'VBA521
Application.ActiveDocument.Grid = True
End Sub
```

Application Property (Page 3484)

Document Object (Page 3319)

Application Object (Page 3282)

GridColor Property

Description

Defines or returns the color of the grid during the configuration phase. The Grid property must be set to TRUE for the grid to be displayed. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the grid color for the active picture will be set to "Blue":

```
Sub ActiveDocumentConfiguration()
'VBA522
Application.ActiveDocument.Grid = True
Application.ActiveDocument.GridColor = RGB(0, 0, 255)
End Sub
```

See also

Grid Property (Page 3620)

ActiveDocument Property (Page 3472)

Application Property (Page 3484)

Document Object (Page 3319)

Application Object (Page 3282)

GridHeight Property

Description

Defines or returns the height (in pixels) of the grid in the current picture during the configuration phase. The Grid property must be set to TRUE for the grid to be displayed.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the grid height for the active picture will be set to "8":

```
Sub ActiveDocumentConfiguration()
'VBA523
Application.ActiveDocument.Grid = True
Application.ActiveDocument.GridHeight = 8
End Sub
```

Grid Property (Page 3620)

ActiveDocument Property (Page 3472)

Application Property (Page 3484)

Document Object (Page 3319)

Application Object (Page 3282)

GridWidth Property

Description

Defines or returns the width (in pixels) of the grid in the current picture during the configuration phase. The Grid property must be set to TRUE for the grid to be displayed.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the grid width for the active picture will be set to "8":

```
Sub ActiveDocumentConfiguration()
'VBA524
Application.ActiveDocument.Grid = True
```

```
Application.ActiveDocument.GridWidth = 8
End Sub
```

Grid Property (Page 3620)

GridHeight Property (Page 3622)

ActiveDocument Property (Page 3472)

Application Property (Page 3484)

Document Object (Page 3319)

Application Object (Page 3282)

GroupParent Property

Description

Returns the higher-ranking object in the specified group object. Read-only access.

Example:

--

See also

Group Object (Page 3348)

ActiveDocument Property (Page 3472)

GroupedObjects Object (Listing) (Page 3353)

Document Object (Page 3319)

Application Object (Page 3282)

GroupedHMIObjects Property

Description

Returns a listing containing all the objects in the current group.

Example:

In this example the group object "Group1" is created from a number of objects. An ellipse segment is then added to the group object:

```
Sub CreateGroup()
'VBA526
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipseSegment As HMIEllipseSegment
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
objGroup.ObjectName = "Group1"
Set objEllipseSegment = ActiveDocument.HMIObjects.AddHMIObject("EllipseSegment",
"HMIEllipseSegment")
'
'Add one object to the existing group
objGroup.GroupedHMIObjects.Add ("EllipseSegment")
End Sub
```

See also

Group Object (Page 3348)

Height Property

Description

Defines or returns the height of the object (Document, View, Object) in pixels.

Note concerning the Document and View objects:

The default value corresponds to the vertical screen resolution set by the operating system. The specified value can be higher than the current screen resolution. The picture can then be moved with the aid of scroll bars.

The maximum picture height that can be set is 10000 pixels.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the height of the current picture will be set to "1600":

```
Sub ActiveDocumentConfiguration()
'VBA527
Application.ActiveDocument.Height = 1600
End Sub
```

See also

View Object (Page 3466)

HMIObject Object (Page 3357)

Document Object (Page 3319)

Hide Property

Description

TRUE if the specified picture is opened as "Visible". BOOLEAN write-read access.

Use the Hide property in order to test, for example, whether a picture is to be visible or invisible when opened. Other WinCC editors (such as CrossReference) open pictures so that they are invisible, i.e. they are not displayed in the Graphics Designer. If you use the DocumentOpened event, for example, you can use the Hide property to prevent the code in the event from being executed by testing that the Hide property is FALSE.

Use the Add and Open methods to define whether a picture is to be visible or invisible when opened.

Note

If you set a picture to "Invisible" (Hide = FALSE), you can then only address it via the Documents listing. The picture is no longer available in the Graphics Designer.

Example:

In the following example, when a picture opens an output indicates whether the picture was opened as visible or invisible:

```
Private Sub Document_Opened(CancelForwarding As Boolean)
'VBA802
MsgBox Me.Hide
End Sub
```

See also

Open Method (Page 3242)

Add Method (Documents Listing) (Page 3169)

Document Object (Page 3319)

HiddenInput Property

Description

TRUE, when the input value should not be displayed when being entered. Each character entered is substituted by a *. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the input will be hidden:

```
Sub IOFieldConfiguration()
'VBA528
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.HiddenInput = True
End With
End Sub
```

See also

IOField Object (Page 3361)

HMIObjects Property

Description

Returns a listing containing all the objects in the specified picture.

To return an element from the HMIObjects listing you can use either the index number or the object name.

Example:

Use the "AddHMIObject(ObjectName, ProgID)" method to insert a new object in a picture: :

```
Sub AddCircle()
```

```
'VBA529
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("my Circle", "HMICircle")
End Sub
```

See also

Document Object (Page 3319)

HMIUdoObjects property

Description

Supplies a collection of HMIObject objects that represent the inner objects of the "CustomizedObjects" object.

See also

CustomizedObject Object (Page 3310)

Hotkey Property

Description

Defines or returns the function key for a mouse action in the case of the Button object.

Function key	Assigned Value
F1	112
F2	113
F3	114
F4	115
F5	116
F6	117
F7	118
F8	119
F9	120
F10	121
F11	122
F12	123

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example it is intended that the button can also be launched with function key "F5":

```
Sub ButtonConfiguration()
'VBA530
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.Hotkey = 116
End With
End Sub
```

See also

Button Object (Page 3293)

Hysteresis Property

Description

TRUE if the display must include hysteresis (deadband) in the case of the BarGraph object. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example the display shall take place with hysteresis:

```
Sub BarGraphConfiguration()
'VBA531
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Hysteresis = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

HysteresisRange Property

Description

Defines or returns the hysteresis (deadband) as a percentage of the display value.

The Hysteresis property must be set to TRUE for the hysteresis to be calculated.

Example:

The "BarGraphConfiguration()" procedure configures In this example the hysteresis will be set to "4%":

```
Sub BarGraphConfiguration()
'VBA532
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Hysteresis = True
.HysteresisRange = 4
End With
End Sub
```

See also

BarGraph Object (Page 3286)

Hysteresis Property (Page 3628)

6.1.8.8 I - K

Icon Property

Description

Defines the icon (*.ICO, full path and file name) or returns the path and file name for a button on a user-defined toolbar.

Path specifications

The following path specification formats are possible:

- Absolute: z.B. "C:\Siemens\WinCC\Icons\myIcon.ICO.
- Relative: The starting folder for relative path specification is the "GraCS" folder of the current project.
- <global>: Refers to the installation path for WinCC. The path specification "<global>\Icons \myIcon" is the same as the path specification under "Absolute".
- <project>: Refers to the current project directory (see example).

Example:

The "CreateToolbar()" procedure creates a user-defined toolbar with two icons:

```
Sub CreateToolbar()
'VBA533
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Dim strFileWithPath
Set objToolbar = ActiveDocument.CustomToolbars.Add("Tool1_1")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "ti1_1",
"myFirstToolbaritem")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(2, "ti1_2",
"mySecondToolbaritem")
'
'To use this example copy a *.ICO-Graphic
'to the "GraCS"-Folder of the actual project.
'Replace the filename "EZSTART.ICO" in the next commandline
'with the name of the ICO-Graphic you copied
strFileWithPath = Application.ApplicationDataPath & "EZSTART.ICO"
'
'To assign the symbol-icon to the first toolbaritem
objToolbar.ToolbarItems(1).Icon = strFileWithPath
End Sub
```

See also

How to Add a New Icon to the Toolbar (Page 3031)

How to Create an Application-specific Toolbar (Page 3029)

IndependentWindow property

Description

Defines whether the display of the picture window in Runtime depends on the process picture in which the picture window was configured.

yes	Size and position of the picture window are independent of the process picture and only defined by the "Window mode" attribute
No	Size and position of the picture window change with the shift or scaling of the process picture

Index Property

Description

Status display

Defines the status (0 bis 255) or returns it. A basic picture and flash picture can be defined for each status value.

Line Object

Defines the start and end point for a line, and so also defines the direction. Use the ActualPointLeft and ActualPointTop properties to define the coordinates for each starting and finishing point.

Polygon object, PolyLine object and TubePolyline object

Defines or returns the number of the corner point whose position coordinates you want to change or display.

CheckBox and OptionGroup objects

Defines or returns the number (1 to 32) of the field whose text is to be defined.

ComboBox and ListBox object

Defines or returns the number (1 to 32) of the line whose text is to be defined.

Example 1: Line

In the following example a line will be inserted into the active picture and the starting and finishing points will be defined:

```
Sub LineAdd()
'VBA682
Dim objLine As HMILine
Dim objEvent As HMIEvent
Set objLine = ActiveDocument.HMIObjects.AddHMIObject("myLine", "HMILine")
With objLine
.BorderColor = RGB(255, 0, 0)
.index = hmiLineIndexTypeStartPoint
.ActualPointLeft = 12
.ActualPointTop = 34
.index = hmiLineIndexTypeEndPoint
.ActualPointLeft = 74
.ActualPointTop = 64
End With
End Sub
```

Example 2: Polyline

For this example to work, insert a polyline called "Polyline1" into the active picture: The "PolyLineCoordsOutput" procedure then outputs the coordinates of all the corner points in the polyline:

```
Sub PolyLineCoordsOutput()
'VBA534
Dim iPcIndex As Integer
Dim iPosX As Integer
Dim iPosY As Integer
Dim iIndex As Integer
Dim objPolyLine As HMIPolyLine
Set objPolyLine = Application.ActiveDocument.HMIObjects.AddHMIObject("PolyLine1",
"HMIPolyLine")
'
'Determine number of corners from "PolyLine1":
iPcIndex = objPolyLine.PointCount
'
'Output of x/y-coordinates from every corner:
For iIndex = 1 To iPcIndex
With objPolyLine
.index = iIndex
iPosX = .ActualPointLeft
iPosY = .ActualPointTop
MsgBox iIndex & ". corner:" & vbCrLf & "x-coordinate: " & iPosX & vbCrLf & "y-coordinate:
" & iPosY
End With
Next iIndex
End Sub
```

Example 3: Check box

The "CreateOptionGroup()" procedure creates the OptionGroup object with four option buttons. Each option button is assigned the default name "myCustomText<Nummer>":

```
Sub CreateOptionGroup()
'VBA535
Dim objRadioBox As HMIOptionGroup
Dim iIndex As Integer
Set objRadioBox = ActiveDocument.HMIObjects.AddHMIObject("RadioBox_1", "HMIOptionGroup")
With objRadioBox
.Height = 100
.Width = 180
.BoxCount = 4
For iIndex = 1 To .BoxCount
.index = iIndex
.Text = "myCustomText" & .index
Next iIndex
End With
End Sub
```

StatusDisplay Object (Page 3436)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

OptionGroup Object (Page 3393)

InheritState property

Description

Defines whether the "Display" and "Operator Control Enable" properties of the user object can be inherited by the individual objects of the user object.

InputValue property

Description

Defines the value to be entered by the user in the I/O field. The value is not displayed in the I/O field when the property is set.

If you want the value to be displayed in the I/O field after confirmation with the <Return> key, configure a direct connection between the properties "input value" and "output value". The direct connection is only practical when no tag is connected to the output value, but the user can nevertheless query the specified value, for example, through a script.

Example:

IsActive Property

Description

Returns TRUE if a copy of the current picture is active. BOOLEAN read access.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example a copy of the current picture will be created and an output will indicate whether the copy is active.

```
Sub ActiveDocumentConfiguration()
'VBA537
Application.ActiveDocument.Views.Add
'If you comment out the following line
'and recall the procedure, the output of
'the messagebox is different
Application.ActiveDocument.Views(1).Activate
'
'Output state of copy:
MsgBox Application.ActiveDocument.Views(1).IsActive
End Sub
```

See also

ActiveDocument Property (Page 3472)

View Object (Page 3466)

IsConnectedToProject Property

Description

Returns TRUE if the project connection is available. BOOLEAN read access.

Example:

The "ConnectCheck()" procedure checks whether a project connection exists and outputs the result:

```
Sub ConnectCheck()
'VBA538
Dim bCheck As Boolean
Dim strStatus As String
bCheck = Application.IsConnectedToProject
If bCheck = True Then
strStatus = "yes"
Else
strStatus = "no"
End If
MsgBox "Connection to project available: " & strStatus
End Sub
```

See also

Application Object (Page 3282)

IsDynamicable Property

Description

TRUE if a property can be made dynamic. BOOLEAN read access.

Example:

The HMIObjectPropertyChanged event always occurs when you change an object property in the Graphics Designer. In this example the property name and value will be output. A check will also be made on whether the property can be made dynamic:

```
Sub Document_HMIObjectPropertyChanged(ByVal Property As IHMIProperty, CancelForwarding As
Boolean)
'VBA539
Dim objProp As HMIProperty
Dim strStatus As String
Set objProp = Property
'
'Checks whether property is dynamicable
If objProp.IsDynamicable = True Then
 strStatus = "yes"
Else
 strStatus = "no"
End If
MsgBox "Property: " & objProp.Name & vbCrLf & "Value: " & objProp.value & vbCrLf &
"Dynamicable: " & strStatus
End Sub
```

Further information on the "Events" topic can be found under the heading "Executing VBA macros in Graphics Designer".

Description

Only used internally.

See also

FaceplateProperty object (Page 3341)

Property Object (Page 3409)

Italic Property

Description

TRUE if the font attribute "Italic" is set for the language-dependent text in the object. BOOLEAN write-read access.

Example:

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA540
Dim objLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "Hello"
Set objLangFonts = objButton.LDFonts
'
'To make fontsettings for french:
With objLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'
'To make fontsettings for english:
With objLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

LanguageFont Object (Page 3365)

Item Property

Description

Returns an element from a listing. Depending on the specified object, you can use either the index number or the name to return a particular element.

Example:

This example shows both kinds of indexing. In order for the example to work, create a group object ("Group1") with two objects. The example outputs the height of the second object in a group:

```
Sub GetHeight()
'VBA541
Dim objGroup As HMIGroup
'Next line uses the property "Item" to get a group by name
Set objGroup = ActiveDocument.HMIObjects.Item("Group1")
'Otherwise next line uses index to identify a groupobject
MsgBox "The height of object 2 is: " & objGroup.GroupedHMIObjects.Item(2).Height
End Sub
```

ItemBorderBackColor Property

Description

Defines or returns the background color of the separation lines in the selection list for the TextList object. LONG write-read access.

The background color is only visible with the property setting ItemBorderStyle > 0.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the background color for the separation lines will be set to "Red":

```
Sub TextListConfiguration()
'VBA542
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.ItemBorderStyle = 1
.ItemBorderBackColor = RGB(255, 0, 0)
End With
End Sub
```

See also

ItemBorderStyle Property (Page 3639)

TextList Object (Page 3441)

ItemBorderColor Property

Description

Defines or returns the color of the separation lines in the selection list for the TextList object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the color for the separation lines will be set to "White":

```
Sub TextListConfiguration()
'VBA543
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.ItemBorderStyle = 1
.ItemBorderColor = RGB(255, 255, 255)
End With
End Sub
```

See also

TextList Object (Page 3441)

ItemBorderStyle Property

Description

Defines or returns the dividing line style in the selection list for the TextList object. Value range from 0 to 4.

Line style	Assigned Value
———	0
— —	1
------	2
— · —	3
—·-—	4

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the dividing line style will be set to "1":

```
Sub TextListConfiguration()
'VBA544
Dim objTextList As HMITextList
```

```
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.ItemBorderStyle = 1
.ItemBorderBackColor = RGB(255, 0, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

ItemBorderWidth Property

Description

Defines or returns the weight in pixels of the dividing lines in the selection list for the TextList object.

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the dividing line width will be set to "4":

```
'Sub E_628_TextListConfiguration()

Sub E_629_TextListConfiguration()

'VBA545

Dim objTextList As HMITextList

Set objTextList =
ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")

With objTextList

.ItemBorderWidth = 4

End With

End Sub
```

See also

TextList Object (Page 3441)

Key Property

Description

Returns the name that identifies the entry (menu point or icon) in the user-defined menu or user-defined toolbar. Read only access.

Use the Key property to determine which entry was clicked. For this purpose you can use, say, the events "MenuItemClicked" and "ToolBarItemClicked".

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"):

```
Sub CreateMenuItem()
'VBA546
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
'
'Add new menu "Delete objects" to menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Adds two menuitems to menu "Delete objects"
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
Rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete Circles")
End Sub
```

In connection with the "MenuItemClicked" event, you can connect the menu entries with procedure calls, for instance. In this example the names of the menu entries will be output:

```
Sub Document_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
'VBA547
Dim strClicked As String
Dim objMenuItem As HMIMenuItem
Set objMenuItem = MenuItem
'
'"strClicked can get two values:
'(1) "DeleteAllRectangles" and
'(2) "DeleteAllCircles"
strClicked = objMenuItem.Key
'
'To analyse "strClicked" with "Select Case"
Select Case strClicked
Case "DeleteAllRectangles"
'
'Instead of "MsgBox" a procedurecall (e.g. "Call <Prozedurname>") can stay here
MsgBox "'Delete rectangle' was clicked"
Case "DeleteAllCircles"
MsgBox "'Delete Circles' was clicked"
```

```
End Select
End Sub
```

Creating Customized Menus and Toolbars (Page 3021)

6.1.8.9 L

Label Property

Description

Returns the label of the user-defined menu or menu entry in the currently set language. Read only access.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"): In this example the labels will then be output:

```
Sub CreateMenuItem()
'VBA548
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim iIndex As Integer
iIndex = 1
'
'Add new menu "Delete objects" to menubar
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Adds two menuitems to menu "Delete objects"
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete circles")
MsgBox ActiveDocument.CustomMenus(1).Label
For iIndex = 1 To objMenu.MenuItems.Count
MsgBox objMenu.MenuItems(iIndex).Label
```

```
Next iIndex
End Sub
```

See also

CustomMenus Property (Page 3566)

MenuItems Object (Listing) (Page 3384)

MenuItem Object (Page 3382)

Menu Object (Page 3378)

LanguageID Property

Description

Returns the language identifier of the project language as a decimal value. LONG read access

Example:

The "DataLanguages()" procedure outputs the project languages together with their language identifiers:

```
Sub DataLanguages()
'VBA549
Dim colDataLang As HMIDataLanguages
Dim objDataLang As HMIDataLanguage
Dim nLangID As Long
Dim strLangName As String
Dim iAnswer As Integer
Set colDataLang = Application.AvailableDataLanguages
For Each objDataLang In colDataLang
nLangID = objDataLang.LanguageID
strLangName = objDataLang.LanguageName
iAnswer = MsgBox(nLangID & " " & strLangName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objDataLang
End Sub
```

See also

DataLanguages Object (Listing) (Page 3314)

DataLanguage Object (Page 3313)

LanguageName Property

Description

Returns the project language. STRING read access.

Example:

The "DataLanguages()" procedure outputs the project languages together with their language identifiers:

```
Sub DataLanguages()
'VBA550
Dim colDataLang As HMIDataLanguages
Dim objDataLang As HMIDataLanguage
Dim nLangID As Long
Dim strLangName As String
Dim iAnswer As Integer
Set colDataLang = Application.AvailableDataLanguages
For Each objDataLang In colDataLang
nLangID = objDataLang.LanguageID
strLangName = objDataLang.LanguageName
iAnswer = MsgBox(nLangID & " " & strLangName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objDataLang
End Sub
```

See also

DataLanguages Object (Listing) (Page 3314)

DataLanguage Object (Page 3313)

LanguageSwitch Property

Description

Defines where the language-dependent assignment texts are stored or returns the value. BOOLEAN write-read access.

TRUE, when the texts in the Text Library are managed. Translation to other language occurs in the Text Library.

FALSE, when the texts are managed directly in the object. Translation to other language can be carried out using Text Distributor.

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the texts will be managed in the Text Library:

```
Sub TextListConfiguration()
'VBA551
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.LanguageSwitch = True
End With
End Sub
```

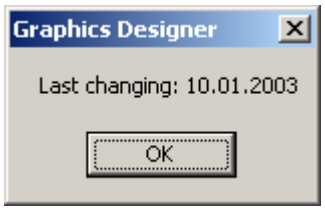
See also

TextList Object (Page 3441)

LastChange Property

Description

Returns the date on which the current picture was last changed. READ access.



Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the date of the last change to the current picture will be output:

```
Sub ActiveDocumentConfiguration()
'VBA552
Dim varLastDocChange As Variant
varLastDocChange = Application.ActiveDocument.LastChange
MsgBox "Last changing: " & varLastDocChange
End Sub
```

See also

Document Object (Page 3319)

Layer Property

Description

Defines which layer of the picture an object is located in, or returns that information. There is a total of 32 layers available, whereby Layer "0" is the bottom layer and Layer "31" the top layer.

The configured objects are initially in the background of a layer.

Note

In VBA the numbering starts at "1". An entry of "objRectangle.Layer = 1" is therefore located in the lowest layer.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the Rectangle object will be inserted in layer "4":

```
Sub RectangleConfiguration()
'VBA553
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.Layer = 4
End With
End Sub
```

See also

HMIObject Object (Page 3357)

Editing Layers with VBA (Page 3050)

Layer00..10Checked property

Description

TRUE if the respective limit "0" to "10" is monitored in the case of the "3DBarGraph" object. BOOLEAN write-read access.

The limit and the color representation are specified with the properties "Layer00..10Value" and "Layer00..10Color".

The bar fill color and the fill pattern are specified with the properties "Layer00..10FillColor" and "Layer00..10FillStyle".

Example

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example, limit "0" is to be monitored:

```
Sub HMI3DBarGraphConfiguration()
'VBA554
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.Layer00Checked = True
End With
End Sub
```

See also

Layer00..10Value property (Page 3648)

Layer00..10Color property (Page 3647)

3DBarGraph Object (Page 3267)

Layer00..10Color property

Description

Defines or returns the color for the respective limit "0" to "10" of the "3DBarGraph" object. LONG write-read access.

When monitoring of the limit value is activated using the "Layer00..10Checked" property, the bar turns to the color defined by this attribute on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

Example

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the color for limit "0" is defined as "Magenta":

```
Sub HMI3DBarGraphConfiguration()
'VBA555
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
```

```
.Layer00Checked = True
.Layer00Color = RGB(255, 0, 255)
End With
End Sub
```

See also

Layer00..10Checked property (Page 3646)

3DBarGraph Object (Page 3267)

Layer00..10FillColor property

Description

Defines or returns the bar fill color for the respective limit "0" to "10" of the "3DBarGraph" object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

Layer00..10FillStyle property

Description

Defines or returns the bar fill pattern for the respective limit "0" to "10" of the "3DBarGraph" object.

The bar fill color has to differ from the bar color to make the fill pattern visible.
There is a choice of 50 fill patterns. The "0" fill pattern fills the object with the set background color. The "1" fill pattern means neither a background nor a fill pattern is displayed.

Layer00..10Value property

Description

Defines or returns the value for "Limit 0" to "Limit 10" in the case of the "3DBarGraph" object.

Monitoring only takes effect when the "Layer00..10Checked" property value is set to "TRUE".

Example

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the value for limit "0" is defined as "0":

```
Sub HMI3DBarGraphConfiguration()
'VBA556
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.Layer00Checked = True
.Layer00Value = 0
End With
End Sub
```

See also

Layer00..10Checked property (Page 3646)

3DBarGraph Object (Page 3267)

LayerDecluttering Property

Description

TRUE if showing and hiding objects dependent upon the minimum and maximum zoom set for a layer has been enabled. BOOLEAN write-read access.

Example:

In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer()
'VBA587
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
'define fade-in and fade-out of objects:
With ActiveDocument
.LayerDecluttering = True
.ObjectSizeDecluttering = True
.SetDeclutterObjectSize 50, 100
End With
End Sub
```

Document Object (Page 3319)

Editing Layers with VBA (Page 3050)

Layers Property

Description

Returns a listing containing the properties of the layers in the current picture.

Note

If the "Layers" property is used, the sequence of HMI objects in the HMIObjects listing can change.

Example:

The "LayerInfo()" procedure outputs the name and zoom configuration for each layer of the current picture:

```
Sub LayerInfo()
'VBA588
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim iAnswer As Integer
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
With objLayer
iAnswer = MsgBox("Layername: " & .Name & vbCrLf & "max. zoom:  " & .MaxZoom & vbCrLf & "min.
zoom:  " & .MinZoom, vbOKCancel)
End With
If vbCancel = iAnswer Then Exit For
Next objLayer
End Sub
```

LDAssignments property

Description

Returns a listing with the (foreign language) assignments of display texts that are displayed depending on the current "Output Value" in the "TextList" object.

The assignments depend on the set list type. Specify the list type with the "ListType" property.

LDFonts Property

Description

Returns a listing containing the language identifiers for the configured fonts.

Example:

Use the LDFonts property to return the LanguageFonts listing. In the following example the language identifiers of the configured fonts will be output:

```
Sub ShowLanguageFont()
'VBA589
Dim colLanguageFonts As HMILanguageFonts
Dim objLanguageFont As HMILanguageFont
Dim objButton As HMIButton
Dim iMax As Integer
Dim iAnswer As Integer
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
Set colLanguageFonts = objButton.LDFonts
iMax = colLanguageFonts.Count
For Each objLanguageFont In colLanguageFonts
iAnswer = MsgBox("Projected fonts: " & iMax & vbCrLf & "Language-ID: " &
objLanguageFont.LanguageID, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objLanguageFont
End Sub
```

FaceplateProperty object (Page 3341)

LDLabelTexts Property

Description

Returns a listing containing the multilingual labels of the user-defined menu or menu entry.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"): In this example, multilingual menu labels will be created:

```
Sub CreateMenuItem()
'VBA590
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objLangText As HMILanguageText
'
'Add new menu "Delete objects" to menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to the new menu
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete circles")
'
'Define foreign-language labels for menu "Delete objects":
Set objLangText = objMenu.LDLabelTexts.Add(1033, "English_Delete objects")
Set objLangText = objMenu.LDLabelTexts.Add(1032, "Greek_Delete objects")
Set objLangText = objMenu.LDLabelTexts.Add(1034, "Spanish_Delete objects")
Set objLangText = objMenu.LDLabelTexts.Add(1036, "French_Delete objects")
End Sub
```

The "LDLabelInfo()" procedure outputs the labels configured for the "Delete Objects" menu:

```
Sub LDLabelInfo()
'VBA591
Dim colLangTexts As HMILanguageTexts
```

```
Dim objLangText As HMILanguageText
Dim iAnswer As Integer
'
'Save all labels of menu into collection "colLangTexts":
Set colLangTexts = ActiveDocument.CustomMenus("DeleteObjects").LDLabelTexts
For Each objLangText In colLangTexts
iAnswer = MsgBox(objLangText.DisplayName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objLangText
End Sub
```

LDNames Property

Description

Returns a listing containing the multilingual names of a folder in the Components Library or of a layer.

Example:

Use the LDNames property to return the LanguageTexts listing. In the following example all multilingual layer names will be output:

Explanation: What the example shows

```
Sub LDLabelInfo()
'VBA592
Dim colLayerLngTexts As HMILanguageTexts
Dim objLayerLngText As HMILanguageText
Dim iIndex As Integer
Dim iAnswer As Integer
Dim strResult As String
iIndex = 1
For iIndex = 1 To ActiveDocument.Layers.Count
'
'Save all labels of layers into collection of "colLayerLngTexts":
Set colLayerLngTexts = ActiveDocument.Layers(iIndex).LDNames
For Each objLayerLngText In colLayerLngTexts
strResult = strResult & vbCrLf & objLayerLngText.LanguageID & " - " &
objLayerLngText.DisplayName
Next objLayerLngText
iAnswer = MsgBox(strResult, vbOKCancel)
strResult = ""
If vbCancel = iAnswer Then Exit For
```

```
Next iIndex
End Sub
```

LanguageTexts Object (Listing) (Page 3369)

FolderItem Object (Page 3342)

LDStatusTexts Property

Description

Returns a listing containing the multilingual status line texts of a user-defined icon or menu entry.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"). In this example, multilingual status line texts will be created:

```
Sub CreateMenuItem()
'VBA593
Dim objMenu As HMIMenu
Dim objMenuItem1 As HMIMenuItem
Dim objMenuItem2 As HMIMenuItem
Dim objLangStateText As HMILanguageText
'
'Add new menu "Delete objects" to menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to the new menu
Set objMenuItem1 = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem2 = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete
circles")
'
'Define foreign-language labels for menuitem "Delete rectangles":
Set objLangStateText = objMenuItem1.LDStatusTexts.Add(1033, "English_Delete rectangles")
Set objLangStateText = objMenuItem1.LDStatusTexts.Add(1032, "Greek_Delete rectangles")
Set objLangStateText = objMenuItem1.LDStatusTexts.Add(1034, "Spanish_Delete rectangles")
Set objLangStateText = objMenuItem1.LDStatusTexts.Add(1036, "French_Delete rectangles")
End Sub
```

The "LDStatusTextInfo()" procedure outputs the status line texts configured for the "Delete Objects" menu:

```
Sub LDStatusTextInfo()
'VBA594
Dim colMenuItems As HMIMenuItems
Dim objMenuItem As HMIMenuItem
Dim colStatusLngTexts As HMILanguageTexts
Dim objStatusLngText As HMILanguageText
Dim strResult As String
Dim iAnswer As Integer
Set colMenuItems = ActiveDocument.CustomMenus("DeleteObjects").MenuItems
For Each objMenuItem In colMenuItems
strResult = "Statustexts of menuitem """ & objMenuItem.Label & """"
Set colStatusLngTexts = objMenuItem.LDStatusTexts
For Each objStatusLngText In colStatusLngTexts
strResult = strResult & vbCrLf & objStatusLngText.DisplayName
Next objStatusLngText
iAnswer = MsgBox(strResult, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objMenuItem
End Sub
```

Menu Object (Page 3378)

LDTexts Property

Description

Returns a listing containing the multilingual labels of an object.

Example:

The "LDTextInfo()" procedure outputs the labels configured for the Button object. For this example to work, create the object "myButton" in the Graphics Designer and configure a number of multilingual labels:

```
Sub LDTextInfo()
'VBA595
Dim colLDLngTexts As HMILanguageTexts
Dim objLDLngText As HMILanguageText
Dim objButton As HMIButton
Dim iAnswer As Integer
Set objButton = ActiveDocument.HMIObjects("myButton")
Set colLDLngTexts = objButton.LDTexts
For Each objLDLngText In colLDLngTexts
```

```
iAnswer = MsgBox(objLDLngText.DisplayName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objLDLngText
End Sub
```

See also

Button Object (Page 3293)

StaticText Object (Page 3433)

OptionGroup Object (Page 3393)

CheckBox Object (Page 3297)

LDTooltipTexts Property

Description

Returns a listing containing the multilingual Tooltip texts for a user-defined icon or for an object.

Example

The "CreateToolbar()" procedure creates a user-defined toolbar with two icons. Two multilingual Tooltip texts are assigned to the first icon:

```
Sub CreateToolbar()
'VBA596
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Dim objLangText As HMILanguageText
Dim strFileWithPath
'
'Create toolbar with two toolbar-items:
Set objToolbar = ActiveDocument.CustomToolbars.Add("Tool1_1")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "ti1_1",
"myFirstToolbaritem")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(2, "ti1_2",
"mySecondToolbaritem")
'
'In order that the example runs correct copy a *.ICO-Graphic
'into the "GraCS"-Folder of the actual project.
'Replace the filename "EZSTART.ICO" in the next commandline
'with the name of the ICO-Graphic you copied
strFileWithPath = Application.ApplicationDataPath & "EZSTART.ICO"
'
'
'To assign the symbol-icon to the first toolbaritem
objToolbar.ToolbarItems(1).Icon = strFileWithPath
'
'Define foreign-language tooltiptexts
```

```
Set objLangText = objToolbar.ToolbarItems(1).LDTooltipTexts.Add(1036, "French_Tooltiptext")
Set objLangText = objToolbar.ToolbarItems(1).LDTooltipTexts.Add(1034,
"Spanish_Tooltiptext")
End Sub
```

The "LDTooltipInfo()" procedure outputs all the Tooltip texts configured for the first icon in the first user-defined toolbar:

```
Sub LDTooltipInfo()
'VBA597
Dim colLangTexts As HMILanguageTexts
Dim objLangText As HMILanguageText
Dim iAnswer As Integer
Set colLangTexts = ActiveDocument.CustomToolbars(1).ToolbarItems(1).LDTooltipTexts
For Each objLangText In colLangTexts
iAnswer = MsgBox(objLangText.DisplayName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objLangText
End Sub
```

See also

ToolbarItem Object (Page 3448)

HMIObject Object (Page 3357)

Left Property

Description

Defines or returns the X coordinate of the object (measured from the top left-hand edge of the picture) in pixels. The X-coordinate relates to the top left corner of the rectangle enclosing the object.

View Object

Defines or returns the X coordinate of the window (measured from the top left-hand edge of the Graphics Designer working area) in pixels.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the rectangle will be moved 40 pixels to the right:

```
Sub RectangleConfiguration()
'VBA598
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
```

```
With objRectangle
.Left = 40
End With
End Sub
```

See also

View Object (Page 3466)

HMIObject Object (Page 3357)

LeftComma Property

Description

Defines or returns the number of digits to the left of the decimal point (0 to 20) for the BarGraph object.

Example:

The "BarGraphConfiguration()" procedure configures In this example the number of digits to the left of the decimal point will be set to "4".

```
Sub BarGraphConfiguration()
'VBA599
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.LeftComma = 4
End With
End Sub
```

See also

BarGraph Object (Page 3286)

LightEffect Property

Description

TRUE if the light effect of the 3DBarGraph object is activated. BOOLEAN write-read access.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the light effect will be activated:

```
Sub HMI3DBarGraphConfiguration()
'VBA600
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.LightEffect = True
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

LimitHigh4 Property

Description

Defines or returns the high limit value for "Reserve 4" in the case of the BarGraph object.

The CheckLimitHigh4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh4 property.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "70".

```
Sub BarGraphLimitConfiguration()
'VBA601
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh4 = False
'Activate monitoring
.CheckLimitHigh4 = True
'Set barcolor to "red"
.ColorLimitHigh4 = RGB(255, 0, 0)
'Set upper limit to "70"
.LimitHigh4 = 70
End With
```

```
End Sub
```

See also

TypeLimitHigh4 Property (Page 3792)

CheckLimitHigh4 Property (Page 3534)

BarGraph Object (Page 3286)

LimitHigh5 Property

Description

Defines or returns the high limit value for "Reserve 5" in the case of the BarGraph object.

The CheckLimitHigh5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh5 property.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "80".

```
Sub BarGraphLimitConfiguration()
'VBA602
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh5 = False
'Activate monitoring
.CheckLimitHigh5 = True
'Set barcolor to "black"
.ColorLimitHigh5 = RGB(0, 0, 0)
'Set upper limit to "80"
.LimitHigh4 = 80
End With
End Sub
```

See also

CheckLimitHigh5 Property (Page 3534)

BarGraph Object (Page 3286)

LimitLow4 Property

Description

Defines or returns the low limit value for "Reserve 4" in the case of the BarGraph object.

The CheckLimitLow4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow4 property.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "5".

```
Sub BarGraphLimitConfiguration()
'VBA603
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitLow4 = False
'Activate monitoring
.CheckLimitLow4 = True
'Set barcolor to "green"
.ColorLimitLow4 = RGB(0, 255, 0)
'Set lower limit to "5"
.LimitLow4 = 5
End With
End Sub
```

BarGraph Object (Page 3286)

LimitLow5 Property

Description

Defines or returns the low limit value for "Reserve 5" in the case of the BarGraph object.

The CheckLimitLow5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow5 property.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "0".

```
Sub BarGraphLimitConfiguration()
'VBA604
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitLow5 = False
'Activate monitoring
.CheckLimitLow5 = True
'Set barcolor to "white"
.ColorLimitLow5 = RGB(255, 255, 255)
'Set lower limit to "0"
.LimitLow5 = 0
End With
End Sub
```

See also

BarGraph Object (Page 3286)

TypeLimitLow5 Property (Page 3795)

CheckLimitLow5 Property (Page 3536)

LimitMax Property

Description

Defines or returns the high limit value as an absolute value dependent on the data format in the case of the IOField object.

If the value to be displayed exceeds the upper limit value, it is identified by a series of *** , indicating it cannot be displayed.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the high limit for a decimal value will be set to "100":

```
Sub IOFieldConfiguration()
'VBA605
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
```

```
.DataFormat = 1
.LimitMax = 100
End With
End Sub
```

See also

DataFormat Property (Page 3569)

IOField Object (Page 3361)

LimitMin Property

Description

Defines or returns the low limit value as an absolute value dependent on the data format in the case of the IOField object.

If the value to be displayed exceeds the upper limit value, it is identified by a series of *** , indicating it cannot be displayed.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the high limit for a decimal value will be set to "0":

```
Sub IOFieldConfiguration()
'VBA606
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.DataFormat = 1
.LimitMin = 0
End With
End Sub
```

See also

DataFormat Property (Page 3569)

IOField Object (Page 3361)

LineJoinStyle property

Description

Defines the way that corners are displayed in a tube polygon.

Angle	The tubes are joined at corner points without rounding.
Round	The tubes are rounded at the outside corner points.

Example

ListType Property

Description

Defines or returns the list type in the case of the TextList object. Value range from 0 to 2.

List type	Assigned Value
Decimal	0
Binary	1
Bit	2

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the list type will be set to "Decimal":

```
Sub TextListConfiguration()
'VBA607
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.ListType = 0
End With
End Sub
```

See also

TextList Object (Page 3441)

LockBackColor Property

Description

Defines or returns the background color of the button for a locked measuring point in the case of the GroupDisplay object. LONG write-read access.

The LockStatus property must be set to TRUE for the background color to be displayed.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color for a locked measuring point will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA608
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.LockStatus = True
.LockBackColor = RGB(255, 0, 0)
End With
End Sub
```

See also

LockStatus Property (Page 3667)

GroupDisplay Object (Page 3350)

LockedByCreatorID Property

Description

TRUE, if a picture was created and/or referenced by SIMATIC Manager. BOOLEAN read access.

If a picture was created in SIMATIC Manager, you may process and subsequently save it in WinCC. You may, however, not delete this picture in WinCC. SIMATIC Manager administers a code for each picture, the so-called CreatorID, which cannot be changed in WinCC.

You may process the picture in WinCC, however, overwriting the picture with a WinCC picture (LockedByCreatorID = FALSE) will be prevented. This may be checked by examining the LockedByCreatorID property of an existing file prior to writing during the SaveAs method. If such a picture is saved into a new (not yet existing) or an existing WinCC picture using the SaveAs method, the CreatorID will not be passed on.

Example 1

Inn the following example, a picture created with SIMATIC Manager (LockedByCreatorID = TRUE) is opened, processed, and saved. The value of the LockedByCreatorID property is not changed.

```
Sub SaveDocAs_1()
'VBA810
'open an existing file, change it and save it
Dim docOld As Document
Const strFile As String = "Simatic_001.Pdl"
'
Set docOld = Application.Documents.Open(Application.ApplicationDataPath & strFile,
hmiOpenDocumentTypeInvisible)
docOld.Width = docOld.Width + 1
docOld.Save
'
MsgBox "LockedByCreatorID = " & docOld.LOckedByCreatorID, vbOKOnly, "Result"
'
docOld.Close
Set docOld = Nothing
'
End Sub
```

Example 2

In this example, a new picture is saved as a new file using the SaveAs method. To check if the picture is permitted to be saved, the LockedByCreatorID property is checked. In the new file the LockedByCreator property is reset.

```
Sub SaveDocAs_2()
'VBA811
'create a new file and overwrite it to an existing file,
'if it is not 'locked by CreatorID'
Dim docNew As Document
Dim docOld As Document
Const strFile As String = "Simatic_001.Pdl"
'
Set docNew = Application.Documents.Add(hmiOpenDocumentTypeInvisible)
Set docOld = Application.Documents.Open(Application.ApplicationDataPath & strFile,
hmiOpenDocumentTypeInvisible)
'
If docOld.LockedByCreatorID = False Then
docOld.Close
```

```
docNew.SaveAs(Application.ApplicationDataPath & strFile)
Else
MsgBox "File cannot be stored (LockedByCreatorID). ", vbOKOnly, "Result"
End If
'
docOld.Close
docNew.Close
Set docOld = Nothing
Set docNew = Nothing
'
End Sub
```

See also

SaveAs Method (Page 3254)

Document Object (Page 3319)

LockStatus Property

Description

TRUE if a locked measuring point is to be displayed with the Object GroupDisplay. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color for a locked measuring point will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA609
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.LockStatus = True
.LockBackColor = RGB(255, 0, 0)
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

LockText Property

Description

Defines the button labels for a locked measuring point in the case of the GroupDisplay object.

The LockStatus property must be set to TRUE for the label to be displayed.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the label for a locked measuring point will be set to "Locked":

```
Sub GroupDisplayConfiguration()
'VBA610
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.LockStatus = True
.LockText = "gesperrt"
End With
End Sub
```

See also

LockStatus Property (Page 3667)

GroupDisplay Object (Page 3350)

LockTextColor Property

Description

Defines or returns the color of the button label for a locked measuring point in the case of the GroupDisplay object. LONG write-read access.

The LockStatus property must be set to TRUE for the background color to be displayed.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the button label for a locked measuring point will be set to "Yellow":

```
Sub GroupDisplayConfiguration()
'VBA611
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.LockStatus = True
.LockTextColor = RGB(0, 255, 255)
End With
End Sub
```

See also

LockStatus Property (Page 3667)

GroupDisplay Object (Page 3350)

LongStrokesBold Property

Description

TRUE if the long strokes on the scale of the BarGraph object are to be displayed in bold. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example the long strokes will not be displayed in bold:

```
Sub BarGraphConfiguration()
'VBA612
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.LongStrokesBold = False
End With
End Sub
```

See also

BarGraph Object (Page 3286)

LongStrokesOnly Property

Description

TRUE if just the long strokes on the scale of the BarGraph object are to be displayed. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example, only the long strokes will be displayed:

```
Sub BarGraphConfiguration()
'VBA613
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.LongStrokesOnly = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

LongStrokesSize Property

Description

The "BarGraphConfiguration()" procedure configures

Example:

In this example the length of the axis section strokes will be set to "10".

```
Sub BarGraphConfiguration()
'VBA614
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.LongStrokesSize = 10
End With
End Sub
```

See also

AxisSection Property (Page 3492)

BarGraph Object (Page 3286)

LongStrokesTextEach Property

Description

Defines or returns which strokes will be labeled when displaying the scale on the BarGraph object (1 = every stroke, 2 = every second stroke, etc.).

Example:

The "BarGraphConfiguration()" procedure configures In this example every third stroke will be labeled:

```
Sub BarGraphConfiguration()
'VBA615
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
LongStrokesTextEach = 3
End With
End Sub
```

See also

BarGraph Object (Page 3286)

6.1.8.10 M

Macro Property

Description

For a user-defined menu entry or icon, defines the VBA macro that will be executed upon selection.

Example:

In the following example, a user-defined menu with two menu entries is created, which retrieve two different VBA macros:

```
Sub CreateDocumentMenusUsingMacroProperty()
'VBA616
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "My first menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second menuitem")
'
'To assign a macro to every menuitem:
With ActiveDocument.CustomMenus("DocMenu1")
.MenuItems("dmItem1_1").Macro = "TestMacro1"
.MenuItems("dmItem1_2").Macro = "TestMacro2"
End With
End Sub
```

You can call the following two procedures via the menu items in the user-defined menu "DocMenu1":

```
Sub TestMacro1()
MsgBox "TestMacro1 is executed"
End Sub
```

```
Sub TestMacro2()
MsgBox "TestMacro2 is executed"
End Sub
```

MenuItem Object (Page 3382)

How to assign VBA macros to menus and toolbars (Page 3036)

Marker Property

Description

TRUE if the limit values are to be displayed as a scale value in the case of the BarGraph object. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example, the limit values will be displayed as scale values:

```
Sub BarGraphConfiguration()
'VBA617
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Marker = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

Max Property

Description

Defines or returns the absolute value in the case of a full value display.

This value is displayed if the scale display is active.

Example:

The "BarGraphConfiguration()" procedure configures In this example the absolute value will be set to "10".

```
Sub BarGraphConfiguration()
'VBA618
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Max = 10
End With
End Sub
```

See also

Slider object (Page 3428)

BarGraph Object (Page 3286)

3DBarGraph Object (Page 3267)

MaxIndex property

Description

Shows the highest index of all configurable alarm and status combinations at the "HMIAdvancedStateDisplay" object.

MaximizeButton Property

Description

TRUE if the ApplicationWindow object can be maximized in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will receive a Maximize button in Runtime:

```
Sub ApplicationWindowConfig()
'VBA619
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
With objAppWindow
.MaximizeButton = True
End With
End Sub
```

See also

ApplicationWindow Object (Page 3284)

MaxZoom Property

Description

Defines or returns the maximum zoom level for the layer.

Example:

The "LayerInfo()" procedure outputs the name and zoom configuration for each layer of the current picture:

```
Sub LayerInfo()
'VBA620
Dim colLayers As HMILayers
Dim objSingleLayer As HMILayer
Dim iAnswer As Integer
Set colLayers = ActiveDocument.Layers
For Each objSingleLayer In colLayers
With objSingleLayer
iAnswer = MsgBox("Layername: " & .Name & vbCrLf & "Min. zoom:  " & .MinZoom & vbCrLf & "Max.
zoom:  " & .MaxZoom, vbOKCancel)
End With
If vbCancel = iAnswer Then Exit For
Next objSingleLayer
End Sub
```

MCGUBackColorOff-Eigenschaft

Description

In the case of the GroupDisplay object, defines or returns the background color for the "Went Out Unacknowledged" status when the flash status is "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color when the flash status is "Off" will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA621
Dim objGroupDisplay As HMIGroupDisplay
```

```
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUBackColorOff = RGB(255, 0, 0)
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCGUBackColorOn Property

Description

In the case of the GroupDisplay object, defines or returns the background color for the "Went Out Unacknowledged" status when the flash status is "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color when the flash status is "On" will be set to "White":

```
Sub GroupDisplayConfiguration()
'VBA622
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUBackColorOn = RGB(255, 255, 255)
End With
End Sub
```

GroupDisplay Object (Page 3350)

MCGUBackFlash Property

Description

TRUE if the background to the GroupDisplay object is to flash when a message goes out unacknowledged. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color is to flash when a message goes out unacknowledged:

```
Sub GroupDisplayConfiguration()
'VBA623
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUBackFlash = True
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCGUTextColorOff Property

Description

In the case of the GroupDisplay object, defines or returns the text color for the "Went Out Unacknowledged" status when the flash status is "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color to the text when the flash status is "Off" will be set to "Blue":

```
Sub GroupDisplayConfiguration()
'VBA624
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUTextColorOff = RGB(0, 0, 255)
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCGUTextColorOn Property

Description

In the case of the GroupDisplay object, defines or returns the background color to the text for the "Went Out Unacknowledged" status when the flash status is "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color to the text when the flash status is "On" will be set to "Black":

```
Sub GroupDisplayConfiguration()
'VBA625
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUTextColorOn = RGB(0, 0, 0)
End With
```

```
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCGUTextFlash Property

Description

TRUE if the font for the GroupDisplay object is to flash when a message goes out unacknowledged. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the font is to flash when a message goes out unacknowledged:

```
Sub GroupDisplayConfiguration()
'VBA626
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUTextFlash = True
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCKOBackColorOff Property

Description

In the case of the GroupDisplay object, defines or returns the background color for the "Came In" status when the flash status is "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color when the flash status is "Off" will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA627
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCKOBackColorOff = RGB(255, 0, 0)
End With
End Sub
```

GroupDisplay Object (Page 3350)

MCKQTextFlash Property

Description

TRUE if the font for the GroupDisplay object is to flash when a message goes out acknowledged. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the font is to flash when a message goes out unacknowledged:

```
Sub GroupDisplayConfiguration()
'VBA638
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCKQTextFlash = True
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCText Property

Description

Defines or returns the label for the appropriate message class in the case of the GroupDisplay object.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the label for the "Alarm High" message class will be set to "Alarm High":

```
Sub GroupDisplayConfiguration()
'VBA639
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MessageClass = 0
.MCText = "Alarm High"
End With
End Sub
```

See also

MessageClass Property (Page 3690)

GroupDisplay Object (Page 3350)

MenuItems Property

Description

Returns a listing containing all the menu entries in the user-defined menu.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"). In this example the labels will then be output:

```
Sub CreateMenuItem()
'VBA640
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim iIndex As Integer
iIndex = 1
'
'Add new menu "Delete objects" to the menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to menu "Delete objects"
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete circles")
'
'Output label of menu:
```

```
MsgBox ActiveDocument.CustomMenus(1).Label
'
'Output labels of all menuitems:
For iIndex = 1 To objMenu.MenuItems.Count
MsgBox objMenu.MenuItems(iIndex).Label
Next iIndex
End Sub
```

See also

Menu Object (Page 3378)

MenuItem Object (Page 3382)

MenuItemType Property

Description

Returns the type for a user-defined menu entry. Read only access.

Returned Value	Type of Menu Entry
0	Separator (Separator)
1	Submenu (SubMenu)
2	Menu Entry (MenuItem)

Example:

The "ShowMenuTypes()" procedure outputs the types for the menu entries in the first user-defined menu:

```
Sub ShowMenuTypes()
'VBA641
Dim iMaxMenuItems As Integer
Dim iMenuItemType As Integer
Dim strMenuItemType As String
Dim iIndex As Integer
iMaxMenuItems = ActiveDocument.CustomMenus(1).MenuItems.Count
For iIndex = 1 To iMaxMenuItems
iMenuItemType = ActiveDocument.CustomMenus(1).MenuItems(iIndex).MenuItemType
Select Case iMenuItemType
Case 0
 strMenuItemType = "Trennstrich (Separator)"
Case 1
 strMenuItemType = "Untermenü (SubMenu)"
Case 2
 strMenuItemType = "Menüeintrag (MenuItem)"
End Select
MsgBox iIndex & ". Menuitemtype: " & strMenuItemType
```

```
Next iIndex
End Sub
```

See also

MenuItem Object (Page 3382)

Menu Object (Page 3378)

MenuToolBarConfig Property

Description

Specifies the configuration file with the user-defined menu and toolbars for the "HMIPictureWindow" object or returns the name of the configuration file. STRING write-read access.

MessageClass Property

Description

Specifies the respective message type (Alarm High, Alarm Low, Warning High, Warning Low, etc.) for which the attribute settings "Display Text", "Came In", "Came In Acknowledged" and "Went Out Unacknowledged" are configured for the "GroupDisplay" and "AdvancedAnalogDisplay" objects.

MessageClass	Assigned Value
AlarmHigh	0
AlarmLow	1
WarningHigh	2
WarningLow	3
Tolerance High	4
Tolerance Low	5
AS Control System Fault	6
AS Process Control Error	7
OS Process Control Error	8

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color for the "AlarmHigh" message type when the flash status is "Off" will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA642
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MessageClass = 0
.MCGUBackColorOff = RGB(255, 0, 0)
End With
End Sub
```

GroupDisplay Object (Page 3350)

Min Property

Description

Defines or returns the absolute value in the case of the smallest value display.

This value is displayed if the scale display is active.

Example:

The "BarGraphConfiguration()" procedure configures In this example the absolute value will be set to "1".

```
Sub BarGraphConfiguration()
'VBA643
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Min = 1
End With
End Sub
```

See also

Slider object (Page 3428)

BarGraph Object (Page 3286)

3DBarGraph Object (Page 3267)

MinZoom Property

Description

Defines or returns the minimum zoom level for the layer.

Example:

The "LayerInfo()" procedure outputs the name and zoom configuration for each layer of the current picture:

```
Sub LayerInfo()
'VBA644
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim strMaxZoom As String
Dim strMinZoom As String
Dim strLayerName As String
Dim iAnswer As Integer
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
With objLayer
strMinZoom = .MinZoom
strMaxZoom = .MaxZoom
strLayerName = .Name
iAnswer = MsgBox("Layername: " & strLayerName & vbCrLf & "Min. zoom:  " & strMinZoom &
vbCrLf & "Max. zoom:  " & strMaxZoom, vbOKCancel)
End With
If vbCancel = iAnswer Then Exit For
Next objLayer
End Sub
```

See also

Layer Object (Page 3370)

Editing Layers with VBA (Page 3050)

Modified Property

Description

TRUE if the source code for a script or picture has been changed. BOOLEAN read access.

Example:

In the following example a check will be made on whether the active picture has been changed:

```
Sub CheckModificationOfActiveDocument()
'VBA645
Dim strCheck As String
Dim bModified As Boolean
bModified = ActiveDocument.Modified
Select Case bModified
Case True
strCheck = "Active document is modified"
Case False
strCheck = "Active document is not modified"
End Select
MsgBox strCheck
End Sub
```

ScriptInfo Object (Page 3424)

Document Object (Page 3319)

Moveable Property

Description

TRUE if the ApplicationWindow and PictureWindow objects can be moved in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example it shall be possible to move the application window in Runtime:

```
Sub ApplicationWindowConfig()
'VBA646
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
```

```
With objAppWindow
.Moveable = True
End With
End Sub
```

ApplicationWindow Object (Page 3284)

6.1.8.11 N-O

Name Property

Description

Returns the name of the object. STRING read access.

Example:

The "LayerInfo()" procedure outputs the name and zoom configuration for each layer of the current picture:

```
Sub LayerInfo()
'VBA647
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim strMaxZoom As String
Dim strMinZoom As String
Dim strLayerName As String
Dim iAnswer As Integer
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
With objLayer
strMinZoom = .MinZoom
strMaxZoom = .MaxZoom
strLayerName = .Name
iAnswer = MsgBox("Layername: " & strLayerName & vbCrLf & "Min. zoom:  " & strMinZoom &
vbCrLf & "Max. zoom:  " & strMaxZoom, vbOKCancel)
End With
If vbCancel = iAnswer Then Exit For
Next objLayer
End Sub
```

Document Object (Page 3319)

Application Object (Page 3282)

Name Property (FolderItem)

Description

Returns the internal name of the specified object of the "FolderItem" type. Read only access.

Example:

In this example the internal name is output for the "PC" object contained in the Global Components Library:

```
Sub ShowInternalNameOfFolderItem()
'VBA536
Dim objGlobalLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
MsgBox objGlobalLib.FolderItems(2).Folder(2).Folder.Item(1).Name
End Sub
```

See also

FolderItem Object (Page 3342)

Accessing the component library with VBA (Page 3040)

NegativeValue Property

Description

Use the BinaryResultInfo property to return the BinaryResultInfo object.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and the associated property values will be assigned to both the binary value ranges:

```
Sub AddDynamicDialogToCircleRadiusTypeBinary()
'VBA648
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBool
.BinaryResultInfo.NegativeValue = 20
.BinaryResultInfo.PositiveValue = 40
End With
End Sub
```

VBA Reference (Page 3124)

PositiveValue Property (Page 3728)

BinaryResultInfo Object (Page 3291)

NibbleSelect property

Description

Only used internally.

See also

AdvancedStateDisplay object (Page 3278)

Number Property

Description

Returns the layer number of a "Layer" type object. The counting starts with 1. The first layer, "Layer0", returns the value "0". READ access.

Example:

This example outputs the name, number and index of a layer:

```
Sub ShowLayerWithNumbers()
'VBA803
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim iAnswer As Integer
Dim iIndex As Integer
iIndex = 1
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
iAnswer = MsgBox("Layername: " & objLayer.Name & vbCrLf & "Layernumber: " & objLayer.Number
& vbCrLf & "Layersindex: " & iIndex, vbOKCancel)
iIndex = iIndex + 1
If vbCancel = iAnswer Then Exit For
Next objLayer
End Sub
```

See also

Layer Object (Page 3370)

NumberLines Property

Description

TextList

Defines for the "TextList object" how many lines the selection list should contain or returns the value. If the configured lines with their number, font size and font do not fit into the dimensions of the object, a vertical scroll bar is added to the selection list.

Combo box and list box

Defines or returns the number of lines of text for the "Combo box" and "List box" objects. You can define a maximum of 32,000 lines.

At the same time, the value of the "Number of rows" attribute specifies the high limit value for the "Index" attribute in the "Font" property group. Changing the value can have the following effects:

- Increasing the number: New lines are added at the bottom. The default labeling of the new filed can be changed using the "Text" attribute in the "Font" property group.
- Reducing the number: All lines are removed for which the value of the "Index" attribute is higher than the new number.

Example

The "TextListConfiguration()" procedure accesses the properties of the "TextList" object. In this example a selection list is created and the number of visible lines is set to three:

```
Sub TextListConfiguration()
'VBA649
Dim objTextList As HMITextList
'
'Insert new TextList in current picture:
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.NumberLines=3
End With
End Sub
```

See also

TextList Object (Page 3441)

ObjectName Property

Description

Depending on the source and destination object types for the direct connection, either defines or returns the name of the constant, object or tag.

The two tables show you when you must use the ObjectName property. A "--" means that the property is assigned an empty string (") by default when the DirectConnection object is created.

Source object type (SourceLink Property)

Type Property	AutomationName Property	ObjectName Property
hmiSourceTypeConstant	--	Name of the constant (e.g. the picture name)
hmiSourceTypeProperty	Property of the source object (e.g. "Top")	Name of the source object (e.g. "Rectangle_A")
hmiSourceTypePropertyOfThisObject	--	--
hmiSourceTypeVariableDirect	--	Tag name
hmiSourceTypeVariableIndirect	--	Tag name

Destination object type (DestinationLink Property)

Type Property	AutomationName Property	ObjectName Property
hmiDestTypeProperty	Property of the destination object (e.g. "Left")	Name of the destination object (e.g. "Rectangle_A")
hmiDestTypePropertyOfThisObject	--	--

Type Property	AutomationName Property	ObjectName Property
hmiDestTypePropertyOfActualWindow	Property of the destination object (e.g. "Left")	--
hmiDestTypeVariableDirect	--	Tag name
hmiDestTypeVariableIndirect	--	Tag name
hmiDestTypeDirectMessage	--	Tag name
hmiDestTypeIndirectMessage	--	Tag name

Example:

In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA650
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 100
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
```

```
End With
End Sub
```

DestLink Object (Page 3316)

ObjectSizeDecluttering Property

Description

TRUE, if objects of the specified picture outside of two configured sizes are to be faded out. BOOLEAN write-read access.

Define the size range with the aid of the SetDeclutterObjectSize method.

Example:

In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer()
'VBA651
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'Configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
'Define fade-in and fade-out of objects:
With ActiveDocument
.LayerDecluttering = True
.ObjectSizeDecluttering = True
.SetDeclutterObjectSize 50, 100
End With
End Sub
```

See also

Document Object (Page 3319)

Editing Layers with VBA (Page 3050)

OffsetLeft Property

Description

Defines or returns the distance of the picture from the left edge of the picture window.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured

```
Sub PictureWindowConfig()
'VBA652
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

OffsetTop Property

Description

Defines or returns the distance of the picture from the top edge of the picture window.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured

```
Sub PictureWindowConfig()
'VBA653
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

OnTop Property

Description

TRUE if the ApplicationWindow object is always in the foreground in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will always be in the foreground in Runtime:

```
Sub ApplicationWindowConfig()
'VBA654
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
With objAppWindow
```

```
.OnTop = True
End With
End Sub
```

See also

ApplicationWindow Object (Page 3284)

Operation Property

Description

TRUE if the object can be used or operated in Runtime. BOOLEAN write-read access.

Example:

In this example the status of the operator-control enables will be output for all objects in the active picture:

```
Sub ShowOperationStatusOfAllObjects()
'VBA655
Dim objObject As HMIObject
Dim bStatus As Boolean
Dim strStatus As String
Dim strName As String
Dim iMax As Integer
Dim iIndex As Integer
Dim iAnswer As Integer
iMax = ActiveDocument.HMIObjects.Count
iIndex = 1
For iIndex = 1 To iMax
strName = ActiveDocument.HMIObjects(iIndex).ObjectName
bStatus = ActiveDocument.HMIObjects(iIndex).Operation
Select Case bStatus
Case True
 strStatus = "yes"
Case False
 strStatus = "no"
End Select
iAnswer = MsgBox("Object: " & strName & vbCrLf & "Operator-Control enable: " & strStatus,
vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next iIndex
If 0 = iMax Then MsgBox "No objects in the active document."
End Sub
```

See also

HMIObject Object (Page 3357)

Document Object (Page 3319)

OperationMessage Property

Description

TRUE, if a message should be output upon successful operation. The reason for the operation can only be input if the "OperationReport" property is set to "True". BOOLEAN write-read access.

The operation is sent to the message system, and is archived. Using the message system, a message may be output in a message line, for example.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, an operation is supposed to be sent to the message system:

```
Sub IOFieldConfiguration()
'VBA656
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.OperationReport = True
.OperationMessage = True
End With
End Sub
```

TextList Object (Page 3441)

Slider object (Page 3428)

OptionGroup Object (Page 3393)

IOField Object (Page 3361)

CheckBox Object (Page 3297)

OperationReport Property

Description

TRUE, if the reason for an operation should be recorded. BOOLEAN write-read access.

When the object is used or operated in Runtime, a dialog opens in which the operator can input the reason for the operation in the form of text. The operation is sent to the message system, and is archived.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, an operation is supposed to be sent to the message system:

```
Sub IOFieldConfiguration()
'VBA657
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.OperationReport = True
.OperationMessage = True
End With
End Sub
```

Slider object (Page 3428)

OptionGroup Object (Page 3393)

IOField Object (Page 3361)

CheckBox Object (Page 3297)

Orientation Property

Description

TRUE, when the text in the object should be displayed horizontally. BOOLEAN write-read access.

Note

It is only the text that is displayed either horizontally or vertically. The position of the object remains unchanged.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the text will be displayed vertically:

```
Sub ButtonConfiguration()
'VBA658
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.Width = 150
.Height = 150
.Text = "Text is displayed vertical"
.Orientation = False
End With
End Sub
```

Description

Only used internally.

See also

FaceplateObjects object (Page 3341)

OutputFormat Property

Description

Defines how the output value shall be displayed, or returns the set value. The representation is dependent on the data format.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, data type "Decimal" will be set for the I/O field: The output value will be displayed with two decimals and three digits to the right of the decimal point:

```
Sub IOFieldConfiguration()
'VBA659
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.DataFormat = 1
.OutputFormat = "99,999"
End With
End Sub
```

See also

DataFormat Property (Page 3569)

IOField Object (Page 3361)

OutputValue Property

Description

Defines or returns presetting for the value to be displayed.

This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

Example

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, the output value is set to "0":

```
Sub IOFieldConfiguration()
'VBA660
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.OutputValue = "0"
End With
End Sub
```

See also

TextList Object (Page 3441)

IOField Object (Page 3361)

OutputValue property

Description

Specifies the interconnection with any analog / text tag. The analog display represents the value of this tag in the configured colors depending on the alarm state.

6.1.8.12 P-Q

PaintColor_QualityCodeBad property

Description

Defines the color in which the grid is shown when a poor status exists, for example, if the connection to the server is interrupted.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

PaintColor_QualityCodeUnCertain property

Description

Defines the color with which the grid is shown in an uncertain status.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Parent Property

Description

Returns the higher-ranking object in the specified object. Read only access.

Example:

In the following example a copy of the active picture is created and the name of the picture is then output with the aid of the Parent property:

```
Sub ExampleForParent()
'VBA661
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
MsgBox objView.Parent.Name
End Sub
```

See also

FaceplateProperty object (Page 3341)

PasswordLevel Property

Description

Defines the authorization for operation (e.g. no input or no triggering actions) of the object.

PasswordLevel	Assigned Value
<No Access Security>	0
User Administration	1
Value input	2
Process controlling	3
Picture editing	4
Screen change	5
Window selection	6
Hard copy	7
Confirm alarms	8
Lock alarms	9
Free alarms	10
Message editing	11
Start archive	12
Stop archive	13
Edit archive values	14
Archive editing	15
Action editing	16
Project Manager	17
Activate remote	1000
Configure remote	1001
Just monitor	1002

You must first define the operator authorizations in the User Administrator.

Example:

--

See also

HMIObject Object (Page 3357)

Path Property

Description

Returns the full path of the folder in which the specified picture is stored. Read only access.

Example:

In this example the path to the folder of the active picture will be output:

```
Sub ShowDocumentPath()
'VBA663
MsgBox ActiveDocument.Path
End Sub
```

See also

Document Object (Page 3319)

Pathname Property

Description

Returns the internal access path to the Components Library for the specified object of the "FolderItem" type. Read only access.

Example:

In this example the internal access path is output for the "PC" object contained in the Global Components Library:

```
Sub ShowInternalNameOfFolderItem()
'VBA664
Dim objGlobalLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
MsgBox objGlobalLib.FolderItems(2).Folder(2).Folder.Item(1).PathName
End Sub
```

See also

FolderItem Object (Page 3342)

Accessing the component library with VBA (Page 3040)

PdlProtection property

Description

Sets a password for a process picture or faceplate type or deletes the password. Write access.

Note

Significance of the password protection

With the PdlProtection property, you can only assign a password to process pictures or faceplate types to, for example, protect the VBA scripts contained in the pictures against unauthorized access.

Examples

In this example, a password is set for the active picture:

```
Sub ProtectPicture()
'VBA854
ActiveDocument.PdlProtection = "Test123"
End Sub
```

Password protection for the active picture is removed in this example:

```
Sub UnprotectPicture()
'VBA855
ActiveDocument.PdlProtection = ""
End Sub
```

Note

Write access only

Read access to the password is prevented due to security reasons.

PicDeactReferenced-Eigenschaft

Description

TRUE if the picture assigned to the "Deactivated" status is to be saved in the RoundButton object. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the picture assigned to the "Deactivated" status will be referenced:

```
Sub RoundButtonConfiguration()
'VBA665
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDeactReferenced = False
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PicDeactTransparent Property

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Disabled" status should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "PicDeactUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Red" assigned in the Bitmap object is to be displayed transparent when in the "Deactivated" status.

```
Sub RoundButtonConfiguration()
'VBA666
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDeactTransparent = RGB(255, 0, 0)
.PicDeactUseTransColor = True
End With
```

```
End Sub
```

See also

PicDeactUseTransColor Property (Page 3715)

RoundButton Object (Page 3418)

PicDeactUseTransColor Property

Description

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Red" assigned in the Bitmap object is to be displayed transparent when in the "Deactivated" status:

```
Sub RoundButtonConfiguration()
'VBA667
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDeactTransparent = RGB(255, 0, 0)
.PicDeactUseTransColor = True
End With
End Sub
```

See also

PicDeactTransparent Property (Page 3715)

RoundButton Object (Page 3418)

PicDownReferenced Property

Description

TRUE if the picture assigned to the "On" status is to be saved in the RoundButton object. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the picture assigned to the "On" status will be referenced:

```
Sub RoundButtonConfiguration()
'VBA668
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDownReferenced = False
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PicDownTransparent Property

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "On" status should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "PicDownUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Yellow" assigned in the Bitmap object is to be displayed transparent when in the "Deactivated" status.

```
Sub RoundButtonConfiguration()
'VBA669
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDownTransparent = RGB(255, 255, 0)
.PicDownUseTransColor = True
End With
```

```
End Sub
```

PicDownUseTransColor Property (Page 3717)

RoundButton Object (Page 3418)

PicDownUseTransColor Property

Description

TRUE, when the transparent color defined by the "PicDownTransparent" property for the "On" status should be used. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Yellow" assigned in the Bitmap object is to be displayed transparent when in the "Deactivated" status:

```
Sub RoundButtonConfiguration()
'VBA670
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDownTransparent = RGB(255, 255, 0)
.PicDownUseTransColor = True
End With
End Sub
```

See also

PicDownTransparent Property (Page 3717)

RoundButton Object (Page 3418)

PicReferenced Property

Description

TRUE if the picture assigned to the GraphicObject object is to be referenced and not saved in the object. BOOLEAN write-read access.

Example:

The "GraphicObjectConfiguration()" procedure accesses the properties of the graphics object. In this example the assigned picture will be referenced:

```
Sub GraphicObjectConfiguration()
'VBA671
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects.AddHMIObject("GraphicObject1",
"HMIGraphicObject")
With objGraphicObject
.PicReferenced = True
End With
End Sub
```

See also

GraphicObject Object (Page 3345)

PictAlignment property

Description

As the "Picture alignment" attribute, it defines the position and scaling of the picture placed on the button or round button.

centered	The picture is positioned, centered in the original proportions.
Left justified	The picture is positioned with original proportions, with left justification on the left side of the button.
Right justified	The picture is positioned with original proportions, with right justification on the right side of the button.
Stretched	The picture is scaled to a square and is adapted to the size of the button.

PicTransColor Property

Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "PicUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GraphicObjectConfiguration()" procedure accesses the properties of the graphics object. In this example the color "Blue" assigned in the Bitmap object is to be displayed transparent:

```
Sub GraphicObjectConfiguration()
'VBA672
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects.AddHMIObject("GraphicObject1",
"HMIGraphicObject")
With objGraphicObject
.PicTransColor = 16711680
.PicUseTransColor = True
End With
End Sub
```

See also

GraphicObject Object (Page 3345)

PictureDeactivated Property

Description

Defines the picture to be displayed in the "Disable" status or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the round button. In this example the pictures for the "On" and "Off" states will be defined:

```
Sub ButtonConfiguration()
'VBA673
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
'
'Toi use this example copy a Bitmap-Graphic
'to the "GraCS"-Folder of the actual project.
'Replace the picturename "TestPicture1.BMP" with the name of
'the picture you copied
.PictureDeactivated = "TestPicture1.BMP"
```

```
End With
End Sub
```

RoundButton Object (Page 3418)

PicReferenced Property (Page 3718)

PictureDown Property

Description

Defines the picture to be displayed in the "On" status or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the round button. In this example the pictures for the "On" and "Off" states will be defined:

```
Sub ButtonConfiguration()
'VBA674
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
'
'To use this example copy two Bitmap-Graphics
'to the "GraCS"-Folder of the actual project.
'Replace the picturenames "TestPicture1.BMP" and "TestPicture2.BMP"
'with the names of the pictures you copied
.PictureDown = "TestPicture1.BMP"
.PictureUp = "TestPicture2.BMP"
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PictureName Property

Description

Defines the picture to be displayed in the picture window in Runtime or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA675
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

PictureUp Property

Description

Defines the picture to be displayed in the "Off" status or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the pictures for the "On" and "Off" states will be defined:

```
Sub ButtonConfiguration()
'VBA676
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
'
'To use this example copy two Bitmap-Graphics
'to the "GraCS"-Folder of the actual project.
'Replace the picturenames "TestPicture1.BMP" and "TestPicture2.BMP"
'with the names of the pictures you copied
.PictureDown = "TestPicture1.BMP"
.PictureUp = "TestPicture2.BMP"
End With
End Sub
```

Button Object (Page 3293)

PicUpReferenced Property

Description

TRUE if the picture assigned to the "Off" status is to be saved in the RoundButton object. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the picture assigned to the "Off" status will be referenced:

```
Sub RoundButtonConfiguration()
'VBA677
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicUpReferenced = False
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PicUpTransparent Property

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Off" status should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "PicUpUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Blue" assigned in the Bitmap object is to be displayed transparent in the status "Off".

```
Sub RoundButtonConfiguration()
'VBA678
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicUpTransparent = RGB(0, 0, 255)
.PicUpUseTransColor = True
End With
End Sub
```

RoundButton Object (Page 3418)

PicUpUseTransColor Property

Description

TRUE, when the transparent color defined by the "PicUpTransparent" property for "Off" status should be used. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Blue" assigned in the Bitmap object is to be displayed transparent in the status "Off":

```
Sub RoundButtonConfiguration()
'VBA679
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicUpTransparent = RGB(0, 0, 255)
.PicUpUseTransColor = True
End With
End Sub
```

See also

PicUpTransparent Property (Page 3723)

RoundButton Object (Page 3418)

PicUseTransColor Property

Description

TRUE if the transparent color defined with the "PicTransColor" property is to be used for the "Deactivated" status. BOOLEAN write-read access.

Example:

The "GraphicObjectConfiguration()" procedure accesses the properties of the graphics object. In this example the color "Blue" assigned in the Bitmap object is to be displayed transparent:

```
Sub GraphicObjectConfiguration()
'VBA680
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects.AddHMIObject("GraphicObject1",
"HMIGraphicObject")
With objGraphicObject
.PicTransColor = RGB(0, 0, 255)
.PicUseTransColor = True
End With
End Sub
```

Description

Only used internally.

See also

PictureWindow Object (Page 3396)

PointCount Property

Description

Defines or returns the number of corner points in the case of the Polygon and Polyline objects. Each corner point has position coordinates and is identified via an index.

Example:

For this example to work, insert a polyline called "Polyline1" into the active picture: The "PolyLineCoordsOutput" procedure then outputs the coordinates of all the corner points in the polyline:

```
Sub PolyLineCoordsOutput()
'VBA681
Dim iPcIndex As Integer
Dim iPosX As Integer
Dim iPosY As Integer
Dim iIndex As Integer
Dim objPolyLine As HMIPolyLine
```

```
Set objPolyLine = Application.ActiveDocument.HMIObjects.AddHMIObject("PolyLine1",
"HMIPolyLine")

'
'Determine number of corners from "PolyLine1":
iPcIndex = objPolyLine.PointCount
'
'Output of x/y-coordinates from every corner:
For iIndex = 1 To iPcIndex
With objPolyLine
.index = iIndex
iPosX = .ActualPointLeft
iPosY = .ActualPointTop
MsgBox iIndex & ". corner:" & vbCrLf & "x-coordinate: " & iPosX & vbCrLf & "y-coordinate:
" & iPosY
End With
Next iIndex
End Sub
```

Position Property

Description

The value for position determines the sequence, in which menu entries and icons are assigned in user-defined menus and toolbars or how user-defined menus are arranged in the menu bar. Write/Read access.

A value of "1" means position 1 (start).

Example:

In the following example the position of all menu entries in the first user-defined menu in the active picture will be output: So that this example will work, first carry out the example shown under the heading "InsertSubMenu".

```
Sub ShowPositionOfCustomMenuItems()
'VBA683
```

```
Dim objMenu As HMIMenu
Dim iMaxMenuItems As Integer
Dim iPosition As Integer
Dim iIndex As Integer
Set objMenu = ActiveDocument.CustomMenus(1)
iMaxMenuItems = objMenu.MenuItems.Count
For iIndex = 1 To iMaxMenuItems
iPosition = objMenu.MenuItems(iIndex).Position
MsgBox "Position of the " & iIndex & ". menuitem: " & iPosition
Next iIndex
End Sub
```

InsertSubmenu Method (Page 3229)

PositiveValue Property

Description

Defines the value for the dynamic property if the configured tag returns a non-zero value, or returns the value.

Example:

Use the BinaryResultInfo property to return the BinaryResultInfo object. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and the associated property values will be assigned to both the binary value ranges:

```
Sub AddDynamicDialogToCircleRadiusTypeBool()
'VBA684
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBool
.BinaryResultInfo.NegativeValue = 20
.BinaryResultInfo.PositiveValue = 40
End With
End Sub
```

See also

NegativeValue Property (Page 3695)

BinaryResultInfo Object (Page 3291)

VBA Reference (Page 3124)

PredefinedAngels Property

Description

Defines or returns the depth of the display of the 3DBarGraph object. Value range from 0 to 3.

Display	Assigned Value
Cavalier	0
Isometric	1
Axonometric	2
Freely Defined	3

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the depth display will be set to "Isometric":

```
Sub HMI3DBarGraphConfiguration()
'VBA685
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
'Depth-angle a = 15 degrees
.AngleAlpha = 15
.PredefinedAngles = 1
'Depth-angle b = 45 degrees
.AngleBeta = 45
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

Pressed Property

Description

TRUE, when the Button or RoundButton object is pressed. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the RoundButton object will be set to "Pressed":

```
Sub RoundButtonConfiguration()
'VBA686
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.Pressed = True
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PrioAlarm..Warning property

Description

Specifies the priority at one of the following states or message types:

- Alarm
- Warning
- Tolerance
- AS Process Control Error
- AS Control System Fault
- Operator request

PrioBit16..31 property

Description

The property indicates the priority of the respective bit in the group value for the alarm evaluation for the advanced analog and status display. The alarm evaluation starts at the highest priority (priority 1). Bits that are not used for the alarm evaluation are assigned priority 0.

If the group value contains multiple bits, the priority determines which status is displayed.

Process Property

Description

Defines or returns presetting for the value to be displayed.

This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the default value will be set to "100":

```
Sub HMI3DBarGraphConfiguration()
'VBA687
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
'Depth-angle a = 15 degrees
.AngleAlpha = 15
'Depth-angle b = 45 degrees
.AngleBeta = 45
.Process = 100
End With
End Sub
```

3DBarGraph Object (Page 3267)

Process property

Description

Here the first tag is stored that is used for status value calculation for the "HMIAdvancedStateDisplay" object.

Use the "BitPosition0..3" properties to specify the bit position of these tags that is taken into account for the status value calculation. This results in the statuses to which you can then assign pictures.

Process1 property

Description

Here the second tag is stored that is used for status value calculation for the "HMIAdvancedStateDisplay" object.

Use the "BitPosition0..3" properties to specify the bit position of these tags that is taken into account for the status value calculation. This results in the statuses to which you can then assign pictures.

Process2 property

Description

Here the third tag is stored that is used for status value calculation for the "HMIAdvancedStateDisplay" object.

Use the "BitPosition0..3" properties to specify the bit position of these tags that is taken into account for the status value calculation. This results in the statuses to which you can then assign pictures.

Process3 property

Description

Here the fourth tag is stored that is used for status value calculation for the "HMIAdvancedStateDisplay" object.

Use the "BitPosition0..3" properties to specify the bit position of these tags that is taken into account for the status value calculation. This results in the statuses to which you can then assign pictures.

ProfileName Property

Description

Returns the name of the specified application. Read only access.

Example:

In this example the name of the "Graphics Designer" application will be output:

```
Sub ShowProfileName()
'VBA688
MsgBox Application.ProfileName
End Sub
```

See also

Application Object (Page 3282)

ProgID Property

Description

Returns the ProgID of an ActiveX Control. STRING read access.

Example:

In the following example the ActiveX Control "WinCC Gauge Control" is inserted in the active picture. The ProgID is then output:

```
Sub AddActiveXControl()
'VBA689
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
With ActiveDocument
.HMIObjects("WinCC_Gauge").Top = 40
.HMIObjects("WinCC_Gauge").Left = 40
MsgBox "ProgID of ActiveX-control: " & .HMIObjects("WinCC_Gauge").ProgID
End With
End Sub
```

See also

ActiveXControl Object (Page 3273)

AddActiveXControl Method (Page 3174)

ProjectName Property

Description

Returns the project name. Read access.

Example:

In this example the name and type of the loaded project will be output.

```
Sub ShowProjectInfo()
'VBA690
Dim iProjectType As Integer
```

```
Dim strProjectName As String
Dim strProjectType As String
iProjectType = Application.ProjectType
strProjectName = Application.ProjectName
Select Case iProjectType
Case 0
strProjectType = "Single-User System"
Case 1
strProjectType = "Multi-User System"
Case 2
strProjectType = "Client System"
End Select
MsgBox "Projecttype: " & strProjectType & vbCrLf & "Projectname: " & strProjectName
End Sub
```

See also

Application Object (Page 3282)

ProjectType Property

Description

Returns the project type. Value range from 0 to 2. Read access.

Project type	Assigned Value
Single-user project	0
Multi-user project	1
client project	2

Example:

In this example the name and type of the loaded project will be output:

```
Sub ShowProjectInfo()
'VBA691
Dim iProjectType As Integer
Dim strProjectName As String
Dim strProjectType As String
iProjectType = Application.ProjectType
strProjectName = Application.ProjectName
Select Case iProjectType
Case 0
strProjectType = "Single-User System"
Case 1
strProjectType = "Multi-User System"
Case 2
strProjectType = "Client System"
```

```
End Select
MsgBox "Projecttype: " & strProjectType & vbCrLf & "Projectname: " & strProjectName
End Sub
```

See also

Application Object (Page 3282)

Properties Property

Description

Returns a Properties listing containing all the properties of the specified object. Read only access.

To return an element from the Properties listing you can use either the index number or the name of the VBA property.

You must use the Properties property if, for example, you wish to access the properties of objects located in a group object.

Example:

Examples showing how to use the Properties property can be found in this documentation under the following headings:

- "Editing Objects with VBA"
- "Group objects"
- "Customized Objects"

See also

HMIObject Object (Page 3357)

Customized Objects (Page 3074)

Group Objects (Page 3067)

Editing Objects with VBA (Page 3053)

Prototype Property

Description

Returns the function heading of a script. The function heading is assigned by default if no source code is configured.

Example:

In the following example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle will enlarge every time you click the button. In this case only the prototype of the VB script is output:

```
Sub ExampleForPrototype()
'VBA692
Dim objButton As HMIButton
Dim objCircleA As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Set objCircleA = ActiveDocument.HMIObjects.AddHMIObject("CircleA", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircleA
.Top = 100
.Left = 100
End With
With objButton
.Top = 10
.Left = 10
.Width = 200
.Text = "Increase Radius"
End With
'On every mouseclick the radius have to increase:
Set objEvent = objButton.Events(1)
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
MsgBox objVBScript.Prototype
End Sub
```

See also

ScriptInfo Object (Page 3424)

QualityCodeStateChecked Properties

Description

TRUE, if the quality code of the specified tag is used in Dynamic dialog for dynamization. BOOLEAN write-read access.

Example:

In the following example the radius of a circle is given dynamics with the Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA816
```

```
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90

.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

See also

DynamicDialog Object (Page 3325)

QualityCodeStateValues Property

Description

Returns the QualityCodeStateValues listing. Use the QualityCodeStateValues property with the Item property to assign a value to the quality code status to be used for dynamization.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA817
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

Radius Property

Description

Defines or returns the radius in the case of the following objects:

- Circle: Radius in pixels (0 to 10000)
- CircularArc: Radius in pixels (0 to 10000)
- PieSegment: Radius in pixels (0 to 10000)
- RoundButton: Radius in pixels (0 to 10000)

Example:

The "PieSegmentConfiguration()" procedure accesses the properties of the Pie Segment. In this example the radius will be set to "80":

```
Sub PieSegmentConfiguration()
'VBA693
Dim objPieSegment As HMIPieSegment
Set objPieSegment = ActiveDocument.HMIObjects.AddHMIObject("PieSegment1", "HMIPieSegment")
With objPieSegment
.StartAngle = 40
.EndAngle = 180
.Radius = 80
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PieSegment Object (Page 3399)

CircularArc Object (Page 3303)

Circle Object (Page 3300)

RadiusHeight Property

Description

Defines or returns the vertical radius in pixels (0 to 5000) in the case of elliptical objects (Ellipse, EllipseArc, EllipseSegment).

Example:

The "EllipseConfiguration()" procedure accesses the properties of the ellipse object. In this example the horizontal radius will be set to "60":

```
Sub EllipseConfiguration()
'VBA694
Dim objEllipse As HMIEllipse
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("Ellipse1", "HMIEllipse")
With objEllipse
.RadiusHeight = 60
.RadiusWidth = 40
End With
End Sub
```

See also

RadiusWidth Property (Page 3740)

EllipseSegment Object (Page 3333)

EllipseArc Object (Page 3330)

Ellipse Object (Page 3327)

RadiusWidth Property

Description

Defines or returns the horizontal radius in pixels (0 to 5000) in the case of elliptical objects (Ellipse, EllipseArc, EllipseSegment).

Example:

The "EllipseConfiguration()" procedure accesses the properties of the ellipse object. In this example the horizontal radius will be set to "40":

```
Sub EllipseConfiguration()
'VBA695
Dim objEllipse As HMIEllipse
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("Ellipse1", "HMIEllipse")
With objEllipse
.RadiusHeight = 60
.RadiusWidth = 40
End With
End Sub
```

See also

RadiusHeight Property (Page 3739)

EllipseSegment Object (Page 3333)

EllipseArc Object (Page 3330)

Ellipse Object (Page 3327)

RangeTo Property

Description

Defines or returns the analog value range.

Example:

An example showing how to use the RangeTo property can be found in this documentation under the heading "AnalogResultInfos Object (Listing)".

See also

Value Property (Page 3807)

AnalogResultInfos Object (Listing) (Page 3281)

AnalogResultInfo Object (Page 3280)

ReferenceRotationLeft Property

Description

Defines or returns the X-coordinate of the reference point about which the object should be rotated in Runtime.

The value of the X-coordinate is relative to the object width. Enter the value in percent starting from the left edge of the rectangle enclosing the object.

Example:

The "PolyLineConfiguration()" procedure accesses the properties of the PolyLine object. In this example, the coordinates of the reference point will be set to 50% of the object width and 50% of the object height:

```
Sub PolyLineConfiguration()
'VBA696
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects.AddHMIObject("PolyLine1", "HMIPolyLine")
With objPolyLine
```

```
.ReferenceRotationLeft = 50
.ReferenceRotationTop = 50
End With
End Sub
```

See also

RotationAngle Property (Page 3744)

ReferenceRotationTop Property (Page 3742)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

Line Object (Page 3373)

ReferenceRotationTop Property

Description

Defines or returns the Y-coordinate of the reference point about which the object should be rotated in Runtime.

The value of the Y-coordinate is relative to the object width. Enter the value in percent starting from the top edge of the rectangle enclosing the object.

Example:

The "PolyLineConfiguration()" procedure accesses the properties of the PolyLine object. In this example, the coordinates of the reference point will be set to 50% of the object width and 50% of the object height:

```
Sub PolyLineConfiguration()
'VBA697
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects.AddHMIObject("PolyLine1", "HMIPolyLine")
With objPolyLine
.ReferenceRotationLeft = 50
.ReferenceRotationTop = 50
End With
End Sub
```

See also

RotationAngle Property (Page 3744)

ReferenceRotationLeft Property (Page 3741)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

Line Object (Page 3373)

Relevant Property

Description

TRUE when the "GroupDisplay", "AdvancedAnalogDisplay" or "AdvancedStateDisplay" object is taken into account when forming the group display. BOOLEAN write-read access.

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the object for forming the group display will be considered:

```
Sub GroupDisplayConfiguration()
'VBA698
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.Relevant = True
End With
End Sub
```

See also

Group Object (Page 3348)

ResultType Property

Description

Defines or returns the value range evaluation type in the Dynamic dialog.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and the associated property values will be assigned to both the binary value ranges:

```
Sub AddDynamicDialogToCircleRadiusTypeBinary()
'VBA699
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
```

```
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBool
.BinaryResultInfo.NegativeValue = 20
.BinaryResultInfo.PositiveValue = 40
End With
End Sub
```

See also

DynamicDialog Object (Page 3325)

RightComma Property

Description

Defines or returns the number of decimal places (0 to 20) for the BarGraph object.

Example:

The "BarGraphConfiguration()" procedure configures In this example the number of decimal places will be limited to 4.

```
Sub BarGraphConfiguration()
'VBA700
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.RightComma = 4
End With
End Sub
```

See also

BarGraph Object (Page 3286)

RotationAngle Property

Description

Line, Polygon and PolyLine

Defines or returns the rotation angle of the following objects in degrees: Line, Polygon, PolyLine.

The object is displayed in Runtime only rotated clockwise around the reference point by the specified value (starting from the configured starting position).

T-piece

Defines or returns the orientation of a T-piece in degrees. The attribute can only assume one of four values:

0	The standard position of the T-piece is the shape of the letter "T"
90	The "leg" of the "T" points towards the left
180	The "leg" of the "T" points upwards
270	The "leg" of the "T" points to the right

Other values are automatically converted to modulus 360 and rounded up or down to the nearest permissible value.

The T-piece is shown rotated around the center point in the project and in Runtime.

Example:

The "PolyLineConfiguration()" procedure accesses the properties of the PolyLine object. In this example the object will be rotated by 45° in Runtime:

```
Sub PolyLineConfiguration()
'VBA701
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects.AddHMIObject("PolyLine1", "HMIPolyLine")
With objPolyLine
.ReferenceRotationLeft = 50
.ReferenceRotationTop = 50
.RotationAngle = 45
End With
End Sub
```

ReferenceRotationTop Property (Page 3742)

ReferenceRotationLeft Property (Page 3741)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

Line Object (Page 3373)

RoundCornerHeight Property

Description

Defines or returns the corner radius of the RoundRectangle object.

Enter the value as a percentage of half the height of the object.

Example:

The "RoundRectangleConfiguration()" procedure accesses the properties of the object RoundRectangle. In this example the corner radius will be set to 25% (height) and 50% (width).

```
Sub RoundRectangleConfiguration()
'VBA702
Dim objRoundRectangle As HMIRoundRectangle
Set objRoundRectangle = ActiveDocument.HMIObjects.AddHMIObject("RoundRectangle1",
"HMIRoundRectangle")
With objRoundRectangle
.RoundCornerHeight = 25
.RoundCornerWidth = 50
End With
End Sub
```

See also

RoundCornerWidth Property (Page 3746)

RoundRectangle Object (Page 3422)

RoundCornerWidth Property

Description

Defines or returns the corner radius of the RoundRectangle object.

Enter the value as a percentage of half the width of the object.

Example:

The "RoundRectangleConfiguration()" procedure accesses the properties of the object RoundRectangle. In this example the corner radius will be set to 25% (height) and 50% (width):

```
Sub RoundRectangleConfiguration()
'VBA703
Dim objRoundRectangle As HMIRoundRectangle
Set objRoundRectangle = ActiveDocument.HMIObjects.AddHMIObject("RoundRectangle1",
"HMIRoundRectangle")
With objRoundRectangle
.RoundCornerHeight = 25
.RoundCornerWidth = 50
End With
End Sub
```

See also

RoundCornerHeight Property (Page 3745)

RoundRectangle Object (Page 3422)

6.1.8.14 S

SameSize Property

Description

TRUE, when all four buttons of a Group Display object have the same size. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example all four buttons will have the same size.

```
Sub GroupDisplayConfiguration()
'VBA704
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.SameSize = True
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

ScaleColor Property

Description

Defines or returns the color of the scale. LONG write-read access.

The "Scaling" property must be set to TRUE for the color to be displayed.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphConfiguration()" procedure configures In this example the scale will be displayed and the scale color will be set to "Red":

```
Sub BarGraphConfiguration()
'VBA705
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScaleColor = RGB(255, 0, 0)
End With
End Sub
```

See also

Scaling Property (Page 3749)

BarGraph Object (Page 3286)

ScaleTicks Property

Description

Defines or returns the number of scale sections for the BarGraph object.

A scale section is a part of the scale bounded by two long scale strokes or division ticks. If you assign a value of "0" to the property, the appropriate scale marks will be calculated automatically.

Example:

The "BarGraphConfiguration()" procedure configures In this example the number of scale sections will be set to "10".

```
Sub BarGraphConfiguration()
'VBA706
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScaleTicks = 10
End With
End Sub
```

See also

BarGraph Object (Page 3286)

Scaling Property

Description

TRUE if a scale is also used to display the values in the case of the BarGraph object. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures the properties of the BarGraph object. In this example the scale will be displayed and the scale color will be set to "Red":

```
Sub BarGraphConfiguration()
'VBA707
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScaleColor = RGB(255, 0, 0)
End With
End Sub
```

See also

BarGraph Object (Page 3286)

ScalingMode property

Description

Defines the size to display the objects of the faceplate instance.

Default	Like scaling mode "proportional"
1 : 1	The faceplate type is displayed in the original size in the faceplate instance. If the faceplate instance is too small, the size of the faceplate instance is adapted to the size of the faceplate type.
Proportional	The faceplate type is scaled in proportion with the size of the faceplate instance.

Example

ScalingType Property

Description

Defines or returns the type of bar scaling. Value range from 0 to 2.

The "Scaling" property must be set to TRUE for the color to be displayed.

Bar Scaling	Assigned Value
Linear	0
Logarithmic	1
Automatic	2

Example:

The "BarGraphConfiguration()" procedure configures In this example the bar scaling will be set to "Linear":

```
Sub BarGraphConfiguration()
'VBA708
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.ScalingType = 0
.Scaling = True
End With
End Sub
```

See also

Scaling Property (Page 3749)

BarGraph Object (Page 3286)

ScriptType Property

Description

Returns the script type (C or VBS) which was used to make a property or event dynamic. Read only access.

Example:

In the following example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle will enlarge every time you click the button. In this case the script type will be output:

```
Sub ExampleForPrototype()
'VBA709
Dim objButton As HMIButton
Dim objCircleA As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Dim strScriptType As String
Set objCircleA = ActiveDocument.HMIObjects.AddHMIObject("CircleA", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircleA
.Top = 100
.Left = 100
End With
With objButton
.Top = 10
.Left = 10
.Width = 200
.Text = "Increase Radius"
End With
'On every mouseclick the radius have to increase:
Set objEvent = objButton.Events(1)
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
Select Case objVBScript.ScriptType
Case 0
strScriptType = "VB script is used"
Case 1
strScriptType = "C-Skript is used"
End Select
MsgBox strScriptType
End Sub
```

See also

ScriptInfo Object (Page 3424)

ScrollBars Property

Description

TRUE if the picture window has scroll bars in Runtime. BOOLEAN write-read access.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA710
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ScrollPositionX Property

Description

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA808
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ScrollPositionX = 50
.ScrollPositionY = 50
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ScrollPositionY Property

Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA809
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
```

```
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ScrollPositionX = 50
.ScrollPositionY = 50
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ScrollPosX Property

Description

Defines or returns the X position of the scroll bars for the View object.

Example:

In the following example a copy of the active picture is created and then activated. The position of the scroll bars will be set to 40 (X) and 10 (Y):

```
Sub CreateViewAndActivateView()
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
objView.ScrollPosX = 40
objView.ScrollPosY = 10
End Sub
```

See also

ScrollPosY Property (Page 3755)

View Object (Page 3466)

ScrollPosY Property

Description

Defines or returns the Y position of the scroll bars for the View object.

Example:

In the following example a copy of the active picture is created and then activated. The position of the scroll bars will be set to 40 (X) and 10 (Y):

```
Sub CreateViewAndActivateView()
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
objView.ScrollPosX = 40
objView.ScrollPosY = 10
End Sub
```

See also

ScrollPosX Property (Page 3754)

View Object (Page 3466)

SelBGColor Property

Description

Defines or returns the background color for the selected entry in the case of the TextList object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the background color for the selected entry will be set to "Red":

```
Sub TextListConfiguration()
Dim objTextList As HMITextList
'
```

```
'Neue TextListe ins aktuelle Bild einfügen:
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.SelBGColor = RGB (255, 0, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

Selected Property

Description

TRUE if an object is selected in the picture. BOOLEAN write-read access.

Example:

In the following example two new objects will be inserted in the active picture and then selected:

```
Sub SelectObjects()
'VBA714
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
End Sub
```

See also

HMIObject Object (Page 3357)

Selection Property

Description

Returns a listing containing all the objects selected in the specified picture.

To return an element from the Selection listing you can use either the index number or the object name.

You can use the Selection property, for example, to select all the objects in the picture.

Example:

In the following example all the objects in the active picture are selected:

```
Sub SelectAllObjectsInActiveDocument()
'VBA715
ActiveDocument.Selection.SelectAll
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

Document Object (Page 3319)

SelIndex property

Description

Defines or returns the index of which the associated text is highlighted in the combobox or list box.

SelText property

Description

Shows the text defined with the "SelIndex" property which is highlighted in the ComboBox or ListBox object. You cannot directly change the "Selected text" attribute. You change the "Selected text" attribute by changing the "Selected box" attribute or the text itself in the "Font" properties group.

SelTextColor Property

Description

Defines or returns the text color for the selected entry in the TextList object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the text color for the selected entry will be set to "Yellow":

```
Sub TextListConfiguration()
'VBA716
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.SelTextColor = RGB(255, 255, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

ServerName Property

Description

Returns the name of the specified ActiveX Control or of the embedded object. Read only access.

Example

In the following example the ActiveX Control "WinCC Gauge Control" will be inserted in the active picture and the name of the ActiveX Control will be output:

```
Sub AddActiveXControl()
'VBA717
```

```
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
With objActiveXControl
.Top = 40
.Left = 60
MsgBox .Properties("ServerName").value
End With
End Sub
```

See also

ActiveXControl Object (Page 3273)

ServerPrefix Property

Description

Defines the server which will hold the picture that is displayed in the picture window in Runtime, or returns the name of the server.

Enter the server name followed by two colons: "<Servername>::". No check is made as to whether the server actually exists.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA718
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = "my_Server::"
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ShortCut Property

Description

Defines or returns a shortcut key sequence for a user-defined menu entry or user-defined icon.

The following keys are permitted in combination with <CTRL>, <ALT> and <SHIFT>:

- Function keys <F1> to <F12>
- The letter keys <A> to <Z> and the number keys <0> to <9>.

The following are not supported: the keys on the alphanumeric keypad, the cursor keys (e.g. <Page Up>) and the remaining function keys such as <RETURN> and <ESC>. No distinction is made upper and lower case. Key combinations with two or more letters or numbers are not permitted, such as "CTRL+A+B", but the combination with two additional keys such as <CTRL +ALT+A" is allowed.

Notes on using the ShortCut property

The key sequences used must be unique within the user-defined menus and toolbars in a picture. Key sequences that you configure with VBA have priority over any key sequences that may be present in the Graphics Designer. Within the user-defined menus and toolbars, picture-specific key sequences have priority over application-specific key sequences.

Note

Shortcut key sequences are only executed if the menu entry or the icon is visible and active.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line. The first menu entry receives the shortcut key sequence <CTRL+SHIFT+M> for retrieval:

```
Sub CreateDocumentMenus()
'VBA719
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
'Add menu to menubar:
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
'Add menuitems to the new menu:
```

```
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "&My first Menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second Menuitem")
'
'Add seperator to menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
'Add submenu to the menu:
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "My first submenu")
'
'Add menuitems to the submenu:
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "My first submenuitem")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "My second
submenuitem")
'
ActiveDocument.CustomMenus("DocMenu1").MenuItems(1).ShortCut = "CTRL+SHIFT+M"
End Sub
```

See also

Configuring Menus and Toolbars (Page 3020)

ToolbarItem Object (Page 3448)

MenuItem Object (Page 3382)

ShowBadTagState property

Description

Determines if the object is grayed out when a bad quality code or tag status is detected. At both objects, "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay", the property is used to specify whether the settings for the "PaintColor_QualityCodeBad" and "PaintColor_QualityCodeUnCertain" properties are used.

SignificantMask Property

Description

Needed in Runtime for displaying the active message class with the highest priority in the GroupDisplay object.

The value of the SignificantMask property represents an internal system output value does not require any specific configuration by the user. Updating takes place in Runtime by clicking on the object.

Example:

--

Simulation property

Description

Specifies the interconnection with any tag that is used for simulation.

SimulationBit property

Description

Shows the bit position of the linked simulation tags that is used for evaluation.

The value of the simulation tag is only evaluated with the alarm status "OK".

Size Property

Description

Defines or returns the font size in points for a language-dependent font.

Example:

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA721
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "DefText"
Set colLangFonts = objButton.LDFonts
'
'Set font-properties for french:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'
'Set font-properties for english:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
```

```
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

Family Property (Page 3587)

Bold Property (Page 3513)

Application Property (Page 3484)

LanguageFont Object (Page 3365)

Sizeable Property

Description

TRUE if the size of the ApplicationWindow and PictureWindow objects can be changed in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example it is intended that the application window can be resized in Runtime:

```
Sub ApplicationWindowConfig()
'VBA722
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
With objAppWindow
.Sizeable = True
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ApplicationWindow Object (Page 3284)

SmallChange Property

Description

Defines how many steps the controller can be moved with one mouse click or returns the value.

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the number of steps will be set to "4":

```
Sub SliderConfiguration()
'VBA723
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.SmallChange = 4
End With
End Sub
```

See also

Slider object (Page 3428)

SnapToGrid Property

Description

TRUE if objects in the picture are aligned on the grid (which is invisible). BOOLEAN write-read access.

Example:

In the following example, the alignment of objects in the active picture on the grid is activated:

```
Sub ActivateSnapToGrid()
'VBA724
ActiveDocument.SnapToGrid = True
End Sub
```

See also

Document Object (Page 3319)

SourceLink Property

Description

Returns the Source object. Use the SourceLink property to configure the source object in the case of a direct connection.

Example:

In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA725
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 100
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of Rectangle_B
```

```
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

See also

Type Property (Page 3790)

ObjectName Property (Page 3698)

AutomationName Property (Page 3488)

SourceLink Object (Page 3431)

DirectConnection Object (Page 3318)

SourceCode Property

Description

Defines or returns the source code of a C script or VB script.

If you assign a C script to the SourceCode property, you must enter only the program code located between the braces ("{}").

If you assign a VB script to the SourceCode property, you must enter only the program code located between the Sub and EndSub keywords.

Note

If you use single quote marks (') or double quote marks (") in the program code, you must enter an additional quote mark in front of every single or double quote mark so that the program code can be correctly interpreted in the VBA editor.

The Compiled property returns TRUE if the source code was successfully compiled.

Example:

In the following example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle will enlarge every time you click the button. A VB script will be used for this purpose:

```
Sub IncreaseCircleRadiusWithVBScript()
'VBA726
Dim objButton As HMIButton
Dim objCircleA As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
```

```
Dim strCode As String
strCode = "Dim objCircle" & vbCrLf & "Set objCircle = "
strCode = strCode & "hmiRuntime.ActiveScreen.ScreenItems(""CircleVB"")"
strCode = strCode & vbCrLf & "objCircle.Radius = objCircle.Radius + 5"
Set objCircleA = ActiveDocument.HMIObjects.AddHMIObject("CircleVB", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircleA
.Top = 100
.Left = 100
End With
With objButton
.Top = 10
.Left = 10
.Width = 200
.Text = "Increase Radius"
End With
'
'On every mouseclick the radius have to increase:
Set objEvent = objButton.Events(1)
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
objVBScript.SourceCode = strCode
Select Case objVBScript.Compiled
Case True
MsgBox "Compilation ok!"
Case False
MsgBox "Error on compilation!"
End Select
End Sub
```

See also

Compiled Property (Page 3556)

ScriptInfo Object (Page 3424)

StartAngle Property

Description

Defines or returns the start of the object for the CircularArc, EllipseArc, EllipseSegment and PieSegment objects. The information is in counterclockwise direction in degrees, beginning at the 12:00 clock position.

Example:

The "PieSegmentConfiguration()" procedure accesses the properties of the Pie Segment. In this example the pie segment begins at 40° and ends at 180°:

```
Sub PieSegmentConfiguration()
'VBA727
```

```
Dim PieSegment As HMIPieSegment
Set PieSegment = ActiveDocument.HMIObjects.AddHMIObject("PieSegment1", "HMIPieSegment")
With PieSegment
.StartAngle = 40
.EndAngle = 180
End With
End Sub
```

See also

EndAngle Property (Page 3580)

PieSegment Object (Page 3399)

EllipseSegment Object (Page 3333)

EllipseArc Object (Page 3330)

CircularArc Object (Page 3303)

StatusText Property

Description

Defines or returns the text that will be displayed in the status bar when you point with the mouse to a user-defined menu entry or user-defined icon.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line. A status bar entry will be defined for each menu entry:

```
Sub CreateDocumentMenus()
'VBA728
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
'Add menu:
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
'Add menuitems to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "My first menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second menuitem")
'
'Add seperator to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
'Add submenu to custom-menu:
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "My first submenu")
```

```
'
'Add menuitems to submenu:
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "My first submenuitem")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "My second
submenuitem")
'
'Assign statustexts to every menuitem
With objDocMenu
.MenuItems(1).StatusText = "My first menuitem"
.MenuItems(2).StatusText = "My second menuitem"
.MenuItems(4).SubMenu.Item(1).StatusText = "My first submenuitem"
.MenuItems(4).SubMenu.Item(2).StatusText = "My second submenuitem"
End With
End Sub
```

See also

ToolbarItem Object (Page 3448)

MenuItem Object (Page 3382)

SubMenu Property

Description

Returns a MenuItems listing if the specified object is the "SubMenu" type.

Use the SubMenu listing if you wish to create a submenu in a user-defined menu.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA730
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
'Add menu:
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
'Add menuitems to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "My first menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second menuitem")
'
'Add seperator to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
```

```
'
'Add submenu to custom-menu:
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "My first submenu")
'
'Add menuitems to submenu:
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "My first submenuitem")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "My second
submenuitem")
End Sub
```

See also

MenuItem Object (Page 3382)

SymbolLibraries Property

Description

Returns a SymbolLibraries listing containing objects of the "SymbolLibrary" type.

Use SymbolLibraries(1) to return the "Global Library". Use SymbolLibraries(2) to return the "Project Library".

Example:

In the following example the names of the libraries will be output:

```
Sub ShowSymbolLibraries()
'VBA731
Dim colSymbolLibraries As HMISymbolLibraries
Dim objSymbolLibrary As HMISymbolLibrary
Set colSymbolLibraries = Application.SymbolLibraries
For Each objSymbolLibrary In colSymbolLibraries
MsgBox objSymbolLibrary.Name
Next objSymbolLibrary
End Sub
```

Application Object (Page 3282)

6.1.8.15 T

TabOrderAlpha Property

Description

Defines or returns the position of the object in the TAB sequence for the alpha / tab order cursor.

Example:

In this example two I/O fields will be inserted in the active picture and the TAB sequence will then be defined:

```
Sub IOFieldConfig()
'VBA734
Dim objIOField1 As HMIIOField
Dim objIOField2 As HMIIOField
Set objIOField1 = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
Set objIOField2 = ActiveDocument.HMIObjects.AddHMIObject("IOField2", "HMIIOField")
With objIOField1
.Top = 10
.Left = 10
.TabOrderAlpha = 1
End With
With objIOField2
.Top = 100
.Left = 10
.TabOrderAlpha = 2
End With
End Sub
```

Document Object (Page 3319)

TabOrderAllHMIObjects Property

Description

TRUE if all the objects in a picture are to be included in the configured TAB sequence. BOOLEAN write-read access.

Example:

The "ConfigureTabOrder()" procedure defines which objects in the active picture are to be included in the configured TAB sequence. In this example all the objects will be included in the TAB sequence:

```
Sub ConfigureTabOrder()
'VBA733
With ActiveDocument
.TABOrderAllHMIObjects = True
.TABOrderKeyboard = False
.TABOrderMouse = False
.TABOrderOtherAction = False
End With
End Sub
```

TabOrderKeyboard Property

Description

TRUE if objects with a keyboard operation event configured to them are to be included in the configured TAB sequence. BOOLEAN write-read access.

Example:

The "ConfigureTabOrder()" procedure defines which objects in the active picture are to be included in the configured TAB sequence. In this example objects with a keyboard operation will be included in the TAB sequence:

```
Sub ConfigureTabOrder()
'VBA735
With ActiveDocument
.TABOrderAllHMIObjects = True
.TABOrderKeyboard = False
.TABOrderMouse = False
.TABOrderOtherAction = False
End With
End Sub
```

Document Object (Page 3319)

TabOrderOtherAction Property

Description

TRUE if objects with an event other than a mouse or keyboard operation event configured to them are to be included in the configured TAB sequence. BOOLEAN write-read access.

Example:

The "ConfigureTabOrder()" procedure defines which objects in the active picture are to be included in the configured TAB sequence. In this example objects with events other than a mouse or keyboard operation will be included in the TAB sequence:

```
Sub ConfigureTabOrder()
'VBA737
With ActiveDocument
.TABOrderAllHMIObjects = True
.TABOrderKeyboard = False
.TABOrderMouse = False
.TABOrderOtherAction = False
End With
End Sub
```

Document Object (Page 3319)

TabOrderSwitch Property

Description

Defines or returns the position of the object in the TAB sequence.

Example:

In this example two I/O fields will be inserted in the active picture and the TAB sequence will then be defined:

```
Sub IOFieldConfig()
'VBA732
Dim objIOField1 As HMIIOField
Dim objIOField2 As HMIIOField
Set objIOField1 = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
Set objIOField2 = ActiveDocument.HMIObjects.AddHMIObject("IOField2", "HMIIOField")
With objIOField1
.Top = 10
.Left = 10
.TabOrderSwitch = 1
End With
With objIOField2
.Top = 100
```

```
.Left = 10
.TabOrderSwitch = 2
End With
End Sub
```

See also

HMIObject Object (Page 3357)

Tag Property

Description

Defines or returns information text for a user-defined menu entry or user-defined icon. You can use the Tag property for example to briefly describe what the menu entry does.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA738
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
'Add menu:
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
'Add menuitems to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "My first menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second menuitem")
'
'Add seperator to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
'Add submenu to custom-menu:
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "My first submenu")
'
'Add menuitems to submenu:
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "My first submenuitem")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "My second
submenuitem")
'
'To place an additional information:
With objDocMenu
.MenuItems(1).Tag = "This is the first menuitem"
```

```
End With
End Sub
```

See also

ToolbarItem Object (Page 3448)

MenuItem Object (Page 3382)

Tag property

Description

Is used for the "Graphic Object Update Wizard" tool and is not evaluated for the "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay" objects.

tagname property

Description

Is used for the "Graphic Object Update Wizard" tool and is not evaluated for the "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay" objects.

TagPrefix Property

Description

Defines or returns the tag prefix for all the tags contained in the Picture Window object.

Example:

The picture "InputOutput" is to be displayed in the picture window. The picture "InputOutput" contains three I/O fields which are linked to a structure tag. The structure tag consists of the elements EA1, EA2, EA3; one element each for each I/O field.

Three such structure tags have been define in the project, with structure names Struct1, Struct2 and Struct3.

The tag prefix is in this case the structure name followed by a period. Specify the tag prefix as, say, Struct2. (the period is necessary in order to address the elements of the structure tag as structure elements in a syntactically correct way). The I/O fields in the picture "InputOutput" are then linked to the elements in structure tag Struct2:

Tag Prefix: "Struct2."

- Output value (first I/O field): EA1
- Output value (second I/O field): EA2
- Output value (third I/O field): EA3

The current tag connection in the picture window is then

- Output value (first I/O field): Struct2.EA1
- Output value (second I/O field): Struct2.EA2
- Output value (third I/O field): Struct2.EA3

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA739
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = "my_Server::"
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

TagScaleParam1 property

Description

Sets the value1 for the value range process.

TagScaleParam2 property

Description

Sets the value2 for the value range process.

TagScaleParam3 property

Description

Sets the value3 for the value range process.

TagScaleParam4 property

Description

Sets the value4 for the value range process.

TagStartvaluePersistence property

Description

Defines whether an internal tag is set as persistent. You can only set internal tags as persistent.

tagtype property

Description

Is used for the "Graphic Object Update Wizard" tool and is not evaluated for the "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay" objects.

Template property

Description

Returns the template for displaying the window content of the "ApplicationWindow" object. Read only access.

The "ApplicationWindow" object can be supplied from applications of the Global Script and the report system:

GSC Diagnostics	The application window is supplied by applications of the Global Script. The results of the diagnostics system are displayed.
GSC Runtime	The application window is supplied by applications of the Global Script. The analysis results regarding characteristics in Runtime are displayed.
All Jobs	The application window is supplied by the report system. The available reports are displayed as a list.
All Jobs – Shortcut Menu	The application window is supplied by the report system. The available reports are displayed as a list. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the report.

Job Detail View	The application window is supplied by the report system. The available reports are displayed in a selection menu. Detailed information is displayed for the selected report.
Selected Jobs - Shortcut Menu	The application window is supplied by the report system. The available reports are displayed as a list. This list only contains reports which you have activated the option "Mark for print job list" in the "Print Job Properties" dialog. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the report.

ApplicationWindow Object (Page 3284)

Text Property

Description

Defines or returns the labeling for an object.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the label will be defined:

```
Sub ButtonConfiguration()
'VBA740
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.Text = "Button1"
End With
End Sub
```

TitleForeColorInactive property

Description

Only used internally.

See also

PictureWindow Object (Page 3396)

Toggle Property

Description

TRUE, if the button or round button should lock after being operated in Runtime. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the round button is intended to latch down when pressed in Runtime:

```
Sub RoundButtonConfiguration()
'VBA741
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.Toggle = True
End With
End Sub
```

See also

RoundButton Object (Page 3418)

ToleranceHigh Property

Description

Defines or returns the limit value for "Tolerance high".

The type of the evaluation (in percent or absolute) is defined in the TypeToleranceHigh property.

Monitoring of the limit value only takes effect when the CheckToleranceHigh property is set to "True".

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the limit values. In this example the limit value for "Tolerance High" will be configured:

```
Sub BarGraphLimitConfiguration()
'VBA742
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeToleranceHigh = False
'Activate monitoring
.CheckToleranceHigh = True
'Set barcolor = "yellow"
.ColorToleranceHigh = RGB(255, 255, 0)
'Set upper limit to "40"
.ToleranceHigh = 40
End With
End Sub
```

See also

TypeToleranceHigh Property (Page 3795)

CheckToleranceHigh Property (Page 3537)

BarGraph Object (Page 3286)

ToleranceLow Property

Description

Defines or returns the limit value for "Tolerance low".

The type of the evaluation (in percent or absolute) is defined in the TypeToleranceLow property.

Monitoring of the limit value only takes effect when the CheckToleranceLow property is set to "True".

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the limit values. In this example the limit value for "Tolerance Low" will be configured.

```
Sub BarGraphLimitConfiguration()
'VBA743
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeToleranceLow = False
'Activate monitoring
.CheckToleranceLow = True
'Set barcolor = "red"
.ColorToleranceLow = RGB(255, 0, 0)
'Set lower limit to "40"
.ToleranceLow = 40
End With
End Sub
```

See also

TypeToleranceLow Property (Page 3796)

CheckToleranceLow Property (Page 3538)

BarGraph Object (Page 3286)

ToolbarItems Property

Description

Returns a listing containing all the elements (icons and separation lines) of a user-defined toolbar.

Example

In the following example a user-defined toolbar with two icons is created in the active picture. These icons are separated by a dividing line:

```
Sub AddDocumentSpecificCustomToolbar()
'VBA744
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Set objToolbar = ActiveDocument.CustomToolbars.Add("DocToolbar")
'
'Add symbol-icon to userdefined toolbar
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "My first
symbol-icon")
```

```
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(3, "tItem1_3", "My second
symbol-icon")
Set objToolbarItem = objToolbar.ToolbarItems.InsertSeparator(2, "tSeparator1_2")
End Sub
```

See also

ToolbarItem Object (Page 3448)

Toolbar Object (Page 3445)

ToolbarItemType property

Description

Returns the type of the "HMIToolbarItem" object of a user-defined toolbar as a "string".

Returned Value	Type in the toolbar
0	Separator
1	Icon

Example

In the following example the type of the first object in the first user-defined toolbar in the active picture is output:

```
Sub ShowFirstObjectOfCollection()
'VBA353
Dim strType As String
strType = ActiveDocument.CustomToolbars(1).ToolbarItems(1).ToolbarItemType
MsgBox strType
End Sub
```

ToolTipText Property

Description

Defines or returns the text that will be displayed as a Tooltip when you run the mouse over an object (HMIObject, icon).

Example:

The "RectangleConfiguration()" procedure accesses the properties of the Rectangle object. In this example a tool tip text will be assigned to the rectangle:

```
Sub RectangleConfiguration()
'VBA745
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.ToolTipText = "This is a rectangle"
End With
End Sub
```

The following example shows how you have to initialize the property prior to dynamization:

```
Sub Dyn()
'VBA823
Dim objCircle As HMICircle
Dim doc As Document
Dim objDynDialog As HMIDynamicDialog
Set doc = ActiveDocument
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle","HMICircle")
objCircle.ObjectName = "Circle1"
objCircle.BorderColor = RGB(255, 0, 0)
objCircle.BackColor = RGB(0, 255, 0)
objCircle.ToolTipText = "Text"
Set objDynDialog =
objCircle.ToolTipText.CreateDynamic(hmiDynamicCreationTypeDynamicDialog, "'Var'")
End Sub
```

ToolbarItem Object (Page 3448)

HMIObject Object (Page 3357)

How to dynamize a property with the Dynamic dialog (Page 3084)

Top Property

Description

Defines or returns the Y-coordinate of an object (measured from the top left edge of the picture) in pixels. The Y-coordinate relates to the top left corner of the rectangle enclosing the object.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the Rectangle object. In this example the rectangle will be set to position 10/40:

```
Sub RectangleConfiguration()
'VBA746
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.Left = 10
.Top = 40
End With
End Sub
```

See also

View Object (Page 3466)

HMIObject Object (Page 3357)

TopConnectedObjectName Property

Description

Returns the name of the end object to which the connector is connected. Read only access.

Example:

An example showing how to use the BottomConnectedObjectName property can be found in this documentation under the heading "ObjConnection Object".

See also

ObjConnection object (Page 3388)

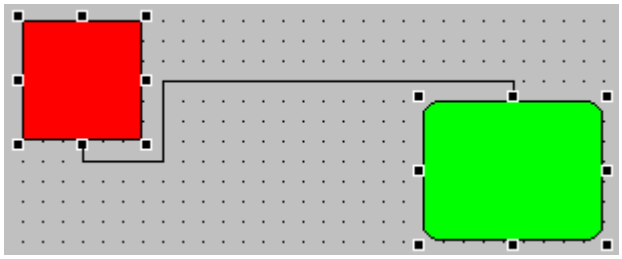
TopConnectedConnectionPointIndex Property

Description

Returns the connection point on the object to which the connector is connected.

Connection Point	Assigned Value
Up	0
Right	1

Connection Point	Assigned Value
Down	2
Left	3



Example:

An example showing how to use the BottomConnectedObjectName property can be found in this documentation under the heading "ObjConnection Object".

See also

ObjConnection object (Page 3388)

Transparency property

Description

Defines the degree of transparency of the object display. Values between 0 and 100 indicate the transparency as a percentage. In the case of a semi-transparent objects other objects shine through. A 100% transparent object is invisible. An invisible object can also be controlled in Runtime.

Example

```
Sub addTransparentObject()
    'VBA849
    Dim objHMICircle As HMICircle
    Set objHMICircle = ActiveDocument.HMIObjects.AddHMIObject("Circle", "HMICircle")
    objHMICircle.Transparency = 40
End Sub
```

Trend Property

Description

TRUE if the trend or tendency of the measured value being monitored (rising or falling) is to be indicated by a little arrow. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example the trend of the measured value will be indicated:

```
Sub BarGraphConfiguration()
'VBA747
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.trend = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

trend property

Description

Is used for the "Graphic Object Update Wizard" tool and is not evaluated for the "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay" objects.

TrendColor Property

Description

Defines or returns the color of the trend display.

The trend display indicates the tendency (rising or falling) of the measuring value being monitored by a small arrow. In order to activate the trend display, the Trend property must be set to "True". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphConfiguration()" procedure configures In this example the trend in the measured value will be indicated. The trend display will be set to "Red":

```
Sub BarGraphConfiguration()
'VBA748
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.trend = True
.TrendColor = RGB(255, 0, 0)
End With
End Sub
```

See also

Trend Property (Page 3788)

BarGraph Object (Page 3286)

Trigger Property

Description

Returns a Trigger object. Use the Trigger property when making a property dynamic with the aid of a script.

Example:

In this example the "Radius" property of a circle will be made dynamic with the aid of a C script (the output value sets the radius):

```
Sub AddDynamicAsCSkriptToProperty()
'VBA749
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle

Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("myCircle", "HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
.Trigger.Type = hmiTriggerTypeStandardCycle
.Trigger.CycleType = hmiCycleType_2s
.Trigger.Name = "Trigger1"
End With
```

```
End Sub
```

See also

Trigger Object (Page 3452)

ScriptInfo Object (Page 3424)

Type Property

Description

Returns or defines the type of an object.

The object type is returned as either a string or and integer.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the Rectangle object. In this example the object type will be output:

```
Sub RectangleConfiguration()
'VBA750
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
MsgBox "Objecttype: " & .Type
End With
End Sub
```

TypeAlarmHigh Property

Description

TRUE, when the upper limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "50".

```
Sub BarGraphLimitConfiguration()
'VBA751
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeAlarmHigh = False
'Activate monitoring
.CheckAlarmHigh = True
'Set barcolor = "yellow"
.ColorAlarmHigh = RGB(255, 255, 0)
'Set upper limit = "50"
.AlarmHigh = 50
End With
End Sub
```

BarGraph Object (Page 3286)

TypeAlarmLow Property

Description

TRUE, when the lower limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "10".

```
Sub BarGraphLimitConfiguration()
'VBA752
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeAlarmLow = False
'Activate monitoring
.CheckAlarmLow = True
'Set barcolor = "yellow"
.ColorAlarmLow = RGB(255, 255, 0)
'Set lower limit = "10"
.AlarmLow = 10
End With
End Sub
```

TypeLimitHigh4 Property

Description

TRUE, when the "Reserve 4" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "70".

```
Sub BarGraphLimitConfiguration()
'VBA753
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
```

```
'Set analysis = absolute
.TypeLimitHigh4 = False
'Activate monitoring
.CheckLimitHigh4 = True
'Set barcolor = "red"
.ColorLimitHigh4 = RGB(255, 0, 0)
'Set upper limit = "70"
.LimitHigh4 = 70
End With
End Sub
```

TypeLimitHigh5 Property

Description

TRUE, when the "Reserve 5" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "80".

```
Sub BarGraphLimitConfiguration()
'VBA754
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeLimitHigh5 = False
'Activate monitoring
.CheckLimitHigh5 = True
'Set barcolor = "black"
.ColorLimitHigh5 = RGB(0, 0, 0)
'Set upper limit = "70"
.LimitHigh5 = 70
End With
End Sub
```

TypeLimitLow4 Property

Description

TRUE, when the "Reserve 4" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "5".

```
Sub BarGraphLimitConfiguration()
'VBA755
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeLimitLow4 = False
'Activate monitoring
.CheckLimitLow4 = True
'Set barcolor = "green"
.ColorLimitLow4 = RGB(0, 255, 0)
'Set lower limit = "5"
.LimitLow4 = 5
End With
End Sub
```

TypeLimitLow5 Property

Description

TRUE, when the "Reserve 5" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "0".

```
Sub BarGraphLimitConfiguration()
'VBA756
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeLimitLow5 = False
'Activate monitoring
.CheckLimitLow5 = True
'Set barcolor = "white"
.ColorLimitLow5 = RGB(255, 255, 255)
'Set lower limit = "0"
.LimitLow5 = 0
End With
End Sub

TypeToleranceHigh Property

Description

TRUE, when the "Tolerance high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the limit values. In this example the limit value for "Tolerance High" will be configured:

```
Sub BarGraphLimitConfiguration()
'VBA757
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeToleranceHigh = False
'Activate monitoring
.CheckToleranceHigh = True
'Set barcolor = "yellow"
.ColorToleranceHigh = RGB(255, 255, 0)
'Set upper limit = "40"
.ToleranceHigh = 40
End With
End Sub
```

TypeToleranceLow Property

Description

TRUE, when the "Tolerance low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the limit values. In this example the limit value for "Tolerance Low" will be configured:

```
Sub BarGraphLimitConfiguration()
'VBA758
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeToleranceLow = False
'Activate monitoring
.CheckToleranceLow = True
```

```
'Set barcolor = "red"
.ColorToleranceLow = RGB(255, 0, 0)
'Set lower limit = "10"
.ToleranceLow = 10
End With
End Sub
```

TypeWarningHigh Property

Description

TRUE, when the "Warning high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "75".

```
Sub BarGraphLimitConfiguration()
'VBA759
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeWarningHigh = False
'Activate monitoring
.CheckWarningHigh = True
'Set barcolor = "red"
.ColorWarningHigh = RGB(255, 0, 0)
'Set upper limit = "75"
.WarningHigh = 75
End With
End Sub
```

6.1.8.16 U

Underlined Property

Description

TRUE if the font attribute "Underline" is set for the language-dependent text in the object.
BOOLEAN write-read access.

Example:

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA761
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "DefText"
Set colLangFonts = objButton.LDFonts
'
'Set font-properties for french:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'
'Set font-properties for english:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

UnselBGColor Property

Description

Defines or returns the background color of entries in the text list object which are not selected. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the colors will be defined for entries that are not selected in the selection list:

```
Sub TextListConfiguration()
'VBA762
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.UnselBGColor = RGB(255, 0, 0)
.UnselTextColor = RGB(0, 0, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

UnselTextColor Property

Description

In the case of the TextList object, defines or returns the color of text in the selection list for entries that are not selected. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the colors will be defined for entries that are not selected in the selection list:

```
Sub TextListConfiguration()
'VBA763
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.UnselBGColor = RGB(255, 0, 0)
.UnselTextColor = RGB(0, 0, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

UpdateCycle Property

Description

Defines or returns the type and frequency of updates to the picture window in Runtime.

Update Cycle	Assigned Value
Upon change	0
250 ms	1
500 ms	2
1 s	3
2 s	4
5 s	5
10 s	6
1 min	7
5 min	8
10 min	9
1 h	10
User cycle 1	11

Update Cycle	Assigned Value
User cycle 2	12
User cycle 3	13
User cycle 4	14
User cycle 5	15
Picture cycle	255

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be updated every 5 seconds in Runtime:

```
Sub PictureWindowConfig()
'VBA764
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.UpdateCycle = 5
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

UseEventState property

Description

Specifies for the "HMIAdvancedStateDisplay" object whether the group value is evaluated for the representation of the states.

If the group value is used, you can assign pictures for the individual alarm statuses.

UsedLanguage property

Description

Use the UsedLanguage property to set the code page that matches the character set used.

LONG write-read access.

Example

The "UsedLanguage" property and language ID "1033" are used in the following example to set the code page to English US.

```
Sub AddDynamicAsCSkriptToProperty()
'VBA856
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
Dim strCode As String
strCode = "long lHeight;" & vbCrLf & "int check;" & vbCrLf
strCode = strCode & "GetHeight (""events.PDL"", ""myCircle""); & vbcrlf"
strCode = strCode & "lHeight = lHeight+5;" & vbCrLf
strCode = strCode & "check = SetHeight(""events.PDL"", ""myCircle"",lHeight);"
strCode = strCode & vbCrLf & "//Return-Type: BOOL" & vbCrLf
strCode = strCode & "return check;"
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
'Create dynamic for Property "Radius":
Set objCScript = objCircle.Height.CreateDynamic(hmiDynamicCreationTypeCScript)
'set Sourcecode and cycletime:
  With objCScript
    .SourceCode = strCode
    .Trigger.Type = hmiTriggerTypeStandardCycle
    .Trigger.CycleType = hmiCycleType_2s
    .Trigger.Name = "Trigger1"
'Set language English-US
.UsedLanguage = 1033
  End With
End Sub
```

UseGlobalAlarmClasses property

Description

Defines whether to use globally configured alarm classes to visualize message events. The property is only relevant for PCS7 projects.

Value	Description
TRUE	Activates the global settings made in PCS7 alarm editor for visualizing the message events.
FALSE	Visualization of the message events is defined locally for each message class.

UseGlobalSettings property

Description

Specify whether to use global settings to assign message events to the buttons visualized in the group view. The display of the message events is configured using the "MessageClass" properties. The property is only relevant for PCS7 projects.

Value	Description
TRUE	Activates the settings made in the PCS7 alarm editor for the assignment of message events to the buttons in the group display. The bit numbers in the group value are assigned to the respective buttons.
FALSE	The message types are assigned locally to the buttons in the group display.

UserValue1 Property

Description

Defines or returns any value in the case of the GroupDisplay object.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example four different user values will be assigned:

```
Sub GroupDisplayConfiguration()
'VBA765
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.UserValue1 = 0
.UserValue2 = 25
.UserValue3 = 50
.UserValue4 = 75
End With
End Sub
```

UserValue4 Property (Page 3806)

UserValue3 Property (Page 3805)

UserValue2-Eigenschaft (Page 3805)

GroupDisplay Object (Page 3350)

UserValue2-Eigenschaft

Description

Defines or returns any value in the case of the GroupDisplay object.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example four different user values will be assigned:

```
Sub GroupDisplayConfiguration()
'VBA766
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.UserValue1 = 0
.UserValue2 = 25
.UserValue3 = 50
.UserValue4 = 75
End With
End Sub
```

UserValue1 Property (Page 3804)

GroupDisplay Object (Page 3350)

UserValue3 Property

Description

Defines or returns any value in the case of the GroupDisplay object.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example four different user values will be assigned:

```
Sub GroupDisplayConfiguration()
'VBA767
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.UserValue1 = 0
.UserValue2 = 25
.UserValue3 = 50
.UserValue4 = 75
End With
End Sub
```

See also

UserValue4 Property (Page 3806)

UserValue1 Property (Page 3804)

GroupDisplay Object (Page 3350)

UserValue4 Property

Description

Defines or returns any value in the case of the GroupDisplay object.

The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example four different user values will be assigned:

```
Sub GroupDisplayConfiguration()
'VBA768
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.UserValue1 = 0
.UserValue2 = 25
```

```
.UserValue3 = 50
.UserValue4 = 75
End With
End Sub
```

UserValue2-Eigenschaft (Page 3805)

UserValue1 Property (Page 3804)

GroupDisplay Object (Page 3350)

UseValueText property

Description

Specifies whether a text tag is used instead of a formatted analog value.

6.1.8.17 V

Value

Value Property

Description

Returns or defines the value of an object property.

Example:

Use the Value property if you wish to return or define a value with the aid of the Properties listing. In this example the property of an ActiveX Control will be accessed via the Value property:

```
Sub AddActiveXControl()
'VBA769

Property Object (Page 3409)

VALUE_ACCESS_FAULT Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Access to tag not permitted" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle is given dynamics with the The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
```

```
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

VALUE_ADDRESS_ERROR Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Addressing error" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA771
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:

VALUE_BAD_MISCSTATES Property

Description

Specifies the value assigned to a dynamized property if quality code "bad miscellaneous states" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60

VALUE_BAD_NONSPECIFIC Property

Description

Specifies the value assigned to a dynamized property if quality code "bad, non-specific" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_BAD_OUTOFSERV Property

Description

Specifies a value assigned to a dynamized property if quality code "bad, out of service" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
```

```
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_BAD_PROCRELNOM Property

Description

Specifies the value assigned to a dynamized property if quality code "bad, process related, no maintenance" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
```

```
'define a value for every state:

VALUE_BAD_PROCRELSUB Property

Description

Specifies the value assigned to a dynamized property if quality code "bad, process related, substitute value" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_CONVERSION_ERROR Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Conversion error" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA772
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20

VALUE_HARDWARE_ERROR Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "No network module" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA774
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:

VALUE_HIGHLIMITED Property

Description

Specifies the value assigned to a dynamized property if quality code "high limited" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
```

```
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_INVALID_KEY Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Tag not found" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA775
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
```

```
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30

VALUE_LOWLIMITED Property

Description

Specifies the value assigned to a dynamized property if quality code "low limited" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
```

```
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

VALUE_MAX_LIMIT Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Upper limit exceeded" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA776
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

VariableStateValue Object (Page 3461)

VALUE_MAX_RANGE Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Format upper limit exceeded" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA777
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
```

```
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90

VariableStateValue Object (Page 3461)

VALUE_NOT_ESTABLISHED Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "No check-back message from the channel" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA780
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate

VariableStateValue Object (Page 3461)

VALUE_SERVERDOWN Property

Description

Defines or returns the value that will be assigned to the dynamic property if tag status "Server not available" occurs.

The value of the VariableStateChecked property must be TRUE in order for the status to be evaluated.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA781
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20

VALUE_UNCERT_ENGVHIGHLIM Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, engineering unit range violation, high limit set" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_UNCERT_ENGVONLIM Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, engineering unit range violation, on limits set" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
```

```
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30

VALUE_UNCERT_INITVAL Property

Description

Specifies a value assigned to a dynamized property if quality code "uncertain, initial value" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
```

```
'define a value for every state:

VALUE_UNCERT_LUV Property

Description

Specifies a value assigned to a dynamized property if quality code "uncertain, last usable value" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_UNCERT_MISCSTATES Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain miscellaneous states" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_UNCERT_NONSPECIFIC Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, non-specific" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_UNCERT_PROCRELNOM Property

Description

Specifies the value assigned to a dynamized property if quality code "uncertain, process related, no maintenance" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:

VALUE_BAD_COMMLUV Property (Page 3811)
QualityCodeStateValue Object (Page 3411)

VALUE_UNCERT_SIMVAL Property

Description

Specifies a value assigned to a dynamized property if quality code "uncertain, simulated value" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
```

```
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

QualityCodeStateValue Object (Page 3411)

VALUE_UNCERT_SUBSTSET Property

Description

Specifies a value assigned to a dynamized property if quality code "uncertain, substitute set" occurs, or returns its value.

In order for the quality code to be analyzed, the QualityCodeStateChecked property must be TRUE.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA770
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
```

```
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

QualityCodeStateValue Object (Page 3411)

VariablesExist Property

Description

TRUE when all the tags used in the source code of a DynamicDialog object are defined. Read only access.

You can use this property to check whether all the tags that you have defined in the source code of the Dynamic dialog are created in WinCC.

Example:

--

See also

DynamicDialog Object (Page 3325)

VariableStateChecked Property

Description

TRUE if the status of the specified tag is used in the dynamic dialog for dynamization. BOOLEAN write-read access.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If a tag does not return

a status, a substitute value (ElseCase property) is defined, a tag name is issued and three analog value ranges are created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA785
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

See also

DynamicDialog Object (Page 3325)

VariableStateType Property

Description

Returns the type of tag monitoring used to dynamize a property or an event: No monitoring, quality code, or tag status. Read only access.

Index	VariableStateType
0	hmiNoVariableState
1	hmiVariableQCState
2	hmiVariableState

Example:

The procedure "GetVariableStateType()" reads the type of monitoring from the current document. In this example, the type of monitoring is output in a message:

```
Sub GetVariableStateType()
'VBA819
Dim objDyn As HMIDynamicDialog
Set objDyn =
ActiveDocument.Properties("Width").CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'TestVal'")
MsgBox objDyn.VariableStateType
objDyn.Delete
End Sub
```

See also

DynamicDialog Object (Page 3325)

VariableStateValues Property

Description

Returns the VariableStateValues listing. Use the VariableStateValues property with the Item property to assign a value to the tag status to be used for dynamization.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog. The dynamization takes place be evaluating the status of a tag. If a tag does not return

a status, a substitute value (ElseCase property) is defined, a tag name is issued and three analog value ranges are created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA786
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of variablestate
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

See also

VariableStateValues Object (Listing) (Page 3462)

DynamicDialog Object (Page 3325)

VariableTriggers Property

Description

Returns the VariableTriggers listing. Use the VariableTriggers property in order to add a tag trigger to a VB action or C action.

Example:

In the following example the radius of a circle is made dynamic with the aid of a VB script. A tag trigger is used as the trigger:

```
Sub DynamicWithVariableTrigger()
'VBA787
Dim objVBScript As HMIScriptInfo
Dim objVarTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VariableTrigger",
"HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
'Triggername and cycletime are defined by add-methode
Set objVarTrigger = .Trigger.VariableTriggers.Add("VarTrigger", hmiVariableCycleType_10s)
.SourceCode = ""
End With
End Sub
```

See also

VariableTriggers Object (Listing) (Page 3465)

VarName Property

Description

Defines the tag whose status is to be used in the Dynamic dialog for the purpose of dynamics, or returns the name.

Example:

In this example the name of the trigger tag used for creating dynamics in the radius of a circle will be output:

```
Sub GetVarName()
'VBA788
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.Item("Circle_VariableTrigger")
Set objVBScript = objCircle.Radius.Dynamic
With objVBScript
'Reading out of variablename
MsgBox "The radius is dynamicabled with: " & .Trigger.VariableTriggers.Item(1).VarName
End With
End Sub
```

See also

VariableStateValue Object (Page 3461)

VBAVersion Property

Description

Returns the VBA version number. Read only access.

Example:

In the following example the current VBA version number is output:

```
Sub ShowVBAVersion()
'VBA789
MsgBox Application.VBAVersion
End Sub
```

See also

Application Object (Page 3282)

VBE Property

Description

Returns the VB Extensibility object. Read access.

Example:

--

See also

Application Object (Page 3282)

Version Property

Description

Returns the version number of the specified application. Read only access.

Example:

In the following example the version number of the Graphics Designer is output:

```
Sub ShowVersionOfGraphicsDesigner()
'VBA791
MsgBox Application.Version
End Sub
```

See also

Application Object (Page 3282)

Views Property

Description

Returns the Views listing. Use the Views listing to create a new copy of a picture, for instance.

Example:

In the following example a copy of the active picture is created and then activated:

```
Sub AddView()
'VBA792
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

See also

Views Object (Listing) (Page 3468)

Visible Property

Description

TRUE if the specified object is intended to be visible. BOOLEAN write-read access.

Example:

In the following example a circle will be inserted into the active picture. This circle is not intended to be visible in Runtime:

```
Sub HideCircleInRuntime()
'VBA793
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("myCircle", "HMICircle")
objCircle.Visible = False
End Sub
```

WarningHigh Property

Description

Defines or returns the high limit value "Warning High" in the case of the BarGraph object.

The "CheckWarningHigh" property must be set to "True" in order for the limit value to be monitored.

The display on reaching the limit value and the type of evaluation are defined via the properties ColorWarningHigh and TypeWarningHigh.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "75".

```
Sub BarGraphLimitConfiguration()
'VBA794
```

```
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeWarningHigh = False
'Activate monitoring
.CheckWarningHigh = True
'Set barcolor = "red"
.ColorWarningHigh = RGB(255, 0, 0)
'Set upper limit = "75"
.WarningHigh = 75
End With
End Sub
```

See also

TypeWarningHigh Property (Page 3797)

ColorWarningHigh Property (Page 3552)

CheckWarningHigh Property (Page 3539)

BarGraph Object (Page 3286)

WarningLow Property

Description

Defines or returns the low limit value "Warning Low" in the case of the BarGraph object.

The "CheckWarningLow" property must be set to "True" in order for the limit value to be monitored.

The display on reaching the limit value and the type of evaluation are defined via the properties ColorWarningLow and TypeWarningLow.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "12".

```
Sub BarGraphLimitConfiguration()
'VBA795
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeWarningLow = False
'Activate monitoring
.CheckWarningLow = True
```

```
'Set barcolor = "magenta"
.ColorWarningLow = RGB(255, 0, 255)
'Set lower limit = "12"
.WarningLow = 75
End With
End Sub
```

See also

TypeWarningLow Property (Page 3798)

ColorWarningLow Property (Page 3553)

CheckWarningLow Property (Page 3539)

BarGraph Object (Page 3286)

Width Property

Description

Defines or returns the width of an object in pixels.

Example:

In the following example three objects of different sizes will be inserted in the active picture. Then all objects will be selected and set to the same width:

```
Sub ApplySameWidthToSelectedObjects()
'VBA796
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Width = 15
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Width = 40
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
```

```
.Width = 120
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.SameWidth
End Sub
```

See also

HMIObject Object (Page 3357)

WinCCStyle property

Description

Defines the style in which the object is displayed.

User-defined	Shows the object according to the respective settings.
global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

Example

WindowBorder Property

Description

TRUE if it is intended that the application window or picture window shall be displayed with a border in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will

```
Sub ApplicationWindowConfig()
'VBA797
Dim objAppWindow As HMIApplicationWindow
```

```
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow",
"HMIApplicationWindow")
With objAppWindow
.Caption = True
.CloseButton = False
.Height = 200
.Left = 10
.MaximizeButton = True
.Moveable = False
.OnTop = True
.Sizeable = True
.Top = 20
.Visible = True
.Width = 250
.WindowBorder = True
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ApplicationWindow Object (Page 3284)

WindowMonitorNumber property

Description

Defines the monitor on which the picture window is displayed. This requires that the system supports more than one monitor. The attribute is only effective if the "Independent window" attribute is set to "Yes".

1-n The number of the monitor in the operating system on which the picture window is displayed.

Example

WindowPositionMode property

Description

Defines the position and scaling of the picture window on the screen. The property is only effective if the "Independent window" attribute is set to "Yes".

Standard	The picture window is positioned in its original size in the configured position on the screen.
Center	The picture window is positioned in its original size, centered on the screen.
Maximize	The picture window is scaled to the size of the screen.

Example

WindowsStyle property

Description

Defines whether the object is displayed in the Windows style of WinCC version 6.2. It can only be selected if "WinCC Classic" is chosen as the current design.

yes	Shows the object using the Windows style from WinCC version 6.2.
No	Shows the object not using the Windows style from WinCC version 6.2.

Example

WindowState Property

Description

Returns the status of the window containing the specified application. READ access.

WindowState	Assigned Value
Maximized	0
Minimized	1
Custom sized	2

Example:

In the following example the window status of the Graphics Designer is output:

```
Sub ShowWindowState()
'VBA798
Dim strState As String
Select Case Application.WindowState
Case 0
strState = "The application-window is maximized"
Case 1
strState = "The applicationwindow is minimized"
Case 2
strState = "The application-window has a userdefined size"
End Select
MsgBox strState
End Sub
```

See also

Application Object (Page 3282)

ZeroPoint Property

Description

Defines or returns the position of the zero point on the bar in the case of the BarGraph object.

Specify the value as a %age of the total bar height. The zero point can also be outside of the range represented.

The "ScalingType" property must be set to "2" and "Scaling" must be set to "True".

Example:

The "BarGraphConfiguration()" procedure configures In this example the zero point is located halfway up the bar height:

```
Sub BarGraphConfiguration()
'VBA799
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScalingType = 2
.ZeroPoint = 50
.ZeroPointValue = 0
End With
End Sub
```

See also

ZeroPointValue Property (Page 3886)

ScalingType Property (Page 3750)

Scaling Property (Page 3749)

BarGraph Object (Page 3286)

ZeroPointValue Property

Description

Defines or returns the absolute value for the zero point.

Example:

The "BarGraphConfiguration()" procedure configures In this example the absolute value of the zero point will be set to "0".

```
Sub BarGraphConfiguration()
'VBA800
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScalingType = 2
.ZeroPointValue = 0
End With
End Sub
```

ScalingType Property (Page 3750)

Scaling Property (Page 3749)

BarGraph Object (Page 3286)

3DBarGraph Object (Page 3267)

Zoom Property

Description

Defines or returns the zoom factor.

Example:

In this example a copy of the active picture is created and the zoom factor is set to 50%:

```
Sub CreateViewFromActiveDocument()
'VBA801
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Zoom = 50
End Sub
```

6.2 VBA in Other WinCC Editors

6.2.1 VBA in Other WinCC Editors

Introduction

In addition to Graphics Designer, you can automate the following WinCC editors with VBA:

- Tag Management
- Tag Logging
- Text library
- Alarm Logging

The functions for accessing the editors are contained in the "HMIGO" class.

Requirement

- The "HMIGenObjects.dll" file is referenced. This happens automatically during WinCC installation.

Principle

For access to the "HMIGO" class with VBA, you must reference the "HMI GeneralObjects 1.0 Type Library" in the VBA editor via the "Tools > References" menu. You must create a new instance of this class in the program code, e.g.:

```
'Dim HMIGOObject As New HMIGO
```

Create several different objects of this class if access several objects at the same time. Two instances of the "HMIGO" class are required, for example, in Tag Logging: The first instance is required for access to the archive tags, the second instance for access to the process value archive.

Application

To enable you to use the functions and properties of the editors in VBA, you must have opened a project in WinCC.

You can then, for example, do the following directly from the program code:

- Create several tags and change the values
- Edit text entries in the TextLibrary
- Adapt messages.

Querying Object State

The "HMIGO" class has the enumeration "HMIGO_OBJECT_STATE" which returns the state of the specified object. The enumeration can return the following values:

- OBJECT_EMPTY (2): Connection to the object is not available.
- OBJECT_OPENED (3): Connection to objects exists. You can change and read its parameters.
- OBJECT_MODIFIED (4): An object's parameters have been changed. If the corresponding Commit function is not called, the changes are not saved.
- WINCC_CONNECTED (1): The object is connected to the WinCC project. By default this connection is established when a function is called the first time. To release the connection, use the instruction "HMIGO = nothing", for example.

Error Handling

Errors can occur when you use the "HMIGO" class. Use the "OnError" statement to respond to these error messages. The "OnError" statement must come before the call of a function from the HMIGeneralObjects class:

```
Sub CreateTag()
'HMIGO_000
Dim hmiGOTag as New HMIGO
On Error GoTo ErrorHandlerHMIGO
hmiGOTag.CreateTag "NewTag", TAG_BINARY_TAG, "ExistingConnection", "DB1,DD0,QC",
"NewOrExistingGroupName"

'...
Exit Sub
ErrorHandlerHMIGO:
MsgBox ("Error: " & Err.Number & " " & Err.Description & " " & Err.Source)
Resume Next
End Sub
```

As a result, an error text returned by the interface is output.

VBA in Tag Logging (Page 3900)

VBA in Tag Management (Page 3889)

6.2.2 VBA in Tag Management

6.2.2.1 VBA in Tag Management

Introduction

VBA can be used to:

- Create tags directly from the program code
- Modify and delete tags
- Read out and change the properties of the tags
- Read out and change the types of the tags
- Read out and change the values of the tags

Note

The tags may not be open or opened in tag management when editing with VBA.
If you wish to change the data type of a tag, you must first delete the tag and then regenerate it. You must save the parameters first in order to be able to transfer them following the generation of tags.

Principle

When you have created the instance of the "HMIGO" class, the following functions are available to you to access the tag management facility:

- CloseTag
- CommitTag
- CreateTag
- DeleteTag
- GetTag
- ListTag

The following enumerations are available for the parameter supply of these functions:

- HMIGO_TAG_TYPE
- HMIGO_TAG_LIST_TYPE

Note

If you set the start value to a binary tag, use the values "0" or "1". Do not use the values "False" or "True". These values are no longer valid for VBA programming in WinCC and will result in an error message.

Replace the values "False" and "True" with "0" and "1" in your existing VBA code.

Access to the Object Properties

You can also access the parameters of the above-mentioned functions directly in VBA by means of the following object properties:

Object property	Description	Read/Write
ObjectStateTag	Returns the object state via the enumeration HMIGO_OBJECT_STATE. Further information on this enumeration can be found in this documentation under "VBA in other WinCC Editors".	Yes/no
TagName	Name of the tag	Yes/no
TagGroupName	Name of a group in which the tag is inserted. If the group does not yet exist, it is created. If no group name is specified, the tag is created outside all groups.	Yes/no
TagConnection	Name of a connection in which the tag and/or group is to be created. The connection must already be in existence, otherwise a tag cannot be created. If the name is omitted, an internal tag is created.	Yes/no
TagMaximum	Sets the new value of the upper limit	Yes/yes
TagMinimum	Sets the new value of the lower limit	Yes/yes
TagStart	Sets the new start value	Yes/yes
TagS5S7Address	Address of the S7 or S5 PLC to which the tag is connected. If no address is specified, a blank entry is passed.	Yes/yes
TagType (Enum)	Data type of the tag. The possible types are: • TAG_BINARY_TAG (1) • TAG_SIGNED_8BIT_VALUE (2) • TAG_UNSIGNED_8BIT_VALUE (3) • TAG_SIGNED_16BIT_VALUE (4) • TAG_UNSIGNED_16BIT_VALUE (5) • TAG_SIGNED_32BIT_VALUE (6) • TAG_UNSIGNED_32BIT_VALUE (7) • TAG_FLOATINGPOINT_NUMBER_32BIT_IEEE_754 (8) • TAG_FLOATINGPOINT_NUMBER_64BIT_IEEE_754 (9) • TAG_TEXT_TAG_8BIT_CHARACTER_SET (10) • TAG_TEXT_TAG_16BIT_CHARACTER_SET (11) • TAG_RAW_DATA_TYPE (12) • TAG_STRUCT (14) • TAG_TEXT_REFERENCE (18)	Yes/no

Object property	Description	Read/Write
TagUpdate (Enum)	Defines whether the tag is updated on the local computer or for the entire project. (For internal tag only.) • TAG_COMPUTER_LOCAL (1) • TAG_PROJECT_WIDE (2)	Yes/yes
LengthText	Length of a text tag (0...255) "LengthText" can also be used for the length of the raw data tag. A testing of the correctness of the length will not be conducted. Observe the instructions of the communication channels.	yes/yes (only for external tag of type text)
TagScaleValid	Defines a linear scaling.	Yes/yes
TagScaleParam1	Sets the value1 for the value range process.	Yes/yes
TagScaleParam2	Sets the value2 for the value range process.	Yes/yes
TagScaleParam3	Sets the value1 for the value range tag.	Yes/yes
TagScaleParam4	Sets the value2 for the value range tag.	Yes/yes
TagStartvaluePersistence	Defines whether an internal tag is set as persistent.	Yes/yes
TagSubst	Replacement value (only for external variables)	Yes/yes
UseSubstValueOnCommonError	Set the replacement value for connection errors.	Yes/yes
UseSubstValueOnMaxLimit	Set the replacement value for upper limit.	Yes/yes
UseSubstValueOnMinLimit	Set the replacement value for lower limit.	Yes/yes
UseSubstValueOnStartValue	Set the replacement value for the start value.	Yes/yes

You will find a description of the properties under the parameter descriptions for the corresponding functions.

Note

The "Tag synchronization" point in the property dialog of tags is not addressable with VBA. Tag synchronization is only available for internal tags.

For external tags, the "Type Conversion" point is not addressable with VBA.

6.2.2.2 CloseTag Function

Description

Closes the open tag.

Note

Modified parameters are not saved.

Syntax

```
Expression.CloseTag()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CloseTag()
' HMIGO_001
' procedure to close a variable
' tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'open a tag
  objHMIGO.GetTag strVariableName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'open a tag
  objHMIGO.CloseTag
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"

  Set objHMIGO = Nothing
```

```
End Sub
```

VBA in Tag Management (Page 3889)

6.2.2.3 CommitTag Function

Description

Writes the changed parameters of the open tag to WinCC.

Note

If further parameters are changed after a CommitTag call, write the changes to WinCC by calling this function again.

syntax

```
Expression.CommitTag()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CommitTag()
' HMIGO_002
' procedure to change a property of a variable
' tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
```

```
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'open a tag
  objHMIGO.GetTag strVariableName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'change a property
  objHMIGO.TagStart = 10
 'current status is "MODIFIED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'commit a tag
  objHMIGO.CommitTag
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"

  Set objHMIGO = Nothing
End Sub
```

6.2.2.4 CreateTag Function

Description

Creates a new tag.

syntax

```
Expression.CreateTag(TagName,TagType,[Connection],[S7S5Address],
[GroupName])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
TagName (string)	Name of the tag to be created.
TagType (HMIGO_TAG_TYPE)	Data type of the tag. The possible types are: TAG_BINARY_TAG TAG_SIGNED_8BIT_VALUE TAG_UNSIGNED_8BIT_VALUE TAG_SIGNED_16BIT_VALUE TAG_UNSIGNED_16BIT_VALUE TAG_SIGNED_32BIT_VALUE TAG_UNSIGNED_32BIT_VALUE TAG_FLOATINGPOINT_NUMBER_32BIT_IEEE_754 TAG_FLOATINGPOINT_NUMBER_64BIT_IEEE_754 TAG_TEXT_TAG_8BIT_CHARACTER_SET TAG_TEXT_TAG_16BIT_CHARACTER_SET TAG_RAW_DATA_TYPE TAG_TEXT_REFERENCE
Connection (String, optional)	Name of a connection in which the tag and/or group is to be created. The connection must already be in existence, otherwise a tag cannot be created. If the name is omitted, an internal tag and/or group is recreated.
S7S5Address (String, optional)	Address of the S7 or S5 PLC to which the tag is connected. Without an address indication, an empty entry will be handed over. The parameter "S7S5Address" must be supplemented by the string ",QC"for the configuration of the Quality Code, for example: "DB1,DD0,QC". If the Quality Code of the tag is no longer to be monitored, the string ",QC" must be deleted.
GroupName (String, optional)	Name of a group in which the tag is inserted. If the group does not exist, it will be newly created. If the group name is not indicated, the tag will be created outside all groups.

Example:

```
Sub CreateTag()
' HMIGO_003
' procedure to create a variable
' tag must not be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
```

```
  'current status is "EMPTY"
   MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
  'create a tag
   objHMIGO.CreateTag strVariableName, TAG_SIGNED_32BIT_VALUE
  'current status is "OPENED"
   MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
   Set objHMIGO = Nothing
End Sub
```

6.2.2.5 DeleteTag Function

Description

Deletes the specified tag.

syntax

```
Expression.DeleteTag(TagName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
TagName (string)	Name of the tag to be deleted.

Example:

```
Sub DeleteTag()
' HMIGO_004
' procedure to delete a variable
' tag need to be created before
```

```
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"

 'delete a tag
  objHMIGO.DeleteTag strVariableName
  Set objHMIGO = Nothing
End Sub
```

6.2.2.6 GetTag Function

Description

Reads in the parameters of the specified tag.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in Tag Management".

syntax

```
Expression.GetTag(TagName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
TagName (string)	Name of the tag whose values are to be read in.

Example:

```
Sub GetTag()
' HMIGO_005
' procedure to open a variable
' tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strVariableName As String
  Set objHMIGO = New HMIGO
  strVariableName = "NewVariable"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
 'open/ get a tag
  objHMIGO.GetTag strVariableName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTag, vbOKOnly, "Status Variable"
  Set objHMIGO = Nothing
End Sub
```

VBA in Tag Management (Page 3889)

6.2.2.7 ListTag function

Description

Alternatively, the ListTag function returns the following contents of the Tag Management as a list:

- All the channel units created
- All the channels created
- All the connections created
- All the tag groups created
- All the tags created

syntax

```
Expression.ListTag(ListType,pListArray,[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_TAG_LIST_TYPE)	Defines which content should be returned as a list. Possibilities are: • TAG_CHANNEL_UNITS (0) all channel units created • TAG_CHANNELS (2) all channels created • TAG_CONNECTIONS (3) all connections created • TAG_GROUPS (4) all tag groups created • TAG_NAMES (5) all tags created
pListArray (Variant)	List with the requested content.
Filter (String)	Filters can be set optionally. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether the list with the connections created is empty because no connections have been set up:

```
Sub ReadTagByConnection()
'HMIGO_027
'read content in data manager by connections
'no conections are implemented
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
'read all connections
  objHMIGO.ListTag TAG_CONNECTIONS, arrContent
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because no connections are implemented"
  End If
End Sub
```

6.2.3 VBA im Tag Logging

6.2.3.1 VBA in Tag Logging

Introduction

VBA allows you to create process value archives, archive tags and triggers directly from the program code, modify them, and delete them.

Note

You should not have or should not open the "Tag Logging" editor when editing with VBA.

Principle

When you have created the instance of the "HMIGO" class, the following functions are available to you to access Tag Logging:

- CloseTlgArchive
- CloseTlgTag
- CloseTlgTrigger
- CommitTlgArchive
- CommitTlgTag
- CommitTlgTrigger
- CreateTlgArchive
- CreateTlgTag
- CreateTlgTrigger
- DeleteTlgArchive
- DeleteTlgTag
- DeleteTlgTrigger
- GetTlgArchive
- GetTlgTag
- GetTlgTrigger
- ListTlgArchive

- ListTlgTag
- ListTlgTrigger

The following enumerations are available for the parameter supply of these functions:

- HMIGO_TLG_ARCHIVE_TYPE
- HMIGO_TLG_ARCHIVE_LIST_TYPE
- HMIGO_TLG_TAG_TYPE
- HMIGO_TLG_TAG_LIST_TYPE
- HMIGO_TLG_TRIGGER_BASE
- HMIGO_TLG_TRIGGER_LIST_TYPE

Direct Access to the Object Properties

You can also access the parameters of the above-mentioned functions directly in VBA by means of the following object properties. The column "is used in" will display whether you will be able to access the object property in the process value archive (P) and/or in the compressed archive (V).

Object property	Description	Read/ Write	is used in
ObjectStateTlgArchive	Returns the object state for the archive via the enumeration "HMIGO_OBJECT_STATE". Further information on this enumeration can be found in this documentation under "VBA in other WinCC Editors".	Yes/no	P, V
ObjectStateTlgTag	Returns the object state for the archive tag via the enumeration "HMIGO_OBJECT_STATE".	Yes/no	P, V
TlgArchiveAccessLevelRead	The authorization level for reading.	Yes/no	P, V
TlgArchiveAccessLevelWrite	The authorization level for writing.	Yes/no	P, V
TlgArchiveArchiveState	Specifies whether archiving is disabled or enabled at system startup. Possible values of the enum "HMIGO_TLG_ARCHIVE_STATE": • TLG_ARCHIVE_STATE_LOCKED (1) • TLG_ARCHIVE_STATE_ACTIVATED (0)	Yes/yes	P, V
TlgArchiveBufferSize	Specifies the number of records for a short-term archive.	Yes/yes	P
TlgArchiveBufferType	Specifies the tag storage location. The possible types of the enum "HMIGO_TLG_ARCHIVE_BUFFER_TYPE": • TLG_ARCHIVE_BUFFER_TYPE_DISK (2) • TLG_ARCHIVE_BUFFER_TYPE_RAM (1)	Yes/yes	P
TlgArchiveCompressRange	Specifies the compression time period. Name of the timer, greater than or equal to 1, defined under "Times" in the Tag Logging editor. Since the format is a string, it is language dependent. Can be determined via the function "ListTlgArchive(TLG_ARCHIVE_TRIGGER_NAMES, arrTrigger)"	Yes/yes	V

Object property	Description	Read/ Write	is used in
TlgArchiveCompressType	Specifies the algorithm for compressing the values. The possible types of the enum "HMIGO_TLG_ARCHIVE_COMPRESS_TYPE": • TLG_COMPRESS_TYPE_CALC (1) • TLG_COMPRESS_TYPE_CALC_COPY (2) • TLG_COMPRESS_TYPE_CALC_DEL (3) • TLG_COMPRESS_TYPE_CALC_COPY_DEL (4)	Yes/yes	V
TlgArchiveFlags	Used internally.		
TlgArchiveName	Name of the process value archive or compressed archive.	Yes/no	P, V
TlgArchiveQCRActive	Specifies for the compressed archive whether weighted quality codes are used during archiving. The possible types of the enum "HMIGO_TLG_QCR_ACTIVE_FLAGS": • TLG_QCR_ALL (15) • TLG_QCR_BAD (1) • TLG_QCR_GOOD_CASCADED (8) • TLG_QCR_GOOD_NONCASCADED (4) • TLG_QCR_OFF (0) • TLG_QCR_UNCERTAIN (2)		V
TlgArchiveQCRBad	If weighted quality codes are used and the "Bad" option is activated, you define for the compression archive the percentage as of which the "Bad" state of process values is archived in the compression tag.		V
TlgArchiveQCRGoodCascade	If weighted quality codes are used and the "Good (Cascade)" option is activated, you define for the compression tag the percentage as of which the "Good (Cascade)" state of process values is archived in the compression tag.		V
TlgArchiveQCRGoodNonCascade	If weighted quality codes are used and the "Good (Non-Cascade)" option is activated, you define for the compression archive the percentage as of which the "Good (Non-Cascade)" state of process values is archived in the compression tag.		V
TlgArchiveQCRUncertain	If weighted quality codes are used and the "Uncertain" option is activated, you define for the compression archive the percentage as of which the "Uncertain" state of process values is archived in the compression tag.		V
TlgArchiveType	Specifies whether the archive is a process value archive or a compressed archive.	Yes/no	P, V
TlgTagAliasName	The alternative name by means of which the tag can be addressed (alias).	Yes/yes	P
TlgTagArchiveName	Name of the archive.	Yes/no	P, V

Object property	Description	Read/ Write	is used in
TlgTagArchiving	Specifies the acquisition type. Possible values of the enum "HMIGO_TLG_TAG_ARCHIVING": • TLG_TAG_ACYCLIC (8388609) • TLG_TAG_CYCLIC_CONTINUOUS (8388610) • TLG_TAG_CYCLIC_SELECTIVE (8388612) • TLG_TAG_ON_EVERY_CHANGE (8388616)	Yes/yes	P
TlgTagArchivingState	Specifies whether archiving is enabled or disabled at system startup. Possible values of the enum "HMIGO_TLG_TAG_ARCHIVING_STATE": • TLG_TAG_LOCKED (1) • TLG_TAG_ACTIVATED (0)	Yes/yes	P, V
TlgTagConvertModule	Name of the conversion DLL used for data conversion.	Yes/yes	P
TlgTagFlags	Possible values of the enum "HMIGO_TLG_TAG_FLAGS": • TLG_TAG_LONGTERM_DISABLED (1) • TLG_TAG_NOFLAGS (0)		
TlgTagHysterese	Value for the hysteresis by means of which a check is carried out to establish whether a value has changed.	Yes/yes	P
TlgTagLowerLimit	Value for the scaling of the tag's lower limit.	Yes/yes	P
TlgTagMethodType	Specifies the method by which the value is edited before archiving. Possible values of the enum "HMIGO_TLG_TAG_METHOD_TYPE": • TLG_TAG_ACTUAL (1) • TLG_TAG_SUM (3) • TLG_TAG_MaxValue (5) • TLG_TAG_MinValue (4) • TLG_TAG_AVERAGE (2)	Yes/yes	P, V
TlgTagName	Name of the archive tag.	Yes/no	P, V
TlgTagNameCompressArchive	In the case of compressed archives, contains the name of the source archive.	Yes/yes	V
TlgTagNameCompressTag	In the case of compressed archives, contains the name of the source tag.	Yes/yes	V
TlgTagNameProcTag	Name of the process tag from which the value to be acquired is taken.	Yes/yes	P
TlgTagNameRawValue	In the cast of process-controlled archives, contains the name of the raw-data tag.	Yes/yes	P
TlgTagOnChange	Specifies whether archiving is to be carried out in the event of a change. Possible values of the enum "HMIGO_TLG_TAG_ON_CHANGE": • TLG_TAG_EVERY_VALUE (0) • TLG_TAG_RELATIVE_HYSTERESE (1) • TLG_TAG_ABSOLUTE_HYSTERESE (2)	Yes/yes	P

Object property	Description	Read/ Write	is used in
TlgTagOnError	Specifies whether, in the event of a problem, the most recently acquired value or the substitute value is saved. Possible values of the enum "HMIGO_TLG_TAG_ON_ERROR": • TLG_TAG_LAST_VALUE (1) • TLG_TAG_SUBSTITUTE (2)	Yes/yes	P
TlgTagPreviousOSGUID	Used internally.		
TlgTagQCRActive	Specifies for the compression tag whether weighted quality codes are used during archiving. The possible types of the enum "HMIGO_TLG_QCR_ACTIVE_FLAGS": • TLG_QCR_ALL (15) • TLG_QCR_BAD (1) • TLG_QCR_GOOD_CASCADED (8) • TLG_QCR_GOOD_NONCASCADED (4) • TLG_QCR_OFF (0) • TLG_QCR_UNCERTAIN (2)		V
TlgTagQCRBad	If weighted quality codes are used and the "Bad" option is activated, you define for the compression tag the percentage as of which the "Bad" state of process values is archived in the compression tag.		V
TlgTagQCRGoodCascade	If weighted quality codes are used and the "Good (Cascade)" option is activated, you define for the compression tag the percentage as of which the "Good (Cascade)" state of process values is archived in the compression tag.		V
TlgTagQCRGoodNonCascade	If weighted quality codes are used and the "Good (Non-Cascade)" option is activated, you define for the compression tag the percentage as of which the "Good (Non-Cascade)" state of process values is archived in the compression tag.		V
TlgTagQCRUncertain	If weighted quality codes are used and the "Uncertain" option is activated, you define for the compression tag the percentage as of which the "Uncertain" state of process values is archived in the compression tag.		V
TlgTagSDCompressDeviation	Specifies the absolute or relative value of the deviation, which is permitted for the calculation of the increase by the algorithm. Basic value is the process value saved last.		P
TlgTagSDCompression	Specifies whether the swinging door compression is activated.		P
TlgTagSDLowLimit	Specifies the low limit of the swinging door compression distribution when a relative deviation is activated.		P
TlgTagSDRelativeDecision	Specifies whether the relative value of the deviation is taken into consideration at the swinging door algorithm.		P
TlgTagSDtMax	Specifies the maximum duration between two archived values as the detection limit for swinging door compression.		P

Object property	Description	Read/ Write	is used in
TlgTagSDtMin	Specifies the minimum duration between two archived values as the detection limit for swinging door compression.		P
TlgTagSDUpperLimit	Specifies the upper limit of the swinging door compression distribution when a relative deviation is activated.		P
TlgTagStartEvent	Name of the tag by means of which the start of archiving is checked.	Yes/yes	P
TlgTagStartTriggerFunction	Specifies the name of a script function by means of which a check is carried out for a start event for the start of archiving.	Yes/yes	P
TlgTagStartTriggerModule	Specifies the name of a DLL from which the script function is called for the checking of a start event.	Yes/yes	P
TlgTagStopEvent	Name of the tag by means of which the stopping of archiving is checked.	Yes/yes	P
TlgTagStopTriggerFunction	Specifies the name of a script function by means of which a check is carried out for a stop event for the start of archiving.	Yes/yes	P
TlgTagTriggerArchiving	Name of the timer for the archiving cycle.	Yes/yes	P
TlgTagTriggerFactor	Contains the factor for the display cycle as a multiple of the archiving cycle.	Yes/yes	P
TlgTagTriggerFunction	Specifies the name of a script function for the dynamic switching of the acquisition and archiving cycles.	Yes/yes	P
TlgTagTriggerScan	Name of the timer for the acquisition cycle	Yes/yes	P
TlgTagTriggerType	Specifies how archiving is carried out at a signal change. Possible values of the enum "HMIGO_TLG_TAG_TRIGGER_TYPE": • TLG_TAG_FROM_0_TO_1 (2) • TLG_TAG_FROM_1_TO_0 (3) • TLG_TAG_ALWAYS (4) • TLG_TAG_EVERY_CHANGE (1)	Yes/yes	P
TlgTagType	Specifies the tag type. The possible types of the enum "HMIGO_TLG_TAG_TYPE": • TLG_TAG_TYP_ANALOG (65537) • TLG_TAG_TYP_BINARY (65538) • TLG_TAG_TYP_PROCESS (65544) • TLG_TAG_TYP_COMPRESS (65540)	Yes/yes	P, V
TlgTagUpperLimit	Value for the scaling of the tag's upper limit.	Yes/yes	P
TlgTriggerBase	Time base for the trigger. Possible values of the enum "HMIGO_TLG_TRIGGER_BASE": • TLG_TRIGGER_BASE_250MS (250) • TLG_TRIGGER_BASE_500MS (500) • TLG_TRIGGER_BASE_DAY (&H5265C00) • TLG_TRIGGER_BASE_HOUR (&H36EE80) • TLG_TRIGGER_BASE_MIN (&HEA60) • TLG_TRIGGER_BASE_SEC (&H3E8)		P

Object property	Description	Read/ Write	is used in
TlgTriggerCreatorID	Used internally.		P
TlgTriggerFactor	Integer factor that is taken into consideration for the trigger together with the time base.		P
TlgTriggerName	Name of the trigger.		P
TlgTriggerScheduleDayOfMonth	Specifies the day for the trigger for the "Monthly" time series.		P
TlgTriggerScheduleDaysOfWeek	Specifies the days for the trigger for the "Weekly" time series. Possible values of the enum "HMIGO_TLG_TRIGGER_SCHEDULE_DAYSOFWEEK": • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_EVERY_DAY (127) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_FRIDAY (32) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_MONDAY (2) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_NO_DAY (0) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_SATURDAY (64) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_SUNDAY (1) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_THURSDAY (16) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_TUESDAY (4) • TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_WEDNESDAY (8)		P
TlgTriggerScheduleInterval	Specifies the interval for the trigger for the calendar times.		P
TlgTriggerScheduleMonthOfYear	Specifies the month for the trigger for the "Yearly" time series.		P
TlgTriggerScheduleType	Defines the type of trigger. Possible time series of the enum "HMIGO_TLG_TRIGGER_SCHEDULE_TYPE": • TLG_TRIGGER_SCHEDULE_TYPE_CYCLIC (0) • TLG_TRIGGER_SCHEDULE_TYPE_DAILY (1) • TLG_TRIGGER_SCHEDULE_TYPE_MONTHLY (3) • TLG_TRIGGER_SCHEDULE_TYPE_WEEKLY (2) • TLG_TRIGGER_SCHEDULE_TYPE_YEARLY (4)		P
TlgTriggerStartByShutdown	The trigger is initiated additionally when the system is shut down regardless of the configured triggers.		P
TlgTriggerStartByStartup	The trigger is initiated additionally when the system is started up regardless of the configured triggers.		P
TlgTriggerStartDay	Specifies the day for the starting point of the trigger.		P
TlgTriggerStartHour	Specifies the hour for the starting point of the trigger.		P
TlgTriggerStartMilliSecond	Specifies the milliseconds for the starting point of the trigger.		P
TlgTriggerStartMinute	Specifies the minute for the starting point of the trigger.		P

Object property	Description	Read/ Write	is used in
TlgTriggerStartMonth	Specifies the month for the starting point of the trigger.		P
TlgTriggerStartSecond	Specifies the seconds for the starting point of the trigger.		P
TlgTriggerStartYear	Specifies the year for the starting point of the trigger.		P

6.2.3.2 CloseTlgArchive Function

Description

Closes the process value or compressed archive which is open.

Note

Modified parameters are not saved.

syntax

```
Expression.CloseTlgArchive()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CloseTlgArchive()
' HMIGO_006
' procedure to close an archive
' the archive need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'open archive
  objHMIGO.GetTlgArchive strArchiveName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'close archive
  objHMIGO.CloseTlgArchive
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"

  Set objHMIGO = Nothing
End Sub
```

6.2.3.3 CloseTlgTag Function

Description

Closes the archive tag which is open.

Note

Modified parameters are not saved.

syntax

```
Expression.CloseTlgTag()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CloseTlgTag()
' HMIGO_007
' procedure to close a tag logging tag
' the archive need to be created before
' the tag logging tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Dim strTlgTagName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
  strTlgTagName = "NewTag"

 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Tag"
 'open/ get tag logging tag
  objHMIGO.GetTlgTag strArchiveName, strTlgTagName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
```

```
  'close tag logging tag
   objHMIGO.CloseTlgTag
  'current status is "EMPTY"
   MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
   Set objHMIGO = Nothing
End Sub
```

6.2.3.4 CloseTlgTrigger function

Description

Closes the opened trigger.

Note

Modified parameters are not saved.

Syntax

```
Expression.CloseTlgTrigger()
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

--

6.2.3.5 CommitTlgArchive Function

Description

Writes the changed parameters of the specified archive to WinCC.

Note

If further parameters are changed after a CommitTlgArchive call, write the changes to WinCC by calling this function again.

syntax

```
Expression.CommitTlgArchive()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CommitTlgArchive()
' HMIGO_008
' procedure to change a property of an archive
' the archive need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'open archive
  objHMIGO.GetTlgArchive strArchiveName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'change a property
  objHMIGO.TlgArchiveArchiveState = TLG_STATE_LOCKED
 'current status is "MODIFIED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'commit archive
  objHMIGO.CommitTlgArchive
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"

  Set objHMIGO = Nothing
```

```
End Sub
```

6.2.3.6 CommitTlgTag Function

Description

Writes the changed parameters of the specified archive tag to WinCC.

Note

If further parameters are changed after a CommitTlgTag call, write the changes to WinCC by calling this function again.

syntax

```
Expression.CommitTlgTag()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CommitTlgTag()
' HMIGO_009
' procedure to change a property of a tag logging tag
' the archive need to be created before
' the tag logging tag need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Dim strTlgTagName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
  strTlgTagName = "NewTag"

 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Tag"
 'open/ get tag logging tag
  objHMIGO.GetTlgTag strArchiveName, strTlgTagName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
 'change a property
  objHMIGO.TlgTagArchiving = TLG_TAG_ON_EVERY_CHANGE
 'current status is "MODIFIED"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
 'commit tag logging tag
  objHMIGO.CommitTlgTag
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
  Set objHMIGO = Nothing
End Sub
```

6.2.3.7 CommitTlgTrigger function

Description

Writes the changed parameters of the specified trigger to WinCC.

Note

If further parameters are changed after a CommitTlgTrigger call, write the changes to WinCC by calling this function again.

Syntax

```
Expression.CommitTlgTrigger()
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

--

6.2.3.8 CreateTlgArchive Function

Description

Creates a process value archive or compressed archive.

syntax

```
Expression.CreateTlgArchive(ArchiveName,ArchiveType)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive to be created
ArchiveType (HMIGO_TLG_ARCHIVE_TYPE)	Type of the archive. The possible types are: • TLG_PROCESSARCHIVE (131073) for a process value archive • TLG_COMPRESSARCHIVE (131074) for a compressed archive

Default Values when Creating a New Tag Archive

The following table indicates the default values that are entered when a new process value archive or compressed archive is created. These values can be modified later and written using the CommitTlgArchive function.

Property	Default Value (Enum Name => Value)	Comment
TlgArchiveAccessLevelRead	0	Without authorization level
TlgArchiveAccessLevelWrite	0	Without authorization level
TlgArchiveArchiveState	TLG_ARCHIVE_STATE_ACTIVATED (0)	Archiving is started at start of Runtime.
TlgArchiveBufferSize	1000	Number of data records
TlgArchiveBufferType	TLG_ARCHIVE_BUFFER_TYPE_DISK (2)	The values are stored on hard disk in the database.
TlgArchiveCompressRange	"1 Tag". This string must be created individually for each language (e.g. English: "1 day")	Corresponds to exactly one day. Only relevant in the case of compressed tags. Special Feature: the user is responsible for values >= 1 minute
TlgArchiveCompressType	TLG_COMPRESS_TYPE_CALC (1)	Only calculate compression values. Only relevant in the case of compressed tags.

Enum HMIGO_TLG_ARCHIVE_STATE

Parameters	Description
TLG_ARCHIVE_STATE_LOCKED (1)	Archiving is disabled at system startup.
TLG_ARCHIVE_STATE_ACTIVATED (0)	Archiving is started at start of Runtime.

Enum HMIGO_TLG_ARCHIVE_BUFFER_TYPE

Parameters	Description
TLG_ARCHIVE_BUFFER_TYPE_DISK (2)	The values are archived on hard disk.
TLG_ARCHIVE_BUFFER_TYPE_RAM (1)	The values are only archived in working memory.

Enum HMIGO_TLG_ARCHIVE_COMPRESS_TYPE

Parameters	Description
TLG_COMPRESS_TYPE_CALC (1)	Only the compression values are calculated.
TLG_COMPRESS_TYPE_CALC_COPY (2)	The compression values are calculated and the original values copied.

Parameters	Description
TLG_COMPRESS_TYPE_CALC_DEL (3)	The compression values are calculated and the original values then deleted.
TLG_COMPRESS_TYPE_CALC_COPY_DEL (4)	The compression values are calculated and the original values copied and then deleted.

Example:

```
Sub CreateTlgArchive()
' HMIGO_010
' procedure to create an archive
' the archive must not be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
 'create tag logging archive
  objHMIGO.CreateTlgArchive strArchiveName, TLG_PROCESSARCHIVE
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"
  Set objHMIGO = Nothing
End Sub
```

6.2.3.9 CreateTlgTag Function

Description

Creates a new archive tag.

syntax

```
Expression.CreateTlgTag(ArchiveName,TagName,[TagType])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of an existing archive in which the tag is to be entered
TagName (string)	Name of the tag to be created
TagType (HMIGO_TLG_TAG_TYPE, optional)	Specifies the type of the tag. If no type is specified, the default value TLG_VAR_TYP_ANALOG is entered. The possible types are: • TLG_VAR_TYP_ANALOG (65537) for an analog tag. • TLG_VAT_TYP_BINARY (65538) for a binary tag. • TLG_VAR_TYP_PROCESS (65544) for a process tag. • TLG_VAT_TYP_COMPRESS (65540) for a compression tag.

Default Values When a New Archive Tag Is Created

The following table indicates the default values that are entered when a new archive tag is created. These values can be modified later and written using the CommitTlgTag function.

Property	Default Value (Enum Name => Value)	Comment
TlgTagType	TLG_VAR_TYP_ANALOG (65537)	Acquired by means of an analog data manager tag
TlgTagArchiving	TLG_TAG_CYCLIC_CONTINUOUS (8388610)	Cyclic, continuous acquisition
TlgTagArchivingState	TLG_TAG_ACTIVATED (0)	Archiving is started at start of Runtime.
TlgTagTriggerScan	1 second	Please note that "1 second" is only the name of the trigger. You must ensure yourself that the trigger exists and actually has a cycle of 1 s.

Property	Default Value (Enum Name => Value)	Comment
TlgTagTriggerArchiving	1 second	Please note that "1 second" is only the name of the trigger. You must ensure yourself that the trigger exists and actually has a cycle of 1 s.
TlgTagTriggerFactor	1	The display cycle and archiving cycle are identical.
TlgTagOnError	TLG_TAG_LAST_VALUE (1)	The last valid value is taken as the substitute value.
TlgTagTriggerType	TLG_TAG_ALWAYS (4)	Every value is archived.
TlgTagMethodType	TLG_TAG_ACTUAL (1)	No editing. The value is accepted immediately.
TlgTagStartTriggerFunction	No function specified	--
TlgTagStopTriggerFunction	No function specified	--
TlgTagTriggerFunction	No function specified	--
TlgTagUpperLimit	No value specified	--
TlgTagLowerLimit	No value specified	--
TlgTagNameCompressArchive	No archive name specified	--
TlgTagNameCompressTag	No tag name specified	--
TlgTagNameRawValue	No raw-data tag specified	--
TlgTagStartTriggerModule	No DLL name specified	--
TlgTagNameProcTag	Corresponds to "TagName"	--
TlgTagOnChange	TLG_TAG_EVERY_VALUE (0)	Every value will be archived.
TlgTagHysterese	0	No check is carried out by means of hysteresis.
TlgTagAliasName	No value specified	--
TlgTagStartEvent	No tag specified	--
TlgTagStopEvent	No tag specified	--

List of the enumerators for Tag Logging

Enum types	Description
TLG_TAG_TYPE	The passed parameter specifies the type of the tag. The possible types are in the table Enum HMIGO_TLG_TAG_TYPE.
TLG_TAG_ARCHIVING	The passed parameter specifies the acquisition type. The possible values are in the table Enum HMIGO_TLG_TAG_ARCHIVING.
TLG_TAG_ARCHIVING_STATE	The passed parameter specifies whether archiving is disabled or enabled at system startup. The possible values are in the table Enum HMIGO_TLG_TAG_ARCHIVING_STATE.

Enum types	Description
TLG_TAG_ON_ERROR	The passed parameter specifies which value is stored in the event of a problem: the most recently acquired value or the substitute value. The possible values are in the table Enum HMIGO_TLG_TAG_ON_ERROR.
TLG_TAG_TRIGGER_TYPE	The passed parameter specifies how archiving is carried out at a signal change. The possible values are in the table Enum HMIGO_TLG_TAG_TRIGGER_TYPE.
TLG_TAG_METHOD_TYPE	The passed parameter specifies the method by which the value is edited before archiving. The possible values are in the table Enum HMIGO_TLG_TAG_METHOD_TYPE.
TLG_TAG_ON_CHANGE	The passed parameter specifies whether archiving is to be carried out in the event of a change. The possible values are in the table Enum HMIGO_TLG_TAG_ON_CHANGE.

Enum HMIGO_TLG_TAG_TYPE

Values	Description
TLG_TAG_TYP_ANALOG (65537)	Analog tag
TLG_TAG_TYP_BINARY (65538)	Binary Tags
TLG_TAG_TYP_PROCESS (65544)	Process tag
TLG_TAG_TYP_COMPRESS (65540)	Compressed archive tag

Enum HMIGO_TLG_TAG_ARCHIVING

Values	Description
TLG_TAG_ACYCLIC (8388609)	Acyclic acquisition
TLG_TAG_CYCLIC_CONTINUOUS (8388610)	Cyclic-continuous acquisition
TLG_TAG_CYCLIC_SELECTIVE (8388612)	Cyclic-selective acquisition
TLG_TAG_ON_EVERY_CHANGE (8388616)	Acquisition only in the event of a change

Enum HMIGO_TLG_TAG_ARCHIVING_STATE

Values	Description
TLG_TAG_LOCKED (1)	Acquisition disabled at system startup
TLG_TAG_ACTIVATED (0)	Acquisition enabled at system startup

Enum HMIGO_TLG_TAG_ON_ERROR

Values	Description
TLG_TAG_LAST_VALUE (1)	The most recently acquired value is used.
TLG_TAG_SUBSTITUTE (2)	A substitute value is entered.

Enum HMIGO_TLG_TAG_TRIGGER_TYPE

Values	Description
TLG_TAG_FROM_0_TO_1 (2)	Signal change from the value 0 to 1
TLG_TAG_FROM_1_TO_0 (3)	Signal change from the value 1 to 0
TLG_TAG_ALWAYS (4)	Always archive.
TLG_TAG_EVERY_CHANGE (1)	Archive at every signal change.

Enum HMIGO_TLG_TAG_METHOD_TYPE

Values	Description
TLG_TAG_ACTUAL (1)	The current value is accepted.
TLG_TAG_SUM (3)	The sum is formed.
TLG_TAG_MaxValue (5)	The greatest value is saved.
TLG_TAG_MinValue (4)	The smallest value is saved.
TLG_TAG_AVERAGE (2)	The average value is saved.

Enum HMIGO_TLG_TAG_ON_CHANGE

Values	Description
TLG_TAG_EVERY_VALUE (0)	The current value is accepted.
TLG_TAG_RELATIVE_HYSTERESE (1)	A hysteresis specified as a percentage is used for the calculation as to whether the value is to be archived.
TLG_TAG_ABSOLUTE_HYSTERESE (2)	A hysteresis specified as an absolute value is used for the calculation as to whether the value is to be archived.

Example:

```
Sub CreateTlgTag()
' HMIGO_011
' procedure to create a tag logging tag
' the archive need to be created before
' the tag logging tag must not be created before
' declarations
  Dim objHMIGO As HMIGO
```

```
   Dim strArchiveName As String
   Dim strTlgTagName As String
   Set objHMIGO = New HMIGO
   strArchiveName = "NewArchive"
   strTlgTagName = "NewTag"

  'current status is "EMPTY"
   MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Tag"
  'create tag logging tag
   objHMIGO.CreateTlgTag strArchiveName, strTlgTagName, TLG_TAG_TYPE_ANALOG
  'current status is "OPENED"
   MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
   Set objHMIGO = Nothing
End Sub
```

6.2.3.10 CreateTlgTrigger function

Description

Creates a new trigger that is used as a timer for the acquisition and archiving cycle.

Syntax

```
Expression.CreateTlgTrigger(TriggerName,TriggerBase,TriggerFactor)
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

Parameter (Data Type)	Description
TriggerName (String)	Name of the trigger to be created
TriggerBase (HMIGO_TLG_TRIGGER_BASE)	Time base of the trigger. Possible values: • TLG_TRIGGER_BASE_250MS (250) • TLG_TRIGGER_BASE_500MS (500) • TLG_TRIGGER_BASE_DAY (&H5265C00) • TLG_TRIGGER_BASE_HOUR (&H36EE80) • TLG_TRIGGER_BASE_MIN (&HEA60) • TLG_TRIGGER_BASE_SEC (&H3E8)
TriggerFactor	Integer factor that is taken into consideration for the trigger together with the time base.

Enum HMIGO_TLG_TRIGGER_BASE

Parameter	Description
TLG_TRIGGER_BASE_250MS (250)	The time base is "250 ms".
TLG_TRIGGER_BASE_500MS (500)	The time base is "500 ms".
TLG_TRIGGER_BASE_DAY (&H5265C00)	The time base is "1 day".
TLG_TRIGGER_BASE_HOUR (&H36EE80)	The time base is "1 hour".
TLG_TRIGGER_BASE_MIN (&HEA60)	The time base is "1 minute".
TLG_TRIGGER_BASE_SEC (&H3E8)	The time base is "1 second".

Enum HMIGO_TLG_TRIGGER_SCHEDULE_DAYSOFWEEK

Parameter	Description
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_EVERY_DAY (127)	Every day is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_FRIDAY (32)	Friday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_MONDAY (2)	Monday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_NO_DAY (0)	No day is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_SATURDAY (64)	Saturday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_SUNDAY (1)	Sunday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_THURSDAY (16)	Thursday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_TUESDAY (4)	Tuesday is used for the "Weekly" trigger.
TLG_TRIGGER_SCHEDULE_DAYSOFWEEK_WEDNESDAY (8)	Wednesday is used for the "Weekly" trigger.

Enum HMIGO_TLG_TRIGGER_SCHEDULE_TYPE

Parameter	Description
TLG_TRIGGER_SCHEDULE_TYPE_CYCLIC (0)	The time series "Standard (cyclic)" is used for the trigger.
TLG_TRIGGER_SCHEDULE_TYPE_DAILY (1)	The time series "Daily" is used for the trigger.
TLG_TRIGGER_SCHEDULE_TYPE_MONTHLY (3)	The time series "Monthly" is used for the trigger.

Parameter	Description
TLG_TRIGGER_SCHEDULE_TYPE_WEEKLY (2)	The time series "Weekly" is used for the trigger.
TLG_TRIGGER_SCHEDULE_TYPE_YEARLY (4)	The time series "Yearly" is used for the trigger.

6.2.3.11 DeleteTlgArchive Function

Description

Deletes the specified archive.

Syntax

```
Expression.DeleteTlgArchive(ArchiveName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive to be deleted. Archive tags contained in the archive are also deleted.

Example:

```
Sub DeleteTlgArchive()
' HMIGO_012
' procedure to delete an archive
' the archive need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgArchive, vbOKOnly, "Status Tlg Archive"

 'delete tag logging archive
  objHMIGO.DeleteTlgArchive strArchiveName
  Set objHMIGO = Nothing
End Sub
```

6.2.3.12 DeleteTlgTag Function

Description

Deletes the specified archive tag.

syntax

```
Expression.DeleteTlgTag(ArchiveName,TagName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive containing the archive tag to be deleted
TagName (string)	Name of the archive tag to be deleted.

Example:

```
Sub DeleteTlgTag()
' HMIGO_013
' procedure to delete a tag logging tag
' the archive need to be created before
' the tag logging tag need to be created before
```

```
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Dim strTlgTagName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
  strTlgTagName = "NewTag"

 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Tag"
 'delete tag logging tag
  objHMIGO.DeleteTlgTag strArchiveName, strTlgTagName
  Set objHMIGO = Nothing
End Sub
```

6.2.3.13 DeleteTlgTrigger function

Description

Deletes the specified trigger.

Syntax

```
Expression.DeleteTlgTrigger(TriggerName)
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

Parameter (Data Type)	Description
TriggerName (String)	Name of the trigger that is deleted.

6.2.3.14 GetTlgArchive Function

Description

Reads in the parameters of the specified archive.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in TagLogging".

syntax

```
Expression.GetTlgArchive(ArchiveName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive whose values are to be read in.

Example:

```
Sub GetTlgArchive()
' HMIGO_014
' procedure to open an archive
' the archive need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
 'current status is "EMPTY"

6.2.3.15 GetTlgTag Function

Description

Reads in the parameters of the specified archive tag.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in TagLogging".

syntax

```
Expression.GetTlgTag(ArchiveName,TagName)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ArchiveName (String)	Name of the archive containing the archive tag.
TagName	Name of the archive tag whose parameters are to be read in.

Example:

```
Sub GetTlgTag()
' HMIGO_015
' procedure to close a tag logging tag
' the archive need to be created before
' the tag logging need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim strArchiveName As String
  Dim strTlgTagName As String
  Set objHMIGO = New HMIGO
  strArchiveName = "NewArchive"
  strTlgTagName = "NewTag"

 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Tag"
 'open/ get tag logging tag
  objHMIGO.GetTlgTag strArchiveName, strTlgTagName
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateTlgTag, vbOKOnly, "Status Tlg Archive"
  Set objHMIGO = Nothing
End Sub
```

6.2.3.16 GetTlgTrigger function

Description

Reads in the parameters of the specified trigger.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in TagLogging".

Syntax

```
Expression.GetTlgTrigger(TriggerName)
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

Parameter (Data Type)	Description
TriggerName (String)	Name of the trigger whose values are read in.

6.2.3.17 ListTlgArchive Function

Description

Alternatively, the ListTlgArchive function returns the following Tag Logging values in a list:

- All existing Tag Logging archives
- All existing cycles / timers

syntax

```
Expression.ListTlgArchive(ListType,pListArray,[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_TLG_ARCHIVE_LIST_TYPE)	Defines which content should be returned in a list. Possibilities are: • TLG_ARCHIVE_NAMES (1) All created Tag Logging archives • TLG_ARCHIVE_TRIGGER_NAMES (2) All created cycles / timers
pListArray (Variant)	List with the requested content.
Filter (String)	Filters can be set optionally. A trigger name can be used as a filter. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether archives are configured:

```
Sub ReadTlgArchives()
'HMIGO_028
'read content in tag logging
'no archives are implemented
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
'read all tlg archives
  objHMIGO.ListTlgArchive TLG_ARCHIVE_NAMES, arrContent
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because no tag logging archives are implemented"
  End If
End Sub
```

6.2.3.18 ListTlgTag Function

Description

The ListTlgTag function returns all the tags created in a Tag Logging archive in a list.

syntax

```
Expression.ListTlgTag(ListType,ListArray,[ArchiveName],[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_TLG_TAG_LIST_TYPE)	Defines which content should be returned in a list. Possibilities are: TLG_TG_NAMES (1) All tags created in a Tag Logging archive
ListArray (Variant)	List with the requested content.
ArchiveName (String)	Name of the archive in Tag Logging (optional). If the name of the archive is not specified, all,archive tags are returned.
Filter (String)	Filters can be set optionally. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether the archive tags are configured in the "Process Archive":

```
Sub ReadTlgTag()
'HMIGO_029
'read content in tag logging
'no tags within archives are implemented
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
  Dim strArchive as String
'set tlg archive name
  strArchive = "processarchive"
'read all tlg tags in specified archive
  objHMIGO.ListTlgTag TLG_TAG_NAMES, arrContent, strArchive
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because no tag logging tags in specified archive are implemented"
End If
End Sub
```

6.2.3.19 ListTlgTrigger function

Description

The function returns all created triggers in a list.

Syntax

```
Expression.ListTlgTrigger(ListType,ListArray,[Filter])
```

Expression

Required. An expression which returns a "HMIGO" type object.

Parameter

Parameter (Data Type)	Description
ListType (HMIGO_TLG_TRIGGER_LIST_TYPE)	Defines the content that is to be returned in a list. Possibilities are: • TLG_TRIGGER_NAMES (1) all created triggers
ListArray (Variant)	List with the requested content.
Filter (String)	Filters can be set optionally. A trigger name can be used as a filter. Wildcards "*" and "?" are also possible.

6.2.4 VBA in the Text Library

6.2.4.1 VBA in the Text Library

Introduction

VBA allows you to generate Text Library texts directly from the program code, modify and delete them, and display text IDs and texts.

Note

You should not have or should not open the "TextLibrary" editor when editing with VBA.

Principle

When you have created the instance of the "HMIGO" class, the following functions are available to you to access the TextLibrary:

- CreateTextLanguage
- CreateText
- DeleteText
- DeleteTextLanguage
- GetText
- GetTextID
- ListText
- ModifyText

The following enumerations are available for the parameter supply of these functions:

- HMIGO_TEXT_CREATE_MODE
- HMIGO_TEXT_LIST_TYPE

6.2.4.2 CreateTextLanguage Function

Description

Creates a language in the Text Library.

syntax

```
Expression.CreateTextLanguage(LanguageID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID for the language to be created (e.g. 1031 for German, 1033 for English, etc.) For a table of all language codes refer to the WinCC online help on "Language Identifiers".

Example:

```
Sub CreateTextLanguage()
' HMIGO_016
' procedure to create a language in text library
' language must not be created before
' LanguageID german = 1031
' LanguageID english(US) = 1033
' LanguageID spanish = 1034
' LanguageID french = 1040
' LanguageID farsi= 1065
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLangugeNumber As Long
  Set objHMIGO = New HMIGO
  lngLangugeNumber = 1065     'farsi
 'create new language
  objHMIGO.CreateTextLanguage lngLangugeNumber
  Set objHMIGO = Nothing
End Sub
```

6.2.4.3 CreateText Function

Description

Creates a new text for the language specified. Text input for other languages can be added using ModifyText.

syntax

```
Expression.CreateText(LanguageID,Text,CreateMode,TextID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language for which the text will be created.
Text (string)	Text to be created.
CreateMode (HMIGO_TEXT_CREATE_MODE)	Mode of text creation: • TEXT_ADD_REFCOUNT (0) only increases the reference counter when an identical text already exists. • TEXT_CREATE_ALWAYS (1) always sets up a new text line and inserts the text in it.
TextID (long)	Returns the TextID assigned to the new text or the TextID whose reference counter is increased. This ID is required for processing the text in other functions.

Example:

```
Sub CreateText()
' HMIGO_017
' procedure to create a new text
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextCreateMode As Long
  Dim lngTextID As Long         'return value of ".CreateText"
  Dim strText As String
  Set objHMIGO = New HMIGO
    strText = "new text"
  'LanguageID = english
  lngLanguageID = 1033
  '"TEXT_ADD_REFCOUNT" check if text exists, if not create new text
  lngTextCreateMode = 0
```

```
   '"TEXT_CREATE_ALWAYS" create always a new text (for messages)
'   lngTextCreateMode = 1

  'create new text
   objHMIGO.CreateText lngLanguageID, strText, lngTextCreateMode, lngTextID
  'show TextID of created text
   MsgBox "TextID: " & lngTextID, vbOKOnly, "Result CreateText"
   Set objHMIGO = Nothing
End Sub
```

6.2.4.4 DeleteText Function

Description

Deletes a line of text. All the languages for the corresponding line of text and the line of text itself are deleted.

syntax

```
Expression.DeleteText(TextID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
TextID (long)	ID of the line of text to be deleted

Example:

```
Sub DeleteText()
' HMIGO_018
' procedure to delete a text
' text will be searched and deleted
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextID As Long         'return value of GetTextID
  Dim strText As String
On Error GoTo ErrorHandler
  Set objHMIGO = New HMIGO
  strText = "new text"
  lngLanguageID = 1033

 'first: find text in text library and return TextID
  objHMIGO.GetTextID 1033, strText, lngTextID

 'if searched text exists: delete this text
  If Not lngTextID = -1 Then
    objHMIGO.DeleteText lngTextID
    MsgBox "Text : """ & strText & """ found in TextID: " & lngTextID & vbNewLine & _
           "TextID is deleted!", vbOKOnly, "Result DeleteText"
  Else
    MsgBox "Text : """ & strText & """ not found." & vbNewLine & _
           "No Text deleted!", vbOKOnly, "Result DeleteText"
End If
  Set objHMIGO = Nothing
  Exit Sub
ErrorHandler:
 'if lngText = (-1),searched text does not exit
  If lngTextID = -1 Then
    'reset errorhandler
    Err.Clear
    Resume Next
End If
  MsgBox "ErrNr. : " & Err.Number & vbNewLine & _
         "ErrDes.: " & Err.Description, vbOKOnly, "Error ocurred"
  'reset errorhandler
  Err.Clear
End Sub
```

6.2.4.5 DeleteTextLanguage Function

Description

Enables a language to be deleted from the TextLibrary. In this case, all the texts in this language are also deleted.

syntax

```
Expression.DeleteTextLanguage(LanguageID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language to be deleted

Example:

In the following example, a check is made whether the language '1036' exists. If it does, it will be deleted.

```
Sub DeleteLanguage()
'HMIGO_030
' delete an existing languages in TextLibrary
' language '1036'/spanish has to exist
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
  Dim intLanguage As Long
  Dim lngPointer As Long
' get all existing languages
  objHMIGO.ListText TEXT_LANGUAGE_IDS, arrContent
' check requested list for language '1036'/ spanish and delete
  For lngPointer = LBound(arrContent) To UBound(arrContent)
    intLanguage = arrContent(lngPointer) + Val("&H400")
    If intLanguage = 1036 Then
     'delete language
      objHMIGO.DeleteTextLanguage intLanguage
    End If
  Next lngPointer
End Sub
```

6.2.4.6 GetText Function

Description

Returns the text for the selected text ID in the selected language.

syntax

```
Expression.GetText(LanguageID,TextID,Text)
```

Expression

Necessary. An expression that returns an object of the type "HMIGeneralObjects".

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language of the text to be read
TextID (long)	ID of the line of text from which text is to be read
Text (string)	Returns the text of the selected line of text and language.

Example:

```
Sub GetText()
' HMIGO_019
' procedure to get a text
' text with TextID = '69' need to be created
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextID As Long
```

```
  Dim strText As String         'return value of GetText
  Set objHMIGO = New HMIGO
  lngTextID = 69
  lngLanguageID = 1033

 'find text text library
  objHMIGO.GetText lngLanguageID, lngTextID, strText

 'show found text
  MsgBox "Read Text in TextID : " & lngTextID & " is """ & strText & """ !", _
                              vbOKOnly, "Result GetText"
  Set objHMIGO = Nothing
End Sub
```

6.2.4.7 GetTextID Function

Description

Returns the ID of the text searched for in the selected language.

If there are several texts with the same contents, only the line of text with the lowest ID is returned. Whether there are several lines of text with the same contents depends on the CreateMode of the CreateText function.

syntax

```
Expression.GetTextID(LanguageID,Text,TextID)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language of the text searched for
Text (string)	The text searched for
TextID (long)	ID of the line of text in which the text searched for was found

Example:

```
Sub GetTextID()
' HMIGO_020
' procedure to search a TextID
' text will be searched and a TextID will be returned
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextID As Long         'return value of GetTextID
  Dim strText As String
On Error GoTo ErrorHandler
  Set objHMIGO = New HMIGO
  strText = "old text"
  lngLanguageID = 1033

 'first: find text in text library and return TextID
  objHMIGO.GetTextID 1033, strText, lngTextID

 'if searched text exists: delete this text
  If Not lngTextID = -1 Then
    MsgBox "Text : """ & strText & """ found in TextID: " & lngTextID, _
                  vbOKOnly, "Result GetTextID"
Else
    MsgBox "Text : """ & strText & """ not found!", vbOKOnly, "Result GetTextID"
End If
  Set objHMIGO = Nothing
  Exit Sub
ErrorHandler:
 'if lngText = (-1),searched text does not exit
  If lngTextID = -1 Then
  'reset errorhandler
Err.Clear
Resume Next
End If
  MsgBox "ErrNr. : " & Err.Number & vbNewLine & _
         "ErrDes.: " & Err.Description, vbOKOnly, "Error ocurred"
  'reset errorhandler
Err.Clear
End Sub
```

6.2.4.8 ListText Function

Description

Alternatively, the ListText function returns the following contents of the TextLibrary as a list:

- All languages created
- All text IDs
- All texts in a specific language

syntax

```
Exoression.ListText(ListType,pListArray,[LanguageID],[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_TEXT_LIST_TYPE)	Defines which content should be returned as a list. Possibilities are: • TEXT_LANGUAGE_IDS (1) All the created languages. The result still has to be converted by adding 400hex. • TEXT_IDS (2) All text IDs. • TEXT_TEXTS (3) All texts in a language.
pListArray (Variant)	List with the requested content.
LanguageID (Long)	The language ID whose text is to be returned.
Filter (String)	Filters can be set optionally. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether the list with the text of a language is empty because the language does not exist:

```
Sub ReadTextsByLanguage()
'HMIGO_031
'read content in textLibrary by language
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
  Dim intLanguage As Integer
'set invalid language ID
  intLanguage = 1051 'language does not exist
'read all texts
  objHMIGO.ListText TEXT_TEXTS, arrContent, intLanguage
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because wrong language selection"
End If
End Sub
```

6.2.4.9 ModifyText Function

Description

Modifies the text for the selected language with the ID specified.

syntax

```
Expression.ModifyText(LanguageID,TextID,Text)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
LanguageID (Long)	ID of the language of the text to be changed.
TextID (long)	ID of the language of the text to be changed.
Text (string)	New text to be inserted.

Example:

```
Sub ModifyText()
' HMIGO_021
' procedure to modify a text
' text will be searched and replaced
' declarations
  Dim objHMIGO As HMIGO
  Dim lngLanguageID As Long
  Dim lngTextID As Long         'return value of GetTextID
  Dim strOldText As String
  Dim strNewText As String
On Error GoTo ErrorHandler
  Set objHMIGO = New HMIGO
  strOldText = "old text"
  strNewText = "new text"
  lngLanguageID = 1033

 'first: find text in text library and return TextID
  objHMIGO.GetTextID 1033, strOldText, lngTextID

 'if searched text exists: replace this text
  If Not lngTextID = -1 Then
    objHMIGO.ModifyText lngLanguageID, lngTextID, strNewText
    MsgBox "Text : """ & strOldText & """ found in TextID: " & lngTextID & vbNewLine & _
           "Text replaced with : """ & strNewText & """ !", vbOKOnly, "Result DeleteText"
Else
    MsgBox "Text : """ & strOldText & """ not found." & vbNewLine & _
           "No Replacements done!", vbOKOnly, "Result DeleteText"
End If
  Set objHMIGO = Nothing
  Exit Sub
ErrorHandler:
 'if lngText = (-1),searched text does not exit
  If lngTextID = -1 Then
  'reset errorhandler
Err.Clear
Resume Next
End If
  MsgBox "ErrNr. : " & Err.Number & vbNewLine & _
         "ErrDes.: " & Err.Description, vbOKOnly, "Error ocurred"
  'reset errorhandler
Err.Clear
End Sub
```

6.2.5 VBA in Alarm Logging

6.2.5.1 VBA in Alarm Logging

Introduction

VBA allows you to create messages directly from the program code, modify them, and delete them.

Note

You should not have or should not open the "Alarm Logging" editor when editing with VBA.

Principle

When you have created the instance of the "HMIGO" class, the following functions are available to you to access Alarm Logging:

- CloseSingleAlarm
- CommitSingleAlarm
- CreateSingleAlarm
- DeleteSingleAlarm
- GetSingleAlarm
- ListSingleAlarm

The following enumerations are available for the parameter supply of these functions:

- HMIGO_SINGLE_ALARM_CLASS_IDS
- HMIGO_SINGLE_ALARM_LIST_TYPE

Access to the Object Properties

You can also access the parameters of the above-mentioned functions directly in VBA by means of the following object properties:

Object property	Description	Read/Write
ObjectStateSingleAlarm	Returns the object state via the enumeration HMIGO_OBJECT_STATE. Further information on this enumeration can be found in this documentation under "VBA in other WinCC Editors".	Yes/no
SingleAlarmMessageNumber	Number of the message	Yes/no
SingleAlarmAGNumber	AS Number	Yes/yes
SingleAlarmCPUNumber	CPU number of the AGs.	Yes/yes
SingleAlarmClassID	Message class of the message. Possible values of the Enum SINGLE_ALARM_CLASS_IDS: • SINGLE_ALARM_ERROR (1) • SINGLE_ALARM_CLASS_2 (2) • SINGLE_ALARM_CLASS_3 (3) • SINGLE_ALARM_CLASS_4 (4) • SINGLE_ALARM_CLASS_5 (5) • SINGLE_ALARM_CLASS_6 (6) • SINGLE_ALARM_CLASS_7 (7) • SINGLE_ALARM_CLASS_8 (8) • SINGLE_ALARM_CLASS_9 (9) • SINGLE_ALARM_CLASS_10 (10) • SINGLE_ALARM_CLASS_11 (11) • SINGLE_ALARM_CLASS_12 (12) • SINGLE_ALARM_CLASS_13 (13) • SINGLE_ALARM_CLASS_14 (14) • SINGLE_ALARM_CLASS_15 (15) • SINGLE_ALARM_CLASS_16 (16) • SINGLE_ALARM_CLASS_SYSTEM_REQUIRE_ACKNOWLEDGEMENT (17) • SINGLE_ALARM_CLASS_SYSTEM_WITHOUT_ACKNOWLEDGEMENT (18)	Yes/yes
SingleAlarmMessageTypeID	Type ID of the message. The permissible values depend on the message class: • Class 1: Values from 1 to 16 • Class 2: Values from 17 to 32 • Class 3: Values from 33 to 48 • ... • Class 18: 273 and 274	Yes/yes
SingleAlarmTextXXID XX = 1...10	The properties SingleAlarmText1ID to SingleAlarmText10ID exist for the user texts 1 to 10.	Yes/yes

Object property	Description	Read/Write
SingleAlarmTagNameProcessValueXX XX = 1...10	For the process values there are the properties SingleAlarmTagNameProcessValue1 through 10 If you want to delete a configured process value, you must describe this parameter with a tag of the type "Long", which has the value "0".[1)]	Yes/yes
SingleAlarmTagName	Tag name for event	Yes/yes
SingleAlarmMessageBit	Bits for bit reporting procedure	Yes/yes
SingleAlarmQuitTag	Tag name for acknowledgment status	Yes/yes
SingleAlarmQuitBits	Bit for bit reporting procedure	Yes/yes
SingleAlarmStateTag	Tag for status query	Yes/yes
SingleAlarmStateBits	Bit for status tag	Yes/yes
SingleAlarmNormDLL	Name of the conversion DLL	Yes/yes
SingleAlarmQuitSingle	Acknowledgment of the messages, TRUE or FALSE possible	Yes/yes
SingleAlarmHornActivate	Activation of the horn, TRUE or FALSE possible	Yes/yes
SingleAlarmArchiving	Archiving of the message, TRUE or FALSE possible	Yes/yes
SingleAlarmProtocol	Logging of the message, TRUE or FALSE possible	Yes/yes
SingleAlarmFlankInvert	Triggering of message at falling edge, TRUE or FALSE possible	Yes/yes
SingleAlarmLockedOnStart	Message is disabled at system startup, TRUE or FALSE possible	Yes/yes
SingleAlarmGlobalAPFunction	Forward message to global AP function, TRUE or FALSE possible	Yes/yes
SingleAlarmActionName	Name of the action	Yes/yes
SingleAlarmActionParams	Parameters of the action	Yes/yes
SingleAlarmInfoText	Information text for message	Yes/yes
SingleAlarmGroup	Name of the user-defined group message assigned to a message.	Yes/yes

1)

```
Sub DeleteSingleAlarmTagNameProcessValue1()
     'HMIGO_033
     Dim objGO as HMIGO
     Dim var as Long
     var = 0
     Set objGO = new HMIGO
     'message 1 will be modified
       objGO.GetSingleAlarm 1
       objGO.SingleAlarmTagNameProcessValue1 = var
       objGO.CommitSingleAlarm
     Set objGO = nothing
   End Sub
```

VBA in Other WinCC Editors (Page 3887)

6.2.5.2 CloseSingleAlarm Function

Description

Closes the message which is open.

Note

Modified parameters are not saved. If the current value should be saved, execute the CommitSingleAlarm() function again.

syntax

```
Expression.CloseSingleAlarm()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CloseSingleAlarm()
' HMIGO_22
' procedure to open a singlealarm
' message #100 need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim lngMsgNumber As Long
  Set objHMIGO = New HMIGO
  lngMsgNumber = 100
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'open a singlealarm
  objHMIGO.GetSingleAlarm lngMsgNumber
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'close a singlealarm
  objHMIGO.CloseSingleAlarm
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
```

```
  Set objHMIGO = Nothing
End Sub
```

6.2.5.3 CommitSingleAlarm Function

Description

Writes the changed parameters of the open message to WinCC.

Note

To change further parameters after a CommitSingleAlarm call, write these changes to WinCC by calling the function again.

syntax

```
Expression.CommitSingleAlarm()
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

--

Example:

```
Sub CommitSingleAlarm()
' HMIGO_023
' procedure to change a property of a singlealarm
' message #100 need to be created before
' declarations
  Dim objHMIGO As HMIGO
```

```
  Dim lngMsgNumber As Long
  Dim lngMsgBitNumber As Long
  Set objHMIGO = New HMIGO
  lngMsgNumber = 100
  lngMsgBitNumber = 10
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'open a singlealarm
  objHMIGO.GetSingleAlarm lngMsgNumber
 'current status is "OPENED" for changes
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'change a property
  objHMIGO.SingleAlarmMessageBit = lngMsgBitNumber
 'current status is "MODIFIED" for changes
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'commit a single alarm
  objHMIGO.CommitSingleAlarm
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"

  Set objHMIGO = Nothing
End Sub
```

6.2.5.4 CreateSingleAlarm Function

Description

Creates a new message.

syntax

```
Expression.CreateSingleAlarm(MessageNumber,ClassID,MessageTypeID,Tex
t1ID,MessageTagName,MessageBit)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
MessageNumber (long)	Number of the message. • If an unused message number is specified here, it is accepted. • If the value "0" is entered, the message number is freely assigned by the system. In this case, the message number is given back here.
ClassID (HMIGO_SINGLE_ALARM_CLASS_IDS)	Message class. The possible values are in the table Enum HMIGO_SINGLE_ALARM_CLASS_IDS.
MessageTypeID (Integer)	The permissible values depend on the message class: • Class 1: Values from 1 to 16 • Class 2: Values from 17 to 32 • Class 3: Values from 33 to 48 • ... • Class 18: Values from 263 to 288
Text1ID (Long)	ID for the first user text. The ModifySingleAlarm function can be used to define nine further user texts (1-10).
MessageTagName (String)	Tag name for the event.
MessageBit (integer)	Bit in bit reporting process (0...31)

Default Values When a New Message Is Created

The following table indicates the default values that are entered when a new message is created. These properties can be modified. The modifications are saved using the ModifySingleAlarm function.

Parameters	Default Value (Enum Name => Value)	Comment
SingleAlarmAGNumber	0	--
SingleAlarmCPUNumber	0	--
SingleAlarmTextXXID	No text entered	--
SingleAlarmTagNameProcessValueXX	No tag entered	--
SingleAlarmQuitTag	No tag entered	--
SingleAlarmQuitBits	0	No bits set.
SingleAlarmStateTag	No tag entered	Corresponds to exactly one day. Only relevant in the case of compressed tags.
SingleAlarmStateBits	0	No bits set.
SingleAlarmNormDLL	No name entered	--
SingleAlarmQuitSingle	FALSE	Single acknowledgment, no group acknowledgment
SingleAlarmHornActivate	FALSE	Horn Not active.

Parameters	Default Value (Enum Name => Value)	Comment
SingleAlarmArchiving	TRUE	Message will be archived.
SingleAlarmProtocol	TRUE	Message is logged.
SingleAlarmFlankInvert	FALSE	Not activated.
SingleAlarmLockedOnStart	FALSE	Message is not disabled.
SingleAlarmGlobalAPIFunction	FALSE	Message is not forwarded.
SingleAlarmActionName	No name entered	--
SingleAlarmActionParams	No parameters entered for the action	--
SingleAlarmInfoText	No text entered	--
SingleAlarmGroup	No text entered	--

Enum HMIGO_SINGLE_ALARM_CLASS_IDS

The following message classes are available for selection:

Values	Description
SINGLE_ALARM_ERROR (1)	--
SINGLE_ALARM_CLASS_2 (2)	--
SINGLE_ALARM_CLASS_3 (3)	--
SINGLE_ALARM_CLASS_4 (4)	--
SINGLE_ALARM_CLASS_5 (5)	--
SINGLE_ALARM_CLASS_6 (6)	--
SINGLE_ALARM_CLASS_7 (7)	--
SINGLE_ALARM_CLASS_8 (8)	--
SINGLE_ALARM_CLASS_9 (9)	--
SINGLE_ALARM_CLASS_10 (10)	--
SINGLE_ALARM_CLASS_11 (11)	--
SINGLE_ALARM_CLASS_12 (12)	--
SINGLE_ALARM_CLASS_13 (13)	--
SINGLE_ALARM_CLASS_14 (14)	--
SINGLE_ALARM_CLASS_15 (15)	--
SINGLE_ALARM_CLASS_16 (16)	--
SINGLE_ALARM_CLASS_SYSTEM_REQUIRE_ACKNOWLEDGEMENT (17)	--
SINGLE_ALARM_CLASS_SYSTEM_WITHOUT_ACKNOWLEDGEMENT (18)	--

Example:

```
Sub CreateSingleAlarm()
' HMIGO_024
' procedure to create a SingleAlarm
' message must not be created before
```

```
' message Text ID need to be created before in text library
' declarations
  Dim objHMIGO As HMIGO
  Dim strMsgText As String      'message text
  Dim strMsgTagName As String   'message variable
  Dim lngMsgNumber As Long      'message number
  Dim lngMsgBitNumber As Long   'bit number within the message variable
  Dim lngMsgTypeID As Long      'message type
  Dim lngMsgClassID             'SINGLE_ALARM_ERROR
  Dim lngMsgTextID As Long      'message text ID from textlibrary
  Set objHMIGO = New HMIGO
  strMsgText = "NewText"
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'preset reqiured parameter
  lngMsgNumber = 50
  lngMsgClassID = 1
  lngMsgTypeID = 2
  lngMsgTextID = 69
  strMsgText = "new text message"
  strMsgTagName = "NewVariable"
  lngMsgBitNumber = 5

 'create a tag
  objHMIGO.CreateSingleAlarm lngMsgNumber,SINGLE_ALARM_ERROR, lngMsgTypeID,lngMsgTextID,
strMsgTagName, lngMsgBitNumber

 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
  Set objHMIGO = Nothing
End Sub
```

6.2.5.5 DeleteSingleAlarm Function

Description

Deletes the specified message.

syntax

```
Expression.DeleteSingleAlarm(MessageNumber)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
MessageNumber (long)	Number of the message to be deleted.

Example:

```
Sub DeleteSingleAlarm()
' HMIGO_025
' procedure to delete a singlealarm
' message #100 need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim lngMsgNumber As Long

  Set objHMIGO = New HMIGO
  lngMsgNumber = 100
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"

 'delete a singlealarm
  objHMIGO.DeleteSingleAlarm lngMsgNumber
  Set objHMIGO = Nothing
End Sub
```

6.2.5.6 GetSingleAlarm Function

Description

Reads in the parameters of the message entered.

You can change or read the parameters by means of the object properties. You will find a list of the available object properties in this documentation under "VBA in Alarm Logging".

syntax

```
Expression.GetSingleAlarm(MessageNumber)
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
MessageNumber (long)	The message number of the message to be read in.

Example:

```
Sub GetSingleAlarm()
' HMIGO_026
' procedure to open a singlealarm
' message #100 need to be created before
' declarations
  Dim objHMIGO As HMIGO
  Dim lngMsgNumber As Long
  Set objHMIGO = New HMIGO
  lngMsgNumber = 100
 'current status is "EMPTY"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
 'open/ get a tag
  objHMIGO.GetSingleAlarm lngMsgNumber
 'current status is "OPENED"
  MsgBox objHMIGO.ObjectStateSingleAlarm, vbOKOnly, "Status SingleAlarm"
  Set objHMIGO = Nothing
End Sub
```

6.2.5.7 ListSingleAlarm Function

Description

The ListSingleAlarm function returns the content of Alarm Logging in a list:

- All actions created which are linked to messages
- All message class IDs created
- All info texts created
- All message numbers created
- All message type IDs created
- All message classes created
- All group messages created

syntax

```
Expression.ListSingleAlarm(ListType,pListArray,[Filter])
```

Expression

Necessary. An expression which returns a "HMIGO" type object.

Parameters

Parameter (Data Type)	Description
ListType (HMIGO_SINGLE_ALARM_LIST_TYPE)	Defines which content should be returned in a list. Possibilities are: • SINGLE_ALARM_ACTION_NAMES (1) All actions created for Loop In Alarm when the parameter is set in the configuration as a string • SINGLE_ALARM_CLASS_IDS (2) All message class IDs created • SINGLE_ALARM_INFO_TEXTS (3) All info texts created • SINGLE_ALARM_MESSAGE_NUMBERS (4) All message numbers created • SINGLE_ALARM_MESSAGE_TYPE_IDS (5) All message type IDs created • SINGLE_ALARM_GROUP_MESSAGE_CLASSES (6) All message classes created • SINGLE_ALARM_GROUP_MESSAGE_USER_DEFINED (7) All group messages created
pListArray (Variant)	List with the requested content.
Filter (String)	Filters can be set optionally. Wildcards "*" and "?" are also possible.

Example:

In the following example, a check is made whether info texts have been configured:

```
Sub ReadSingleAlarm()
'HMIGO_032
'read content in alarm logging
'no info texts are implemented
  Dim objHMIGO As New HMIGO
Dim varRange As Variant
'read all info texts
  objHMIGO.ListSingleAlarm SINGLE_ALARM_INFO_TEXTS, arrContent
'check result
  If (UBound(arrContent) - LBound(arrContent) + 1) <= 0 Then
    MsgBox "no entries because no info texts are implemented"
End If
End Sub
```
