As RptShowError is a standard function the output type and form can be changed if required.

Please note that modified standard functions are overwritten by a WinCC installation so that the changes will be lost.

Syntax

void RptShowError (LPCSTR pszFailedFunction, CMN_ERRORA* pCmnErrorA)

Parameters

pszFailedFunction

Pointer to the name of the failed function.

If this pointer is NULL there will be no output of the function name.

pCmnErrorA

Pointer to the error structure of the failed function.

If this pointer is NULL there will be no output of the error structure.

STRUCTURES_TABLES_ERROR_STRUCTURE

3.15.2.6 WinCC

WinCC - short description

The WinCC group contains functions which affect the entire WinCC system.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetHWDiag

Function

This function realizes the direct start of diagnosis at runtime triggered by an event, which must be configured, exercised on an object.

If the event occurs, the hardware diagnostics function is started from STEP7 for the associated PLC.

The following conditions must be fulfilled in order to use the function:

- The WinCC project, with the picture from which access should occur, and the STEP7 project must be on the same computer.
- The WinCC project must be stored as a subdirectory of the STEP7 project (STEP7 Projekt \wincproj\WinCC Projekt).
- The S7 tags have been mapped to WinCC.

Syntax

BOOL GetHWDiag(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpProperties)

Parameters

lpszPictureName

Name of the picture (PDL file) that contains the tag that will be used for the entry point for the hardware diagnostics

Since the name "lpszPictureName" stands for the current picture, entries are only required here in cases where it is necessary to access an object tag in a different picture.

lpszObjectName

Name of the object in the picture that connected with the tag that will be used for the entry point for the hardware diagnostics

Since the name "lpszObjectName" stands for the current object entries are only required here in cases where it is necessary to access a tag in a different object.

lpProperties

Name of the attribute that is connected with the tag that will be used for the entry point for the hardware diagnostics

If multiple attribute are entered, they must be separated by semicolons (";").

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetHWDiagLevel

Function

Checks the logged-in user's authorization on the basis of the User Administrator function number in dwLevel.

Then, diagnostics is started directly during runtime and is triggered by an event, which has to be configured, occurring on an object.

If the event occurs, the hardware diagnostics function is started from STEP7 for the associated PLC.

The following conditions must be fulfilled in order to use the function:

- The WinCC project, with the picture from which access should occur, and the STEP7 project must be on the same computer.
- The WinCC project must be stored as a subdirectory of the STEP7 project (STEP7 Projekt \wincproj\WinCC Projekt).
- The S7 tags have been mapped to WinCC.
- In order for the user logged into WinCC to edit the hardware diagnostics dialog, the user must have a WinCC user authorization matching the number passed by the function call in the parameter "dwLevel".

Syntax

BOOL GetHWDiagLevel(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpProperties, DWORD dwLevel)

Parameters

lpszPictureName

Name of the picture (PDL file) that contains the tag that will be used for the entry point for the hardware diagnostics

Since the name "lpszPictureName" stands for the current picture, entries are only required here in cases where it is necessary to access an object tag in a different picture.

lpszObjectName

Name of the object in the picture that connected with the tag that will be used for the entry point for the hardware diagnostics

Since the name "lpszObjectName" stands for the current object entries are only required here in cases where it is necessary to access a tag in a different object.

lpProperties

Name of the attribute that is connected with the tag that will be used for the entry point for the hardware diagnostics

If multiple attribute are entered, they must be separated by semicolons (";").

dwLevel

Level number for STEP7 write permissions.

This can be defined in User Administrator.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetKopFupAwl

Function

This function performs the network entry jump of WinCC into the STEP7 Editor "KFA".

When executing this function two tasks are performed:

- Determination of the required date for the network entry jump from WinCC.
- Transfer of the data to Step7 and finding the places of use of the operand in a STEP7 program by means of AUTAPI.

Syntax

BOOL GetKopFupAwl(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpProperties)

Parameters

lpszPictureName

Name of the picture (PDL file) that contains the tag that will be used for the network entry jump

Since the name "lpszPictureName" stands for the current picture, entries are only required here in cases where it is necessary to access an object tag in a different picture.

lpszObjectName

Name of the object in the picture that connected with the tag that will be used for the network entry jump

Since the name "lpszObjectName" stands for the current object entries are only required here in cases where it is necessary to access a tag in a different object.

lpProperties

Name of the attrribute that is connected with the tag that will be used for the network entry jump

If multiple attribute are entered, they must be separated by semicolons (";").

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetKopFupAwlLevel

Function

Checks the active user's authorization on the basis of the User Administrator function number in dwLevel and then performs the entry jump into the STEP7 Editor "KFA".

When executing this function three tasks are performed:

- Determination of the required date for the network entry jump from WinCC.
- Authorization check for the active user within WinCC.
- Transfer of the data to STEP7 and finding the places of use of the operand in a STEP7 program by means of AUTAPI.

Note

Depending on the result of the authorization check in WinCC the user has either only reading rights in STEP7 or is authorized to change S7 data.

Syntax

BOOL GetKopFupAwlLevel(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,LPCTSTR lpProperties, DWORD dwLevel)

Parameters

lpszPictureName

Name of the picture (PDL file) that contains the tag that will be used for the network entry jump

Since the name "lpszPictureName" stands for the current picture, entries are only required here in cases where it is necessary to access an object tag in a different picture.

lpszObjectName

Name of the object in the picture that connected with the tag that will be used for the network entry jump

Since the name "lpszObjectName" stands for the current object entries are only required here in cases where it is necessary to access a tag in a different object.

lpProperties

Name of the attrribute that is connected with the tag that will be used for the network entry jump

If multiple attribute are entered, they must be separated by semicolons (";").

dwLevel

Level number for STEP7 write permissions.

This can be defined in User Administrator.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OnDeactivateExecute

Function

This function is called when terminating WinCC Runtime.

As this is a standard function, you can insert instructions which are then executed.

Note

Concerning the instructions it must be taken into account that the Runtime is terminating and therefore not all functionalities are available.

Please note that modified standard functions are overwritten by a WinCC installation so that the changes will be lost.

Syntax

```
void OnDeactivateExecute()
```

OnErrorExecute

Function

OnErrorExecute is called by the system when an error occurred upon executing an action or a function.

This allows you to determine the precise error cause.

The function is called by the system and does not require an additional call.

As this function is available as a standard function the output type and form can be changed if required.

Note

Please note that modified standard functions are overwritten by a new installation so that the changes will be lost.

Syntax

void OnErrorExecute(CCAPErrorExecute ErrorExecute)

Parameters

ErrorExecute

Structure informing about the error that has occurred

Diagnostic information

These information are displayed in a Global Script diagnostics window.

SystemTime	Time (UTC) at which the error occurred
dwErrorCode1	The error codes and their meaning are to be found in the structure definition
dwErrorCode2	The error codes and their meaning are to be found in the structure definition
szErrorText	Text description of the error cause
bCycle	Cycle type
szApplicationName	Error-triggering application
szFunctionName	FunctionID
szTagName	Tag name
dwCycle	Cycle type
szErrorTextTagName	Text description of the tag status
status	Tag status
lpszPictureName	Picture in which the error occurred
lpszObjectName	Object in which the error occurred
lpszPropertyName	Object property in which the error occurred
dwParamSize	only used internally
szErrorText	Text description of the error cause returned by the error structure "pError"

See also

CCAPErrorExecute structure definition

OnTime

Function

OnTime is exclusively called by the system. The function returns the runtime of all actions or determines the actions running longer than the specified time. Time measurement can be enabled/disabled via APDIAG.

As this function is available as a standard function the output type can be influenced by changing the function code.

Note

Please note that modified standard functions are overwritten by a WinCC installation so that the changes will be lost.

Syntax

void OnTime(CCAPTime time)

Parameters

time

Result structure

STRUCTURES_TABLES_CCAPTIME

3.15.2.7 Windows

Windows - short description

The Windows group contains the ProgramExecute function.

This function can be used to execute any program.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

ProgramExecute

Function

Starts the program with the specified name.

Syntax

unsigned int ProgramExecute(char* Program_Name)

Parameters

Program_Name

Pointer to the program name

Return value

If the return value is greater than 31, the function has been completed without any errors.

In case of an error, the return value contains one of the following error codes:

0	out of memory
2	Specified file could not be found.
3	Specified path could not be found.
11	Program could not be started.

ProgramExecute

3.15.3 Internal functions

3.15.3.1 Internal functions - short description

Internal functions are used to make graphic objects and archives dynamic and in project functions, standard functions and global script actions.

Internal funtions are recognized throughout a project.

They can be neither be newly created nor can existing internal functions be modified.

Internal functions are divided into the following groups:

allocate

Functions to reserve and release working memory space

c_bib

Functions from the standard C-library

graphics

Functions to read and set properties of graphical objects

tag

Functions to read and write tags

wincc

Functions for changing languages, deactivating Runtime and ending WinCC

3.15.3.2 allocate

SysFree

Function

Releases the memory area previously reserved with the SysMalloc function.

Syntax

void SysFree(void* lpFree);

Parameters

lpFree

Pointer to the memory area reserved with the SysMalloc function

SysMalloc

Function

Reserves memory space for an action. The memory area is assigned to the action. When the action has been completed and the result transferred, the system releases the memory again.

The SysFree function can be used to release reserved memory space.

Syntax

void* SysMalloc(unsigned long int size);

Parameters

size

Size of the memory area in bytes.

3.15.3.3 c_bib

c_bib - short description

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ctype

isalnum

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib

- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

isalpha

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

isdigit

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

isgraph

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

islower

The function group c_bib contains C functions from the C library and is divided into:

- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

log

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

log10

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

modf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

pow

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

sin

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

sinh

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

sqrt

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

tan

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

tanh

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memory

memchr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memcmp

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memcpy

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memmove

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memset

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

stdio

char_io

fgetc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fgets

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib

- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fputc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fputs

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

getc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

putc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ungetc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

Directio

fread

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fwrite

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

Error

clearerr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

feof

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ferror

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

File

fclose

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fflush

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fopen

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

freopen

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

remove

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

rename

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

setbuf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

setvbuf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

tmpfile

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

tmpnam

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

File_pos

fgetpos

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fseek

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fsetpos

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ftell

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

rewind

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

Output

vfprintf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

vsprintf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

stdlib

abs

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

atof

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

atoi

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

atol

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

bsearch

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

calloc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

div

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

free

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

getenv

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

labs

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ldiv

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

malloc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

qsort

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

rand

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

realloc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

srand

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strtod

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strtol

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strtoul

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

string

strcat

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strchr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strcmp

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strcpy

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strcspn

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strerror

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strlen

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strncat

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strncmp

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strncpy

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strpbrk

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strrchr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strspn

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strstr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strtok

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

time

asctime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

clock

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ctime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

difftime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

gmtime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

localtime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

mktime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strftime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

time

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

3.15.3.4 graphics

Graphics - short description

The functions of the Graphics group allow to modify or query graphical properties of WinCC objects.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

Note

If the function is called for the picture object, set the parameter lpszObjectName = ZERO.

get

axes

GetAlignment

Function

When using bar objects, it indicates whether the text is to the right or left of the bar.

Syntax

BOOL GetAlignment(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Text is to the right of the bar

FALSE

Text is to the left of the bar

See also

GetScaling example

Beispiel GetScaling (Page 2234)

GetAxisSection

Function

When using bar objects, it specifies the difference between the values of two neighboring axis labels.

Syntax

double GetAxisSection(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Difference between the values of two neighboring axis labels

GetExponent

Function

When using bar objects, it specifies whether the axis label corresponds to the decimal or exponential form.

Syntax

BOOL GetExponent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Axis label in exponential form

FALSE

Axis label in decimal form

See also

GetScaling example

Beispiel GetScaling (Page 2234)

GetLeftComma

Function

When using bar objects, it specifies the number of integers in the axis label.

Syntax

long int GetLeftComma(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

The number of integers in the axis label

GetLongStrokesBold

Function

When using bar objects, it specifies whether the main division lines on the scale are bold or regular.

Syntax

BOOL GetLongStrokesBold(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The main division lines on the graph scale are bold

FALSE

The main division lines on the graph scale are regular

See also

GetScaling example

Beispiel GetScaling (Page 2234)

GetLongStrokesOnly

Function

When using bar objects, it specifies whether intermediate division lines are used on the scale.

Syntax

BOOL GetLongStrokesOnly(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Only main division lines are used on the bar graph scale.

FALSE

Both main and intermediate division lines are used on the bar graph scale.

See also

GetScaling example

Beispiel GetScaling (Page 2234)

GetLongStrokesSize

Function

When using bar objects, it specifies the length of the main division lines.

Syntax

```
long int GetLongStrokesSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Length of the main division lines as numeric value

GetLongStrokesTextEach

Function

When using bar objects, it specifies the interval between the main division lines being assigned a label.

Syntax

long int GetLongStrokesTextEach(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Label of the main division lines as numeric value

Example:

Return value = 1 -> Every main division line is assigned a label.

Return value = 2 -> Every 2nd main division line is assigned a label.

etc.

GetRightComma

Function

When using bar objects, it specifies the number of decimal places in the axis label.

Syntax

long int GetRightComma(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

The number of decimal places in the axis label

GetScaleTicks

Function

When using bar objects, it specifies the scale marks as number of scale sections. A scale section is a part of the scale bounded by two main tick marks.

Syntax

long int GetScaleTicks(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Scale marks as number of scale sections

Note

The number of scale sections is given as 0, if the bar object itself calculates a suitable scale unit.

GetScaling

Function

When using bar objects, it specifies whether the scale is activated or deactivated.

Syntax

BOOL GetScaling(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Display with scale

FALSE

Display without scale

See also

GetScaling example

Beispiel GetScaling (Page 2234)

GetScalingType

Function

When using bar objects, it specifies the type of bar scaling.

Syntax

long int GetScalingType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Type of bar scaling as numeric value

See also

Bar scaling

Bar Scaling (Page 2284)

color

Color - short description

The various color properties of objects can be modified or queried using the functions in the Color group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetBackColor

Function

Specifies the background color of the object as a numeric value.

Syntax

long int GetBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Background color of the object as a numeric value

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor2

Function

When using bar objects, it specifies the color of the bar as a numeric value.

Syntax

long int GetBackColor2(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor3

Function

When using bar objects, it specifies the background color of the bar as a numeric value.

Syntax

long int GetBackColor3(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar background color

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColorBottom

Function

Specifies the background color of the slider objects at the bottom right.

Syntax

long int GetBackColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the slider objects at the bottom right

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColorTop

Function

Specifies the background color of the slider objects at the top left.

Syntax

long int GetBackColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the slider objects at the top left

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBorderBackColor

Function

Specifies the background color of the lines or borders.

Syntax

long int GetBorderBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the lines or borders

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBorderColor

Function

Specifies the line or border color as a numeric value.

Syntax

long int GetBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the color of lines or borders

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBorderColorBottom

Function

Specifies the 3D border color at the bottom.

Syntax

long int GetBorderColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the 3D border color at the bottom

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBorderColorTop

Function

Specifies the 3D border color at the top.

Syntax

long int GetBorderColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the 3D border color at the top

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetButtonColor

Function

Specifies the button color of slider objects.

Syntax

long int GetButtonColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the button color of slider objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetColorBottom

Function

When using slider objects, it specifies the color of the bottom limit.

Syntax

long int GetColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the color of the bottom limit of slider objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetColorTop

Function

When using slider objects, it specifies the color of the top limit.

Syntax

long int GetColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the color of the top limit of slider objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetFillColor

Function

Specifies the color of the fill pattern.

Syntax

long int GetFillColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value of the fill color

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetForeColor

Function

Specifies the color of the font.

Syntax

long int GetForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the font color

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetGridColor

Function

Specifies the grid color of Graphics Designer.

Syntax

long int GetGridColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the grid color of Graphics Designer

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetItemBorderBackColor

Function

Specifies the background color of the dividing line for the "text list" object.

Syntax

long int GetItemBorderBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the dividing line for the "text list" object

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetItemBorderColor

Function

Specifies the color of the dividing line for the "text list" object.

Syntax

long int GetItemBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the dividing line color for the "text list" object

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetScaleColor

Function

Specifies the scale color for bar objects.

Syntax

long int GetScaleColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value of the scale color for bar objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetSelBGColor

Function

Specifies the background color of the selected entry for the "text list" object.

Syntax

long int GetSelBGColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the selected entry

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetSelTextColor

Function

Specifies the font color of the selected entry for the "text list" object.

Syntax

long int GetSelTextColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the font color of the selected entry

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetTrendColor

Function

Specifies the trend color of bar objects.

Syntax

long int GetTrendColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the trend color of bar objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetUnselBGColor

Function

Specifies the background color of the non-selected entries for the "text list" object.

Syntax

long int GetUnselBGColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the non-selected entries

See also

GetBackColor example

Color chart

Color chart (Page 2286)

GetBackColor example (Page 2218)

GetUnselTextColor

Function

Specifies the font color of the non-selected entries for the "text list" object.

Syntax

long int GetUnselTextColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the font color of the non-selected entries

See also

GetBackColor example

Color chart

GetBackColor example (Page 2218)

Color chart (Page 2286)

fill

Fill - short description

The functions in the Fill group control the dynamic filling of objects.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetFilling

Function

Specifies whether dynamic filling with background color is activated.

Syntax

BOOL GetFilling(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Dynamic filling with background color is activated.

FALSE

Dynamic filling with background color is not activated.

See also

GetFilling example

GetFilling example (Page 2219)

GetFillingIndex

Function

Specifies the current fill level.

Syntax

long int GetFillingIndex(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Current fill level as a numeric value (0 - 100)

See also

GetFillingIndex example

GetFillingIndex example (Page 2219)

flash

Flash - short description

The various flashing properties can be modified or called in using the functions in the Flash group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetBackFlashColorOff

Function

Specifies the background flash color for the deactivated status.

Syntax

long int GetBackFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Background flash color for the deactivated status as a numeric value

See also

Color chart (Page 2286)

GetFlashBackColorOn example

GetFlashBackColorOn example (Page 2221)

Color chart

GetBackFlashColorOn

Function

Specifies the background flash color for the activated status.

Syntax

long int GetBackFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Background flash color for the activated status as a numeric value

See also

GetFlashBackColorOn example (Page 2221)

Color chart (Page 2286)

Color chart

GetFlashBackColorOn example

GetBorderFlashColorOff

Function

Specifies the border or line flashing color for the deactivated status.

Syntax

long int GetBorderFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Border or line flashing color for the deactivated status as a numeric value

See also

GetFlashBackColorOn example (Page 2221)

Color chart (Page 2286)

Color chart

GetFlashBackColorOn example

GetBorderFlashColorOn

Function

Specifies the border or line flashing color for the activated status.

Syntax

long int GetBorderFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Border or line flashing color for the activated status as a numeric value

See also

GetFlashBackColorOn example (Page 2221)

Color chart (Page 2286)

Color chart

GetFlashBackColorOn example

GetFlashBackColor

Function

Specifies whether flashing of the background is activated or not.

Syntax

BOOL GetFlashBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Flashing background is activated.

FALSE

Flashing background is not activated.

See also

GetFlashBackColor example (Page 2220)

GetFlashBackColor example

GetFlashBorderColor

Function

Specifies whether flashing of the border or line is activated or not.

Syntax

BOOL GetFlashBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Flashing of the border or line is activated.

FALSE

Flashing of the border or line is not activated.

See also

GetFlashBackColor example (Page 2220)

GetFlashBackColor example

GetFlashForeColor

Function

Specifies whether flashing of the font is activated or not.

Syntax

BOOL GetFlashForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Flashing of the font is activated.

FALSE

Flashing of the font is not activated.

See also

GetFlashBackColor example (Page 2220)

GetFlashBackColor example

GetFlashRateBackColor

Function

Specifies the flash frequency of the background.

Syntax

long int GetFlashRateBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash frequency of the background

See also

GetFlashBackColorOn example (Page 2221)

Flash frequencies (Page 2284)

GetFlashBackColorOn example

Flash frequencies

GetFlashRateBorderColor

Function

Specifies the flash frequency of the line or border.

Syntax

long int GetFlashRateBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash frequency of the line or border

See also

GetFlashBackColorOn example (Page 2221)

Flash frequencies (Page 2284)

GetFlashBackColorOn example

Flash frequencies

GetFlashRateForeColor

Function

Specifies the flash frequency of the font.

Syntax

long int GetFlashRateForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash frequency of the font

See also

GetFlashBackColorOn example (Page 2221)

Flash frequencies (Page 2284)

GetFlashBackColorOn example

Flash frequencies

GetForeFlashColorOff

Function

Specifies the font flash color for the deactivated status.

Syntax

long int GetForeFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Font flash color for the deactivated status as a numeric value

See also

GetFlashBackColorOn example (Page 2221)

Color chart (Page 2286)

GetFlashBackColorOn example

Flash frequencies

GetForeFlashColorOn

Function

Specifies the font flash color for the activated status.

Syntax

long int GetForeFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Font flash color for the activated status as a numeric value

See also

GetFlashBackColorOn example (Page 2221)

Color chart (Page 2286)

GetFlashBackColorOn example

Color chart

focus

Focus - short description

Using the functions in the Focus group, it is possible to set the focus or poll which object has the focus.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

Get_Focus

Function

Specifies the name of the object currently or last focussed.

Syntax

char *Get_Focus();

Return value

Name of the object currently or last focussed.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetFocus example (Page 2222)

GetFocus example

font

Font - short description

The various properties affecting text can be modified or called in using the functions in the Font group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetAlignmentLeft

Function

Specifies the horizontal text alignment (left, centered, right).

Syntax

long int GetAlignmentLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Horizontal text alignment as a numeric value

See also

Text alignment (Page 2291)

GetFontSize example (Page 2223)

GetFontSize example

Text alignment

GetAlignmentTop

Function

Specifies the vertical text alignment (top, centered, bottom).

Syntax

long int GetAlignmentTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Vertical text alignment as a numeric value

See also

GetFontSize example (Page 2223)

Text alignment (Page 2291)

GetFontSize example

Text alignment

GetFontBold

Function

Specifies whether the font is bold or not.

Syntax

BOOL GetFontBold(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Bold font on

FALSE

Bold font off

See also

GetFontBold example (Page 2223)

GetFontBold example

GetFontItalic

Function

Specifies whether the font is italic or not.

Syntax

BOOL GetFontItalic(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Italic font on

FALSE

Italic font off

See also

GetFontBold example (Page 2223)

GetFontBold example

GetFontName

Function

Indicates the current font name.

Syntax

char* GetFontName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to the name of the font currently selected.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetText example (Page 2251)

GetText example

GetFontSize

Function

Specifies the font size.

Syntax

long int GetFontSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Current font size

See also

GetFontSize example (Page 2223)

GetFontSize example

GetFontUnderline

Function

Specifies whether the font is underlined or not.

Syntax

BOOL GetFontUnderline(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Underlined font on

FALSE

Underlined font off

See also

GetFontBold example (Page 2223)

GetFontBold example

GetOrientation

Function

Specifies the text orientation (vertical/horizontal).

Syntax

BOOL GetOrientation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Vertical text orientation

FALSE

Horizontal text orientation

See also

GetFontBold example (Page 2223)

GetFontBold example

GetText

Function

Specifies the value of the "text" property for objects like static text, check box or radio box.

Syntax

char* GetText(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to a text.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

Note

In case of check and radio boxes, the element to be determined must be defined with the "SetIndex" function before actually activating this function.

See also

GetText example (Page 2251)

general

GetLayer

Function

Specifies the picture layer in which the object is located.

Syntax

long int GetLayer(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Picture layer in which the object is located

geometry

Geometry - short description

The size, position and other geometrical properties of objects can be modified or called in using the functions in the Geometry group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetActualPointLeft

Function

Specifies the X value of the current position in a polygon or polygon line.

Syntax

long int GetActualPointLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

X value for the current point of a polygon or polygon line

Note

The current point of the polygon can be set using the SetIndex function.

See also

GetLeft example (Page 2225)

GetLeft example

GetActualPointTop

Function

Specifies the Y value of the current position in a polygon or polygon line.

Syntax

long int GetActualPointTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Y value for the current point of a polygon or polygon line

Note

The current point of the polygon can be set using the SetIndex function.

See also

GetTop example (Page 2252)

GetTop example

GetBoxCount

Function

Specifies the number of fields for check boxes and radio boxes.

Syntax

long int GetBoxCount(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Number of fields in a check box or radio box.

GetDirection

Function

Specifies the bar direction for bar objects.

Syntax

long int GetDirection(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Bar direction of bar objects as numeric value

See also

Bar direction (Page 2283)

Bar direction

GetEndAngle

Function

Specifies the end angle of circle and ellipse segments and circle and elliptical arcs.

Syntax

long int GetEndAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

End angle of circle and ellipse segments as well as circle and ellipse arcs

GetGrid

Function

Specifies whether the grid is activated in the graphics area of Graphics Designer.

Syntax

BOOL GetGrid(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Grid in Graphics Designer is activated.

FALSE

Grid in Graphics Designer is deactivated.

GetGridHeight

Function

Specifies the height of the grid in the graphics area of Graphics Designer.

Syntax

long int GetGridHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Height of the grid in Graphics Designer

GetGridWidth

Function

Specifies the width of the grid in the graphics area of Graphics Designer.

Syntax

long int GetGridWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Width of the grid in Graphics Designer

GetHeight

Function

Specifies the height of the rectangle framing an object.

Syntax

long int GetHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Height of the rectangle framing an object

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetHeight example (Page 2224)

GetLeft

Function

Specifies the X position of the upper left corner of the rectangle framing an object.

Syntax

long int GetLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Current X value of the upper left corner of the rectangle framing an object

See also

GetLeft example (Page 2225)

GetLeft example

GetPointCount

Function

Specifies the number of corners of a polygon or in a polygon line.

Syntax

long int GetPointCount(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Number of corners of a polygon or in a polyline

GetRadius

Function

Specifies the radius of a circle, circle segment or arc.

Syntax

long int GetRadius(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Radius of a circle, circle segment or arc

See also

GetHeight example (Page 2224)

GetHeight example

GetRadiusHeight

Function

Specifies the radius of an ellipse, ellipse segment or elliptical arc in a vertical direction.

Syntax

long int GetRadiusHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Radius of an ellipse, ellipse segment or elliptical arc in a vertical direction

See also

GetHeight example (Page 2224)

GetHeight example

GetRadiusWidth

Function

Specifies the radius of an ellipse, ellipse segment or elliptical arc in a horizontal direction.

Syntax

long int GetRadiusWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Radius of an ellipse, ellipse segment or elliptical arc in a horizontal direction

See also

GetHeight example (Page 2224)

GetHeight example

GetReferenceRotationLeft

Function

Specifies the X value of the rotation reference (central axis about which the object can be rotated) for lines, polygons and polylines.

Syntax

long int GetReferenceRotationLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

X value of the rotation reference for lines, polygons and polygon lines

See also

GetLeft example (Page 2225)

GetLeft example

GetReferenceRotationTop

Function

Specifies the Y value of the rotation reference (central axis about which the object can be rotated) for lines, polygons and polylines.

Syntax

long int GetReferenceRotationTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Y value of the rotation reference for lines, polygons and polygon lines

See also

GetTop example (Page 2252)

GetTop example

GetRotationAngle

Function

Specifies the angle of rotation about the central axis for lines, polygons and polylines.

Syntax

long int GetRotationAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Angle of rotation about the central axis

See also

GetHeight example (Page 2224)

GetHeight example

GetRoundCornerHeight

Function

Specifies the radius of the rounded corner of a rectangle vertically.

Syntax

long int GetRoundCornerHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Vertical radius of the rounded corner of a rectangle

See also

GetHeight example (Page 2224)

GetHeight example

GetRoundCornerWidth

Function

Specifies the radius of the rounded corner of a rectangle horizontally.

Syntax

long int GetRoundCornerWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Horizontal radius of the corner of the rounded corner of a rectangle

See also

GetWidth example (Page 2253)

GetWidth example

GetStartAngle

Function

Specifies the start angle of circle and ellipse segments and circle and elliptical arcs.

Syntax

long int GetStartAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Start angle of circle and ellipse segments as well as circle and elliptical arcs

See also

GetHeight example (Page 2224)

GetHeight example

GetTop

Function

Specifies the Y position of the upper left corner of the rectangle framing an object.

Syntax

long int GetTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Current Y value of the upper left corner of the rectangle framing an object

See also

GetTop example (Page 2252)

GetTop example

GetWidth

Function

Specifies the width of the rectangle framing an object.

Syntax

long int GetWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Width of the rectangle framing an object

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetWidth example (Page 2253)

GetWidth example

GetZeroPoint

Function

When using bar objects, it indicates the zero point.

Syntax

long int GetZeroPoint(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Zero point for bar objects

See also

GetHeight example (Page 2224)

GetHeight example

i_o

i_o - short description

The various properties affecting input and output values can be modified or called in using the functions in the i_o group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetAssignments

Function

Assignment of text to the value range of lists

Syntax

char* GetAssignments(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

The assignment of text to the value range depends on the list type.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

List types (Page 2290)

List types

GetAssumeOnExit

Function

Specifies for I/O fields whether the entered value is assumed upon exiting the field.

Syntax

BOOL GetAssumeOnExit(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Value application upon exiting the field.

FALSE

No value application upon exiting the field.

GetAssumeOnFull

Function

Specifies for I/O fields whether the entered value is assumed on completion of input.

Syntax

BOOL GetAssumeOnFull(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Value application on completion of input.

FALSE

No value application on completion of input.

GetBitNumber

Function

Specifies the relevant bit in the output value for the "bit" list type.

Syntax

long int GetBitNumber(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Indication of the relevant bit in the output value for the "bit" list type

See also

GetHiddenInput example (Page 2224)

List types (Page 2290)

List types

GetHiddenInput example

GetClearOnError

Function

Specifies for I/O fields whether deletion of the content in case of input errors is activated.

Syntax

BOOL GetClearOnError(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Deletion of the content in case of input errors is activated

FALSE

Deletion of the content in case of input errors is not activated

GetClearOnNew

Function

Specifies for I/O fields whether deletion of the content on new input is activated.

Syntax

BOOL GetClearOnNew(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Deletion of the content on new input is activated.

FALSE

Deletion of the content on new input is not activated.

GetDataFormat

Function

Specifies the data type of the field content for I/O fields.

Syntax

long int GetDataFormat(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Data type of the field content as numeric value

See also

GetHiddenInput example (Page 2224)

I/O field, data type of the field content (Page 2285)

GetHiddenInput example

I/O field, data type of the field content

GetHiddenInput

Function

Specifies whether hidden input is activated for I/O fields.

Syntax

BOOL GetHiddenInput(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Hidden input is activated

FALSE

Hidden input is not activated

See also

GetHiddenInput example (Page 2224)

GetHiddenInput example

GetInputValueChar

Function

Specifies the input value in the data type "char" for I/O fields.

Syntax

char* GetInputValueChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to the input value in the data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetInputValueDouble

Function

Specifies the input value in the data type "double" for I/O fields.

Syntax

double GetInputValueDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Input value in the data type "double"

GetListType

Function

Specifies the list type for the "text list" object.

Syntax

long int GetListType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

List type for the "text list" object

See also

GetHiddenInput example (Page 2224)

List types (Page 2290)

GetHiddenInput example

List types

GetNumberLines

Function

Specifies the number of visible lines for the "text list" object.

Syntax

long int GetNumberLines(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Number of visible lines for the "text list" object

Note

If the amount of configured text is larger than the number of visible lines, the "text list" object receives a vertical scroll bar.

See also

GetHiddenInput example (Page 2224)

GetHiddenInput example

GetOutputFormat

Function

Specifies the output format for I/O fields.

Syntax

char* GetOutputFormat(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to the output format.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

I/O field, data type of the field content (Page 2285)

I/O field, output format (Page 2284)

I/O field, data type of the field content

I/O field, output format

GetOutputValueChar

Function

Determines the output value in the data type "char" for I/O fields. This function should only be used if the field content of the I/O field is of the "string" data type.

Syntax

char* GetOutputValueChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to the output value in the data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetOutputValueDouble

Function

Determines the output value in the data type "double" for I/O fields. This function should only be used if the field content of the I/O field is not of the "string" data type.

Syntax

double GetOutputValueDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Output value in the data type "double"

See also

GetOutputValueDouble example (Page 2228)

GetOutputValueDouble example

Limits

Limits - short description

The various properties affecting limit values can be modified or called in using the functions in the Limits group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetAlarmHigh

Function

Specifies the upper alarm limit for bar objects.

Syntax

double GetAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Upper alarm limit for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetAlarmLow

Function

Specifies the lower alarm limit for bar objects.

Syntax

double GetAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Lower alarm limit for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetCheckAlarmHigh

Function

When using bar objects, it specifies whether the upper alarm limit is monitored.

Syntax

BOOL GetCheckAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper alarm limit is monitored.

FALSE

In case of bar objects the upper alarm limit is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckAlarmLow

Function

When using bar objects, it specifies whether the lower alarm limit is monitored.

Syntax

```
BOOL GetCheckAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower alarm limit is monitored.

FALSE

In case of bar objects the lower alarm limit is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckLimitHigh4

Function

When using bar objects, it specifies whether the upper limit value reserve 4 is monitored.

Syntax

BOOL GetCheckLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper limt value reserve 4 is monitored.

FALSE

In case of bar objects the upper limt value reserve 4 is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckLimitHigh5

Function

When using bar objects, it specifies whether the upper limit value reserve 5 is monitored.

Syntax

BOOL GetCheckLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper limt value reserve 5 is monitored.

FALSE

In case of bar objects the upper limt value reserve 5 is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckLimitLow4

Function

When using bar objects, it specifies whether the lower limit value reserve 4 is monitored.

Syntax

BOOL GetCheckLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower limt value reserve 4 is monitored.

FALSE

In case of bar objects the lower limt value reserve 4 is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckLimitLow5

Function

When using bar objects, it specifies whether the lower limit value reserve 5 is monitored.

Syntax

BOOL GetCheckLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower limt value reserve 5 is monitored.

FALSE

In case of bar objects the lower limt value reserve 5 is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckToleranceHigh

Function

When using bar objects, it specifies whether the upper tolerance limit is monitored.

Syntax

BOOL GetCheckToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper tolerance limit is monitored.

FALSE

In case of bar objects the upper tolerance limit is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckToleranceLow

Function

When using bar objects, it specifies whether the lower tolerance limit is monitored.

Syntax

BOOL GetCheckToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower tolerance limit is monitored.

FALSE

In case of bar objects the lower tolerance limit is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckWarningHigh

Function

When using bar objects, it specifies whether the upper warning limit is monitored.

Syntax

BOOL GetCheckWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper warning limit is monitored.

FALSE

In case of bar objects the upper warning limit is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetCheckWarningLow

Function

When using bar objects, it specifies whether the lower warning limit is monitored.

Syntax

BOOL GetCheckWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower warning limit is monitored.

FALSE

In case of bar objects the lower warning limit is not monitored.

See also

GetMarker example (Page 2228)

GetMarker example

GetColorAlarmHigh

Function

Specifies the bar color for bar objects upon reaching the upper alarm limit.

Syntax

long int GetColorAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper alarm limit

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorAlarmLow

Function

Specifies the bar color for bar objects upon reaching the lower alarm limit.

Syntax

long int GetColorAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower alarm limit

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorLimitHigh4

Function

Specifies the bar color for bar objects upon reaching the upper limit reserve 4.

Syntax

long int GetColorLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper limit reserve 4

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorLimitHigh5

Function

Specifies the bar color for bar objects upon reaching the upper limit reserve 5.

Syntax

long int GetColorLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper limit reserve 5

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorLimitLow4

Function

Specifies the bar color for bar objects upon reaching the lower limit reserve 4.

Syntax

long int GetColorLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower limit reserve 4

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorLimitLow5

Function

Specifies the bar color for bar objects upon reaching the lower limit reserve 5.

Syntax

long int GetColorLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower limit reserve 5

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorToleranceHigh

Function

Specifies the bar color for bar objects upon reaching the upper tolerance limit.

Syntax

long int GetColorToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper tolerance limit

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorToleranceLow

Function

Specifies the bar color for bar objects upon reaching the lower tolerance limit.

Syntax

long int GetColorToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower tolerance limit

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorWarningHigh

Function

Specifies the bar color for bar objects upon reaching the upper warning limit limit.

Syntax

long int GetColorWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper warning limit

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetColorWarningLow

Function

Specifies the bar color for bar objects upon reaching the lower warning limit.

Syntax

long int GetColorWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower warning limit

See also

GetBackColor example (Page 2218)

Color chart (Page 2286)

GetBackColor example

Color chart

GetLimitHigh4

Function

Specifies the upper limit value for reserve 4 for bar objects.

Syntax

double GetLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

High limit value for reserve 4 for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetLimitHigh5

Function

Specifies the upper limit value for reserve 5 for bar objects.

Syntax

double GetLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

High limit value for reserve 5 for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetLimitLow4

Function

Specifies the low limit value for reserve 4 for bar objects.

Syntax

double GetLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Low limit value for reserve 4 for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetLimitLow5

Function

Specifies the low limit value for reserve 5 for bar objects.

Syntax

double GetLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Low limit value for reserve 5 for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetLimitMax

Function

Specifies the upper limit value for I/O fields.

Syntax

double GetLimitMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

High limit value for I/O fields

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetLimitMin

Function

Specifies the low limit value for I/O fields.

Syntax

double GetLimitMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Low limit value for I/O fields

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetMarker

Function

When using bar objects, it specifies whether the limit marker is displayed.

Syntax

```
BOOL GetMarker(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Limit marker for bar objects is displayed.

FALSE

Limit marker for bar objects is not displayed.

See also

GetMarker example (Page 2228)

GetMarker example

GetToleranceHigh

Function

Specifies the upper tolerance limit for bar objects.

Syntax

double GetToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Upper tolerance limit for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetToleranceLow

Function

Specifies the lower tolerance limit for bar objects.

Syntax

double GetToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Lower tolerance limit for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetTypeAlarmHigh

Function

Specifies for bar objects whether the upper alarm limit is given in percentages or absolute terms.

Syntax

```
BOOL GetTypeAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper alarm limit is given in percentages.

FALSE

In case of bar objects the upper alarm limit is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetTypeAlarmLow

Function

Specifies for bar objects whether the lower alarm limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower alarm limit is given in percentages.

FALSE

In case of bar objects the lower alarm limit is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetTypeLimitHigh4

Function

Specifies for bar objects whether the upper limit reserve 4 is given in percentages or absolute terms.

Syntax

BOOL GetTypeLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper limit reserve 4 is given in percentages.

FALSE

In case of bar objects the upper limit reserve 4 is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetTypeLimitHigh5

Function

Specifies for bar objects whether the upper limit reserve 5 is given in percentages or absolute terms.

Syntax

BOOL GetTypeLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper limit reserve 5 is given in percentages.

FALSE

In case of bar objects the upper limit reserve 5 is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetTypeLimitLow4

Function

Specifies for bar objects whether the lower limit reserve 4 is given in percentages or absolute terms.

Syntax

BOOL GetTypeLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower limit reserve 4 is given in percentages.

FALSE

In case of bar objects the lower limit reserve 4 is given in absolute terms.

GetTypeLimitLow5

Function

Specifies for bar objects whether the lower limit reserve 5 is given in percentages or absolute terms.

Syntax

BOOL GetTypeLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower limit reserve 5 is given in percentages.

FALSE

In case of bar objects the lower limit reserve 5 is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetTypeToleranceHigh

Function

Specifies for bar objects whether the upper tolerance limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper tolerance limit is given in percentages.

FALSE

In case of bar objects the upper tolerance limit is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetTypeToleranceLow

Function

Specifies for bar objects whether the lower tolerance limit is given in percentages or absolute terms.

Syntax

```
BOOL GetTypeToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower tolerance limit is given in percentages.

FALSE

In case of bar objects the lower tolerance limit is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetTypeWarningHigh

Function

Specifies for bar objects whether the upper warning limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper warning limit is given in percentages.

FALSE

In case of bar objects the upper warning limit is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetTypeWarningLow

Function

Specifies for bar objects whether the lower warning limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower warning limit is given in percentages.

FALSE

In case of bar objects the lower warning limit is given in absolute terms.

See also

GetMarker example (Page 2228)

GetMarker example

GetWarningHigh

Function

Specifies the upper warning limit for bar objects.

Syntax

double GetWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Upper warning limit for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

GetWarningLow

Function

Specifies the lower warning limit for bar objects.

Syntax

```
double GetWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Lower warning limit for bar objects

See also

GetAlarmHigh example (Page 2217)

GetAlarmHigh example

link

Link - short description

A tag link property can be created or called in using the functions in the Link group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetLink

Function

Specifies the current tag connection of object properties.

Syntax

BOOL GetLink(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, LPLINKINFO *pLink);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Object property

pLink

Pointer to a structure of the type: LINKINFO

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Structure definition LINKINFO (Page 2299)

GetLink example (Page 2226)

GetLink example

LINKINFO structure definition

miscs

Miscs - short description

The properties of objects can be modified or called in using the functions in the Miscs group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetAdaptBorder

Function

Specifies for static texts, I/O fields, check boxes and radio boxes whether the border of the field is to be dynamically adapted to the text size.

Syntax

BOOL GetAdaptBorder(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Border is adapted

FALSE

Border is not adapted

See also

GetVisible example (Page 2253)

GetVisible example

GetAdaptPicture

Function

Specifies for picture windows whether the picture is to be adapted to the window size.

Syntax

BOOL GetAdaptPicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture is adapted

FALSE

Picture is not adapted

See also

GetVisible example (Page 2253)

GetVisible example

GetAdaptSize

Function

Specifies for picture windows whether the window is to be adapted.

Syntax

BOOL GetAdaptSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Window is adapted

FALSE

Window is not adapted

See also

GetVisible example (Page 2253)

GetVisible example

GetAverage

Function

When using bar objects, it specifies whether value averaging is activated.

Syntax

BOOL GetAverage(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Averaging is activated for bar objects

FALSE

Averaging is not activated for bar objects

See also

GetVisible example (Page 2253)

GetVisible example

GetBoxType

Function

Specifies the field type (input field, output field, input/output field) for I/O fields.

Syntax

long int GetBoxType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Field type of an I/O field

See also

I/O field, field type (Page 2286)

I/O field, field type

GetCaption

Function

Specifies whether a picture or application window has a title.

Syntax

BOOL GetCaption(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture/application window has a title

FALSE

Picture/application window has no title

See also

GetVisible example (Page 2253)

GetVisible example

GetCloseButton

Function

When using a picture window, it specifies whether the window can be closed.

Syntax

BOOL GetCloseButton(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture window can be closed

FALSE

Picture window cannot be closed

See also

GetVisible example (Page 2253)

GetVisible example

GetColorChangeType

Function

When using bar objects, it specifies whether the color change upon reaching a limit value only affects a bar segment or the entire bar.

Syntax

BOOL GetColorChangeType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Color change applies to the bar sagment

FALSE

Color change applies to the entire bar

See also

GetVisible example (Page 2253)

GetVisible example

GetCursorControl

Function

Specifies whether cursor control is activated for I/O fields.

Syntax

BOOL GetCursorControl(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Cursor control for I/O fields is enabled.

FALSE

Cursor control for I/O fields is disabled.

See also

GetVisible example (Page 2253)

GetVisible example

GetCursorMode

Function

Specifies whether the cursor mode for the picture is alpha cursor or tab order cursor.

Syntax

BOOL GetCursorMode(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Cursor mode for the picture is "Alpha-cursor"

FALSE

Cursor mode for the picture is "tab order cursor"

See also

GetVisible example (Page 2253)

GetVisible example

GetEditAtOnce

Function

Specifies whether the "Immediate input" property is activated for I/O fields.

Syntax

BOOL GetEditAtOnce(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

"Immediate input" property is activated

FALSE

"Immediate input" property is deactivated

See also

GetVisible example (Page 2253)

GetVisible example

GetExtendedOperation

Function

Specifies whether the "Extended operation" property is activated for slider objects.

Syntax

BOOL GetExtendedOperation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

"Extended operation" property is activated

FALSE

"Extended operation" property is deactivated

See also

GetVisible example (Page 2253)

GetVisible example

GetHotkey

Function

Specifies the key combination for check boxes.

Syntax

long int GetHotkey(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Key code for key combinations for check boxes

GetHysteresis

Function

When using bar objects, it specifies whether the display appears with or without hysteresis.

Syntax

BOOL GetHysteresis(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Display with hysteresis for bar objects

FALSE

Display without hysteresis for bar objects

See also

GetVisible example (Page 2253)

GetVisible example

GetHysteresisRange

Function

Specifies the hysteresis value in the display for bar objects.

Syntax

double GetHysteresisRange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Hysteresis in the display for bar objects

GetLanguageSwitch

Function

Specifies fot the "Text list" object whether the assignment texts are to be stored in the text library or in the object itself.

Syntax

BOOL GetLanguageSwitch(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Assignment texts are stored in the text library

FALSE

Assignment texts are stored in the text list object

See also

GetVisible example (Page 2253)

GetVisible example

GetLastChange

Function

Specifies the date when the picture was last changed.

Syntax

char* GetLastChange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Date of the last change of the picture.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetPictureName example (Page 2230)

GetPictureName example

GetMax

Function

Specifies the maximum value for bar and slider objects.

Syntax

double GetMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Maximum value for bar and slider objects.

GetMaximizeButton

Function

Specifies for picture or application windows whether the window can be maximized.

Syntax

BOOL GetMaximizeButton(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture or application window can be maximized

FALSE

Picture or application window cannot be maximized

See also

GetVisible example (Page 2253)

GetVisible example

GetMin

Function

Specifies the minimum value for bar and slider objects.

Syntax

double GetMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Minimum value for bar and slider objects

GetMoveable

Function

Specifies for picture or application windows whether the window can be moved.

Syntax

BOOL GetMoveable(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture or application window is movable

FALSE

Picture or application window is not movable

See also

GetVisible example (Page 2253)

GetVisible example

GetOffsetLeft

Function

Specifies the horizontal picture distance from the left window border for picture windows.

Syntax

long int GetOffsetLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Horizontal picture distance from the left window border for picture windows

GetOffsetTop

Function

Specifies the vertical picture distance from the upper window border for picture windows.

Syntax

long int GetOffsetTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Vertical picture distance from the upper window border for picture windows

GetOnTop

Function

Specifies for picture or application windows whether the window is always in the foreground.

Syntax

BOOL GetOnTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture or application window is always in the foreground

FALSE

Picture or application window can be overlapped by other windows.

See also

GetVisible example (Page 2253)

GetVisible example

GetOperation

Function

Specifies whether the object can be operated.

Syntax

BOOL GetOperation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Object is operable

FALSE

Object is not operable

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetVisible example (Page 2253)

GetVisible example

GetOperationMessage

Function

Specifies for I/O fields, check boxes, radio boxes or sliders whether a message is output following operation.

Syntax

BOOL GetOperationMessage(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Upon operation a message is issued

FALSE

Upon operation no message is issued

See also

GetVisible example (Page 2253)

GetVisible example

GetOperationReport

Function

Specifies for all objects except application and picture windows and OLE control whether the reason for the operation is logged.

Syntax

BOOL GetOperationReport(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Reason for the operation is logged.

FALSE

Reason for the operation is not logged.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetVisible example (Page 2253)

GetVisible example

GetPasswordLevel

Function

Specifies the authorization level for the operation of the object for all objects except application and picture windows and OLE control.

Syntax

long int GetPasswordLevel(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Authorization level for the operation of the object

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

GetPictureName

Function

Returns the name of the picture currently displayed in the picture window.

Syntax

char* GetPictureName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Name of the picture window

Return value

Pointer to the name of the currently displayed picture

Note

If both parameters are NULL, a pointer appears indicating the name of the basic screen.

See also

GetPictureName example (Page 2230)

GetPictureName example

GetProcess

Function

Specifies the default setting value for the process value to be displayed for bar and slider objects.

Specifies the selected fields for check boxes and radio boxes.

Syntax

```
double GetProcess(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

- For bar and slider objects: Default setting value for the process value to be displayed
- For check and radio boxes: In a 32-bit word each field is represented by a bit (field 1 corrsponds to the bit value 0). Selected fields are marked by a set bit. Non-existing are assigned 0.

GetScrollBars

Function

Specifies for picture windows whether the window has a scroll bar.

Syntax

BOOL GetScrollBars(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture window has a scroll bar

FALSE

Picture window has no scroll bar

See also

GetVisible example (Page 2253)

GetVisible example

GetServerName

Function

Specifies the default setting for the process value to be displayed for OLE control and OLE object.

Syntax

char* GetServerName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Name of the object (OLE control and OLE object) under which it is registered in WINDOWS.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetPictureName example (Page 2230)

GetPictureName example

GetSizeable

Function

Specifies for application or picture windows whether the window size can be changed.

Syntax

BOOL GetSizeable(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Application or picture window is sizeable

FALSE

Application or picture window is not sizeable

See also

GetVisible example (Page 2253)

GetVisible example

GetSmallChange

Function

Specifies the number of steps for slider objects by which the slider is shifted by a mouse click.

Syntax

```
long int GetSmallChange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Number of steps by which the slider is shifted by a mouse click

GetTagPrefix

Function

Returns the tag prefix of a picture window.

Syntax

```
char* GetTagPrefix(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Tag prefix of the picture window.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetTagPrefix example (Page 2246)

GetTagPrefix example

GetTrend

Function

When using bar objects, it specifies whether the trend display is activated.

Syntax

BOOL GetTrend(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Trend display is activated for a bar object

FALSE

Trend display is not activated for a bar object

See also

GetVisible example (Page 2253)

GetVisible example

GetUpdateCycle

Function

Specifies the update cycle for the entire picture.

Syntax

long int GetUpdateCycle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the update cycle

See also

Structure definition LINKINFO (Page 2299)

Structure definition LINKINFO

GetVisible

Function

Specifies whether the object is displayed.

Syntax

BOOL GetVisible(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Object is displayed

FALSE

Object is not displayed

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetVisible example (Page 2253)

GetVisible example

GetWindowBorder

Function

Specifies for application or picture windows whether the object is displayed with a border.

Syntax

BOOL GetWindowBorder(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Application or picture window is displayed with a border.

FALSE

Application or picture window is displayed without a border.

See also

GetVisible example (Page 2253)

GetVisible example

GetZeroPointValue

Function

Specifies the absolute value of the zero point for bar objects.

Syntax

double GetZeroPointValue(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Absolute value of the zero point for the bar display

GetZoom

Function

Specifies the scaling factor for picture windos.

Syntax

long int GetZoom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Scaling factor of a picture window

ole_control

OLE_control - short description

The functions in the ole_Control group can only be used with OCX slider objects.

Various OCX slider object properties and settings can be modified or called in using these functions.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetPosition

Function

Specifies the position of the slider for OCX slider objects.

Syntax

long int GetPosition(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Slider position of the OCX slider object as numeric value

See also

GetPosition example (Page 2231)

GetPosition example

GetRangeMax

Function

Specifies the adjustment range "Max" for OCX slider objects.

Syntax

long int GetRangeMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Adjustment range "Max" of the OCX slider object as numeric value

See also

GetRangeMax example (Page 2233)

GetRangeMax example

GetRangeMin

Function

Specifies the adjustment range "Min" for OCX slider objects.

Syntax

long int GetRangeMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Adjustment range "Min" of the OCX slider object as numeric value

See also

GetRangeMin example (Page 2234)

GetRangeMin example

pictures

Pictures - short description

Various properties of pictures of graphic objects and round buttons can be modified or called in using the functions in the Pictures group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetPicDeactReferenced

Function

Specifies whether the picture for the "deactivated" status is referenced for round buttons.

Syntax

BOOL GetPicDeactReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The picture assigned to the "deactivated" status was not stored in the object.

FALSE

The picture assigned to the "deactivated" status was stored in the object.

GetPicDeactTransparent

Function

Specifies the transparent color for the "deactivated" status of round buttons.

Syntax

long int GetPicDeactTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the transparent color for the "deactivated" status

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

GetBackColor example (Page 2218)

GetBackColor example

Color chart

GetPicDeactUseTransColor

Function

Specifies whether the transparent color for the "deactivated" status is used for round buttons.

Syntax

BOOL GetPicDeactUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color for "deactivated" status is used

FALSE

Transparent color for "deactivated" status is not used

GetPicDownReferenced

Function

Specifies whether the picture for the "On/pressed" status is referenced for round buttons.

Syntax

BOOL GetPicDownReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The picture assigned to the "On/pressed" status was not stored in the object.

FALSE

The picture assigned to the "On/pressed" status was stored in the object.

GetPicDownTransparent

Function

Specifies the transparent color for the "On/pressed" status of round buttons.

Syntax

long int GetPicDownTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the transparent color for the "On/pressed" status

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

GetPictureDown example (Page 2229)

Color chart

GetPictureDown example

GetPicDownUseTransColor

Function

Specifies whether the transparent color for the "On/pressed" status is used for round buttons.

Syntax

BOOL GetPicDownUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color for "On/pressed" status is used

FALSE

Transparent color for "On/pressed" status is not used

GetPicReferenced

Function

When using graphic objects, it specifies whether the picture is referenced.

Syntax

BOOL GetPicReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The assigned picture was not stored in the object.

FALSE

The assigned picture was stored in the object.

GetPicTransColor

Function

Specifies the transparent color for a background picture for graphic objects.

Syntax

long int GetPicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background picture of a graphic object

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

GetBackColor example (Page 2218)

GetBackColor example

Color chart

GetPictureDeactivated

Function

Specifies the picture name for the "deactivated" status of round buttons.

Syntax

char* GetPictureDeactivated(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Picture name for "deactivated" status.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

GetPictureDown

Function

Specifies the picture name for the "On/pressed" status of round buttons.

Syntax

char* GetPictureDown(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Picture name for the "On/pressed" status.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

GetPictureUp

Function

Specifies the picture name for the "Off/not pressed" status of round buttons.

Syntax

char* GetPictureUp(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Picture name for the "Off/not pressed" status.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

GetPictureUp example (Page 2231)

GetPictureUp example

GetPicUpReferenced

Function

Specifies whether the picture for the "Off/not pressed" status is referenced for round buttons.

Syntax

BOOL GetPicUpReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The picture assigned to the "Off/not pressed" status was not stored in the object.

FALSE

The picture assigned to the "Off/not pressed" status was stored in the object.

GetPicUpTransparent

Function

Specifies the transparent color for the "Off/not pressed" status of round buttons.

Syntax

long int GetPicUpTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the transparent color for the "Off/not pressed" status

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

GetBackColor example (Page 2218)

GetBackColor example

Color chart

GetPicUpUseTransColor

Function

Specifies whether the transparent color for the "Off/not pressed" status is used for round buttons.

Syntax

BOOL GetPicUpUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color for "Off/not pressed" status is used

FALSE

Transparent color for "Off/not pressed" status is not used

GetPicUseTransColor

Function

When using graphic objects, it specifies whether the transparent color is used for a background picture.

Syntax

BOOL GetPicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color is used for a background picture.

FALSE

Transparent color is not used for a background picture.

property

Property - short description

The properties of objects for which there are no direct functions can be modified or called in using the functions in the Property group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetPropBOOL

Function

Specifies the current status of a property of the data type "BOOL".

Syntax

BOOL GetPropBOOL(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

Return value

Value of the attribute in the data type "BOOL"

See also

GetPropBOOL example (Page 2232)

GetPropBOOL example

GetPropChar

Function

Specifies the current status of a property of the data type "char".

Syntax

char* GetPropChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

Return value

Pointer to a character string containing the value of the object property.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetPropChar example (Page 2233)

GetPropChar example

GetPropDouble

Function

Specifies the current status of a property of the data type "double".

Syntax

double GetPropDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

Return value

Value of the attribute in the data type "double"

GetPropWord

Function

Specifies the current status of a property of the data type "long".

Syntax

long GetPropWord(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

Return value

Value of the attribute in the type "long"

state

State - short description

The properties of status displays can be modified or called in using the functions in the State group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetBasePicReferenced

Function

Specifies whether the basic picture is referenced for the status display.

Syntax

BOOL GetBasePicReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The basic picture was not stored in the object.

FALSE

The basic picture was stored in the object.

GetBasePicTransColor

Function

Specifies the transparent color of the basic picture for the status display.

Syntax

long int GetBasePicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Transparent color of the basic picture as numeric value

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

GetBackColor example (Page 2218)

GetBackColor example

Color chart

GetBasePicture

Function

Specifies the basic picture name fur the status display.

Syntax

char* GetBasePicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Basic picture name for the status display.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetBasePicUseTransColor

Function

When using the status display, it specifies whether the transparent color is used for the basic picture.

Syntax

BOOL GetBasePicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color is used for the basic picture.

FALSE

Transparent color is not used for the basic picture.

GetFlashFlashPicture

Function

Specifies whether the flash picture of the status display is animated dynamically or statically.

Syntax

BOOL GetFlashFlashPicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The flash picture is animated dynamically.

FALSE

The flash picture is animated statically.

GetFlashPicReferenced

Function

Specifies whether the flash picture is referenced for the status display.

Syntax

BOOL GetFlashPicReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The flash picture was not stored in the object.

FALSE

The flash picture was stored in the object.

GetFlashPicTransColor

Function

Specifies the transparent color of the flash picture for the status display.

Syntax

long int GetFlashPicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Transparent color of the flash picture as numeric value

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

GetBackColor example (Page 2218)

GetBackColor example

Color chart

GetFlashPicture

Function

Specifies the flash picture name for the status display.

Syntax

char* GetFlashPicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash picture name (file name of the graphic).

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetFlashPicUseTransColor

Function

When using the status display, it specifies whether the transparent color is used for the flash picture.

Syntax

BOOL GetFlashPicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color is used for the flash picture.

FALSE

Transparent color is not used for the flash picture.

GetFlashRateFlashPic

Function

Specifies the flash frequency of the flash picture for the status display.

Syntax

long int GetFlashRateFlashPic(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash frequency of a flash picture as numeric value

Note

Since the flashing is performed by means of software engineering, the precise frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time etc.).

See also

Flash frequencies (Page 2284)

GetFlashRateFlashPic example (Page 2222)

Flash frequencies

GetFlashRateFlashPic example

GetIndex

Function

Specifies the index of the current position in a polygon or polygon line.

Specifies the index of the current field for check boxes and radio boxes.

Syntax

long int GetIndex(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Index of the current point or field

style

Style - short description

Various properties affecting the appearance of objects can be modified or called in using the functions in the Style group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetBackBorderWidth

Function

Specifies the frame width of 3D frames and slider objects.

Syntax

long int GetBackBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value for the frame width of 3D frames and slider objects

See also

GetBorderStyle example (Page 2218)

GetBorderStyle example

GetBorderEndStyle

Function

Specifies the type of line end.

Syntax

long int GetBorderEndStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Type of line end as numeric value

See also

GetBorderStyle example (Page 2218)

Line end style (Page 2289)

GetBorderStyle example

Line style

GetBorderStyle

Function

Specifies the line or border style.

Syntax

long int GetBorderStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the line or border style

See also

GetBorderStyle example (Page 2218)

Line styles (Page 2289)

GetBorderStyle example

Line styles

GetBorderWidth

Function

Specifies the line or border line width.

Syntax

long int GetBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Line or border line width as numeric value

See also

GetBorderStyle example (Page 2218)

GetBorderStyle example

GetBoxAlignment

Function

Specifies the arrangement of controls (left or right justified) in check boxes or radio boxes.

Syntax

long int GetBoxAlignment(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the arrangement of controls in check boxes or radio boxes

See also

GetBorderStyle example (Page 2218)

Text alignment (Page 2291)

GetBorderStyle example

Text alignment

GetFillStyle

Function

Specifies the type of fill pattern.

Syntax

long int GetFillStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Type of fill pattern as numeric value

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

Fill pattern (Page 2288)

GetFillStyle example (Page 2220)

Fill pattern

GetFillStyle example

GetFillStyle2

Function

Specifies the bar fill pattern for a bar graph.

Syntax

long int GetFillStyle2(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Bar fill pattern as numeric value

See also

Fill pattern (Page 2288)

GetFillStyle example (Page 2220)

GetFillStyle example

Fill pattern

GetItemBorderStyle

Function

Specifies the dividing line style for the "text list" object.

Syntax

long int GetItemBorderStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Dividing line style for the "text list" object

See also

GetBorderStyle example (Page 2218)

Line styles (Page 2289)

GetBorderStyle example

Line styles

GetItemBorderWidth

Function

Specifies the dividing line width for the "text list" object.

Syntax

long int GetItemBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the dividing line width for the "text list" object

See also

GetBorderStyle example (Page 2218)

GetBorderStyle example

GetPressed

Function

Specifies for buttons or round buttons whether the switch setting is "pressed" or "not pressed".

Syntax

BOOL GetPressed(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Switch setting is "pressed"

FALSE

Switch setting is "not pressed"

GetToggle

Function

Specifies for buttons or round buttons whether the switch is latchable or not.

Syntax

BOOL GetToggle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Switch is latchable

FALSE

Switch is not latchable

GetWindowsStyle

Function

Specifies whether buttons are to be displayed in Windows style.

Syntax

BOOL GetWindowsStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Button is displayed in the usual Windows fashion.

FALSE

The apperance of the button is defined by the user.

set

axes

Axes - short description

The functions in the Axes group can only be used with bar graph objects.

This function can be used to modify or query various bar graph object properties.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAlignment

Function

When using bar objects, it indicates whether the text is to the right or left of the bar.

Syntax

BOOL SetAlignment(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bAlignment);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bAlignment

Text alignment

TRUE	Text is to the right of the bar
FALSE	Text is to the left of the bar

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetScaling example

SetAxisSection

Function

When using bar objects, it specifies the axis section, i.e. the difference between the values of two neighboring axis labels.

Syntax

BOOL SetAxisSection(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dAxisSection);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dAxisSection

Axis section

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetExponent

Function

Sets the axis label display for bar objects (exponential/decimal).

Syntax

BOOL SetExponent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bExponent);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bExponent

Axis labeling

TRUE	Axis label in exponential form
FALSE	Axis label in decimal form

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetScaling example

SetLeftComma

Function

When using bar objects, it specifies the number of integers in the axis label.

Syntax

BOOL SetLeftComma(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lLeftComma);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lLeftComma

Number of integers

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetScaling example

SetLongStrokesBold

Function

When using bar objects, it specifies whether the main division lines are bold or regular.

Syntax

BOOL SetLongStrokesBold(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bLongStrokesBold);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bLongStrokesBold

Main division lines on the bar graph scale

TRUE	bold
FALSE	normal

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetScaling example

SetLongStrokesOnly

Function

When using bar objects, it specifies whether intermediate or only main division lines are used on the scale.

Syntax

BOOL SetLongStrokesOnly(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bLongStrokesOnly);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bLongStrokesOnly

Only main division lines yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetScaling example

SetLongStrokesSize

Function

When using bar objects, it specifies the length of the main division lines on the bar graph scale.

Syntax

BOOL SetLongStrokesSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lLongStrokesSize);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lLongStrokesSize

Length of the main division marks in pixels

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetScaling example

SetRightComma

Function

When using bar objects, it specifies the number of decimal places in the axis label.

Syntax

BOOL SetRightComma(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRightComma);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRightComma

Number of decimal places

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetScaling example

SetScaleTicks

Function

When using bar objects, it specifies the scale marks as number of scale sections. A scale section is a part of the scale bounded by two main tick marks.

Syntax

BOOL SetScaleTicks(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lScaleTicks);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lScaleTicks

Number of scale sections

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the number of scale sections is given as 0, the bar object itself calculates a suitable scale unit.

See also

SetScaling example (Page 2267)

SetScaling example

SetScaling

Function

Switches the bar graph scale of bar objects on or off.

Syntax

BOOL SetScaling(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bScaling);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bScaling

Scale on/off.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2267)

SetScaling example

SetScalingType

Function

When using bar objects, it specifies the type of bar scaling.

Syntax

BOOL SetScalingType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lScalingType);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lScalingType

Type of bar scaling as numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Bar Scaling (Page 2284)

SetScaling example (Page 2267)

SetScaling example

Bar scaling

color

Color - short description

The various color properties of objects can be modified or queried using the functions in the Color group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetBackColor

Function

Sets the background color of the object.

Syntax

BOOL SetBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColor

Background color of the object as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetBackColor2

Function

Sets the bar color for bar objects.

Syntax

BOOL SetBackColor2(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColor2);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColor2

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetBackColor3

Function

Sets the bar background color for bar objects.

Syntax

BOOL SetBackColor3(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColor3);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColor3

Numeric value defining the bar background color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetBackColorBottom

Function

Sets the background color of the slider objects at the bottom right.

Syntax

BOOL SetBackColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColorBottom);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColorBottom

Numeric value defining the background color of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetBackColorTop

Function

Sets the background color of the slider objects at the top left.

Syntax

BOOL SetBackColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColorTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColorTop

Numeric value defining the background color of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetBorderBackColor

Function

Sets the background color of the lines or borders.

Syntax

BOOL SetBorderBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderBackColor

Background color of the lines or borders

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetBorderColor

Function

Sets the color of the lines or borders.

Syntax

BOOL SetBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderColor

Numeric value defining the color of lines or borders

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetBorderColorBottom

Function

Sets the 3D border color at the bottom.

Syntax

BOOL SetBorderColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderColorBottom);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderColorBottom

Numeric value defining the 3-D border color at the bottom

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetBorderColorTop

Function

Sets the 3D border color at the top.

Syntax

BOOL SetBorderColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderColorTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderColorTop

Numeric value defining the 3-D border color at the top

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetButtonColor

Function

Sets the button color of slider objects.

Syntax

BOOL SetButtonColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lButtonColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lButtonColor

Numeric value defining the button color of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetColorBottom

Function

When using slider objects, it sets the color of the bottom limit.

Syntax

BOOL SetColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorBottom);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorBottom

Numeric value defining the color of the bottom limit of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetColorTop

Function

When using slider objects, it sets the color of the top limit.

Syntax

BOOL SetColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorTop

Numeric value defining the color of the top limit of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example

Color chart

SetFillColor

Function

Sets the color of the fill pattern.

Syntax

BOOL SetFillColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFillColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFillColor

Numeric value of the fill color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

Color chart

SetBackColor example

SetForeColor

Function

Sets the font color.

Syntax

BOOL SetForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lForeColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lForeColor

Numeric value defining the font color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetItemBorderBackColor

Function

Sets the background color of the separating line for the "text list" object.

Syntax

BOOL SetItemBorderBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lItemBorderBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lItemBorderBackColor

Background color of the dividing line as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetItemBorderColor

Function

Sets the color of the dividing line for the "text list" object.

Syntax

BOOL SetItemBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lItemBorderColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lItemBorderColor

Numeric value defining the dividing line color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetScaleColor

Function

Sets the scale color for bar objects.

Syntax

BOOL SetScaleColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lScaleColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lScaleColor

Numeric value of the scale color for bar objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetSelBGColor

Function

Sets the background color of the selected entry for the "text list" object.

Syntax

BOOL SetSelBGColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lSelBGColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lSelBGColor

Numeric value defining the background color in the selected entry

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetSelTextColor

Function

Sets the font color of a selected entry for the "text list" object.

Syntax

BOOL SetSelTextColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lSelTextColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lSelTextColor

Numeric value defining the font color in the selected entry

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetTrendColor

Function

Sets the trend color for bar objects.

Syntax

BOOL SetTrendColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lTrendColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lTrendColor

Numeric value defining the trend color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetUnselBGColor

Function

Sets the background color of non-selected entries for the "text list" object.

Syntax

BOOL SetUnselBGColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lUnselBGColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lUnselBGColor

Numeric value defining the background color for non-selected entries

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetUnselTextColor

Function

Sets the font color of non-selected entries for the "text list" object.

Syntax

BOOL SetUnselTextColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lUnselTextColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lUnselTextColor

Numeric value defining the font color for non-selected entries

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

fill

Fill - short description

The functions in the Fill group control the dynamic filling of objects.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetFilling

Function

Activates or deactivates dynamic filling with background color.

Syntax

BOOL SetFilling(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFilling);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFilling

Dynamic filling with background color on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFilling example (Page 2258)

SetFilling example

SetFillingIndex

Function

Sets the fill level.

Syntax

BOOL SetFillingIndex(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFillingIndex);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFillingIndex

Fill level as a numeric value (0 - 100)

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFillingIndex example (Page 2259)

SetFillingIndex example

flash

Flash - short description

The various flashing properties can be modified or called in using the functions in the Flash group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetBackFlashColorOff

Function

Sets the background flash color for the deactivated status.

Syntax

BOOL SetBackFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackFlashColorOff);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackFlashColorOff

Background flash color for the deactivated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetFlashBackColorOn example (Page 2260)

Color chart

SetFlashBackColorOn example

SetBackFlashColorOn

Function

Sets the background flash color for the activated status.

Syntax

BOOL SetBackFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackFlashColorOn);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackFlashColorOn

Background flash color for the activated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetFlashBackColorOn example (Page 2260)

Color chart

SetFlashBackColorOn example

SetBorderFlashColorOff

Function

Sets the border or line flashing color for the deactivated status.

Syntax

```
BOOL SetBorderFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
long int lBorderFlashColorOff);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderFlashColorOff

Border or line flashing color for the deactivated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFlashBackColorOn example (Page 2260)

Color chart (Page 2286)

Color chart

SetFlashBackColorOn example

SetBorderFlashColorOn

Function

Sets the border or line flashing color for the activated status.

Syntax

```
BOOL SetBorderFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
long int lBorderFlashColorOn);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderFlashColorOn

Border or line flashing color for the activated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetFlashBackColorOn example (Page 2260)

Color chart

SetFlashBackColorOn example

SetFlashBackColor

Function

Activates or deactivates background flashing.

Syntax

```
BOOL SetFlashBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL
bFlashBackColor);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashBackColor

Flashing background on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFlashBackColor example (Page 2259)

SetFlashBackColor example

SetFlashBorderColor

Function

Activates or deactivates flashing of the border or line.

Syntax

BOOL SetFlashBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFlashBorderColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashBorderColor

Flashing of the border or line on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFlashBackColor example (Page 2259)

Color chart

SetFlashForeColor

Function

Activates or deactivates font flashing.

Syntax

BOOL SetFlashForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFlashForeColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashForeColor

Flashing of the font on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFlashBackColor example (Page 2259)

SetFlashBackColor example

SetFlashRateBackColor

Function

Sets the flash frequency of the background.

Syntax

BOOL SetFlashRateBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashRateBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashRateBackColor

Flash frequency of the background

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Flash frequencies (Page 2284)

SetFlashBackColor example (Page 2259)

SetFlashBackColor example

Flash frequencies

SetFlashRateBorderColor

Function

Sets the flash frequency of the line or border.

Syntax

BOOL SetFlashRateBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashRateBorderColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashRateBorderColor

Flash frequency of the line or border

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Flash frequencies (Page 2284)

SetFlashBackColor example (Page 2259)

SetFlashBackColor example

Flash frequencies

SetFlashRateForeColor

Function

Sets the flash frequency of the font.

Syntax

BOOL SetFlashRateForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashRateForeColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashRateForeColor

Flash frequency of the font

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Flash frequencies (Page 2284)

SetFlashBackColor example (Page 2259)

Flash frequencies

SetFlashBackColor example

SetForeFlashColorOff

Function

Sets the font flash color for the deactivated status.

Syntax

BOOL SetForeFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lForeFlashColorOff);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lForeFlashColorOff

Font flash color for the deactivated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetFlashBackColorOn example (Page 2260)

SetFlashBackColorOn example

Color chart

SetForeFlashColorOn

Function

Sets the font flash color for the activated status.

Syntax

BOOL SetForeFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lForeFlashColorOn);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lForeFlashColorOn

Font flash color for the activated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetFlashBackColorOn example (Page 2260)

SetFlashBackColorOn example

Color chart

focus

Focus - short description

Using the functions in the Focus group, it is possible to set the focus or poll which object has the focus.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

Set_Focus

Function

Sets the focus on the specified object.

Syntax

BOOL Set_Focus(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFocus example (Page 2260)

SetFocus example

font

Font - short description

The various properties affecting text can be modified or called in using the functions in the Font group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAlignmentLeft

Function

Sets the horizontal text alignment (left, centered, right).

Syntax

BOOL SetAlignmentLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lAlignmentLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lAlignmentLeft

Horizontal text alignment as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Text alignment (Page 2291)

SetFontSize example (Page 2261)

Text alignment

SetFontSize example

SetAlignmentTop

Function

Sets the vertical text alignment (top, centered, bottom).

Syntax

BOOL SetAlignmentTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lAlignmentTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lAlignmentTop

Vertical text alignment as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Text alignment (Page 2291)

SetFontSize example (Page 2261)

Text alignment

SetFontSize example

SetFontBold

Function

Switches the bold font on or off.

Syntax

BOOL SetFontBold(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFontBold);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFontBold

Bold font on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontBold example (Page 2261)

SetFontBold example

SetFontItalic

Function

Switches the italic font on or off.

Syntax

BOOL SetFontItalic(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFontItalic);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFontItalic

Italic font on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontBold example (Page 2261)

SetFontBold example

SetFontName

Function

Sets a font.

Syntax

BOOL SetFontName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szFontName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szFontName

Pointer to name of font

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetText example (Page 2274)

SetText example

SetFontSize

Function

Sets the font size.

Syntax

BOOL SetFontSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFontSize);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFontSize

Font Size

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontSize example (Page 2261)

SetFontSize example

SetFontUnderline

Function

Switches the underlined font on or off.

Syntax

BOOL SetFontUnderline(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFontUnderline);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFontUnderline

Underlined font on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontBold example (Page 2261)

SetFontBold example

SetOrientation

Function

Defines the text orientation (vertical/horizontal).

Syntax

BOOL SetOrientation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bOrientation);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bOrientation

Text orientation

TRUE	vertical
FALSE	Horizontal

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontBold example (Page 2261)

SetFontBold example

SetText

Function

Sets the value of the "text" property for objects like static text, check box or radio box.

Syntax

BOOL SetText(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szText);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szText

Pointer to a text

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

In case of check and radio boxes the element to be changed must be defined with the SetIndex function before actually activating this function.

See also

SetText example (Page 2274)

SetText example

geometry

Geometry - short description

The size, position and other geometrical properties of objects can be modified or called in using the functions in the Geometry group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetActualPointLeft

Function

Sets the X value for the current point of a polygon or polygon line.

Syntax

BOOL SetActualPointLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lActualPointLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lActualPointLeft

X value for the current point of a polygon or polygon line

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The current point of the polygon can be set using the SetIndex function.

See also

SetLeft example (Page 2262)

SetLeft example

SetActualPointTop

Function

Sets the Y value for the current point of a polygon or polygon line.

Syntax

BOOL SetActualPointTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lActualPointTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lActualPointTop

Y value for the current point of a polygon or polygon line

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The current point of the polygon can be set using the SetIndex function.

See also

SetTop example (Page 2275)

SetTop example

SetBoxCount

Function

Sets the number of fields in a check box or radio box.

Syntax

BOOL SetBoxCount(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBoxCount);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBoxCount

Number of fields in a check box or radio box.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetDirection

Function

Sets the bar direction for bar objects.

Syntax

BOOL SetDirection(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lDirection);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lDirection

Numeric value defining the bar direction

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Bar direction (Page 2283)

SetTop example (Page 2275)

SetTop example

Bar direction

SetEndAngle

Function

Sets the end angle of circle and ellipse segments and circle and elliptical arcs.

Syntax

BOOL SetEndAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lEndAngle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lEndAngle

End angle of circle and ellipse segments as well as circle and ellipse arcs

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetTop example (Page 2275)

SetTop example

SetHeight

Function

Sets the height of the rectangle framing an object.

Syntax

BOOL SetHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lHeight);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lHeight

Height of the framing rectangle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

SetHeight example (Page 2261)

SetHeight example

SetLeft

Function

Sets the X value of the upper left corner of the rectangle framing an object

Syntax

BOOL SetLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lLeft

X value of the upper left corner of the framing rectangle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetLeft example (Page 2262)

SetLeft example

SetPointCount

Function

Sets the number of corners of a polygon or in a polygon line.

Syntax

BOOL SetPointCount(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPointCount);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPointCount

Number of corner points

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetLeft example (Page 2262)

SetLeft example

SetRadius

Function

Sets the radius of a circle, circle segment or arc.

Syntax

BOOL SetRadius(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRadius);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRadius

Radius

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHeight example (Page 2261)

SetHeight example

SetRadiusHeight

Function

Sets the radius of an ellipse, ellipse segment or elliptical arc in vertical direction.

Syntax

BOOL SetRadiusHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRadiusHeight);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRadiusHeight

Radius in vertical direction

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHeight example (Page 2261)

SetHeight example

SetRadiusWidth

Function

Sets the radius of an ellipse, ellipse segment or elliptical arc in horizontal direction.

Syntax

BOOL SetRadiusWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRadiusWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRadiusWidth

Radius in horizontal direction

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetWidth example (Page 2275)

SetWidth example

SetReferenceRotationLeft

Function

Sets the X value of the rotation reference (central axis about which the object can be rotated) for lines, polygons and polylines.

Syntax

BOOL SetReferenceRotationLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lReferenceRotationLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lReferenceRotationLeft

X value of the rotation reference

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetLeft example (Page 2262)

SetLeft example

SetReferenceRotationTop

Function

Sets the Y value of the rotation reference (central axis about which the object can be rotated) for lines, polygons and polylines.

Syntax

BOOL SetReferenceRotationTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lReferenceRotationTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lReferenceRotationTop

Y value of the rotation reference

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetTop example (Page 2275)

SetTop example

SetRotationAngle

Function

Sets the angle of rotation about the central axis for lines, polygons and polylines.

Syntax

BOOL SetRotationAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRotationAngle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRotationAngle

Angle of rotation

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetLeft example (Page 2262)

SetLeft example

SetRoundCornerHeight

Function

Specifies the radius of the rounded corner of a rectangle vertically.

Syntax

BOOL SetRoundCornerHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRoundCornerHeight);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRoundCornerHeight

Vertical radius

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHeight example (Page 2261)

SetHeight example

SetRoundCornerWidth

Function

Specifies the radius of the rounded corner of a rectangle horizontally.

Syntax

BOOL SetRoundCornerWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRoundCornerWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRoundCornerWidth

Horizontal radius

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetWidth example (Page 2275)

SetWidth example

SetStartAngle

Function

Sets the start angle of circle and ellipse segments and circle and elliptical arcs.

Syntax

BOOL SetStartAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lStartAngle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lStartAngle

Starting angle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHeight example (Page 2261)

SetHeight example

SetTop

Function

Sets the Y value of the upper left corner of the rectangle framing an object.

Syntax

BOOL SetTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lTop

Y value of the upper left corner of the framing rectangle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetTop example (Page 2275)

SetTop example

SetWidth

Function

Sets the width of the rectangle framing an object.

Syntax

BOOL SetWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lWidth

Width of the framing rectangle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

SetWidth example (Page 2275)

SetWidth example

SetZeroPoint

Function

Sets the zero point for bar objects.

Syntax

BOOL SetZeroPoint(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lZeroPoint);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lZeroPoint

Zero point

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetTop example (Page 2275)

SetTop example

i_o

i_o - short description

The various properties affecting input and output values can be modified or called in using the functions in the i_o group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAssumeOnExit

Function

Specifies for I/O fields whether the entered value is assumed upon exiting the field.

Syntax

BOOL SetAssumeOnExit(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bAssumeOnExit);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bAssumeOnExit

Value application upon exiting the field yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2262)

SetHiddenInput example

SetAssumeOnFull

Function

Specifies for I/O fields whether the entered value is assumed on completion of input.

Syntax

BOOL SetAssumeOnFull(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bAssumeOnFull);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bAssumeOnFull

Value application on completion of input yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2262)

SetHiddenInput example

SetBitNumber

Function

Sets the relevant bit in the output value for the "bit" list type.

Syntax

BOOL SetBitNumber(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBitNumber);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBitNumber

Relevant bit in the output value for the "bit" list type

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

List types (Page 2290)

List types

SetClearOnError

Function

Specifies for I/O fields whether deletion of the content in case of input errors is activated.

Syntax

BOOL SetClearOnError(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bClearOnError);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bClearOnError

Deletion of the entry in case of input errors yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2262)

SetHiddenInput example

SetClearOnNew

Function

Specifies the deletion of the content in case of new inputs for I/O fields.

Syntax

```
BOOL SetClearOnNew(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL
bClearOnNew);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bClearOnNew

Deletion of content in case of new input yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2262)

SetHiddenInput example

SetHiddenInput

Function

Controls the hidden input for I/O fields.

Syntax

BOOL SetHiddenInput(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bHiddenInput);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bHiddenInput

Hidden input yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2262)

SetHiddenInput example

SetNumberLines

Function

Sets the number of visible lines lines for the "text list" object.

Syntax

BOOL SetNumberLines(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lNumberLines);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lNumberLines

Number of visible lines

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the amount of configured text is larger than the number of visible lines, the "text list" object receives a vertical scroll bar.

SetOutputValueChar

Function

Sets a pointer to the output value for I/O fields

Syntax

BOOL SetOutputValueChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szOutputValueChar);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szOutputValueChar

Pointer to the output value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetOutputValueDouble

Function

Sets the output value for I/O fields.

Syntax

BOOL SetOutputValueDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dOutputValueDouble);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dOutputValueDouble

Output value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetOutputValueDouble example (Page 2264)

SetOutputValueDouble example

Limits

Limits - short description

The various properties affecting limit values can be modified or called in using the functions in the Limits group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAlarmHigh

Function

Sets the upper alarm limit for bar objects.

Syntax

BOOL SetAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dAlarmHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dAlarmHigh

Upper alarm limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetAlarmLow

Function

Sets the lower alarm limit for bar objects.

Syntax

BOOL SetAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dAlarmLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dAlarmLow

Lower alarm limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetCheckAlarmHigh

Function

Controls the monitoring of the upper alarm limit for bar objects.

Syntax

BOOL SetCheckAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckAlarmHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckAlarmHigh

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckAlarmLow

Function

Controls the monitoring of the lower alarm limit for bar objects.

Syntax

BOOL SetCheckAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckAlarmLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckAlarmLow

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckLimitHigh4

Function

Controls the monitoring of the upper limit value reserve 4 for bar objects.

Syntax

BOOL SetCheckLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckLimitHigh4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckLimitHigh4

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckLimitHigh5

Function

Controls the monitoring of the upper limit value reserve 5 for bar objects.

Syntax

BOOL SetCheckLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckLimitHigh5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckLimitHigh5

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckLimitLow4

Function

Controls the monitoring of the lower limit value reserve 4 for bar objects.

Syntax

BOOL SetCheckLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckLimitLow4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckLimitLow4

Monitoring yes/no.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckLimitLow5

Function

Controls the monitoring of the lower limit value reserve 5 for bar objects.

Syntax

```
BOOL SetCheckLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL
bCheckLimitLow5);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckLimitLow5

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckToleranceHigh

Function

Controls the monitoring of the upper tolerance limit for bar objects.

Syntax

```
BOOL SetCheckToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bCheckToleranceHigh);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckToleranceHigh

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckToleranceLow

Function

Controls the monitoring of the lower tolerance limit for bar objects.

Syntax

BOOL SetCheckToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckToleranceLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckToleranceLow

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckWarningHigh

Function

Controls the monitoring of the upper warning limit for bar objects.

Syntax

BOOL SetCheckWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckWarningHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckWarningHigh

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetCheckWarningLow

Function

Controls the monitoring of the lower warning limit for bar objects.

Syntax

BOOL SetCheckWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckWarningLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckWarningLow

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetColorAlarmHigh

Function

Sets the bar color for bar objects upon reaching the upper alarm limit.

Syntax

```
BOOL SetColorAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorAlarmHigh);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorAlarmHigh

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetColorAlarmLow

Function

Sets the bar color for bar objects upon reaching the lower alarm limit.

Syntax

BOOL SetColorAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorAlarmLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorAlarmLow

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetColorLimitHigh4

Function

Sets the bar color for bar objects upon reaching the upper limit reserve 4.

Syntax

BOOL SetColorLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorLimitHigh4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorLimitHigh4

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetColorLimitHigh5

Function

Sets the bar color for bar objects upon reaching the upper limit reserve 5.

Syntax

BOOL SetColorLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorLimitHigh5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorLimitHigh5

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetColorLimitLow4

Function

Sets the bar color for bar objects upon reaching the lower limit reserve 4.

Syntax

BOOL SetColorLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorLimitLow4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorLimitLow4

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetColorLimitLow5

Function

Sets the bar color for bar objects upon reaching the lower limit reserve 5.

Syntax

BOOL SetColorLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorLimitLow5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorLimitLow5

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetColorToleranceHigh

Function

Sets the bar color for bar objects upon reaching the upper tolerance limit.

Syntax

BOOL SetColorToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorToleranceHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorToleranceHigh

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetColorToleranceLow

Function

Sets the bar color for bar objects upon reaching the lower tolerance limit.

Syntax

BOOL SetColorToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorToleranceLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorToleranceLow

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetColorWarningHigh

Function

Sets the bar color for bar objects upon reaching the upper warning limit.

Syntax

BOOL SetColorWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorWarningHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorWarningHigh

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetColorWarningLow

Function

Sets the bar color for bar objects upon reaching the lower warning limit.

Syntax

BOOL SetColorWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorWarningLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorWarningLow

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetLimitHigh4

Function

Sets the high limit value for reserve 4 for bar objects.

Syntax

BOOL SetLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitHigh4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitHigh4

High limit value for reserve 4

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetLimitHigh5

Function

Sets the high limit value for reserve 5 for bar objects.

Syntax

BOOL SetLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitHigh5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitHigh5

High limit value for reserve 5

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetLimitLow4

Function

Sets the low limit value for reserve 4 for bar objects.

Syntax

```
BOOL SetLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double
dLimitLow4);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitLow4

Low limit value for reserve 4

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetLimitLow5

Function

Sets the low limit value for reserve 5 for bar objects.

Syntax

BOOL SetLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitLow5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitLow5

Low limit value for reserve 5

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetLimitMax

Function

Sets the high limit value for I/O fields.

Syntax

BOOL SetLimitMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitMax);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitMax

High limit value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetLimitMin

Function

Sets the low limit value for I/O fields.

Syntax

BOOL SetLimitMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitMin);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitMin

Lower limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetMarker

Function

Controls the limit marker display for bar objects.

Syntax

BOOL SetMarker(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bMarker);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bMarker

Limit marker on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetToleranceHigh

Function

Sets the upper tolerance limit for bar objects.

Syntax

BOOL SetToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dToleranceHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dToleranceHigh

Upper tolerance limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetToleranceLow

Function

Sets the lower tolerance limit for bar objects.

Syntax

BOOL SetToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dToleranceLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dToleranceLow

Lower tolerance limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2256)

SetAlarmHigh example

SetTypeAlarmHigh

Function

Specifies for bar objects whether the upper alarm limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeAlarmHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeAlarmHigh

Upper alarm limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeAlarmLow

Function

Specifies for bar objects whether the lower alarm limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeAlarmLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeAlarmLow

Lower alarm limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeLimitHigh4

Function

Specifies for bar objects whether the upper limit for reserve 4 is given in percentages or absolute terms.

Syntax

BOOL SetTypeLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeLimitHigh4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeLimitHigh4

High limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeLimitHigh5

Function

Specifies for bar objects whether the upper limit for reserve 5 is given in percentages or absolute terms.

Syntax

BOOL SetTypeLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeLimitHigh5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeLimitHigh5

High limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeLimitLow4

Function

Specifies for bar objects whether the lower limit for reserve 4 is given in percentages or absolute terms.

Syntax

BOOL SetTypeLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeLimitLow4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeLimitLow4

Low limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeLimitLow5

Function

Specifies for bar objects whether the lower limit for reserve 5 is given in percentages or absolute terms.

Syntax

BOOL SetTypeLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeLimitLow5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeLimitLow5

Low limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeToleranceHigh

Function

Specifies for bar objects whether the high tolerance limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeToleranceHigh);

Parameter

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeToleranceHigh

High tolerance limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeToleranceLow

Function

Specifies for bar objects whether the lower tolerance limit is given in percentages or absolute terms.

Syntax

```
BOOL SetTypeToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bTypeToleranceLow);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeToleranceLow

Lower tolerance limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeWarningHigh

Function

Specifies for bar objects whether the upper warning limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeWarningHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeWarningHigh

Upper warning limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetTypeWarningLow

Function

Specifies for bar objects whether the lower warning limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeWarningLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeWarningLow

Lower warning limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetWarningHigh

Function

Sets the upper warning limit for bar objects.

Syntax

BOOL SetWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dWarningHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dWarningHigh

Upper warning limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

SetWarningLow

Function

Sets the lower warning limit for bar objects.

Syntax

BOOL SetWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dWarningLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dWarningLow

Lower warning limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2263)

SetMarker example

link

Link - short description

A tag link property can be created or called in using the functions in the Link group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetLink

Function

Creating a tag connection of object properties

Syntax

BOOL SetLink(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, LPLINKINFO *pLink);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

pLink

Pointer to a structure of the type: LINKINFO

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Structure definition LINKINFO (Page 2299)

SetLink example (Page 2263)

LINKINFO structure definition

SetLink example

miscs

Miscs - short description

The properties of objects can be modified or called in using the functions in the Miscs group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAverage

Function

Controls the averaging of bar objects.

Syntax

BOOL SetAverage(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bAverage);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bAverage

Averaging yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2275)

SetVisible example

SetBoxType

Function

Specifies the field type (input field, output field, input/output field) for an I/O object.

Syntax

BOOL SetBoxType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBoxType);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBoxType

Field type

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

I/O field, field type (Page 2286)

I/O field, field type

SetColorChangeType

Function

When using bar objects, it defines whether the color change upon reaching a limit value only affects a bar segment or the entire bar.

Syntax

BOOL SetColorChangeType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bColorChangeType);

Parameter

lpszPictureName

Picture name

lpszObjectName

Object name

bColorChangeType

Type of color change

TRUE	Color change applies to a segment
FALSE	Color change applies to the entire bar

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2275)

SetVisible example

SetCursorControl

Function

Sets the cursor control for I/O fields.

Syntax

BOOL SetCursorControl(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCursorControl);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCursorControl

Cursor control on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2275)

SetVisible example

SetCursorMode

Function

Sets the cursor control for pictures.

Syntax

BOOL SetCursorMode(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCursorMode);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCursorMode

Cursor Mode

TRUE	Tab order cursor
FALSE	Alpha-Cursor

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Example - SetCursorMode (Page 2258)

SetCursorMode example

SetEditAtOnce

Function

Specifies whether the "Immediate input" property is activated for I/O fields.

Syntax

BOOL SetEditAtOnce(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bEditAtOnce);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bEditAtOnce

Immediate input yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2275)

SetVisible example

SetExtendedOperation

Function

Controls the "Extended operation" property of slider objects.

Syntax

```
BOOL SetExtendedOperation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bExtendedOperation);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bExtendedOperation

Extended operation yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2275)

SetVisible example

SetHysteresis

Function

When using bar objects, it specifies whether the display appears with or without hysteresis.

Syntax

BOOL SetHysteresis(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bHysteresis);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bHysteresis

Display with/without hysteresis

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2275)

SetVisible example

SetHysteresisRange

Function

Sets the hysteresis value in the display for bar objects.

Syntax

BOOL SetHysteresisRange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dHysteresisRange);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dHysteresisRange

Hysteresis value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetMax

Function

Sets the maximum value for bar and slider objects.

Syntax

BOOL SetMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dMax);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dMax

Maximum value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetMin

Function

Sets the minimum value for bar and slider objects.

Syntax

BOOL SetMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dMin);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dMin

Minimum value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetOffsetLeft

Function

Sets the horizontal picture distance from the left window border for picture windows.

Syntax

BOOL SetOffsetLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lOffsetLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lOffsetLeft

Picture distance

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetOffsetTop

Function

Sets the vertical picture distance from the upper window border for picture windows.

Syntax

BOOL SetOffsetTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lOffsetTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lOffsetTop

Picture distance

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetOperation

Function

Controls the operability of the objects.

Syntax

BOOL SetOperation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bOperation);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bOperation

Object operable, yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

See also

SetVisible example (Page 2275)

SetVisible example

SetOperationMessage

Function

Controls the output of a message when operating the objects "I/O field", "Check box", "Radio box" and "Slider".

Syntax

BOOL SetOperationMessage(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bOperationMessage);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bOperationMessage

Message output for yes/no operation

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2275)

SetVisible example

SetOperationReport

Function

Controls the logging of the operating reason for all objects except application and picture windows and OLE control.

Syntax

BOOL SetOperationReport(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bOperationReport);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bOperationReport

Logging operating reason yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

See also

SetVisible example (Page 2275)

SetVisible example

SetPasswordLevel

Function

Defines the authorization level for operating objects for all objects except application and picture windows and OLE control.

Syntax

BOOL SetPasswordLevel(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPasswordLevel);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPasswordLevel

Authorization level

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

SetPictureName

Function

Sets the name of the picture, which should be shown in a picture window or in a graphic object.

Syntax

BOOL SetPictureName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szPictureName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Name of the picture window or graphic object

szPictureName

Pointer to the picture name

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetPictureName example (Page 2264)

SetPictureName example

SetProcess

Function

Specifies the default setting of the value to be displayed for bar and slider objects.

Sets the selected fields for check boxes and radio boxes.

Syntax

BOOL SetProcess(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dProcess);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dProcess

- In case of bar and slider objects, this value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.
- For check boxes and radio boxes the selected fields are specified. In the 32-bit word each field is represented by a bit (field 1 corrsponds to the bit value 0). Selected fields are marked by a set bit. Non-existing are assigned 0.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetSmallChange

Function

Sets the number of steps for slider objects by which the slider is shifted by a mouse click.

Syntax

BOOL SetSmallChange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lSmallChange);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lSmallChange

Number of setting steps

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetTagPrefix

Function

This function sets the tag prefix of a picture window:

In a picture window the "temperature" tag is requested on an object. If a "Motor1." tag prefix is assigned to the picture window, the tag "Motor1.Temperature" is requested.

The setting of the tag prefix only becomes effective when newly supplying the picture name.

This means you must either set the prefix before picture selection or newly supply the picture name if the picture is not changed.

Syntax

BOOL SetTagPrefix(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,char* szTagPrefix);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szTagPrefix

Tag prefix to be set

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the tag prefix is set for a picture window, the tag prefix is added to all tags contained in the picture to be displayed. This also applies if the request takes place in a function. If a tag needs to be read without the tag prefix, you must add "@NOTP::" to the tag name.

Using a tag prefix greatly simplifies the picture module technology.

See also

SetTagPrefix example (Page 2271)

SetTagPrefix example

SetTrend

Function

Controls the trend display for bar objects.

Syntax

BOOL SetTrend(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTrend);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTrend

Trend display yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2275)

SetVisible example

SetVisible

Function

Controls the display of an object.

Syntax

BOOL SetVisible(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bVisible);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bVisible

Object display yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

SetVisible example (Page 2275)

SetVisible example

SetZeroPointValue

Function

Sets the absolute value of the zero point for bar objects.

Syntax

BOOL SetZeroPointValue(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dZeroPointValue);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dZeroPointValue

Absolute value of the zero point

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetZoom

Function

Sets the scaling factor for a picture window.

Syntax

BOOL SetZoom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lZoom);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lZoom

Scaling factor

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

ole_control

OLE_control - short description

The functions in the ole_Control group can only be used with OCX slider objects.

Various OCX slider object properties and settings can be modified or called in using these functions.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetPosition

Function

Sets the slider position of the OCX slider object.

Syntax

BOOL SetPosition(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPosition);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPosition

Slider position of the OCX slider object

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetPosition example (Page 2265)

SetPosition example

SetRangeMax

Function

Defines the adjustment range "Max" of the OCX slider object.

Syntax

BOOL SetRangeMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRangeMax);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRangeMax

Adjustment range "Max" of the OCX slider object

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetRangeMax example (Page 2266)

SetRangeMax example

SetRangeMin

Function

Defines the adjustment range "Min" of the OCX slider object.

Syntax

BOOL SetRangeMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRangeMin);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRangeMin

Adjustment range "Min" of the OCX slider object

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetRangeMin example (Page 2266)

SetRangeMin example

pictures

Pictures - short description

Various properties of pictures of graphic objects and round buttons can be modified or called in using the functions in the Pictures group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetPicDeactTransparent

Function

Sets the transparent color for the "deactivated" status of a round button.

Syntax

BOOL SetPicDeactTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPicDeactTransparent);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPicDeactTransparent

Transparent color for "deactivated" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetPicDeactUseTransColor

Function

Controls the transparent color for the "deactivated" status of a round button.

Syntax

```
BOOL SetPicDeactUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bPicDeactUseTransColor);
```

Parameter

lpszPictureName

Picture name

lpszObjectName

Object name

bPicDeactUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetPicDownTransparent

Function

Sets the transparent color for the "On/pressed" status of a round button.

Syntax

BOOL SetPicDownTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPicDownTransparent);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPicDownTransparent

Transparent color for "On/pressed" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetPicDownUseTransColor

Function

Controls the transparent color for the "On/pressed" status of a round button.

Syntax

BOOL SetPicDownUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bPicDownUseTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bPicDownUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetPicTransColor

Function

Sets the transparent color of the background picture of a graphic object.

Syntax

BOOL SetPicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPicTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPicTransColor

Transparent color of the background picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetPictureDeactivated

Function

Specifies the picture name for the "deactivated" status of a round button.

Syntax

BOOL SetPictureDeactivated(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szPictureDeactivated);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szPictureDeactivated

Picture name for "deactivated" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

SetPictureDown example (Page 2264)

SetPictureDown example

SetPictureDown

Function

Specifies the picture name for the "On/pressed" status of a round button.

Syntax

BOOL SetPictureDown(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szPictureDown);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szPictureDown

Picture name for "On/pressed" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

SetPictureDown example (Page 2264)

SetPictureDown example

SetPictureUp

Function

Specifies the picture name for the "Off/not pressed" status of a round button.

Syntax

BOOL SetPictureUp(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szPictureUp);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szPictureUp

Picture name for "Off/not pressed" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

SetPictureUp example (Page 2265)

SetPictureUp example

SetPicUpTransparent

Function

Sets the transparent color for the "Off/not pressed" status of a round button.

Syntax

BOOL SetPicUpTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPicUpTransparent);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPicUpTransparent

Transparent color for "Off/not pressed" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetPicUpUseTransColor

Function

Controls the transparent color for the "Off/not pressed" status of a round button.

Syntax

```
BOOL SetPicUpUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bPicUpUseTransColor);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bPicUpUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetPicUseTransColor

Function

Controls the transparent color of the background picture of a graphic object.

Syntax

```
BOOL SetPicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bPicUseTransColor);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bPicUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

property

Property - short description

The properties of objects for which there are no direct functions can be modified or called in using the functions in the Property group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetPropBOOL

Function

Sets a property with the value "bValue".

Syntax

BOOL SetPropBOOL(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, BOOL bValue)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

bValue

Value in BOOL data format

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

See also

SetPropBOOL example (Page 2265)

SetPropChar

Function

Sets a property with the value the pointer "szValue" points to.

Syntax

BOOL SetPropChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, char* szValue)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

szValue

Pointer to the value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

See also

GetPropChar example (Page 2233)

SetPropDouble

Function

Sets a property with the value "dValue".

Syntax

BOOL SetPropDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, double dValue)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

dValue

Value in "double" data format

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

SetPropWord

Function

Sets a property with the value "lValue".

Syntax

BOOL SetPropWord(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, long lValue)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

lValue

Value in "long" data format

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

state

State - short description

The properties of status displays can be modified or called in using the functions in the State group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetBasePicTransColor

Function

Sets the transparent color of the basic picture for the status display.

Syntax

BOOL SetBasePicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBasePicTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBasePicTransColor

Transparent color of the basic picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

Color chart

SetBackColor example

SetBasePicUseTransColor

Function

Controls the transparent color of the basic picture for the status display.

Syntax

BOOL SetBasePicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bBasePicUseTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bBasePicUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetFlashFlashPicture

Function

Specifies whether the flash picture of the status display is animated dynamically or statically.

Syntax

BOOL SetFlashFlashPicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFlashFlashPicture);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashFlashPicture

Type of flash picture

TRUE	dynamically animated flash picture
FALSE	statically animated flash picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetFlashPicTransColor

Function

Sets the transparent color of the flash picture for a status display.

Syntax

BOOL SetFlashPicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashPicTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashPicTransColor

Transparent color of the flash picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2286)

SetBackColor example (Page 2256)

SetBackColor example

Color chart

SetFlashPicUseTransColor

Function

Controls the transparent color of the flash picture for a status display.

Syntax

```
BOOL SetFlashPicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bFlashPicUseTransColor);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashPicUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetFlashRateFlashPic

Function

Sets the flash frequency of the flash picture for a status display.

Syntax

BOOL SetFlashRateFlashPic(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashRateFlashPic);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashRateFlashPic

Flash frequency of the flash picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Since the flashing is performed by means of software engineering, the precise frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time etc.).

See also

Flash frequencies (Page 2284)

SetFlashRateFlashPic example (Page 2260)

Flash frequencies

SetIndex

Function

Sets the index of a polygon or polyline thus defining the current object point.

Syntax

BOOL SetIndex(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lIndex);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lIndex

Index value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

style

Style - short description

Various properties affecting the appearance of objects can be modified or called in using the functions in the Style group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetBackBorderWidth

Function

Sets the frame width of 3D frames and slider objects.

Syntax

BOOL SetBackBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackBorderWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackBorderWidth

Frame width in pixels

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetBorderStyle example (Page 2257)

SetBorderStyle example

SetBorderEndStyle

Function

Sets the type of line end.

Syntax

BOOL SetBorderEndStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderEndStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderEndStyle

Type of line end as numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Line end style (Page 2289)

SetBorderEndStyle example (Page 2257)

SetBorderEndStyle example

Line style

SetBorderStyle

Function

Sets the line or border style.

Syntax

BOOL SetBorderStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderStyle

Numeric value defining the line or border style

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Line styles (Page 2289)

SetBorderStyle example (Page 2257)

SetBorderStyle example

Line styles

SetBorderWidth

Function

Sets the line or border line width.

Syntax

BOOL SetBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderWidth

Line width or border line width

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetBorderStyle example (Page 2257)

SetBorderStyle example

SetBoxAlignment

Function

Defines the arrangement of controls (left or right justified) in check boxes or radio boxes.

Syntax

BOOL SetBoxAlignment(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBoxAlignment);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBoxAlignment

Arrangement of controls

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Element alignment in check boxes and radio boxes (Page 2286)

SetBorderStyle example (Page 2257)

SetBorderStyle example

Element alignment in check boxes and radio boxes

SetFillStyle

Function

Sets the type of fill pattern.

Syntax

```
BOOL SetFillStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int
lFillStyle);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFillStyle

Type of fill pattern as numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = ZERO.

See also

Fill pattern (Page 2288)

SetFillStyle example (Page 2259)

Fill pattern

SetFillStyle example

SetFillStyle2

Function

Sets the bar fill pattern for a bar graph.

Syntax

BOOL SetFillStyle2(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFillStyle2);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFillStyle2

Bar fill pattern as numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Fill pattern (Page 2288)

SetFillStyle example (Page 2259)

Fill pattern

SetFillStyle example

SetItemBorderStyle

Function

Sets the dividing line style for the "text list" object.

Syntax

BOOL SetItemBorderStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lItemBorderStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lItemBorderStyle

Numeric value defining the dividing line style

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Line styles (Page 2289)

SetBorderStyle example (Page 2257)

Line styles

SetBorderStyle example

SetItemBorderWidth

Function

Sets the dividing line width for the "text list" object.

Syntax

BOOL SetItemBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lItemBorderWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lItemBorderWidth

Numeric value defining the dividing line width

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetBorderStyle example (Page 2257)

SetBorderStyle example

SetPressed

Function

Specifies for buttons or round buttons whether the switch setting is "pressed" or "not pressed".

Syntax

BOOL SetPressed(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bPressed);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bPressed

Switch setting of the button

TRUE	Switch setting "pressed"
FALSE	Switch setting "not pressed"

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetToggle

Function

Specifies for buttons or round buttons whether the switch is latchable or not.

Syntax

BOOL SetToggle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bToggle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bToggle

Switch latchable/not latchable

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetWindowsStyle

Function

Specifies whether buttons are to be displayed in Windows style.

Syntax

BOOL SetWindowsStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bWindowStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bWindowStyle

"Windows style" on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OpenHomePicture

Function

Opens the entered start picture.

Syntax

```
BOOL OpenHomePicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OpenNextPicture

Function

WinCC saves the names of the pictures opened by the user during runtime as well as the sequence in which these pictures were opened.

The maximum number of picture names saved this way can be set in the WinCC Explorer in the computer properties on the "Graphics Runtime" tab under "picture buffer size".

The OpenNextPicture function now opens the picture which was opened before the last call of OpenPrevPicture.

Syntax

```
BOOL OpenNextPicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OpenPrevPicture

Function

WinCC saves the names of the pictures opened by the user during runtime as well as the sequence in which these pictures were opened.

The maximum number of picture names saved this way can be set in the WinCC Explorer in the computer properties on the "Graphics Runtime" tab under "picture buffer size".

The OpenPrevPicture function now opens the picture which was opened before the currently open picture.

Syntax

```
BOOL OpenPrevPicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OpenStoredPicture

Function

Opens the picture saved with the StorePicture function.

Syntax

```
BOOL OpenStoredPicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

StorePicture

Function

Saves the current picture which can then be opened with the OpenStoredPicture function.

Syntax

```
BOOL StorePicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

3.15.3.5 tag

tag - short description

Tags can be set or called in using the functions from the tag group.

GetTag or GetTagWait?

Process tags that are called with GetTag are put in an image. Since updating and reading the image is done in two separate procedures, the GetTag call is not directly influenced by the coupling. It can therefore be executed quicker and more independently than a GetTagWait retrieval.

With GetTagWait, process tags that have been requested are not accepted in the image. A GetTagWait retrieval reads the value explicitly from the AS. This always includes the send and return path through the coupling and the response time of the AS. During this runtime, the processing of the C actions is blocked and the time required for the retrieval cannot be estimated. If multiple tags are read, the time is added.

A GetTagWait call is required if

- fast write/read procedures are to be synchronized
- a value is read explicitly from the AS
- or a registration is to be avoided in the image deliberately.

The GetTagWait call is to be avoided in cyclic C-Actions, this is the main reason for performance problems.

SetTag or SetTagWait?

The SetTag retrieval distributes a write job without waiting for confirmation from the AS.

The SetTagWait retrieval distributes a write job and waits for confirmation from the AS. This always includes the send and return path through the coupling and the response time of the AS. During this runtime, the processing of the C actions is blocked and the time required for the retrieval cannot be estimated. If multiple tags are written, the time is added.

A SetTagWait call is set to guarantee that the value has been written before the C-Action is processed any further. The SetTagWait call in cyclic C actions is to be avoided.

Note

The difference between GetTag and GetTagWait also exists for internal tags. The difference is not quite so serious here however, since no coupling comes into play. To synchronize fast write/read procedures, the respective wait function is to be used with internal tags as well.

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

get

Functionality of the GetTag functions

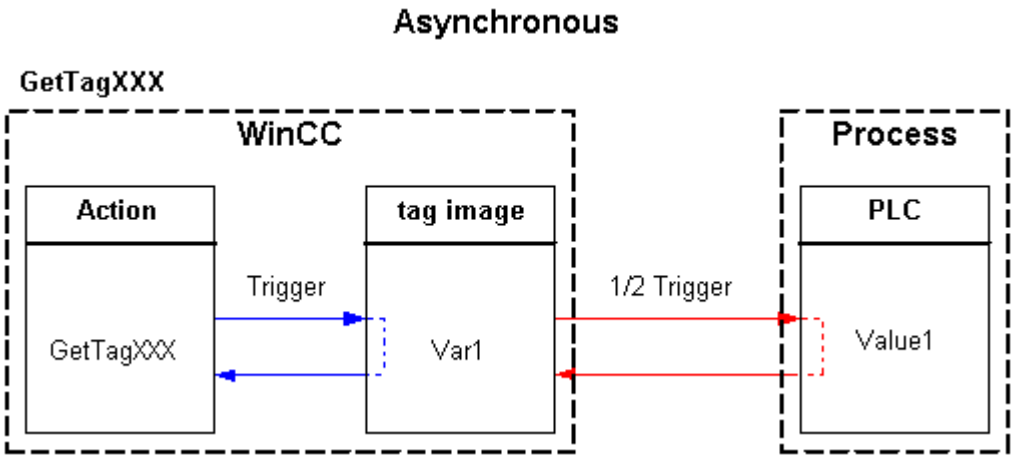
GetTagXXX

By calling the function the tag is logged on and, from that moment, polled cyclically from the AS. The cycle for the registration depends on the trigger (see following description). For GetTagXXX calls, the value that is available in WinCC is sent. For Close Picture, the tag actions are ended again.

The call is marked by the following:

- The value is read from the tag image by WinCC.
- The call is faster in comparison to GetTagXXXWait (except for the first call which generally takes longer because the value from the PLC must be read out and logged on).

- The duration of the call does not depend on the bus-load or on the AS.
- The function does not deliver any information on the status of the tags



Note

If a tag is requested in a Global Script action, it remains registered throughout the enter Runtime of WinCC.

In Callback functions, the respective GetTagXXXWait function must be used.

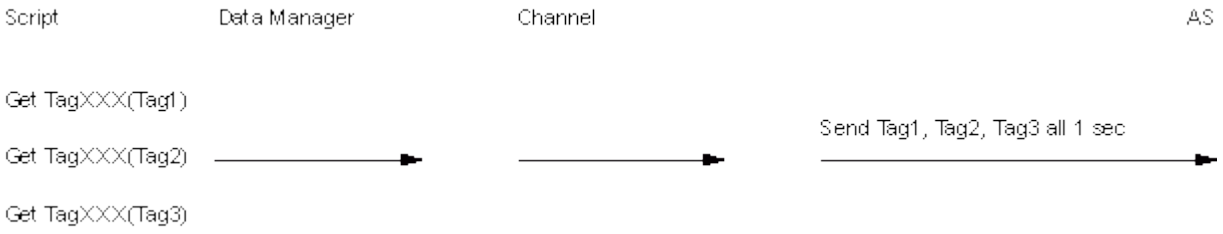
Behavior in actions with tag trigger (recommended):

All of the tags contained in the tag trigger are already known with Open Picture and are registered with the defined monitoring time.

Since all tags are requested at once, the best possible optimization can be targeted from the channel. If a tag is requested with GetTagXXX() within a C-Action, which is contained in the trigger, the value already exists and is sent directly to the call (high-performance).

Registering tags in actions with tag trigger

As the tags are already known when the picture is selected, they can be transmitted in a job to the Data Manager and so be registered collectively to the channel.



Note

If a tag is requested, which is not in the trigger, then the behavior is the same as with the default trigger.

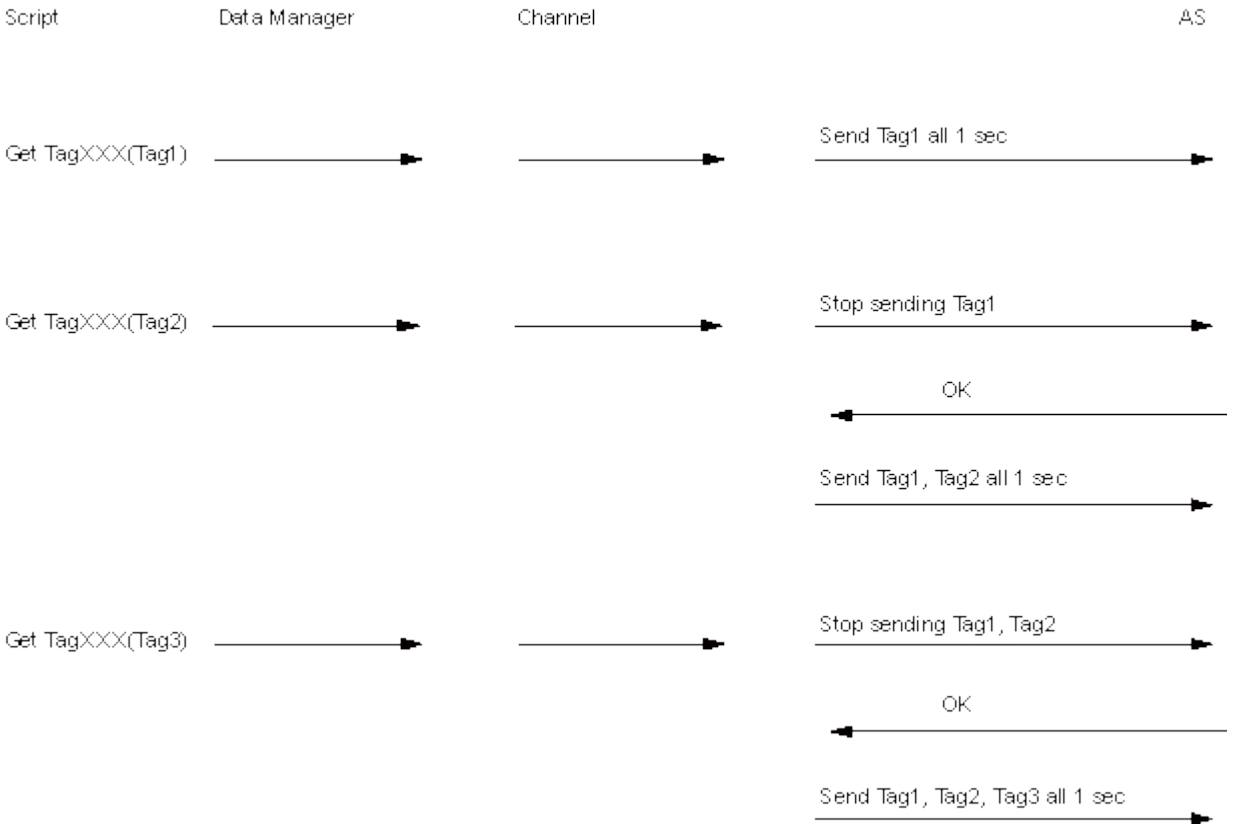
Behavior in actions with default trigger:

tags are registered with half of the cycle time with the first call. For every other call, the value is present.

Registering tags in actions with default trigger and event trigger

Only when the individual actions are executed is it identified which tags are needed in the picture. As a result, the tags are registered to the channel in a large number of single jobs. When a picture with cyclic actions is selected, the continual reorganization may place a heavy strain on communications.

Example: The channel supports custom cycle creation. Usually cycles are created by the channel directly from the AS. The resources for these cycles are limited by the AS. As a result, the channel stops the current jobs for this cycle and reconfigures the cycle on the AS.



Behavior in event triggered actions:

The tag is registered in the "upon change" mode with the first call. Process tags that are registered in the "upon change" mode correspond with a cyclic read job with a cycle time of 1s.

Note

If a value is requested by GetTagXXX() by a mouse click for example, the tag is accepted in the tag image. The tag is requested cyclically from the AS as of this point in time and therefore increases the basic load.

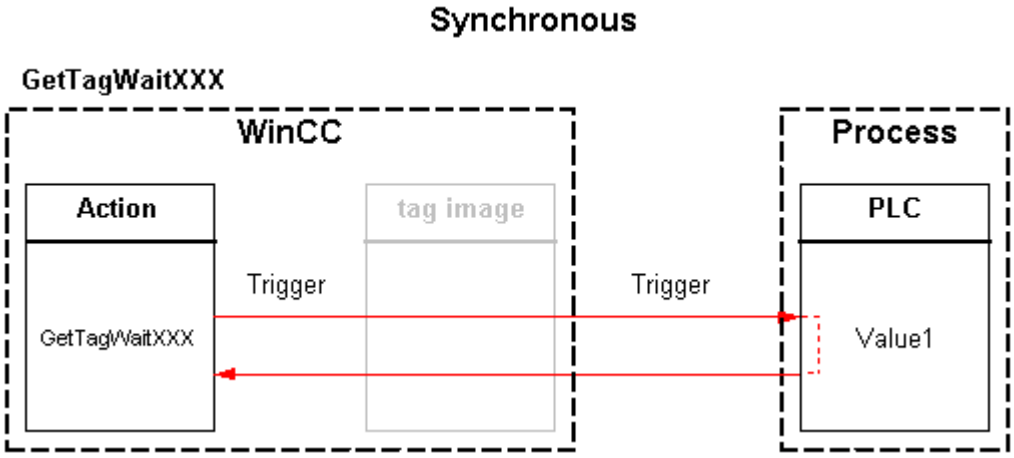
To avoid this increase in basic loading, the value can be requested by GetTagXXXWait(). The call GetTagXXXWait() causes a higher communication load one time but the tag is not added to the tag image.

GetTagXXXWait

The function returns the current value. The tag is not registered cyclically, the value is requested from the AS one time only.

The call is marked by the following:

- The value is read explicitly from the AS.
- The call, compared with GetTagXXX, takes longer.
- The duration of the call does not depend on the bus-load or on the AS.
- The function does not deliver any information on the status of the tags.



GetTagXXXState

The function GetTagXXXState has the same features as GetTagXXX, it also sends the function information on the status of the tags. Since the status is always delivered internally, there is no performance difference to GetTagXXX.

GetTagXXXStateWait

The function GetTagXXXStateWait has the same features as GetTagXXXWait, additionally it sends the function information on the status of the tags. Since the status is always delivered internally, there is no performance difference to GetTagXXXWait.

The difference between functions GetTagXXXStateWait and GetTagXXXState corresponds with the difference between GetTagXXXWait and GetTagXXX. Since the value is explicitly read from the AS for process tags, the value and the status can be more current than for GetTagXXXState.

GetTagXXXStateQC

The function GetTagXXXStateQC has the same features as GetTagXXXState. The function also delivers information on the quality code of the tag.

GetTagXXXStateQCWait

The function GetTagXXXStateQCWait has the same features as GetTagXXXStateWait. The function also delivers information on the quality code of the tag.

GetTagMultiWait

The function GetTagMultiWait has the same features as GetTagXXXWait. However, it allows the request for more tags in a job. Therefore, the read requests in the direction of the AS can be optimized in most cases so that only one request will be given to the AS.

GetTagMultiStateWait

The function GetTagMultiStateWait has the same features as GetTagMultiWait, additionally it sends the function information on the statuses of the tags.

GetTagMultiStateQCWait

The function GetTagMultiStateQCWait has the same features as GetTagMultiStateWait. The function also delivers information on the quality codese of the tags.

state

wait

getTagBitStateWait

Function

Determines the value of a tag of data type "Binary tag". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

BOOL GetTagBitStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "BOOL"

See also

Tag statuses (Page 2291)

GetTagBitStateWait example (Page 2239)

Functionality of the GetTag functions (Page 2095)

Tag states

GetTagBitStateWait example

GetTag functions, function principle

GetTagByteStateWait

Function

Determines the value of a tag of data type "unsigned 8 bit". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

BYTE GetTagByteStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "BYTE"

See also

Tag statuses (Page 2291)

GetTagWordStateWait example (Page 2251)

Functionality of the GetTag functions (Page 2095)

Tag states

GetTag functions, function principle

GetTagWordStateWait example

GetTagCharStateWait

Function

Determines the value of a tag of data type "8-bit text tag" or "16-bit text tag". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

char* GetTagCharStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Pointer to the value of the tag in data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
```

```
{
   . . . . . .
}
```

GetTag functions, function principle

Tag states

GetTagDoubleStateWait

Function

Determines the value of a tag of data type "64-bit floating point value". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

double GetTagDoubleStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "double"

GetTagDWordStateWait

Function

Determines the value of a tag of data type "unsigned 32 bit". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

DWORD GetTagDWordStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "DWORD"

See also

Tag states

GetTagFloatStateWait

Function

Determines the value of a tag of data type "32-bit floating point value". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

float GetTagFloatStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "float"

See also

Tag statuses (Page 2291)

GetTagFloatStateWait example (Page 2243)

Functionality of the GetTag functions (Page 2095)

GetTagFloatStateWait example

Tag states

GetTag functions, function principle

GetTagMultiStateWait

Function

The values and states of several tags are established and stored in the corresponding addresses in the specified format. The values are read explicitly from the AS.

The function must transfer a DWORD array whose members contain the individual tag states after the function is invoked. The size of the array must be selected so that sufficient memory space is available for these statuses.

Syntax

BOOL GetTagMultiStateWait(DWORD* pdwState, const char* pFormat)

Parameters

pdwState

Field in which the tag statuses are stored.

pFormat

Format description for all requested tags and for each tag name and address of the value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagRawStateWait

Function

Determines the value of a tag of data type "Raw data type". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

BOOL GetTagRawStateWait(Tag Tag_Name, BYTE pValue, DWORD size, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagSByteStateWait

Function

Determines the value of a tag of data type "signed 8 bit". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

signed char GetTagSByteStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

The value of the tag in the data type "signed char"

See also

GetTagCharState

Function

Determines the value of a tag of data type "8-bit text tag" or "16-bit text tag". The status of the tag is also returned.

Syntax

char* GetTagCharState(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Pointer to the value of the tag in data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetTagRawState

Function

Determines the value of a tag of data type "Raw data type". The status of the tag is also returned.

Syntax

BOOL GetTagRawState(Tag Tag_Name, BYTE* pValue, DWORD size, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagSDWordState

Function

Determines the value of a tag of data type "signed 32 bit". The status of the tag is also returned.

Syntax

long GetTagSDWordState(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "long"

See also

Tag statuses (Page 2291)

GetTagSByteStateWait example

GetTagSWordState

Function

Determines the value of a tag of data type "signed 16 bit". The status of the tag is also returned.

Syntax

short GetTagSWordState(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "short"

See also

Tag statuses (Page 2291)

GetTagSByteStateWait example (Page 2249)

Functionality of the GetTag functions (Page 2095)

Tag states

GetTag functions, function principle

GetTagSByteStateWait example

GetTagWordState

Function

Determines the value of a tag of data type "unsigned 16 bit". The status of the tag is also returned.

Syntax

WORD GetTagWordState(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "WORD"

See also

Tag statuses (Page 2291)

GetTagWordStateWait example (Page 2251)

stateqc

wait

GetTagBitStateQCWait

Function

Determines the value of a tag of data type "Binary tag". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

BOOL GetTagBitStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tags in the data type "BOOL".

See also

Tag statuses (Page 2291)

GetTagWordStateQCWait example (Page 2250)

Functionality of the GetTag functions (Page 2095)

GetTag functions, function principle

Tag states

GetTagWordStateQCWait example

GetTagByteStateQCWait

Function

Determines the value of a tag of data type "unsigned 8 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

BYTE GetTagByteStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "BYTE".

See also

Tag statuses (Page 2291)

GetTagWordStateQCWait example (Page 2250)

Functionality of the GetTag functions (Page 2095)

GetTagWordStateQCWait example

Tag states

GetTag functions, function principle

GetTagCharStateQCWait

Function

Determines the value of a tag of data type "8-bit text tag" or "16-bit text tag". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

char* GetTagCharStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Pointer to the value of the tag in data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetTagDoubleStateQCWait

Function

Determines the value of a tag of data type "64-bit floating point value". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

double GetTagDoubleStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "double".

Function

Determines the value of a tag of data type "32-bit floating point value". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

float GetTagFloatStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "float".

GetTagFloatStateQCWait example

GetTagMultiStateQCWait

Function

The values, states and quality codes are determined for several tags and are stored in the respective addresses in the specified format. The values are read explicitly from the AS.

The function must be provided with two DWORD arrays, the member of which contains the states and quality codes of the individual tags after the function has been called. The size of the arrays must be selected so that sufficient memory space is available for these statuses.

Syntax

BOOL GetTagMultiStateQCWait(DWORD* pdwState, DWORD* pdwQualityCode, const char* pFormat)

Parameters

pdwState

Field in which the status of the individual tags is stored after the function has been completed.

pdwQualityCode

Field in which the quality codes of the individual tags is stored after the function has been completed.

pFormat

Format description for all requested tags and for each tag name and address of the value.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagRawStateQCWait

Function

Determines the value of a tag of data type "Raw data type". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

BOOL GetTagRawStateQCWait(Tag Tag_Name, BYTE pValue, DWORD size, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

pValue

Pointer to a byte field containing the value of the raw data tag.

size

Size of the byte field in bytes.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagSByteStateQCWait

Function

Determines the value of a tag of data type "signed 8 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

signed char GetTagSByteStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "signed char".

GetTagValueStateQCWait

Function

Enables the transfer of a value in the form of a variant. Establishes the pointer to the result structure containing the value. The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

BOOL GetTagValueStateQCWait(LPDM_VARKEY lpdmVarKey, LPDM_VAR_UPDATE_STRUCTEX lpdmresult, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmresult

Pointer to the value from data type "DM_VAR_UPDATE_STRUCTEX"

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagWordStateQCWait

Function

Determines the value of a tag of data type "unsigned 16 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

```
WORD GetTagWordStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD
pdwQualityCode);
```

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "WORD".

GetTagBitStateQC

Function

Determines the value of a tag of data type "Binary tag". In addition, the status and the quality code of the tags are returned.

Syntax

```
BOOL GetTagBitStateQC(Tag Tag_Name, PDWORD lp_dwstate, PDWORD
pdwQualityCode);
```

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tags in the data type "BOOL".

Parameters

Tag_Name

Name of the tag.

pValue

Pointer to a byte field containing the value of the raw data tag.

size

Size of the byte field in bytes.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagRawWait

Function

Determines the value of a tag of data type "Raw data type". The value is read explicitly from the AS.

Syntax

BOOL GetTagRawWait(Tag Tag_Name , BYTE pValue, DWORD size);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTag functions, function principle

GetTagRaw example

GetTagSByteWait

Function

Determines the value of a tag of data type "signed 8 bit". The value is read explicitly from the AS.

Syntax

signed char GetTagSByteWait(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

The value of the tag in the data type "signed char"

See also

GetTagSByte example (Page 2248)

Functionality of the GetTag functions (Page 2095)

GetTag functions, function principle

GetTagSByte example

GetTagSDWordWait

Function

Determines the value of a tag of data type "signed 32 bit". The value is read explicitly from the AS.

Syntax

long GetTagSDWordWait(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Value of the tag in the data type "long"

See also

GetTagSByte example (Page 2248)

Functionality of the GetTag functions (Page 2095)

GetTagSByte example

GetTag functions, function principle

GetTagSWordWait

Function

Determines the value of a tag of data type "signed 16 bit". The value is read explicitly from the AS.

Syntax

short GetTagSWordWait(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Value of the tag in the data type "short"

See also

GetTagSByte example (Page 2248)

Functionality of the GetTag functions (Page 2095)

GetTagSByte example

GetTag functions, function principle

GetTagValueWait

Function

Enables the transfer of a value in the form of a variant. Establishes the pointer to the result structure containing the value. The value is read explicitly from the AS.

Syntax

BOOL GetTagValueWait(LPDM_VARKEY lpdmVarKey, LPDM_VAR_UPDATE_STRUCT lpdmresult, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmresult

Pointer to the value from data type "DM_VAR_UPDATE_STRUCT"

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

GetTag functions, function principle

DM_VARKEY structure definition

DM_VAR_UPDATE_STRUCTEX structure definition

CMN_ERROR structure definition

GetTagWordWait

Function

Determines the value of a tag of data type "unsigned 16 bit". The value is read explicitly from the AS.

Syntax

WORD GetTagWordWait(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Value of the tag in the data type "WORD"

See also

GetTagWord example (Page 2250)

Functionality of the GetTag functions (Page 2095)

GetTagWord example

GetTag functions, function principle

GetTagBit

Function

Determines the value of a tag of data type "Binary tag".

Syntax

BOOL GetTagBit(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "BOOL"

See also

GetTagBit example (Page 2237)
Functionality of the GetTag functions (Page 2095)
GetTagBit example
GetTag functions, function principle

GetTagByte

Function

Determines the value of a tag of data type "unsigned 8 bit".

Syntax

BYTE GetTagByte(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "BYTE"

See also

GetTagWord example (Page 2250)
Functionality of the GetTag functions (Page 2095)
GetTagWord example
GetTag functions, function principle

GetTagChar

Function

Determines the value of a tag of data type "8-bit text tag" or "16-bit text tag".

Syntax

char* GetTagChar(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Pointer to a character string containing the value of the tag.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetTag functions, function principle

GetTagDateTime

Function

Determines the value of a tag of data type "Date/Time".

Syntax

SYSTEMTIME GetTagDateTime(Tag Tag_Name);

Parameter

Tag_Name
Name of the tag

Return value

Value of the tag in the data type "Date/Time".

GetTagDouble

Function

Determines the value of a tag of data type "64-bit floating point value".

Syntax

double GetTagDouble(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "double"

See also

GetTagFloat example (Page 2241)
Functionality of the GetTag functions (Page 2095)
GetTagFloat example
GetTag functions, function principle

GetTagDWord

Function

Determines the value of a tag of data type "unsigned 32 bit".

Syntax

DWORD GetTagDWord(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "DWORD"

See also

GetTagWord example (Page 2250)
Functionality of the GetTag functions (Page 2095)
GetTagWord example
GetTag functions, function principle

GetTagFloat

Function

Determines the value of a tag of data type "32-bit floating point value".

Syntax

float GetTagFloat(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "float".

See also

GetTagFloat example (Page 2241)
Functionality of the GetTag functions (Page 2095)
GetTagFloat example
GetTag functions, function principle

GetTagRaw

Function

Determines the value of a tag of data type "Raw data type".

Syntax

BOOL GetTagRaw(Tag Tag_Name, BYTE* pValue, DWORD size);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

GetTagRaw example (Page 2246)

Functionality of the GetTag functions (Page 2095)

GetTagSByte example

GetTag functions, function principle

GetTagValue

Function

Enables the transfer of a value in the form of a variant. Establishes the pointer to the result structure containing the value.

Syntax

BOOL GetTagValue(LPDM_VARKEY lpdmVarKey, LPDM_VAR_UPDATE_STRUCT lpdmresult, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmresult

Pointer to the value from data type "DM_VAR_UPDATE_STRUCT"

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagWord

Function

Determines the value of a tag of data type "unsigned 16 bit".

Syntax

```
WORD GetTagWord(Tag Tag_Name);
```

Parameters

Tag_Name

name of the tag

Return value

Value of the tag in the data type "WORD"

See also

GetTagWord example (Page 2250)

Functionality of the GetTag functions (Page 2095)

GetTagWord example

GetTag functions, function principle

set

Principle of the SetTag functions

SetTagXXX

The SetTagXXX function assigns the job a value to write and returns immediately to the caller. In this case, the system does not wait until value is actually written.

The call is marked by the following:

- The call is fast.
- The caller does not know when the value is actually written.
- The function provides no information on the state of the write job.

SetTagXXXWait

The function SetTagXXXWait assigns the job of writing a value and will first return to the caller when the value has actually been written.

The call is marked by the following:

- The call takes longer in comparison to SetTagXXX. The duration is also dependent on the channel and AS, amongst other things.
- The value is written after the call.
- The function provides no information on the state of the write job.

SetTagXXXState

The function SetTagXXXState has the same features as SetTagXXX; plus the function returns information regarding the status of the write request.

Since the status is always provided internally, there is no performance difference compared to SetTagXXX.

SetTagXXXStateWait

The function SetTagXXXStateWait has the same features as SetTagXXXWait; plus the function returns information regarding the status of the write request.

Since the status is always provided internally, there is no performance difference compared to SetTagXXXWait.

The difference between the functions SetTagXXXStateWait and SetTagXXXState corresponds to the difference between SetTagXXXWait and SetTagXXX.

Note, that certain statuses can only be generated when the write process has been completed.

SetTagMultiWait

The SetTagMultiWait function has the same features as SetTagXXXWait. It also offers the option of granting several write jobs in a single job.

state

wait

SetTagBitStateWait

Function

Sets the value of a tag of data type "Binary tag". The function is ended after the AS has acknowledged acceptance of the value. The status of the tag is also returned.

Principle of the SetTag functionsEXAMPLE_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Syntax

BOOL SetTagBitStateWait(Tag Tag_Name, short value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. To do this, the tag status must be evaluated.

FALSE

An error has occurred.

See also

Tag states

SetTagBitStateWait example

SetTagByteStateWait

Function

Sets the value of a tag of the data type "unsigned 8 Bit". The function is ended after the AS has acknowledged acceptance of the value. The status of the tag is also returned.

Principle of the SetTag functionsEXAMPLE_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Syntax

BOOL SetTagByteStateWait(Tag Tag_Name, BYTE value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "BYTE"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. To do this, the tag status must be evaluated.

FALSE

An error has occurred.

Syntax

BOOL SetTagFloatStateWait(Tag Tag_Name, float value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "float"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. To do this, the tag status must be evaluated.

FALSE

An error has occurred.

See also

Tag statuses (Page 2291)

SetTagFloatStateWait example (Page 2269)

Tag states

SetTagFloatStateWait example

SetTagMultiStateWait

Function

Sets the values of several tags. The function is ended after the AS has acknowledged acceptance of the value.

The function must transfer a DWORD array whose members contain the individual tag states after the function is invoked. The size of the array must be selected so that sufficient memory space is available for these statuses.

Principle of the SetTag functionsEXAMPLE_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Syntax

BOOL SetTagMultiStateWait(DWORD* pdwState, const char* pFormat,...)

Parameters

pdwState

Field in which the tag statuses are stored.

pFormat

Format description for all requested tags and for each tag name and value.

FormatdescriberEXAMPLES_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTag functions, function principle

Tag states

GetTagRaw example

SetTagSByteState

Function

Sets the value of a tag of the data type "signed 8 bit". The status of the tag is also returned.

Syntax

BOOL SetTagSByteState(Tag Tag_Name, signed char value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

The value of the tag in the data type "signed char"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. For this purpose, the tag status must be evaluated.

FALSE

An error has occurred.

See also

Tag statuses (Page 2291)

Principle of the SetTag functions (Page 2159)

SetTagSByteStateWait example

SetTag functions, function principle

Tag states

SetTagSDWordState

Function

Sets the value of a tag of the data type "signed 32 bit". The status of the tag is also returned.

Syntax

BOOL SetTagSDWordState(Tag Tag_Name, long value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "long"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. For this purpose, the tag status must be evaluated.

FALSE

An error has occurred.

SetTagSByteStateWait example

SetTag functions, function principle

Tag states

SetTagSWordState

Function

Sets the value of a tag of the data type "signed 16 bit". The status of the tag is also returned.

Syntax

BOOL SetTagSWordState(Tag Tag_Name, short value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. For this purpose, the tag status must be evaluated.

FALSE

An error has occurred.

Principle of the SetTag functions (Page 2159)

SetTagSByteStateWait example

SetTag functions, function principle

Tag states

SetTagWordState

Function

Sets the value of a tag of the data type "unsigned 16 Bit". The status of the tag is also returned.

Syntax

BOOL SetTagWordState(Tag Tag_Name, WORD value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. For this purpose, the tag status must be evaluated.

FALSE

An error has occurred.

Principle of the SetTag functions (Page 2159)

SetTagWordStateWait example

Tag states

SetTag functions, function principle

wait

SetTagBitWait

Function

Sets the value of a tag of data type "Binary tag". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagBitWait(Tag Tag_Name, short value);

Parameter

Tag_Name

Name of the tag

Value

Value of the tag in the data type "short"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagBit example (Page 2267)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagBit example

SetTagByteWait

Function

Sets the value of a tag of the data type "unsigned 8 Bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagByteWait(Tag Tag_Name, BYTE value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "BYTE"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2274)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagWord example

SetTagCharWait

Function

Sets the value of a tag of the data type " 8-bit text tag" or "16-bit text tag". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagCharWait(Tag Tag_Name, LPSTR value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "LPSTR"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

Principle of the SetTag functions (Page 2159)

SetTagChar example (Page 2268)

SetTag functions, function principle

SetTagChar example

SetTagDoubleWait

Function

Defines the value of a tag of the data type "64-bit floating point value". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagDoubleWait(Tag Tag_Name, double value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "double"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagFloat example (Page 2269)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagFloat example

SetTagDWordWait

Function

Sets the value of a tag of the data type "unsigned 32 Bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagDWordWait(Tag Tag_Name, DWORD value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "DWORD"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2274)

Principle of the SetTag functions (Page 2159)

SetTagWord example

SetTag functions, function principle

SetTagFloatWait

Function

Defines the value of a tag of the data type "32-bit floating point value". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagFloatWait(Tag Tag_Name, float value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "float"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagFloat example (Page 2269)

Principle of the SetTag functions (Page 2159)

SetTagFloat example

SetTag functions, function principle

SetTagMultiWait

Function

The values of several tags are set in the specified format. The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagMultiWait(const char* pFormat,...)

Parameters

pFormat

Format description for all requested tags and for each tag name and value.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

Format descriptors (Page 2287)

SetTagMultiWait example (Page 2271)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

Format descriptors

SetTagMultiWait example

SetTagRawWait

Function

Sets the value of a tag of the data type "Raw data type". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagRawWait(Tag Tag_Name, BYTE pValue, DWORD size);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagRaw example (Page 2271)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagRaw example

SetTagSByteWait

Function

Sets the value of a tag of the data type "signed 8 bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

```
BOOL SetTagSByteWait(Tag Tag_Name, signed char value);
```

Parameters

Tag_Name

name of the tag

value

The value of the tag in the data type "signed char"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2273)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagSByte example

SetTagSDWordWait

Function

Sets the value of a tag of the data type "signed 32 bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagSDWordWait(Tag Tag_Name, long value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "long"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

Principle of the SetTag functions (Page 2159)

SetTagSByte example (Page 2273)

SetTag functions, function principle

SetTagSByte example

SetTagSWordWait

Function

Sets the value of a tag of the data type "signed 16 bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagSWordWait(Tag Tag_Name, short value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2273)

Principle of the SetTag functions (Page 2159)

SetTagSByte example

SetTag functions, function principle

SetTagValueWait

Function

Enables the transfer of a value in the form of a variant and sets the pointer to the value of the data type "Variant". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagValueWait(LPDM_VARKEY lpdmVarKey, LPVARIANT lpdmValue, PDWORD dwState, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmValue

Pointer to the value of data type "Variant". A description of the data type VARIANT can be found in the associated documentation.

dwState

Tag status which is returned after the function has been run.

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

Structure definition CMN_ERROR (Page 2295)

SetTagWordWait

Function

Sets the value of a tag of the data type "unsigned 16 Bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagWordWait(Tag Tag_Name, WORD value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "WORD"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2274)

Principle of the SetTag functions (Page 2159)

SetTagWord example

SetTag functions, function principle

SetTagBit

Function

Sets the value of a tag of data type "Binary tag".

Syntax

BOOL SetTagBit(Tag Tag_Name, short int value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short int"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

Principle of the SetTag functions (Page 2159)

SetTagBit example (Page 2267)

SetTagBit example

SetTag functions, function principle

SetTagByte

Function

Sets the value of a tag of the data type "unsigned 8 Bit".

Syntax

BOOL SetTagByte(Tag Tag_Name, BYTE value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "BYTE"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2274)

Principle of the SetTag functions (Page 2159)

SetTagWord example

SetTag functions, function principle

SetTagChar

Function

Sets the value of a tag of the data type " 8-bit text tag" or "16-bit text tag".

Parameter

Tag_Name

Name of the tag

Value

Value of the tag in the data type "LPSTR"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagChar example (Page 2268)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagChar example

SetTagDateTime

Function

Sets the value of a tag of data type "Date/Time".

Syntax

BOOL SetTagDateTime(Tag Tag_Name, SYSTEMTIME value);

Parameter

Tag_Name

Name of the tag

value

Value of the tag in the data type "Date/Time".

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagDouble

Function

Defines the value of a tag of the data type "64-bit floating point value".

Syntax

BOOL SetTagDouble(Tag Tag_Name, double value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "double"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagFloat example (Page 2269)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagFloat example

SetTagDWord

Function

Sets the value of a tag of the data type "unsigned 32 Bit".

Syntax

```
BOOL SetTagDWord(Tag Tag_Name, DWORD value);
```

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "DWORD"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2274)

Principle of the SetTag functions (Page 2159)

SetTagWord example

SetTag functions, function principle

SetTagFloat

Function

Defines the value of a tag of the data type "32-bit floating point value".

Syntax

BOOL SetTagFloat(Tag Tag_Name, float value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "float"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagFloat example (Page 2269)

Principle of the SetTag functions (Page 2159)

SetTagFloat example

SetTag functions, function principle

SetTagRaw

Function

Sets the value of a tag of the data type "Raw data type".

Syntax

BOOL SetTagRaw(Tag Tag_Name, BYTE* pValue, DWORD size);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagRaw example (Page 2271)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagRaw example

SetTagSByte

Function

Sets the value of a tag of the data type "signed 8 bit".

Syntax

BOOL SetTagSByte(Tag Tag_Name, signed char value);

Parameters

Tag_Name

name of the tag

value

The value of the tag in the data type "signed char"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2273)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagSByte example

SetTagSDWord

Function

Sets the value of a tag of the data type "signed 32 bit".

Syntax

BOOL SetTagSDWord(Tag Tag_Name, long value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "long"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2273)

Principle of the SetTag functions (Page 2159)

SetTagSByte example

SetTag functions, function principle

SetTagSWord

Function

Sets the value of a tag of the data type "signed 16 bit".

Syntax

BOOL SetTagSWord(Tag Tag_Name, short value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

size

Size of the byte field in bytes

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2273)

Principle of the SetTag functions (Page 2159)

SetTagSByte example

SetTag functions, function principle

SetTagValue

Function

Enables the transfer of a value in the form of a variant and sets the pointer to the value of the data type "Variant".

Syntax

BOOL SetTagValue(LPDM_VARKEY lpdmVarKey, LPVARIANT lpdmValue, PDWORD dwState, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmValue

Pointer to the value of data type "Variant". A description of the data type VARIANT can be found in the associated documentation.

dwState

Tag status which is returned after the function has been run.

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord

Function

Sets the value of a tag of the data type "unsigned 16 Bit".

Syntax

BOOL SetTagWord(Tag Tag_Name, WORD value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "WORD"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2274)

SetTagWord example

SetTag functions, function principle

3.15.3.6 WinCC

WinCC - short description

The functions of the WinCC group allow to define various setting in Runtime.

The functions of the System subgroup can be used to influence WinCC Runtime.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

system

DeactivateRTProject

Function

Deactivates the activated project.

Note

If Runtime is exited on a server or client this applies only to the respective computer.

An activated project for which the WinCC Explorer has not been started must be closed with the internal function "ExitWinCC".

If the activated project was exited with the internal function "DeactivateRTProject" the WinCC project remains open in the background. To close this project, the WinCC Explorer must be opened and then be closed by means of the menu commands "File" > "Exit".

Syntax

```
BOOL DeactivateRTProject();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

DeactivateRTProject example (Page 2217)

DeactivateRTProject example

ExitWinCC

Function

Deactivates Runtime and exits WinCC on the computer executing the function.

Note

If Runtime is exited on a server or client this applies only to the respective computer.

An activated project for which the WinCC Explorer has not been started must be closed with the internal function "ExitWinCC".

If the activated project was exited with the internal function "DeactivateRTProject" the WinCC project remains open in the background. To close this project, the WinCC Explorer must be opened and then be closed by means of the menu commands "File" > "Exit".

Syntax

BOOL ExitWinCC ();

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

ExitWinCC example (Page 2217)

ExitWinCC example

GetLanguage

Function

Determines the current Runtime language.

Syntax

DWORD GetLanguage();

Return value

The current Runtime language with the associated language identifier is returned.

Note

You can find a comprehensive "Language code" table in the "Basic Principles of VBScript" documentation under the index entry "Language code".

See also

GetLanguage example (Page 2225)

GetLanguage example

InquireLanguage

Function

Determines all languages configured in the text library for the runtime.

Use dWCount to specify where the number of determined language IDs is to be stored.

Syntax

```
DWORD* InquireLanguage(DWORD* dwCount);
```

Parameters

dwCount

Pointer to the number of determined language IDs

Return value

The configured languages with the associated language identifiers are returned.

Note

You can find a comprehensive "Language code" table in the "Basic Principles of VBScript" documentation under the index entry "Language code".

See also

InquireLanguage example (Page 2254)

InquireLanguage example

SetLanguage

Function

Changes the language setting in Runtime.

Syntax

BOOL SetLanguage(DWORD dwLocaleID);

Parameters

dwLocaleID

Language ID of the language to be set

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Language ID (Page 2290)

SetLanguage example (Page 2262)

SetLanguage example

Language IDs

FillDiagnoseInTags

Function

Activates or deactivates the storage of diagnostic information in tags.

As filling the tags is an additional load for the system, it should only be activated temporarily for diagnostic information.

Syntax

void FillDiagnoseInTags(BOOL bfill);

Parameters

bFill

Storage of diagnostic information in tags on/off

TRUE	Activate supply of diagnostic tags
FALSE	Deactivate supply of diagnostic tags

Diagnostic tags of GlobalScript

@SCRIPT_COUNT_TAGS

This tag contains the current number of tags requested via Script.

@SCRIPT_COUNT_REQUEST_IN_QUEUES

This tag contains the current number of jobs.

@SCRIPT_COUNT_ACTIONS_IN_QUEUES

This tag contains the current number of actions.

GetServerTagPrefix

Function

To be able to access tags of the respective server from a WinCC client in a distributed system, the tag names must be supplemented with the server prefix.

If the tags are accessed by means of the functions GetTagxx or SetTagxx, the required addition is made by the script control.

If WinCC API functions are used for accessing, the tag names have to be supplemented by the user. The GetServer TagPrefix function provides the required prefixes.

One pointer each of the "char" type to ServerPrefix, TagPrefix and WindowPrefix is returned.

The user must neither change the memory (also no strcat) nor release it.

Syntax

void GetServerTagPrefix(char** ppszServerPrefix, char** ppszTagPrefix, char** ppszWindowPrefix);

Parameters

ppszServerPrefix

Pointer to a pointer referring to the server prefix

ppszTagPrefix

Pointer to a pointer referring to the tag prefix

ppszWindowPrefix

Pointer to a pointer referring to the window prefix

See also

GetServerTagPrefix example (Page 2236)

GetServerTagPrefix example

TraceText

Function

The value defined in <Parameter> is recorded in APDiag if the specified diagnostic level has been reached.

Syntax

void TraceText(DWORD dwTraceLevel, char* pszFormat, <Parameter>);

Parameters

dwTraceLevel

Diagnostic level

pszFormat

Output format (according to printf function)

<Parameter>

Value to be reported

Note

The parameterization dialog for this function provides the selection of tags, graphic objects and pictures.

TraceTime

Function

The value defined in <Parameter> is recorded in APDiag if the specified diagnostic level has been reached.

In addition, the time since the AP start of diagnosis is output in milliseconds to enable performance measurements.

Syntax

void TraceTime(DWORD dwTraceLevel, char* pszFormat, <Parameter>);

Parameters

dwTraceLevel

Diagnostic level

pszFormat

Output format (according to printf function)

<Parameter>

Value to be reported

Note

The parameterization dialog for this function provides the selection of tags, graphic objects and pictures.

3.15.4 Examples

3.15.4.1 Examles - A to G

AcknowledgeMessage example

```
{
//Acknowledge the AlarmLogging message which is selected
AcknowledgeMessage(GetTagWord("U08i_MsgNr"));
}
```

Specify the message number to be acknowledged. It is read from a tag.

AXC_OnBtnMsgFirst example

```
{
// jump to the first message in the WinCC Alarm Control
AXC_OnBtnMsgFirst("gs_alarm_00","Control1");
}
```

Parameters of the AXC_OnBtnMsgFirst function:

"gs_alarm_00" is the name of the picture in which WinCC Alarm Control was configured.

Control1 is the object name of the WinCC Alarm Control.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

Beispiel AXC_OnBtnMsgLast

```
{
// jump to the last message in the WinCC Alarm Control
AXC_OnBtnMsgLast("gs_alarm_00","Control1");
}
```

Parameters of the AXC_OnBtnMsgLast function:

"gs_alarm_00" is the name of the picture in which WinCC Alarm Control was configured.

Control1 is the object name of the WinCC Alarm Control.

AXC_OnBtnScroll example

```
{
// activate/deactivate the scroll function
AXC_OnBtnScroll("gs_alarm_00","Control1");
}
```

Parameters of the AXC_OnBtnScroll function:

"gs_alarm_00" is the name of the picture in which WinCC Alarm Control was configured.

Control1 is the object name of the WinCC Alarm Control.

AXC_OnBtnSinglAckn example

```
{
// acknowledge the active message
AXC_OnBtnSinglAckn("gs_alarm_00","Control1");
}
```

Parameters of the AXC_OnBtnSinglAckn function:

"gs_alarm_00" is the name of the picture in which WinCC Alarm Control was configured.

Control1 is the object name of the WinCC Alarm Control.

AXC_SetFilter example

```
{
BOOL ret;
MSG_FILTER_STRUCT Filter;
CMN_ERROR Error;

//Reset the filter struct
memset( &Filter, 0, sizeof( MSG_FILTER_STRUCT ) );

//Set the filter name
strcpy( Filter.szFilterName, "Control1");

// Choose selection elements
Filter.dwFilter = MSG_FILTER_NR_FROM | MSG_FILTER_NR_TO;

// Message number from
Filter.dwMsgNr[0] = 2;
// Message number to
Filter.dwMsgNr[1] = 2;

ret = AXC_SetFilter("gs_alarm_00","Control1",&Filter,&Error);
}
```

1. Name the filter.
2. Select the filter type.
3. Specify the filter criteria.
4. Set the filter.

Note

The filter type and the filter criteria are to be adapted, all other filter types are described in the filter structure.

DeactivateRTProject example

```
{
//deactivate the runtime
DeactivateRTProject ();
}
```

This function deactivates WinCC Runtime.

ExitWinCC example

```
{
//exit wincc
ExitWinCC ();
}
```

This function exits WinCC.

3.15.4.2 Examples - GetAlarmHigh to GetPropChar

GetAlarmHigh example

```
{
double dAlarmHigh;
//Get the Alarm High Limit
dAlarmHigh = GetAlarmHigh(lpszPictureName,"Bar1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the function GetAlarmHigh:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

1. Read out the upper alarm limit and temporarily store it in dAlarmHigh.
2. Executing user-defined code for processing return values.

GetBackColor example

```
{
long int bk_color;

//Get the background color
bk_color = GetBackColor(lpszPictureName,"StatischerText1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the function GetBackColor:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

1. Read out the current background color and temporarily store it in bk_color.
2. Executing user-defined code for processing return values.

GetBorderStyle example

```
{
long int lstyle;

//Get the current border style
lstyle = GetBorderStyle(lpszPictureName,"Rectangle1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the function GetBorderStyle:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

1. Read out the current line style of the object and temporarily store it in lstyle.
2. Executing user-defined code for processing return values.

GetFilling example

```
{
BOOL bfilling;

//Get the actual state of dynamic filling
bfilling = GetFilling(lpszPictureName,"Rectangle1");

if(bfilling)
{
  // User defined code if the
  // dynamic filling is activated
  ...
}
Else
{
  // User defined code if the
  // dynamic filling is deactivated
  ...
}
}
```

Parameters of the function GetFilling:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

1. Read out whether dynamic filling is activated or not and temporary store in bfilling.
2. Executing user-defined code, depending on the return value of the function.

GetFillingIndex example

```
{
long int filling_index;

//Get the actual filling index of the object
filling_index = GetFillingIndex(lpszPictureName,"Rectangle1");

//User defined code where the
//user can do something with the return value
```

```
...
}
```

Parameters of the function GetFillingIndex:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

1. Read out the current fill level of the object and temporarily store it in filling_index.
2. Executing user-defined code for processing return values.

GetFillStyle example

```
{
long int lstyle;

//Get the current fill style
lstyle = GetFillStyle(lpszPictureName,"Rectangle1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the function GetFillStyle:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

1. Read out the current fill pattern of the object and temporarily store it in lstyle.
2. Executing user-defined code for processing return values.

GetFlashBackColor example

```
{
BOOL bflash_col;

//Get if the flashing is on or off
bflash_col = GetFlashBackColor(lpszPictureName,"Group1");
```

```
if(bflash_col)
{
  // User defined code if the
  // flashing is activated
  ...
}
Else
{
  // User defined code if the
  // flashing is deactivated
  ...
}
}
```

Parameters of the function GetFlashBackColor:

"lpszPictureName" is the name of the picture in which the object was configured.

"Group1" is the name of the object.

1. Read out whether flashing of the background color is activated or not and temporary store in bflash_col.
2. Executing user-defined code, depending on the return value of the function.

GetFlashBackColorOn example

```
{
long int flashcol_on;

//Get the BackFlashColor
flashcol_on = GetBackFlashColorOn(lpszPictureName,"Group1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetBackFlashColorOn function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Group1" is the name of the object.

1. Read out the background flash color for the "On" status of the obvject and and temporarily store it in flashcol_on.
2. Executing user-defined code for processing return values.

GetFlashRateFlashPic example

```
{
long lFlashRate;

//Get the flashrate
lFlashRate = GetFlashRateFlashPic(lpszPictureName,"StatusDisplay1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetFlashRateFlashPic function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Status display1" is the name of the object.

1. Read out the flash frequency of the object and temporarily store it in lFlashRate.
2. Executing user-defined code for processing return values.

GetFocus example

```
{
char* pszValue = NULL;
char szValue[_MAX_PATH+1];

//Get the Object which has the focus
pszValue = Get_Focus();

//Copy the string
if(pszValue != NULL)
{
  strncpy(szValue,pszValue,_MAX_PATH);
}
//User defined code where the
//user can do something with the return value
...
}
```

1. Read out on which object the focus is and temporarily store in pszValue.
2. If a valid value has been returned, store the return value of the function in the local string szValue. A maximum of _MAX_PATH characters is stored.
3. Executing user-defined code for processing return values.

GetFontBold example

```
{
BOOL bbold;

//Get if the text is bold
bbold = GetFontBold(lpszPictureName,"StaticText1");

if(bbold)
{
  // User defined code if the
  // font is bold
  ...
}
Else
{
  // User defined code if the
  // font is not bold
  ...
}
}
```

Parameters of the GetBackColor function

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

1. Read out whether the text is in bold or not and temporarily store in bbold.
2. Executing user-defined code, depending on the return value of the function.

GetFontSize example

```
{
long int fontsize;

//Get the actual Font size
fontsize = GetFontSize(lpszPictureName,"StaticText1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetFontSize function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

1. Read out the current font size and temporarily store it in fontsize.
2. Executing user-defined code for processing return values.

GetHeight example

```
{
long lHeight;

//Get the height of the object
lHeight = GetHeight(lpszPictureName,"WinCCLogo");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetHeight function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

1. Read out the current height of the object and temporarily store it in lHeight.
2. Executing user-defined code for processing return values.

GetHiddenInput example

```
{
BOOL bHiddenInput;

//Get the state of hidden input
bHiddenInput = GetHiddenInput(lpszPictureName,"IOField1");

if(bHiddenInput)
{
  // User defined code if the
  // hidden input is activated
  ...
}
Else
{
  // User defined code if the
  // hidden input is activated
  ...
```

```
}
}
```

Parameters of the GetHiddenInput function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

1. Read out whether the text is in bold or not and temporarily store in bHiddenInput.
2. Executing user-defined code, depending on the return value of the function.

GetLanguage example

```
{
DWORD rt_language;

//Get the current language
rt_language = GetLanguage ();

//User defined code where the
//user can do something with the return value
...
}
```

1. Read out the current Runtime language and temporarily store it in rt_language.
2. Executing user-defined code for processing return values.

GetLeft example

```
{
long lPos;

//Get the x-position of the object
lPos = GetLeft(lpszPictureName,"WinCCLogo");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetLeft function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

1. Read out the current X position of the object and temporarily store it in lPos.
2. Executing user-defined code for processing return values.

GetLink example

```
{
LINKINFO linkinfo;

//Get the linked Tag
GetLink(lpszPictureName,"Bar1","Process",&linkinfo);

// linkinfo.szLinkName is the tag name
// linkinfo.dwCycle is the update cycle
// linkinfo.LinkType is the type of the connection

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetLink function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"Process" is the property connected to a tag.

"&linkinfo" is the address of the linkinfo structure.

1. Fills the passed linkinfo structure with the tag connection information.
2. Executing user-defined code, depending on the return value of the function.

GetLinkedVariable example

```
{
char* pszVarName = NULL;
char szVarName[_MAX_PATH+1];

//Get the TagName
pszVarName = GetLinkedVariable("gs_stand_graph_00","StaticText6","Visible");

//Copy the string
if (strcmp (pszVarName,"")!= 0)
```

```
{
  strncpy(szVarName,pszVarName,_MAX_PATH);
}
else printf("Attribute 'visible' is not made dynamic\r\n");
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetLinkedVariable function:

"gs_stand_graph_00" is the name of the picture in which the object was configured.

"StaticText6" is the name of the object.

"Visible" is the property connected to a tag.

1. Temporarily store the return value of the GetLinkedVariable function in pszVarName.
2. If a valid value has been returned, store the return value in szVarName. A maximum of _MAX_PATH characters is stored.
3. Executing user-defined code for processing return values.

GetLocalPicture example

```
{
char* pszPicName = NULL;
char szPicName[_MAX_PATH+1];

//Get the Local Picture
pszPicName = GetLocalPicture(lpszPictureName);

//Copy the string
if (pszPicName != NULL)
{
  strncpy(szPicName,pszPicName,_MAX_PATH);
}
//User defined code where the
//user can do something with the return value
...
}
```

1. Temporarily store the return value of the GetLocalPicture function in pszPicName.
2. If a valid value has been returned, store the return value in szPicName. A maximum of _MAX_PATH characters is stored.
3. Executing user-defined code for processing return values.

GetMarker example

```
{
BOOL bmarker;

//Get the state of the Marker
bmarker = GetMarker(lpszPictureName,"Bar1");

if(bmarker)
{
  // User defined code if the
  // marker is activated
  ...
}
Else
{
  // User defined code if the
  // marker is deactivated
  ...
}
}
```

Parameters of the GetMarker function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

1. Read out whether the marker is displayed or not and temporarily store in bmarker.
2. Executing user-defined code, depending on the return value of the function.

GetOutputValueDouble example

```
{
double doutput;

//Get the output value of IO Field 1
doutput = GetOutputValueDouble(lpszPictureName,"IOField1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetOutputValueDouble function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

1. Read out the output value and temporarily store it in doutput.
2. Executing user-defined code for processing return values.

GetParentPicture example

```
{
char* pszPicName = NULL;
char szPicName[_MAX_PATH+1];

//Get the parent picture
pszPicName = GetParentPicture(lpszPictureName);

//Copy the string
if (pszPicName != NULL)
{
  strncpy(szPicName,pszPicName,_MAX_PATH);
}
//User defined code where the
//user can do something with the return value
...
}
```

1. Temporarily store the return value of the GetParentPicture function in pszPicName.
2. If a valid value has been returned, store the return value in szPicName. A maximum of _MAX_PATH characters is stored.
3. Executing user-defined code for processing return values.

GetPictureDown example

```
{
char* pszPicName = NULL;
char szPicName[_MAX_PATH+1];

//Get the current picture name
pszPicName = GetPictureDown(lpszPictureName,"Roundbutton1");

if (pszPicName != NULL)
{
//Copy the string
  strncpy(szPicName,pszPicName,_MAX_PATH);
}

//User defined code where the
//user can do something with the return value
```

```
...
}
```

Parameters of the GetPictureDown function:

"lpszPictureName" is the name of the picture in which the object was configured.

"RoundButton1" is the name of the object.

1. Read out the picture name of the picture displayed in round button 1 and temporarily store it in pszPicName.

2. If a valid value has been returned, store the return value of the function in the local string szPicName. A maximum of _MAX_PATH characters is stored.

3. Executing user-defined code for processing return values.

GetPictureName example

```
{
char* pszPictureName = NULL;
char szPictureName[_MAX_PATH + 1];

//Get the current PictureName
pszPictureName = GetPictureName(lpszPictureName,"GraphicObject1");

if(pszPictureName != NULL)
{
//copy the string
strncpy(szPictureName,pszPictureName,_MAX_PATH);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetPictureName function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

1. Read out the picture name of the picture displayed in graphic object 1 and temporarily store it in pszPictureName.

2. If a valid value has been returned, store the return value of the function in the local string szPictureName. A maximum of _MAX_PATH characters is stored.

3. Executing user-defined code for processing return values.

GetPictureUp example

```
{
char* pszPicName = NULL;
char szPicName[_MAX_PATH+1];

//Get the current picture name
pszPicName = GetPictureUp(lpszPictureName,"Roundbutton1");

if (pszPicName != NULL)
{
//Copy the string
  strncpy(szPicName,pszPicName,_MAX_PATH);
}

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetPictureUp function:

"lpszPictureName" is the name of the picture in which the object was configured.

"RoundButton1" is the name of the object.

1. Read out the picture name of the picture displayed in round button 1 and temporarily store it in pszPicName.

2. If a valid value has been returned, store the return value of the function in the local string szPicName. A maximum of _MAX_PATH characters is stored.

3. Executing user-defined code for processing return values.

GetPosition example

```
{
long int lpos;

//Get the actual position of the Slider
lpos = GetPosition(lpszPictureName,"Control1");

//User defined code where the
//user can do something with the return value
```

```
...
}
```

Parameters of the GetPosition function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

1. Read out the current slider position and temporarily store it in lpos.
2. Executing user-defined code for processing return values.

GetPropBOOL example

```
{
BOOL bProp;

//Get the property Visible
bProp = GetPropBOOL("gs_graph_eafield","IOField1","Visible");

if(bProp)
{
  // User defined code if the
  // object is visible
  ...
}
else
{
  // User defined code if the
  // object is not visible
  ...
}
}
```

Parameters of the GetVisible function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"Visible" is the object property.

1. Read out whether the object is visible or not and temporarily store in bProp.
2. Executing user-defined code, depending on the return value of the function.

GetPropChar example

```
{
char* pszProp = NULL;
char szProp[14];

//Get the property Tooltiptext
pszProp = GetPropChar("lpszPictureName","EAFeld1","Tooltiptext");

if(pszProp != NULL)
{
//Copy the string
strncpy(szProp,pszProp,13);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetPropChar function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"Tooltiptext" is the object property.

1. Read out the tooltip text of the object and temporarily store it in pszProp.
2. If a valid value has been returned, store the return value of the function in the local string szProp. A maximum of 13 characters is stored.
3. Executing user-defined code for processing return values.

3.15.4.3 Examples - GetRangeMax to GetWidth

GetRangeMax example

```
{
long int lrange;

//Get the upper scale Limit
lrange = GetRangeMax(lpszPictureName,"Control1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetRangeMax function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

1. Read out the current upper limit of the object and temporarily store it in lrange.
2. Executing user-defined code for processing return values.

GetRangeMin example

```
{
long int lrange;

//Get the lower scale Limit
lrange = GetRangeMin(lpszPictureName,"Control1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetRangeMin function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

1. Read out the current lower limit of the object and temporarily store it in lrange.
2. Executing user-defined code for processing return values.

Beispiel GetScaling

```
{
BOOL bscaling;

//Get the Scaling state
bscaling = GetScaling(lpszPictureName,"Bar1");

if (bscaling)
{
  // User defined code if the
  // bar object has an additional scale
  ...
}
```

```
Else
{
  // User defined code if the
  // bar object has no additional scale
  ...
}
}
```

Parameters of the GetScaling function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

1. Read out whether the scale of the bar is displayed or not and temporarily store in bscaling.
2. Executing user-defined code, depending on the return value of the function.

GetServerTagPrefix example

```
{
char* pszServerPrefix;
char* pszTagPrefix;
char* pszWindowPrefix;
int nServerPrefixLen = 0;
int nTagPrefixLen = 0;
int nTagLen = 0;
char myTagName[MAX_DM_VAR_NAME+1];

//Initialize the return value
memset(myTagName,0,MAX_DM_VAR_NAME + 1);

//Get the serverprefix the tagprefix and the windowprefix
GetServerTagPrefix(&pszServerPrefix, &pszTagPrefix, &pszWindowPrefix);

//If a serverprefix exists
if (pszServerPrefix)
{
  //Get the length of the string
  nServerPrefixLen = strlen(pszServerPrefix);
}
Else
{
  printf("No server prefix was returned.");
return;
}

//If a tagprefix exists
if (pszTagPrefix)
```

```
{
  //Get the length of the string
  nTagPrefixLen = strlen(pszTagPrefix);
}

//Get the length of the tag
nTagLen = strlen("TagName");

//Check if the lenght of the
//ServerPrefix+TagPrefix+VarName + the double points < MAX_DM_VAR_NAME)
if (nServerPrefixLen + nTagPrefixLen + nTagLen+2 < MAX_DM_VAR_NAME)
{
  sprintf(myTagName,"%s::%s%s",pszServerPrefix,pszTagPrefix,"TagName");
//User defined code where the
//user can do something with the return value
  ...
}
Else
{
  printf("The resulting string is too long.");
return;
}
}
```

1. Initialize the myTagName tag.
2. Read out the server prefix, the tag prefix and the window prefix.
3. If no server prefix has been returned, a text ist output and the function is terminated.
4. If a server prefix has been returned, determine its length and temporarily store it in nServerPrefixLen.
5. If a tag prefix has been returned, determine its length and temporarily store it in TagPrefixLen.
6. Determine the length of the tag name and temporarily store it in nVarLen.
7. If the length permitted for tag names is exceeded a text is output and the function is terminated.
8. If the length permitted for tag names is not exceeded, the tag name required for a client environment is compiled.
9. Executing user-defined code for processing return values.

GetServerTagPrefix example

```
{
char* pszServerPrefix;
char* pszTagPrefix;
char* pszWindowPrefix;

//Get the serverprefix and the tagprefix
GetServerTagPrefix(&pszServerPrefix, &pszTagPrefix, &pszWindowPrefix);
```

```
//User defined code where the
//user can do something with the return value
...

}
```

Parameters of the GetServerTagPrefix function:

"pszServerPrefix" is the tag which is written into the server prefix.

"pszTagPrefix" is the tag which is written into the tag prefix.

"pszWindowrPrefix" is the tag which is written into the window prefix.

1. Read out the server prefix, the tag prefix and the window prefix.
2. The pszServerPrefix tag contains the returned server prefix.
3. The pszTagPrefix tag contains the returned tag prefix.
4. The pszWindowPrefix tag contains the returned window prefix.
5. Executing user-defined code for processing return values.

GetTagBit example

```
{
BOOL bstate;

//Get the current state of the tag
bstate = GetTagBit("gs_tag_bit");

if(bstate)
{
  // User defined code if the
  // value of the tag is true
  ...
}
else
{
  // User defined code if the
  // value of the tag is false
  ...
}
}
```

Parameters of the GetTagBit function

"gs_tag_bit" is the name of the tag.

1. Read out the value of the tag and temporarily store it in bstate.
2. Executing user-defined code, depending on the return value of the function.

GetTagBitStateQC example

```
{
DWORD dwState;
DWORD dwQC;
BOOL bValue;

dwState = 0xFFFFFFFF;

//Get the tag value
//dwstate is the tag state
bValue = GetTagBitStateQCWait("gs_tag_bit",&dwState,&dwQC);

//Create a string which includes the tag value
if (bValue)
{
  // User defined code if the
  // value of the tag is true
  ...
}
else
{
  // User defined code if the
  // value of the tag is false
  ...
}
}
```

Parameters of the GetTagBitStateQC function:

"gs_tag_bit" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read out the value of the tag and temporarily store it in bValue. The function puts the tag status in dwState and the quality code in dwQC.
2. Executing user-defined code, depending on the return value of the function.

GetTagBitStateWait example

```
{
DWORD dwstate;
BOOL bValue;

dwstate = 0xFFFFFFFF;

//Get the tag value
//dwstate is the tag state
bValue = GetTagBitStateWait("gs_tag_bit",&dwstate);

//Create a string which includes the tag value
if (bValue)
{
  // User defined code if the
  // value of the tag is true
  ...
}
else
{
  // User defined code if the
  // value of the tag is false
  ...
}
}
```

Parameters of the GetTagBitStateWait function:

"gs_tag_bit" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read out the value of the tag and temporarily store it in bstate. The function puts the tag status in dwstate.
2. Executing user-defined code, depending on the return value of the function.

GetTagChar example

```
{
char* pszValue = NULL;
char szValue[13];

//Get the current value of the tag
pszValue = GetTagChar("gs_tag_char");

if(pszValue != NULL)
{
//Copy the string
```

```
strncpy(szValue,pszValue,12);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagChar function:

"gs_tag_char" is the name of the tag.

1. Reading the value of the tag and temporarily storing in pszValue.

2. If a valid value has been returned, store the return value of the function in the local string szValue. A maximum of 12 characters is stored.

3. Executing user-defined code for processing return values.

GetTagCharStateQCWait example

```
{
DWORD dwState;
DWORD dwQC;
char* pszRetValue = NULL;
char szRetValue[13];

dwState = 0xFFFFFFFF;

//Get the tag value
pszRetValue = GetTagCharStateQCWait("gs_tag_char",&dwState, &dwQC);

if (pszRetValue != NULL)
{
//Copy the string
strncpy(szRetValue,pszRetValue,12);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagCharStateQCWait function:

"gs_tag_char" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read out the value of the tag and temporarily store it in pszRetValue. The function puts the tag status in dwState and the quality code in dwQC.

2. If a valid value has been returned, store the return value of the function in the local string szRetValue. A maximum of 12 characters is stored.

3. Executing user-defined code for processing return values.

Beispiel GetTagCharStateWait

```
{
DWORD dwstate;
char szValue[11];
char* pszRetValue = NULL;
char szRetValue[13];

dwstate = 0xFFFFFFFF;
//Get the tag value
//dwstate is the tag state
pszRetValue = GetTagCharStateWait("gs_tag_char",&dwstate);

if (pszRetValue != NULL)
{
//Copy the string
strncpy(szRetValue,pszRetValue,12);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagCharStateWait function:

"gs_tag_char" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read out the value of the tag and temporarily store it in pszRetValue. The function puts the tag status in dwstate.

2. If a valid value has been returned, store the return value of the function in the local string szRetValue. A maximum of 12 characters is stored.

3. Executing user-defined code for processing return values.

GetTagFloat example

```
{
float fValue;
```

```
//Get the current value of the tag
fValue = GetTagFloat("gs_tag_float");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagFloat function:

"gs_tag_float" is the name of the tag.

1. Read out the value of the tag and temporarily store it in fValue.
2. Executing user-defined code for processing return values.

GetTagFloatStateQCWait example

```
{
DWORD dwState;
DWORD dwQC;
float fValue;

dwState = 0xFFFFFFFF;

//Get the tag value
fValue = GetTagFloatStateQCWait("gs_tag_float",&dwState, &dwQC);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagFloatStateQCWait function:

"gs_tag_float" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read out the value of the tag and temporarily store it in fValue. The function puts the tag status in dwState and the quality code in dwQC.
2. Executing user-defined code for processing return values.

GetTagFloatStateWait example

```
{
DWORD dwstate;
float fValue;

dwstate = 0xFFFFFFFF;
//Get the tag value
//dwstate is the tag state
fValue = GetTagFloatStateWait("gs_tag_float",&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagFloatStateWait function:

"gs_tag_float" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read out the value of the tag and temporarily store it in fValue. The function puts the tag status in dwstate.
2. Executing user-defined code for processing return values.

GetTagMultiStateQCWait example

```
{
#define DATA_SIZE 5
DWORD dwState[DATA_SIZE];
DWORD dwQC[DATA_SIZE];

//define all Datas
BOOL lValue1;
long lValue2 ;
char* szValue3;
double dblValue4 ;
WORD lValue5 ;

//Set the tags
GetTagMultiStateQCWait(dwState,dwQC,"%d%d%s%f%d",
  "gs_tag_bit",&lValue1,
  "gs_tag_SByte",&lValue2,
  "gs_tag_char",&szValue3,
  "gs_tag_float",&dblValue4,
  "gs_tag_word",&lValue5);
```

```
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagMultiStateWait function:

"dwState" is the DWord-Array, in which the tag statuses are stored.

"dwQC" is the DWord-Array, in which the quality codes are stored.

"%d%d%s%f%d" are the type descriptions of the tags to be read.

"gs_tag_bit" is the tag to be read.

"&lValue1" is the address of the tags in which the value of the tags gs_tag_bit should be stored.

"gs_tag_SByte" is the tag to be read.

"&lValue2" is the address of the tags in which the value of the tags gs_tag_SByte should be stored.

The other parameters are to be handled in the same way as those described previously.

1. Creating a DWord-Array with the required size (Number of tags).

2. Reading and storing the values of the tags. The value of the tags gs_tag_bit is stored temporarily in lValue1. The value of the tags gs_tag_SByte is stored temporarily in lValue2, etc.

3. Executing user-defined code for processing return values.

GetTagMultiStateWait example

```
{
#define DATA_SIZE 5
DWORD dwData[DATA_SIZE];

//define all Datas
BOOL lValue1;
long lValue2 ;
char* szValue3;
double dblValue4 ;
WORD lValue5 ;

//Set the tags
GetTagMultiStateWait(dwData,"%d%d%s%f%d",
  "gs_tag_bit",&lValue1,
  "gs_tag_SByte",&lValue2,
  "gs_tag_char",&szValue3,
  "gs_tag_float",&dblValue4,
  "gs_tag_word",&lValue5);
```

```
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagMultiStateWait function:

"dwData" is the DWord-Array, in which the tag statuses are stored.

"%d%d%s%f%d" are the type descriptions of the tags to be read.

"gs_tag_bit" is the tag to be read.

"&lValue1" is the address of the tags in which the value of the tags gs_tag_bit should be stored.

"gs_tag_SByte" is the tag to be read.

"&lValue2" is the address of the tags in which the value of the tags gs_tag_SByte should be stored.

The other parameters are to be handled in the same way as those described previously.

1. Creating a DWord-Array with the required size (Number of tags).

2. Reading and storing the values of the tags. The value of the tags gs_tag_bit is stored temporarily in lValue1. The value of the tags gs_tag_SByte is stored temporarily in lValue2, etc.

3. Executing user-defined code for processing return values.

GetTagMultiWait example

```
DWORD dwVar1Value;
char* szVar2Value;
//Memory for the tag value is
//created by teh function with SysMalloc
double dbVar3Value;

BOOL ok;

ok=GetTagMultiWait("%d%s%f", "Ernie_word", &dwVar1Value,
  "Ernie_char", &szVar2Value,
  "Ernie_double", &dbVar3Value);

printf("Word %d, String %s, Double %f\r\n",
  dwVar1Value, szVar2Value, dbVar3Value);
```

GetTagPrefix example

```
{
char* pszTagPrefix = NULL;
char szTagPrefix[7];

//Get the current tag prefix
pszTagPrefix = GetTagPrefix(lpszPictureName,"PicWindow1");

if(pszTagPrefix != NULL)
{
//Copy the string
strncpy(szTagPrefix,pszTagPrefix,6);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagPrefix function:

"lpszPictureName" is the name of the picture in which the object was configured.

"PictureWindow1" is the name of the object.

1. Read out the current tag prefix of picture window 1 and temporarily store it in pszTagPrefix.
2. If a valid value has been returned, store the return value of the function in the local string szTagPrefix. A maximum of 6 characters is stored.
3. Executing user-defined code for processing return values.

GetTagRaw example

```
{
#define DATA_SIZE 3

BYTE byData[DATA_SIZE];

//Get the current values of the tag
GetTagRaw("gs_tag_raw",byData,DATA_SIZE);

//Use the values received in the array byData
...
}
```

Parameters of the GetTagRaw function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array in which the values of the raw data tags will be stored.

"DATA_SIZE" is the number of values that will be read.

1. Reading the values of the tags and temporarily storing in byData.
2. Executing user-defined code for processing return values.

GetTagRawStateQCWait example

```
{
#define DATA_SIZE 3
DWORD dwState;
DWORD dwQC;
BYTE byData[DATA_SIZE];

dwState = 0xFFFFFFFF;

//Get the values of the tag
GetTagRawStateQCWait("gs_tag_raw",byData,DATA_SIZE,&dwState,&dwQC);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagRawStateQCWait function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array in which the values of the raw data tags will be stored.

"DATA_SIZE" is the number of values that will be read.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Reading the values of the tags and temporarily storing in byData.
2. Executing user-defined code for processing return values.

GetTagRawStateWait example

```
{
#define DATA_SIZE 3
DWORD dwstate;
BYTE byData[DATA_SIZE];
```

```
char szValue[11];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Get the values of the tag
//dwstate is the tag state
GetTagRawStateWait("gs_tag_raw",byData,DATA_SIZE,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagRawStateWait function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array in which the values of the raw data tags will be stored.

"DATA_SIZE" is the number of values that will be read.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Reading the values of the tags and temporarily storing in byData.
2. Executing user-defined code for processing return values.

GetTagSByte example

```
{
long lValue;

//Get the current value of the tag
lValue = GetTagSByte("gs_tag_SByte");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagSByte function:

"gs_tag_SByte" is the name of the tag.

1. Read the value of the tag and temporarily store it in lValue.
2. Executing user-defined code for processing return values.

GetTagSByteStateQCWait example

```
{
DWORD dwState;
DWORD dwQC;
long lValue;

dwState = 0xFFFFFFFF;

//Get the tag value
lValue = GetTagSByteStateQCWait("gs_tag_SByte",&dwState, &dwQC);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagSByteStateQCWait function:

"gs_tag_SByte" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read the value of the tag and temporarily store it in lValue. The function puts the tag status in dwState and the quality code in dwQC.
2. Executing user-defined code for processing return values.

GetTagSByteStateWait example

```
{
DWORD dwstate;
long lValue;

dwstate = 0xFFFFFFFF;
//Get the tag value
//dwstate is the tag state
lValue = GetTagSByteStateWait("gs_tag_SByte",&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagSByteStateWait function:

"gs_tag_SByte" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read the value of the tag and temporarily store it in lValue. The function puts the tag status in dwstate.
2. Executing user-defined code for processing return values.

GetTagWord example

```
{
WORD wValue;

//Get the current value of the tag
wValue = GetTagWord("gs_tag_word");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagWord function:

"gs_tag_word" is the name of the tag.

1. Read out the value of the tag and temporarily store it in wValue.
2. Executing user-defined code for processing return values.

GetTagWordStateQCWait example

```
{
DWORD dwState;
DWORD dwQC;
WORD wValue;

dwState = 0xFFFFFFFF;

//Get the tag value
wValue = GetTagWordStateQCWait("gs_tag_word",&dwState, &dwQC);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagWordStateQCWait function:

"gs_tag_word" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read out the value of the tag and temporarily store it in wValue. The function puts the tag status in dwState and the quality code in dwQC.
2. Executing user-defined code for processing return values.

GetTagWordStateWait example

```
{
DWORD dwstate;
WORD wValue;

dwstate = 0xFFFFFFFF;
//Get the tag value
//dwstate is the tag state
wValue = GetTagWordStateWait("gs_tag_word",&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of then GetTagWordStateWait function:

"gs_tag_word" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read out the value of the tag and temporarily store it in wValue. The function puts the tag status in dwstate.
2. Executing user-defined code for processing return values.

GetText example

```
{
char* pszValue = NULL;
char szValue[13];

//Get the Text which is actually set
pszValue = GetText(lpszPictureName,"StaticText1");

if(pszValue != NULL)
```

```
{
//Copy the string
strncpy(szValue,pszValue,12);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetText function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

1. Read out the text in the object StaticText1 and temporarily store it in pszValue.
2. If a valid value has been returned, store the return value of the function in the local string szValue. A maximum of 12 characters is stored.
3. Executing user-defined code for processing return values.

GetTop example

```
{
long lPos;

//Get the y-Position of the Object
lPos = GetTop(lpszPictureName,"WinCCLogo");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTop function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

1. Read out the current Y position of the object and temporarily store it in lPos.
2. Executing user-defined code for processing return values.

GetVisible example

```
{
BOOL bVisible;

//Get the visibility
bVisible = GetVisible(lpszPictureName,"GraphicObject1");

if(bVisible)
{
  // User defined code if the
  // object is visible
  ...
}
else
{
  // User defined code if the
  // object is not visible
  ...
}
}
```

Parameters of the GetVisible function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

1. Read out whether the object is visible or not and temporarily store in bVisible.
2. Executing user-defined code, depending on the return value of the function.

GetWidth example

```
{
long lWidth;

//Get the width of the object
lWidth = GetWidth(lpszPictureName,"WinCCLogo");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetWidth function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

1. Read out the current width of the object and temporarily store it in lWidth.
2. Executing user-defined code for processing return values.

3.15.4.4 Examples - H to S

InquireLanguage example

```
{
DWORD count;
DWORD* language;
int i;

//Count the installed languages
language = InquireLanguage(&count);

printf("###################### INQUIRE LANGUAGE ####################");
//Print out the count of languages
printf ( "\r\nCount Languages=%d\r\n", count );

//print out which languages are installed
for (i=1;i<=count; i++)
{
printf ("\r\n%d.language=%x", i,*language++);
}
}
```

1. Determine the languages configured for the runtime. In language the language IDs are temporarily stored. In count the number of languages is temporarily stored.
2. The number of determined languages is output.
3. All determined language IDs are displayed.

ProgramExecute example

```
{
//start the program calc.exe
ProgramExecute("C:\\Winnt\\system32\\calc.exe");
}
```

As parameter the file is to be specified with its path.

ResetFilter example

```
{
BOOL ret;
MSG_FILTER_STRUCT Filter;
CMN_ERROR Error;

//delete the whole Filter struct
memset( &Filter, 0, sizeof( MSG_FILTER_STRUCT ) );

//set an empty filter struct
AXC_SetFilter("gs_alarm_00","Control1",&Filter,&Error);
}
```

1. Delete the filter structure.
2. Write empty values into the filter structure.

RPTJobPreview example

```
{
//Start the print preview of the specified print job
RPTJobPreview("Documentation Text Library");
}
```

Parameters of the "RPTJobPreview" function:

"Documentation Text Library" is the name of the print job.

RPTJobPrint example

```
{
//Print the specified print job out
RPTJobPrint("@Text library (compact)");
}
```

Parameters of the RPTJobPrint function:

@Text library (compact) is the name of the print job.

SysMalloc example

```
char* main(...);
{
```

```
char* returnwert;
char text[17];
returnwert=SysMalloc(17);
strcpy(returnwert,&text[0];
return returnwert;
}
```

3.15.4.5 Examples - SetAlarmHigh to SetPropChar

SetAlarmHigh example

```
{
//Set the upper limit for the warning
SetAlarmHigh(lpszPictureName,"Bar1",3.0);
}
```

Parameters of the SetAlarmHigh funtion:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"3.0" is the value to which the upper alarm limit will be set.

SetBackColor example

```
{
//Set the back color blue
SetBackColor(lpszPictureName,"StaticText1",CO_BLUE);
}
```

Parameters of the SetBackColor function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

"CO_BLUE" is the constant for the color "Blue".

Note

Instead of using the constant for the color value you may also specify the color by means of a hexadecimal value.

SetBorderEndStyle example

```
{
SetBorderEndStyle(lpszPictureName,"Line", (2|393216));
}
```

Sets the left line end as filled arrow and the right one as filled circle. The left line end is stored in the two lower bytes, the right line end in the two upper bytes. The parameters are transferred by means of numeric values.

Example of setting the line ends with symbolic names

```
{
SetBorderEndStyle(lpszPictureName,"Line", (LE_FULL_ARROW|(LE_FULL_CIRCLE <<16));
}
```

Sets the left line end as filled arrow and the right one as filled circle. The left line end is stored in the two lower bytes, the right line end in the two upper bytes. To address the right line end the symbolic designation "LE_FULL_CIRCLE" is moved by 2 bytes or 16 bit into the two upper bytes.

SetBorderStyle example

```
{
//Change the Border style
SetBorderStyle(lpszPictureName,"Rectangle1",3);
}
```

Parameters of the SetBorderStyle function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

"3" is the line style which is set for the object.

SetColorAlarmHigh example

```
{
//Set the Color for the alarm high limit to red
```

```
SetColorAlarmHigh(lpszPictureName,"Bar1",CO_RED);
}
```

Parameters of the SetColorAlarmHigh function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"CO_RED" is the constant for the color red.

Note

Instead of using the constant for the color value you may also specify the color by means of a hexadecimal value.

Example - SetCursorMode

```
{
//Set the Cursor Mode to Alpha cursor
SetCursorMode(lpszPictureName,"GraphikObjekt1",FALSE);
}
```

Parameters of the SetCursorMode function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

"FALSE" signifies: Cursor mode "Alpha-Cursor" is set.

SetFilling example

```
{
//Set the dynamic filling true
SetFilling(lpszPictureName,"Rectangle1",TRUE);
}
```

Parameters of the SetFilling function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

"TRUE" means: Activating dynamic filling.

SetFillingIndex example

```
{
//Set the Filling of Rectangle1 to 10
SetFillingIndex(lpszPictureName,"Rectangle1",10);
}
```

Parameters of the SetFillingIndex function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

"10" is the fill level which is assigned to the object.

SetFillStyle example

```
{
//Change the fill style
SetFillStyle(lpszPictureName,"Rectangle1",196617);
}
```

Parameters of the SetFillStyle function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

"196617" is the fill pattern (brick wall) which is set for the object.

SetFlashBackColor example

```
{
//Set the flashing to True
SetFlashBackColor(lpszPictureName,"Group1",TRUE);
}
```

Parameters of the SetFlashBackColor function

"lpszPictureName" is the name of the picture in which the object was configured.

"Group1" is the name of the object.

"TRUE" means: Activating flashing of the background color.

SetFlashBackColorOn example

```
{
//Set the Flash color for the state on to red
SetBackFlashColorOn(lpszPictureName,"Group1",CO_RED);
}
```

Parameters of the SetBackFlashColorOn function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Group1" is the name of the object.

"CO_Red" is the constant for the color "Red".

Note

Instead of using the constant for the color value you may also specify the color by means of a hexadecimal value.

SetFlashRateFlashPic example

```
{
//Set the flash rate to 0
SetFlashRateFlashPic(lpszPictureName,"Statusdisplay1",0);
}
```

Parameters of the SetFlashRateFlashPic function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Status display1" is the name of the object.

"0" is the flash frequency of the object.

SetFocus example

```
{
//Set the Focus on the Object Button 1
Set_Focus(lpszPictureName,"Button1");
}
```

Parameters of the Set_Focus function

"lpszPictureName" is the name of the picture in which the object was configured.

"Button1" is the name of the object on which the focus is set.

SetFontBold example

```
{
//Set the displayed Text bold
SetFontBold(lpszPictureName,"StatischerText1",TRUE);
}
```

Parameters of the SetFontBold function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

"TRUE" means: The text is written in bold face.

SetFontSize example

```
{
//Set Font Size to 12
SetFontSize(lpszPictureName,"StaticText1",12);
}
```

Parameters of the SetFontSize function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

"12" is the font size to which the text is set.

SetHeight example

```
{
//Set the height of the object to 100
SetHeight(lpszPictureName,"WinCCLogo",100);
}
```

Parameters of the SetHeight function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

"100" is the height to which the object is set.

SetHiddenInput example

```
{
//Set the hidden input true
SetHiddenInput(lpszPictureName,"IOField1",TRUE);
}
```

Parameters of the SetHiddenInput function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"TRUE" means: Activating the hidden input.

SetLanguage example

```
{
//German
SetLanguage(0x0407);
}
```

The Runtime language is set to German.

SetLeft example

```
{
//Set the x-position to 0
SetLeft(lpszPictureName,"WinCCLogo",0);
}
```

Parameters of the SetLeft function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

"0" is the X position to which the object is set.

SetLink example

```
{
LINKINFO linkinfo;

//Set the link type
linkinfo.LinkType = 1;

//Set the update cycle
linkinfo.dwCycle = 0;

//set the Structmember
strcpy(linkinfo.szLinkName, "U08i_link_00");

//Set the connection to the tag
SetLink(lpszPictureName,"Bar1","Process",&linkinfo);
}
```

Parameters of the SetLink function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"Process" is the property connected to a tag.

"&linkinfo" is the address of the linkinfo structure.

1. Set the connection type for the process property to direct connection.
2. Set the update cycle to "Upon change".
3. Set the tag name to U08i_link_00.

SetMarker example

```
{
//Set the marker visible
SetMarker(lpszPictureName,"Bar1",TRUE);
}
```

Parameters of the SetMarker function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"TRUE" means: The marker is displayed.

SetOutputValueDouble example

```
{
//Set the output value of the IO field to 55.5
SetOutputValueDouble(lpszPictureName,"IOField1",55.5);
}
```

Parameters of the SetOutputValueDouble function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"55.5" is the value which is output.

SetPictureDown example

```
{
//Set the picture name to activated.bmp
SetPictureDown(lpszPictureName,"Roundbutton1","activated.bmp");
}
```

Parameters of the SetPictureDown function:

"lpszPictureName" is the name of the picture in which the object was configured.

"RoundButton1" is the name of the object.

"activated.bmp" is the picture name of the picture to be displayed in round button 1.

SetPictureName example

```
{
//Set the picture name cool_man.bmp
SetPictureName(lpszPictureName,"GraphicObject1","cool_man.bmp");
}
```

Parameters of the SetPictureName function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

"cool_man.bmp" is the picture name of the picture to be displayed in graphic object 1.

SetPictureUp example

```
{
//Set the picture name to deactivated.bmp
SetPictureUp(lpszPictureName,"Roundbutton1","deactivated.bmp");
}
```

Parameters of the SetPictureUp function:

"lpszPictureName" is the name of the picture in which the object was configured.

"RoundButton1" is the name of the object.

"deactivated.bmp" is the picture name of the picture to be displayed in round button 1.

SetPosition example

```
{
//Set the Slider Position to 30
SetPosition(lpszPictureName,"Control1",30);
}
```

Parameters of the SetPosition function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

"30" is the position to which the slider is to be set.

SetPropBOOL example

```
{
//Set the visibility TRUE
SetPropBOOL("lpszPictureName","EAFeld1","Visible",TRUE);
}
```

Parameters of the SetVisible function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"TRUE" means: The object is intended to be visible.

SetPropChar example

```
{
//Set the property Tooltiptext
SetPropChar("gs_graph_eafield","IOField1","ToolTipText","Tooltiptext1 ");
}
```

Parameters of the SetPropChar function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"Tooltiptext" is the object property.

"Tooltiptext 1" is the value to which the property is to be set.

3.15.4.6 Examples - SetRangeMax to SetWidth

SetRangeMax example

```
{
//Set the Upper Scale Limit
SetRangeMax(lpszPictureName,"Control1",80);
}
```

Parameters of the SetRangeMax function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

"80" is the upper limit to be assigned to the object.

SetRangeMin example

```
{
//Set the lower Scale Limit
SetRangeMin(lpszPictureName,"Control1",0);
}
```

Parameters of the SetRangeMin function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

"0" is the lower limit to be assigned to the object.

SetScaling example

```
{
//Set the Scaling Visible
SetScaling(lpszPictureName,"Bar1",TRUE);

}
```

Parameters of the SetScaling function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"TRUE" means: Making the scaling visible.

SetTagBit example

```
{
//Set the tag to true
SetTagBit("gs_tag_bit",TRUE);
}
```

Parameters of the SetTagBit function:

"gs_tag_bit" is the name of the tag.

"TRUE" is the value to be written to the tag.

Beispiel SetTagBitStateWait

```
{
DWORD dwstate;

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the value of the tag to TRUE
//dwstate is the tag state
SetTagBitStateWait("gs_tag_bit",TRUE,&dwstate);

//User defined code where the
//user can do something with the return value
```

```
...
}
```

Parameters of the SetTagBitStateWait function:

"gs_tag_bit" is the name of the tag.

"TRUE" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

SetTagChar example

```
{
//Set the tag to Example text
SetTagChar("gs_tag_char","Example Text");
}
```

Parameters of the SetTagChar function:

"gs_tag_char" is the name of the tag.

"Example text" is the value to be written to the tag.

SetTagCharStateWait example

```
{
DWORD dwstate;

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the tag to Example Text
//dwstate is the tag state
SetTagCharStateWait("gs_tag_char","Example Text",&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagCharStateWait function:

"gs_tag_char" is the name of the tag.

"Example text" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

SetTagFloat example

```
{
//Set the tag to 55.4711
SetTagFloat("gs_tag_float",55.4711);
}
```

Parameters of the SetTagFloat function:

"gs_tag_float" is the name of the tag.

"55.4711" is the value to be written to the tag.

SetTagFloatStateWait example

```
{
DWORD dwstate;
char szValue[9];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the tag to 55.4711
//dwstate is the tag state
SetTagFloatStateWait("gs_tag_float",55.4711,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagFloatStateWait function:

"gs_tag_float" is the name of the tag.

"55.4711" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

SetTagMultiStateWait example

```
{
#define DATA_SIZE 5
DWORD dwData[DATA_SIZE];

//define all tags
BOOL lValue1;
long lValue2 ;
char szValue3[_MAX_PATH];
float lValue4;
char lValue5;

// Fill the tags with the values
// you want to set into the WinCC tags
...

//Set the WinCC tags
SetTagMultiStateWait(dwData,"%d%d%s%f%d","gs_tag_bit",lValue1,
 "gs_tag_SByte",lValue2,
 "gs_tag_char",szValue3,
 "gs_tag_float",lValue4,
 "gs_tag_word",lValue5);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagMultiStateWait function:

"dwData" is the DWord-Array, in which the tag statuses are stored.

"%d%d%s%f%d" are the type descriptions of the tags to be written.

"gs_tag_bit" is the WinCC tag to be written.

"lValue1" is the tag to whose value the WinCC tag gs_tag_bit is to be set.

"gs_tag_SByte" is the WinCC tag to be written.

"&lValue2" is the tag to whose value the WinCC tag gs_tag_SByte is to be set.

The other parameters are to be handled in the same way as those described previously.

1. Creating a DWord-Array with the required size (Number of tags).
2. Creating tags whose values are to be written to the WinCC tags.
3. Writing the values of the previously created and filled tags to the WinCC tags.l

4. Executing user-defined code for processing return values.

SetTagMultiWait example

```
BOOL ok;

ok=SetTagMultiWait("%d%s%f", "Ernie_word", 16,
  "Ernie_char", "Hello World",
  "Ernie_double", 55.4711);
```

SetTagPrefix example

```
{
//Set the TagPrefix to Struct1.
SetTagPrefix(lpszPictureName,"PicWindow1","Struct1.");

//Set the picture name again to update the tag prefix
SetPictureName(lpszPictureName,"PicWindow1","gs_graph_eafield");
}
```

Parameters of the SetTagPrefix function:

"lpszPictureName" is the name of the picture in which the object was configured.

"PictureWindow1" is the name of the object.

"Struct1." is the tag prefix to be set at picture window 1.

1. Set the tag prefix of the object "PictureWindow1" to "Struct1.".

2. Reset the name of the picture shown in the picture window to make the tag prefix setting effective.

SetTagRaw example

```
{
#define DATA_SIZE 3

BYTE byData[DATA_SIZE];

// Fill the Byte array with the values
// you want to set into the raw data tag
...

//Set the tag to the default values
SetTagRaw("gs_tag_raw",byData,DATA_SIZE);
```

```
}
```

Parameters of the SetTagRaw function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array whose values are written to the raw data tags.

"DATA_SIZE" is the number of values that will be written.

1. Creating a BYTE-Array with the required size (size of the raw data tag).
2. Filling the BYTE-Array with the values to be written.
3. Writing the values of the BYTE-Array to the raw data tag.

SetTagRawStateWait example

```
{
#define DATA_SIZE 3

BYTE byData[DATA_SIZE];
DWORD dwstate;
char szValue[9];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

// Fill the Byte array with the values
// you want to set into the raw data tag
...

//Set the tag to the default values
//dwstate is the tag state
SetTagRawStateWait("gs_tag_raw",byData,DATA_SIZE,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagRawStateWait function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array whose values are written to the raw data tags.

"DATA_SIZE" is the number of values that will be written.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Creating a BYTE-Array with the required size (size of the raw data tag).
2. Filling the BYTE-Array with the values to be written.
3. Writing the values of the BYTE-Array to the raw data tag.
4. Executing user-defined code for processing return values.

SetTagSByte example

```
{
//Set the tag to 50
SetTagSByte("gs_tag_SByte",50);
}
```

Parameters of the SetTagSByte function:

"gs_tag_SByte" is the name of the tag.

"50" is the value to be written to the tag.

Beispiel SetTagSByteStateWait

```
{
DWORD dwstate;
char szValue[9];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the tag to 50
//dwstate is the tag state
SetTagSByteStateWait("gs_tag_SByte",50,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagSByteStateWait:

"gs_tag_SByte" is the name of the tag.

"50" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

SetTagWord example

```
{
//Set the tag to 50
SetTagWord("gs_tag_word",50);
}
```

Parameters of the SetTagWord function:

"gs_tag_word" is the name of the tag.

"50" is the value to be written to the tag.

Beispiel SetTagWordStateWait

```
{
DWORD dwstate;
char szValue[9];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the tag to 50
//dwstate is the tag state
SetTagWordStateWait("gs_tag_word",50,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagWordStateWait funtion:

"gs_tag_word" is the name of the tag.

"50" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

SetText example

```
{
```

```
//Set the text Example Text on the StaticText field
SetText(lpszPictureName,"StaticText1","Example Text");
}
```

Parameters of the SetText function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

"ExampleText" is the text which is to be output.

SetTop example

```
{
//Set the y-position to 0
SetTop(lpszPictureName,"WinCCLogo",140);
}
```

Parameters of the SetTop function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

"140" is the Y position to which the object is set.

SetVisible example

```
{
//Set the Object visible
SetVisible(lpszPictureName,"GraphicObject1",TRUE);
}
```

Parameters of the SetVisible function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

"TRUE" means: The object is intended to be visible.

SetWidth example

```
{
```

```
//Set the width of the object to 400
SetWidth(lpszPictureName,"WinCCLogo",400);
}
```

Parameters of the SetWidth function

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

"400" is the width to which the object is set.

3.15.4.7 Examples - T to Z

TlgGetNumberOfColumns example

```
{
char text[5];
long int columns

//get number of Columns
columns = GetNumberOfColumns("TableControl_01");

//convert long int to char
sprintf(text,"%d",columns);

//set text on TextField5
SetText(lpszPictureName,"StaticText5",text);
}
```

Parameters of the TlgGetNumberOfColumns function:

"TableControl_01" is the name of the WinCC Table Control.

1. Temporarily store the return value of the TlgGetNumberofColumns in columns.
2. Temporarily store the return value in the text string.
3. Output the return value to a static text field.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

TlgGetNumberOfColumns example

```
{
char text[5];
long int columns

//get number of Columns
columns = GetNumberOfColumns("TableControl_01");

//convert long int to char
sprintf(text,"%d",columns);

//set text on TextField5
SetText(lpszPictureName,"StaticText5",text);
}
```

Parameters of the TlgGetNumberOfColumns function:

"TableControl_01" is the name of the WinCC Table Control.

1. Temporarily store the return value of the TlgGetNumberofColumns in columns.
2. Temporarily store the return value in the text string.
3. Output the return value to a static text field.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

TlgGetNumberOfRows example

```
{
char text[5];
long int rows;

//get number of rows
rows = TlgGetNumberOfRows("TableControl_01");
```

```
//convert long int to char
sprintf(text,"%d",rows);

//set text on TextField5
SetText(lpszPictureName,"StaticText5",text);
}
```

Parameters of the TlgGetNumberOfRows function:

TableControl_01 is the name of the WinCC Table Control.

1. Temporarily store the return value of the TlgGetNumberofRows in rows.
2. Temporarily store the return value in the text string.
3. Output the return value to a static text field.

TlgGetRulerTimeTrend example

```
{
SYSTEMTIME systime;
WORD wHour;
WORD wMin;
WORD wSec;

char szTime[10];

//Get the current systemtime
systime = TlgGetRulerTimeTrend("TrendControl_01",0);

//Get the hour
wHour = systime.wHour;
//Get the minute
wMin = systime.wMinute;
//Get the second
wSec = systime.wSecond;

//
sprintf(szTime,"%d:%d:%d",wHour,wMin,wSec);

//output the variable name
SetText(lpszPictureName,"StaticText7",szTime);
}
```

1. Read out the current system time.
2. Read out hour, minute and second from the SYSTEMTIME structure.
3. Create a string containing the time.
4. Output the current time.

TlgGetRulerVariableNameTrend example

```
{
char* pszVarName = NULL;
char szVarName[20];

//Get the ruler variable name
pszVarName = TlgGetRulerVariableNameTrend("TrendControl_01",0);

if (pszVarName != NULL)
{
//Copy the string
strncpy(szVarName,pszVarName,19);
}
//output the variable name
SetText(lpszPictureName,"StaticText6",szVarName);
}
```

Parameters of the TlgGetRulerVariableNameTrend function:

"TrendControl_01" is the name of the WinCC Trend Control.

"0" is the number of the trend.

1. Temporarily store the return value of the TlgGetRulerVariableNameTrend function in pszVarName.
2. If a valid value has been returned, copy the return value to szVarName.
3. Output the return value to a static text field.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

TlgTrendWindowPressOpenDlgButton example

```
{
//Opens the Property Dialog
TlgTrendWindowPressOpenDlgButton("TrendControl_01");
}
```

Parameters of the TlgTrendWindowPressOpenDlgButton function:

"TrendControl_01" is the window title of WinCC Trend Control.

TlgTrendWindowPressStartStopButton example

```
{
//start/stop the actualization
TlgTrendWindowPressStartStopButton("TrendControl_01");
}
```

Parameters of the TlgTrendWindowPressStartStopButton function:

"TrendControl_01" is the window title of WinCC Trend Control.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

TlgTrendWindowPressZoomInButton example

```
{
//zoom in
TlgTrendWindowPressZoomInButton("TrendControl_01");
}
```

Parameters of the TlgTrendWindowPressZoomInButton function:

"TrendControl_01" is the window title of WinCC Trend Control.

TlgTrendWindowPressZoomOutButton example

```
{
// zoom out
TlgTrendWindowPressZoomOutButton("TrendControl_01");
}
```

Parameters of the TlgTrendWindowPressZoomOutButton function:

"TrendControl_01" is the window title of WinCC Trend Control.

3.15.4.8 Examples of WinCC controls

How to add elements to a WinCC OnlineTrendControl

Introduction

In the following example, insert value columns with properties in an empty WinCC OnlineTableControl and link the columns to archive tags.

Prerequisite

- An archive is created in the "Tag Logging Editor" with three archive tags.
- A "WinCC OnlineTableControl" with the name "Control2" is inserted in the process picture in the Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured, for example, the event "mouse click" with a C action and the following script for the button.

Example

```
//enable BackColor
SetPropBOOL(lpszPictureName, "Control2", "UseColumnBackColor",TRUE);

//add new TimeColumn and assign column length
SetPropChar(lpszPictureName, "Control2", "TimeColumnAdd", "myRefTimeColumn");
SetPropWord(lpszPictureName, "Control2", "TimeColumnLength", 20);

//add new ValueColumn and assign properties
SetPropChar(lpszPictureName, "Control2", "ValueColumnAdd", "myValueTable1");
SetPropWord(lpszPictureName, "Control2", "ValueColumnProvider", 1);
SetPropChar(lpszPictureName, "Control2", "ValueColumnTagName", "Process value archive\
\PDL_ZT_1");
SetPropWord(lpszPictureName, "Control2", "ValueColumnBackColor", RGB(255,255,255));
SetPropChar(lpszPictureName, "Control2", "ValueColumnTimeColumn", "myRefTimeColumn");

//add new ValueColumn and assign properties
SetPropChar(lpszPictureName, "Control2", "ValueColumnAdd", "myValueTable2");
SetPropWord(lpszPictureName, "Control2", "ValueColumnProvider", 1);
SetPropChar(lpszPictureName, "Control2", "ValueColumnTagName", "Process value archive\
\PDL_ZT_2");
SetPropWord(lpszPictureName, "Control2", "ValueColumnBackColor", RGB(0,255,255));
SetPropChar(lpszPictureName, "Control2", "ValueColumnTimeColumn", "myRefTimeColumn");

//add new ValueColumn and assign properties
SetPropChar(lpszPictureName, "Control2", "ValueColumnAdd", "myValueTable3");
```

```
SetPropWord(lpszPictureName, "Control2", "ValueColumnProvider", 1);
SetPropChar(lpszPictureName, "Control2", "ValueColumnTagName", "Process value archive\
\PDL_ZT_3");
SetPropWord(lpszPictureName, "Control2", "ValueColumnBackColor", RGB(255,255,0));
SetPropChar(lpszPictureName, "Control2", "ValueColumnTimeColumn", "myRefTimeColumn");
```

Result

	myRefTimeAxis	myValueTable1	myValueTable2	myValueTable3
112	08.02.2010 14:15:03	1	1	84
113	08.02.2010 14:15:03	22	1	84
114	08.02.2010 14:15:04	2	1	84
115	08.02.2010 14:15:04	1	1	84
116	08.02.2010 14:15:05	1	1	84
117	08.02.2010 14:15:05	3	1	84
118	08.02.2010 14:15:06	1	1	84
119	08.02.2010 14:15:06	1	1	84
120	08.02.2010 14:15:07	18	1	84

How to add elements to a WinCC OnlineTrendControl

Introduction

In the following example you insert the Trend Window, Value Axis, Time Axis and Trends elements into an empty WinCC OnlineTrendControl.

Prerequisite

- An archive is created in the "Tag Logging Editor" with three archive tags.
- A "WinCC OnlineTrendControl" with the name "Control2" is inserted in the process picture in the Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured, for example, the event "mouse click" with a C action and the following script for the button.

Example

```
//create reference to new window, time and value axis
SetPropChar(lpszPictureName, "Control2", "TrendWindowAdd", "myWindow");
SetPropChar(lpszPictureName, "Control2", "TimeAxisAdd", "myTimeAxis");
SetPropChar(lpszPictureName, "Control2", "ValueAxisAdd", "myValueAxis");
```

```
//assign time and value axis to the window
SetPropChar(lpszPictureName, "Control2", "TimeAxisTrendWindow", "myWindow");
SetPropChar(lpszPictureName, "Control2", "ValueAxisTrendWindow", "myWindow");

//add new trend and assign properties
SetPropChar(lpszPictureName, "Control2", "TrendAdd", "myTrend1");
SetPropWord(lpszPictureName, "Control2", "TrendProvider", 1);
SetPropChar(lpszPictureName, "Control2", "TrendTagName", "Process value archive\
\PDL_ZT_1");
SetPropWord(lpszPictureName, "Control2", "TrendColor",  RGB(255,0,0));
SetPropChar(lpszPictureName, "Control2", "TrendTrendWindow", "myWindow");
SetPropChar(lpszPictureName, "Control2", "TrendTimeAxis", "myTimeAxis");
SetPropChar(lpszPictureName, "Control2", "TrendValueAxis", "myValueAxis");

//add new trend and assign properties
SetPropChar(lpszPictureName, "Control2", "TrendAdd", "myTrend2");
SetPropWord(lpszPictureName, "Control2", "TrendProvider", 1);
SetPropChar(lpszPictureName, "Control2", "TrendTagName", "Process value archive\
\PDL_ZT_2");
SetPropWord(lpszPictureName, "Control2", "TrendColor", RGB(0,255,0));
SetPropChar(lpszPictureName, "Control2", "TrendTrendWindow", "myWindow");
SetPropChar(lpszPictureName, "Control2", "TrendTimeAxis", "myTimeAxis");
SetPropChar(lpszPictureName, "Control2", "TrendValueAxis", "myValueAxis");

//add new trend and assign properties
SetPropChar(lpszPictureName, "Control2", "TrendAdd", "myTrend3");
SetPropWord(lpszPictureName, "Control2", "TrendProvider", 1);
SetPropChar(lpszPictureName, "Control2", "TrendTagName", "Process value archive\
\PDL_ZT_3");
SetPropWord(lpszPictureName, "Control2", "TrendColor", RGB(0,0,255));
SetPropChar(lpszPictureName, "Control2", "TrendTrendWindow", "myWindow");
SetPropChar(lpszPictureName, "Control2", "TrendTimeAxis", "myTimeAxis");
SetPropChar(lpszPictureName, "Control2", "TrendValueAxis", "myValueAxis");
```

3.15.5 Lists

3.15.5.1 Bar direction

Bar direction	Numeric value
Up	0
bottom	1
left	2
right	3

3.15.5.2 Bar Scaling

Numeric value	Bar Scaling
0	Linear (same weighting)
1	Logarithmic (low values emphasized)
2	Negative logarithmic (high values emphasized)
3	Automatic (linear)
4	Tangential (high and low values emphasized)
5	Square (high values emphasized)
6	Cubic (high values strongly emphasized)

3.15.5.3 Flash frequencies

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Since the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time etc.).

The information in the table is therefore only for orientation purposes.

3.15.5.4 I/O field, output format

The display of numeric values output into an I/O field is controlled by a format specification.

A format indication consists of one or several formatting characters. The valid formatting characters and their meaning are listed in the following table:

Characters	Meaning	Note
s	Positive numbers are displayed with signs	Always in the first position of the format specification May only appear once in the format specification
0(ZERO)	Leading and ending zeros are output.	Always following s If s is missing, it is in the first position May only appear once in the format specification
9	Specifies the position of a digit in the number to be output	May appear in the format indication as often as required.

Characters	Meaning	Note
, (comma)	Position of the decimal point	
e	Returns the number in exponential form	Always at the last position of the format specification

Example:

Number	Format	Representation
123,455	999,999	123,455
123,455	999,99	123,46
123,455	9999,9999	123,4550
123,455	s09999.9999	+0123,4550
123,455	9.99999e	1.23455e+002

If the decimal point is left out in the format specification the decimal places are not displayed and the number is rounded to an integer.

If fewer decimal positions are provided in the format specification than the number actually has, only the decimal places specified in the format specification are output.

The number is rounded correspondingly.

If the number has more places before the decimal point than specified in the format specification, three asterisks (***) are output which means that the number cannot be displayed in this format.

3.15.5.5 I/O field, data type of the field content

Data type	Numeric value
Binary	0
decimal	1
string	2
hexadecimal	3

3.15.5.6 I/O field, field type

Type	Numeric value
Edition	0
Input	1
Output and input	2

3.15.5.7 Element alignment in check boxes and radio boxes

Alignment	Numeric value
left	0
right	-1

3.15.5.8 Color chart

The 16 primary colors are:

Color	Color value (Hex)	symbolic constant
Red	0x000000FF	CO_RED
Dark red	0x00000080	CO_DKRED
Green	0x0000FF00	CO_GREEN
Dark green	0x00008000	CO_DKGREEN
Blue	0x00FF0000	CO_BLUE
Dark blue	0x00800000	CO_DKBLUE
Cyan	0x00FFFF00	CO_CYAN
Dark cyan	0x00808000	CO_DKCYAN
Yellow	0x0000FFFF	CO_YELLOW
Dark yellow	0x00008080	CO_DKYELLOW
Magenta	0x00FF00FF	CO_MAGENTA
Dark magenta	0x00800080	CO_DKMAGENTA
Light gray	0x00C0C0C0	CO_LTGRAY
Gray	0x00808080	CO_DKGRAY

Color	Color value (Hex)	symbolic constant
Black	0x00000000	CO_BLACK
White	0x00FFFFFF	CO_WHITE

Note

The symbolic constants are externally predefined by #define and provied by WinCC.

3.15.5.9 Format descriptors

For format descriptors the following type is expected:

%d = DWORD / Int

%f = double

%s = char*

It is also possible e.g. to read a text tag with %d if provisions are made that the value can be mapped in a DWORD.

The following provision makes sure the value can be mapped:

Variable	Format	C-tag
Bit	%d	DWORD / long int signed
Byte	%d	DWORD / long int signed
SByte	%d	DWORD / long int signed
Word	%d	DWORD / long int signed
SWord	%d	DWORD / long int signed
DWord	%d	DWORD / long int signed
SDWord	%d	DWORD / long int signed
Float	%f	double
Double	%f	double
Char	%s	char*

Note

If a "DWORD," for which the 32nd bit is set, is to be read, a format descriptor must be used for unsigned integers (%u).

3.15.5.10 Fill pattern

Fill pattern	Value
Transparent	65536
Solid	0

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	1048576		196611		196627
	1048577		196612		196628
	1048578		196613		196629
	1048579		196614		196630
	1048832		196615		196631
	1048833		196616		196632
	1048834		196617		196633
	1048835		196618		196634
	131072		196619		196635
	131073		196620		196636
	131074		196621		196637
	131075		196622		196638
	131076		196623		196639
	196608		196624		196640
	196609		196625		196641
	196610		196626		196642

Note

The "Solid" fill pattern fills the object with the set background color.

3.15.5.11 Line styles

Line style	symbolic name	Value
	LS_SOLID	0
	LS_DASH	1
	LS_DOT	2
	LS_DASHDOT	3
	LS_DASHDOT DOT	4
hidden	LS_INVISIBLE	5

3.15.5.12 Line end style

Line end	symbolic name	Value for the left line ends	Value for the right line ends
	LE_NO	0	0
	LE_HOLLOW_ARROW	1	65536
	LE_FULL_ARROW	2	131072
	LE_CFULL_ARROW	3	196608
	LE_LINE	4	262144
	LE_HOLLOW_CIRCLE	5	327680
	LE_FULL_CIRCLE	6	393216

Note

From a line width > 5 the line end "empty circle" is displayed as filled circle.

3.15.5.13 List types

List type	Numeric value
decimal	0
Binary	1
bit	2

3.15.5.14 Language ID

WinCC only supports the SUBLANG_DEFAULT languages of Windows.

symbolic name	Value (hexadecimal)	Abbreviation
LANG_ARABIC	0x0401	
LANG_AFRIKAANS	0x0436	
LANG_ALBANIAN	0x041C	
LANG_BASQUE	0x042D	
LANG_BULGARIAN	0x0402	
LANG_BYELORUSSIAN	0x0423	
LANG_CATALAN	0x0403	
LANG_CHINESE	0x0404	
LANG_CROATIAN	0x041A	
LANG_CZECH	0x0405	CSY
LANG_DANISH	0x0406	DAN
LANG_DUTCH	0x0413	NLD

LANG_SWEDISH	0x041D	SVE
LANG_THAI	0x041E	
LANG_TURKISH	0x041F	TRK
LANG_UKRAINIAN	0x0422	

3.15.5.15 Text alignment

Horizontal	Alignment	Numeric value
	left	0
	centered	1
	right	2

Vertical	Alignment	Numeric value
	Up	0
	centered	1
	bottom	2

3.15.5.16 Tag statuses

Value (decimal)	Value (hexdecimal)	Meaning
0	0x0000	No error
1	0x0001	Connection to partner not established
2	0x0002	Handshake error
4	0x0004	Network module defective

Value (decimal)	Value (hexdecimal)	Meaning
8	0x0008	Configured upper limit exceeded
16	0x0010	Configured lower limit exceeded
32	0x0020	Format upper limit exceeded
64	0x0040	Format lower limit exceeded
128	0x0080	Conversion error
256	0x0100	Tag initialization value
512	0x0200	Tag replacement value
1024	0x0400	Channel addressing error
2048	0x0800	Tag not found or not available
4096	0x1000	Access to tag not permitted
8192	0x2000	Timeout, no check-back message from the channel
16384	0x4000	Server not available.

3.15.6 Structure definitions

3.15.6.1 Structure definition CCAPErrorExecute

```
typedef struct {
DWORD dwCurrentThreadID; Thread ID of the current thread
DWORD dwErrorCode1;      Error code 1
DWORD dwErrorCode2;      Error code 2
BOOL bCycle;             cycle/acycle
char* szApplicationName; Name of the application
char* szFunctionName;    Name of the function
char* szTagName;         Name of the tag
LPVOID lpParam;          Pointer to the action stack
DWORD dwParamSize;       Size of the action stack
DWORD dwCycle;           Cycle of the variable
CMN_ERROR* pError;       Pointer to CMN_ERROR
} CCAPErrorExecute;
```

Members

The meaning of the individual error IDs and the structure elements depending on them are specified in the following table:

dwErrorCode1	dwErrorCode2	bCycle	szApplicationName	szFunctionName	szTagName	lpParamSize	dwParamSize	dwCycle	pError	Description
1007001	0	X	X	X		X	X			Action requires exception
1007001	1	X	X	X		X	X			Exception when accessing the return result
1007001	4097	X	X	X		X	X			Stack overflow while executing the action
1007001	4098	X	X	X		X	X			The action contains a division by 0
1007001	4099	X	X	X		X	X			The action contains an access to a non-existing symbol
1007001	4100	X	X	X		X	X			The action contains an access violation
1007004	0	X	X	X						Function is not known
1007005	1	X	X							Action does not include a P code.
1007005	2	X	X							Incorrect function name
1007005	4	X	X	X		X	X			Return value type is invalid
1007005	32768ff	X	X	X		X	X			Ciss Compiler error when loading the action
1007006	0	X	X	X	X	X	X	X		Tag is not defined
1007006	1	X	X	X	X	X	X	X		Tag timeout
1007006	2	X	X	X	X	X	X	X	X	Tag cannot be returned in the desired format
1007006	3	X	X	X	X	X	X	X	X	Tag returns status violation, status present in CMN_ERROR.dwError1
1007007	1	X	X	X		X	X		X	Error in PDLRTGetProp
1007007	2	X	X	X		X	X		X	Error in PDLRTSetProp
1007007	3	X	X	X		X	X		X	Error with DM call

Error structure

The OnErrorExecute function uses the error structure to evaluate or to output error messages, if marked by an "x" in the pError column.

See also

Structure definition CMN_ERROR (Page 2295)

3.15.6.2 Structure definition CCAPTime

```
typedef struct {
DWORD dwCurrentThreadID; ThreadID of the current Thread
DWORD dwCode;            Code
BOOL bCycle;             cycle/acycle
char* szApplicationName; Name of the Application
char* szFunctionName;    Name of the Function
LPVOID lpParam;          Pointer to the Action-Stack
DWORD dwParamSize;       size of the Action-Stack
double dblTime;
DWORD dwFlags;           flags
} CCAPTime;
```

Members

dwCode

The structure element dwCode provides information on calling OnTime:

dwCode = 113	Call with time definition for each action
dwCode = 114	Call with time monitoring for each action

dwFlags

The structure element dwFlags provides information on the output type:

dwFlags = TRUE	The results are output to a file
dwFlags = FALSE	The results are output to the diagnostics window

3.15.6.3 Structure definition CMN_ERROR

```
struct CMNERRORSTRUCT {
DWORD       dwError1,
DWORD       dwError2,
DWORD       dwError3,
DWORD       dwError4,
DWORD       dwError5;
TCHAR       szErrorText[MAX_ERROR_LEN];
}
CMN_ERROR
```

Description

The extended error structure contains the error code and an error text for the error that has occurred. Each application can use the error structure to evaluate or to output error messages.

Members

dwError1 .. dwError5

These entries can be used in any way by the API functions.

The API descriptions inform about the values the respective entries contain in case of an error. If not specified otherwise, the error codes are present in dwError1.

szErrorText

Buffer for the text description of the error cause

The content is determined from the resources and therefore language-dependent.

3.15.6.4 Structure definition DM_TYPEREF

```
typedef struct {
DWORD dwType;
DWORD dwSize;
char szTypeName[MAX_DM_TYPE_NAME + 1];
}
DM_TYPEREF;
```

Members

dwType

Specifies the tag type

DM_VARTYPE_BIT	Binary tag
DM_VARTYPE_SBYTE	Signed 8-bit value
DM_VARTYPE_BYTE	Unsigned 8-bit value
DM_VARTYPE_SWORD	Signed 16-bit value
DM_VARTYPE_WORD	Unsigned 16-bit value
DM_VARTYPE_SDWORD	Signed 32-bit value
DM_VARTYPE_DWORD	Unsigned 32-bit value
DM_VARTYPE_FLOAT	Floating-point number 32-bit IEEE 754
DM_VARTYPE_DOUBLE	Floating-point number 64-bit IEEE 754
DM_VARTYPE_TEXT_8	Text tag, 8-bit font
DM_VARTYPE_TEXT_16	Text tag, 16-bit font
DM_VARTYPE_RAW	Raw data type
DM_VARTYPE_STRUCT	Structure tag
DM_VARTYPE_TEXTREF	Text reference tag

dwSize

Specifies the length of the data type in bytes.

szTypeName

In the case of structure tags, contains the name of the structure type

3.15.6.5 Structure definition DM_VAR_UPDATE_STRUCT

```
typedef struct {
DM_TYPEREF dmTypeRef;
DM_VARKEY dmVarKey;
VARIANT dmValue;
DWORD dwState;
}
DM_VAR_UPDATE_STRUCT;
```

Members

dmTypeRef

Contains information on the tag type. For performance reasons, nothing is entered into this structure in case of cyclic requirements.

dmVarKey

Specifies the tags to be edited.

dmValue

Tag value

Upon access to the value of the VARIANT a ".u." has to be inserted between the name of the VARIANT and the name of the member.

```
Example:
// Supply variant
myVariant.vt = VT_I4;
myVariant.u.lVal = 233;
```

A description of the data type VARIANT can be found in the associated documentation. The VARIANT dmValue must be initialized with VariantInit() before first use and enabled again with VariantClear(&dmValue) after use. For this reason, the structure DM_VAR_UPDATE_STRUCT must not be deleted with ZeroMemory() or memset().

dwState

Identifies the tag status.

See also

Tag statuses (Page 2289)

Structure definition DM_VARKEY (Page 2298)

Structure definition DM_TYPEREF (Page 2293)

3.15.6.6 Structure definition DM_VAR_UPDATE_STRUCTEX

```
typedef struct {
DM_TYPEREF dmTypeRef;
DM_VARKEY dmVarKey;
VARIANT dmValue;
DWORD dwState;
DWORD dwQualityCode;
}
DM_VAR_UPDATE_STRUCTEX;
```

Members

dmTypeRef

Contains information on the tag type. For performance reasons, nothing is entered into this structure in case of cyclic requirements.

dmVarKey

Specifies the tags to be edited.

dmValue

Tag value

Upon access to the value of the VARIANT a ".u." has to be inserted between the name of the VARIANT and the name of the member.

```
Example:
// Supply variant
myVariant.vt = VT_I4;
myVariant.u.lVal = 233;
```

A description of the data type VARIANT can be found in the associated documentation. The VARIANT dmValue must be initialized with VariantInit() before first use and enabled again with VariantClear(&dmValue) after use. For this reason, the structure DM_VAR_UPDATE_STRUCTEX must not be deleted with ZeroMemory() or memset().

dwState

Identifies the tag status.

dwQualityCode

Identifies the tag quality code.

See also

Tag statuses (Page 2289)

Structure definition DM_VARKEY (Page 2298)

Structure definition DM_TYPEREF (Page 2293)

3.15.6.7 Structure definition DM_VARKEY

```
typedef struct {
DWORD dwKeyType;
DWORD dwID;
char szName[ MAX_DM_VAR_NAME + 1 ];
LPVOID lpvUserData;
}
DM_VARKEY;
```

Members

dwKeyType

Defines whether the tag is to be addressed by a key ID or by its name.

DM_VARKEY_ID Specification via key ID

DM_VARKEY_NAME Specification via tag name

dwID

Contains the key ID of the tags if dwKeyType is set accordingly

szName

Contains the name of the tag if dwKeyType is set accordingly

lpvUserData

Pointer to application-specific data

3.15.6.8 Structure definition LINKINFO

```
typedef struct {
LINKTYPE LinkType;
DWORD dwCycle;
TCHAR szLinkName[256];
}
LINKINFO;
```

Members

LinkType

LinkType are enumeration constants defined in the "Trigger.h" file. They are to be integrated into your script with the #include "Trigger.h" command and the corresponding enumeration constants.

BUBRT_LT_NOLINK	0	no shortcut
BUBRT_LT_VARIABLE_DIRECT	1	direct tag
BUBRT_LT_VARIABLE_INDIRECT	2	indirect tag
BUBRT_LT_ACTION	3	C action
BUBRT_LT_ACTION_WIZARD	4	Dynamic Dialog
BUB_LT_DIRECT_CONNECTION	5	Direct connection
BUBRT_LT_ACTION_WIZARD_INPROC	6	Dynamic Dialog

For the function SetLink only the enumeration constants BUBRT_LT_VARIABLE_DIRECT and BUBRT_LT_VARIABLE_INDIRECT may be used. The function GetLink allows to return all listed enumeration constants.

dwCycle

Update cycle time

dwCycle	Update Cycle
255	Picture cycle
235	Window Cycle
0	Upon change
1	250ms

dwCycle	Update Cycle
2	500 ms
3	1 s
4	2 s
5	5s
6	10s
7	1min
8	5min
9	10min
10	1h
11-15	User cycle 1-5

szLinkName

Tag name

3.15.6.9 Structure definition MSG_FILTER_STRUCT

```
typedef struct {
CHAR        szFilterName[MSG_MAX_TEXTLEN+1];
WORD        dwFilter;
SYSTEMTIME  st[2];
DWORD       dwMsgNr[2];
DWORD       dwMsgClass;
DWORD       dwMsgType[MSG_MAX_CLASS];
DWORD               dwMsgState;
WORD        wAGNr[2];
WORD        wAGSubNr[2];
DWORD       dwArchivMode;
char        szTB[MSG_MAX_TB][
MSG_MAX_TB_CONTENT+1]
DWORD       dwTB;
Double      dPValue[MSG_MAX_PVALUE][2];
DWORD       dwPValue[2];
DWORD       dwMsgCounter[2];
DWORD       dwQuickSelect;
}
MSG_FILTER_STRUCT;
```

Description

In this structure the filter criteria are specified.

Members

dwFilter

The filter conditions are defined by means of the following constants from the file "m_global.h":

MSG_FILTER_DATE_FROM	Date from
MSG_FILTER_DATE_TO	Date to
MSG_FILTER_TIME_FROM	Time from
MSG_FILTER_TIME_TO	Time to
MSG_FILTER_NR_FROM	Message number from
MSG_FILTER_NR_TO	Message number to
MSG_FILTER_CLASS	Message classes
MSG_FILTER_STATE	Message status
MSG_FILTER_AG_FROM	AS number from
MSG_FILTER_AG_TO	AS number to
MSG_FILTER_AGSUB_FROM	AG subnumber from
MSG_FILTER_AGSUB_TO	AG subnumber to
MSG_FILTER_TEXT	Message texts
MSG_FILTER_PVALUE	Process values

MSG_FILTER_COUNTER_FROM	Internal message counter from
MSG_FILTER_COUNTER_TO	Internal message counter to
MSG_FILTER_PROCESSMSG	Process messages
MSG_FILTER_SYSMSG	System messages
MSG_FILTER_BEDMSG	Operator messages
MSG_FILTER_DATE	Date from to
MSG_FILTER_TIME	Time from to
MSG_FILTER_NR	Message number from to
MSG_FILTER_VISIBLEONLY	Display visible messages
MSG_FILTER_HIDDENONLY	Display hidden messages

st

Date/time from - to

Where st[0] is the start time (from), st[1] the end time (to)

Assign these fields for the filter criteria: MSG_FILTER_DATE, MSG_FILTER_DATE_FROM, MSG_FILTER_DATE_TO, MSG_FILTER_TIME, MSG_FILTER_TIME_FROM or MSG_FILTER_TIME_TO

If a current time is needed for the transfer of a SYSTEMTIME parameter the function GetLocalTime is to be used instead of GetSystemTime. As a rule there is a significant time difference between these two functions.

dwMsgNr

Message number from - to

Where dwMsgNr[0] is the start no. (from), dwMsgNr[1] the end no. (to)

Assign these fields for the filter criteria: MSG_FILTER_NR, MSG_FILTER_NR_FROM or MSG_FILTER_NR_TO

dwMsgClass

Message classes bit-coded.

Assign this field for the filter criterion: MSG_FILTER_CLASS

dwMsgType

Message type per message class, bit-coded

Assign this field for the filter criterion: MSG_FILTER_CLASS

dwMsgState

Message status bit-coded.

Assign this field for the filter criterion: MSG_FILTER_STATE

wAGNr

AGNr from - to

Assign these fields for the filter criteria: MSG_FILTER_AG_FROM or MSG_FILTER_AG_TO

wAGSubNr

AGSubNr from - to

Assign this field for the filter criteria: MSG_FILTER_AGSUB_FROM or MSG_FILTER_AGSUB_TO

dwArchivMode

Archiving / logging

Must be assigned 0.

szTB

Texts of the text blocks

Assign these fields for the filter criterion: MSG_FILTER_TEXT

dwTB

Active text blocks (from - to, bit-coded)

Assign this field for the filter criterion: MSG_FILTER_TEXT

dPValue

Process values from - to

Assign these fields for the filter criterion: MSG_FILTER_PVALUE

dwPValue

Active process values (from - to, bit-coded)

Assign this field for the filter criterion: MSG_FILTER_PVALUE

dwMsgCounter

Internal message counter from - to

Assign these fields for the filter criteria: MSG_FILTER_COUNTER_FROM, MSG_FILTER_COUNTER_TO

dwQuickSelect

Quick selection for hour, day, month

The parameter is reserved for future upgrades and must be preset to 0.

Assign this field for the filter criterion: MSG_FILTER_QUICKSELECT

LOWORD type:

MSG_FILTER_QUICK_MONTH	Quick selection last n months
MSG_FILTER_QUICK_DAYS	Quick selection last n days
MSG_FILTER_QUICK_HOUR	Quick selection last n hours

HIWORD number: 1...n

The end time of the quick selection refers to the current system time of the local computer. The start time is calucalted back n * (months, days, hours).

3.15.6.10 Structure definition MSG_RTDATA_STRUCT

```
typedef struct {
DWORD                dwMsgState;
DWORD                dwMsgNr;
SYSTEMTIME           stMsgTime;
DWORD                dwTimeDiff;
DWORD                dwCounter;
DWORD                dwFlags;
WORD                 wPValueUsed;
WORD                 wTextValueUsed;
double               dPValue[MSG_MAX_PVALUE];
MSG_TEXTVAL_STRUCT   mtTextValue[MSG_MAX_PVALUE];
}
MSG_RTDATA_STRUCT;
```

Members

dwMsgState

Message status

MSG_STATE_COME	0x00000001	Message came in
MSG_STATE_GO	0x00000002	Message went out

MSG_STATE_QUIT	0x00000003	Message acknowledged
MSG_STATE_LOCK	0x00000004	Message locked
MSG_STATE_UNLOCK	0x00000005	Message unlocked
MSG_STATE_QUIT_SYSTEM	0x00000010	Message acknowledged by system
MSG_STATE_QUIT_EMERGENCY	0x00000011	Emergency acknowledgement
MSG_STATE_QUIT_HORN	0x00000012	Horn acknowledgement
MSG_STATE_COMEGO	0x00000013	Message came in and went out, only display in message list
MSG_STATE_UPDATE	0x00010000	Bit for message update
MSG_STATE_RESET	0x00020000	Bit for message reset
MSG_STATE_SUMTIME	0x00040000	Bit active for daylight savings time
MSG_STATE_INSTANCE	0x00080000	Bit for instance message (n messages of a no.)

dwMsgNr

Message number

stMsgTime

Date/Time: Telegram time depending on the calling function

dwTimeDiff

Duration coming/Telegram time in seconds

dwCounter

Internal message counter

dwFlags

Message flags in the database

MSG_FLAG_SUMTIME	0x00000001	Daylight savings time active
MSG_FLAG_COMMENT	0x00000002	Message has comments
MSG_FLAG_ARCHIV	0x00000004	Archiving
MSG_FLAG_PROTOCOL	0x00000008	Logging
MSG_FLAG_TEXTVALUES	0x00000010	Message has values accompanying the text
MSG_FLAG_TIMEINVALID	0x00000020	Bit for invalid date/time stamp
MSG_FLAG_INSTANCE	0x00000040	Instance message identification (185269)

wPValueUsed

Process values used, bit-coded. Every bit may only be set in one of the two structure elements "wPValueUsed" or "wTextValueUsed". An accompanying value may either be a number or a text.

wTextValueUsed

text values used, bit-coded. Every bit may only be set in one of the two structure elements "wPValueUsed" or "wTextValueUsed". An accompanying value may either be a number or a text.

ANSI-C function descriptions 4

4.1 lpszPictureName

Overview

"lpszPictureName" is the name of the picture.

If you configure an action on a property or a "Mouse-click" event in WinCC, the name of the picture is provided as "lpszPictureName" in the action. The picture name has the following structure:

<BASE PICTURE NAME>.<PICTURE WINDOW NAME>:<PICTURE NAME>. ... .<Picture window name>:<Picture name>.

The "BASE PICTURE NAME" and the "PICTURE NAME" are provided without the file extension ".PDL".

This enables you to identify the object's picture path. You can also address specific picture windows, if a process picture is opened more than once for example.

Note

Do not change the text in "lpszPictureName not even using the function "strcat".

4.2 Standard functions

4.2.1 Standard functions - short description

The system provides standard functions. You can modify these functions to adapt them to your personal needs. Furthermore, you can create your own standard functions.

The basic system provides you with standard functions. They are divided into the following function groups:

- Alarm
- Graphics
- Report
- TagLog
- WinCC
- Windows

The "Obsolete functions" directory contains standard functions that were used to control the control before WinCC V7.

If the corresponding options have been installed, the following additional function groups are available:

- Options
- Split Screen Manager
- userarc (user archives)

4.2.2 Alarm

4.2.2.1 AcknowledgeMessage

Function

Acknowledges the message with the number that has been sent as a parameter in the message system.

Syntax

void AcknowledgeMessage(DWORD MsgNr)

Parameters

MsgNo

Message to be acknowledged

Note

Make sure a configured message exists for the transferred message number.
To use the function on a client with its own project, a standard server for alarms has to be configured on the client.

See also

AcknowledgeMessage example

4.2.2.2 AXC_SetFilter

Function

External message window operation

This function sets a filter for WinCC Alarm Control to show a portion of the existing messages according to the filter criterion.

Syntax

BOOL AXC_SetFilter(char* lpszPictureName, char* lpszObjectName, LPMSG_FILTER_STRUCT lpMsgFilter, LPCMN_ERROR, lpError)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the WinCC Alarm Control name

lpMsgFilter

Pointer to the structure containing the filter criterion

lpError

Pointer to the structure of the error description

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

CMN_ERROR structure definition

ResetFilter example

AXC_SetFilter example

Structure definition MSG_FILTER_STRUCT structure definition

4.2.2.3 GCreateMyOperationMsg

Function

The "GCreateMyOperationMsg" standard function makes it possible to trigger your own operator input message in the message system. The message with the "dwMsgNum" message number must have already been configured as the operator input message.

Syntax

int GCreateMyOperationMsg(DWORD dwFlags, DWORD dwMsgNum, char* lpszPictureName, char* lpszObjectName, DWORD dwMyTextID, double doValueOld, double doValueNew, char* pszComment)

Parameters

dwFlags

The message form can be selected using the "dwFlags" parameter.

Name	Value	Description
FLAG_COMMENT_PARAMETER	0x00000001	The text is entered as a comment directly into the message in Runtime, without its own comment dialog. The pointer to the comment must not equal "NULL."
FLAG_COMMENT_DIALOG	0x00000003	A comment dialog appears. The comment entered there is transferred to the message.
FLAG_TEXTID_PARAMETER	0x00000100	The text ID of a text from the TextLibrary is provided as the accompanying process value of the message.

dwMsgNum

WinCC message number of a self-created operator input message.

lpszPictureName

Pointer to the picture name of the picture from which the function is called.

lpszObjectName

Pointer to the WinCC tag name to which the old values and new values belong.

The name is forwarded as the instance name of the operator input message and entered in the accompanying process value "1".

dwMyTextID

Text ID of a text from the TextLibrary.

When the "FLAG_TEXTID_PARAMETER" is set, the text ID is provided as the numeric accompanying process value "8" of the message and is displayed as a number in process value block 8. So that the language-dependent text from the TextLibrary is displayed in the message, you must enter format statement "@8%s@" in the message text block.

doValueOld

Numeric old value of the WinCC tags with the name specified in "lpszObjectName". "doValueOld" is entered in the accompanying process value "2" of the message.
The function itself has no option of reading a tag value before the action. For this, use the provided "GetTag..." feature.

doValueNew

Numeric new value of the WinCC tags with the name specified in "lpszObjectName". "doValueNew" is entered in the accompanying proces value "3" of the message.
The function itself has no option of reading a tag value after the action. For this, use the provided "GetTag..." feature.

pszComment

Comment text or empty string.

When "FLAG_COMMENT_PARAMETER" is set, the text is entered directly into the message in Runtime as a comment. The message does not need a separate comment dialog.

Return value

Value	Description
0	The function has been completed without any errors.
-101	The message editing could not be started.
-201	An error occurred when calling the "MSRTGetComment()" feature.
-301	An error occurred when calling the "MSRTCreateMsgInstanceWithComment()" feature.

Note

Make sure that only operator input messages are used for the "GCreateMyOperationMsg" function. The use of messages of different message classes is not permitted.

Please note the role of the standard server when using the function with a Client. For more information see the chapter "Client configuration".

4.2.2.4 GMsgFunction

Function

This function provides the message data.

It is a global function for single messages. It is called for each message for which the "Triggers an action" parameter has been set.

Evaluation of the message data is best made in a project function called from GMsgFunction.

Syntax

BOOL GMsgFunction(char* pszMsgData)

Parameters

pszMsgData

Pointer to a string whose data are mapped with scanf to the MSG_RTDATA_STRUCT structure.

The "MSG_RTDATA_STRUCT" string contains the following data, which are separated from each other with "#":

1. Telegram time
2. Process values
3. Instance
4. User

5. Computer
6. Current time in format "yyyy.mm.dd, hh:mm:ss.mmm"

Note

The value "Instance" of string "MSG_RTDATA_STRUCT" is only supplied if an instance message was triggered.

The values "User" and "Computer" of the string "MSG_RTDATA_STRUCT" are only supplied if a comment was provided during the creation of the message with the same call.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Please note that modified standard functions are overwritten by a WinCC installation so that the changes will be lost.

See also

Structure definition MSG_RTDATA_STRUCT

4.2.3 Graphics

4.2.3.1 Graphics - short description

The Graphics group contains functions for programming the graphic system.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.2.3.2 GetLinkedVariable

Function

Provides the name of the variable linked to a certain object property.

Syntax

char* GetLinkedVariable(char* lpszPictureName, char* lpszObjectName, char* lpszPropertyName);

Parameters

lpszPictureName

Pointer to the picture

lpszObjectName

Pointer to the object

lpszPropertyName

Pointer to the object property

Return value

Pointer to the name of the tag linked to a certain object property.

See also

GetLinkedVariable example

4.2.3.3 GetLocalPicture

Function

Provides a pointer to the name of the picture. The picture name is the file name without the ".PDL" extension.

Syntax

char* GetLocalPicture(char* lpszPictureName);

Parameters

lpszPictureName

Pointer to the picture

Return value

Pointer on the name of the picture.

Note

The passed call parameter lpszPictureName must have the structure provided by the graphics system for the picture paths:

<Basic picture name>.<Picture window name>:<Picture name>. ... .<Picture window name>[:<Picture name>]

where <Basic picture name> and <Picture name> go without the ".PDL" file extension.

Example:

In a basic picture "AAA" there is a picture window "bbb" in which a picture "CCC" is called which itself contains a picture window "ddd" in which a picture "EEE" is called.

Then the function call

```
GetLocalPicture(lpszPictureName)
```

returns the pointer to the picture name:

"EEE" if the functions is called in the picture "EEE";

"CCC" if the functions is called in the picture "CCC";

"AAA" if the functions is called in the picture "AAA".

See also

GetLocalPicture example

4.2.3.4 GetParentPicture

Function

Provides a pointer to the name of the picture. The picture name is the file name without the ".PDL" extension.

Syntax

char* GetParentPicture(char* lpszPictureName);

Parameters

lpszPictureName

Pointer to the picture

Return value

Name of the current picture if the function is called in the basic picture

Name path of the higher-level picture if the function is called in a picture window

Note

The passed call parameter lpszPictureName must have the structure provided by the graphics system for the picture paths:

<Basic picture name>.<Picture window name>:<Picture name>. ... .<Picture window name>[:<Picture name>]

where <Basic picture name> and <Picture name> go without the ".PDL" file extension.

See also

GetParentPicture example

4.2.3.5 GetParentPictureWindow

Function

Provides a pointer to the name of the picture window.

Syntax

char* GetParentPictureWindow(char* lpszPictureName);

Parameters

lpszPictureName

Pointer to the picture

Return value

Pointer to the name of the picture window if the function is called in a picture displayed in a picture window of a higher-level picture

Call parameter lpszPictureName unchanged if the function is called in the basic picture

Note

The passed call parameter lpszPictureName must have the structure provided by the graphics system for the picture paths:

<Basic picture name>.<Picture window name>:<Picture name>. ... .<Picture window name>[:<Picture name>]

where <Basic picture name> and <Picture name> go without the ".PDL" file extension.

Example:

In a basic picture "Picture_1" there is a picture window "Picture_window_1" in which a picture "Picture_2" is called.

In the picture "Picture_2" there is a picture window "Picture_window_2" in which a picture "Picture_3" is called.

Then the function call

```
GetParentPictureWindow(lpszPictureName)
```

returns the pointer to the picture window name:

"Picture_2" if the function is called in the picture "Picture_3";

"Picture_window_1" if the function is called in the picture "Picture_2";

"Picture_1" if the function is called in the picture "Picture_1".

4.2.3.6 OpenPicture

Function

Changes the specified basic picture. On the client and in case of a picture name with server prefix a picture change is performed in the picture window.

If, for example, the picture window is located in a different picture window with a server prefix, a picture change is not performed in the picture window in which the function was called.

If multiple picture windows with server prefix are integrated in the picture and the "OpenPicture()" function calls the last picture, the picture change is carried out in the first picture window, e.g.
"screen1.window1(screen2.window2(screen3.window3(screen4.OpenPicture)))" executes a picture change in "window1".

Syntax

void OpenPicture(Picture PictureName)

Parameters

Picture name

Picture name

4.2.3.7 Registry2

Function

This function manages a list of string pairs (String0, String1).

It knows the following types of calls controlled by the mode parameter:

- Registry2("set", "String0", "String1");

Includes the passed string pair into the list.

- Registry2("get", "String0", NULL);

Returns the first string pair partner String1 which belongs to the passed String0 and then deletes the string pair from the list.

- Registry2("reset", NULL, NULL);

Deletes all string pairs from the list.

- Registry2("display", NULL, NULL);

Shows the string pairs currently stored in the list in a Global Script diagnostics window.

Syntax

```
char* Registry2(char* mode, char* String0, char* String1);
```

Parameters

mode

Defines the working principle of the function.

set	Incorporation of the string pair into the list
get	Determination of the first sting pair partner for String0 and deletion of the string pair from the list
reset	Deletion of all string pairs
display	Display of the string pairs in a Global Script diagnostics window

String0

The parameter supply depends on the working principle of the function.

String1

The parameter supply depends on the working principle of the function.

Return value

In the mode=get mode a pointer to the first string pair partner is returned.

Note

This function is used in conjunction with the picture module technology.

If you work with the "Create faceplate as type" and "Create instance(s) in the process picture" wizards in the "Faceplates" tab of the Dynamic Wizard, using the "Registry2" function is not permitted!

4.2.4 Obsolete functions

4.2.4.1 Alarm

AXC_OnBtnAlarmHidingList

Function

This function displays the list of hidden messages in a message window.

Syntax

BOOL AXC_OnBtnAlarmHidingList(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnArcLong

Function

This function displays the messages stored in a long-term archive list in a message window.

Syntax

BOOL AXC_OnBtnArcLong (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnArcShort

Function

This function displays the messages stored in a short-term archive list in a message window.

Syntax

BOOL AXC_OnBtnArcShort(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnComment

Function

External message window operation

This function displays the comment of the previously selected messages.

Syntax

BOOL AXC_OnBtnComment (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnEmergAckn

Function

External message window operation

This function opens the acknowledgement dialog (emergency acknowledgement/reset).

Syntax

BOOL AXC_OnBtnEmergAckn(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnHideDlg

Function

This function opens the display options dialog for defining the messages that are to be displayed in the message window. The options are "All messages", "Shown messages" or "Hidden messages".

Syntax

BOOL AXC_OnBtnHideDlg(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnHideUnhideMsg

Function

The function hides the selected message or displays again the hidden message.

Syntax

BOOL AXC_OnBtnHideUnhideMsg(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnHit

Function

This function displays the messages stored in the hit list in a message window.

Syntax

BOOL AXC_OnBtnHit (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnHornAckn

Function

External message window operation

This function acknowledges the horn signal.

Syntax

BOOL AXC_OnBtnHornAckn (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnInfo

Function

External message window operation

This function displays the information text.

Syntax

BOOL AXC_OnBtnInfo (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnLock

Function

External message window operation

This function opens the "Set the Lock List Parameters" dialog.

Syntax

BOOL AXC_OnBtnLock (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnLockUnlock

Function

This function locks the selected message in the message window. This message will then no longer be archived.

This function unlocks the selected message in the lock list.

Syntax

BOOL AXC_OnBtnLockUnlock (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnLockWin

Function

External message window operation.

This function calls the lock list.

Syntax

BOOL AXC_OnBtnLockWin (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnLoop

Function

External message window operation

This function triggers the "LoopInAlarm" function of the selected message.

Syntax

BOOL AXC_OnBtnLoop (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnMsgFirst

Function

External message window operation

This function switches to the beginning of the message list.

Syntax

BOOL AXC_OnBtnMsgFirst (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnMsgLast

Function

External message window operation

This function switches to the beginning of the message list.

Syntax

BOOL AXC_OnBtnMsgLast (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgLast example

AXC_OnBtnMsgNext

Function

External message window operation

This function switches to the next message in the message list.

Syntax

BOOL AXC_OnBtnMsgNext (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnMsgPrev

Function

External message window operation

This function switches to the previous message in the message list.

Syntax

BOOL AXC_OnBtnMsgPrev (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnMsgWin

Function

External message window operation

This function calls the message list.

Note

The message list contains the currently pending and unacknowledged messages.

Syntax

BOOL AXC_OnBtnMsgWin (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnPrint

Function

External message window operation

All messages fulfilling the selection criterion set in the Alarm Control are output to the printer.

Syntax

BOOL AXC_OnBtnPrint(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnProtocol

Function

External message window operation

Printing of the current view of the Alarm Control is started. All messages fulfilling the selection criterion set in the Alarm Control are output to the printer.

Syntax

BOOL AXC_OnBtnProtocol(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnScroll

Function

External message window operation

This function activates or deactivates the horizontal and vertical scroll functions.

Syntax

BOOL AXC_OnBtnScroll(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnScroll example

AXC_OnBtnSelect

Function

External message window operation

This function opens the "Specify Selection" dialog for the displayed list.

Syntax

BOOL AXC_OnBtnSelect(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnSinglAckn

Function

External message window operation

This function acknowledges the currently selected message.

Syntax

BOOL AXC_OnBtnSinglAckn(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnSinglAckn example

AXC_OnBtnSortDlg

Function

External operation of the message window

This function opens the dialog for setting a user-defined sorting of the displayed messages for the displayed list.

Syntax

BOOL AXC_OnBtnSortDlg(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnTimeBase

Function

External operation of the message window

This function opens the dialog for setting the time base for the times shown in the messages.

Syntax

BOOL AXC_OnBtnTimeBase(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnVisibleAckn

Function

External message window operation

All visible messages in the message window are acknowledged (group acknowledgement).

Syntax

BOOL AXC_OnBtnVisibleAckn(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnMsgFirst example

4.2.4.2 Report

ReportJob

Function

Depending on the value of the lpMethod Name parameter a print job or the preview for a print job is started.

Syntax

void ReportJob(LPSTR lpJobName, LPSTR lpMethodName)

Parameters

lpJobName

Pointer to the name of the print job

lpMethodName

PRINTJOB	Print job is started
PREVIEW	Preview of the print job is started

Note

This function is replaced by the RPTJobPreview and RPTJobPrint functions and should no longer be used.

4.2.4.3 TagLog

TOOLBAR_BUTTONS

TlgTableWindowPressEditRecordButton

Function

The editing of the table window is blocked or enabled (toggle function).

If editing is enabled, updating of the table window is stopped at the same time.

The updating of the table window remains to be stopped afterward, even if editing is blocked by a further function call.

Syntax

BOOL TlgTableWindowPressEditRecordButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgTableWindowPressFirstButton

Function

Displays the first data records of the display area in the table window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTableWindowPressFirstButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressHelpButton

Function

Displays the online help for the table window.

Syntax

BOOL TlgTableWindowPressHelpButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressInsertRecordButton

Syntax

BOOL TlgTableWindowPressInsertRecordButton(char* lpszWindowName)

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgTableWindowPressLastButton

Function

Displays the last data records of the display area in the table window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTableWindowPressLastButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressNextButton

Function

The data records following the current display area are displayed in the table window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTableWindowPressNextButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressNextItemButton

Function

The columns of the table window are moved one column to the left, the left column taking the position of the right column.

Syntax

BOOL TlgTableWindowPressNextItemButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressOpenArchiveVariableSelectionDlgButton

Function

Opens the dialog for connecting table columns to archives and tags.

Syntax

BOOL TlgTableWindowPressOpenArchiveVariableSelectionDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressOpenDlgButton

Function

Opens the dialog for online configuration of the table window.

Syntax

BOOL TlgTableWindowPressOpenDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressOpenDlgButton example

TlgTableWindowPressOpenItemSelectDlgButton

Function

Opens the dialog for selecting the visible columns and the first column of the table window.

Syntax

BOOL TlgTableWindowPressOpenItemSelectDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressOpenTimeSelectDlgButton

Function

Opens the dialog for setting the time range to be displayed in the table columns.

Syntax

BOOL TlgTableWindowPressOpenTimeSelectDlgButton(char* lpszWindowNumber)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressPrevButton

Function

The data records preceding the current display area are displayed in the table window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTableWindowPressPrevButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressPrevItemButton

Function

The columns of the table window are moved one column to the right, the right column taking the position of the left column.

Syntax

BOOL TlgTableWindowPressPrevItemButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressRemoveRecordButton

Syntax

BOOL TlgTableWindowPressRemoveRecordButton(char* lpszWindowName)

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgTableWindowPressStartStopButton

Function

Updating of the table window is switched on or off (toggle function).

Syntax

BOOL TlgTableWindowPressStartStopButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressFirstButton

Function

Displays the first data records of the display area in the trend window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTrendWindowPressFirstButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressHelpButton

Function

Displays the online help for the trend window.

Syntax

BOOL TlgTableWindowPressNextButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressLastButton

Function

Displays the last data records of the display area in the trend window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTrendWindowPressLastButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressLinealButton

Function

The ruler of the trend window is shown or hidden (toggle function).

The ruler can be moved by means of the "cursor left" and "cursor right" buttons.

Syntax

BOOL TlgTableWindowPressNextButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressNextButton

Function

The data records following the current display area are displayed in the trend window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTrendWindowPressNextButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressNextItemButton

Function

Brings all trends in the trend window one layer to the front.

The trend in the foreground is moved into the background.

Syntax

BOOL TlgTrendWindowPressNextItemButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOneToOneButton

Function

Restores the standard size (1:1) in the trend window.

Syntax

BOOL TlgTrendWindowPressOneToOneButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOpenArchiveVariableSelectionDlgButton

Function

Opens the dialog for connecting trends to archives and tags.

Syntax

BOOL TlgTrendWindowPressOpenArchiveVariableSelectionDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOpenDlgButton

Function

Opens the dialog for online configuration of the trend window.

Syntax

BOOL TlgTrendWindowPressOpenDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOpenItemSelectDlgButton

Function

Opens the dialog for selecting the visible trends and the trend which is to be in the foreground.

Syntax

BOOL TlgTrendWindowPressOpenItemSelectDlgButton(char* lpszWindowNumber)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOpenTimeSelectDlgButton

Function

Opens the dialog for setting the time range to be displayed.

Syntax

BOOL TlgTrendWindowPressOpenTimeSelectDlgButton(char* lpszWindowNumber)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressPrevButton

Function

The data records preceding the current display area are displayed in the trend window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTrendWindowPressPrevButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressPrevItemButton

Function

Brings all trends in the trend window one layer to the back.

The trend in the background is moved to the foreground.

Syntax

BOOL TlgTrendWindowPressPrevItemButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressPrintButton

Function

The current view of the trends is output in accordance with the display configured for the WinCC Trend Control.

Syntax

BOOL TlgTrendWindowPressPrintButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

TlgTrendWindowPressReportSaveButton

Function

The displayed trend window data is saved in a text file.

Syntax

BOOL TlgTrendWindowPressReportSaveButton (char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

TlgTrendWindowPressStartStopButton

Function

Updating of the trend window is switched on or off (toggle function).

Syntax

BOOL TlgTrendWindowPressStartStopButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressStatsResultButton

Function

Starts the evaluation of data in the selected time area.
The statistic values minimum, maximum, average and standard deviation are calculated.

Syntax

BOOL TlgTrendWindowPressStatsResultButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressStatsSelectRangeButton

Function

To select the time range for the statistics function, the rulers for start and end time are displayed.

Syntax

BOOL TlgTrendWindowPressStatsSelectRangeButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressZoomInButton

Function

The zoom in the trend window is activated. The zoom range can only be selected with the mouse.

Syntax

BOOL TlgTrendWindowPressZoomInButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressZoomInButton example

TlgTrendWindowPressZoomOutButton

Function

The trend window is restored to the state in which it was before the zoom was activated. The zoom is deactivated.

The zoom range can only be selected with the mouse (also see TlgTrendWindowPressZoomInButton).

Syntax

BOOL TlgTrendWindowPressZoomOutButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressZoomOutButton example

Template

TlgGetNumberOfColumns

Function

Provides the number of columns in the table window.

The window title of the corresponding WinCC Online Table Control is passed with the lpszTemplate parameter.

Syntax

int TlgGetNumberOfColumns(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

Return value

Number of colums in a table window

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgGetNumberOfRows

Function

Provides the number of lines in the table window.

The window title of the corresponding WinCC Online Table Control is passed with the lpszTemplate parameter.

Syntax

int TlgGetNumberOfRows(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

Return value

Number of lines in the table window

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgGetNumberOfRows example

TlgGetNumberOfTrends

Function

Provides the number of trends in the trend window.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

int TlgGetNumberOfTrends(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

Return value

Number of trends in the trend window

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

TlgGetRowPosition

Function

Provides the current position of the line pointer in the table window.

The window title of the corresponding WinCC Online Table Control is passed with the lpszTemplate parameter.

Syntax

int TlgGetRowPosition(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

Return value

Current position of the line pointer in the table window

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgGetRulerArchivNameTrend

Function

Provides the archive name of the trend with the nTrend number in the trend window at the ruler position.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

char* TlgGetRulerArchivNameTrend(char* lpszTemplate, int nTrend)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

nTrend

Number of the trend

(0 <= nTrend <= Number of visible trends - 1)

Return value

Archive name of the trend with the nTrend number in the trend window at the ruler position

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgGetRulerVariableNameTrend example

TlgGetRulerTimeTrend

Function

Provides the time of the trend with the nTrend number in the trend window at the ruler position.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

SYSTEMTIME TlgGetRulerTimeTrend(char* lpszTemplate, int nTrend)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

nTrend

Number of the trend

(0 <= nTrend <= Number of visible trends - 1)

Return value

Time of the trend with the nTrend number in the trend window at the ruler position

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgGetRulerTimeTrend example (Page 2276)

TlgGetRulerValueTrend

Function

Provides the value of the trend with the nTrend number in the trend window at the ruler position.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

double TlgGetRulerValueTrend(char* lpszTemplate, int nTrend)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

nTrend

Number of the trend

(0 <= nTrend <= Number of visible trends - 1)

Return value

Value of the trend with the nTrend number in the trend window at the ruler position

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

TlgGetRulerVariableNameTrend

Function

Provides the tag name of the trend with the nTrend number in the trend window.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

char* TlgGetRulerVariableNameTrend(char* lpszTemplate, int nTrend)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

nTrend

Number of the trend

(0 <= nTrend <= Number of visible trends - 1)

Return value

The tag name of the trend with the nTrend number in the trend window.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgGetRulerVariableNameTrend example

TlgGetTextAtPos

Function

Provides the content of a cell of the table window as text for process value archives and user archives.

The cell is specified by nColumn and nLine.

The window title of the corresponding WinCC Online Table Control is passed with the lpszTemplate parameter.

Syntax

char* TlgGetTextAtPos(char* lpszTemplate, int nColumn, int nLine)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

nColumn

Number of the column

nLine

Number of the line

Return value

Content of the cell of a table window as text

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgGetRulerVariableNameTrend example

TlgGetColumnPosition

Function

Provides the current position of the column pointer in the table window as column index.

Syntax

int TlgGetColumnPosition(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

Return value

Current position of the column pointer in a table window

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgGetNumberOfColumns example

TlgTrendWindowActivateCurve

Function

Activates a certain trend in WinCC Online Trend Control via the configured name of the trend. This function is executed independently of the visibility or foreground position of the trend.

Syntax

BOOL TlgTrendWindowActivateCurve(char* lpszPictureName, char* lpszObjectName, char* szValue)

Parameter

lpszPictureName

Picture name

lpszObjectName

Name of Trend Control

szValue

Name of the curve

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

4.2.5 Report

4.2.5.1 Report - short description

The Report group contains functions with which to start the print preview of a print job or the printout itself.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.2.5.2 RPTJobPreview

Function

The preview of a print job is started.

Syntax

BOOL RPTJobPreview(LPSTR lpJobName)

Parameters

lpJobName

Pointer to the name of the print job

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

RPTJobPreview example

4.2.5.3 RPTJobPrint

Function

A print job is started.

Syntax

BOOL RPTJobPrint(LPSTR lpJobName)

Parameters

lpJobName

Pointer to the name of the print job

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

RPTJobPrint example

4.2.5.4 RptShowError

Function

This function provides an error decription for a failed print job.

The function is already integrated into the RptJobPrint and RptJobPreview standard functions and does not have to be called separately.

The error description is displayed in a Global Script diagnostics window.

Note

As RptShowError is a standard function the output type and form can be changed if required.

Please note that modified standard functions are overwritten by a WinCC installation so that the changes will be lost.

Syntax

void RptShowError (LPCSTR pszFailedFunction, CMN_ERRORA* pCmnErrorA)

Parameters

pszFailedFunction

Pointer to the name of the failed function.

If this pointer is NULL there will be no output of the function name.

pCmnErrorA

Pointer to the error structure of the failed function.

If this pointer is NULL there will be no output of the error structure.

STRUCTURES_TABLES_ERROR_STRUCTURE

4.2.6 WinCC

4.2.6.1 WinCC - short description

The WinCC group contains functions which affect the entire WinCC system.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.2.6.2 GetHWDiag

Function

This function realizes the direct start of diagnosis at runtime triggered by an event, which must be configured, exercised on an object.

If the event occurs, the hardware diagnostics function is started from STEP7 for the associated PLC.

The following conditions must be fulfilled in order to use the function:

- The WinCC project, with the picture from which access should occur, and the STEP7 project must be on the same computer.
- The WinCC project must be stored as a subdirectory of the STEP7 project (STEP7 Projekt \wincproj\WinCC Projekt).
- The S7 tags have been mapped to WinCC.

Syntax

BOOL GetHWDiag(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpProperties)

Parameters

lpszPictureName

Name of the picture (PDL file) that contains the tag that will be used for the entry point for the hardware diagnostics

Since the name "lpszPictureName" stands for the current picture, entries are only required here in cases where it is necessary to access an object tag in a different picture.

lpszObjectName

Name of the object in the picture that connected with the tag that will be used for the entry point for the hardware diagnostics

Since the name "lpszObjectName" stands for the current object entries are only required here in cases where it is necessary to access a tag in a different object.

lpProperties

Name of the attribute that is connected with the tag that will be used for the entry point for the hardware diagnostics

If multiple attribute are entered, they must be separated by semicolons (";").

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

4.2.6.3 GetHWDiagLevel

Function

Checks the logged-in user's authorization on the basis of the User Administrator function number in dwLevel.

Then, diagnostics is started directly during runtime and is triggered by an event, which has to be configured, occurring on an object.

If the event occurs, the hardware diagnostics function is started from STEP7 for the associated PLC.

The following conditions must be fulfilled in order to use the function:

- The WinCC project, with the picture from which access should occur, and the STEP7 project must be on the same computer.
- The WinCC project must be stored as a subdirectory of the STEP7 project (STEP7 Projekt \wincproj\WinCC Projekt).
- The S7 tags have been mapped to WinCC.
- In order for the user logged into WinCC to edit the hardware diagnostics dialog, the user must have a WinCC user authorization matching the number passed by the function call in the parameter "dwLevel".

Syntax

BOOL GetHWDiagLevel(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpProperties, DWORD dwLevel)

Parameters

lpszPictureName

Name of the picture (PDL file) that contains the tag that will be used for the entry point for the hardware diagnostics

Since the name "lpszPictureName" stands for the current picture, entries are only required here in cases where it is necessary to access an object tag in a different picture.

lpszObjectName

Name of the object in the picture that connected with the tag that will be used for the entry point for the hardware diagnostics

Since the name "lpszObjectName" stands for the current object entries are only required here in cases where it is necessary to access a tag in a different object.

lpProperties

Name of the attribute that is connected with the tag that will be used for the entry point for the hardware diagnostics

If multiple attribute are entered, they must be separated by semicolons (";").

dwLevel

Level number for STEP7 write permissions.

This can be defined in User Administrator.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

4.2.6.4 GetKopFupAwl

Function

This function performs the network entry jump of WinCC into the STEP7 Editor "KFA".

When executing this function two tasks are performed:

- Determination of the required date for the network entry jump from WinCC.
- Transfer of the data to Step7 and finding the places of use of the operand in a STEP7 program by means of AUTAPI.

Syntax

BOOL GetKopFupAwl(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpProperties)

Parameters

lpszPictureName

Name of the picture (PDL file) that contains the tag that will be used for the network entry jump

Since the name "lpszPictureName" stands for the current picture, entries are only required here in cases where it is necessary to access an object tag in a different picture.

lpszObjectName

Name of the object in the picture that connected with the tag that will be used for the network entry jump

Since the name "lpszObjectName" stands for the current object entries are only required here in cases where it is necessary to access a tag in a different object.

lpProperties

Name of the attrribute that is connected with the tag that will be used for the network entry jump

If multiple attribute are entered, they must be separated by semicolons (";").

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

4.2.6.5 GetKopFupAwlLevel

Function

Checks the active user's authorization on the basis of the User Administrator function number in dwLevel and then performs the entry jump into the STEP7 Editor "KFA".

When executing this function three tasks are performed:

- Determination of the required date for the network entry jump from WinCC.
- Authorization check for the active user within WinCC.
- Transfer of the data to STEP7 and finding the places of use of the operand in a STEP7 program by means of AUTAPI.

Note

Depending on the result of the authorization check in WinCC the user has either only reading rights in STEP7 or is authorized to change S7 data.

Syntax

BOOL GetKopFupAwlLevel(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,LPCTSTR lpProperties, DWORD dwLevel)

Parameters

lpszPictureName

Name of the picture (PDL file) that contains the tag that will be used for the network entry jump

Since the name "lpszPictureName" stands for the current picture, entries are only required here in cases where it is necessary to access an object tag in a different picture.

lpszObjectName

Name of the object in the picture that connected with the tag that will be used for the network entry jump

Since the name "lpszObjectName" stands for the current object entries are only required here in cases where it is necessary to access a tag in a different object.

lpProperties

Name of the attrribute that is connected with the tag that will be used for the network entry jump

If multiple attribute are entered, they must be separated by semicolons (";").

dwLevel

Level number for STEP7 write permissions.

This can be defined in User Administrator.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

4.2.6.6 OnDeactivateExecute

Function

This function is called when terminating WinCC Runtime.

As this is a standard function, you can insert instructions which are then executed.

Note

Concerning the instructions it must be taken into account that the Runtime is terminating and therefore not all functionalities are available.

Please note that modified standard functions are overwritten by a WinCC installation so that the changes will be lost.

Syntax

```
void OnDeactivateExecute()
```

4.2.6.7 OnErrorExecute

Function

OnErrorExecute is called by the system when an error occurred upon executing an action or a function.

This allows you to determine the precise error cause.

The function is called by the system and does not require an additional call.

As this function is available as a standard function the output type and form can be changed if required.

Note

Please note that modified standard functions are overwritten by a new installation so that the changes will be lost.

Syntax

void OnErrorExecute(CCAPErrorExecute ErrorExecute)

Parameters

ErrorExecute

Structure informing about the error that has occurred

Diagnostic information

These information are displayed in a Global Script diagnostics window.

SystemTime	Time (UTC) at which the error occurred
dwErrorCode1	The error codes and their meaning are to be found in the structure definition
dwErrorCode2	The error codes and their meaning are to be found in the structure definition
szErrorText	Text description of the error cause
bCycle	Cycle type
szApplicationName	Error-triggering application
szFunctionName	FunctionID
szTagName	Tag name
dwCycle	Cycle type
szErrorTextTagName	Text description of the tag status
status	Tag status
lpszPictureName	Picture in which the error occurred
lpszObjectName	Object in which the error occurred
lpszPropertyName	Object property in which the error occurred
dwParamSize	only used internally
szErrorText	Text description of the error cause returned by the error structure "pError"

See also

CCAPErrorExecute structure definition

4.2.6.8 OnTime

Function

OnTime is exclusively called by the system. The function returns the runtime of all actions or determines the actions running longer than the specified time. Time measurement can be enabled/disabled via APDIAG.

As this function is available as a standard function the output type can be influenced by changing the function code.

Note

Please note that modified standard functions are overwritten by a WinCC installation so that the changes will be lost.

Syntax

void OnTime(CCAPTime time)

Parameters

time

Result structure

STRUCTURES_TABLES_CCAPTIME

4.2.7 Windows

4.2.7.1 Windows - short description

The Windows group contains the ProgramExecute function.

This function can be used to execute any program.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.2.7.2 ProgramExecute

Function

Starts the program with the specified name.

Syntax

unsigned int ProgramExecute(char* Program_Name)

Parameters

Program_Name

Pointer to the program name

Return value

If the return value is greater than 31, the function has been completed without any errors.

In case of an error, the return value contains one of the following error codes:

0	out of memory
2	Specified file could not be found.
3	Specified path could not be found.
11	Program could not be started.

See also

ProgramExecute

4.3 Internal functions

4.3.1 Internal functions - short description

Internal functions are used to make graphic objects and archives dynamic and in project functions, standard functions and global script actions.

Internal funtions are recognized throughout a project.

They can be neither be newly created nor can existing internal functions be modified.

Internal functions are divided into the following groups:

allocate

Functions to reserve and release working memory space

c_bib

Functions from the standard C-library

graphics

Functions to read and set properties of graphical objects

tag

Functions to read and write tags

wincc

Functions for changing languages, deactivating Runtime and ending WinCC

4.3.2 allocate

4.3.2.1 SysFree

Function

Releases the memory area previously reserved with the SysMalloc function.

Syntax

void SysFree(void* lpFree);

Parameters

lpFree

Pointer to the memory area reserved with the SysMalloc function

4.3.2.2 SysMalloc

Function

Reserves memory space for an action. The memory area is assigned to the action. When the action has been completed and the result transferred, the system releases the memory again.

The SysFree function can be used to release reserved memory space.

Syntax

void* SysMalloc(unsigned long int size);

Parameters

size

Size of the memory area in bytes.

4.3.3 c_bib

4.3.3.1 c_bib - short description

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file

- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

4.3.3.2 ctype

isalnum

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

isalpha

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

isdigit

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

isgraph

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

islower

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

isprint

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ispunct

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

isspace

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

toupper

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

4.3.3.3 math

acos

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

asin

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

atan

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

atan2

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ceil

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

cos

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

cosh

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

exp

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fabs

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

log

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

log10

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

modf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

pow

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

sin

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

sinh

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

sqrt

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

tan

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

tanh

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

4.3.3.4 memory

memchr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memcmp

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memcpy

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memmove

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

memset

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

4.3.3.5 stdio

char_io

fgetc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib

- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fgets

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fputc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fputs

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

getc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

putc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ungetc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

Directio

fread

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fwrite

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

Error

clearerr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

feof

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ferror

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

File

fclose

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fflush

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fopen

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

freopen

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

remove

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

rename

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

setbuf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

setvbuf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

tmpfile

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

tmpnam

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

File_pos

fgetpos

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fseek

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

fsetpos

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ftell

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

rewind

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

Output

vfprintf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

vsprintf

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

4.3.3.6 stdlib

abs

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

atof

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

atoi

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

atol

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

bsearch

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

calloc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

div

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

free

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

getenv

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

labs

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ldiv

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

malloc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

qsort

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

rand

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

realloc

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

srand

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strtod

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strtol

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strtoul

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

4.3.3.7 string

strcat

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strchr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strcmp

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strcpy

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strcspn

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strerror

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strlen

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strncat

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strncmp

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strncpy

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strpbrk

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strrchr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strspn

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strstr

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strtok

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

4.3.3.8 time

asctime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

clock

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

ctime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

difftime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

gmtime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

localtime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

mktime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

strftime

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

time

The function group c_bib contains C functions from the C library and is divided into:

- ctype
- math
- memory
- stdio
- stdlib
- string
- time

stdio itself is further divided into:

- char_io
- directio
- error
- file
- file_pos
- output

You can find a description of this function in related technical literature.

Note

The function localtime reacts as follows in respect of date output:

Numbering of the months begins with 0.

The years are counted from 1900, beginning with 0.

The C-library functions printf(), sprintf(), fprintf() can only process 360 characters in WinCC.

4.3.4 graphics

4.3.4.1 Graphics - short description

The functions of the Graphics group allow to modify or query graphical properties of WinCC objects.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

Note

If the function is called for the picture object, set the parameter lpszObjectName = ZERO.

4.3.4.2 get

axes

GetAlignment

Function

When using bar objects, it indicates whether the text is to the right or left of the bar.

Syntax

BOOL GetAlignment(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Text is to the right of the bar

FALSE

Text is to the left of the bar

See also

GetScaling example

Beispiel GetScaling (Page 2232)

GetAxisSection

Function

When using bar objects, it specifies the difference between the values of two neighboring axis labels.

Syntax

double GetAxisSection(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Difference between the values of two neighboring axis labels

GetExponent

Function

When using bar objects, it specifies whether the axis label corresponds to the decimal or exponential form.

Syntax

BOOL GetExponent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Axis label in exponential form

FALSE

Axis label in decimal form

See also

GetScaling example

Beispiel GetScaling (Page 2232)

GetLeftComma

Function

When using bar objects, it specifies the number of integers in the axis label.

Syntax

long int GetLeftComma(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

The number of integers in the axis label

GetLongStrokesBold

Function

When using bar objects, it specifies whether the main division lines on the scale are bold or regular.

Syntax

BOOL GetLongStrokesBold(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The main division lines on the graph scale are bold

FALSE

The main division lines on the graph scale are regular

See also

GetScaling example

Beispiel GetScaling (Page 2232)

GetLongStrokesOnly

Function

When using bar objects, it specifies whether intermediate division lines are used on the scale.

Syntax

BOOL GetLongStrokesOnly(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Only main division lines are used on the bar graph scale.

FALSE

Both main and intermediate division lines are used on the bar graph scale.

See also

GetScaling example

Beispiel GetScaling (Page 2232)

GetLongStrokesSize

Function

When using bar objects, it specifies the length of the main division lines.

Syntax

long int GetLongStrokesSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Length of the main division lines as numeric value

GetLongStrokesTextEach

Function

When using bar objects, it specifies the interval between the main division lines being assigned a label.

Syntax

long int GetLongStrokesTextEach(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Label of the main division lines as numeric value

Example:

Return value = 1 -> Every main division line is assigned a label.

Return value = 2 -> Every 2nd main division line is assigned a label.

etc.

GetRightComma

Function

When using bar objects, it specifies the number of decimal places in the axis label.

Syntax

long int GetRightComma(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

The number of decimal places in the axis label

GetScaleTicks

Function

When using bar objects, it specifies the scale marks as number of scale sections. A scale section is a part of the scale bounded by two main tick marks.

Syntax

long int GetScaleTicks(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Scale marks as number of scale sections

Note

The number of scale sections is given as 0, if the bar object itself calculates a suitable scale unit.

GetScaling

Function

When using bar objects, it specifies whether the scale is activated or deactivated.

Syntax

BOOL GetScaling(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Display with scale

FALSE

Display without scale

See also

GetScaling example

Beispiel GetScaling (Page 2232)

GetScalingType

Function

When using bar objects, it specifies the type of bar scaling.

Syntax

long int GetScalingType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Type of bar scaling as numeric value

See also

Bar scaling

Bar Scaling (Page 2282)

color

Color - short description

The various color properties of objects can be modified or queried using the functions in the Color group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetBackColor

Function

Specifies the background color of the object as a numeric value.

Syntax

long int GetBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Background color of the object as a numeric value

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor2

Function

When using bar objects, it specifies the color of the bar as a numeric value.

Syntax

long int GetBackColor2(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor3

Function

When using bar objects, it specifies the background color of the bar as a numeric value.

Syntax

long int GetBackColor3(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar background color

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColorBottom

Function

Specifies the background color of the slider objects at the bottom right.

Syntax

long int GetBackColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the slider objects at the bottom right

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColorTop

Function

Specifies the background color of the slider objects at the top left.

Syntax

long int GetBackColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the slider objects at the top left

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBorderBackColor

Function

Specifies the background color of the lines or borders.

Syntax

long int GetBorderBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the lines or borders

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBorderColor

Function

Specifies the line or border color as a numeric value.

Syntax

long int GetBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the color of lines or borders

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBorderColorBottom

Function

Specifies the 3D border color at the bottom.

Syntax

long int GetBorderColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the 3D border color at the bottom

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBorderColorTop

Function

Specifies the 3D border color at the top.

Syntax

long int GetBorderColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the 3D border color at the top

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetButtonColor

Function

Specifies the button color of slider objects.

Syntax

long int GetButtonColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the button color of slider objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetColorBottom

Function

When using slider objects, it specifies the color of the bottom limit.

Syntax

long int GetColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the color of the bottom limit of slider objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetColorTop

Function

When using slider objects, it specifies the color of the top limit.

Syntax

long int GetColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the color of the top limit of slider objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetFillColor

Function

Specifies the color of the fill pattern.

Syntax

long int GetFillColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value of the fill color

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetForeColor

Function

Specifies the color of the font.

Syntax

long int GetForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the font color

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetGridColor

Function

Specifies the grid color of Graphics Designer.

Syntax

long int GetGridColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the grid color of Graphics Designer

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetItemBorderBackColor

Function

Specifies the background color of the dividing line for the "text list" object.

Syntax

long int GetItemBorderBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the dividing line for the "text list" object

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetItemBorderColor

Function

Specifies the color of the dividing line for the "text list" object.

Syntax

long int GetItemBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the dividing line color for the "text list" object

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetScaleColor

Function

Specifies the scale color for bar objects.

Syntax

long int GetScaleColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value of the scale color for bar objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetSelBGColor

Function

Specifies the background color of the selected entry for the "text list" object.

Syntax

long int GetSelBGColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the selected entry

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetSelTextColor

Function

Specifies the font color of the selected entry for the "text list" object.

Syntax

long int GetSelTextColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the font color of the selected entry

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetTrendColor

Function

Specifies the trend color of bar objects.

Syntax

long int GetTrendColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the trend color of bar objects

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetUnselBGColor

Function

Specifies the background color of the non-selected entries for the "text list" object.

Syntax

long int GetUnselBGColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background color of the non-selected entries

See also

GetBackColor example

Color chart

Color chart (Page 2284)

GetBackColor example (Page 2216)

GetUnselTextColor

Function

Specifies the font color of the non-selected entries for the "text list" object.

Syntax

long int GetUnselTextColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the font color of the non-selected entries

See also

GetBackColor example

Color chart

GetBackColor example (Page 2216)

Color chart (Page 2284)

fill

Fill - short description

The functions in the Fill group control the dynamic filling of objects.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetFilling

Function

Specifies whether dynamic filling with background color is activated.

Syntax

BOOL GetFilling(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Dynamic filling with background color is activated.

FALSE

Dynamic filling with background color is not activated.

See also

GetFilling example

GetFilling example (Page 2217)

GetFillingIndex

Function

Specifies the current fill level.

Syntax

long int GetFillingIndex(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Current fill level as a numeric value (0 - 100)

See also

GetFillingIndex example

GetFillingIndex example (Page 2217)

flash

Flash - short description

The various flashing properties can be modified or called in using the functions in the Flash group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetBackFlashColorOff

Function

Specifies the background flash color for the deactivated status.

Syntax

long int GetBackFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Background flash color for the deactivated status as a numeric value

See also

Color chart (Page 2284)

GetFlashBackColorOn example

GetFlashBackColorOn example (Page 2219)

Color chart

GetBackFlashColorOn

Function

Specifies the background flash color for the activated status.

Syntax

long int GetBackFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Background flash color for the activated status as a numeric value

See also

GetFlashBackColorOn example (Page 2219)

Color chart (Page 2284)

Color chart

GetFlashBackColorOn example

GetBorderFlashColorOff

Function

Specifies the border or line flashing color for the deactivated status.

Syntax

long int GetBorderFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Border or line flashing color for the deactivated status as a numeric value

See also

GetFlashBackColorOn example (Page 2219)

Color chart (Page 2284)

Color chart

GetFlashBackColorOn example

GetBorderFlashColorOn

Function

Specifies the border or line flashing color for the activated status.

Syntax

long int GetBorderFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Border or line flashing color for the activated status as a numeric value

See also

GetFlashBackColorOn example (Page 2219)

Color chart (Page 2284)

Color chart

GetFlashBackColorOn example

GetFlashBackColor

Function

Specifies whether flashing of the background is activated or not.

Syntax

BOOL GetFlashBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Flashing background is activated.

FALSE

Flashing background is not activated.

See also

GetFlashBackColor example (Page 2218)

GetFlashBackColor example

GetFlashBorderColor

Function

Specifies whether flashing of the border or line is activated or not.

Syntax

BOOL GetFlashBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Flashing of the border or line is activated.

FALSE

Flashing of the border or line is not activated.

See also

GetFlashBackColor example (Page 2218)

GetFlashBackColor example

GetFlashForeColor

Function

Specifies whether flashing of the font is activated or not.

Syntax

BOOL GetFlashForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Flashing of the font is activated.

FALSE

Flashing of the font is not activated.

See also

GetFlashBackColor example (Page 2218)

GetFlashBackColor example

GetFlashRateBackColor

Function

Specifies the flash frequency of the background.

Syntax

long int GetFlashRateBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash frequency of the background

See also

GetFlashBackColorOn example (Page 2219)

Flash frequencies (Page 2282)

GetFlashBackColorOn example

Flash frequencies

GetFlashRateBorderColor

Function

Specifies the flash frequency of the line or border.

Syntax

long int GetFlashRateBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash frequency of the line or border

See also

GetFlashBackColorOn example (Page 2219)

Flash frequencies (Page 2282)

GetFlashBackColorOn example

Flash frequencies

GetFlashRateForeColor

Function

Specifies the flash frequency of the font.

Syntax

long int GetFlashRateForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash frequency of the font

See also

GetFlashBackColorOn example (Page 2219)

Flash frequencies (Page 2282)

GetFlashBackColorOn example

Flash frequencies

GetForeFlashColorOff

Function

Specifies the font flash color for the deactivated status.

Syntax

long int GetForeFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Font flash color for the deactivated status as a numeric value

See also

GetFlashBackColorOn example (Page 2219)

Color chart (Page 2284)

GetFlashBackColorOn example

Flash frequencies

GetForeFlashColorOn

Function

Specifies the font flash color for the activated status.

Syntax

long int GetForeFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Font flash color for the activated status as a numeric value

See also

GetFlashBackColorOn example (Page 2219)

Color chart (Page 2284)

GetFlashBackColorOn example

Color chart

focus

Focus - short description

Using the functions in the Focus group, it is possible to set the focus or poll which object has the focus.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

Get_Focus

Function

Specifies the name of the object currently or last focussed.

Syntax

char *Get_Focus();

Return value

Name of the object currently or last focussed.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetFocus example (Page 2220)

GetFocus example

font

Font - short description

The various properties affecting text can be modified or called in using the functions in the Font group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetAlignmentLeft

Function

Specifies the horizontal text alignment (left, centered, right).

Syntax

long int GetAlignmentLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Horizontal text alignment as a numeric value

See also

Text alignment (Page 2289)

GetFontSize example (Page 2221)

GetFontSize example

Text alignment

GetAlignmentTop

Function

Specifies the vertical text alignment (top, centered, bottom).

Syntax

long int GetAlignmentTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Vertical text alignment as a numeric value

See also

GetFontSize example (Page 2221)

Text alignment (Page 2289)

GetFontSize example

Text alignment

GetFontBold

Function

Specifies whether the font is bold or not.

Syntax

BOOL GetFontBold(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Bold font on

FALSE

Bold font off

See also

GetFontBold example (Page 2221)

GetFontBold example

GetFontItalic

Function

Specifies whether the font is italic or not.

Syntax

BOOL GetFontItalic(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Italic font on

FALSE

Italic font off

See also

GetFontBold example (Page 2221)

GetFontBold example

GetFontName

Function

Indicates the current font name.

Syntax

char* GetFontName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to the name of the font currently selected.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetText example (Page 2249)

GetText example

GetFontSize

Function

Specifies the font size.

Syntax

long int GetFontSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Current font size

See also

GetFontSize example (Page 2221)

GetFontSize example

GetFontUnderline

Function

Specifies whether the font is underlined or not.

Syntax

BOOL GetFontUnderline(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Underlined font on

FALSE

Underlined font off

See also

GetFontBold example (Page 2221)

GetFontBold example

GetOrientation

Function

Specifies the text orientation (vertical/horizontal).

Syntax

BOOL GetOrientation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Vertical text orientation

FALSE

Horizontal text orientation

See also

GetFontBold example (Page 2221)

GetFontBold example

GetText

Function

Specifies the value of the "text" property for objects like static text, check box or radio box.

Syntax

char* GetText(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to a text.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

Note

In case of check and radio boxes, the element to be determined must be defined with the "SetIndex" function before actually activating this function.

See also

GetText example (Page 2249)

general

GetLayer

Function

Specifies the picture layer in which the object is located.

Syntax

long int GetLayer(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Picture layer in which the object is located

geometry

Geometry - short description

The size, position and other geometrical properties of objects can be modified or called in using the functions in the Geometry group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetActualPointLeft

Function

Specifies the X value of the current position in a polygon or polygon line.

Syntax

long int GetActualPointLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

X value for the current point of a polygon or polygon line

Note

The current point of the polygon can be set using the SetIndex function.

See also

GetLeft example (Page 2223)

GetLeft example

GetActualPointTop

Function

Specifies the Y value of the current position in a polygon or polygon line.

Syntax

long int GetActualPointTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Y value for the current point of a polygon or polygon line

Note

The current point of the polygon can be set using the SetIndex function.

See also

GetTop example (Page 2250)

GetTop example

GetBoxCount

Function

Specifies the number of fields for check boxes and radio boxes.

Syntax

long int GetBoxCount(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Number of fields in a check box or radio box.

GetDirection

Function

Specifies the bar direction for bar objects.

Syntax

long int GetDirection(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Bar direction of bar objects as numeric value

See also

Bar direction (Page 2281)

Bar direction

GetEndAngle

Function

Specifies the end angle of circle and ellipse segments and circle and elliptical arcs.

Syntax

long int GetEndAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

End angle of circle and ellipse segments as well as circle and ellipse arcs

GetGrid

Function

Specifies whether the grid is activated in the graphics area of Graphics Designer.

Syntax

BOOL GetGrid(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Grid in Graphics Designer is activated.

FALSE

Grid in Graphics Designer is deactivated.

GetGridHeight

Function

Specifies the height of the grid in the graphics area of Graphics Designer.

Syntax

long int GetGridHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Height of the grid in Graphics Designer

GetGridWidth

Function

Specifies the width of the grid in the graphics area of Graphics Designer.

Syntax

long int GetGridWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Width of the grid in Graphics Designer

GetHeight

Function

Specifies the height of the rectangle framing an object.

Syntax

long int GetHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Height of the rectangle framing an object

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetHeight example (Page 2222)

GetLeft

Function

Specifies the X position of the upper left corner of the rectangle framing an object.

Syntax

long int GetLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Current X value of the upper left corner of the rectangle framing an object

See also

GetLeft example (Page 2223)

GetLeft example

GetPointCount

Function

Specifies the number of corners of a polygon or in a polygon line.

Syntax

long int GetPointCount(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Number of corners of a polygon or in a polyline

GetRadius

Function

Specifies the radius of a circle, circle segment or arc.

Syntax

long int GetRadius(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Radius of a circle, circle segment or arc

See also

GetHeight example (Page 2222)

GetHeight example

GetRadiusHeight

Function

Specifies the radius of an ellipse, ellipse segment or elliptical arc in a vertical direction.

Syntax

long int GetRadiusHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Radius of an ellipse, ellipse segment or elliptical arc in a vertical direction

See also

GetHeight example (Page 2222)

GetHeight example

GetRadiusWidth

Function

Specifies the radius of an ellipse, ellipse segment or elliptical arc in a horizontal direction.

Syntax

long int GetRadiusWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Radius of an ellipse, ellipse segment or elliptical arc in a horizontal direction

See also

GetHeight example (Page 2222)

GetHeight example

GetReferenceRotationLeft

Function

Specifies the X value of the rotation reference (central axis about which the object can be rotated) for lines, polygons and polylines.

Syntax

long int GetReferenceRotationLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

X value of the rotation reference for lines, polygons and polygon lines

See also

GetLeft example (Page 2223)

GetLeft example

GetReferenceRotationTop

Function

Specifies the Y value of the rotation reference (central axis about which the object can be rotated) for lines, polygons and polylines.

Syntax

long int GetReferenceRotationTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Y value of the rotation reference for lines, polygons and polygon lines

See also

GetTop example (Page 2250)

GetTop example

GetRotationAngle

Function

Specifies the angle of rotation about the central axis for lines, polygons and polylines.

Syntax

long int GetRotationAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Angle of rotation about the central axis

See also

GetHeight example (Page 2222)

GetHeight example

GetRoundCornerHeight

Function

Specifies the radius of the rounded corner of a rectangle vertically.

Syntax

long int GetRoundCornerHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Vertical radius of the rounded corner of a rectangle

See also

GetHeight example (Page 2222)

GetHeight example

GetRoundCornerWidth

Function

Specifies the radius of the rounded corner of a rectangle horizontally.

Syntax

long int GetRoundCornerWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Horizontal radius of the corner of the rounded corner of a rectangle

See also

GetWidth example (Page 2251)

GetWidth example

GetStartAngle

Function

Specifies the start angle of circle and ellipse segments and circle and elliptical arcs.

Syntax

long int GetStartAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Start angle of circle and ellipse segments as well as circle and elliptical arcs

See also

GetHeight example (Page 2222)

GetHeight example

GetTop

Function

Specifies the Y position of the upper left corner of the rectangle framing an object.

Syntax

long int GetTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Current Y value of the upper left corner of the rectangle framing an object

See also

GetTop example (Page 2250)

GetTop example

GetWidth

Function

Specifies the width of the rectangle framing an object.

Syntax

long int GetWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Width of the rectangle framing an object

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetWidth example (Page 2251)

GetWidth example

GetZeroPoint

Function

When using bar objects, it indicates the zero point.

Syntax

long int GetZeroPoint(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Zero point for bar objects

See also

GetHeight example (Page 2222)

GetHeight example

i_o

i_o - short description

The various properties affecting input and output values can be modified or called in using the functions in the i_o group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetAssignments

Function

Assignment of text to the value range of lists

Syntax

char* GetAssignments(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

The assignment of text to the value range depends on the list type.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

List types (Page 2288)

List types

GetAssumeOnExit

Function

Specifies for I/O fields whether the entered value is assumed upon exiting the field.

Syntax

BOOL GetAssumeOnExit(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Value application upon exiting the field.

FALSE

No value application upon exiting the field.

GetAssumeOnFull

Function

Specifies for I/O fields whether the entered value is assumed on completion of input.

Syntax

```
BOOL GetAssumeOnFull(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Value application on completion of input.

FALSE

No value application on completion of input.

GetBitNumber

Function

Specifies the relevant bit in the output value for the "bit" list type.

Syntax

long int GetBitNumber(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Indication of the relevant bit in the output value for the "bit" list type

See also

GetHiddenInput example (Page 2222)

List types (Page 2288)

List types

GetHiddenInput example

GetClearOnError

Function

Specifies for I/O fields whether deletion of the content in case of input errors is activated.

Syntax

BOOL GetClearOnError(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Deletion of the content in case of input errors is activated

FALSE

Deletion of the content in case of input errors is not activated

GetClearOnNew

Function

Specifies for I/O fields whether deletion of the content on new input is activated.

Syntax

BOOL GetClearOnNew(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Deletion of the content on new input is activated.

FALSE

Deletion of the content on new input is not activated.

GetDataFormat

Function

Specifies the data type of the field content for I/O fields.

Syntax

long int GetDataFormat(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Data type of the field content as numeric value

See also

GetHiddenInput example (Page 2222)

I/O field, data type of the field content (Page 2283)

GetHiddenInput example

I/O field, data type of the field content

GetHiddenInput

Function

Specifies whether hidden input is activated for I/O fields.

Syntax

BOOL GetHiddenInput(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Hidden input is activated

FALSE

Hidden input is not activated

See also

GetHiddenInput example (Page 2222)

GetHiddenInput example

GetInputValueChar

Function

Specifies the input value in the data type "char" for I/O fields.

Syntax

char* GetInputValueChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to the input value in the data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetInputValueDouble

Function

Specifies the input value in the data type "double" for I/O fields.

Syntax

double GetInputValueDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Input value in the data type "double"

GetListType

Function

Specifies the list type for the "text list" object.

Syntax

long int GetListType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

List type for the "text list" object

See also

GetHiddenInput example (Page 2222)

List types (Page 2288)

GetHiddenInput example

List types

GetNumberLines

Function

Specifies the number of visible lines for the "text list" object.

Syntax

long int GetNumberLines(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Number of visible lines for the "text list" object

Note

If the amount of configured text is larger than the number of visible lines, the "text list" object receives a vertical scroll bar.

See also

GetHiddenInput example (Page 2222)

GetHiddenInput example

GetOutputFormat

Function

Specifies the output format for I/O fields.

Syntax

char* GetOutputFormat(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to the output format.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

I/O field, data type of the field content (Page 2283)

I/O field, output format (Page 2282)

I/O field, data type of the field content

I/O field, output format

GetOutputValueChar

Function

Determines the output value in the data type "char" for I/O fields. This function should only be used if the field content of the I/O field is of the "string" data type.

Syntax

char* GetOutputValueChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Pointer to the output value in the data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetOutputValueDouble

Function

Determines the output value in the data type "double" for I/O fields. This function should only be used if the field content of the I/O field is not of the "string" data type.

Syntax

double GetOutputValueDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Output value in the data type "double"

See also

GetOutputValueDouble example (Page 2226)

GetOutputValueDouble example

Limits

Limits - short description

The various properties affecting limit values can be modified or called in using the functions in the Limits group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetAlarmHigh

Function

Specifies the upper alarm limit for bar objects.

Syntax

double GetAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Upper alarm limit for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetAlarmLow

Function

Specifies the lower alarm limit for bar objects.

Syntax

double GetAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Lower alarm limit for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetCheckAlarmHigh

Function

When using bar objects, it specifies whether the upper alarm limit is monitored.

Syntax

BOOL GetCheckAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper alarm limit is monitored.

FALSE

In case of bar objects the upper alarm limit is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckAlarmLow

Function

When using bar objects, it specifies whether the lower alarm limit is monitored.

Syntax

BOOL GetCheckAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower alarm limit is monitored.

FALSE

In case of bar objects the lower alarm limit is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckLimitHigh4

Function

When using bar objects, it specifies whether the upper limit value reserve 4 is monitored.

Syntax

BOOL GetCheckLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper limt value reserve 4 is monitored.

FALSE

In case of bar objects the upper limt value reserve 4 is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckLimitHigh5

Function

When using bar objects, it specifies whether the upper limit value reserve 5 is monitored.

Syntax

BOOL GetCheckLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper limt value reserve 5 is monitored.

FALSE

In case of bar objects the upper limt value reserve 5 is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckLimitLow4

Function

When using bar objects, it specifies whether the lower limit value reserve 4 is monitored.

Syntax

BOOL GetCheckLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower limt value reserve 4 is monitored.

FALSE

In case of bar objects the lower limt value reserve 4 is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckLimitLow5

Function

When using bar objects, it specifies whether the lower limit value reserve 5 is monitored.

Syntax

BOOL GetCheckLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower limt value reserve 5 is monitored.

FALSE

In case of bar objects the lower limt value reserve 5 is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckToleranceHigh

Function

When using bar objects, it specifies whether the upper tolerance limit is monitored.

Syntax

BOOL GetCheckToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper tolerance limit is monitored.

FALSE

In case of bar objects the upper tolerance limit is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckToleranceLow

Function

When using bar objects, it specifies whether the lower tolerance limit is monitored.

Syntax

BOOL GetCheckToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower tolerance limit is monitored.

FALSE

In case of bar objects the lower tolerance limit is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckWarningHigh

Function

When using bar objects, it specifies whether the upper warning limit is monitored.

Syntax

BOOL GetCheckWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper warning limit is monitored.

FALSE

In case of bar objects the upper warning limit is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetCheckWarningLow

Function

When using bar objects, it specifies whether the lower warning limit is monitored.

Syntax

BOOL GetCheckWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower warning limit is monitored.

FALSE

In case of bar objects the lower warning limit is not monitored.

See also

GetMarker example (Page 2226)

GetMarker example

GetColorAlarmHigh

Function

Specifies the bar color for bar objects upon reaching the upper alarm limit.

Syntax

long int GetColorAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper alarm limit

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorAlarmLow

Function

Specifies the bar color for bar objects upon reaching the lower alarm limit.

Syntax

long int GetColorAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower alarm limit

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorLimitHigh4

Function

Specifies the bar color for bar objects upon reaching the upper limit reserve 4.

Syntax

long int GetColorLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper limit reserve 4

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorLimitHigh5

Function

Specifies the bar color for bar objects upon reaching the upper limit reserve 5.

Syntax

long int GetColorLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper limit reserve 5

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorLimitLow4

Function

Specifies the bar color for bar objects upon reaching the lower limit reserve 4.

Syntax

long int GetColorLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower limit reserve 4

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorLimitLow5

Function

Specifies the bar color for bar objects upon reaching the lower limit reserve 5.

Syntax

long int GetColorLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower limit reserve 5

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorToleranceHigh

Function

Specifies the bar color for bar objects upon reaching the upper tolerance limit.

Syntax

long int GetColorToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper tolerance limit

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorToleranceLow

Function

Specifies the bar color for bar objects upon reaching the lower tolerance limit.

Syntax

long int GetColorToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower tolerance limit

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorWarningHigh

Function

Specifies the bar color for bar objects upon reaching the upper warning limit limit.

Syntax

long int GetColorWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the upper warning limit

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetColorWarningLow

Function

Specifies the bar color for bar objects upon reaching the lower warning limit.

Syntax

long int GetColorWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the bar color upon reaching the lower warning limit

See also

GetBackColor example (Page 2216)

Color chart (Page 2284)

GetBackColor example

Color chart

GetLimitHigh4

Function

Specifies the upper limit value for reserve 4 for bar objects.

Syntax

double GetLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

High limit value for reserve 4 for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetLimitHigh5

Function

Specifies the upper limit value for reserve 5 for bar objects.

Syntax

double GetLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

High limit value for reserve 5 for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetLimitLow4

Function

Specifies the low limit value for reserve 4 for bar objects.

Syntax

double GetLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Low limit value for reserve 4 for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetLimitLow5

Function

Specifies the low limit value for reserve 5 for bar objects.

Syntax

double GetLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Low limit value for reserve 5 for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetLimitMax

Function

Specifies the upper limit value for I/O fields.

Syntax

double GetLimitMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

High limit value for I/O fields

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetLimitMin

Function

Specifies the low limit value for I/O fields.

Syntax

double GetLimitMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Low limit value for I/O fields

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetMarker

Function

When using bar objects, it specifies whether the limit marker is displayed.

Syntax

```
BOOL GetMarker(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Limit marker for bar objects is displayed.

FALSE

Limit marker for bar objects is not displayed.

See also

GetMarker example (Page 2226)

GetMarker example

GetToleranceHigh

Function

Specifies the upper tolerance limit for bar objects.

Syntax

double GetToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Upper tolerance limit for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetToleranceLow

Function

Specifies the lower tolerance limit for bar objects.

Syntax

double GetToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Lower tolerance limit for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetTypeAlarmHigh

Function

Specifies for bar objects whether the upper alarm limit is given in percentages or absolute terms.

Syntax

```
BOOL GetTypeAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper alarm limit is given in percentages.

FALSE

In case of bar objects the upper alarm limit is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeAlarmLow

Function

Specifies for bar objects whether the lower alarm limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower alarm limit is given in percentages.

FALSE

In case of bar objects the lower alarm limit is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeLimitHigh4

Function

Specifies for bar objects whether the upper limit reserve 4 is given in percentages or absolute terms.

Syntax

BOOL GetTypeLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper limit reserve 4 is given in percentages.

FALSE

In case of bar objects the upper limit reserve 4 is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeLimitHigh5

Function

Specifies for bar objects whether the upper limit reserve 5 is given in percentages or absolute terms.

Syntax

BOOL GetTypeLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper limit reserve 5 is given in percentages.

FALSE

In case of bar objects the upper limit reserve 5 is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeLimitLow4

Function

Specifies for bar objects whether the lower limit reserve 4 is given in percentages or absolute terms.

Syntax

BOOL GetTypeLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower limit reserve 4 is given in percentages.

FALSE

In case of bar objects the lower limit reserve 4 is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeLimitLow5

Function

Specifies for bar objects whether the lower limit reserve 5 is given in percentages or absolute terms.

Syntax

BOOL GetTypeLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower limit reserve 5 is given in percentages.

FALSE

In case of bar objects the lower limit reserve 5 is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeToleranceHigh

Function

Specifies for bar objects whether the upper tolerance limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper tolerance limit is given in percentages.

FALSE

In case of bar objects the upper tolerance limit is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeToleranceLow

Function

Specifies for bar objects whether the lower tolerance limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower tolerance limit is given in percentages.

FALSE

In case of bar objects the lower tolerance limit is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeWarningHigh

Function

Specifies for bar objects whether the upper warning limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the upper warning limit is given in percentages.

FALSE

In case of bar objects the upper warning limit is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetTypeWarningLow

Function

Specifies for bar objects whether the lower warning limit is given in percentages or absolute terms.

Syntax

BOOL GetTypeWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

In case of bar objects the lower warning limit is given in percentages.

FALSE

In case of bar objects the lower warning limit is given in absolute terms.

See also

GetMarker example (Page 2226)

GetMarker example

GetWarningHigh

Function

Specifies the upper warning limit for bar objects.

Syntax

double GetWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Upper warning limit for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

GetWarningLow

Function

Specifies the lower warning limit for bar objects.

Syntax

```
double GetWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Lower warning limit for bar objects

See also

GetAlarmHigh example (Page 2215)

GetAlarmHigh example

link

Link - short description

A tag link property can be created or called in using the functions in the Link group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetLink

Function

Specifies the current tag connection of object properties.

Syntax

BOOL GetLink(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, LPLINKINFO *pLink);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Object property

pLink

Pointer to a structure of the type: LINKINFO

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Structure definition LINKINFO (Page 2297)

GetLink example (Page 2224)

GetLink example

LINKINFO structure definition

miscs

Miscs - short description

The properties of objects can be modified or called in using the functions in the Miscs group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetAdaptBorder

Function

Specifies for static texts, I/O fields, check boxes and radio boxes whether the border of the field is to be dynamically adapted to the text size.

Syntax

BOOL GetAdaptBorder(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Border is adapted

FALSE

Border is not adapted

See also

GetVisible example (Page 2251)

GetVisible example

GetAdaptPicture

Function

Specifies for picture windows whether the picture is to be adapted to the window size.

Syntax

BOOL GetAdaptPicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture is adapted

FALSE

Picture is not adapted

See also

GetVisible example (Page 2251)

GetVisible example

GetAdaptSize

Function

Specifies for picture windows whether the window is to be adapted.

Syntax

BOOL GetAdaptSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Window is adapted

FALSE

Window is not adapted

See also

GetVisible example (Page 2251)

GetVisible example

GetAverage

Function

When using bar objects, it specifies whether value averaging is activated.

Syntax

BOOL GetAverage(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Averaging is activated for bar objects

FALSE

Averaging is not activated for bar objects

See also

GetVisible example (Page 2251)

GetVisible example

GetBoxType

Function

Specifies the field type (input field, output field, input/output field) for I/O fields.

Syntax

long int GetBoxType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Field type of an I/O field

See also

I/O field, field type (Page 2284)

I/O field, field type

GetCaption

Function

Specifies whether a picture or application window has a title.

Syntax

BOOL GetCaption(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture/application window has a title

FALSE

Picture/application window has no title

See also

GetVisible example (Page 2251)

GetVisible example

GetCloseButton

Function

When using a picture window, it specifies whether the window can be closed.

Syntax

BOOL GetCloseButton(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture window can be closed

FALSE

Picture window cannot be closed

See also

GetVisible example (Page 2251)

GetVisible example

GetColorChangeType

Function

When using bar objects, it specifies whether the color change upon reaching a limit value only affects a bar segment or the entire bar.

Syntax

BOOL GetColorChangeType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Color change applies to the bar sagment

FALSE

Color change applies to the entire bar

See also

GetVisible example (Page 2251)

GetVisible example

GetCursorControl

Function

Specifies whether cursor control is activated for I/O fields.

Syntax

BOOL GetCursorControl(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Cursor control for I/O fields is enabled.

FALSE

Cursor control for I/O fields is disabled.

See also

GetVisible example (Page 2251)

GetVisible example

GetCursorMode

Function

Specifies whether the cursor mode for the picture is alpha cursor or tab order cursor.

Syntax

BOOL GetCursorMode(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Cursor mode for the picture is "Alpha-cursor"

FALSE

Cursor mode for the picture is "tab order cursor"

See also

GetVisible example (Page 2251)

GetVisible example

GetEditAtOnce

Function

Specifies whether the "Immediate input" property is activated for I/O fields.

Syntax

BOOL GetEditAtOnce(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

"Immediate input" property is activated

FALSE

"Immediate input" property is deactivated

See also

GetVisible example (Page 2251)

GetVisible example

GetExtendedOperation

Function

Specifies whether the "Extended operation" property is activated for slider objects.

Syntax

BOOL GetExtendedOperation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

"Extended operation" property is activated

FALSE

"Extended operation" property is deactivated

See also

GetVisible example (Page 2251)

GetVisible example

GetHotkey

Function

Specifies the key combination for check boxes.

Syntax

long int GetHotkey(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Key code for key combinations for check boxes

GetHysteresis

Function

When using bar objects, it specifies whether the display appears with or without hysteresis.

Syntax

BOOL GetHysteresis(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Display with hysteresis for bar objects

FALSE

Display without hysteresis for bar objects

See also

GetVisible example (Page 2251)

GetVisible example

GetHysteresisRange

Function

Specifies the hysteresis value in the display for bar objects.

Syntax

double GetHysteresisRange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Hysteresis in the display for bar objects

GetLanguageSwitch

Function

Specifies fot the "Text list" object whether the assignment texts are to be stored in the text library or in the object itself.

Syntax

BOOL GetLanguageSwitch(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Assignment texts are stored in the text library

FALSE

Assignment texts are stored in the text list object

See also

GetVisible example (Page 2251)

GetVisible example

GetLastChange

Function

Specifies the date when the picture was last changed.

Syntax

char* GetLastChange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Date of the last change of the picture.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetPictureName example (Page 2228)

GetPictureName example

GetMax

Function

Specifies the maximum value for bar and slider objects.

Syntax

double GetMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Maximum value for bar and slider objects.

GetMaximizeButton

Function

Specifies for picture or application windows whether the window can be maximized.

Syntax

BOOL GetMaximizeButton(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture or application window can be maximized

FALSE

Picture or application window cannot be maximized

See also

GetVisible example (Page 2251)

GetVisible example

GetMin

Function

Specifies the minimum value for bar and slider objects.

Syntax

double GetMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Minimum value for bar and slider objects

GetMoveable

Function

Specifies for picture or application windows whether the window can be moved.

Syntax

BOOL GetMoveable(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture or application window is movable

FALSE

Picture or application window is not movable

See also

GetVisible example (Page 2251)

GetVisible example

GetOffsetLeft

Function

Specifies the horizontal picture distance from the left window border for picture windows.

Syntax

long int GetOffsetLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Horizontal picture distance from the left window border for picture windows

GetOffsetTop

Function

Specifies the vertical picture distance from the upper window border for picture windows.

Syntax

long int GetOffsetTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Vertical picture distance from the upper window border for picture windows

GetOnTop

Function

Specifies for picture or application windows whether the window is always in the foreground.

Syntax

BOOL GetOnTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture or application window is always in the foreground

FALSE

Picture or application window can be overlapped by other windows.

See also

GetVisible example (Page 2251)

GetVisible example

GetOperation

Function

Specifies whether the object can be operated.

Syntax

BOOL GetOperation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Object is operable

FALSE

Object is not operable

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetVisible example (Page 2251)

GetVisible example

GetOperationMessage

Function

Specifies for I/O fields, check boxes, radio boxes or sliders whether a message is output following operation.

Syntax

BOOL GetOperationMessage(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Upon operation a message is issued

FALSE

Upon operation no message is issued

See also

GetVisible example (Page 2251)

GetVisible example

GetOperationReport

Function

Specifies for all objects except application and picture windows and OLE control whether the reason for the operation is logged.

Syntax

BOOL GetOperationReport(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Reason for the operation is logged.

FALSE

Reason for the operation is not logged.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetVisible example (Page 2251)

GetVisible example

GetPasswordLevel

Function

Specifies the authorization level for the operation of the object for all objects except application and picture windows and OLE control.

Syntax

long int GetPasswordLevel(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Authorization level for the operation of the object

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

GetPictureName

Function

Returns the name of the picture currently displayed in the picture window.

Syntax

char* GetPictureName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Name of the picture window

Return value

Pointer to the name of the currently displayed picture

Note

If both parameters are NULL, a pointer appears indicating the name of the basic screen.

See also

GetPictureName example (Page 2228)

GetPictureName example

GetProcess

Function

Specifies the default setting value for the process value to be displayed for bar and slider objects.

Specifies the selected fields for check boxes and radio boxes.

Syntax

```
double GetProcess(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

- For bar and slider objects: Default setting value for the process value to be displayed
- For check and radio boxes: In a 32-bit word each field is represented by a bit (field 1 corrsponds to the bit value 0). Selected fields are marked by a set bit. Non-existing are assigned 0.

GetScrollBars

Function

Specifies for picture windows whether the window has a scroll bar.

Syntax

BOOL GetScrollBars(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Picture window has a scroll bar

FALSE

Picture window has no scroll bar

See also

GetVisible example (Page 2251)

GetVisible example

GetServerName

Function

Specifies the default setting for the process value to be displayed for OLE control and OLE object.

Syntax

char* GetServerName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Name of the object (OLE control and OLE object) under which it is registered in WINDOWS.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetPictureName example (Page 2228)

GetPictureName example

GetSizeable

Function

Specifies for application or picture windows whether the window size can be changed.

Syntax

BOOL GetSizeable(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Application or picture window is sizeable

FALSE

Application or picture window is not sizeable

See also

GetVisible example (Page 2251)

GetVisible example

GetSmallChange

Function

Specifies the number of steps for slider objects by which the slider is shifted by a mouse click.

Syntax

long int GetSmallChange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Number of steps by which the slider is shifted by a mouse click

GetTagPrefix

Function

Returns the tag prefix of a picture window.

Syntax

char* GetTagPrefix(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Tag prefix of the picture window.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetTagPrefix example (Page 2244)

GetTagPrefix example

GetTrend

Function

When using bar objects, it specifies whether the trend display is activated.

Syntax

BOOL GetTrend(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Trend display is activated for a bar object

FALSE

Trend display is not activated for a bar object

See also

GetVisible example (Page 2251)

GetVisible example

GetUpdateCycle

Function

Specifies the update cycle for the entire picture.

Syntax

long int GetUpdateCycle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the update cycle

See also

Structure definition LINKINFO (Page 2297)

Structure definition LINKINFO

GetVisible

Function

Specifies whether the object is displayed.

Syntax

BOOL GetVisible(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Object is displayed

FALSE

Object is not displayed

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

GetVisible example (Page 2251)

GetVisible example

GetWindowBorder

Function

Specifies for application or picture windows whether the object is displayed with a border.

Syntax

BOOL GetWindowBorder(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Application or picture window is displayed with a border.

FALSE

Application or picture window is displayed without a border.

See also

GetVisible example (Page 2251)

GetVisible example

GetZeroPointValue

Function

Specifies the absolute value of the zero point for bar objects.

Syntax

double GetZeroPointValue(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Absolute value of the zero point for the bar display

GetZoom

Function

Specifies the scaling factor for picture windos.

Syntax

long int GetZoom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Scaling factor of a picture window

ole_control

OLE_control - short description

The functions in the ole_Control group can only be used with OCX slider objects.

Various OCX slider object properties and settings can be modified or called in using these functions.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetPosition

Function

Specifies the position of the slider for OCX slider objects.

Syntax

long int GetPosition(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Slider position of the OCX slider object as numeric value

See also

GetPosition example (Page 2229)

GetPosition example

GetRangeMax

Function

Specifies the adjustment range "Max" for OCX slider objects.

Syntax

long int GetRangeMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Adjustment range "Max" of the OCX slider object as numeric value

See also

GetRangeMax example (Page 2231)

GetRangeMax example

GetRangeMin

Function

Specifies the adjustment range "Min" for OCX slider objects.

Syntax

long int GetRangeMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Adjustment range "Min" of the OCX slider object as numeric value

See also

GetRangeMin example (Page 2232)

GetRangeMin example

pictures

Pictures - short description

Various properties of pictures of graphic objects and round buttons can be modified or called in using the functions in the Pictures group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetPicDeactReferenced

Function

Specifies whether the picture for the "deactivated" status is referenced for round buttons.

Syntax

BOOL GetPicDeactReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The picture assigned to the "deactivated" status was not stored in the object.

FALSE

The picture assigned to the "deactivated" status was stored in the object.

GetPicDeactTransparent

Function

Specifies the transparent color for the "deactivated" status of round buttons.

Syntax

long int GetPicDeactTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the transparent color for the "deactivated" status

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

GetBackColor example (Page 2216)

GetBackColor example

Color chart

GetPicDeactUseTransColor

Function

Specifies whether the transparent color for the "deactivated" status is used for round buttons.

Syntax

BOOL GetPicDeactUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color for "deactivated" status is used

FALSE

Transparent color for "deactivated" status is not used

GetPicDownReferenced

Function

Specifies whether the picture for the "On/pressed" status is referenced for round buttons.

Syntax

BOOL GetPicDownReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The picture assigned to the "On/pressed" status was not stored in the object.

FALSE

The picture assigned to the "On/pressed" status was stored in the object.

GetPicDownTransparent

Function

Specifies the transparent color for the "On/pressed" status of round buttons.

Syntax

long int GetPicDownTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the transparent color for the "On/pressed" status

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

GetPictureDown example (Page 2227)

Color chart

GetPictureDown example

GetPicDownUseTransColor

Function

Specifies whether the transparent color for the "On/pressed" status is used for round buttons.

Syntax

BOOL GetPicDownUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color for "On/pressed" status is used

FALSE

Transparent color for "On/pressed" status is not used

GetPicReferenced

Function

When using graphic objects, it specifies whether the picture is referenced.

Syntax

BOOL GetPicReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The assigned picture was not stored in the object.

FALSE

The assigned picture was stored in the object.

GetPicTransColor

Function

Specifies the transparent color for a background picture for graphic objects.

Syntax

long int GetPicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the background picture of a graphic object

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

GetBackColor example (Page 2216)

GetBackColor example

Color chart

GetPictureDeactivated

Function

Specifies the picture name for the "deactivated" status of round buttons.

Syntax

char* GetPictureDeactivated(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Picture name for "deactivated" status.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

GetPictureDown

Function

Specifies the picture name for the "On/pressed" status of round buttons.

Syntax

char* GetPictureDown(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Picture name for the "On/pressed" status.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

GetPictureDown example (Page 2227)

GetPictureDown example

GetPictureUp

Function

Specifies the picture name for the "Off/not pressed" status of round buttons.

Syntax

char* GetPictureUp(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Picture name for the "Off/not pressed" status.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

GetPictureUp example (Page 2229)

GetPictureUp example

GetPicUpReferenced

Function

Specifies whether the picture for the "Off/not pressed" status is referenced for round buttons.

Syntax

BOOL GetPicUpReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The picture assigned to the "Off/not pressed" status was not stored in the object.

FALSE

The picture assigned to the "Off/not pressed" status was stored in the object.

GetPicUpTransparent

Function

Specifies the transparent color for the "Off/not pressed" status of round buttons.

Syntax

long int GetPicUpTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the transparent color for the "Off/not pressed" status

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

GetBackColor example (Page 2216)

GetBackColor example

Color chart

GetPicUpUseTransColor

Function

Specifies whether the transparent color for the "Off/not pressed" status is used for round buttons.

Syntax

BOOL GetPicUpUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color for "Off/not pressed" status is used

FALSE

Transparent color for "Off/not pressed" status is not used

GetPicUseTransColor

Function

When using graphic objects, it specifies whether the transparent color is used for a background picture.

Syntax

BOOL GetPicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color is used for a background picture.

FALSE

Transparent color is not used for a background picture.

property

Property - short description

The properties of objects for which there are no direct functions can be modified or called in using the functions in the Property group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetPropBOOL

Function

Specifies the current status of a property of the data type "BOOL".

Syntax

BOOL GetPropBOOL(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

Return value

Value of the attribute in the data type "BOOL"

See also

GetPropBOOL example (Page 2230)

GetPropBOOL example

GetPropChar

Function

Specifies the current status of a property of the data type "char".

Syntax

char* GetPropChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

Return value

Pointer to a character string containing the value of the object property.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

See also

GetPropChar example (Page 2231)

GetPropChar example

GetPropDouble

Function

Specifies the current status of a property of the data type "double".

Syntax

double GetPropDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

Return value

Value of the attribute in the data type "double"

GetPropWord

Function

Specifies the current status of a property of the data type "long".

Syntax

long GetPropWord(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

Return value

Value of the attribute in the type "long"

state

State - short description

The properties of status displays can be modified or called in using the functions in the State group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetBasePicReferenced

Function

Specifies whether the basic picture is referenced for the status display.

Syntax

BOOL GetBasePicReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The basic picture was not stored in the object.

FALSE

The basic picture was stored in the object.

GetBasePicTransColor

Function

Specifies the transparent color of the basic picture for the status display.

Syntax

long int GetBasePicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Transparent color of the basic picture as numeric value

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

GetBackColor example (Page 2216)

GetBackColor example

Color chart

GetBasePicture

Function

Specifies the basic picture name fur the status display.

Syntax

char* GetBasePicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Basic picture name for the status display.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetBasePicUseTransColor

Function

When using the status display, it specifies whether the transparent color is used for the basic picture.

Syntax

BOOL GetBasePicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color is used for the basic picture.

FALSE

Transparent color is not used for the basic picture.

GetFlashFlashPicture

Function

Specifies whether the flash picture of the status display is animated dynamically or statically.

Syntax

BOOL GetFlashFlashPicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The flash picture is animated dynamically.

FALSE

The flash picture is animated statically.

GetFlashPicReferenced

Function

Specifies whether the flash picture is referenced for the status display.

Syntax

BOOL GetFlashPicReferenced(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The flash picture was not stored in the object.

FALSE

The flash picture was stored in the object.

GetFlashPicTransColor

Function

Specifies the transparent color of the flash picture for the status display.

Syntax

long int GetFlashPicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Transparent color of the flash picture as numeric value

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

GetBackColor example (Page 2216)

GetBackColor example

Color chart

GetFlashPicture

Function

Specifies the flash picture name for the status display.

Syntax

char* GetFlashPicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash picture name (file name of the graphic).

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetFlashPicUseTransColor

Function

When using the status display, it specifies whether the transparent color is used for the flash picture.

Syntax

BOOL GetFlashPicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Transparent color is used for the flash picture.

FALSE

Transparent color is not used for the flash picture.

GetFlashRateFlashPic

Function

Specifies the flash frequency of the flash picture for the status display.

Syntax

long int GetFlashRateFlashPic(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Flash frequency of a flash picture as numeric value

Note

Since the flashing is performed by means of software engineering, the precise frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time etc.).

See also

Flash frequencies (Page 2282)

GetFlashRateFlashPic example (Page 2220)

Flash frequencies

GetFlashRateFlashPic example

GetIndex

Function

Specifies the index of the current position in a polygon or polygon line.

Specifies the index of the current field for check boxes and radio boxes.

Syntax

long int GetIndex(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Index of the current point or field

style

Style - short description

Various properties affecting the appearance of objects can be modified or called in using the functions in the Style group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetBackBorderWidth

Function

Specifies the frame width of 3D frames and slider objects.

Syntax

long int GetBackBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value for the frame width of 3D frames and slider objects

See also

GetBorderStyle example (Page 2216)

GetBorderStyle example

GetBorderEndStyle

Function

Specifies the type of line end.

Syntax

long int GetBorderEndStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Type of line end as numeric value

See also

GetBorderStyle example (Page 2216)

Line end style (Page 2287)

GetBorderStyle example

Line style

GetBorderStyle

Function

Specifies the line or border style.

Syntax

long int GetBorderStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the line or border style

See also

GetBorderStyle example (Page 2216)

Line styles (Page 2287)

GetBorderStyle example

Line styles

GetBorderWidth

Function

Specifies the line or border line width.

Syntax

long int GetBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Line or border line width as numeric value

See also

GetBorderStyle example (Page 2216)

GetBorderStyle example

GetBoxAlignment

Function

Specifies the arrangement of controls (left or right justified) in check boxes or radio boxes.

Syntax

long int GetBoxAlignment(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the arrangement of controls in check boxes or radio boxes

See also

GetBorderStyle example (Page 2216)

Text alignment (Page 2289)

GetBorderStyle example

Text alignment

GetFillStyle

Function

Specifies the type of fill pattern.

Syntax

long int GetFillStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Type of fill pattern as numeric value

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

Fill pattern (Page 2286)

GetFillStyle example (Page 2218)

Fill pattern

GetFillStyle example

GetFillStyle2

Function

Specifies the bar fill pattern for a bar graph.

Syntax

long int GetFillStyle2(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Bar fill pattern as numeric value

See also

Fill pattern (Page 2286)

GetFillStyle example (Page 2218)

GetFillStyle example

Fill pattern

GetItemBorderStyle

Function

Specifies the dividing line style for the "text list" object.

Syntax

long int GetItemBorderStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Dividing line style for the "text list" object

See also

GetBorderStyle example (Page 2216)

Line styles (Page 2287)

GetBorderStyle example

Line styles

GetItemBorderWidth

Function

Specifies the dividing line width for the "text list" object.

Syntax

long int GetItemBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

Numeric value defining the dividing line width for the "text list" object

See also

GetBorderStyle example (Page 2216)

GetBorderStyle example

GetPressed

Function

Specifies for buttons or round buttons whether the switch setting is "pressed" or "not pressed".

Syntax

BOOL GetPressed(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Switch setting is "pressed"

FALSE

Switch setting is "not pressed"

GetToggle

Function

Specifies for buttons or round buttons whether the switch is latchable or not.

Syntax

BOOL GetToggle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Switch is latchable

FALSE

Switch is not latchable

GetWindowsStyle

Function

Specifies whether buttons are to be displayed in Windows style.

Syntax

BOOL GetWindowsStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

Button is displayed in the usual Windows fashion.

FALSE

The apperance of the button is defined by the user.

4.3.4.3 set

axes

Axes - short description

The functions in the Axes group can only be used with bar graph objects.

This function can be used to modify or query various bar graph object properties.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAlignment

Function

When using bar objects, it indicates whether the text is to the right or left of the bar.

Syntax

BOOL SetAlignment(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bAlignment);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bAlignment

Text alignment

TRUE	Text is to the right of the bar
FALSE	Text is to the left of the bar

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetScaling example

SetAxisSection

Function

When using bar objects, it specifies the axis section, i.e. the difference between the values of two neighboring axis labels.

Syntax

BOOL SetAxisSection(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dAxisSection);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dAxisSection

Axis section

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetExponent

Function

Sets the axis label display for bar objects (exponential/decimal).

Syntax

BOOL SetExponent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bExponent);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bExponent

Axis labeling

TRUE	Axis label in exponential form
FALSE	Axis label in decimal form

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetScaling example

SetLeftComma

Function

When using bar objects, it specifies the number of integers in the axis label.

Syntax

BOOL SetLeftComma(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lLeftComma);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lLeftComma

Number of integers

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetScaling example

SetLongStrokesBold

Function

When using bar objects, it specifies whether the main division lines are bold or regular.

Syntax

BOOL SetLongStrokesBold(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bLongStrokesBold);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bLongStrokesBold

Main division lines on the bar graph scale

TRUE	bold
FALSE	normal

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetScaling example

SetLongStrokesOnly

Function

When using bar objects, it specifies whether intermediate or only main division lines are used on the scale.

Syntax

BOOL SetLongStrokesOnly(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bLongStrokesOnly);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bLongStrokesOnly

Only main division lines yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetScaling example

SetLongStrokesSize

Function

When using bar objects, it specifies the length of the main division lines on the bar graph scale.

Syntax

BOOL SetLongStrokesSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lLongStrokesSize);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lLongStrokesSize

Length of the main division marks in pixels

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetScaling example

SetRightComma

Function

When using bar objects, it specifies the number of decimal places in the axis label.

Syntax

BOOL SetRightComma(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRightComma);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRightComma

Number of decimal places

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetScaling example

SetScaleTicks

Function

When using bar objects, it specifies the scale marks as number of scale sections. A scale section is a part of the scale bounded by two main tick marks.

Syntax

BOOL SetScaleTicks(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lScaleTicks);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lScaleTicks

Number of scale sections

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the number of scale sections is given as 0, the bar object itself calculates a suitable scale unit.

See also

SetScaling example (Page 2265)

SetScaling example

SetScaling

Function

Switches the bar graph scale of bar objects on or off.

Syntax

BOOL SetScaling(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bScaling);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bScaling

Scale on/off.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetScaling example (Page 2265)

SetScaling example

SetScalingType

Function

When using bar objects, it specifies the type of bar scaling.

Syntax

BOOL SetScalingType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lScalingType);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lScalingType

Type of bar scaling as numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Bar Scaling (Page 2282)

SetScaling example (Page 2265)

SetScaling example

Bar scaling

color

Color - short description

The various color properties of objects can be modified or queried using the functions in the Color group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetBackColor

Function

Sets the background color of the object.

Syntax

BOOL SetBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColor

Background color of the object as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetBackColor2

Function

Sets the bar color for bar objects.

Syntax

BOOL SetBackColor2(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColor2);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColor2

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetBackColor3

Function

Sets the bar background color for bar objects.

Syntax

BOOL SetBackColor3(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColor3);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColor3

Numeric value defining the bar background color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetBackColorBottom

Function

Sets the background color of the slider objects at the bottom right.

Syntax

BOOL SetBackColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColorBottom);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColorBottom

Numeric value defining the background color of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetBackColorTop

Function

Sets the background color of the slider objects at the top left.

Syntax

BOOL SetBackColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackColorTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackColorTop

Numeric value defining the background color of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetBorderBackColor

Function

Sets the background color of the lines or borders.

Syntax

BOOL SetBorderBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderBackColor

Background color of the lines or borders

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetBorderColor

Function

Sets the color of the lines or borders.

Syntax

BOOL SetBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderColor

Numeric value defining the color of lines or borders

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetBorderColorBottom

Function

Sets the 3D border color at the bottom.

Syntax

BOOL SetBorderColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderColorBottom);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderColorBottom

Numeric value defining the 3-D border color at the bottom

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetBorderColorTop

Function

Sets the 3D border color at the top.

Syntax

BOOL SetBorderColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderColorTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderColorTop

Numeric value defining the 3-D border color at the top

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetButtonColor

Function

Sets the button color of slider objects.

Syntax

BOOL SetButtonColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lButtonColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lButtonColor

Numeric value defining the button color of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetColorBottom

Function

When using slider objects, it sets the color of the bottom limit.

Syntax

BOOL SetColorBottom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorBottom);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorBottom

Numeric value defining the color of the bottom limit of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetColorTop

Function

When using slider objects, it sets the color of the top limit.

Syntax

BOOL SetColorTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorTop

Numeric value defining the color of the top limit of slider objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetFillColor

Function

Sets the color of the fill pattern.

Syntax

BOOL SetFillColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFillColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFillColor

Numeric value of the fill color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetForeColor

Function

Sets the font color.

Syntax

BOOL SetForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lForeColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lForeColor

Numeric value defining the font color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetItemBorderBackColor

Function

Sets the background color of the separating line for the "text list" object.

Syntax

BOOL SetItemBorderBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lItemBorderBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lItemBorderBackColor

Background color of the dividing line as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetItemBorderColor

Function

Sets the color of the dividing line for the "text list" object.

Syntax

BOOL SetItemBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lItemBorderColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lItemBorderColor

Numeric value defining the dividing line color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetScaleColor

Function

Sets the scale color for bar objects.

Syntax

BOOL SetScaleColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lScaleColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lScaleColor

Numeric value of the scale color for bar objects

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetSelBGColor

Function

Sets the background color of the selected entry for the "text list" object.

Syntax

BOOL SetSelBGColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lSelBGColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lSelBGColor

Numeric value defining the background color in the selected entry

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetSelTextColor

Function

Sets the font color of a selected entry for the "text list" object.

Syntax

BOOL SetSelTextColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lSelTextColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lSelTextColor

Numeric value defining the font color in the selected entry

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetTrendColor

Function

Sets the trend color for bar objects.

Syntax

BOOL SetTrendColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lTrendColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lTrendColor

Numeric value defining the trend color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetUnselBGColor

Function

Sets the background color of non-selected entries for the "text list" object.

Syntax

BOOL SetUnselBGColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lUnselBGColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lUnselBGColor

Numeric value defining the background color for non-selected entries

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetUnselTextColor

Function

Sets the font color of non-selected entries for the "text list" object.

Syntax

BOOL SetUnselTextColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lUnselTextColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lUnselTextColor

Numeric value defining the font color for non-selected entries

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

fill

Fill - short description

The functions in the Fill group control the dynamic filling of objects.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetFilling

Function

Activates or deactivates dynamic filling with background color.

Syntax

BOOL SetFilling(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFilling);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFilling

Dynamic filling with background color on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFilling example (Page 2256)

SetFilling example

SetFillingIndex

Function

Sets the fill level.

Syntax

BOOL SetFillingIndex(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFillingIndex);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFillingIndex

Fill level as a numeric value (0 - 100)

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFillingIndex example (Page 2257)

SetFillingIndex example

flash

Flash - short description

The various flashing properties can be modified or called in using the functions in the Flash group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetBackFlashColorOff

Function

Sets the background flash color for the deactivated status.

Syntax

BOOL SetBackFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackFlashColorOff);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackFlashColorOff

Background flash color for the deactivated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetFlashBackColorOn example (Page 2258)

Color chart

SetFlashBackColorOn example

SetBackFlashColorOn

Function

Sets the background flash color for the activated status.

Syntax

BOOL SetBackFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackFlashColorOn);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackFlashColorOn

Background flash color for the activated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetFlashBackColorOn example (Page 2258)

Color chart

SetFlashBackColorOn example

SetBorderFlashColorOff

Function

Sets the border or line flashing color for the deactivated status.

Syntax

BOOL SetBorderFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderFlashColorOff);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderFlashColorOff

Border or line flashing color for the deactivated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFlashBackColorOn example (Page 2258)

Color chart (Page 2284)

Color chart

SetFlashBackColorOn example

SetBorderFlashColorOn

Function

Sets the border or line flashing color for the activated status.

Syntax

```
BOOL SetBorderFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
long int lBorderFlashColorOn);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderFlashColorOn

Border or line flashing color for the activated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetFlashBackColorOn example (Page 2258)

Color chart

SetFlashBackColorOn example

SetFlashBackColor

Function

Activates or deactivates background flashing.

Syntax

BOOL SetFlashBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFlashBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashBackColor

Flashing background on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFlashBackColor example (Page 2257)

SetFlashBackColor example

SetFlashBorderColor

Function

Activates or deactivates flashing of the border or line.

Syntax

BOOL SetFlashBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFlashBorderColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashBorderColor

Flashing of the border or line on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFlashBackColor example (Page 2257)

Color chart

SetFlashForeColor

Function

Activates or deactivates font flashing.

Syntax

BOOL SetFlashForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFlashForeColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashForeColor

Flashing of the font on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFlashBackColor example (Page 2257)

SetFlashBackColor example

SetFlashRateBackColor

Function

Sets the flash frequency of the background.

Syntax

BOOL SetFlashRateBackColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashRateBackColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashRateBackColor

Flash frequency of the background

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Flash frequencies (Page 2282)

SetFlashBackColor example (Page 2257)

SetFlashBackColor example

Flash frequencies

SetFlashRateBorderColor

Function

Sets the flash frequency of the line or border.

Syntax

BOOL SetFlashRateBorderColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashRateBorderColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashRateBorderColor

Flash frequency of the line or border

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Flash frequencies (Page 2282)

SetFlashBackColor example (Page 2257)

SetFlashBackColor example

Flash frequencies

SetFlashRateForeColor

Function

Sets the flash frequency of the font.

Syntax

BOOL SetFlashRateForeColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashRateForeColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashRateForeColor

Flash frequency of the font

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Flash frequencies (Page 2282)

SetFlashBackColor example (Page 2257)

Flash frequencies

SetFlashBackColor example

SetForeFlashColorOff

Function

Sets the font flash color for the deactivated status.

Syntax

BOOL SetForeFlashColorOff(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lForeFlashColorOff);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lForeFlashColorOff

Font flash color for the deactivated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetFlashBackColorOn example (Page 2258)

SetFlashBackColorOn example

Color chart

SetForeFlashColorOn

Function

Sets the font flash color for the activated status.

Syntax

BOOL SetForeFlashColorOn(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lForeFlashColorOn);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lForeFlashColorOn

Font flash color for the activated status as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetFlashBackColorOn example (Page 2258)

SetFlashBackColorOn example

Color chart

focus

Focus - short description

Using the functions in the Focus group, it is possible to set the focus or poll which object has the focus.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

Set_Focus

Function

Sets the focus on the specified object.

Syntax

BOOL Set_Focus(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFocus example (Page 2258)

SetFocus example

font

Font - short description

The various properties affecting text can be modified or called in using the functions in the Font group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAlignmentLeft

Function

Sets the horizontal text alignment (left, centered, right).

Syntax

BOOL SetAlignmentLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lAlignmentLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lAlignmentLeft

Horizontal text alignment as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Text alignment (Page 2289)

SetFontSize example (Page 2259)

Text alignment

SetFontSize example

SetAlignmentTop

Function

Sets the vertical text alignment (top, centered, bottom).

Syntax

BOOL SetAlignmentTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lAlignmentTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lAlignmentTop

Vertical text alignment as a numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Text alignment (Page 2289)

SetFontSize example (Page 2259)

Text alignment

SetFontSize example

SetFontBold

Function

Switches the bold font on or off.

Syntax

BOOL SetFontBold(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFontBold);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFontBold

Bold font on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontBold example (Page 2259)

SetFontBold example

SetFontItalic

Function

Switches the italic font on or off.

Syntax

BOOL SetFontItalic(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFontItalic);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFontItalic

Italic font on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontBold example (Page 2259)

SetFontBold example

SetFontName

Function

Sets a font.

Syntax

BOOL SetFontName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szFontName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szFontName

Pointer to name of font

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetText example (Page 2272)

SetText example

SetFontSize

Function

Sets the font size.

Syntax

BOOL SetFontSize(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFontSize);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFontSize

Font Size

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontSize example (Page 2259)

SetFontSize example

SetFontUnderline

Function

Switches the underlined font on or off.

Syntax

BOOL SetFontUnderline(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFontUnderline);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFontUnderline

Underlined font on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontBold example (Page 2259)

SetFontBold example

SetOrientation

Function

Defines the text orientation (vertical/horizontal).

Syntax

BOOL SetOrientation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bOrientation);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bOrientation

Text orientation

TRUE	vertical
FALSE	Horizontal

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetFontBold example (Page 2259)

SetFontBold example

SetText

Function

Sets the value of the "text" property for objects like static text, check box or radio box.

Syntax

BOOL SetText(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szText);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szText

Pointer to a text

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

In case of check and radio boxes the element to be changed must be defined with the SetIndex function before actually activating this function.

See also

SetText example (Page 2272)

SetText example

geometry

Geometry - short description

The size, position and other geometrical properties of objects can be modified or called in using the functions in the Geometry group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetActualPointLeft

Function

Sets the X value for the current point of a polygon or polygon line.

Syntax

BOOL SetActualPointLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lActualPointLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lActualPointLeft

X value for the current point of a polygon or polygon line

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The current point of the polygon can be set using the SetIndex function.

See also

SetLeft example (Page 2260)

SetLeft example

SetActualPointTop

Function

Sets the Y value for the current point of a polygon or polygon line.

Syntax

BOOL SetActualPointTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lActualPointTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lActualPointTop

Y value for the current point of a polygon or polygon line

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The current point of the polygon can be set using the SetIndex function.

See also

SetTop example (Page 2273)

SetTop example

SetBoxCount

Function

Sets the number of fields in a check box or radio box.

Syntax

BOOL SetBoxCount(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBoxCount);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBoxCount

Number of fields in a check box or radio box.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetDirection

Function

Sets the bar direction for bar objects.

Syntax

BOOL SetDirection(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lDirection);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lDirection

Numeric value defining the bar direction

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Bar direction (Page 2281)

SetTop example (Page 2273)

SetTop example

Bar direction

SetEndAngle

Function

Sets the end angle of circle and ellipse segments and circle and elliptical arcs.

Syntax

BOOL SetEndAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lEndAngle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lEndAngle

End angle of circle and ellipse segments as well as circle and ellipse arcs

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetTop example (Page 2273)

SetTop example

SetHeight

Function

Sets the height of the rectangle framing an object.

Syntax

BOOL SetHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lHeight);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lHeight

Height of the framing rectangle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

SetHeight example (Page 2259)

SetHeight example

SetLeft

Function

Sets the X value of the upper left corner of the rectangle framing an object

Syntax

BOOL SetLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lLeft

X value of the upper left corner of the framing rectangle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetLeft example (Page 2260)

SetLeft example

SetPointCount

Function

Sets the number of corners of a polygon or in a polygon line.

Syntax

BOOL SetPointCount(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPointCount);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPointCount

Number of corner points

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetLeft example (Page 2260)

SetLeft example

SetRadius

Function

Sets the radius of a circle, circle segment or arc.

Syntax

BOOL SetRadius(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRadius);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRadius

Radius

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHeight example (Page 2259)

SetHeight example

SetRadiusHeight

Function

Sets the radius of an ellipse, ellipse segment or elliptical arc in vertical direction.

Syntax

BOOL SetRadiusHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRadiusHeight);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRadiusHeight

Radius in vertical direction

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHeight example (Page 2259)

SetHeight example

SetRadiusWidth

Function

Sets the radius of an ellipse, ellipse segment or elliptical arc in horizontal direction.

Syntax

BOOL SetRadiusWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRadiusWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRadiusWidth

Radius in horizontal direction

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetWidth example (Page 2273)

SetWidth example

SetReferenceRotationLeft

Function

Sets the X value of the rotation reference (central axis about which the object can be rotated) for lines, polygons and polylines.

Syntax

BOOL SetReferenceRotationLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lReferenceRotationLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lReferenceRotationLeft

X value of the rotation reference

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetLeft example (Page 2260)

SetLeft example

SetReferenceRotationTop

Function

Sets the Y value of the rotation reference (central axis about which the object can be rotated) for lines, polygons and polylines.

Syntax

BOOL SetReferenceRotationTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lReferenceRotationTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lReferenceRotationTop

Y value of the rotation reference

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetTop example (Page 2273)

SetTop example

SetRotationAngle

Function

Sets the angle of rotation about the central axis for lines, polygons and polylines.

Syntax

BOOL SetRotationAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRotationAngle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRotationAngle

Angle of rotation

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetLeft example (Page 2260)

SetLeft example

SetRoundCornerHeight

Function

Specifies the radius of the rounded corner of a rectangle vertically.

Syntax

BOOL SetRoundCornerHeight(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRoundCornerHeight);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRoundCornerHeight

Vertical radius

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHeight example (Page 2259)

SetHeight example

SetRoundCornerWidth

Function

Specifies the radius of the rounded corner of a rectangle horizontally.

Syntax

BOOL SetRoundCornerWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRoundCornerWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRoundCornerWidth

Horizontal radius

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetWidth example (Page 2273)

SetWidth example

SetStartAngle

Function

Sets the start angle of circle and ellipse segments and circle and elliptical arcs.

Syntax

BOOL SetStartAngle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lStartAngle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lStartAngle

Starting angle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHeight example (Page 2259)

SetHeight example

SetTop

Function

Sets the Y value of the upper left corner of the rectangle framing an object.

Syntax

BOOL SetTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lTop

Y value of the upper left corner of the framing rectangle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetTop example (Page 2273)

SetTop example

SetWidth

Function

Sets the width of the rectangle framing an object.

Syntax

BOOL SetWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lWidth

Width of the framing rectangle

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

SetWidth example (Page 2273)

SetWidth example

SetZeroPoint

Function

Sets the zero point for bar objects.

Syntax

BOOL SetZeroPoint(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lZeroPoint);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lZeroPoint

Zero point

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetTop example (Page 2273)

SetTop example

i_o

i_o - short description

The various properties affecting input and output values can be modified or called in using the functions in the i_o group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAssumeOnExit

Function

Specifies for I/O fields whether the entered value is assumed upon exiting the field.

Syntax

BOOL SetAssumeOnExit(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bAssumeOnExit);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bAssumeOnExit

Value application upon exiting the field yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2260)

SetHiddenInput example

SetAssumeOnFull

Function

Specifies for I/O fields whether the entered value is assumed on completion of input.

Syntax

BOOL SetAssumeOnFull(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bAssumeOnFull);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bAssumeOnFull

Value application on completion of input yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2260)

SetHiddenInput example

SetBitNumber

Function

Sets the relevant bit in the output value for the "bit" list type.

Syntax

BOOL SetBitNumber(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBitNumber);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBitNumber

Relevant bit in the output value for the "bit" list type

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

List types (Page 2288)

List types

SetClearOnError

Function

Specifies for I/O fields whether deletion of the content in case of input errors is activated.

Syntax

BOOL SetClearOnError(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bClearOnError);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bClearOnError

Deletion of the entry in case of input errors yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2260)

SetHiddenInput example

SetClearOnNew

Function

Specifies the deletion of the content in case of new inputs for I/O fields.

Syntax

```
BOOL SetClearOnNew(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL
bClearOnNew);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bClearOnNew

Deletion of content in case of new input yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2260)

SetHiddenInput example

SetHiddenInput

Function

Controls the hidden input for I/O fields.

Syntax

BOOL SetHiddenInput(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bHiddenInput);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bHiddenInput

Hidden input yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetHiddenInput example (Page 2260)

SetHiddenInput example

SetNumberLines

Function

Sets the number of visible lines lines for the "text list" object.

Syntax

BOOL SetNumberLines(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lNumberLines);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lNumberLines

Number of visible lines

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the amount of configured text is larger than the number of visible lines, the "text list" object receives a vertical scroll bar.

SetOutputValueChar

Function

Sets a pointer to the output value for I/O fields

Syntax

BOOL SetOutputValueChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szOutputValueChar);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szOutputValueChar

Pointer to the output value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetOutputValueDouble

Function

Sets the output value for I/O fields.

Syntax

BOOL SetOutputValueDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dOutputValueDouble);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dOutputValueDouble

Output value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetOutputValueDouble example (Page 2262)

SetOutputValueDouble example

Limits

Limits - short description

The various properties affecting limit values can be modified or called in using the functions in the Limits group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAlarmHigh

Function

Sets the upper alarm limit for bar objects.

Syntax

BOOL SetAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dAlarmHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dAlarmHigh

Upper alarm limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetAlarmLow

Function

Sets the lower alarm limit for bar objects.

Syntax

BOOL SetAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dAlarmLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dAlarmLow

Lower alarm limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetCheckAlarmHigh

Function

Controls the monitoring of the upper alarm limit for bar objects.

Syntax

BOOL SetCheckAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckAlarmHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckAlarmHigh

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckAlarmLow

Function

Controls the monitoring of the lower alarm limit for bar objects.

Syntax

BOOL SetCheckAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckAlarmLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckAlarmLow

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckLimitHigh4

Function

Controls the monitoring of the upper limit value reserve 4 for bar objects.

Syntax

BOOL SetCheckLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckLimitHigh4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckLimitHigh4

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckLimitHigh5

Function

Controls the monitoring of the upper limit value reserve 5 for bar objects.

Syntax

BOOL SetCheckLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckLimitHigh5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckLimitHigh5

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckLimitLow4

Function

Controls the monitoring of the lower limit value reserve 4 for bar objects.

Syntax

BOOL SetCheckLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckLimitLow4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckLimitLow4

Monitoring yes/no.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckLimitLow5

Function

Controls the monitoring of the lower limit value reserve 5 for bar objects.

Syntax

BOOL SetCheckLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckLimitLow5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckLimitLow5

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckToleranceHigh

Function

Controls the monitoring of the upper tolerance limit for bar objects.

Syntax

```
BOOL SetCheckToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bCheckToleranceHigh);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckToleranceHigh

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckToleranceLow

Function

Controls the monitoring of the lower tolerance limit for bar objects.

Syntax

```
BOOL SetCheckToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bCheckToleranceLow);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckToleranceLow

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckWarningHigh

Function

Controls the monitoring of the upper warning limit for bar objects.

Syntax

BOOL SetCheckWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckWarningHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckWarningHigh

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetCheckWarningLow

Function

Controls the monitoring of the lower warning limit for bar objects.

Syntax

BOOL SetCheckWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCheckWarningLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCheckWarningLow

Monitoring yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetColorAlarmHigh

Function

Sets the bar color for bar objects upon reaching the upper alarm limit.

Syntax

BOOL SetColorAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorAlarmHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorAlarmHigh

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetColorAlarmLow

Function

Sets the bar color for bar objects upon reaching the lower alarm limit.

Syntax

BOOL SetColorAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorAlarmLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorAlarmLow

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetColorLimitHigh4

Function

Sets the bar color for bar objects upon reaching the upper limit reserve 4.

Syntax

BOOL SetColorLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorLimitHigh4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorLimitHigh4

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetColorLimitHigh5

Function

Sets the bar color for bar objects upon reaching the upper limit reserve 5.

Syntax

BOOL SetColorLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorLimitHigh5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorLimitHigh5

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetColorLimitLow4

Function

Sets the bar color for bar objects upon reaching the lower limit reserve 4.

Syntax

BOOL SetColorLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorLimitLow4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorLimitLow4

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetColorLimitLow5

Function

Sets the bar color for bar objects upon reaching the lower limit reserve 5.

Syntax

BOOL SetColorLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorLimitLow5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorLimitLow5

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetColorToleranceHigh

Function

Sets the bar color for bar objects upon reaching the upper tolerance limit.

Syntax

BOOL SetColorToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorToleranceHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorToleranceHigh

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetColorToleranceLow

Function

Sets the bar color for bar objects upon reaching the lower tolerance limit.

Syntax

BOOL SetColorToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorToleranceLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorToleranceLow

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetColorWarningHigh

Function

Sets the bar color for bar objects upon reaching the upper warning limit.

Syntax

BOOL SetColorWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorWarningHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorWarningHigh

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetColorWarningLow

Function

Sets the bar color for bar objects upon reaching the lower warning limit.

Syntax

BOOL SetColorWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lColorWarningLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lColorWarningLow

Numeric value defining the bar color

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetLimitHigh4

Function

Sets the high limit value for reserve 4 for bar objects.

Syntax

BOOL SetLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitHigh4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitHigh4

High limit value for reserve 4

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetLimitHigh5

Function

Sets the high limit value for reserve 5 for bar objects.

Syntax

BOOL SetLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitHigh5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitHigh5

High limit value for reserve 5

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetLimitLow4

Function

Sets the low limit value for reserve 4 for bar objects.

Syntax

BOOL SetLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitLow4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitLow4

Low limit value for reserve 4

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetLimitLow5

Function

Sets the low limit value for reserve 5 for bar objects.

Syntax

BOOL SetLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitLow5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitLow5

Low limit value for reserve 5

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetLimitMax

Function

Sets the high limit value for I/O fields.

Syntax

BOOL SetLimitMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitMax);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitMax

High limit value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetLimitMin

Function

Sets the low limit value for I/O fields.

Syntax

BOOL SetLimitMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dLimitMin);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dLimitMin

Lower limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetMarker

Function

Controls the limit marker display for bar objects.

Syntax

BOOL SetMarker(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bMarker);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bMarker

Limit marker on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetToleranceHigh

Function

Sets the upper tolerance limit for bar objects.

Syntax

BOOL SetToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dToleranceHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dToleranceHigh

Upper tolerance limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetToleranceLow

Function

Sets the lower tolerance limit for bar objects.

Syntax

```
BOOL SetToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double
dToleranceLow);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dToleranceLow

Lower tolerance limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetAlarmHigh example (Page 2254)

SetAlarmHigh example

SetTypeAlarmHigh

Function

Specifies for bar objects whether the upper alarm limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeAlarmHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeAlarmHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeAlarmHigh

Upper alarm limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeAlarmLow

Function

Specifies for bar objects whether the lower alarm limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeAlarmLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeAlarmLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeAlarmLow

Lower alarm limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeLimitHigh4

Function

Specifies for bar objects whether the upper limit for reserve 4 is given in percentages or absolute terms.

Syntax

BOOL SetTypeLimitHigh4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeLimitHigh4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeLimitHigh4

High limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeLimitHigh5

Function

Specifies for bar objects whether the upper limit for reserve 5 is given in percentages or absolute terms.

Syntax

BOOL SetTypeLimitHigh5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeLimitHigh5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeLimitHigh5

High limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeLimitLow4

Function

Specifies for bar objects whether the lower limit for reserve 4 is given in percentages or absolute terms.

Syntax

BOOL SetTypeLimitLow4(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeLimitLow4);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeLimitLow4

Low limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeLimitLow5

Function

Specifies for bar objects whether the lower limit for reserve 5 is given in percentages or absolute terms.

Syntax

BOOL SetTypeLimitLow5(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeLimitLow5);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeLimitLow5

Low limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeToleranceHigh

Function

Specifies for bar objects whether the high tolerance limit is given in percentages or absolute terms.

Syntax

```
BOOL SetTypeToleranceHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bTypeToleranceHigh);
```

Parameter

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeToleranceHigh

High tolerance limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeToleranceLow

Function

Specifies for bar objects whether the lower tolerance limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeToleranceLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeToleranceLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeToleranceLow

Lower tolerance limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeWarningHigh

Function

Specifies for bar objects whether the upper warning limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeWarningHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeWarningHigh

Upper warning limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetTypeWarningLow

Function

Specifies for bar objects whether the lower warning limit is given in percentages or absolute terms.

Syntax

BOOL SetTypeWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTypeWarningLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTypeWarningLow

Lower warning limit

TRUE	Specification in percent
FALSE	Absolute specification

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetWarningHigh

Function

Sets the upper warning limit for bar objects.

Syntax

BOOL SetWarningHigh(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dWarningHigh);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dWarningHigh

Upper warning limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

SetWarningLow

Function

Sets the lower warning limit for bar objects.

Syntax

BOOL SetWarningLow(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dWarningLow);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dWarningLow

Lower warning limit

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetMarker example (Page 2261)

SetMarker example

link

Link - short description

A tag link property can be created or called in using the functions in the Link group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetLink

Function

Creating a tag connection of object properties

Syntax

BOOL SetLink(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, LPLINKINFO *pLink);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

pLink

Pointer to a structure of the type: LINKINFO

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Structure definition LINKINFO (Page 2297)

SetLink example (Page 2261)

LINKINFO structure definition

SetLink example

miscs

Miscs - short description

The properties of objects can be modified or called in using the functions in the Miscs group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetAverage

Function

Controls the averaging of bar objects.

Syntax

BOOL SetAverage(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bAverage);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bAverage

Averaging yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2273)

SetVisible example

SetBoxType

Function

Specifies the field type (input field, output field, input/output field) for an I/O object.

Syntax

BOOL SetBoxType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBoxType);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBoxType

Field type

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

I/O field, field type (Page 2284)

I/O field, field type

SetColorChangeType

Function

When using bar objects, it defines whether the color change upon reaching a limit value only affects a bar segment or the entire bar.

Syntax

BOOL SetColorChangeType(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bColorChangeType);

Parameter

lpszPictureName

Picture name

lpszObjectName

Object name

bColorChangeType

Type of color change

TRUE	Color change applies to a segment
FALSE	Color change applies to the entire bar

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2273)

SetVisible example

SetCursorControl

Function

Sets the cursor control for I/O fields.

Syntax

BOOL SetCursorControl(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCursorControl);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCursorControl

Cursor control on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2273)

SetVisible example

SetCursorMode

Function

Sets the cursor control for pictures.

Syntax

BOOL SetCursorMode(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bCursorMode);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bCursorMode

Cursor Mode

TRUE	Tab order cursor
FALSE	Alpha-Cursor

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Example - SetCursorMode (Page 2256)

SetCursorMode example

SetEditAtOnce

Function

Specifies whether the "Immediate input" property is activated for I/O fields.

Syntax

BOOL SetEditAtOnce(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bEditAtOnce);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bEditAtOnce

Immediate input yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2273)

SetVisible example

SetExtendedOperation

Function

Controls the "Extended operation" property of slider objects.

Syntax

```
BOOL SetExtendedOperation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bExtendedOperation);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bExtendedOperation

Extended operation yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2273)

SetVisible example

SetHysteresis

Function

When using bar objects, it specifies whether the display appears with or without hysteresis.

Syntax

BOOL SetHysteresis(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bHysteresis);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bHysteresis

Display with/without hysteresis

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2273)

SetVisible example

SetHysteresisRange

Function

Sets the hysteresis value in the display for bar objects.

Syntax

BOOL SetHysteresisRange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dHysteresisRange);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dHysteresisRange

Hysteresis value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetMax

Function

Sets the maximum value for bar and slider objects.

Syntax

BOOL SetMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dMax);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dMax

Maximum value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetMin

Function

Sets the minimum value for bar and slider objects.

Syntax

BOOL SetMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dMin);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dMin

Minimum value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetOffsetLeft

Function

Sets the horizontal picture distance from the left window border for picture windows.

Syntax

BOOL SetOffsetLeft(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lOffsetLeft);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lOffsetLeft

Picture distance

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetOffsetTop

Function

Sets the vertical picture distance from the upper window border for picture windows.

Syntax

BOOL SetOffsetTop(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lOffsetTop);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lOffsetTop

Picture distance

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetOperation

Function

Controls the operability of the objects.

Syntax

BOOL SetOperation(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bOperation);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bOperation

Object operable, yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

See also

SetVisible example (Page 2273)

SetVisible example

SetOperationMessage

Function

Controls the output of a message when operating the objects "I/O field", "Check box", "Radio box" and "Slider".

Syntax

BOOL SetOperationMessage(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bOperationMessage);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bOperationMessage

Message output for yes/no operation

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2273)

SetVisible example

SetOperationReport

Function

Controls the logging of the operating reason for all objects except application and picture windows and OLE control.

Syntax

BOOL SetOperationReport(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bOperationReport);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bOperationReport

Logging operating reason yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

See also

SetVisible example (Page 2273)

SetVisible example

SetPasswordLevel

Function

Defines the authorization level for operating objects for all objects except application and picture windows and OLE control.

Syntax

BOOL SetPasswordLevel(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPasswordLevel);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPasswordLevel

Authorization level

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

SetPictureName

Function

Sets the name of the picture, which should be shown in a picture window or in a graphic object.

Syntax

BOOL SetPictureName(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szPictureName);

Parameters

lpszPictureName

Picture name

lpszObjectName

Name of the picture window or graphic object

szPictureName

Pointer to the picture name

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetPictureName example (Page 2262)

SetPictureName example

SetProcess

Function

Specifies the default setting of the value to be displayed for bar and slider objects.

Sets the selected fields for check boxes and radio boxes.

Syntax

BOOL SetProcess(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dProcess);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dProcess

- In case of bar and slider objects, this value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.
- For check boxes and radio boxes the selected fields are specified. In the 32-bit word each field is represented by a bit (field 1 corrsponds to the bit value 0). Selected fields are marked by a set bit. Non-existing are assigned 0.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetSmallChange

Function

Sets the number of steps for slider objects by which the slider is shifted by a mouse click.

Syntax

BOOL SetSmallChange(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lSmallChange);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lSmallChange

Number of setting steps

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetTagPrefix

Function

This function sets the tag prefix of a picture window:

In a picture window the "temperature" tag is requested on an object. If a "Motor1." tag prefix is assigned to the picture window, the tag "Motor1.Temperature" is requested.

The setting of the tag prefix only becomes effective when newly supplying the picture name.

This means you must either set the prefix before picture selection or newly supply the picture name if the picture is not changed.

Syntax

BOOL SetTagPrefix(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,char* szTagPrefix);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szTagPrefix

Tag prefix to be set

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the tag prefix is set for a picture window, the tag prefix is added to all tags contained in the picture to be displayed. This also applies if the request takes place in a function. If a tag needs to be read without the tag prefix, you must add "@NOTP::" to the tag name.

Using a tag prefix greatly simplifies the picture module technology.

See also

SetTagPrefix example (Page 2269)

SetTagPrefix example

SetTrend

Function

Controls the trend display for bar objects.

Syntax

BOOL SetTrend(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bTrend);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bTrend

Trend display yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetVisible example (Page 2273)

SetVisible example

SetVisible

Function

Controls the display of an object.

Syntax

BOOL SetVisible(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bVisible);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bVisible

Object display yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = NULL.

See also

SetVisible example (Page 2273)

SetVisible example

SetZeroPointValue

Function

Sets the absolute value of the zero point for bar objects.

Syntax

BOOL SetZeroPointValue(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, double dZeroPointValue);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

dZeroPointValue

Absolute value of the zero point

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetZoom

Function

Sets the scaling factor for a picture window.

Syntax

BOOL SetZoom(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lZoom);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lZoom

Scaling factor

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

ole_control

OLE_control - short description

The functions in the ole_Control group can only be used with OCX slider objects.

Various OCX slider object properties and settings can be modified or called in using these functions.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetPosition

Function

Sets the slider position of the OCX slider object.

Syntax

BOOL SetPosition(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPosition);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPosition

Slider position of the OCX slider object

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetPosition example (Page 2263)

SetPosition example

SetRangeMax

Function

Defines the adjustment range "Max" of the OCX slider object.

Syntax

BOOL SetRangeMax(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRangeMax);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRangeMax

Adjustment range "Max" of the OCX slider object

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetRangeMax example (Page 2264)

SetRangeMax example

SetRangeMin

Function

Defines the adjustment range "Min" of the OCX slider object.

Syntax

BOOL SetRangeMin(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lRangeMin);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lRangeMin

Adjustment range "Min" of the OCX slider object

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetRangeMin example (Page 2264)

SetRangeMin example

pictures

Pictures - short description

Various properties of pictures of graphic objects and round buttons can be modified or called in using the functions in the Pictures group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetPicDeactTransparent

Function

Sets the transparent color for the "deactivated" status of a round button.

Syntax

BOOL SetPicDeactTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPicDeactTransparent);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPicDeactTransparent

Transparent color for "deactivated" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetPicDeactUseTransColor

Function

Controls the transparent color for the "deactivated" status of a round button.

Syntax

BOOL SetPicDeactUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bPicDeactUseTransColor);

Parameter

lpszPictureName

Picture name

lpszObjectName

Object name

bPicDeactUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetPicDownTransparent

Function

Sets the transparent color for the "On/pressed" status of a round button.

Syntax

BOOL SetPicDownTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPicDownTransparent);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPicDownTransparent

Transparent color for "On/pressed" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetPicDownUseTransColor

Function

Controls the transparent color for the "On/pressed" status of a round button.

Syntax

BOOL SetPicDownUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bPicDownUseTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bPicDownUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetPicTransColor

Function

Sets the transparent color of the background picture of a graphic object.

Syntax

BOOL SetPicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPicTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPicTransColor

Transparent color of the background picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetPictureDeactivated

Function

Specifies the picture name for the "deactivated" status of a round button.

Syntax

BOOL SetPictureDeactivated(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szPictureDeactivated);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szPictureDeactivated

Picture name for "deactivated" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

SetPictureDown example (Page 2262)

SetPictureDown example

SetPictureDown

Function

Specifies the picture name for the "On/pressed" status of a round button.

Syntax

BOOL SetPictureDown(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szPictureDown);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szPictureDown

Picture name for "On/pressed" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

SetPictureDown example (Page 2262)

SetPictureDown example

SetPictureUp

Function

Specifies the picture name for the "Off/not pressed" status of a round button.

Syntax

BOOL SetPictureUp(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, char* szPictureUp);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

szPictureUp

Picture name for "Off/not pressed" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Bitmap files (*.bmp, *.dib) as well as metafiles (*.emf, *.wmf) can be integrated.

See also

SetPictureUp example (Page 2263)

SetPictureUp example

SetPicUpTransparent

Function

Sets the transparent color for the "Off/not pressed" status of a round button.

Syntax

BOOL SetPicUpTransparent(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lPicUpTransparent);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lPicUpTransparent

Transparent color for "Off/not pressed" status

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetPicUpUseTransColor

Function

Controls the transparent color for the "Off/not pressed" status of a round button.

Syntax

```
BOOL SetPicUpUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bPicUpUseTransColor);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bPicUpUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetPicUseTransColor

Function

Controls the transparent color of the background picture of a graphic object.

Syntax

```
BOOL SetPicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bPicUseTransColor);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bPicUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

property

Property - short description

The properties of objects for which there are no direct functions can be modified or called in using the functions in the Property group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetPropBOOL

Function

Sets a property with the value "bValue".

Syntax

BOOL SetPropBOOL(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, BOOL bValue)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

bValue

Value in BOOL data format

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

See also

SetPropBOOL example (Page 2263)

SetPropChar

Function

Sets a property with the value the pointer "szValue" points to.

Syntax

BOOL SetPropChar(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, char* szValue)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

szValue

Pointer to the value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

See also

GetPropChar example (Page 2231)

SetPropDouble

Function

Sets a property with the value "dValue".

Syntax

BOOL SetPropDouble(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, double dValue)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

dValue

Value in "double" data format

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

SetPropWord

Function

Sets a property with the value "lValue".

Syntax

BOOL SetPropWord(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, LPCTSTR lpszPropertyName, long lValue)

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lpszPropertyName

Name of the object property

lValue

Value in "long" data format

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called for the picture object, set the parameter lpszObjectName = NULL.

state

State - short description

The properties of status displays can be modified or called in using the functions in the State group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetBasePicTransColor

Function

Sets the transparent color of the basic picture for the status display.

Syntax

BOOL SetBasePicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBasePicTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBasePicTransColor

Transparent color of the basic picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

Color chart

SetBackColor example

SetBasePicUseTransColor

Function

Controls the transparent color of the basic picture for the status display.

Syntax

BOOL SetBasePicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bBasePicUseTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bBasePicUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetFlashFlashPicture

Function

Specifies whether the flash picture of the status display is animated dynamically or statically.

Syntax

BOOL SetFlashFlashPicture(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bFlashFlashPicture);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashFlashPicture

Type of flash picture

TRUE	dynamically animated flash picture
FALSE	statically animated flash picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetFlashPicTransColor

Function

Sets the transparent color of the flash picture for a status display.

Syntax

BOOL SetFlashPicTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashPicTransColor);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashPicTransColor

Transparent color of the flash picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

This function only applies to Bitmap graphics (*.bmp).

See also

Color chart (Page 2284)

SetBackColor example (Page 2254)

SetBackColor example

Color chart

SetFlashPicUseTransColor

Function

Controls the transparent color of the flash picture for a status display.

Syntax

```
BOOL SetFlashPicUseTransColor(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName,
BOOL bFlashPicUseTransColor);
```

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bFlashPicUseTransColor

Transparent color yes/no

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetFlashRateFlashPic

Function

Sets the flash frequency of the flash picture for a status display.

Syntax

BOOL SetFlashRateFlashPic(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFlashRateFlashPic);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFlashRateFlashPic

Flash frequency of the flash picture

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Since the flashing is performed by means of software engineering, the precise frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time etc.).

See also

Flash frequencies (Page 2282)

SetFlashRateFlashPic example (Page 2258)

Flash frequencies

SetIndex

Function

Sets the index of a polygon or polyline thus defining the current object point.

Syntax

BOOL SetIndex(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lIndex);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lIndex

Index value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

style

Style - short description

Various properties affecting the appearance of objects can be modified or called in using the functions in the Style group.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

SetBackBorderWidth

Function

Sets the frame width of 3D frames and slider objects.

Syntax

BOOL SetBackBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBackBorderWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBackBorderWidth

Frame width in pixels

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetBorderStyle example (Page 2255)

SetBorderStyle example

SetBorderEndStyle

Function

Sets the type of line end.

Syntax

BOOL SetBorderEndStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderEndStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderEndStyle

Type of line end as numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetBorderEndStyle example

Line style

SetBorderStyle

Function

Sets the line or border style.

Syntax

BOOL SetBorderStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderStyle

Numeric value defining the line or border style

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Line styles (Page 2287)

SetBorderStyle example (Page 2255)

SetBorderStyle example

Line styles

SetBorderWidth

Function

Sets the line or border line width.

Syntax

BOOL SetBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBorderWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBorderWidth

Line width or border line width

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetBorderStyle example (Page 2255)

SetBorderStyle example

SetBoxAlignment

Function

Defines the arrangement of controls (left or right justified) in check boxes or radio boxes.

Syntax

BOOL SetBoxAlignment(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lBoxAlignment);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lBoxAlignment

Arrangement of controls

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Element alignment in check boxes and radio boxes (Page 2284)

SetBorderStyle example (Page 2255)

SetBorderStyle example

Element alignment in check boxes and radio boxes

SetFillStyle

Function

Sets the type of fill pattern.

Syntax

BOOL SetFillStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFillStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFillStyle

Type of fill pattern as numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

If the function is called in relation to the entire picture, set the parameter lpszObjectName = ZERO.

See also

Fill pattern (Page 2286)

SetFillStyle example (Page 2257)

Fill pattern

SetFillStyle example

SetFillStyle2

Function

Sets the bar fill pattern for a bar graph.

Syntax

BOOL SetFillStyle2(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lFillStyle2);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lFillStyle2

Bar fill pattern as numeric value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Fill pattern (Page 2286)

SetFillStyle example (Page 2257)

Fill pattern

SetFillStyle example

SetItemBorderStyle

Function

Sets the dividing line style for the "text list" object.

Syntax

BOOL SetItemBorderStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lItemBorderStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lItemBorderStyle

Numeric value defining the dividing line style

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Line styles (Page 2287)

SetBorderStyle example (Page 2255)

Line styles

SetBorderStyle example

SetItemBorderWidth

Function

Sets the dividing line width for the "text list" object.

Syntax

BOOL SetItemBorderWidth(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, long int lItemBorderWidth);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

lItemBorderWidth

Numeric value defining the dividing line width

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

SetBorderStyle example (Page 2255)

SetBorderStyle example

SetPressed

Function

Specifies for buttons or round buttons whether the switch setting is "pressed" or "not pressed".

Syntax

BOOL SetPressed(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bPressed);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bPressed

Switch setting of the button

TRUE	Switch setting "pressed"
FALSE	Switch setting "not pressed"

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetToggle

Function

Specifies for buttons or round buttons whether the switch is latchable or not.

Syntax

BOOL SetToggle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bToggle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bToggle

Switch latchable/not latchable

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

SetWindowsStyle

Function

Specifies whether buttons are to be displayed in Windows style.

Syntax

BOOL SetWindowsStyle(LPCTSTR lpszPictureName, LPCTSTR lpszObjectName, BOOL bWindowStyle);

Parameters

lpszPictureName

Picture name

lpszObjectName

Object name

bWindowStyle

"Windows style" on/off

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OpenHomePicture

Function

Opens the entered start picture.

Syntax

```
BOOL OpenHomePicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OpenNextPicture

Function

WinCC saves the names of the pictures opened by the user during runtime as well as the sequence in which these pictures were opened.

The maximum number of picture names saved this way can be set in the WinCC Explorer in the computer properties on the "Graphics Runtime" tab under "picture buffer size".

The OpenNextPicture function now opens the picture which was opened before the last call of OpenPrevPicture.

Syntax

```
BOOL OpenNextPicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OpenPrevPicture

Function

WinCC saves the names of the pictures opened by the user during runtime as well as the sequence in which these pictures were opened.

The maximum number of picture names saved this way can be set in the WinCC Explorer in the computer properties on the "Graphics Runtime" tab under "picture buffer size".

The OpenPrevPicture function now opens the picture which was opened before the currently open picture.

Syntax

```
BOOL OpenPrevPicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

OpenStoredPicture

Function

Opens the picture saved with the StorePicture function.

Syntax

```
BOOL OpenStoredPicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

StorePicture

Function

Saves the current picture which can then be opened with the OpenStoredPicture function.

Syntax

```
BOOL StorePicture();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

4.3.5 tag

4.3.5.1 tag - short description

Tags can be set or called in using the functions from the tag group.

GetTag or GetTagWait?

Process tags that are called with GetTag are put in an image. Since updating and reading the image is done in two separate procedures, the GetTag call is not directly influenced by the coupling. It can therefore be executed quicker and more independently than a GetTagWait retrieval.

With GetTagWait, process tags that have been requested are not accepted in the image. A GetTagWait retrieval reads the value explicitly from the AS. This always includes the send and return path through the coupling and the response time of the AS. During this runtime, the processing of the C actions is blocked and the time required for the retrieval cannot be estimated. If multiple tags are read, the time is added.

A GetTagWait call is required if

- fast write/read procedures are to be synchronized
- a value is read explicitly from the AS
- or a registration is to be avoided in the image deliberately.

The GetTagWait call is to be avoided in cyclic C-Actions, this is the main reason for performance problems.

SetTag or SetTagWait?

The SetTag retrieval distributes a write job without waiting for confirmation from the AS.

The SetTagWait retrieval distributes a write job and waits for confirmation from the AS. This always includes the send and return path through the coupling and the response time of the AS. During this runtime, the processing of the C actions is blocked and the time required for the retrieval cannot be estimated. If multiple tags are written, the time is added.

A SetTagWait call is set to guarantee that the value has been written before the C-Action is processed any further. The SetTagWait call in cyclic C actions is to be avoided.

Note

The difference between GetTag and GetTagWait also exists for internal tags. The difference is not quite so serious here however, since no coupling comes into play. To synchronize fast write/read procedures, the respective wait function is to be used with internal tags as well.

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.3.5.2 get

Functionality of the GetTag functions

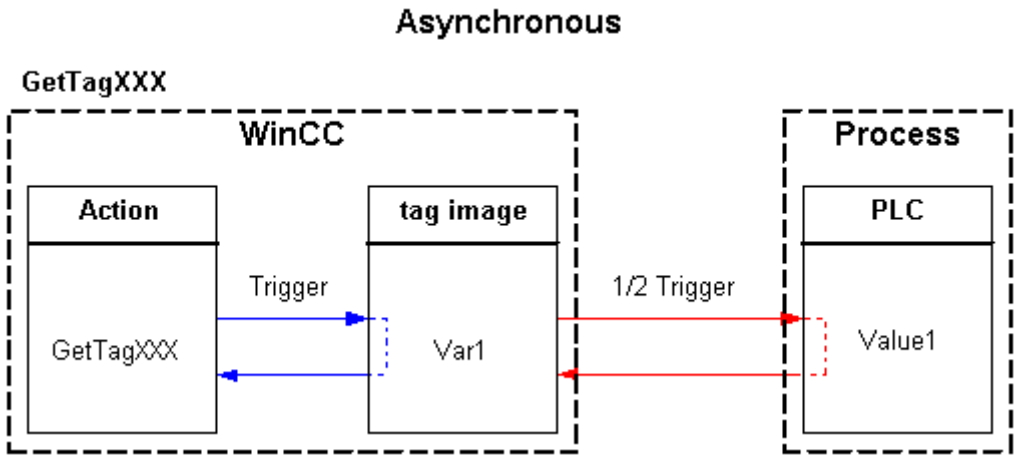
GetTagXXX

By calling the function the tag is logged on and, from that moment, polled cyclically from the AS. The cycle for the registration depends on the trigger (see following description). For GetTagXXX calls, the value that is available in WinCC is sent. For Close Picture, the tag actions are ended again.

The call is marked by the following:

- The value is read from the tag image by WinCC.
- The call is faster in comparison to GetTagXXXWait (except for the first call which generally takes longer because the value from the PLC must be read out and logged on).

- The duration of the call does not depend on the bus-load or on the AS.
- The function does not deliver any information on the status of the tags



Note

If a tag is requested in a Global Script action, it remains registered throughout the enter Runtime of WinCC.

In Callback functions, the respective GetTagXXXWait function must be used.

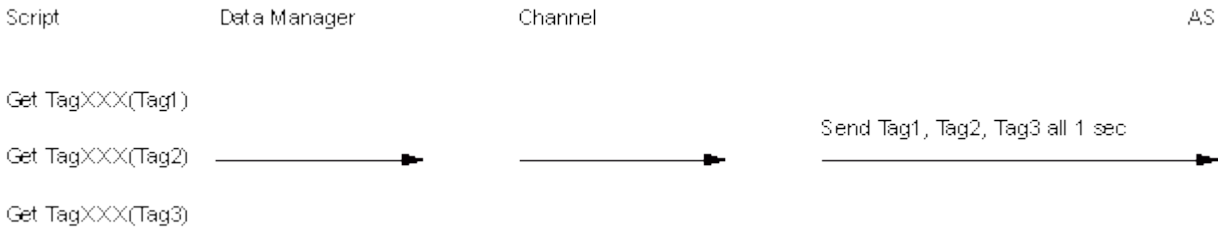
Behavior in actions with tag trigger (recommended):

All of the tags contained in the tag trigger are already known with Open Picture and are registered with the defined monitoring time.

Since all tags are requested at once, the best possible optimization can be targeted from the channel. If a tag is requested with GetTagXXX() within a C-Action, which is contained in the trigger, the value already exists and is sent directly to the call (high-performance).

Registering tags in actions with tag trigger

As the tags are already known when the picture is selected, they can be transmitted in a job to the Data Manager and so be registered collectively to the channel.



Note

If a tag is requested, which is not in the trigger, then the behavior is the same as with the default trigger.

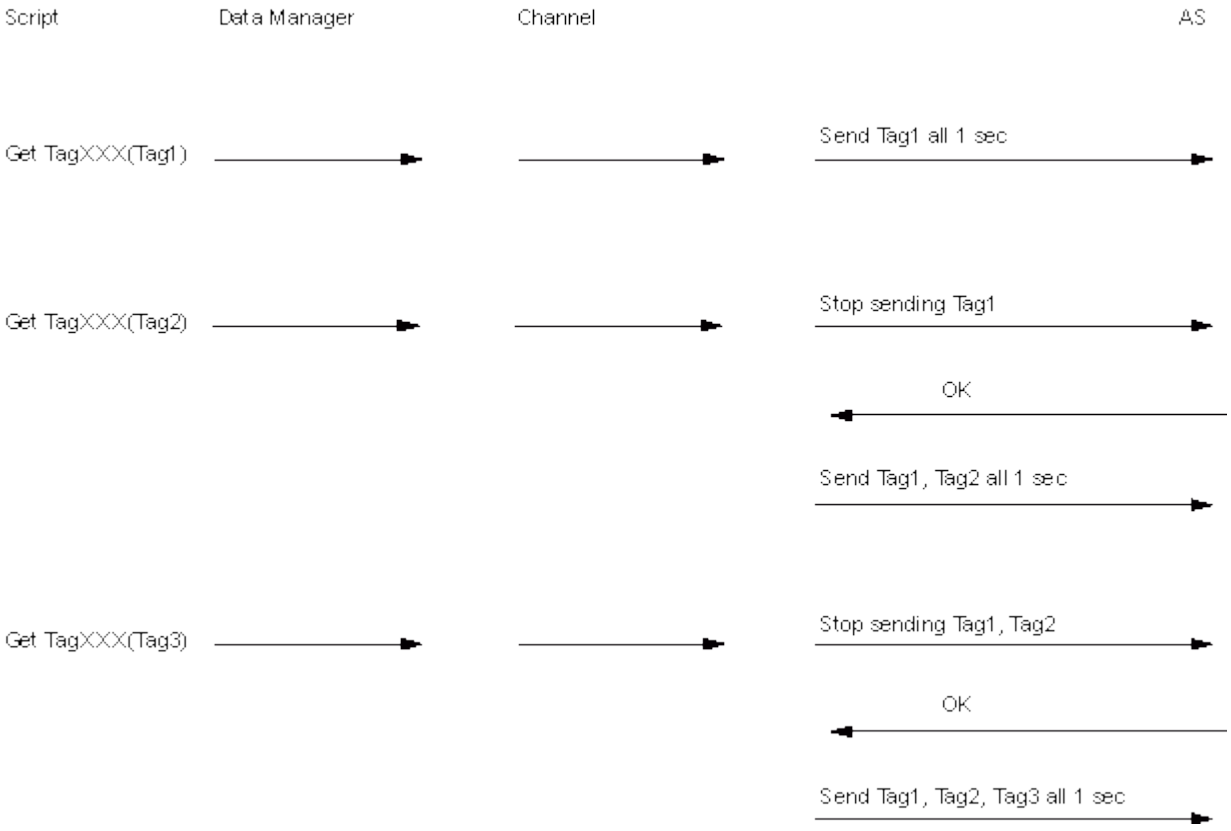
Behavior in actions with default trigger:

tags are registered with half of the cycle time with the first call. For every other call, the value is present.

Registering tags in actions with default trigger and event trigger

Only when the individual actions are executed is it identified which tags are needed in the picture. As a result, the tags are registered to the channel in a large number of single jobs. When a picture with cyclic actions is selected, the continual reorganization may place a heavy strain on communications.

Example: The channel supports custom cycle creation. Usually cycles are created by the channel directly from the AS. The resources for these cycles are limited by the AS. As a result, the channel stops the current jobs for this cycle and reconfigures the cycle on the AS.



Behavior in event triggered actions:

The tag is registered in the "upon change" mode with the first call. Process tags that are registered in the "upon change" mode correspond with a cyclic read job with a cycle time of 1s.

Note

If a value is requested by GetTagXXX() by a mouse click for example, the tag is accepted in the tag image. The tag is requested cyclically from the AS as of this point in time and therefore increases the basic load.

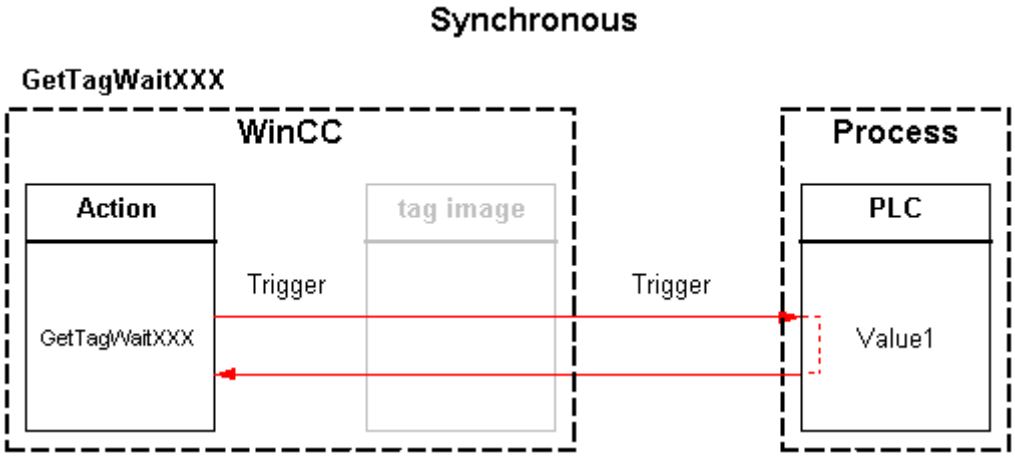
To avoid this increase in basic loading, the value can be requested by GetTagXXXWait(). The call GetTagXXXWait() causes a higher communication load one time but the tag is not added to the tag image.

GetTagXXXWait

The function returns the current value. The tag is not registered cyclically, the value is requested from the AS one time only.

The call is marked by the following:

- The value is read explicitly from the AS.
- The call, compared with GetTagXXX, takes longer.
- The duration of the call does not depend on the bus-load or on the AS.
- The function does not deliver any information on the status of the tags.



GetTagXXXState

The function GetTagXXXState has the same features as GetTagXXX, it also sends the function information on the status of the tags. Since the status is always delivered internally, there is no performance difference to GetTagXXX.

GetTagXXXStateWait

The function GetTagXXXStateWait has the same features as GetTagXXXWait, additionally it sends the function information on the status of the tags. Since the status is always delivered internally, there is no performance difference to GetTagXXXWait.

The difference between functions GetTagXXXStateWait and GetTagXXXState corresponds with the difference between GetTagXXXWait and GetTagXXX. Since the value is explicitly read from the AS for process tags, the value and the status can be more current than for GetTagXXXState.

GetTagXXXStateQC

The function GetTagXXXStateQC has the same features as GetTagXXXState. The function also delivers information on the quality code of the tag.

GetTagXXXStateQCWait

The function GetTagXXXStateQCWait has the same features as GetTagXXXStateWait. The function also delivers information on the quality code of the tag.

GetTagMultiWait

The function GetTagMultiWait has the same features as GetTagXXXWait. However, it allows the request for more tags in a job. Therefore, the read requests in the direction of the AS can be optimized in most cases so that only one request will be given to the AS.

GetTagMultiStateWait

The function GetTagMultiStateWait has the same features as GetTagMultiWait, additionally it sends the function information on the statuses of the tags.

GetTagMultiStateQCWait

The function GetTagMultiStateQCWait has the same features as GetTagMultiStateWait. The function also delivers information on the quality codese of the tags.

state

wait

getTagBitStateWait

Function

Determines the value of a tag of data type "Binary tag". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

BOOL GetTagBitStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "BOOL"

See also

Tag statuses (Page 2289)

GetTagBitStateWait example (Page 2237)

Functionality of the GetTag functions (Page 2095)

Tag states

GetTagBitStateWait example

GetTag functions, function principle

GetTagByteStateWait

Function

Determines the value of a tag of data type "unsigned 8 bit". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

BYTE GetTagByteStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "BYTE"

See also

Tag statuses (Page 2289)

GetTagWordStateWait example (Page 2249)

Functionality of the GetTag functions (Page 2095)

Tag states

GetTag functions, function principle

GetTagWordStateWait example

GetTagCharStateWait

Function

Determines the value of a tag of data type "8-bit text tag" or "16-bit text tag". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

char* GetTagCharStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Pointer to the value of the tag in data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
```

```
{
   . . . . . .
}
```

Tag states

GetTagDoubleStateWait

Function

Determines the value of a tag of data type "64-bit floating point value". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

double GetTagDoubleStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "double"

GetTagDWordStateWait

Function

Determines the value of a tag of data type "unsigned 32 bit". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

DWORD GetTagDWordStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "DWORD"

See also

GetTagFloatStateWait

Function

Determines the value of a tag of data type "32-bit floating point value". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

float GetTagFloatStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "float"

See also

Tag statuses (Page 2289)

GetTagFloatStateWait example (Page 2241)

GetTagFloatStateWait example

Tag states

GetTag functions, function principle

GetTagMultiStateWait

Function

The values and states of several tags are established and stored in the corresponding addresses in the specified format. The values are read explicitly from the AS.

The function must transfer a DWORD array whose members contain the individual tag states after the function is invoked. The size of the array must be selected so that sufficient memory space is available for these statuses.

Syntax

BOOL GetTagMultiStateWait(DWORD* pdwState, const char* pFormat)

Parameters

pdwState

Field in which the tag statuses are stored.

pFormat

Format description for all requested tags and for each tag name and address of the value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagRawStateWait

Function

Determines the value of a tag of data type "Raw data type". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

BOOL GetTagRawStateWait(Tag Tag_Name, BYTE pValue, DWORD size, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagSByteStateWait

Function

Determines the value of a tag of data type "signed 8 bit". The value is read explicitly from the AS. The status of the tag is also returned.

Syntax

signed char GetTagSByteStateWait(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

The value of the tag in the data type "signed char"

GetTagRawState

Function

Determines the value of a tag of data type "Raw data type". The status of the tag is also returned.

Syntax

BOOL GetTagRawState(Tag Tag_Name, BYTE* pValue, DWORD size, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Functionality of the GetTag functions (Page 2095)

Tag states

GetTag functions, function principle

GetTagSByteStateWait example

GetTagWordState

Function

Determines the value of a tag of data type "unsigned 16 bit". The status of the tag is also returned.

Syntax

WORD GetTagWordState(Tag Tag_Name, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

Value of the tag in the data type "WORD"

See also

Tag statuses (Page 2289)

stateqc

wait

GetTagBitStateQCWait

Function

Determines the value of a tag of data type "Binary tag". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

BOOL GetTagBitStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tags in the data type "BOOL".

See also

Tag statuses (Page 2289)

GetTagWordStateQCWait example (Page 2248)

Functionality of the GetTag functions (Page 2095)

GetTag functions, function principle

Tag states

GetTagWordStateQCWait example

GetTagByteStateQCWait

Function

Determines the value of a tag of data type "unsigned 8 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

BYTE GetTagByteStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "BYTE".

See also

Tag statuses (Page 2289)

GetTagWordStateQCWait example (Page 2248)

Functionality of the GetTag functions (Page 2095)

GetTagWordStateQCWait example

Tag states

GetTag functions, function principle

GetTagCharStateQCWait

Function

Determines the value of a tag of data type "8-bit text tag" or "16-bit text tag". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

char* GetTagCharStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Pointer to the value of the tag in data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetTagCharStateQCWait example

GetTagDoubleStateQCWait

Function

Determines the value of a tag of data type "64-bit floating point value". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

double GetTagDoubleStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "double".

GetTagDWordStateQCWait

Function

Determines the value of a tag of data type "unsigned 32 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

DWORD GetTagDWordStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "DWORD".

GetTagFloatStateQCWait

Function

Determines the value of a tag of data type "32-bit floating point value". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

float GetTagFloatStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "float".

Functionality of the GetTag functions (Page 2095)

Tag states

GetTag functions, function principle

GetTagFloatStateQCWait example

GetTagMultiStateQCWait

Function

The values, states and quality codes are determined for several tags and are stored in the respective addresses in the specified format. The values are read explicitly from the AS.

The function must be provided with two DWORD arrays, the member of which contains the states and quality codes of the individual tags after the function has been called. The size of the arrays must be selected so that sufficient memory space is available for these statuses.

Syntax

BOOL GetTagMultiStateQCWait(DWORD* pdwState, DWORD* pdwQualityCode, const char* pFormat)

Parameters

pdwState

Field in which the status of the individual tags is stored after the function has been completed.

pdwQualityCode

Field in which the quality codes of the individual tags is stored after the function has been completed.

pFormat

Format description for all requested tags and for each tag name and address of the value.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagMultiStateQCWait example

GetTagRawStateQCWait

Function

Determines the value of a tag of data type "Raw data type". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

BOOL GetTagRawStateQCWait(Tag Tag_Name, BYTE pValue, DWORD size, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

pValue

Pointer to a byte field containing the value of the raw data tag.

size

Size of the byte field in bytes.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagRawStateQCWait example

GetTagSByteStateQCWait

Function

Determines the value of a tag of data type "signed 8 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

signed char GetTagSByteStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "signed char".

GetTagSDWordStateQCWait

Function

Determines the value of a tag of data type "signed 32 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

long GetTagSDWordStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tags in the data type "long".

GetTagSWordStateQCWait

Function

Determines the value of a tag of data type "signed 16 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

short GetTagSWordStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "short".

GetTagValueStateQCWait

Function

Enables the transfer of a value in the form of a variant. Establishes the pointer to the result structure containing the value. The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

BOOL GetTagValueStateQCWait(LPDM_VARKEY lpdmVarKey, LPDM_VAR_UPDATE_STRUCTEX lpdmresult, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmresult

Pointer to the value from data type "DM_VAR_UPDATE_STRUCTEX"

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagWordStateQCWait

Function

Determines the value of a tag of data type "unsigned 16 bit". The value is read explicitly from the AS. In addition, the status and the quality code of the tags are returned.

Syntax

```
WORD GetTagWordStateQCWait(Tag Tag_Name, PDWORD lp_dwstate, PDWORD
pdwQualityCode);
```

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tag in the data type "WORD".

GetTagBitStateQC

Function

Determines the value of a tag of data type "Binary tag". In addition, the status and the quality code of the tags are returned.

Syntax

```
BOOL GetTagBitStateQC(Tag Tag_Name, PDWORD lp_dwstate, PDWORD
pdwQualityCode);
```

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Value of the tags in the data type "BOOL".

See also

GetTagWordStateQCWait example

GetTagCharStateQC

Function

Determines the value of a tag of data type "8-bit text tag" or "16-bit text tag". In addition, the status and the quality code of the tags are returned.

Syntax

char* GetTagCharStateQC(Tag Tag_Name, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

Pointer to the value of the tag in data type "char".

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
```

```
if(pszValue != NULL)
{
  .......
}
```

GetTagRawStateQC

Function

Determines the value of a tag of data type "Raw data type". In addition, the status and the quality code of the tags are returned.

Syntax

BOOL GetTagRawStateQC(Tag Tag_Name, BYTE* pValue, DWORD size, PDWORD lp_dwstate, PDWORD pdwQualityCode);

Parameters

Tag_Name

Name of the tag.

pValue

Pointer to a byte field containing the value of the raw data tag.

size

Size of the byte field in bytes.

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

pdwQualityCode

Pointer to a DWORD in which the quality code of the tag is stored after the function is complete.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagFloat example

GetTag functions, function principle

GetTagMultiWait

Function

The values of several tags are established and stored in the corresponding addresses in the specified format. The value is read explicitly from the AS. The memory for the tag value is created by the function with SysMalloc.

Syntax

BOOL GetTagMultiWait(const char* pFormat,...)

Parameters

pFormat

Format description for all requested tags and for each tag name and address of the value

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagRawWait

Function

Determines the value of a tag of data type "Raw data type". The value is read explicitly from the AS.

Syntax

BOOL GetTagRawWait(Tag Tag_Name , BYTE pValue, DWORD size);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagSByte example

GetTagSDWordWait

Function

Determines the value of a tag of data type "signed 32 bit". The value is read explicitly from the AS.

Syntax

long GetTagSDWordWait(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Value of the tag in the data type "long"

See also

GetTagSByte example (Page 2246)

Functionality of the GetTag functions (Page 2095)

GetTagSByte example

GetTag functions, function principle

GetTagSWordWait

Function

Determines the value of a tag of data type "signed 16 bit". The value is read explicitly from the AS.

Syntax

short GetTagSWordWait(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Value of the tag in the data type "short"

See also

GetTagSByte example (Page 2246)

Functionality of the GetTag functions (Page 2095)

GetTagSByte example

GetTag functions, function principle

GetTagValueWait

Function

Enables the transfer of a value in the form of a variant. Establishes the pointer to the result structure containing the value. The value is read explicitly from the AS.

Syntax

BOOL GetTagValueWait(LPDM_VARKEY lpdmVarKey, LPDM_VAR_UPDATE_STRUCT lpdmresult, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmresult

Pointer to the value from data type "DM_VAR_UPDATE_STRUCT"

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

GetTag functions, function principle

DM_VARKEY structure definition

DM_VAR_UPDATE_STRUCTEX structure definition

CMN_ERROR structure definition

GetTagWordWait

Function

Determines the value of a tag of data type "unsigned 16 bit". The value is read explicitly from the AS.

Syntax

WORD GetTagWordWait(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Value of the tag in the data type "WORD"

See also

GetTagWord example (Page 2248)

Functionality of the GetTag functions (Page 2095)

GetTagWord example

GetTag functions, function principle

GetTagBit

Function

Determines the value of a tag of data type "Binary tag".

Syntax

BOOL GetTagBit(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "BOOL"

See also

GetTagBit example (Page 2235)
Functionality of the GetTag functions (Page 2095)
GetTagBit example
GetTag functions, function principle

GetTagByte

Function

Determines the value of a tag of data type "unsigned 8 bit".

Syntax

BYTE GetTagByte(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "BYTE"

See also

GetTagWord example (Page 2248)
Functionality of the GetTag functions (Page 2095)
GetTagWord example
GetTag functions, function principle

GetTagChar

Function

Determines the value of a tag of data type "8-bit text tag" or "16-bit text tag".

Syntax

char* GetTagChar(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Pointer to a character string containing the value of the tag.

The return value must be checked for validity to prevent a null pointer exception, e.g. with the function "GetText()":

```
pszValue = GetText(lpszPictureName,"Text1");
if(pszValue != NULL)
{
  .......
}
```

GetTagDateTime

Function

Determines the value of a tag of data type "Date/Time".

Syntax

SYSTEMTIME GetTagDateTime(Tag Tag_Name);

Parameter

Tag_Name
Name of the tag

Return value

Value of the tag in the data type "Date/Time".

GetTagDouble

Function

Determines the value of a tag of data type "64-bit floating point value".

Syntax

double GetTagDouble(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "double"

See also

GetTagFloat example (Page 2239)
Functionality of the GetTag functions (Page 2095)
GetTagFloat example
GetTag functions, function principle

GetTagDWord

Function

Determines the value of a tag of data type "unsigned 32 bit".

Syntax

DWORD GetTagDWord(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "DWORD"

See also

GetTagWord example (Page 2248)
Functionality of the GetTag functions (Page 2095)
GetTagWord example

GetTagFloat

Function

Determines the value of a tag of data type "32-bit floating point value".

Syntax

float GetTagFloat(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

Value of the tag in the data type "float".

See also

GetTagFloat example (Page 2239)
Functionality of the GetTag functions (Page 2095)
GetTagFloat example
GetTag functions, function principle

GetTagRaw

Function

Determines the value of a tag of data type "Raw data type".

Syntax

BOOL GetTagRaw(Tag Tag_Name, BYTE* pValue, DWORD size);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

GetTagRaw example (Page 2244)

GetTagSByte

Function

Determines the value of a tag of data type "signed 8 bit".

Syntax

signed char GetTagSByte(Tag Tag_Name);

Parameters

Tag_Name
name of the tag

Return value

The value of the tag in the data type "signed char"

See also

GetTagSByte example (Page 2246)

GetTagSByte example

GetTag functions, function principle

GetTagValue

Function

Enables the transfer of a value in the form of a variant. Establishes the pointer to the result structure containing the value.

Syntax

BOOL GetTagValue(LPDM_VARKEY lpdmVarKey, LPDM_VAR_UPDATE_STRUCT lpdmresult, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmresult

Pointer to the value from data type "DM_VAR_UPDATE_STRUCT"

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

GetTagWord

Function

Determines the value of a tag of data type "unsigned 16 bit".

Syntax

WORD GetTagWord(Tag Tag_Name);

Parameters

Tag_Name

name of the tag

Return value

Value of the tag in the data type "WORD"

See also

GetTagWord example (Page 2248)

Functionality of the GetTag functions (Page 2095)

GetTagWord example

GetTag functions, function principle

4.3.5.3 set

Principle of the SetTag functions

SetTagXXX

The SetTagXXX function assigns the job a value to write and returns immediately to the caller. In this case, the system does not wait until value is actually written.

The call is marked by the following:

- The call is fast.
- The caller does not know when the value is actually written.
- The function provides no information on the state of the write job.

SetTagXXXWait

The function SetTagXXXWait assigns the job of writing a value and will first return to the caller when the value has actually been written.

The call is marked by the following:

- The call takes longer in comparison to SetTagXXX. The duration is also dependent on the channel and AS, amongst other things.
- The value is written after the call.
- The function provides no information on the state of the write job.

SetTagXXXState

The function SetTagXXXState has the same features as SetTagXXX; plus the function returns information regarding the status of the write request.

Since the status is always provided internally, there is no performance difference compared to SetTagXXX.

SetTagXXXStateWait

The function SetTagXXXStateWait has the same features as SetTagXXXWait; plus the function returns information regarding the status of the write request.

Since the status is always provided internally, there is no performance difference compared to SetTagXXXWait.

The difference between the functions SetTagXXXStateWait and SetTagXXXState corresponds to the difference between SetTagXXXWait and SetTagXXX.

Note, that certain statuses can only be generated when the write process has been completed.

SetTagMultiWait

The SetTagMultiWait function has the same features as SetTagXXXWait. It also offers the option of granting several write jobs in a single job.

state

wait

SetTagBitStateWait

Function

Sets the value of a tag of data type "Binary tag". The function is ended after the AS has acknowledged acceptance of the value. The status of the tag is also returned.

Principle of the SetTag functionsEXAMPLE_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Syntax

BOOL SetTagBitStateWait(Tag Tag_Name, short value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. To do this, the tag status must be evaluated.

FALSE

An error has occurred.

See also

Beispiel SetTagBitStateWait (Page 2265)

Tag states

SetTagBitStateWait example

SetTagByteStateWait

Function

Sets the value of a tag of the data type "unsigned 8 Bit". The function is ended after the AS has acknowledged acceptance of the value. The status of the tag is also returned.

Principle of the SetTag functionsEXAMPLE_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Syntax

BOOL SetTagByteStateWait(Tag Tag_Name, BYTE value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "BYTE"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. To do this, the tag status must be evaluated.

FALSE

An error has occurred.

See also

SetTagWordStateWait example

SetTagFloatStateWait

Function

Defines the value of a tag of the data type "32-bit floating point value". The function is ended after the AS has acknowledged acceptance of the value. The status of the tag is also returned.

Principle of the SetTag functionsEXAMPLE_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Syntax

BOOL SetTagFloatStateWait(Tag Tag_Name, float value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "float"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. To do this, the tag status must be evaluated.

FALSE

An error has occurred.

See also

Tag statuses (Page 2289)

SetTagFloatStateWait example (Page 2267)

Tag states

SetTagFloatStateWait example

SetTagMultiStateWait

Function

Sets the values of several tags. The function is ended after the AS has acknowledged acceptance of the value.

The function must transfer a DWORD array whose members contain the individual tag states after the function is invoked. The size of the array must be selected so that sufficient memory space is available for these statuses.

Principle of the SetTag functionsEXAMPLE_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Syntax

BOOL SetTagMultiStateWait(DWORD* pdwState, const char* pFormat,...)

Parameters

pdwState

Field in which the tag statuses are stored.

pFormat

Format description for all requested tags and for each tag name and value.

FormatdescriberEXAMPLES_INTERNAL_FUNCTIONS_TAG_STATEWAIT_23_130

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

Principle of the SetTag functions (Page 2159)

SetTagSByteStateWait example

SetTag functions, function principle

Tag states

SetTagSDWordState

Function

Sets the value of a tag of the data type "signed 32 bit". The status of the tag is also returned.

Syntax

BOOL SetTagSDWordState(Tag Tag_Name, long value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "long"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. For this purpose, the tag status must be evaluated.

FALSE

An error has occurred.

See also

Tag statuses (Page 2289)

Beispiel SetTagSByteStateWait (Page 2271)

Principle of the SetTag functions (Page 2159)

SetTagSByteStateWait example

SetTag functions, function principle

Tag states

SetTagSWordState

Function

Sets the value of a tag of the data type "signed 16 bit". The status of the tag is also returned.

Syntax

BOOL SetTagSWordState(Tag Tag_Name, short value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. For this purpose, the tag status must be evaluated.

FALSE

An error has occurred.

SetTagSByteStateWait example

SetTag functions, function principle

Tag states

SetTagWordState

Function

Sets the value of a tag of the data type "unsigned 16 Bit". The status of the tag is also returned.

Syntax

BOOL SetTagWordState(Tag Tag_Name, WORD value, PDWORD lp_dwstate);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

lp_dwstate

Pointer to a DWORD in which the status of the tag is stored after the function has been completed.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors. For this purpose, the tag status must be evaluated.

FALSE

An error has occurred.

wait

SetTagBitWait

Function

Sets the value of a tag of data type "Binary tag". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagBitWait(Tag Tag_Name, short value);

Parameter

Tag_Name

Name of the tag

Value

Value of the tag in the data type "short"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagBit example (Page 2265)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagBit example

SetTagByteWait

Function

Sets the value of a tag of the data type "unsigned 8 Bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagByteWait(Tag Tag_Name, BYTE value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "BYTE"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagWord example (Page 2272)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagWord example

SetTagCharWait

Function

Sets the value of a tag of the data type " 8-bit text tag" or "16-bit text tag". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagCharWait(Tag Tag_Name, LPSTR value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "LPSTR"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

Principle of the SetTag functions (Page 2159)

SetTagChar example (Page 2266)

SetTag functions, function principle

SetTagChar example

SetTagDoubleWait

Function

Defines the value of a tag of the data type "64-bit floating point value". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagDoubleWait(Tag Tag_Name, double value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "double"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagFloat example (Page 2267)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagFloat example

SetTagDWordWait

Function

Sets the value of a tag of the data type "unsigned 32 Bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagDWordWait(Tag Tag_Name, DWORD value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "DWORD"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2272)

SetTagWord example

SetTag functions, function principle

SetTagFloatWait

Function

Defines the value of a tag of the data type "32-bit floating point value". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagFloatWait(Tag Tag_Name, float value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "float"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagFloat example (Page 2267)

Principle of the SetTag functions (Page 2159)

SetTagFloat example

SetTag functions, function principle

SetTagMultiWait

Function

The values of several tags are set in the specified format. The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagMultiWait(const char* pFormat,...)

Parameters

pFormat

Format description for all requested tags and for each tag name and value.

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagMultiWait example (Page 2269)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

Format descriptors

SetTagMultiWait example

SetTagRawWait

Function

Sets the value of a tag of the data type "Raw data type". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

```
BOOL SetTagRawWait(Tag Tag_Name, BYTE pValue, DWORD size);
```

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagRaw example (Page 2269)

SetTagRaw example

SetTagSByteWait

Function

Sets the value of a tag of the data type "signed 8 bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

```
BOOL SetTagSByteWait(Tag Tag_Name, signed char value);
```

Parameters

Tag_Name

name of the tag

value

The value of the tag in the data type "signed char"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagSByte example

SetTagSDWordWait

Function

Sets the value of a tag of the data type "signed 32 bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagSDWordWait(Tag Tag_Name, long value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "long"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example

SetTagSWordWait

Function

Sets the value of a tag of the data type "signed 16 bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagSWordWait(Tag Tag_Name, short value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2271)

Principle of the SetTag functions (Page 2159)

SetTagSByte example

SetTag functions, function principle

SetTagValueWait

Function

Enables the transfer of a value in the form of a variant and sets the pointer to the value of the data type "Variant". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagValueWait(LPDM_VARKEY lpdmVarKey, LPVARIANT lpdmValue, PDWORD dwState, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmValue

Pointer to the value of data type "Variant". A description of the data type VARIANT can be found in the associated documentation.

dwState

Tag status which is returned after the function has been run.

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagWordWait

Function

Sets the value of a tag of the data type "unsigned 16 Bit". The function is ended after the AS has acknowledged acceptance of the value.

Syntax

BOOL SetTagWordWait(Tag Tag_Name, WORD value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "WORD"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2272)

Principle of the SetTag functions (Page 2159)

SetTagWord example

SetTag functions, function principle

SetTagBit

Function

Sets the value of a tag of data type "Binary tag".

Syntax

BOOL SetTagBit(Tag Tag_Name, short int value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short int"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

Principle of the SetTag functions (Page 2159)

SetTagBit example (Page 2265)

SetTagBit example

SetTag functions, function principle

SetTagByte

Function

Sets the value of a tag of the data type "unsigned 8 Bit".

Syntax

BOOL SetTagByte(Tag Tag_Name, BYTE value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "BYTE"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2272)

Principle of the SetTag functions (Page 2159)

SetTagWord example

SetTag functions, function principle

SetTagChar

Function

Sets the value of a tag of the data type " 8-bit text tag" or "16-bit text tag".

Parameter

Tag_Name

Name of the tag

Value

Value of the tag in the data type "LPSTR"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagChar example (Page 2266)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagChar example

SetTagDateTime

Function

Sets the value of a tag of data type "Date/Time".

Syntax

BOOL SetTagDateTime(Tag Tag_Name, SYSTEMTIME value);

Parameter

Tag_Name

Name of the tag

value

Value of the tag in the data type "Date/Time".

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTagDouble

Function

Defines the value of a tag of the data type "64-bit floating point value".

Syntax

BOOL SetTagDouble(Tag Tag_Name, double value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "double"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagFloat example (Page 2267)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagFloat example

SetTagDWord

Function

Sets the value of a tag of the data type "unsigned 32 Bit".

Syntax

BOOL SetTagDWord(Tag Tag_Name, DWORD value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "DWORD"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord example (Page 2272)

Principle of the SetTag functions (Page 2159)

SetTagWord example

SetTag functions, function principle

SetTagFloat

Function

Defines the value of a tag of the data type "32-bit floating point value".

Syntax

BOOL SetTagFloat(Tag Tag_Name, float value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "float"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagFloat example (Page 2267)

Principle of the SetTag functions (Page 2159)

SetTagFloat example

SetTag functions, function principle

SetTagRaw

Function

Sets the value of a tag of the data type "Raw data type".

Syntax

BOOL SetTagRaw(Tag Tag_Name, BYTE* pValue, DWORD size);

Parameters

Tag_Name

name of the tag

pValue

The pointer to a byte field which contains the value of the raw data tag

size

Size of the byte field in bytes

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagRaw example (Page 2269)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagRaw example

SetTagSByte

Function

Sets the value of a tag of the data type "signed 8 bit".

Syntax

BOOL SetTagSByte(Tag Tag_Name, signed char value);

Parameters

Tag_Name

name of the tag

value

The value of the tag in the data type "signed char"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2271)

Principle of the SetTag functions (Page 2159)

SetTag functions, function principle

SetTagSByte example

SetTagSDWord

Function

Sets the value of a tag of the data type "signed 32 bit".

Syntax

BOOL SetTagSDWord(Tag Tag_Name, long value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "long"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2271)

Principle of the SetTag functions (Page 2159)

SetTagSByte example

SetTag functions, function principle

SetTagSWord

Function

Sets the value of a tag of the data type "signed 16 bit".

Syntax

BOOL SetTagSWord(Tag Tag_Name, short value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "short"

size

Size of the byte field in bytes

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagSByte example (Page 2271)

Principle of the SetTag functions (Page 2159)

SetTagSByte example

SetTag functions, function principle

SetTagValue

Function

Enables the transfer of a value in the form of a variant and sets the pointer to the value of the data type "Variant".

Syntax

BOOL SetTagValue(LPDM_VARKEY lpdmVarKey, LPVARIANT lpdmValue, PDWORD dwState, LPCMN_ERROR lpdmError);

Parameters

lpdmVarKey

Pointer to a structure of the data type "DM_VARKEY"

lpdmValue

Pointer to the value of data type "Variant". A description of the data type VARIANT can be found in the associated documentation.

dwState

Tag status which is returned after the function has been run.

lpdmError

Pointer to the structure which contains the error description

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

See also

SetTagWord

Function

Sets the value of a tag of the data type "unsigned 16 Bit".

Syntax

BOOL SetTagWord(Tag Tag_Name, WORD value);

Parameters

Tag_Name

name of the tag

value

Value of the tag in the data type "WORD"

Return value

TRUE

The function itself has been completed without any errors.

However, no test is made as to whether the tag could be written without errors.

FALSE

An error has occurred.

SetTag functions, function principle

4.3.6 WinCC

4.3.6.1 WinCC - short description

The functions of the WinCC group allow to define various setting in Runtime.

The functions of the System subgroup can be used to influence WinCC Runtime.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.3.6.2 system

DeactivateRTProject

Function

Deactivates the activated project.

Note

If Runtime is exited on a server or client this applies only to the respective computer.

An activated project for which the WinCC Explorer has not been started must be closed with the internal function "ExitWinCC".

If the activated project was exited with the internal function "DeactivateRTProject" the WinCC project remains open in the background. To close this project, the WinCC Explorer must be opened and then be closed by means of the menu commands "File" > "Exit".

Syntax

```
BOOL DeactivateRTProject();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

DeactivateRTProject example (Page 2215)

DeactivateRTProject example

ExitWinCC

Function

Deactivates Runtime and exits WinCC on the computer executing the function.

Note

If Runtime is exited on a server or client this applies only to the respective computer.

An activated project for which the WinCC Explorer has not been started must be closed with the internal function "ExitWinCC".

If the activated project was exited with the internal function "DeactivateRTProject" the WinCC project remains open in the background. To close this project, the WinCC Explorer must be opened and then be closed by means of the menu commands "File" > "Exit".

Syntax

```
BOOL ExitWinCC ();
```

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

ExitWinCC example (Page 2215)

ExitWinCC example

GetLanguage

Function

Determines the current Runtime language.

Syntax

```
DWORD GetLanguage();
```

Return value

The current Runtime language with the associated language identifier is returned.

Note

You can find a comprehensive "Language code" table in the "Basic Principles of VBScript" documentation under the index entry "Language code".

See also

GetLanguage example (Page 2223)

GetLanguage example

InquireLanguage

Function

Determines all languages configured in the text library for the runtime.

Use dWCount to specify where the number of determined language IDs is to be stored.

Syntax

DWORD* InquireLanguage(DWORD* dwCount);

Parameters

dwCount

Pointer to the number of determined language IDs

Return value

The configured languages with the associated language identifiers are returned.

Note

You can find a comprehensive "Language code" table in the "Basic Principles of VBScript" documentation under the index entry "Language code".

See also

InquireLanguage example (Page 2252)

InquireLanguage example

SetLanguage

Function

Changes the language setting in Runtime.

Syntax

BOOL SetLanguage(DWORD dwLocaleID);

Parameters

dwLocaleID

Language ID of the language to be set

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

See also

Language ID (Page 2288)

SetLanguage example (Page 2260)

SetLanguage example

Language IDs

4.3.6.3 FillDiagnoseInTags

Function

Activates or deactivates the storage of diagnostic information in tags.

As filling the tags is an additional load for the system, it should only be activated temporarily for diagnostic information.

Syntax

void FillDiagnoseInTags(BOOL bfill);

Parameters

bFill

Storage of diagnostic information in tags on/off

TRUE	Activate supply of diagnostic tags
FALSE	Deactivate supply of diagnostic tags

Diagnostic tags of GlobalScript

@SCRIPT_COUNT_TAGS

This tag contains the current number of tags requested via Script.

@SCRIPT_COUNT_REQUEST_IN_QUEUES

This tag contains the current number of jobs.

@SCRIPT_COUNT_ACTIONS_IN_QUEUES

This tag contains the current number of actions.

4.3.6.4 GetServerTagPrefix

Function

To be able to access tags of the respective server from a WinCC client in a distributed system, the tag names must be supplemented with the server prefix.

If the tags are accessed by means of the functions GetTagxx or SetTagxx, the required addition is made by the script control.

If WinCC API functions are used for accessing, the tag names have to be supplemented by the user. The GetServer TagPrefix function provides the required prefixes.

One pointer each of the "char" type to ServerPrefix, TagPrefix and WindowPrefix is returned.

The user must neither change the memory (also no strcat) nor release it.

Syntax

void GetServerTagPrefix(char** ppszServerPrefix, char** ppszTagPrefix, char** ppszWindowPrefix);

Parameters

ppszServerPrefix

Pointer to a pointer referring to the server prefix

ppszTagPrefix

Pointer to a pointer referring to the tag prefix

ppszWindowPrefix

Pointer to a pointer referring to the window prefix

See also

GetServerTagPrefix example (Page 2234)

GetServerTagPrefix example

4.3.6.5 TraceText

Function

The value defined in <Parameter> is recorded in APDiag if the specified diagnostic level has been reached.

Syntax

void TraceText(DWORD dwTraceLevel, char* pszFormat, <Parameter>);

Parameters

dwTraceLevel

Diagnostic level

pszFormat

Output format (according to printf function)

<Parameter>

Value to be reported

Note

The parameterization dialog for this function provides the selection of tags, graphic objects and pictures.

4.3.6.6 TraceTime

Function

The value defined in <Parameter> is recorded in APDiag if the specified diagnostic level has been reached.

In addition, the time since the AP start of diagnosis is output in milliseconds to enable performance measurements.

Syntax

void TraceTime(DWORD dwTraceLevel, char* pszFormat, <Parameter>);

Parameters

dwTraceLevel

Diagnostic level

pszFormat

Output format (according to printf function)

<Parameter>

Value to be reported

Note

The parameterization dialog for this function provides the selection of tags, graphic objects and pictures.

4.4 Examples

4.4.1 Examles - A to G

4.4.1.1 AcknowledgeMessage example

```
{
//Acknowledge the AlarmLogging message which is selected
AcknowledgeMessage(GetTagWord("U08i_MsgNr"));
}
```

Specify the message number to be acknowledged. It is read from a tag.

4.4.1.2 AXC_OnBtnMsgFirst example

```
{
// jump to the first message in the WinCC Alarm Control
AXC_OnBtnMsgFirst("gs_alarm_00","Control1");
}
```

Parameters of the AXC_OnBtnMsgFirst function:

"gs_alarm_00" is the name of the picture in which WinCC Alarm Control was configured.

Control1 is the object name of the WinCC Alarm Control.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.4.1.3 Beispiel AXC_OnBtnMsgLast

```
{
// jump to the last message in the WinCC Alarm Control
AXC_OnBtnMsgLast("gs_alarm_00","Control1");
```

```
}
```

Parameters of the AXC_OnBtnMsgLast function:

"gs_alarm_00" is the name of the picture in which WinCC Alarm Control was configured.

Control1 is the object name of the WinCC Alarm Control.

4.4.1.4 AXC_OnBtnScroll example

```
{
// activate/deactivate the scroll function
AXC_OnBtnScroll("gs_alarm_00","Control1");
}
```

Parameters of the AXC_OnBtnScroll function:

"gs_alarm_00" is the name of the picture in which WinCC Alarm Control was configured.

Control1 is the object name of the WinCC Alarm Control.

4.4.1.5 AXC_OnBtnSinglAckn example

```
{
// acknowledge the active message
AXC_OnBtnSinglAckn("gs_alarm_00","Control1");
}
```

Parameters of the AXC_OnBtnSinglAckn function:

"gs_alarm_00" is the name of the picture in which WinCC Alarm Control was configured.

Control1 is the object name of the WinCC Alarm Control.

4.4.1.6 AXC_SetFilter example

```
{
BOOL ret;
MSG_FILTER_STRUCT Filter;
CMN_ERROR Error;

//Reset the filter struct
```

```
memset( &Filter, 0, sizeof( MSG_FILTER_STRUCT ) );

//Set the filter name
strcpy( Filter.szFilterName, "Control1");

// Choose selection elements
Filter.dwFilter = MSG_FILTER_NR_FROM | MSG_FILTER_NR_TO;

// Message number from
Filter.dwMsgNr[0] = 2;
// Message number to
Filter.dwMsgNr[1] = 2;

ret = AXC_SetFilter("gs_alarm_00","Control1",&Filter,&Error);
}
```

1. Name the filter.
2. Select the filter type.
3. Specify the filter criteria.
4. Set the filter.

Note

The filter type and the filter criteria are to be adapted, all other filter types are described in the filter structure.

4.4.1.7 DeactivateRTProject example

```
{
//deactivate the runtime
DeactivateRTProject ();
}
```

This function deactivates WinCC Runtime.

4.4.1.8 ExitWinCC example

```
{
//exit wincc
ExitWinCC ();
}
```

This function exits WinCC.

4.4.2 Examples - GetAlarmHigh to GetPropChar

4.4.2.1 GetAlarmHigh example

```
{
double dAlarmHigh;
//Get the Alarm High Limit
dAlarmHigh = GetAlarmHigh(lpszPictureName,"Bar1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the function GetAlarmHigh:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

1. Read out the upper alarm limit and temporarily store it in dAlarmHigh.
2. Executing user-defined code for processing return values.

4.4.2.2 GetBackColor example

```
{
long int bk_color;

//Get the background color
bk_color = GetBackColor(lpszPictureName,"StatischerText1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the function GetBackColor:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

1. Read out the current background color and temporarily store it in bk_color.
2. Executing user-defined code for processing return values.

4.4.2.3 GetBorderStyle example

```
{
long int lstyle;

//Get the current border style
lstyle = GetBorderStyle(lpszPictureName,"Rectangle1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the function GetBorderStyle:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

1. Read out the current line style of the object and temporarily store it in lstyle.
2. Executing user-defined code for processing return values.

4.4.2.4 GetFilling example

```
{
BOOL bfilling;

//Get the actual state of dynamic filling
bfilling = GetFilling(lpszPictureName,"Rectangle1");

if(bfilling)
{
  // User defined code if the
  // dynamic filling is activated
  ...
}
Else
{
  // User defined code if the
  // dynamic filling is deactivated
  ...
```

```
}
}
```

Parameters of the function GetFilling:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

1. Read out whether dynamic filling is activated or not and temporary store in bfilling.
2. Executing user-defined code, depending on the return value of the function.

4.4.2.5 GetFillingIndex example

```
{
long int filling_index;

//Get the actual filling index of the object
filling_index = GetFillingIndex(lpszPictureName,"Rectangle1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the function GetFillingIndex:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

1. Read out the current fill level of the object and temporarily store it in filling_index.
2. Executing user-defined code for processing return values.

4.4.2.6 GetFillStyle example

```
{
long int lstyle;

//Get the current fill style
lstyle = GetFillStyle(lpszPictureName,"Rectangle1");

//User defined code where the
//user can do something with the return value
```

```
...
}
```

Parameters of the function GetFillStyle:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

1. Read out the current fill pattern of the object and temporarily store it in lstyle.
2. Executing user-defined code for processing return values.

4.4.2.7 GetFlashBackColor example

```
{
BOOL bflash_col;

//Get if the flashing is on or off
bflash_col = GetFlashBackColor(lpszPictureName,"Group1");

if(bflash_col)
{
  // User defined code if the
  // flashing is activated
  ...
}
Else
{
  // User defined code if the
  // flashing is deactivated
  ...
}
}
```

Parameters of the function GetFlashBackColor:

"lpszPictureName" is the name of the picture in which the object was configured.

"Group1" is the name of the object.

1. Read out whether flashing of the background color is activated or not and temporary store in bflash_col.
2. Executing user-defined code, depending on the return value of the function.

4.4.2.8 GetFlashBackColorOn example

```
{
long int flashcol_on;

//Get the BackFlashColor
flashcol_on = GetBackFlashColorOn(lpszPictureName,"Group1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetBackFlashColorOn function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Group1" is the name of the object.

1. Read out the background flash color for the "On" status of the obvject and and temporarily store it in flashcol_on.
2. Executing user-defined code for processing return values.

4.4.2.9 GetFlashRateFlashPic example

```
{
long lFlashRate;

//Get the flashrate
lFlashRate = GetFlashRateFlashPic(lpszPictureName,"StatusDisplay1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetFlashRateFlashPic function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Status display1" is the name of the object.

1. Read out the flash frequency of the object and temporarily store it in lFlashRate.
2. Executing user-defined code for processing return values.

4.4.2.10 GetFocus example

```
{
char* pszValue = NULL;
char szValue[_MAX_PATH+1];

//Get the Object which has the focus
pszValue = Get_Focus();

//Copy the string
if(pszValue != NULL)
{
  strncpy(szValue,pszValue,_MAX_PATH);
}
//User defined code where the
//user can do something with the return value
...
}
```

1. Read out on which object the focus is and temporarily store in pszValue.
2. If a valid value has been returned, store the return value of the function in the local string szValue. A maximum of _MAX_PATH characters is stored.
3. Executing user-defined code for processing return values.

4.4.2.11 GetFontBold example

```
{
BOOL bbold;

//Get if the text is bold
bbold = GetFontBold(lpszPictureName,"StaticText1");

if(bbold)
{
  // User defined code if the
  // font is bold
  ...
}
Else
{
  // User defined code if the
  // font is not bold
  ...
}
}
```

Parameters of the GetBackColor function

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

1. Read out whether the text is in bold or not and temporarily store in bbold.
2. Executing user-defined code, depending on the return value of the function.

4.4.2.12 GetFontSize example

```
{
long int fontsize;

//Get the actual Font size
fontsize = GetFontSize(lpszPictureName,"StaticText1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetFontSize function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

1. Read out the current font size and temporarily store it in fontsize.
2. Executing user-defined code for processing return values.

4.4.2.13 GetHeight example

```
{
long lHeight;

//Get the height of the object
lHeight = GetHeight(lpszPictureName,"WinCCLogo");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetHeight function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

1. Read out the current height of the object and temporarily store it in lHeight.
2. Executing user-defined code for processing return values.

4.4.2.14 GetHiddenInput example

```
{
BOOL bHiddenInput;

//Get the state of hidden input
bHiddenInput = GetHiddenInput(lpszPictureName,"IOField1");

if(bHiddenInput)
{
  // User defined code if the
  // hidden input is activated
  ...
}
Else
{
  // User defined code if the
  // hidden input is activated
  ...
}
}
```

Parameters of the GetHiddenInput function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

1. Read out whether the text is in bold or not and temporarily store in bHiddenInput.
2. Executing user-defined code, depending on the return value of the function.

4.4.2.15 GetLanguage example

```
{
DWORD rt_language;

//Get the current language
rt_language = GetLanguage ();
```

```
//User defined code where the
//user can do something with the return value
...
}
```

1. Read out the current Runtime language and temporarily store it in rt_language.
2. Executing user-defined code for processing return values.

4.4.2.16 GetLeft example

```
{
long lPos;

//Get the x-position of the object
lPos = GetLeft(lpszPictureName,"WinCCLogo");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetLeft function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

1. Read out the current X position of the object and temporarily store it in lPos.
2. Executing user-defined code for processing return values.

4.4.2.17 GetLink example

```
{
LINKINFO linkinfo;

//Get the linked Tag
GetLink(lpszPictureName,"Bar1","Process",&linkinfo);

// linkinfo.szLinkName is the tag name
// linkinfo.dwCycle is the update cycle
// linkinfo.LinkType is the type of the connection

//User defined code where the
```

```
//user can do something with the return value
...
}
```

Parameters of the GetLink function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"Process" is the property connected to a tag.

"&linkinfo" is the address of the linkinfo structure.

1. Fills the passed linkinfo structure with the tag connection information.
2. Executing user-defined code, depending on the return value of the function.

4.4.2.18 GetLinkedVariable example

```
{
char* pszVarName = NULL;
char szVarName[_MAX_PATH+1];

//Get the TagName
pszVarName = GetLinkedVariable("gs_stand_graph_00","StaticText6","Visible");

//Copy the string
if (strcmp (pszVarName,"")!= 0)
{
  strncpy(szVarName,pszVarName,_MAX_PATH);
}
else printf("Attribute 'visible' is not made dynamic\r\n");
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetLinkedVariable function:

"gs_stand_graph_00" is the name of the picture in which the object was configured.

"StaticText6" is the name of the object.

"Visible" is the property connected to a tag.

1. Temporarily store the return value of the GetLinkedVariable function in pszVarName.

2. If a valid value has been returned, store the return value in szVarName. A maximum of _MAX_PATH characters is stored.

3. Executing user-defined code for processing return values.

4.4.2.19 GetLocalPicture example

```
{
char* pszPicName = NULL;
char szPicName[_MAX_PATH+1];

//Get the Local Picture
pszPicName = GetLocalPicture(lpszPictureName);

//Copy the string
if (pszPicName != NULL)
{
  strncpy(szPicName,pszPicName,_MAX_PATH);
}
//User defined code where the
//user can do something with the return value
...
}
```

1. Temporarily store the return value of the GetLocalPicture function in pszPicName.

2. If a valid value has been returned, store the return value in szPicName. A maximum of _MAX_PATH characters is stored.

3. Executing user-defined code for processing return values.

4.4.2.20 GetMarker example

```
{
BOOL bmarker;

//Get the state of the Marker
bmarker = GetMarker(lpszPictureName,"Bar1");

if(bmarker)
{
  // User defined code if the
  // marker is activated
  ...
}
Else
{
  // User defined code if the
  // marker is deactivated
  ...
```

```
}
}
```

Parameters of the GetMarker function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

1. Read out whether the marker is displayed or not and temporarily store in bmarker.
2. Executing user-defined code, depending on the return value of the function.

4.4.2.21 GetOutputValueDouble example

```
{
double doutput;

//Get the output value of IO Field 1
doutput = GetOutputValueDouble(lpszPictureName,"IOField1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetOutputValueDouble function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

1. Read out the output value and temporarily store it in doutput.
2. Executing user-defined code for processing return values.

4.4.2.22 GetParentPicture example

```
{
char* pszPicName = NULL;
char szPicName[_MAX_PATH+1];

//Get the parent picture
pszPicName = GetParentPicture(lpszPictureName);

//Copy the string
```

```
if (pszPicName != NULL)
{
  strncpy(szPicName,pszPicName,_MAX_PATH);
}
//User defined code where the
//user can do something with the return value
...
}
```

1. Temporarily store the return value of the GetParentPicture function in pszPicName.
2. If a valid value has been returned, store the return value in szPicName. A maximum of _MAX_PATH characters is stored.
3. Executing user-defined code for processing return values.

4.4.2.23 GetPictureDown example

```
{
char* pszPicName = NULL;
char szPicName[_MAX_PATH+1];

//Get the current picture name
pszPicName = GetPictureDown(lpszPictureName,"Roundbutton1");

if (pszPicName != NULL)
{
//Copy the string
  strncpy(szPicName,pszPicName,_MAX_PATH);
}

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetPictureDown function:

"lpszPictureName" is the name of the picture in which the object was configured.

"RoundButton1" is the name of the object.

1. Read out the picture name of the picture displayed in round button 1 and temporarily store it in pszPicName.
2. If a valid value has been returned, store the return value of the function in the local string szPicName. A maximum of _MAX_PATH characters is stored.
3. Executing user-defined code for processing return values.

4.4.2.24 GetPictureName example

```
{
char* pszPictureName = NULL;
char szPictureName[_MAX_PATH + 1];

//Get the current PictureName
pszPictureName = GetPictureName(lpszPictureName,"GraphicObject1");

if(pszPictureName != NULL)
{
//copy the string
strncpy(szPictureName,pszPictureName,_MAX_PATH);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetPictureName function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

1. Read out the picture name of the picture displayed in graphic object 1 and temporarily store it in pszPictureName.

2. If a valid value has been returned, store the return value of the function in the local string szPictureName. A maximum of _MAX_PATH characters is stored.

3. Executing user-defined code for processing return values.

4.4.2.25 GetPictureUp example

```
{
char* pszPicName = NULL;
char szPicName[_MAX_PATH+1];

//Get the current picture name
pszPicName = GetPictureUp(lpszPictureName,"Roundbutton1");

if (pszPicName != NULL)
{
//Copy the string
  strncpy(szPicName,pszPicName,_MAX_PATH);
}
```

```
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetPictureUp function:

"lpszPictureName" is the name of the picture in which the object was configured.

"RoundButton1" is the name of the object.

1. Read out the picture name of the picture displayed in round button 1 and temporarily store it in pszPicName.

2. If a valid value has been returned, store the return value of the function in the local string szPicName. A maximum of _MAX_PATH characters is stored.

3. Executing user-defined code for processing return values.

4.4.2.26 GetPosition example

```
{
long int lpos;

//Get the actual position of the Slider
lpos = GetPosition(lpszPictureName,"Control1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetPosition function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

1. Read out the current slider position and temporarily store it in lpos.

2. Executing user-defined code for processing return values.

4.4.2.27 GetPropBOOL example

```
{
BOOL bProp;

//Get the property Visible
bProp = GetPropBOOL("gs_graph_eafield","IOField1","Visible");

if(bProp)
{
  // User defined code if the
  // object is visible
  ...
}
else
{
  // User defined code if the
  // object is not visible
  ...
}
}
```

Parameters of the GetVisible function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"Visible" is the object property.

1. Read out whether the object is visible or not and temporarily store in bProp.
2. Executing user-defined code, depending on the return value of the function.

4.4.2.28 GetPropChar example

```
{
char* pszProp = NULL;
char szProp[14];

//Get the property Tooltiptext
pszProp = GetPropChar("lpszPictureName","EAFeld1","Tooltiptext");

if(pszProp != NULL)
{
//Copy the string
strncpy(szProp,pszProp,13);
}
//User defined code where the
//user can do something with the return value
```

```
...
}
```

Parameters of the GetPropChar function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"Tooltiptext" is the object property.

1. Read out the tooltip text of the object and temporarily store it in pszProp.
2. If a valid value has been returned, store the return value of the function in the local string szProp. A maximum of 13 characters is stored.
3. Executing user-defined code for processing return values.

4.4.3 Examples - GetRangeMax to GetWidth

4.4.3.1 GetRangeMax example

```
{
long int lrange;

//Get the upper scale Limit
lrange = GetRangeMax(lpszPictureName,"Control1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetRangeMax function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

1. Read out the current upper limit of the object and temporarily store it in lrange.
2. Executing user-defined code for processing return values.

4.4.3.2 GetRangeMin example

```
{
long int lrange;

//Get the lower scale Limit
lrange = GetRangeMin(lpszPictureName,"Control1");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetRangeMin function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

1. Read out the current lower limit of the object and temporarily store it in lrange.
2. Executing user-defined code for processing return values.

4.4.3.3 Beispiel GetScaling

```
{
BOOL bscaling;

//Get the Scaling state
bscaling = GetScaling(lpszPictureName,"Bar1");

if (bscaling)
{
  // User defined code if the
  // bar object has an additional scale
  ...
}
Else
{
  // User defined code if the
  // bar object has no additional scale
  ...
}
}
```

Parameters of the GetScaling function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

1. Read out whether the scale of the bar is displayed or not and temporarily store in bscaling.
2. Executing user-defined code, depending on the return value of the function.

4.4.3.4 GetServerTagPrefix example

```
{
char* pszServerPrefix;
char* pszTagPrefix;
char* pszWindowPrefix;
int nServerPrefixLen = 0;
int nTagPrefixLen = 0;
int nTagLen = 0;
char myTagName[MAX_DM_VAR_NAME+1];

//Initialize the return value
memset(myTagName,0,MAX_DM_VAR_NAME + 1);

//Get the serverprefix the tagprefix and the windowprefix
GetServerTagPrefix(&pszServerPrefix, &pszTagPrefix, &pszWindowPrefix);

//If a serverprefix exists
if (pszServerPrefix)
{
  //Get the length of the string
  nServerPrefixLen = strlen(pszServerPrefix);
}
Else
{
  printf("No server prefix was returned.");
return;
}

//If a tagprefix exists
if (pszTagPrefix)
{
  //Get the length of the string
  nTagPrefixLen = strlen(pszTagPrefix);
}

//Get the length of the tag
nTagLen = strlen("TagName");

//Check if the lenght of the
//ServerPrefix+TagPrefix+VarName + the double points < MAX_DM_VAR_NAME)
if (nServerPrefixLen + nTagPrefixLen + nTagLen+2 < MAX_DM_VAR_NAME)
{
  sprintf(myTagName,"%s::%s%s",pszServerPrefix,pszTagPrefix,"TagName");
//User defined code where the
```

```
//user can do something with the return value
  ...
}
Else
{
  printf("The resulting string is too long.");
return;
}
}
```

1. Initialize the myTagName tag.
2. Read out the server prefix, the tag prefix and the window prefix.
3. If no server prefix has been returned, a text ist output and the function is terminated.
4. If a server prefix has been returned, determine its length and temporarily store it in nServerPrefixLen.
5. If a tag prefix has been returned, determine its length and temporarily store it in TagPrefixLen.
6. Determine the length of the tag name and temporarily store it in nVarLen.
7. If the length permitted for tag names is exceeded a text is output and the function is terminated.
8. If the length permitted for tag names is not exceeded, the tag name required for a client environment is compiled.
9. Executing user-defined code for processing return values.

4.4.3.5 GetServerTagPrefix example

```
{
char* pszServerPrefix;
char* pszTagPrefix;
char* pszWindowPrefix;

//Get the serverprefix and the tagprefix
GetServerTagPrefix(&pszServerPrefix, &pszTagPrefix, &pszWindowPrefix);
//User defined code where the
//user can do something with the return value
...

}
```

Parameters of the GetServerTagPrefix function:

"pszServerPrefix" is the tag which is written into the server prefix.

"pszTagPrefix" is the tag which is written into the tag prefix.

"pszWindowrPrefix" is the tag which is written into the window prefix.

1. Read out the server prefix, the tag prefix and the window prefix.
2. The pszServerPrefix tag contains the returned server prefix.
3. The pszTagPrefix tag contains the returned tag prefix.
4. The pszWindowPrefix tag contains the returned window prefix.
5. Executing user-defined code for processing return values.

4.4.3.6 GetTagBit example

```
{
BOOL bstate;

//Get the current state of the tag
bstate = GetTagBit("gs_tag_bit");

if(bstate)
{
  // User defined code if the
  // value of the tag is true
  ...
}
else
{
  // User defined code if the
  // value of the tag is false
  ...
}
}
```

Parameters of the GetTagBit function

"gs_tag_bit" is the name of the tag.

1. Read out the value of the tag and temporarily store it in bstate.
2. Executing user-defined code, depending on the return value of the function.

4.4.3.7 GetTagBitStateQC example

```
{
DWORD dwState;
DWORD dwQC;
```

```
BOOL bValue;

dwState = 0xFFFFFFFF;

//Get the tag value
//dwstate is the tag state
bValue = GetTagBitStateQCWait("gs_tag_bit",&dwState,&dwQC);

//Create a string which includes the tag value
if (bValue)
{
  // User defined code if the
  // value of the tag is true
  ...
}
else
{
  // User defined code if the
  // value of the tag is false
  ...
}
}
```

Parameters of the GetTagBitStateQC function:

"gs_tag_bit" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read out the value of the tag and temporarily store it in bValue. The function puts the tag status in dwState and the quality code in dwQC.

2. Executing user-defined code, depending on the return value of the function.

4.4.3.8 GetTagBitStateWait example

```
{
DWORD dwstate;
BOOL bValue;

dwstate = 0xFFFFFFFF;

//Get the tag value
//dwstate is the tag state
bValue = GetTagBitStateWait("gs_tag_bit",&dwstate);

//Create a string which includes the tag value
if (bValue)
{
```

```
  // User defined code if the
  // value of the tag is true
  ...
}
else
{
  // User defined code if the
  // value of the tag is false
  ...
}
}
```

Parameters of the GetTagBitStateWait function:

"gs_tag_bit" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read out the value of the tag and temporarily store it in bstate. The function puts the tag status in dwstate.

2. Executing user-defined code, depending on the return value of the function.

4.4.3.9 GetTagChar example

```
{
char* pszValue = NULL;
char szValue[13];

//Get the current value of the tag
pszValue = GetTagChar("gs_tag_char");

if(pszValue != NULL)
{
//Copy the string
strncpy(szValue,pszValue,12);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagChar function:

"gs_tag_char" is the name of the tag.

1. Reading the value of the tag and temporarily storing in pszValue.

2. If a valid value has been returned, store the return value of the function in the local string szValue. A maximum of 12 characters is stored.

3. Executing user-defined code for processing return values.

4.4.3.10 GetTagCharStateQCWait example

```
{
DWORD dwState;
DWORD dwQC;
char* pszRetValue = NULL;
char szRetValue[13];

dwState = 0xFFFFFFFF;

//Get the tag value
pszRetValue = GetTagCharStateQCWait("gs_tag_char",&dwState, &dwQC);

if (pszRetValue != NULL)
{
//Copy the string
strncpy(szRetValue,pszRetValue,12);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagCharStateQCWait function:

"gs_tag_char" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read out the value of the tag and temporarily store it in pszRetValue. The function puts the tag status in dwState and the quality code in dwQC.

2. If a valid value has been returned, store the return value of the function in the local string szRetValue. A maximum of 12 characters is stored.

3. Executing user-defined code for processing return values.

4.4.3.11 Beispiel GetTagCharStateWait

```
{
DWORD dwstate;
char szValue[11];
```

```
char* pszRetValue = NULL;
char szRetValue[13];

dwstate = 0xFFFFFFFF;
//Get the tag value
//dwstate is the tag state
pszRetValue = GetTagCharStateWait("gs_tag_char",&dwstate);

if (pszRetValue != NULL)
{
//Copy the string
strncpy(szRetValue,pszRetValue,12);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagCharStateWait function:

"gs_tag_char" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read out the value of the tag and temporarily store it in pszRetValue. The function puts the tag status in dwstate.

2. If a valid value has been returned, store the return value of the function in the local string szRetValue. A maximum of 12 characters is stored.

3. Executing user-defined code for processing return values.

4.4.3.12 GetTagFloat example

```
{
float fValue;

//Get the current value of the tag
fValue = GetTagFloat("gs_tag_float");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagFloat function:

"gs_tag_float" is the name of the tag.

1. Read out the value of the tag and temporarily store it in fValue.
2. Executing user-defined code for processing return values.

4.4.3.13 GetTagFloatStateQCWait example

```
{
DWORD dwState;
DWORD dwQC;
float fValue;

dwState = 0xFFFFFFFF;

//Get the tag value
fValue = GetTagFloatStateQCWait("gs_tag_float",&dwState, &dwQC);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagFloatStateQCWait function:

"gs_tag_float" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read out the value of the tag and temporarily store it in fValue. The function puts the tag status in dwState and the quality code in dwQC.
2. Executing user-defined code for processing return values.

4.4.3.14 GetTagFloatStateWait example

```
{
DWORD dwstate;
float fValue;

dwstate = 0xFFFFFFFF;
//Get the tag value
//dwstate is the tag state
fValue = GetTagFloatStateWait("gs_tag_float",&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagFloatStateWait function:

"gs_tag_float" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read out the value of the tag and temporarily store it in fValue. The function puts the tag status in dwstate.

2. Executing user-defined code for processing return values.

4.4.3.15 GetTagMultiStateQCWait example

```
{
#define DATA_SIZE 5
DWORD dwState[DATA_SIZE];
DWORD dwQC[DATA_SIZE];

//define all Datas
BOOL lValue1;
long lValue2 ;
char* szValue3;
double dblValue4 ;
WORD lValue5 ;

//Set the tags
GetTagMultiStateQCWait(dwState,dwQC,"%d%d%s%f%d",
  "gs_tag_bit",&lValue1,
  "gs_tag_SByte",&lValue2,
  "gs_tag_char",&szValue3,
  "gs_tag_float",&dblValue4,
  "gs_tag_word",&lValue5);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagMultiStateWait function:

"dwState" is the DWord-Array, in which the tag statuses are stored.

"dwQC" is the DWord-Array, in which the quality codes are stored.

"%d%d%s%f%d" are the type descriptions of the tags to be read.

"gs_tag_bit" is the tag to be read.

"&lValue1" is the address of the tags in which the value of the tags gs_tag_bit should be stored.

"gs_tag_SByte" is the tag to be read.

"&lValue2" is the address of the tags in which the value of the tags gs_tag_SByte should be stored.

The other parameters are to be handled in the same way as those described previously.

1. Creating a DWord-Array with the required size (Number of tags).

2. Reading and storing the values of the tags. The value of the tags gs_tag_bit is stored temporarily in lValue1. The value of the tags gs_tag_SByte is stored temporarily in lValue2, etc.

3. Executing user-defined code for processing return values.

4.4.3.16 GetTagMultiStateWait example

```
{
#define DATA_SIZE 5
DWORD dwData[DATA_SIZE];

//define all Datas
BOOL lValue1;
long lValue2 ;
char* szValue3;
double dblValue4 ;
WORD lValue5 ;

//Set the tags
GetTagMultiStateWait(dwData,"%d%d%s%f%d",
  "gs_tag_bit",&lValue1,
  "gs_tag_SByte",&lValue2,
  "gs_tag_char",&szValue3,
  "gs_tag_float",&dblValue4,
  "gs_tag_word",&lValue5);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagMultiStateWait function:

"dwData" is the DWord-Array, in which the tag statuses are stored.

"%d%d%s%f%d" are the type descriptions of the tags to be read.

"gs_tag_bit" is the tag to be read.

"&lValue1" is the address of the tags in which the value of the tags gs_tag_bit should be stored.

"gs_tag_SByte" is the tag to be read.

"&lValue2" is the address of the tags in which the value of the tags gs_tag_SByte should be stored.

The other parameters are to be handled in the same way as those described previously.

1. Creating a DWord-Array with the required size (Number of tags).

2. Reading and storing the values of the tags. The value of the tags gs_tag_bit is stored temporarily in lValue1. The value of the tags gs_tag_SByte is stored temporarily in lValue2, etc.

3. Executing user-defined code for processing return values.

4.4.3.17 GetTagMultiWait example

```
DWORD dwVar1Value;
char* szVar2Value;
//Memory for the tag value is
//created by teh function with SysMalloc
double dbVar3Value;

BOOL ok;

ok=GetTagMultiWait("%d%s%f", "Ernie_word", &dwVar1Value,
  "Ernie_char", &szVar2Value,
  "Ernie_double", &dbVar3Value);

printf("Word %d, String %s, Double %f\r\n",
  dwVar1Value, szVar2Value, dbVar3Value);
```

4.4.3.18 GetTagPrefix example

```
{
char* pszTagPrefix = NULL;
char szTagPrefix[7];

//Get the current tag prefix
pszTagPrefix = GetTagPrefix(lpszPictureName,"PicWindow1");

if(pszTagPrefix != NULL)
{
//Copy the string
strncpy(szTagPrefix,pszTagPrefix,6);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagPrefix function:

"lpszPictureName" is the name of the picture in which the object was configured.

"PictureWindow1" is the name of the object.

1. Read out the current tag prefix of picture window 1 and temporarily store it in pszTagPrefix.
2. If a valid value has been returned, store the return value of the function in the local string szTagPrefix. A maximum of 6 characters is stored.
3. Executing user-defined code for processing return values.

4.4.3.19 GetTagRaw example

```
{
#define DATA_SIZE 3

BYTE byData[DATA_SIZE];

//Get the current values of the tag
GetTagRaw("gs_tag_raw",byData,DATA_SIZE);

//Use the values received in the array byData
...
}
```

Parameters of the GetTagRaw function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array in which the values of the raw data tags will be stored.

"DATA_SIZE" is the number of values that will be read.

1. Reading the values of the tags and temporarily storing in byData.
2. Executing user-defined code for processing return values.

4.4.3.20 GetTagRawStateQCWait example

```
{
#define DATA_SIZE 3
DWORD dwState;
DWORD dwQC;
BYTE byData[DATA_SIZE];

dwState = 0xFFFFFFFF;
```

```
//Get the values of the tag
GetTagRawStateQCWait("gs_tag_raw",byData,DATA_SIZE,&dwState,&dwQC);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagRawStateQCWait function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array in which the values of the raw data tags will be stored.

"DATA_SIZE" is the number of values that will be read.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Reading the values of the tags and temporarily storing in byData.
2. Executing user-defined code for processing return values.

4.4.3.21 GetTagRawStateWait example

```
{
#define DATA_SIZE 3
DWORD dwstate;
BYTE byData[DATA_SIZE];
char szValue[11];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Get the values of the tag
//dwstate is the tag state
GetTagRawStateWait("gs_tag_raw",byData,DATA_SIZE,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagRawStateWait function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array in which the values of the raw data tags will be stored.

"DATA_SIZE" is the number of values that will be read.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Reading the values of the tags and temporarily storing in byData.
2. Executing user-defined code for processing return values.

4.4.3.22 GetTagSByte example

```
{
long lValue;

//Get the current value of the tag
lValue = GetTagSByte("gs_tag_SByte");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagSByte function:

"gs_tag_SByte" is the name of the tag.

1. Read the value of the tag and temporarily store it in lValue.
2. Executing user-defined code for processing return values.

4.4.3.23 GetTagSByteStateQCWait example

```
{
DWORD dwState;
DWORD dwQC;
long lValue;

dwState = 0xFFFFFFFF;

//Get the tag value
lValue = GetTagSByteStateQCWait("gs_tag_SByte",&dwState, &dwQC);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagSByteStateQCWait function:

"gs_tag_SByte" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read the value of the tag and temporarily store it in lValue. The function puts the tag status in dwState and the quality code in dwQC.
2. Executing user-defined code for processing return values.

4.4.3.24 GetTagSByteStateWait example

```
{
DWORD dwstate;
long lValue;

dwstate = 0xFFFFFFFF;
//Get the tag value
//dwstate is the tag state
lValue = GetTagSByteStateWait("gs_tag_SByte",&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagSByteStateWait function:

"gs_tag_SByte" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read the value of the tag and temporarily store it in lValue. The function puts the tag status in dwstate.
2. Executing user-defined code for processing return values.

4.4.3.25 GetTagWord example

```
{
WORD wValue;

//Get the current value of the tag
wValue = GetTagWord("gs_tag_word");

//User defined code where the
//user can do something with the return value
```

```
...
}
```

Parameters of the GetTagWord function:

"gs_tag_word" is the name of the tag.

1. Read out the value of the tag and temporarily store it in wValue.
2. Executing user-defined code for processing return values.

4.4.3.26 GetTagWordStateQCWait example

```
{
DWORD dwState;
DWORD dwQC;
WORD wValue;

dwState = 0xFFFFFFFF;

//Get the tag value
wValue = GetTagWordStateQCWait("gs_tag_word",&dwState, &dwQC);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTagWordStateQCWait function:

"gs_tag_word" is the name of the tag.

"&dwState" is the address of the tags in which the tag status is to be stored.

"&dwQC" is the address of the tag in which the quality code is to be stored.

1. Read out the value of the tag and temporarily store it in wValue. The function puts the tag status in dwState and the quality code in dwQC.
2. Executing user-defined code for processing return values.

4.4.3.27 GetTagWordStateWait example

```
{
DWORD dwstate;
WORD wValue;
```

```
dwstate = 0xFFFFFFFF;
//Get the tag value
//dwstate is the tag state
wValue = GetTagWordStateWait("gs_tag_word",&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of then GetTagWordStateWait function:

"gs_tag_word" is the name of the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Read out the value of the tag and temporarily store it in wValue. The function puts the tag status in dwstate.
2. Executing user-defined code for processing return values.

4.4.3.28 GetText example

```
{
char* pszValue = NULL;
char szValue[13];

//Get the Text which is actually set
pszValue = GetText(lpszPictureName,"StaticText1");

if(pszValue != NULL)
{
//Copy the string
strncpy(szValue,pszValue,12);
}
//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetText function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

1. Read out the text in the object StaticText1 and temporarily store it in pszValue.

2. If a valid value has been returned, store the return value of the function in the local string szValue. A maximum of 12 characters is stored.

3. Executing user-defined code for processing return values.

4.4.3.29 GetTop example

```
{
long lPos;

//Get the y-Position of the Object
lPos = GetTop(lpszPictureName,"WinCCLogo");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetTop function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

1. Read out the current Y position of the object and temporarily store it in lPos.

2. Executing user-defined code for processing return values.

4.4.3.30 GetVisible example

```
{
BOOL bVisible;

//Get the visibility
bVisible = GetVisible(lpszPictureName,"GraphicObject1");

if(bVisible)
{
  // User defined code if the
  // object is visible
  ...
}
else
{
  // User defined code if the
  // object is not visible
  ...
}
}
```

Parameters of the GetVisible function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

1. Read out whether the object is visible or not and temporarily store in bVisible.
2. Executing user-defined code, depending on the return value of the function.

4.4.3.31 GetWidth example

```
{
long lWidth;

//Get the width of the object
lWidth = GetWidth(lpszPictureName,"WinCCLogo");

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the GetWidth function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

1. Read out the current width of the object and temporarily store it in lWidth.
2. Executing user-defined code for processing return values.

4.4.4 Examples - H to S

4.4.4.1 InquireLanguage example

```
{
DWORD count;
DWORD* language;
int i;

//Count the installed languages
language = InquireLanguage(&count);
```

```
printf("###################### INQUIRE LANGUAGE ####################");
//Print out the count of languages
printf ( "\r\nCount Languages=%d\r\n", count );

//print out which languages are installed
for (i=1;i<=count; i++)
{
printf ("\r\n%d.language=%x", i,*language++);
}
}
```

1. Determine the languages configured for the runtime. In language the language IDs are temporarily stored. In count the number of languages is temporarily stored.
2. The number of determined languages is output.
3. All determined language IDs are displayed.

4.4.4.2 ProgramExecute example

```
{
//start the program calc.exe
ProgramExecute("C:\\Winnt\\system32\\calc.exe");
}
```

As parameter the file is to be specified with its path.

4.4.4.3 ResetFilter example

```
{
BOOL ret;
MSG_FILTER_STRUCT Filter;
CMN_ERROR Error;

//delete the whole Filter struct
memset( &Filter, 0, sizeof( MSG_FILTER_STRUCT ) );

//set an empty filter struct
AXC_SetFilter("gs_alarm_00","Control1",&Filter,&Error);
}
```

1. Delete the filter structure.
2. Write empty values into the filter structure.

4.4.4.4 RPTJobPreview example

```
{
//Start the print preview of the specified print job
RPTJobPreview("Documentation Text Library");
}
```

Parameters of the "RPTJobPreview" function:

"Documentation Text Library" is the name of the print job.

4.4.4.5 RPTJobPrint example

```
{
//Print the specified print job out
RPTJobPrint("@Text library (compact)");
}
```

Parameters of the RPTJobPrint function:

@Text library (compact) is the name of the print job.

4.4.4.6 SysMalloc example

```
char* main(...);
{
char* returnwert;
char text[17];
returnwert=SysMalloc(17);
strcpy(returnwert,&text[0];
return returnwert;
}
```

4.4.5 Examples - SetAlarmHigh to SetPropChar

4.4.5.1 SetAlarmHigh example

```
{
//Set the upper limit for the warning
SetAlarmHigh(lpszPictureName,"Bar1",3.0);
}
```

Parameters of the SetAlarmHigh funtion:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"3.0" is the value to which the upper alarm limit will be set.

4.4.5.2 SetBackColor example

```
{
//Set the back color blue
SetBackColor(lpszPictureName,"StaticText1",CO_BLUE);
}
```

Parameters of the SetBackColor function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

"CO_BLUE" is the constant for the color "Blue".

Note

Instead of using the constant for the color value you may also specify the color by means of a hexadecimal value.

4.4.5.3 SetBorderEndStyle example

```
{
SetBorderEndStyle(lpszPictureName,"Line", (2|393216));
}
```

Sets the left line end as filled arrow and the right one as filled circle. The left line end is stored in the two lower bytes, the right line end in the two upper bytes. The parameters are transferred by means of numeric values.

Example of setting the line ends with symbolic names

```
{
SetBorderEndStyle(lpszPictureName,"Line", (LE_FULL_ARROW|(LE_FULL_CIRCLE <<16));
}
```

Sets the left line end as filled arrow and the right one as filled circle. The left line end is stored in the two lower bytes, the right line end in the two upper bytes. To address the right line end the symbolic designation "LE_FULL_CIRCLE" is moved by 2 bytes or 16 bit into the two upper bytes.

4.4.5.4 SetBorderStyle example

```
{
//Change the Border style
SetBorderStyle(lpszPictureName,"Rectangle1",3);
}
```

Parameters of the SetBorderStyle function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

"3" is the line style which is set for the object.

4.4.5.5 SetColorAlarmHigh example

```
{
//Set the Color for the alarm high limit to red
SetColorAlarmHigh(lpszPictureName,"Bar1",CO_RED);
}
```

Parameters of the SetColorAlarmHigh function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"CO_RED" is the constant for the color red.

Note

Instead of using the constant for the color value you may also specify the color by means of a hexadecimal value.

4.4.5.6 Example - SetCursorMode

```
{
//Set the Cursor Mode to Alpha cursor
SetCursorMode(lpszPictureName,"GraphikObjekt1",FALSE);
}
```

Parameters of the SetCursorMode function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

"FALSE" signifies: Cursor mode "Alpha-Cursor" is set.

4.4.5.7 SetFilling example

```
{
//Set the dynamic filling true
SetFilling(lpszPictureName,"Rectangle1",TRUE);
}
```

Parameters of the SetFilling function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

"TRUE" means: Activating dynamic filling.

4.4.5.8 SetFillingIndex example

```
{
//Set the Filling of Rectangle1 to 10
SetFillingIndex(lpszPictureName,"Rectangle1",10);
}
```

Parameters of the SetFillingIndex function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

"10" is the fill level which is assigned to the object.

4.4.5.9 SetFillStyle example

```
{
//Change the fill style
SetFillStyle(lpszPictureName,"Rectangle1",196617);
}
```

Parameters of the SetFillStyle function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Rectangle1" is the name of the object.

"196617" is the fill pattern (brick wall) which is set for the object.

4.4.5.10 SetFlashBackColor example

```
{
//Set the flashing to True
SetFlashBackColor(lpszPictureName,"Group1",TRUE);
}
```

Parameters of the SetFlashBackColor function

"lpszPictureName" is the name of the picture in which the object was configured.

"Group1" is the name of the object.

"TRUE" means: Activating flashing of the background color.

4.4.5.11 SetFlashBackColorOn example

```
{
//Set the Flash color for the state on to red
SetBackFlashColorOn(lpszPictureName,"Group1",CO_RED);
}
```

Parameters of the SetBackFlashColorOn function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Group1" is the name of the object.

"CO_Red" is the constant for the color "Red".

Note

Instead of using the constant for the color value you may also specify the color by means of a hexadecimal value.

4.4.5.12 SetFlashRateFlashPic example

```
{
//Set the flash rate to 0
SetFlashRateFlashPic(lpszPictureName,"Statusdisplay1",0);
}
```

Parameters of the SetFlashRateFlashPic function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Status display1" is the name of the object.

"0" is the flash frequency of the object.

4.4.5.13 SetFocus example

```
{
//Set the Focus on the Object Button 1
Set_Focus(lpszPictureName,"Button1");
}
```

Parameters of the Set_Focus function

"lpszPictureName" is the name of the picture in which the object was configured.

"Button1" is the name of the object on which the focus is set.

4.4.5.14 SetFontBold example

```
{
//Set the displayed Text bold
SetFontBold(lpszPictureName,"StatischerText1",TRUE);
}
```

Parameters of the SetFontBold function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

"TRUE" means: The text is written in bold face.

4.4.5.15 SetFontSize example

```
{
//Set Font Size to 12
SetFontSize(lpszPictureName,"StaticText1",12);
}
```

Parameters of the SetFontSize function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

"12" is the font size to which the text is set.

4.4.5.16 SetHeight example

```
{
//Set the height of the object to 100
SetHeight(lpszPictureName,"WinCCLogo",100);
}
```

Parameters of the SetHeight function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

"100" is the height to which the object is set.

4.4.5.17 SetHiddenInput example

```
{
//Set the hidden input true
SetHiddenInput(lpszPictureName,"IOField1",TRUE);
}
```

Parameters of the SetHiddenInput function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"TRUE" means: Activating the hidden input.

4.4.5.18 SetLanguage example

```
{
//German
SetLanguage(0x0407);
}
```

The Runtime language is set to German.

4.4.5.19 SetLeft example

```
{
//Set the x-position to 0
SetLeft(lpszPictureName,"WinCCLogo",0);
}
```

Parameters of the SetLeft function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

"0" is the X position to which the object is set.

4.4.5.20 SetLink example

```
{
LINKINFO linkinfo;

//Set the link type
linkinfo.LinkType = 1;

//Set the update cycle
linkinfo.dwCycle = 0;

//set the Structmember
strcpy(linkinfo.szLinkName, "U08i_link_00");
```

```
//Set the connection to the tag
SetLink(lpszPictureName,"Bar1","Process",&linkinfo);
}
```

Parameters of the SetLink function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"Process" is the property connected to a tag.

"&linkinfo" is the address of the linkinfo structure.

1. Set the connection type for the process property to direct connection.
2. Set the update cycle to "Upon change".
3. Set the tag name to U08i_link_00.

4.4.5.21 SetMarker example

```
{
//Set the marker visible
SetMarker(lpszPictureName,"Bar1",TRUE);
}
```

Parameters of the SetMarker function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"TRUE" means: The marker is displayed.

4.4.5.22 SetOutputValueDouble example

```
{
//Set the output value of the IO field to 55.5
SetOutputValueDouble(lpszPictureName,"IOField1",55.5);
}
```

Parameters of the SetOutputValueDouble function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"55.5" is the value which is output.

4.4.5.23 SetPictureDown example

```
{
//Set the picture name to activated.bmp
SetPictureDown(lpszPictureName,"Roundbutton1","activated.bmp");
}
```

Parameters of the SetPictureDown function:

"lpszPictureName" is the name of the picture in which the object was configured.

"RoundButton1" is the name of the object.

"activated.bmp" is the picture name of the picture to be displayed in round button 1.

4.4.5.24 SetPictureName example

```
{
//Set the picture name cool_man.bmp
SetPictureName(lpszPictureName,"GraphicObject1","cool_man.bmp");
}
```

Parameters of the SetPictureName function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

"cool_man.bmp" is the picture name of the picture to be displayed in graphic object 1.

4.4.5.25 SetPictureUp example

```
{
//Set the picture name to deactivated.bmp
SetPictureUp(lpszPictureName,"Roundbutton1","deactivated.bmp");
}
```

Parameters of the SetPictureUp function:

"lpszPictureName" is the name of the picture in which the object was configured.

"RoundButton1" is the name of the object.

"deactivated.bmp" is the picture name of the picture to be displayed in round button 1.

4.4.5.26 SetPosition example

```
{
//Set the Slider Position to 30
SetPosition(lpszPictureName,"Control1",30);
}
```

Parameters of the SetPosition function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

"30" is the position to which the slider is to be set.

4.4.5.27 SetPropBOOL example

```
{
//Set the visibility TRUE
SetPropBOOL("lpszPictureName","EAFeld1","Visible",TRUE);
}
```

Parameters of the SetVisible function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"TRUE" means: The object is intended to be visible.

4.4.5.28 SetPropChar example

```
{
//Set the property Tooltiptext
SetPropChar("gs_graph_eafield","IOField1","ToolTipText","Tooltiptext1 ");
}
```

Parameters of the SetPropChar function:

"lpszPictureName" is the name of the picture in which the object was configured.

"IOField1" is the name of the object.

"Tooltiptext" is the object property.

"Tooltiptext 1" is the value to which the property is to be set.

4.4.6 Examples - SetRangeMax to SetWidth

4.4.6.1 SetRangeMax example

```
{
//Set the Upper Scale Limit
SetRangeMax(lpszPictureName,"Control1",80);
}
```

Parameters of the SetRangeMax function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

"80" is the upper limit to be assigned to the object.

4.4.6.2 SetRangeMin example

```
{
//Set the lower Scale Limit
SetRangeMin(lpszPictureName,"Control1",0);
}
```

Parameters of the SetRangeMin function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Control1" is the name of the object.

"0" is the lower limit to be assigned to the object.

4.4.6.3 SetScaling example

```
{
//Set the Scaling Visible
SetScaling(lpszPictureName,"Bar1",TRUE);

}
```

Parameters of the SetScaling function:

"lpszPictureName" is the name of the picture in which the object was configured.

"Bar1" is the name of the object.

"TRUE" means: Making the scaling visible.

4.4.6.4 SetTagBit example

```
{
//Set the tag to true
SetTagBit("gs_tag_bit",TRUE);
}
```

Parameters of the SetTagBit function:

"gs_tag_bit" is the name of the tag.

"TRUE" is the value to be written to the tag.

4.4.6.5 Beispiel SetTagBitStateWait

```
{
DWORD dwstate;

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the value of the tag to TRUE
//dwstate is the tag state
SetTagBitStateWait("gs_tag_bit",TRUE,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagBitStateWait function:

"gs_tag_bit" is the name of the tag.

"TRUE" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

4.4.6.6 SetTagChar example

```
{
//Set the tag to Example text
SetTagChar("gs_tag_char","Example Text");
}
```

Parameters of the SetTagChar function:

"gs_tag_char" is the name of the tag.

"Example text" is the value to be written to the tag.

4.4.6.7 SetTagCharStateWait example

```
{
DWORD dwstate;

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the tag to Example Text
//dwstate is the tag state
SetTagCharStateWait("gs_tag_char","Example Text",&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagCharStateWait function:

"gs_tag_char" is the name of the tag.

"Example text" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

4.4.6.8 SetTagFloat example

```
{
//Set the tag to 55.4711
```

```
SetTagFloat("gs_tag_float",55.4711);
}
```

Parameters of the SetTagFloat function:

"gs_tag_float" is the name of the tag.

"55.4711" is the value to be written to the tag.

4.4.6.9 SetTagFloatStateWait example

```
{
DWORD dwstate;
char szValue[9];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the tag to 55.4711
//dwstate is the tag state
SetTagFloatStateWait("gs_tag_float",55.4711,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagFloatStateWait function:

"gs_tag_float" is the name of the tag.

"55.4711" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

4.4.6.10 SetTagMultiStateWait example

```
{
#define DATA_SIZE 5
DWORD dwData[DATA_SIZE];

//define all tags
BOOL lValue1;
```

```
long lValue2 ;
char szValue3[_MAX_PATH];
float lValue4;
char lValue5;

// Fill the tags with the values
// you want to set into the WinCC tags
...

//Set the WinCC tags
SetTagMultiStateWait(dwData,"%d%d%s%f%d","gs_tag_bit",lValue1,
 "gs_tag_SByte",lValue2,
 "gs_tag_char",szValue3,
 "gs_tag_float",lValue4,
 "gs_tag_word",lValue5);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagMultiStateWait function:

"dwData" is the DWord-Array, in which the tag statuses are stored.

"%d%d%s%f%d" are the type descriptions of the tags to be written.

"gs_tag_bit" is the WinCC tag to be written.

"lValue1" is the tag to whose value the WinCC tag gs_tag_bit is to be set.

"gs_tag_SByte" is the WinCC tag to be written.

"&lValue2" is the tag to whose value the WinCC tag gs_tag_SByte is to be set.

The other parameters are to be handled in the same way as those described previously.

1. Creating a DWord-Array with the required size (Number of tags).
2. Creating tags whose values are to be written to the WinCC tags.
3. Writing the values of the previously created and filled tags to the WinCC tags.l
4. Executing user-defined code for processing return values.

4.4.6.11 SetTagMultiWait example

```
BOOL ok;

ok=SetTagMultiWait("%d%s%f", "Ernie_word", 16,
  "Ernie_char", "Hello World",
  "Ernie_double", 55.4711);
```

4.4.6.12 SetTagPrefix example

```
{
//Set the TagPrefix to Struct1.
SetTagPrefix(lpszPictureName,"PicWindow1","Struct1.");

//Set the picture name again to update the tag prefix
SetPictureName(lpszPictureName,"PicWindow1","gs_graph_eafield");
}
```

Parameters of the SetTagPrefix function:

"lpszPictureName" is the name of the picture in which the object was configured.

"PictureWindow1" is the name of the object.

"Struct1." is the tag prefix to be set at picture window 1.

1. Set the tag prefix of the object "PictureWindow1" to "Struct1.".
2. Reset the name of the picture shown in the picture window to make the tag prefix setting effective.

4.4.6.13 SetTagRaw example

```
{
#define DATA_SIZE 3

BYTE byData[DATA_SIZE];

// Fill the Byte array with the values
// you want to set into the raw data tag
...

//Set the tag to the default values
SetTagRaw("gs_tag_raw",byData,DATA_SIZE);
}
```

Parameters of the SetTagRaw function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array whose values are written to the raw data tags.

"DATA_SIZE" is the number of values that will be written.

1. Creating a BYTE-Array with the required size (size of the raw data tag).
2. Filling the BYTE-Array with the values to be written.

3. Writing the values of the BYTE-Array to the raw data tag.

4.4.6.14 SetTagRawStateWait example

```
{
#define DATA_SIZE 3

BYTE byData[DATA_SIZE];
DWORD dwstate;
char szValue[9];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

// Fill the Byte array with the values
// you want to set into the raw data tag
...

//Set the tag to the default values
//dwstate is the tag state
SetTagRawStateWait("gs_tag_raw",byData,DATA_SIZE,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagRawStateWait function:

"gs_tag_raw" is the name of the tag.

"byData" is the byte array whose values are written to the raw data tags.

"DATA_SIZE" is the number of values that will be written.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Creating a BYTE-Array with the required size (size of the raw data tag).
2. Filling the BYTE-Array with the values to be written.
3. Writing the values of the BYTE-Array to the raw data tag.
4. Executing user-defined code for processing return values.

4.4.6.15 SetTagSByte example

```
{
//Set the tag to 50
SetTagSByte("gs_tag_SByte",50);
```

```
}
```

Parameters of the SetTagSByte function:

"gs_tag_SByte" is the name of the tag.

"50" is the value to be written to the tag.

4.4.6.16 Beispiel SetTagSByteStateWait

```
{
DWORD dwstate;
char szValue[9];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the tag to 50
//dwstate is the tag state
SetTagSByteStateWait("gs_tag_SByte",50,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagSByteStateWait:

"gs_tag_SByte" is the name of the tag.

"50" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

4.4.6.17 SetTagWord example

```
{
//Set the tag to 50
SetTagWord("gs_tag_word",50);
}
```

Parameters of the SetTagWord function:

"gs_tag_word" is the name of the tag.

"50" is the value to be written to the tag.

4.4.6.18 Beispiel SetTagWordStateWait

```
{
DWORD dwstate;
char szValue[9];

//Load dwState with default values
dwstate = 0xFFFFFFFF;

//Set the tag to 50
//dwstate is the tag state
SetTagWordStateWait("gs_tag_word",50,&dwstate);

//User defined code where the
//user can do something with the return value
...
}
```

Parameters of the SetTagWordStateWait funtion:

"gs_tag_word" is the name of the tag.

"50" is the value to be written to the tag.

"&dwstate" is the address of the tags in which the tag status is to be stored.

1. Setting the tags to the specified value.
2. Executing user-defined code for processing return values.

4.4.6.19 SetText example

```
{
//Set the text Example Text on the StaticText field
SetText(lpszPictureName,"StaticText1","Example Text");
}
```

Parameters of the SetText function:

"lpszPictureName" is the name of the picture in which the object was configured.

"StaticText1" is the name of the object.

"ExampleText" is the text which is to be output.

4.4.6.20 SetTop example

```
{
//Set the y-position to 0
SetTop(lpszPictureName,"WinCCLogo",140);
}
```

Parameters of the SetTop function:

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

"140" is the Y position to which the object is set.

4.4.6.21 SetVisible example

```
{
//Set the Object visible
SetVisible(lpszPictureName,"GraphicObject1",TRUE);
}
```

Parameters of the SetVisible function:

"lpszPictureName" is the name of the picture in which the object was configured.

"GraphicObject1" is the name of the object.

"TRUE" means: The object is intended to be visible.

4.4.6.22 SetWidth example

```
{
//Set the width of the object to 400
SetWidth(lpszPictureName,"WinCCLogo",400);
}
```

Parameters of the SetWidth function

"lpszPictureName" is the name of the picture in which the object was configured.

"WinCCLogo" is the name of the object.

"400" is the width to which the object is set.

4.4.7 Examples - T to Z

4.4.7.1 TlgGetNumberOfColumns example

```
{
char text[5];
long int columns

//get number of Columns
columns = GetNumberOfColumns("TableControl_01");

//convert long int to char
sprintf(text,"%d",columns);

//set text on TextField5
SetText(lpszPictureName,"StaticText5",text);
}
```

Parameters of the TlgGetNumberOfColumns function:

"TableControl_01" is the name of the WinCC Table Control.

1. Temporarily store the return value of the TlgGetNumberofColumns in columns.
2. Temporarily store the return value in the text string.
3. Output the return value to a static text field.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.4.7.2 TlgGetNumberOfColumns example

```
{
char text[5];
long int columns

//get number of Columns
columns = GetNumberOfColumns("TableControl_01");
```

```
//convert long int to char
sprintf(text,"%d",columns);

//set text on TextField5
SetText(lpszPictureName,"StaticText5",text);
}
```

Parameters of the TlgGetNumberOfColumns function:

"TableControl_01" is the name of the WinCC Table Control.

1. Temporarily store the return value of the TlgGetNumberofColumns in columns.
2. Temporarily store the return value in the text string.
3. Output the return value to a static text field.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.4.7.3 TlgGetNumberOfRows example

```
{
char text[5];
long int rows;

//get number of rows
rows = TlgGetNumberOfRows("TableControl_01");

//convert long int to char
sprintf(text,"%d",rows);

//set text on TextField5
SetText(lpszPictureName,"StaticText5",text);
}
```

Parameters of the TlgGetNumberOfRows function:

TableControl_01 is the name of the WinCC Table Control.

1. Temporarily store the return value of the TlgGetNumberofRows in rows.
2. Temporarily store the return value in the text string.
3. Output the return value to a static text field.

4.4.7.4 TlgGetRulerTimeTrend example

```
{
SYSTEMTIME systime;
WORD wHour;
WORD wMin;
WORD wSec;

char szTime[10];

//Get the current systemtime
systime = TlgGetRulerTimeTrend("TrendControl_01",0);

//Get the hour
wHour = systime.wHour;
//Get the minute
wMin = systime.wMinute;
//Get the second
wSec = systime.wSecond;

//
sprintf(szTime,"%d:%d:%d",wHour,wMin,wSec);

//output the variable name
SetText(lpszPictureName,"StaticText7",szTime);
}
```

1. Read out the current system time.
2. Read out hour, minute and second from the SYSTEMTIME structure.
3. Create a string containing the time.
4. Output the current time.

4.4.7.5 TlgGetRulerVariableNameTrend example

```
{
char* pszVarName = NULL;
char szVarName[20];
```

```
//Get the ruler variable name
pszVarName = TlgGetRulerVariableNameTrend("TrendControl_01",0);

if (pszVarName != NULL)
{
//Copy the string
strncpy(szVarName,pszVarName,19);
}
//output the variable name
SetText(lpszPictureName,"StaticText6",szVarName);
}
```

Parameters of the TlgGetRulerVariableNameTrend function:

"TrendControl_01" is the name of the WinCC Trend Control.

"0" is the number of the trend.

1. Temporarily store the return value of the TlgGetRulerVariableNameTrend function in pszVarName.
2. If a valid value has been returned, copy the return value to szVarName.
3. Output the return value to a static text field.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.4.7.6 TlgTrendWindowPressOpenDlgButton example

```
{
//Opens the Property Dialog
TlgTrendWindowPressOpenDlgButton("TrendControl_01");
}
```

Parameters of the TlgTrendWindowPressOpenDlgButton function:

"TrendControl_01" is the window title of WinCC Trend Control.

4.4.7.7 TlgTrendWindowPressStartStopButton example

```
{
//start/stop the actualization
TlgTrendWindowPressStartStopButton("TrendControl_01");
}
```

Parameters of the TlgTrendWindowPressStartStopButton function:

"TrendControl_01" is the window title of WinCC Trend Control.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

4.4.7.8 TlgTrendWindowPressZoomInButton example

```
{
//zoom in
TlgTrendWindowPressZoomInButton("TrendControl_01");
}
```

Parameters of the TlgTrendWindowPressZoomInButton function:

"TrendControl_01" is the window title of WinCC Trend Control.

4.4.7.9 TlgTrendWindowPressZoomOutButton example

```
{
// zoom out
TlgTrendWindowPressZoomOutButton("TrendControl_01");
}
```

Parameters of the TlgTrendWindowPressZoomOutButton function:

"TrendControl_01" is the window title of WinCC Trend Control.

4.4.8 Examples of WinCC controls

4.4.8.1 How to add elements to a WinCC OnlineTrendControl

Introduction

In the following example, insert value columns with properties in an empty WinCC OnlineTableControl and link the columns to archive tags.

Prerequisite

- An archive is created in the "Tag Logging Editor" with three archive tags.
- A "WinCC OnlineTableControl" with the name "Control2" is inserted in the process picture in the Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured, for example, the event "mouse click" with a C action and the following script for the button.

Example

```
//enable BackColor
SetPropBOOL(lpszPictureName, "Control2", "UseColumnBackColor",TRUE);

//add new TimeColumn and assign column length
SetPropChar(lpszPictureName, "Control2", "TimeColumnAdd", "myRefTimeColumn");
SetPropWord(lpszPictureName, "Control2", "TimeColumnLength", 20);

//add new ValueColumn and assign properties
SetPropChar(lpszPictureName, "Control2", "ValueColumnAdd", "myValueTable1");
SetPropWord(lpszPictureName, "Control2", "ValueColumnProvider", 1);
SetPropChar(lpszPictureName, "Control2", "ValueColumnTagName", "Process value archive\
\PDL_ZT_1");
SetPropWord(lpszPictureName, "Control2", "ValueColumnBackColor", RGB(255,255,255));
SetPropChar(lpszPictureName, "Control2", "ValueColumnTimeColumn", "myRefTimeColumn");

//add new ValueColumn and assign properties
SetPropChar(lpszPictureName, "Control2", "ValueColumnAdd", "myValueTable2");
SetPropWord(lpszPictureName, "Control2", "ValueColumnProvider", 1);
SetPropChar(lpszPictureName, "Control2", "ValueColumnTagName", "Process value archive\
\PDL_ZT_2");
SetPropWord(lpszPictureName, "Control2", "ValueColumnBackColor", RGB(0,255,255));
SetPropChar(lpszPictureName, "Control2", "ValueColumnTimeColumn", "myRefTimeColumn");

//add new ValueColumn and assign properties
SetPropChar(lpszPictureName, "Control2", "ValueColumnAdd", "myValueTable3");
SetPropWord(lpszPictureName, "Control2", "ValueColumnProvider", 1);
SetPropChar(lpszPictureName, "Control2", "ValueColumnTagName", "Process value archive\
\PDL_ZT_3");
SetPropWord(lpszPictureName, "Control2", "ValueColumnBackColor", RGB(255,255,0));
```

```
SetPropChar(lpszPictureName, "Control2", "ValueColumnTimeColumn", "myRefTimeColumn");
```

Result

	myRefTimeAxis	myValueTable1	myValueTable2	myValueTable3
112	08.02.2010 14:15:03	1	1	84
113	08.02.2010 14:15:03	22	1	84
114	08.02.2010 14:15:04	2	1	84
115	08.02.2010 14:15:04	1	1	84
116	08.02.2010 14:15:05	1	1	84
117	08.02.2010 14:15:05	3	1	84
118	08.02.2010 14:15:06	1	1	84
119	08.02.2010 14:15:06	1	1	84
120	08.02.2010 14:15:07	18	1	84

4.4.8.2 How to add elements to a WinCC OnlineTrendControl

Introduction

In the following example you insert the Trend Window, Value Axis, Time Axis and Trends elements into an empty WinCC OnlineTrendControl.

Prerequisite

- An archive is created in the "Tag Logging Editor" with three archive tags.
- A "WinCC OnlineTrendControl" with the name "Control2" is inserted in the process picture in the Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured, for example, the event "mouse click" with a C action and the following script for the button.

Example

```
//create reference to new window, time and value axis
SetPropChar(lpszPictureName, "Control2", "TrendWindowAdd", "myWindow");
SetPropChar(lpszPictureName, "Control2", "TimeAxisAdd", "myTimeAxis");
SetPropChar(lpszPictureName, "Control2", "ValueAxisAdd", "myValueAxis");

//assign time and value axis to the window
SetPropChar(lpszPictureName, "Control2", "TimeAxisTrendWindow", "myWindow");
```

```
SetPropChar(lpszPictureName, "Control2", "ValueAxisTrendWindow", "myWindow");

//add new trend and assign properties
SetPropChar(lpszPictureName, "Control2", "TrendAdd", "myTrend1");
SetPropWord(lpszPictureName, "Control2", "TrendProvider", 1);
SetPropChar(lpszPictureName, "Control2", "TrendTagName", "Process value archive\
\PDL_ZT_1");
SetPropWord(lpszPictureName, "Control2", "TrendColor",  RGB(255,0,0));
SetPropChar(lpszPictureName, "Control2", "TrendTrendWindow", "myWindow");
SetPropChar(lpszPictureName, "Control2", "TrendTimeAxis", "myTimeAxis");
SetPropChar(lpszPictureName, "Control2", "TrendValueAxis", "myValueAxis");

//add new trend and assign properties
SetPropChar(lpszPictureName, "Control2", "TrendAdd", "myTrend2");
SetPropWord(lpszPictureName, "Control2", "TrendProvider", 1);
SetPropChar(lpszPictureName, "Control2", "TrendTagName", "Process value archive\
\PDL_ZT_2");
SetPropWord(lpszPictureName, "Control2", "TrendColor", RGB(0,255,0));
SetPropChar(lpszPictureName, "Control2", "TrendTrendWindow", "myWindow");
SetPropChar(lpszPictureName, "Control2", "TrendTimeAxis", "myTimeAxis");
SetPropChar(lpszPictureName, "Control2", "TrendValueAxis", "myValueAxis");

//add new trend and assign properties
SetPropChar(lpszPictureName, "Control2", "TrendAdd", "myTrend3");
SetPropWord(lpszPictureName, "Control2", "TrendProvider", 1);
SetPropChar(lpszPictureName, "Control2", "TrendTagName", "Process value archive\
\PDL_ZT_3");
SetPropWord(lpszPictureName, "Control2", "TrendColor", RGB(0,0,255));
SetPropChar(lpszPictureName, "Control2", "TrendTrendWindow", "myWindow");
SetPropChar(lpszPictureName, "Control2", "TrendTimeAxis", "myTimeAxis");
SetPropChar(lpszPictureName, "Control2", "TrendValueAxis", "myValueAxis");
```

4.5 Lists

4.5.1 Bar direction

Bar direction	Numeric value
Up	0
bottom	1
left	2
right	3

4.5.2 Bar Scaling

Numeric value	Bar Scaling
0	Linear (same weighting)
1	Logarithmic (low values emphasized)
2	Negative logarithmic (high values emphasized)
3	Automatic (linear)
4	Tangential (high and low values emphasized)
5	Square (high values emphasized)
6	Cubic (high values strongly emphasized)

4.5.3 Flash frequencies

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Since the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time etc.).

The information in the table is therefore only for orientation purposes.

4.5.4 I/O field, output format

The display of numeric values output into an I/O field is controlled by a format specification.

A format indication consists of one or several formatting characters. The valid formatting characters and their meaning are listed in the following table:

Characters	Meaning	Note
s	Positive numbers are displayed with signs	Always in the first position of the format specification May only appear once in the format specification
0(ZERO)	Leading and ending zeros are output.	Always following s If s is missing, it is in the first position May only appear once in the format specification
9	Specifies the position of a digit in the number to be output	May appear in the format indication as often as required.
, (comma)	Position of the decimal point	
e	Returns the number in exponential form	Always at the last position of the format specification

Example:

Number	Format	Representation
123,455	999,999	123,455
123,455	999,99	123,46
123,455	9999,9999	123,4550
123,455	s09999.9999	+0123,4550
123,455	9.99999e	1.23455e+002

If the decimal point is left out in the format specification the decimal places are not displayed and the number is rounded to an integer.

If fewer decimal positions are provided in the format specification than the number actually has, only the decimal places specified in the format specification are output.

The number is rounded correspondingly.

If the number has more places before the decimal point than specified in the format specification, three asterisks (***) are output which means that the number cannot be displayed in this format.

4.5.5 I/O field, data type of the field content

Data type	Numeric value
Binary	0
decimal	1
string	2
hexadecimal	3

4.5.6 I/O field, field type

Type	Numeric value
Edition	0
Input	1
Output and input	2

4.5.7 Element alignment in check boxes and radio boxes

Alignment	Numeric value
left	0
right	-1

4.5.8 Color chart

The 16 primary colors are:

Color	Color value (Hex)	symbolic constant
Red	0x000000FF	CO_RED
Dark red	0x00000080	CO_DKRED
Green	0x0000FF00	CO_GREEN
Dark green	0x00008000	CO_DKGREEN
Blue	0x00FF0000	CO_BLUE
Dark blue	0x00800000	CO_DKBLUE
Cyan	0x00FFFF00	CO_CYAN
Dark cyan	0x00808000	CO_DKCYAN
Yellow	0x0000FFFF	CO_YELLOW
Dark yellow	0x00008080	CO_DKYELLOW
Magenta	0x00FF00FF	CO_MAGENTA
Dark magenta	0x00800080	CO_DKMAGENTA
Light gray	0x00C0C0C0	CO_LTGRAY
Gray	0x00808080	CO_DKGRAY
Black	0x00000000	CO_BLACK
White	0x00FFFFFF	CO_WHITE

Note

The symbolic constants are externally predefined by #define and provied by WinCC.

4.5.9 Format descriptors

For format descriptors the following type is expected:

%d = DWORD / Int

%f = double

%s = char*

It is also possible e.g. to read a text tag with %d if provisions are made that the value can be mapped in a DWORD.

The following provision makes sure the value can be mapped:

Variable	Format	C-tag
Bit	%d	DWORD / long int signed
Byte	%d	DWORD / long int signed
SByte	%d	DWORD / long int signed
Word	%d	DWORD / long int signed
SWord	%d	DWORD / long int signed
DWord	%d	DWORD / long int signed
SDWord	%d	DWORD / long int signed
Float	%f	double
Double	%f	double
Char	%s	char*

Note

If a "DWORD," for which the 32nd bit is set, is to be read, a format descriptor must be used for unsigned integers (%u).

4.5.10 Fill pattern

Fill pattern	Value
Transparent	65536
Solid	0

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	1048576		196611		196627
	1048577		196612		196628
	1048578		196613		196629
	1048579		196614		196630
	1048832		196615		196631

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	1048833		196616		196632
	1048834		196617		196633
	1048835		196618		196634
	131072		196619		196635
	131073		196620		196636
	131074		196621		196637
	131075		196622		196638
	131076		196623		196639
	196608		196624		196640
	196609		196625		196641
	196610		196626		196642

Note

The "Solid" fill pattern fills the object with the set background color.

4.5.11 Line styles

Line style	symbolic name	Value
	LS_SOLID	0
	LS_DASH	1
	LS_DOT	2
	LS_DASHDOT	3

Line style	symbolic name	Value
	LS_DASHDOT DOT	4
hidden	LS_INVISIBLE	5

4.5.12 Line end style

Line end	symbolic name	Value for the left line ends	Value for the right line ends
	LE_NO	0	0
	LE_HOLLOW_ARROW	1	65536
	LE_FULL_ARROW	2	131072
	LE_CFULL_ARROW	3	196608
	LE_LINE	4	262144
	LE_HOLLOW_CIRCLE	5	327680
	LE_FULL_CIRCLE	6	393216

Note

From a line width > 5 the line end "empty circle" is displayed as filled circle.

4.5.13 List types

List type	Numeric value
decimal	0
Binary	1
bit	2

4.5.14 Language ID

WinCC only supports the SUBLANG_DEFAULT languages of Windows.

symbolic name	Value (hexadecimal)	Abbreviation
LANG_ARABIC	0x0401	
LANG_AFRIKAANS	0x0436	
LANG_ALBANIAN	0x041C	
LANG_BASQUE	0x042D	
LANG_BULGARIAN	0x0402	
LANG_BYELORUSSIAN	0x0423	
LANG_CATALAN	0x0403	
LANG_CHINESE	0x0404	
LANG_CROATIAN	0x041A	
LANG_CZECH	0x0405	CSY
LANG_DANISH	0x0406	DAN
LANG_DUTCH	0x0413	NLD
LANG_ENGLISH	0x0409	ENU
LANG_ESTONIAN	0x0425	
LANG_FAEROESE	0x0438	
LANG_FARSI	0x0429	
LANG_FINNISH	0x040B	FIN
LANG_FRENCH	0x040C	FRA
LANG_GERMAN	0x0407	DEU
LANG_GREEK	0x0408	
LANG_HEBREW	0x040D	
LANG_HUNGARIAN	0x040E	HUN
LANG_ICELANDIC	0x040F	ISL
LANG_INDONESIAN	0x0421	
LANG_ITALIAN	0x0410	ITA
LANG_JAPANESE	0x0411	
LANG_KOREAN	0x0412	
LANG_LATVIAN	0x0426	
LANG_LITHUANIAN	0x0427	
LANG_NORWEGIAN	0x0414	NOR
LANG_POLISH	0x0415	PLK
LANG_PORTUGUESE	0x0416	PTB
LANG_ROMANIAN	0x0418	
LANG_RUSSIAN	0x0419	RUS
LANG_SLOVAK	0x041B	SKY
LANG_SLOVENIAN	0x0424	
LANG_SORBIAN	0x042E	
LANG_SPANISH	0x040A	ESP

symbolic name	Value (hexadecimal)	Abbreviation
LANG_SWEDISH	0x041D	SVE
LANG_THAI	0x041E	
LANG_TURKISH	0x041F	TRK
LANG_UKRAINIAN	0x0422	

4.5.15 Text alignment

Horizontal	Alignment	Numeric value
	left	0
	centered	1
	right	2

Vertical	Alignment	Numeric value
	Up	0
	centered	1
	bottom	2

4.5.16 Tag statuses

Value (decimal)	Value (hexdecimal)	Meaning
0	0x0000	No error
1	0x0001	Connection to partner not established
2	0x0002	Handshake error
4	0x0004	Network module defective
8	0x0008	Configured upper limit exceeded
16	0x0010	Configured lower limit exceeded
32	0x0020	Format upper limit exceeded
64	0x0040	Format lower limit exceeded
128	0x0080	Conversion error
256	0x0100	Tag initialization value
512	0x0200	Tag replacement value
1024	0x0400	Channel addressing error

Value (decimal)	Value (hexdecimal)	Meaning
2048	0x0800	Tag not found or not available
4096	0x1000	Access to tag not permitted
8192	0x2000	Timeout, no check-back message from the channel
16384	0x4000	Server not available.

4.6 Structure definitions

4.6.1 Structure definition CCAPErrorExecute

```
typedef struct {
DWORD dwCurrentThreadID; Thread ID of the current thread
DWORD dwErrorCode1;      Error code 1
DWORD dwErrorCode2;      Error code 2
BOOL bCycle;             cycle/acycle
char* szApplicationName; Name of the application
char* szFunctionName;    Name of the function
char* szTagName;         Name of the tag
LPVOID lpParam;          Pointer to the action stack
DWORD dwParamSize;       Size of the action stack
DWORD dwCycle;           Cycle of the variable
CMN_ERROR* pError;       Pointer to CMN_ERROR
} CCAPErrorExecute;
```

Members

The meaning of the individual error IDs and the structure elements depending on them are specified in the following table:

dwErrorCode1	dwErrorCode2	bCycle	szApplicationName	szFunctionName	szTagName	lpParamSize	dwParamSize	dwCycle	pError	Description
1007001	0	X	X	X		X	X			Action requires exception
1007001	1	X	X	X		X	X			Exception when accessing the return result
1007001	4097	X	X	X		X	X			Stack overflow while executing the action
1007001	4098	X	X	X		X	X			The action contains a division by 0
1007001	4099	X	X	X		X	X			The action contains an access to a non-existing symbol
1007001	4100	X	X	X		X	X			The action contains an access violation
1007004	0	X	X	X						Function is not known

1007005	1	X	X							Action does not include a P code.
1007005	2	X	X							Incorrect function name
1007005	4	X	X	X		X	X			Return value type is invalid
1007005	32768ff	X	X	X		X	X			Ciss Compiler error when loading the action
1007006	0	X	X	X	X	X	X	X		Tag is not defined
1007006	1	X	X	X	X	X	X	X		Tag timeout
1007006	2	X	X	X	X	X	X	X	X	Tag cannot be returned in the desired format
1007006	3	X	X	X	X	X	X	X	X	Tag returns status violation, status present in CMN_ERROR.dwError1
1007007	1	X	X	X		X	X		X	Error in PDLRTGetProp
1007007	2	X	X	X		X	X		X	Error in PDLRTSetProp
1007007	3	X	X	X		X	X		X	Error with DM call

Error structure

The OnErrorExecute function uses the error structure to evaluate or to output error messages, if marked by an "x" in the pError column.

See also

Structure definition CMN_ERROR (Page 2293)

4.6.2 Structure definition CCAPTime

```
typedef struct {
DWORD dwCurrentThreadID; ThreadID of the current Thread
DWORD dwCode;            Code
BOOL bCycle;             cycle/acycle
char* szApplicationName; Name of the Application
char* szFunctionName;    Name of the Function
LPVOID lpParam;          Pointer to the Action-Stack
DWORD dwParamSize;       size of the Action-Stack
double dblTime;
DWORD dwFlags;           flags
} CCAPTime;
```

Members

dwCode

The structure element dwCode provides information on calling OnTime:

dwCode = 113	Call with time definition for each action
dwCode = 114	Call with time monitoring for each action

dwFlags

The structure element dwFlags provides information on the output type:

dwFlags = TRUE	The results are output to a file
dwFlags = FALSE	The results are output to the diagnostics window

4.6.3 Structure definition CMN_ERROR

```
struct CMNERRORSTRUCT {
DWORD       dwError1,
DWORD       dwError2,
DWORD       dwError3,
DWORD       dwError4,
DWORD       dwError5;
TCHAR       szErrorText[MAX_ERROR_LEN];
}
CMN_ERROR
```

Description

The extended error structure contains the error code and an error text for the error that has occurred. Each application can use the error structure to evaluate or to output error messages.

Members

dwError1 .. dwError5

These entries can be used in any way by the API functions.

The API descriptions inform about the values the respective entries contain in case of an error. If not specified otherwise, the error codes are present in dwError1.

szErrorText

Buffer for the text description of the error cause

The content is determined from the resources and therefore language-dependent.

4.6.4 Structure definition DM_TYPEREF

```
typedef struct {
DWORD dwType;
DWORD dwSize;
char szTypeName[MAX_DM_TYPE_NAME + 1];
}
DM_TYPEREF;
```

Members

dwType

Specifies the tag type

DM_VARTYPE_BIT	Binary tag
DM_VARTYPE_SBYTE	Signed 8-bit value
DM_VARTYPE_BYTE	Unsigned 8-bit value
DM_VARTYPE_SWORD	Signed 16-bit value
DM_VARTYPE_WORD	Unsigned 16-bit value
DM_VARTYPE_SDWORD	Signed 32-bit value
DM_VARTYPE_DWORD	Unsigned 32-bit value
DM_VARTYPE_FLOAT	Floating-point number 32-bit IEEE 754
DM_VARTYPE_DOUBLE	Floating-point number 64-bit IEEE 754
DM_VARTYPE_TEXT_8	Text tag, 8-bit font
DM_VARTYPE_TEXT_16	Text tag, 16-bit font
DM_VARTYPE_RAW	Raw data type
DM_VARTYPE_STRUCT	Structure tag
DM_VARTYPE_TEXTREF	Text reference tag

dwSize

Specifies the length of the data type in bytes.

szTypeName

In the case of structure tags, contains the name of the structure type

4.6.5 Structure definition DM_VAR_UPDATE_STRUCT

```
typedef struct {
DM_TYPEREF dmTypeRef;
DM_VARKEY dmVarKey;
VARIANT dmValue;
DWORD dwState;
}
DM_VAR_UPDATE_STRUCT;
```

Members

dmTypeRef

Contains information on the tag type. For performance reasons, nothing is entered into this structure in case of cyclic requirements.

dmVarKey

Specifies the tags to be edited.

dmValue

Tag value

Upon access to the value of the VARIANT a ".u." has to be inserted between the name of the VARIANT and the name of the member.

```
Example:
// Supply variant
myVariant.vt = VT_I4;
myVariant.u.lVal = 233;
```

A description of the data type VARIANT can be found in the associated documentation. The VARIANT dmValue must be initialized with VariantInit() before first use and enabled again with VariantClear(&dmValue) after use. For this reason, the structure DM_VAR_UPDATE_STRUCT must not be deleted with ZeroMemory() or memset().

dwState

Identifies the tag status.

See also

Tag statuses (Page 2289)

Structure definition DM_VARKEY (Page 2296)

Structure definition DM_TYPEREF (Page 2293)

4.6.6 Structure definition DM_VAR_UPDATE_STRUCTEX

```
typedef struct {
DM_TYPEREF dmTypeRef;
DM_VARKEY dmVarKey;
VARIANT dmValue;
DWORD dwState;
DWORD dwQualityCode;
}
DM_VAR_UPDATE_STRUCTEX;
```

Members

dmTypeRef

Contains information on the tag type. For performance reasons, nothing is entered into this structure in case of cyclic requirements.

dmVarKey

Specifies the tags to be edited.

dmValue

Tag value

Upon access to the value of the VARIANT a ".u." has to be inserted between the name of the VARIANT and the name of the member.

```
Example:
// Supply variant
myVariant.vt = VT_I4;
myVariant.u.lVal = 233;
```

A description of the data type VARIANT can be found in the associated documentation. The VARIANT dmValue must be initialized with VariantInit() before first use and enabled again with VariantClear(&dmValue) after use. For this reason, the structure DM_VAR_UPDATE_STRUCTEX must not be deleted with ZeroMemory() or memset().

dwState

Identifies the tag status.

dwQualityCode

Identifies the tag quality code.

See also

Tag statuses (Page 2289)

Structure definition DM_VARKEY (Page 2296)

Structure definition DM_TYPEREF (Page 2293)

4.6.7 Structure definition DM_VARKEY

```
typedef struct {
DWORD dwKeyType;
DWORD dwID;
char szName[ MAX_DM_VAR_NAME + 1 ];
LPVOID lpvUserData;
}
DM_VARKEY;
```

Members

dwKeyType

Defines whether the tag is to be addressed by a key ID or by its name.

DM_VARKEY_ID Specification via key ID

DM_VARKEY_NAME Specification via tag name

dwID

Contains the key ID of the tags if dwKeyType is set accordingly

szName

Contains the name of the tag if dwKeyType is set accordingly

lpvUserData

Pointer to application-specific data

4.6.8 Structure definition LINKINFO

```
typedef struct {
LINKTYPE LinkType;
DWORD dwCycle;
TCHAR szLinkName[256];
}
LINKINFO;
```

Members

LinkType

LinkType are enumeration constants defined in the "Trigger.h" file. They are to be integrated into your script with the #include "Trigger.h" command and the corresponding enumeration constants.

BUBRT_LT_NOLINK	0	no shortcut
BUBRT_LT_VARIABLE_DIRECT	1	direct tag
BUBRT_LT_VARIABLE_INDIRECT	2	indirect tag
BUBRT_LT_ACTION	3	C action
BUBRT_LT_ACTION_WIZARD	4	Dynamic Dialog
BUB_LT_DIRECT_CONNECTION	5	Direct connection
BUBRT_LT_ACTION_WIZARD_INPROC	6	Dynamic Dialog

For the function SetLink only the enumeration constants BUBRT_LT_VARIABLE_DIRECT and BUBRT_LT_VARIABLE_INDIRECT may be used. The function GetLink allows to return all listed enumeration constants.

dwCycle

Update cycle time

dwCycle	Update Cycle
255	Picture cycle
235	Window Cycle
0	Upon change
1	250ms
2	500 ms
3	1 s
4	2 s
5	5s
6	10s
7	1min
8	5min
9	10min
10	1h
11-15	User cycle 1-5

szLinkName

Tag name

4.6.9 Structure definition MSG_FILTER_STRUCT

```
typedef struct {
CHAR        szFilterName[MSG_MAX_TEXTLEN+1];
WORD        dwFilter;
SYSTEMTIME  st[2];
DWORD       dwMsgNr[2];
DWORD       dwMsgClass;
DWORD       dwMsgType[MSG_MAX_CLASS];
DWORD               dwMsgState;
WORD        wAGNr[2];
WORD        wAGSubNr[2];
DWORD       dwArchivMode;
char        szTB[MSG_MAX_TB][
MSG_MAX_TB_CONTENT+1]
DWORD       dwTB;
Double      dPValue[MSG_MAX_PVALUE][2];
DWORD       dwPValue[2];
DWORD       dwMsgCounter[2];
DWORD       dwQuickSelect;
}
MSG_FILTER_STRUCT;
```

Description

In this structure the filter criteria are specified.

Members

dwFilter

The filter conditions are defined by means of the following constants from the file "m_global.h":

MSG_FILTER_DATE_FROM	Date from
MSG_FILTER_DATE_TO	Date to
MSG_FILTER_TIME_FROM	Time from
MSG_FILTER_TIME_TO	Time to
MSG_FILTER_NR_FROM	Message number from
MSG_FILTER_NR_TO	Message number to
MSG_FILTER_CLASS	Message classes
MSG_FILTER_STATE	Message status
MSG_FILTER_AG_FROM	AS number from
MSG_FILTER_AG_TO	AS number to
MSG_FILTER_AGSUB_FROM	AG subnumber from
MSG_FILTER_AGSUB_TO	AG subnumber to
MSG_FILTER_TEXT	Message texts
MSG_FILTER_PVALUE	Process values

MSG_FILTER_COUNTER_FROM	Internal message counter from
MSG_FILTER_COUNTER_TO	Internal message counter to
MSG_FILTER_PROCESSMSG	Process messages
MSG_FILTER_SYSMSG	System messages
MSG_FILTER_BEDMSG	Operator messages
MSG_FILTER_DATE	Date from to
MSG_FILTER_TIME	Time from to
MSG_FILTER_NR	Message number from to
MSG_FILTER_VISIBLEONLY	Display visible messages
MSG_FILTER_HIDDENONLY	Display hidden messages

st

Date/time from - to

Where st[0] is the start time (from), st[1] the end time (to)

Assign these fields for the filter criteria: MSG_FILTER_DATE, MSG_FILTER_DATE_FROM, MSG_FILTER_DATE_TO, MSG_FILTER_TIME, MSG_FILTER_TIME_FROM or MSG_FILTER_TIME_TO

If a current time is needed for the transfer of a SYSTEMTIME parameter the function GetLocalTime is to be used instead of GetSystemTime. As a rule there is a significant time difference between these two functions.

dwMsgNr

Message number from - to

Where dwMsgNr[0] is the start no. (from), dwMsgNr[1] the end no. (to)

Assign these fields for the filter criteria: MSG_FILTER_NR, MSG_FILTER_NR_FROM or MSG_FILTER_NR_TO

dwMsgClass

Message classes bit-coded.

Assign this field for the filter criterion: MSG_FILTER_CLASS

dwMsgType

Message type per message class, bit-coded

Assign this field for the filter criterion: MSG_FILTER_CLASS

dwMsgState

Message status bit-coded.

Assign this field for the filter criterion: MSG_FILTER_STATE

wAGNr

AGNr from - to

Assign these fields for the filter criteria: MSG_FILTER_AG_FROM or MSG_FILTER_AG_TO

wAGSubNr

AGSubNr from - to

Assign this field for the filter criteria: MSG_FILTER_AGSUB_FROM or MSG_FILTER_AGSUB_TO

dwArchivMode

Archiving / logging

Must be assigned 0.

szTB

Texts of the text blocks

Assign these fields for the filter criterion: MSG_FILTER_TEXT

dwTB

Active text blocks (from - to, bit-coded)

Assign this field for the filter criterion: MSG_FILTER_TEXT

dPValue

Process values from - to

Assign these fields for the filter criterion: MSG_FILTER_PVALUE

dwPValue

Active process values (from - to, bit-coded)

Assign this field for the filter criterion: MSG_FILTER_PVALUE

dwMsgCounter

Internal message counter from - to

Assign these fields for the filter criteria: MSG_FILTER_COUNTER_FROM, MSG_FILTER_COUNTER_TO

dwQuickSelect

Quick selection for hour, day, month

The parameter is reserved for future upgrades and must be preset to 0.

Assign this field for the filter criterion: MSG_FILTER_QUICKSELECT

LOWORD type:

MSG_FILTER_QUICK_MONTH	Quick selection last n months
MSG_FILTER_QUICK_DAYS	Quick selection last n days
MSG_FILTER_QUICK_HOUR	Quick selection last n hours

HIWORD number: 1...n

The end time of the quick selection refers to the current system time of the local computer. The start time is calucalted back n * (months, days, hours).

4.6.10 Structure definition MSG_RTDATA_STRUCT

```
typedef struct {
DWORD                dwMsgState;
DWORD                dwMsgNr;
SYSTEMTIME           stMsgTime;
DWORD                dwTimeDiff;
DWORD                dwCounter;
DWORD                dwFlags;
WORD                 wPValueUsed;
WORD                 wTextValueUsed;
double               dPValue[MSG_MAX_PVALUE];
MSG_TEXTVAL_STRUCT   mtTextValue[MSG_MAX_PVALUE];
}
MSG_RTDATA_STRUCT;
```

Members

dwMsgState

Message status

MSG_STATE_COME	0x00000001	Message came in
MSG_STATE_GO	0x00000002	Message went out
MSG_STATE_QUIT	0x00000003	Message acknowledged
MSG_STATE_LOCK	0x00000004	Message locked
MSG_STATE_UNLOCK	0x00000005	Message unlocked
MSG_STATE_QUIT_SYSTEM	0x00000010	Message acknowledged by system
MSG_STATE_QUIT_EMERGENCY	0x00000011	Emergency acknowledgement
MSG_STATE_QUIT_HORN	0x00000012	Horn acknowledgement
MSG_STATE_COMEGO	0x00000013	Message came in and went out, only display in message list
MSG_STATE_UPDATE	0x00010000	Bit for message update
MSG_STATE_RESET	0x00020000	Bit for message reset
MSG_STATE_SUMTIME	0x00040000	Bit active for daylight savings time
MSG_STATE_INSTANCE	0x00080000	Bit for instance message (n messages of a no.)

dwMsgNr

Message number

stMsgTime

Date/Time: Telegram time depending on the calling function

dwTimeDiff

Duration coming/Telegram time in seconds

dwCounter

Internal message counter

dwFlags

Message flags in the database

MSG_FLAG_SUMTIME	0x00000001	Daylight savings time active
MSG_FLAG_COMMENT	0x00000002	Message has comments
MSG_FLAG_ARCHIV	0x00000004	Archiving
MSG_FLAG_PROTOCOL	0x00000008	Logging
MSG_FLAG_TEXTVALUES	0x00000010	Message has values accompanying the text
MSG_FLAG_TIMEINVALID	0x00000020	Bit for invalid date/time stamp
MSG_FLAG_INSTANCE	0x00000040	Instance message identification (185269)

wPValueUsed

Process values used, bit-coded. Every bit may only be set in one of the two structure elements "wPValueUsed" or "wTextValueUsed". An accompanying value may either be a number or a text.

wTextValueUsed

text values used, bit-coded. Every bit may only be set in one of the two structure elements "wPValueUsed" or "wTextValueUsed". An accompanying value may either be a number or a text.

VBA for Automated Configuration

5

5.1 Automated configuration

Contents

You can use VBA to automate configuration in Graphics Designer. This comprises:

- Adaptation of the Graphics Designer
- Editing of pictures
- Editing of objects
- Dynamizing with VBA
- Access to external applications

A VBA editor is available for this purpose in the "Graphics Designer" editor.

This chapter contains

- a brief introduction on how to use VBA in WinCC,
- basic information on using VBA in Graphics Designer and
- reference to the VBA object model in Graphics Designer.

5.2 Introduction: Using VBA in WinCC

5.2.1 Introduction: Using VBA in WinCC

Introduction

You have a VBA editor available in Graphics Designer which allows you to configure pictures automatically. The VBA editor is identical to the one from the products in the Microsoft Office family. You can make direct use of your VBA programming experience.

Principle

With VBA you extend the functionality of the Graphics Designer and automate configuring. You may use VBA in Graphics Designer as follows, including:

- Creating user-defined menus and toolbars
- Creating and editing Standard, Smart and Windows objects
- Adding dynamics to properties of pictures and objects
- Configuring actions in pictures and objects
- Accessing products that support VBA (e.g. products in the MS Office family)

A description of the VBA object model for the Graphics Designer is provided in this documentation in the section under "VBA Reference".

VBA Reference (Page 3126)

VBA in the Graphics Designer (Page 3017)

Executing VBA Macros in Graphics Designer (Page 3015)

Differentiation: Using VBA (Page 3010)

5.2.2 Differentiation: Using VBA

Introduction

You can use VBA exclusively for configuration and functional enhancement in the Graphics Designer. The following indicates where there are better options available for efficient configuration or where VBA cannot be used.

VB and C Scripts

VB and C scripts are active only at runtime and are used to dynamize picture and object properties as well as in action configuration.

Dynamic Wizards

The dynamic wizards are not replaced by VBA. However, VBA allows you to enhance the functionality of the dynamic wizards with ease.

ODK

ODK comprises function calls that enable access to all the functionality of WinCC both in the configuration system and in runtime. In contrast to ODK, VBA offers simple object-oriented access to the objects of the Graphics Designer.

Executing VBA Macros in Graphics Designer (Page 3015)

Organizing VBA Code in a WinCC Project (Page 3011)

Introduction: Using VBA in WinCC (Page 3008)

5.2.3 Organizing VBA Code in a WinCC Project

Introduction

You organize the VBA code for your WinCC project in the VBA editor. This is where you specify whether the VBA code is to be available in only one picture, in the entire project or in all projects. Depending on where you place the VBA code, the term used to refer to the code is:

- global VBA code,
- project-specific VBA code or
- picture-specific VBA code.

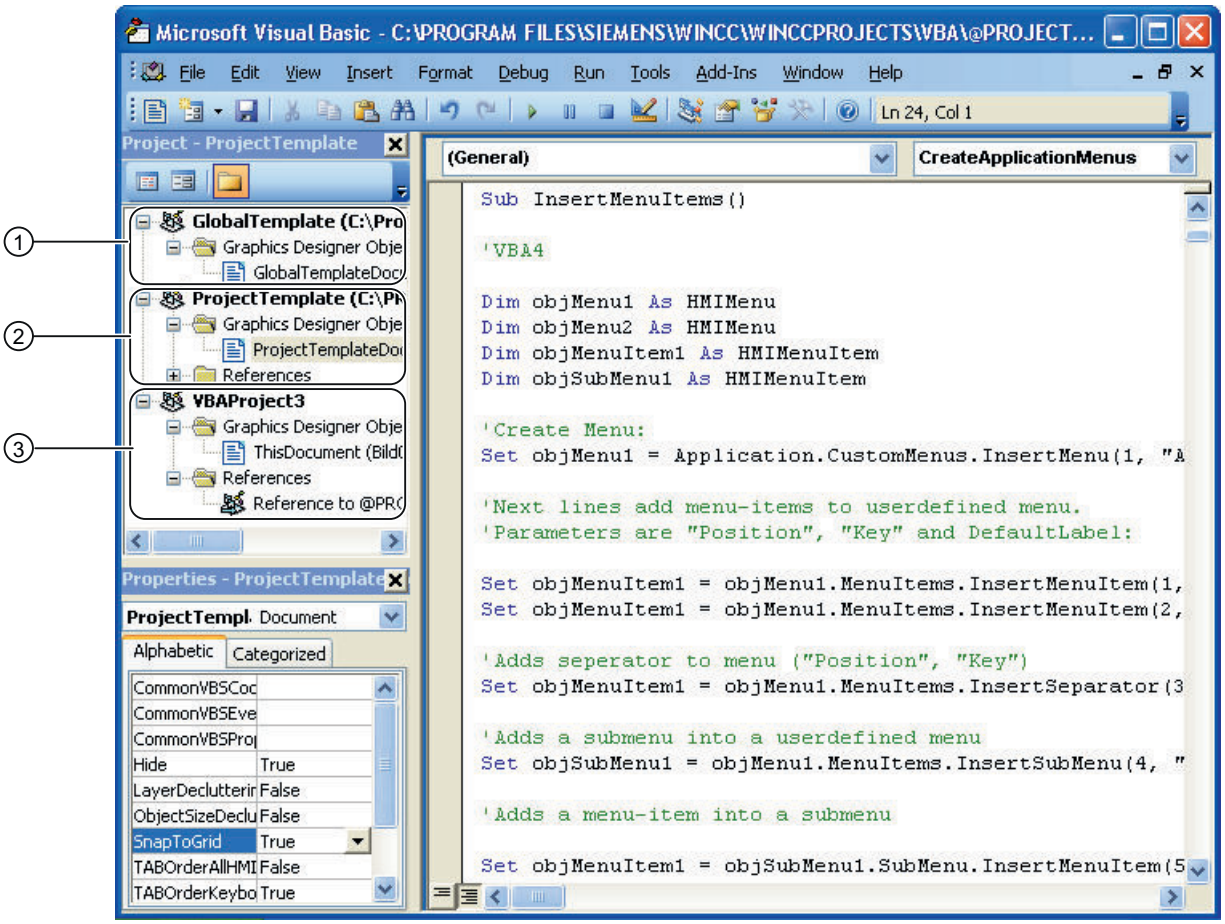
Note

A picture in the Graphics Designer is known as a "document" in the VBA object model.

The VBA editor

To start the VBA editor in the Graphics Designer, press <ALT+F11> or choose "Tools" > "Macros" > "Visual Basic Editor". If you have not yet opened a picture in the Graphics Designer, you can only edit the global or project-specific VBA code.

The global and project-specific data and all open pictures are displayed in the VBA editor's Project Explorer:



Global VBA code (1)

Refers to VBA code that you write to the "GlobalTemplateDocument" in the VBA editor. This VBA code is saved in the "@GLOBAL.PDT" file, which is located in the WinCC installation directory.

The VBA code that you put in the "GlobalTemplateDocument" is the code that you want to be made available in all WinCC projects on your computer. If you need the VBA code on a different computer, use the export and import functions in the VBA editor.

A WinCC computer uses only the @GLOBAL.PDT stored locally in the WinCC installation directory (…\Siemens\WinCC\Templates).

Note

When you perform an update installation, your global "@Global.pdt" template is saved in the "@Global.sav" backup file. The backup file is saved in the …\Siemens\WinCC\Templates directory. Your VBA code from the old global template is not automatically applied to the new global template.

Applying the VBA Code from the Old Global Template:

In order to apply the VBA code from the old template after an update installation, proceed as follows:

1. If you have already entered VBA code into the new global template, open the VBA editor in the Graphics Designer and copy the VBA code.
2. Close WinCC.
3. Open the …\Siemens\WinCC\Templates directory in Windows Explorer.
4. Delete the new global template "@Global.pdt".
5. Rename the "@Global.sav" backup file to "@Global.pdt".
6. If you have already copied VBA code from the new global template, open the VBA editor in the Graphics Designer and insert the copied VBA code.

The VBA code from your old global template is available again.

Project-specific VBA code (2)

Refers to VBA code that you write to the "ProjectTemplateDocument" in the VBA editor. This VBA code is saved in the @"PROJECT.PDT" file, which is located in the root directory of each WinCC project.

The "@PROJECT.PDT" file has a reference to the "@GLOBAL.PDT" file. Functions and procedures which you have saved in the "@GLOBAL.PDT" file can be called up directly in the "ProjectTemplateDocument".

The "ProjectTemplateDocument" is where you put VBA code that you want to use in all pictures in the open project. If you need the VBA code on a different computer, use the export and import functions in the VBA editor.

You can open and edit the "@PROJECT.PDT" file in the same way as a PDL file. This will allow you to use the "@PROJECT.PDT" file as a template: For example, you may create there the basic picture of your system which will then be automatically transferred into each new PDL file of the project. Picture properties such as layers or zoom are not copied to the PDL file, nor is the VBA code.

Picture-specific VBA code (3)

Refers to VBA code that you write to the document "This Document" relating to the corresponding picture in the VBA editor. This VBA code is saved as a PDL file together with the picture.

The PDL file has a reference to the "@PROJECT.PDT" file. Functions and procedures which you have saved in the "@PROJECT.PDT" file can be called up directly from the PDL file. However, you do not have access to functions or procedures that are stored in the "@GLOBAL.PDT" file.

Note

You can create modules, class modules and user forms in each document.

You can protect the VBA code of a module against unauthorized access by setting a password. To do this, select the "Tools" > "VBAObject Properties" menu item in the VBA editor.

Special features during the execution of VBA macros

For the execution of VBA macros, the following applies: Initially picture-specific VBA code is executed, followed by project-specific VBA code. If therefore you call a VBA macro that is contained for example both in the picture and in the project-specific VBA code, only the VBA macro from the picture is executed. This has the effect of preventing VBA macros and functions from being executed twice, which otherwise can lead to errors.

In connection with event handling the forwarding of events is activated by default. You can prevent events from being forwarded if you want to respond to an event in the picture-specific VBA code only.

Additional information on this topic is given under "Event Handling".

Testing with the Debugger

You can test your VB scripts at runtime with the VBA editor's debugger. You may find additional information in the help system of the VBA editor.

Executing VBA Macros in Graphics Designer (Page 3015)

How to export and import VBA code (Page 3014)

5.2.4 How to export and import VBA code

Principle

In the VBA editor you can import and export VBA code, enabling you to transfer it to another computer. References to procedures and functions which you call within the project are therefore retained.

Note

When you import VBA code you must enter references to external libraries manually after the import process, on the target computer.

Procedure

Exporting VBA code

1. In the VBA editor's Project Explorer, select the module, whose VBA code you want to export.
2. Choose the "File" > "Export File menu command".

3. Select the path and enter the file name.
4. Click "Save".

The VBA code is exported to a file. The file type depends on the module from which the VBA code was exported.

Importing VBA code

1. In the VBA editor's Project Explorer, select the document into which you want to import the VBA code.
2. Choose the menu option "File" > "Import File".
3. Select the file and click "Open" in order to import the VBA code as "ThisDocument" into the "Class Modules" folder.
4. In the "Class Modules" folder, open the document "ThisDocument" and copy the VBA code into the document in the required project.

Organizing VBA Code in a WinCC Project (Page 3009)

5.2.5 Executing VBA Macros in Graphics Designer

Introduction

Three possibilities are available to you for executing VBA macros in the Graphics Designer:

- Event Handling
- User-defined menu or toolbar
- VBA editor

Event Handling

Predefined events (such as the opening of a picture) can occur in the Graphics Designer, the active picture or the component library, to which you can respond with VBA event handlers. These events occur only during configuring in the Graphics Designer and have nothing to do with the events of action configuring.

In this example, a brief message is to be issued when a picture is opened. The "Opened event" is used for this:

```
Private Sub Document_Opened(CancelForwarding As Boolean)
MsgBox ("Picture was opened!")
End Sub
```

Further information on the subject of event handling is provided under "Event handling" and "Events".

User-defined menu or toolbar

VBA allows you to create user-defined menus and toolbars in the Graphics Designer. You can assign a VBA macro to each user-defined menu entry or icon; this macro is then executed when you click on the menu entry or the icon. This way you can extend the functionality of the Graphics Designer to suit your requirements.

Further information on the creation of user-defined menus and toolbars is provided under "Creating your own menus and toolbars".

VBA editor

You can start a VBA macro in the VBA editor by pressing <F5>. If you press <F8>, you can execute a VBA macro step by step.

5.3 VBA in the Graphics Designer

5.3.1 VBA in the Graphics Designer

Introduction

You use VBA in the Graphics Designer in order to automate frequently recurring steps during configuring. You can create user-defined menus and toolbars in order to make it easier to execute the VBA macros that you have created.

Basically, in the Graphics Designer you can replace all configuring work that you would otherwise perform with the mouse with VBA macros. This applies in particular to the GUI (layers and zoom) and the editing of objects in pictures including dynamics.

Adapting the Graphics Designer with VBA

The Graphics Designer is represented by the Application object in VBA. With VBA you can carry out configuring in the Graphics Designer in several languages, create user-defined menus and toolbars and access the component library.

Editing Pictures with VBA

A picture in the Graphics Designer is represented by the Document object.

With VBA you can access the properties of the picture and edit settings for layers and the zoom factors. As well as this you can create picture-specific menus and toolbars. These are only visible, however, for as long as the picture is active.

Editing Objects with VBA

An object in the picture is represented by the HMIObject object. With VBA you can create and delete objects and access the object properties. For example, with VBA you can very quickly create a large number of objects with identical properties for your plant display.

Creating Dynamics with VBA

VBA enables you to add dynamics to properties and events of pictures and objects.

Event Handling

With VBA you can respond to events that occur in the Graphics Designer or in a picture, for example when you insert a new object into a picture. You use event handling in order to execute VBA macros in certain program situations.

Access to external applications

You can use VBA to access programs which support VBA, for example products in the Microsoft Office family. This means that you have an opportunity to read values from an Excel table and then assign them to object properties.

Note

Access to applications that were compiled with .net

You need to recompile applications that were compiled with .net to enable access to VBA in Graphics Designer.

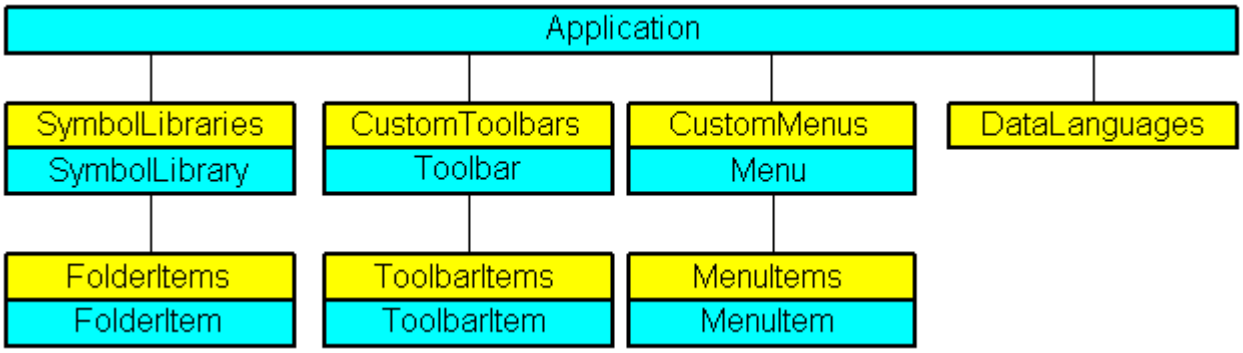
Introduction: Using VBA in WinCC (Page 3008)

5.3.2 Adapting the Graphics Designer with VBA

5.3.2.1 Adapting the Graphics Designer with VBA

Introduction

In VBA the Application object represents the Graphics Designer:



Access to the component library

VBA gives you full access to the component library. You can extend the component library with VBA by for example creating and deleting folders or copying objects and inserting them into a picture.

User-defined menus and toolbars

You can create user-defined menus and toolbars in order to execute VBA macros in the Graphics Designer. In this way you can extend the functionality of the Graphics Designer to suit your particular requirements.

Language-dependent configuring

With VBA you can carry out configuring in the Graphics Designer in more than one language. You therefore have access to the language-dependent object properties and you can create the user-defined menus and toolbars in different languages.

See also

Editing Pictures with VBA (Page 3049)

Accessing the component library with VBA (Page 3042)

Creating Customized Menus and Toolbars (Page 3023)

Language-Dependent Configuration with VBA (Page 3020)

VBA in the Graphics Designer (Page 3015)

5.3.2.2 Language-Dependent Configuration with VBA

Introduction

With VBA you can carry out configuring in the Graphics Designer for several different languages. This gives you access to the language-dependent properties of objects in the Graphics Designer, while you can also make the user-defined menus and toolbars available in different languages. In VBA, foreign-language texts are stored in a list of the "LanguageTexts" type. The settings for language-dependent fonts are stored in a list of the "LanguageFonts" type.

Further information about language-dependent configuring is also provided in the WinCC documentation "Setting up multilingual projects".

User interface language

You can only switch to a different desktop language in WinCC, not with VBA. When you switch desktop language in WinCC, the "DesktopLanguageChanged" event is triggered. You can adapt the user-defined menus and toolbars to suit the user, for example, by replacing language-dependent tool icons.

The following objects and the associated language-dependent properties react to the switching of the user interface language:

- FolderItem Object
- Menu object and MenuItem object
- ToolbarItem Object
- Further information about the desktop language is provided in the WinCC documentation "Setting up multilingual projects" under "Language terms in WinCC".

As of WinCC V7.3, VBA is installed in all languages that you have selected in the WinCC setup. When you open the "VBA" editor in the Graphics Designer, the "VBA" editor opens in the same user interface language as the Graphics Designer.

Project language

You can change the configuring language with VBA using the "CurrentDataLanguage" property.

In this example the configuring language is changed to "English":

```
Sub ChangeCurrentDataLanguage()
'VBA1
Application.CurrentDataLanguage = 1033
MsgBox "The Data language has been changed to english"
Application.CurrentDataLanguage = 1031
MsgBox "The Data language has been changed to german"
End Sub
```

All language-dependent properties, such as ToolTipText, are affected by the change.

Configuring for more than one language in VBA

There are two possible ways for you to carry out configuring for several languages with VBA.

- Language switching: Text properties of objects.
- Text language lists: Text properties of user-defined menus and toolbars, and objects.

Language change

You can change the language-dependent properties (e.g., "Text") of objects with VBA. To do this, assign the text to the corresponding property and then change the configuring language in order to assign the text in the other language.

LanguageTexts listing

You can save the multilingual texts for the respective object directly in the associated listing of the "LanguageTexts" type. To do this, enter the language ID for the language and the associated text.

The list of language codes is available in the WinCC documentation (Index > Language Code).

In this example a German label and an English label are assigned to the button "myButton":

```
Sub AddLanguagesToButton()
'VBA2
Dim objLabelText As HMILanguageText
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
'
'Set defaultlabel:
objButton.Text = "Default-Text"
'
'Add english label:
Set objLabelText = objButton.LDTexts.Add(1033, "English Text")
'Add german label:
Set objLabelText = objButton.LDTexts.Add(1031, "German Text")
End Sub
```

How to create menus in multiple languages (Page 3029)

VBA Reference (Page 3126)

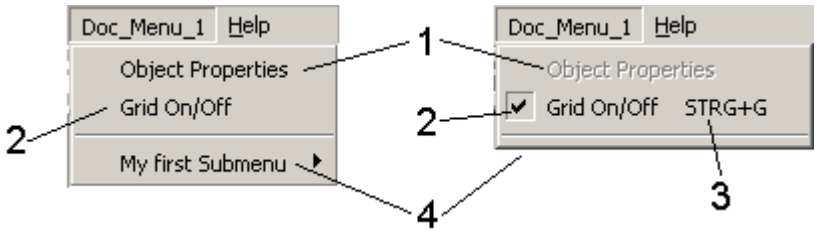
5.3.2.3 Creating Customized Menus and Toolbars

Configuring Menus and Toolbars

Introduction

You can "liven up" user-defined menus and toolbars so that they respond to certain program situations in the Graphics Designer. For example, if an icon is not available because no object is selected, you can gray out the icon. A check mark before a menu item can indicate, for example, whether a selection is activated.

The following illustration shows you the configuration possibilities, using the example of a user-defined menu:



Active (yes/no) (1)

Activates the entry or dims it. You can use the "Enabled" property for user-defined menus, menu items and icons:

```
'VBA13
Application.ActiveDocument.CustomMenus(1).MenuItems(1).Enabled = False
```

Marked with check mark (yes/no) (2)

Marks the menu item with a check mark. You can only use the "Checked" property for user-defined menu items:

```
'VBA14
Application.ActiveDocument.CustomMenus(1).MenuItems(2).Checked = True
```

Shortcut (3)

Defines a key combination for a menu item or an icon. You can only use the "Shortcut" property for user-defined menu items and icons:

```
'VBA15
Application.ActiveDocument.CustomMenus(1).MenuItems(3).Shortcut = "Ctrl+G"
```

Visible (yes/no) (4)

Displays or hides the item. You can use the "Visible" property for user-defined menus, menu items and toolbars and for their icons:

```
'VBA16
Application.ActiveDocument.CustomMenus(1).MenuItems(4).Visible = False
```

Creating Customized Menus and Toolbars

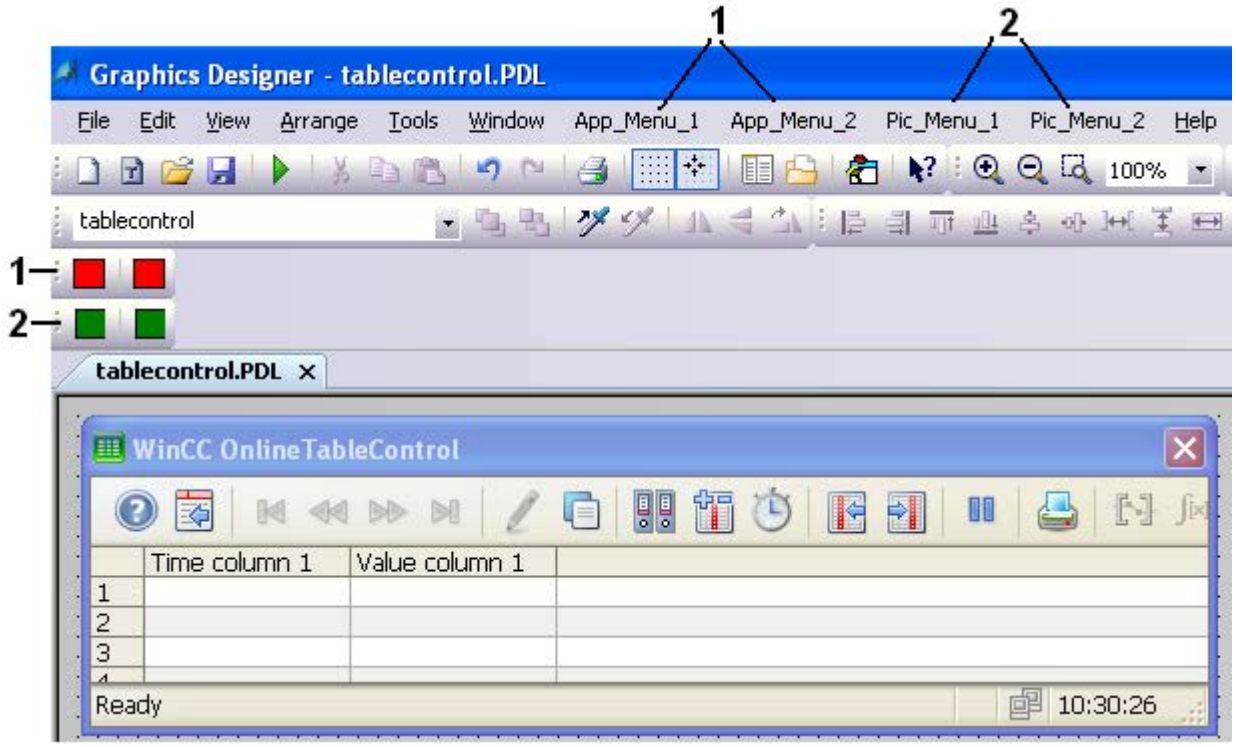
User-defined menus and toolbars in the Graphics Designer

You can use the following user-defined menus and toolbars in the Graphics Designer to run VBA macros:

- User-defined menus and toolbars are always visible when the Graphics Designer is open. You should use application-specific menus and toolbars when the VBA macros that are to be executed from them have to be accessible at all times.
- Picture-specific menus and toolbars are linked to a specific picture and remain visible for as long as the picture is active. You should use picture-specific menus and toolbars when the VBA macros used there are relevant only for that particular picture.

Positioning of user-defined menus and toolbars

In the case of user-defined menus, the "Position" parameter determines the final positioning in the menu bar:



Application-specific menus (1) are always positioned to the right of the "Windows" menu in the Graphics Designer, while picture-specific menus (2) are always positioned to the left of the "Help" menu in the Graphics Designer.

However, application-specific toolbars are not treated as "preferred". In this case, the positioning is determined by the order in which you insert the toolbars. Toolbars are positioned below the Graphics Designer toolbar.

Properties of user-defined menus and toolbars

In the case of user-defined menus and toolbars you can use hyphens to divide entries, for example according to certain categories. As well as this you can also create submenus in a user-defined menu.

The following configuration options are available to you for user-defined menus and toolbars and their entries:

- Visible (yes/no): Displays or hides the item (visible property).
- Active (yes/no): Activates the entry or dims it (enabled property).
- Marked with check mark (yes/no) - only available for menu command (Checked property).
- Shortcut: Key combination for calling a menu command (ShortCut property).

- Statustext: Text that is displayed in the status bar (StatusText property).
- Tooltip text - only available for an icon (ToolTipText property).

You can hide a menu command, for example, if the macro cannot be executed at a certain time. In this way you can prevent inadvertent wrong operation.

You can create all texts and labels of user-defined menus and toolbars in multiple languages so that the user-defined menus and toolbars can also react to a language change.

How to Create a New Application-Specific Menu (Page 3025)

Configuring Menus and Toolbars (Page 3020)

Executing VBA Macros in Graphics Designer (Page 3013)

How to Create a New Application-Specific Menu

Introduction

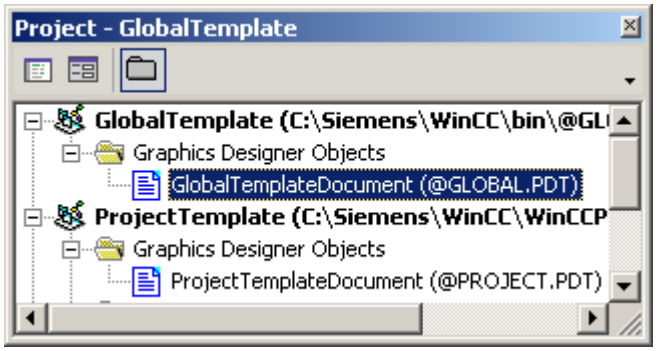
Application-specific menus remain visible even when all pictures in Graphics Designer are closed. You can use the Started event, for example, in order to insert an application-specific menu at an early stage.

Position the VBA code either

- in the "GlobalTemplateDocument" if you want the menu to be available in all projects, or
- in the "ProjectTemplateDocument" if you want the menu to be available in the current project.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



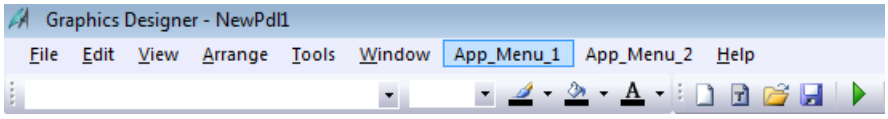
3. To create a user-defined menu in the Graphics Designer, you can for example insert a "CreateApplicationMenus()" procedure in the document. In this example, two user-defined menus are created:

```
Sub CreateApplicationMenus()
'VBA3
'Declaration of menus...:
Dim objMenu1 As HMIMenu
Dim objMenu2 As HMIMenu
'
'Add menus. Parameters are "Position", "Key" und "DefaultLabel":
Set objMenu1 = Application.CustomMenus.InsertMenu(1, "AppMenu1",
"App_Menu_1")
Set objMenu2 = Application.CustomMenus.InsertMenu(2, "AppMenu2",
"App_Menu_2")
End Sub
```

4. Start the procedure with <F5>.

Result

The two menus "App_Menu_1" and "App_Menu_2" are inserted to the right of the "Window" menu:



See also

Creating Customized Menus and Toolbars (Page 3021)

InsertMenu Method (Page 3227)

How to assign VBA macros to menus and toolbars (Page 3038)

How to assign help texts to menus and toolbars (Page 3035)

How to create menus in multiple languages (Page 3029)
How to add a new menu entry to a menu (Page 3027)
Configuring Menus and Toolbars (Page 3020)
Organizing VBA Code in a WinCC Project (Page 3009)

How to add a new menu entry to a menu

Requirements

You must have created the user-defined menu first.

Introduction

You can insert three different types of menu items in the user-defined menu:

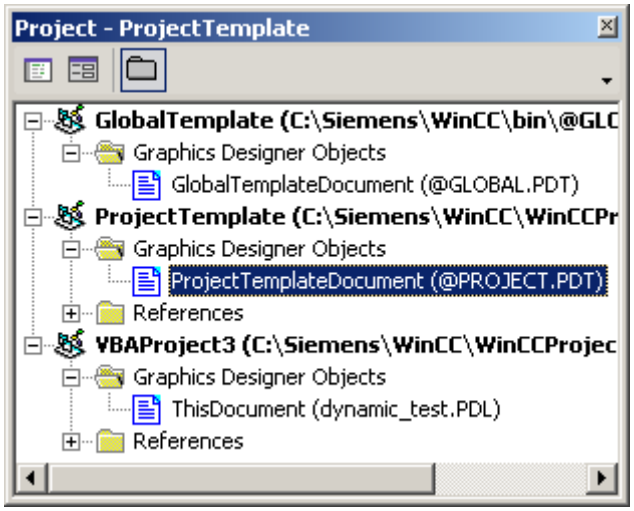
- Menu entry: To call VBA macros.
- Separator line: For clearer design of user-defined menu.
- Submenu: Same as user-defined menu (e.g. command structuring).

The "Position" parameter determines the order of the menu items within the user-defined menu.

The "Key" parameter is a unique identification of the menu item. This parameter is used if you use the "MenuItemClicked" event for calling VBA macros.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To create menu items in a previously created user-defined menu, you can for example insert an "InsertMenuItems()" procedure in the document. In this example a number of menu items are created in the user-defined menu "App_Menu_1":

```
Sub InsertMenuItems()
'VBA4
Dim objMenu1 As HMIMenu
Dim objMenu2 As HMIMenu
Dim objMenuItem1 As HMIMenuItem
Dim objSubMenu1 As HMIMenuItem
'Create Menu:
Set objMenu1 = Application.CustomMenus.InsertMenu(1, "AppMenu1",
"App_Menu_1")
'Next lines add menu-items to userdefined menu.
'Parameters are "Position", "Key" and DefaultLabel:
Set objMenuItem1 = objMenu1.MenuItems.InsertMenuItem(1,
"mItem1_1", "App_MenuItem_1")
Set objMenuItem1 = objMenu1.MenuItems.InsertMenuItem(2,
"mItem1_2", "App_MenuItem_2")
'
'Adds seperator to menu ("Position", "Key")
Set objMenuItem1 = objMenu1.MenuItems.InsertSeparator(3,
"mItem1_3")
'
'Adds a submenu into a userdefined menu
Set objSubMenu1 = objMenu1.MenuItems.InsertSubMenu(4, "mItem1_4",
"App_SubMenu_1")
'
'Adds a menu-item into a submenu
Set objMenuItem1 = objSubMenu1.SubMenu.InsertMenuItem(5,
"mItem1_5", "App_SubMenuItem_1")
Set objMenuItem1 = objSubMenu1.SubMenu.InsertMenuItem(6,
"mItem1_6", "App_SubMenuItem_2")
End Sub
```

4. Start the procedure with <F5>.

Result

The "InsertMenuItems()" procedure inserts the menu "App_Menu_1" with these menu items:

How to Create a New Application-Specific Menu (Page 3023)

Configuring Menus and Toolbars (Page 3020)

Creating Customized Menus and Toolbars (Page 3021)

How to create menus in multiple languages

Introduction

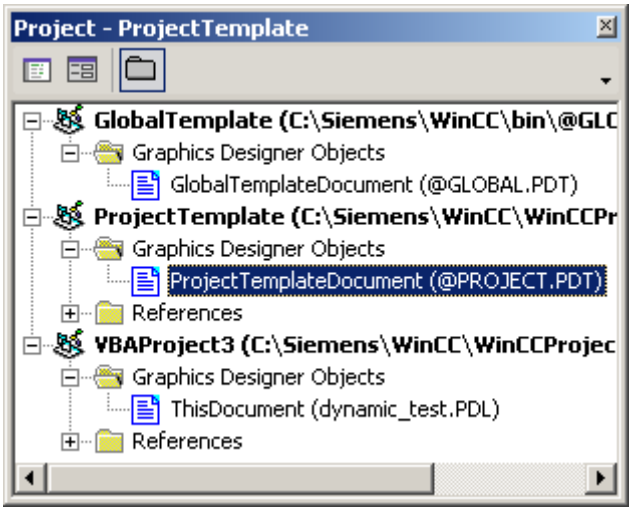
You can create a user-defined menu that responds to a change of language. To do this you need to define the necessary number of labels in other languages for the menu and for each menu item.

The foreign-language label comprises the language ID (LCID) and the foreign-language text (DisplayName).

The list of language codes is available in the WinCC documentation (Index > Language Code).

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To define multilingual labels for a user-defined menu, you can for example insert a "MultipleLanguagesForAppMenu1()" procedure in the document. In this example English labels are defined for the "App_Menu_1" menu:

```
Sub InsertMenuItems()
'VBA5
'Execute this procedure first
Dim objMenu1 As HMIMenu
Dim objMenu2 As HMIMenu
Dim objMenuItem1 As HMIMenuItem
Dim objSubMenu1 As HMIMenuItem
'Insert Menu:
Set objMenu1 = Application.CustomMenus.InsertMenu(1, "AppMenu1",
"App_Menu_1")
'Next lines inserts menu-items to userdefined menu.
'parameters are "Position", "Key" and DefaultLabel:
Set objMenuItem1 = objMenu1.MenuItems.InsertMenuItem(1,
"mItem1_1", "App_MenuItem_1")
Set objMenuItem1 = objMenu1.MenuItems.InsertMenuItem(2,
"mItem1_2", "App_MenuItem_2")
'
'Inserts seperator into menu ("Position", "Key")
Set objMenuItem1 = objMenu1.MenuItems.InsertSeparator(3,
"mItem1_3")
'
'Inserts a submenu into a userdefined menu
Set objSubMenu1 = objMenu1.MenuItems.InsertSubMenu(4, "mItem1_4",
"App_SubMenu_1")
'
'Inserts a menu-item into a submenu
Set objMenuItem1 = objSubMenu1.SubMenu.InsertMenuItem(5,
"mItem1_5", "App_SubMenuItem_1")
Set objMenuItem1 = objSubMenu1.SubMenu.InsertMenuItem(6,
"mItem1_6", "App_SubMenuItem_2")
End Sub
Sub MultipleLanguagesForAppMenu1()
'   execute this procedure after "InsertMenuItems()" was run
'Object "objLanguageTextMenu1" contains the
'foreign-language labels for the menu
Dim objLanguageTextMenu1 As HMILanguageText
'
'Object "objLanguageTextMenu1Item" contains the
'foreign-language labels for the menu-items
Dim objLanguageTextMenuItem1 As HMILanguageText
Dim objMenu1 As HMIMenu
Dim objSubMenu1 As HMIMenuItem
Set objMenu1 = Application.CustomMenus("AppMenu1")
Set objSubMenu1 =
Application.CustomMenus("AppMenu1").MenuItems("mItem1_4")
'
'Inserts foreign-language label into a menu:
'("Add(LCID, DisplayName)" method:
```

```
Set objLanguageTextMenu1 = objMenu1.LDLabelTexts.Add(1033,
"English_App_Menu_1")
'
'Inserts foreign-language label into a menuitem:
Set objLanguageTextMenuItem1 =
objMenu1.MenuItems("mItem1_1").LDLabelTexts.Add(1033, "My first
menu item")
'
'Adds a foreign-language label into a submenu:
Set objLanguageTextMenuItem1 =
objSubMenu1.SubMenu.Item("mItem1_5").LDLabelTexts.Add(1033, "My
first submenu item")
End Sub
```

4. Start the procedure with <F5>.

Result

If you now switch the configuring language to English, certain items in the user-defined menu are shown in English.

Configuring Menus and Toolbars (Page 3020)

Creating Customized Menus and Toolbars (Page 3021)

Language-Dependent Configuration with VBA (Page 3018)

How to Create an Application-specific Toolbar

Introduction

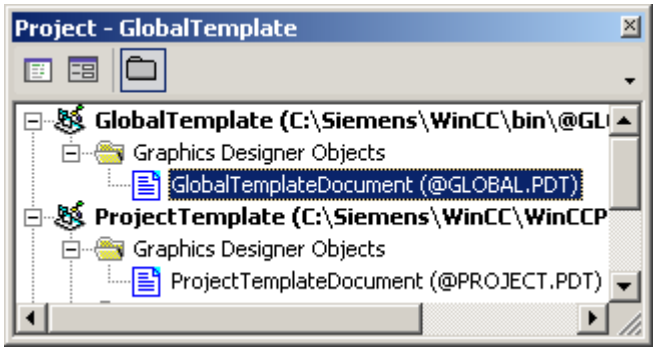
Application-specific toolbars remain visible even when all pictures in the Graphics Designer are closed.

Position the VBA code either

- in the "GlobalTemplateDocument" if you want the toolbar to be available in all projects, or
- in the "ProjectTemplateDocument" if you want the toolbar to be available in the current project.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To create a user-defined toolbar in the Graphics Designer, you can for example insert a "CreateApplicationToolbars()" procedure in the document. In this example two user-defined toolbars are created:

```
Sub CreateApplicationToolbars()
'VBA6
'Declare toolbar-objects...:
Dim objToolbar1 As HMIToolbar
Dim objToolbar2 As HMIToolbar
'
'Add the toolbars with parameter "Key"
Set objToolbar1 = Application.CustomToolbars.Add("AppToolbar1")
Set objToolbar2 = Application.CustomToolbars.Add("AppToolbar2")
End Sub
```

4. Start the procedure with <F5>.

Result

The two toolbars are inserted beneath the Graphics Designer toolbars.

How to Add a New Icon to the Toolbar (Page 3033)

Configuring Menus and Toolbars (Page 3020)

Creating Customized Menus and Toolbars (Page 3021)

How to Add a New Icon to the Toolbar

Requirement

You must have created the user-defined toolbar first.

Introduction

You can insert two different types of objects in the user-defined toolbar:

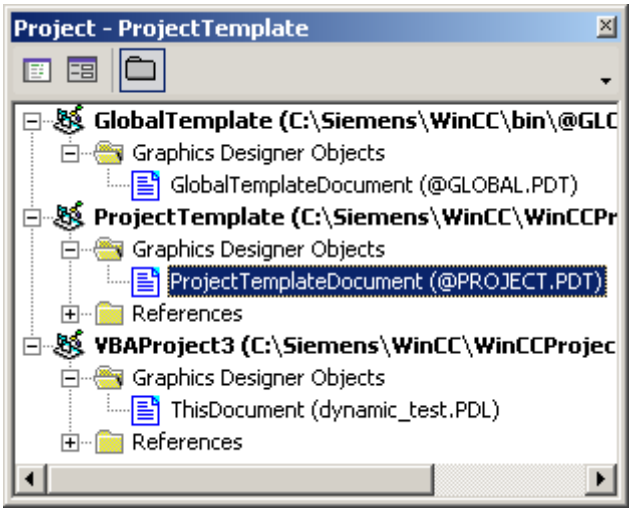
- Symbol: To call VBA macros.
- Separator line: For clearer design of user-defined toolbars.

The "Position" parameter determines the order of the icons within the user-defined toolbar.

The "Key" parameter is a unique identification of the icon. This parameter is used if you use the "ToolbarItemClicked" event for calling VBA macros.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



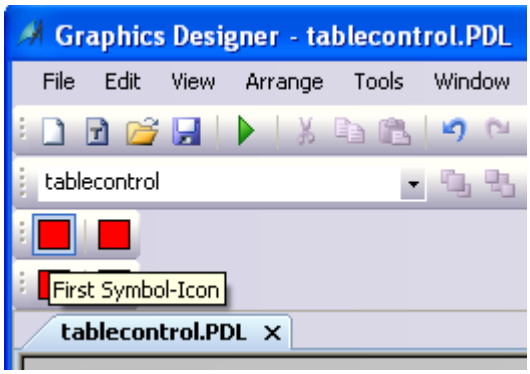
3. To create icons in a previously created user-defined toolbar, you can for example insert an "InsertToolbarItems()" procedure in the document. In this example, two icons separated by a separator line are created in the user-defined toolbar "AppToolbar1":

```
Sub InsertToolbarItems()
'VBA7
Dim objToolbar1 As HMIToolbar
Dim objToolbarItem1 As HMIToolbarItem
'
'Add a new toolbar:
Set objToolbar1 = Application.CustomToolbars.Add("AppToolbar1")
'Adds two toolbar-items to the toolbar
'("InsertToolbarItem(Position, Key, DefaultToolTipText)"-Methode):
Set objToolbarItem1 =
objToolbar1.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "First
Symbol-Icon")
Set objToolbarItem1 =
objToolbar1.ToolbarItems.InsertToolbarItem(3, "tItem1_2", "Second
Symbol-Icon")
'
'Adds a seperator between the two toolbar-items
'("InsertSeparator(Position, Key)"-Methode):
Set objToolbarItem1 = objToolbar1.ToolbarItems.InsertSeparator(2,
"tSeparator1_3")
End Sub
```

4. Start the procedure with <F5>.

Result

The "InsertToolbarItems()" procedure adds a toolbar with two icons, separated by a dividing line, to the Graphics Designer toolbars:



Note

Use the icon property in order to specify a graphic (*.ICO format) for a tool icon.

How to Create an Application-specific Toolbar (Page 3029)

Configuring Menus and Toolbars (Page 3020)

How to assign help texts to menus and toolbars

Requirements

You must have created the user-defined menu or the user-defined toolbar first.

Introduction

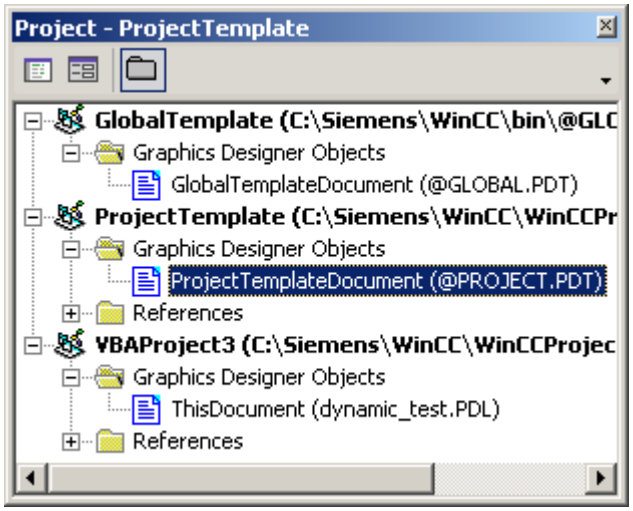
When the configuring engineer moves the mouse over a user-defined menu item or over a user-defined icon, you can provide additional help text to explain the functionality in more detail:

- You can define a help text for user-defined menu items and icons; the help text is displayed in the status bar.
- For user-defined icons, the default option is to create the help text as a tooltip.

You can also define status texts and tooltip texts for other languages.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To assign a status text to a user-defined menu item, you can for example insert an "AddStatusTextsToAppMenu1()" procedure in the document. In this example one status text in German and one in English is assigned to the first menu item in the previously created "AppMenu1" menu:

```
Sub AddStatusTextsToAppMenu1()
'VBA8
Dim objMenu1 As HMIMenu
'
'Object "objStatusTextMenuItem1" contains foreign-language texts
Dim objStatusTextMenuItem1 As HMILanguageText
Set objMenu1 = Application.CustomMenus("AppMenu1")
'
'Assign a statustext to a menuitem:
objMenu1.MenuItems("mItem1_1").StatusText = "Statustext the first
menuitem"
'
'Assign a foreign statustext to a menuitem:
Set objStatusTextMenuItem1 =
objMenu1.MenuItems("mItem1_1").LDStatusTexts.Add(1033, "This is
my first status text in English")
End Sub
```

4. To assign status and foreign-language tool tip text to a user-defined icon on the toolbar, insert a "AddStatusAndTooltipTextsToAppToolbar1()" procedure in the document, for example. In this example, the first icon on the toolbar created is assigned a status text (German/English) and an English tool tip text:

```
Sub AddStatusAndTooltipTextsToAppToolbar1()
'VBA9
Dim objToolbar1 As HMIToolbar
'
'Variable "StatusTextToolbarItem1" for foreign statustexts
Dim objStatusTextToolbarItem1 As HMILanguageText
'
'Variable "TooltipTextToolbarItem1 for foreign tooltiptexts
Dim objTooltipTextToolbarItem1 As HMILanguageText
Set objToolbar1 = Application.CustomToolbars("AppToolbar1")
'
'Assign a statustext to a toolbaritem:
objToolbar1.ToolbarItems("tItem1_1").StatusText = "Statustext für
das erste Symbol-Icon"
'
'Assign a foreign statustext to a toolbaritem:
Set objStatusTextToolbarItem1 =
objToolbar1.ToolbarItems("tItem1_1").LDStatusTexts.Add(1033,
"This is my first status text in English")
'
'Assign a foreign tooltiptext to a toolbaritem:
Set objTooltipTextToolbarItem1 =
objToolbar1.ToolbarItems("tItem1_1").LDTooltipTexts.Add(1033,
"This is my first tooltip text in English")
End Sub
```

5. Start the procedure with <F5>.

Results

The status text is displayed when you move the mouse pointer over the user-defined menu item or the icon.

Configuring Menus and Toolbars (Page 3020)

Creating Customized Menus and Toolbars (Page 3021)

How to assign VBA macros to menus and toolbars

Introduction

There are two possible ways for you to assign VBA macros to user-defined menus and toolbars:

- You can use either the VBA event handlers "MenuItemClicked" and "ToolbarItemClicked" or
- "Macro" property.

Note

You will find the VBA code for creating the required user-defined menus and toolbars in this documentation under "Adding a New Menu Item to a Menu" and "Adding a New Icon to a Toolbar".

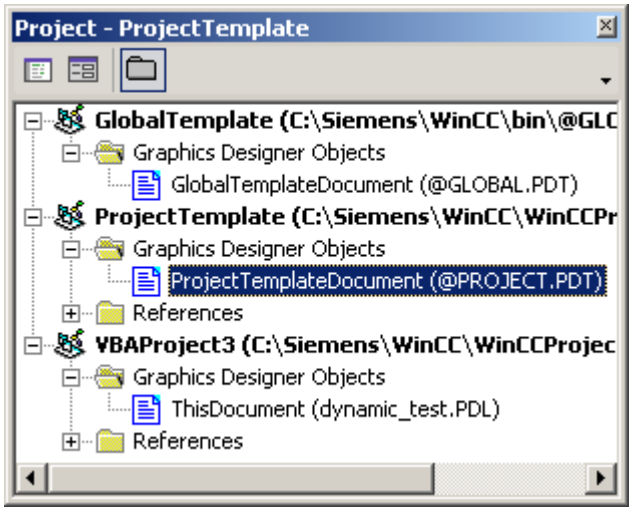
Procedure

Assigning a VBA macro with a VBA event handler

Note

You will find further information on VBA event handlers in this documentation under "Event Handling".

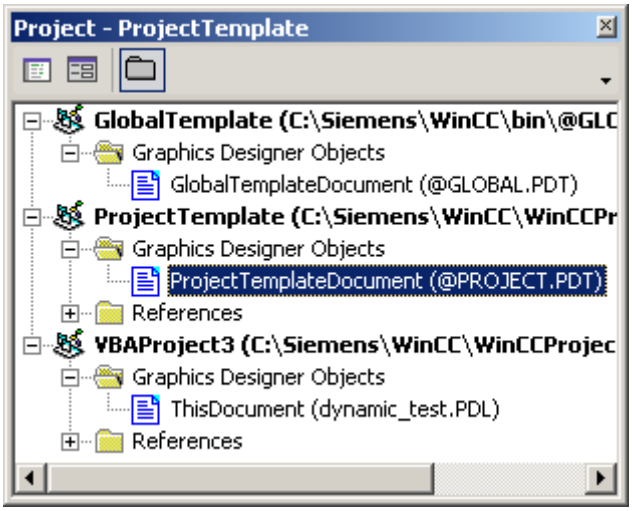
1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To start a VBA macro via the VBA event handlers, use the "MenuItemClicked" or "ToolbarItemClicked" event:
4. Insert the VBA code from the "VBA10" table.
5. Start the procedure with <F5>.

Assigning a VBA Macro using the "Macro" property

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To start a VBA macro via the Macro property, assign the VBA macro to each menu item or icon. In the following example, a user-defined menu with two menu entries is created, which retrieve two different VBA macros:
   The VBA code of the following VBA11 example depends on the file type. The VBA code is added as an example for a PDL and a PDT file. Both cases can be distinguished in the following manner:
   - PDL file:
     The VBA code in a PDL file is only executed when this PDL file is being displayed.
   - PDT file:
     The VBA code in a PDT file is always executed when the Graphics Designer is open.
4. Insert the VBA code from the "VBA11" table. Sample code for PDL file or "VBA821: Sample code for PDT file".
   You can call the following two procedures via the menu items in the user-defined menu "DocMenu1":
5. Insert the VBA code from the "VBA12" table.
6. Start the procedure with <F5>.

The following tables show the VBA codes for the example:

Start VBA via event handler (VBA10)

```
Option Explicit
'VBA10
'The next declaration has to be placed in the module section
Dim WithEvents theApp As grafexe.Application
```

```
Private Sub SetApplication()
'This procedure has to be executed (with "F5") first
Set theApp = grafexe.Application
End Sub

Private Sub theApp_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
Dim objClicked As HMIMenuItem
Dim varMenuItemKey As Variant
Set objClicked = MenuItem
'
'"varMenuItemKey" contains the value of parameter "Key"
'from clicked menu-item
varMenuItemKey = objClicked.Key
Select Case varMenuItemKey
Case "mItem1_1"
MsgBox "The first menuitem was clicked!"
End Select
End Sub

Private Sub theApp_ToolbarItemClicked(ByVal ToolbarItem As IHMIToolbarItem)
Dim objClicked As HMIToolbarItem
Dim varToolbarItemKey As Variant
Set objClicked = ToolbarItem
'
'"varToolbarItemKey" contains the value of parameter "Key"
'from clicked toolbar-item
varToolbarItemKey = objClicked.Key
Select Case varToolbarItemKey
Case "tItem1_1"
MsgBox "The first symbol-icon was clicked!"
End Select
End Sub
```

Creating a menu (VBA11: Sample code for PDL file)

```
Sub CreateDocumentMenusUsingMacroProperty()
'VBA11
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1",
"Doc_Menu_1")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1",
"First Menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2",
"Second Menuitem")
'
'Assign a VBA-macro to every menu item
With ActiveDocument.CustomMenus("DocMenu1")
.MenuItems("dmItem1_1").Macro = "TestMacro1"
.MenuItems("dmItem1_2").Macro = "TestMacro2"
End With
End Sub
```

Creating a menu (VBA821: Sample code for PDT file)

```
Sub CreateDocumentMenusUsingMacroProperty()
'VBA821
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Set objDocMenu = Application.CustomMenus.InsertMenu(1, "DocMenu1",
"Doc_Menu_1")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1",
"First Menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2",
"Second Menuitem")
'
'Assign a VBA-macro to every menu item
With Application.CustomMenus("DocMenu1")
.MenuItems("dmItem1_1").Macro = "TestMacro1"
.MenuItems("dmItem1_2").Macro = "TestMacro2"
End With
End Sub
```

Macros for user-defined menu entries (VBA12)

```
Sub TestMacro1()
'VBA12
MsgBox "TestMacro1 was executed"
End Sub

Sub TestMacro2()
MsgBox "TestMacro2 was executed"
End Sub
```

5.3.2.4 Accessing the component library with VBA

Accessing the component library with VBA

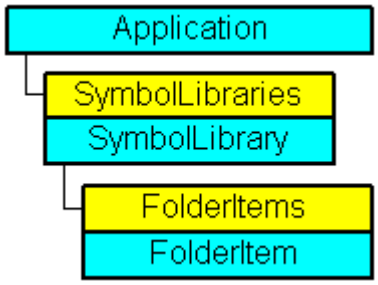
Introduction

The component library contains a large selection of ready-made objects which you can use to design your screens efficiently. The component library consists of a global library and a project-related library:

- The "Global Library" contains prepared objects that are supplied with WinCC. The objects are filed in folders, sorted according to subjects, such as valves, motors, cables and many others.
- The "Project Library" contains neither objects nor folders when you have created a new project. You can create objects which you need only in this particular project in the "Project Library".

VBA gives you full access to the component library: You can create and delete folders and save objects in the component library or insert them into pictures.

Access to the component library with VBA



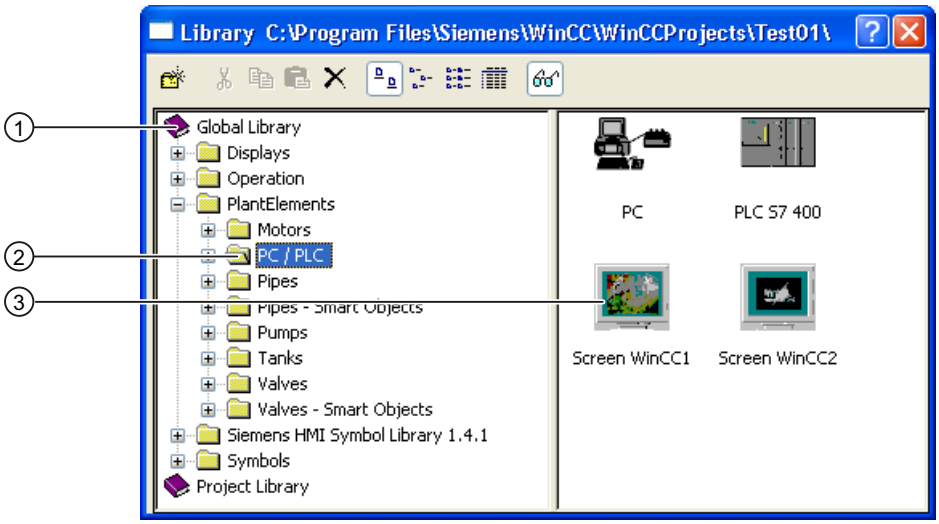
The component library is represented in VBA by the "SymbolLibraries" listing. The listing contains two elements, which represent the "Global Library" and the "Project Library". The "FolderItems" listing contains elements, which represent folders as well as objects.

Note

To address an object in the "SymbolLibraries" listing you use either the index number or the internal name.

You can find out the internal name by clicking the right mouse button on the relevant object in the component library and then choosing the "Copy path" command in the pop-up menu.

The path to the object within the component library is then copied to the clipboard.



Global Library (1)

The "Global Library" is the first element in the SymbolLibraries listing, which you address using index number "1". You address the "Project Library" using index number "2".

Access to the "Global Library" with VBA:

```
'VBA17
Application.SymbolLibraries(1)
```

Folder (2)

A folder in the component library contains either other folders or the objects of a particular subject area. In VBA a folder corresponds to the "FolderItem" object and its type is "Folder". The folders are contained in the "FolderItems" listing. With VBA you can create a new folder or delete an existing one, and add an object to the folder via the clipboard.

Access to the "Plant Components" folder with VBA:

```
'VBA18
Application.SymbolLibraries(1).FolderItems("Folder2")
```

Object (3)

In VBA an object corresponds to the "FolderItem" object and its type is "Item". The objects are contained in the "Folder" listing. With VBA you can delete an object or copy it to the clipboard.

Access to the "PC" object with VBA:

```
'VBA19
Application.SymbolLibraries(1).FolderItems("Folder2").Folder("Folder2").Folder.Item("Objec
t1").DisplayName
```

Creating or deleting folders in the component library

Use the following methods to create or delete folders:

- "AddFolder(DefaultName)" Method: Creates a new folder in the components library. A newly created folder receives the internal name "FolderX", where "X" stands for a consecutive number.
- "Delete()" Method: Deletes an existing folder (including all folders and objects that it contains) from the component library.

Inserting or deleting an object in the component library

You can copy objects within the component library (for example from the "Global Library" to the "Project Library"), insert an object from a picture into the component library or delete an object from the component library:

- Methoden "CopyToClipboard()" und "AddFromClipboard()": Copies an object to the clipboard within the component library.
- "AddItem(DefaultName, pHMIObject)" method: Copies an existing object in the picture into a folder in the component library.
- "Delete()" Method: Deletes an object.

Finding an object or folder in the component library

Use the "FindByDisplayName("DisplayName") method to search for an object or folder. The specified display name is dependent on which language is currently set. The search ends with the first occurrence of the object or folder that you are looking for.

Inserting an object into a picture from the component library

Use the "CopyToClipboard()" and "PasteClipboard()" methods to insert an object from the component library into the current picture.

SymbolLibraries Object (Listing) (Page 3441)

How to paste an object from the object library into a picture with VBA (Page 3047)

How to edit the component library with VBA (Page 3045)

How to edit the component library with VBA

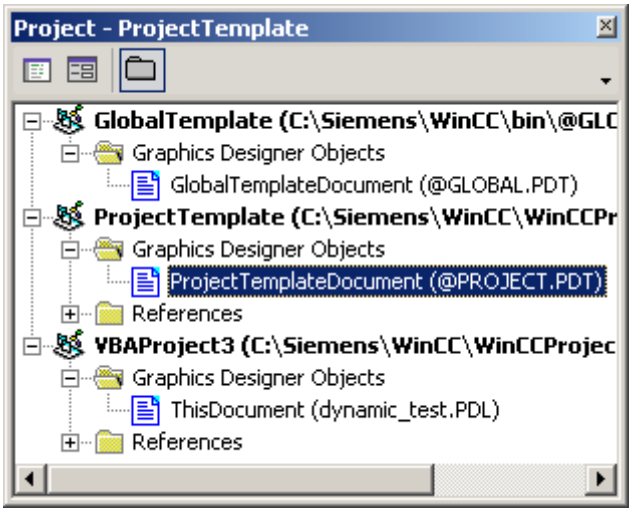
Introduction

Here you will find the following instructions for editing the component library with VBA:

- Creating a new folder
- Copying an object within the component library
- Copying an object from the active picture into the component library
- Deleting an object from the component library

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To create a new folder in the component library, you can for example insert an "AddNewFolderToProjectLibrary()" procedure in the document. In this example the folder "My folder" is created:

```
Sub AddNewFolderToProjectLibrary()
'VBA20
Dim objProjectLib As HMISymbolLibrary
Set objProjectLib = Application.SymbolLibraries(2)
'
'("AddFolder(DefaultName)"-Methode):
objProjectLib.FolderItems.AddFolder ("Custom Folder")
End Sub
```

4. In order to copy an object from the "global library" to the "library project", insert a "CopyObjectFromGlobalLibraryToProjectLibrary()" procedure in the document, for example. In this example, the object "Object1" is copied:

```
Sub CopyObjectFromGlobalLibraryToProjectLibrary()
'VBA21
Dim objGlobalLib As HMISymbolLibrary
Dim objProjectLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
Set objProjectLib = Application.SymbolLibraries(2)
'
'Copies object "PC" from the "Global Library" into the clipboard
objGlobalLib.FolderItems("Folder2").Folder("Folder2").Folder.Item(
"Object1").CopyToClipboard
'
'The folder "Custom Folder" has to be available
objProjectLib.FolderItems("Folder1").Folder.AddFromClipBoard
("Copy of PC/PLC")
End Sub
```

5. In order to copy an object from the active picture to the "Project Library", insert a procedure like "AddObjectFromPictureToProjectLibrary()" into document. In this example, the object "Circle1" is created in the active picture and then copied to the folder "Folder1":

```
Sub AddObjectFromPictureToProjectLibrary()
'VBA22
Dim objProjectLib As HMISymbolLibrary
Dim objCircle As HMICircle
Set objProjectLib = Application.SymbolLibraries(2)
'
'Insert new object "Circle1"
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1",
"HMICircle")
'
'The folder "Custom Folder" has to be available
'("AddItem(DefaultName, pHMIObject)"-Methode):
objProjectLib.FolderItems("Folder1").Folder.AddItem "ProjectLib
Circle", ActiveDocument.HMIObjects("Circle1")
End Sub
```

6. To delete an object from the component library, insert a "DeleteObjectFromProjectLibrary()" procedure in the document, for example. In this example the previously created folder "Folder1" is deleted:

```
Sub DeleteObjectFromProjectLibrary()
'VBA23
Dim objProjectLib As HMISymbolLibrary
Set objProjectLib = Application.SymbolLibraries(2)
'
'The folder "Custom Folder" has to be available
"Delete" Method:
objProjectLib.FolderItems("Folder1").Delete
End Sub
```

7. Start the procedure with <F5>.

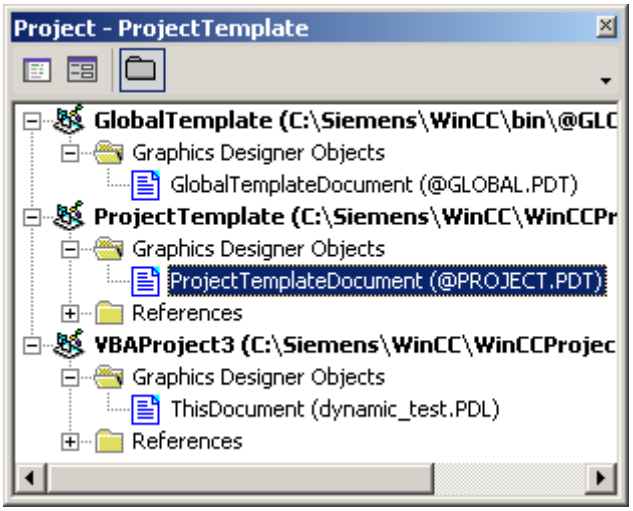
How to paste an object from the object library into a picture with VBA

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To insert an object from the "Global Library" into the active picture, you can for example insert a "CopyObjectFromGlobalLibraryToActiveDocument()" procedure in the document. In this example the object "Object1" is inserted

```
Sub CopyObjectFromGlobalLibraryToActiveDocument()
'VBA24
Dim objGlobalLib As HMISymbolLibrary
Dim objHMIObject As HMIObject
Dim iLastObject As Integer
Set objGlobalLib = Application.SymbolLibraries(1)
'
'Copy object "PC" from "Global Library" to clipboard
objGlobalLib.FolderItems("Folder2").Folder("Folder2").Folder.Item(
"Object1").CopyToClipboard
'
'Get object from clipboard and add it to active document
ActiveDocument.PasteClipboard
'
'Get last inserted object
iLastObject = ActiveDocument.HMIObjects.Count
Set objHMIObject = ActiveDocument.HMIObjects(iLastObject)
'
'Set position of the object:
With objHMIObject
.Left = 40
.Top = 40
End With
End Sub
```

4. Start the procedure with <F5>.

CopyToClipboard Method (Page 3203)

How to edit the component library with VBA (Page 3043)

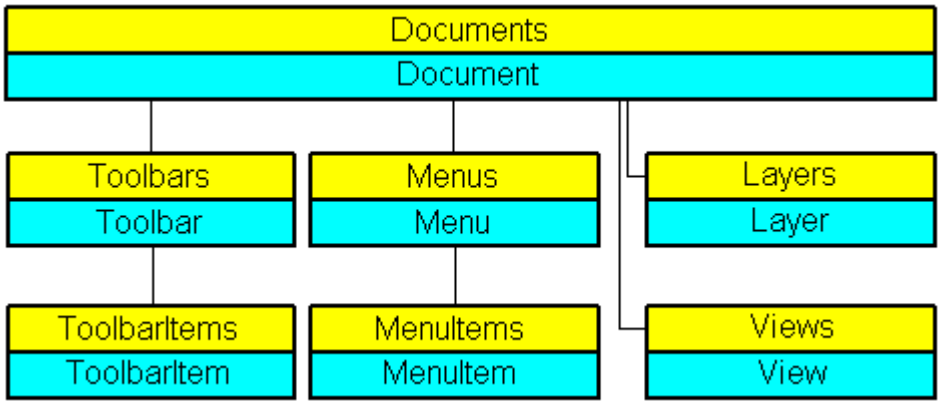
Accessing the component library with VBA (Page 3040)

5.3.3 Editing Pictures with VBA

5.3.3.1 Editing Pictures with VBA

Introduction

Pictures visualize the process to be executed and observed. They display the important process steps or plant parts and present the production process in a schematic manner. In VBA the picture is represented by the Document object.



Picture-specific menus and toolbars

In contrast with the application-specific menus and toolbars, the picture-specific menus and toolbars are coupled to a specific picture. The picture-specific menus and toolbars remain visible for as long as the picture is active.

You should use picture-specific menus and toolbars when the called VBA macros are only used in that picture.

Layers

You can access the layers in the Graphics Designer with VBA. Each layer is represented by the Layer object. By changing the properties of the Layer object you can specify among other things the layer names and the zoom settings.

You control the visibility of the RT layers via the Document object. You control the visibility of the CS layers via the View object.

Copies of the picture

You can create copies of a picture with VBA in order to display different views of a picture. The copy of a picture is represented in VBA by the View object.

In the properties of the View object you can among other things set the zoom factor and specify which picture section is to be displayed.

Note

If you want to run VBA code in a picture saved in WinCC V7.0 SP1 under WinCC V7.0, you need to deactivate the "CCHMIDotNetObj 1.0 Type Library" in the VBA Editor under "Tools > References".

The VBA program will then be executed within the usual functional scope of WinCC V7.0. In this case, you cannot use the new functions of WinCC V7.0 SP1.

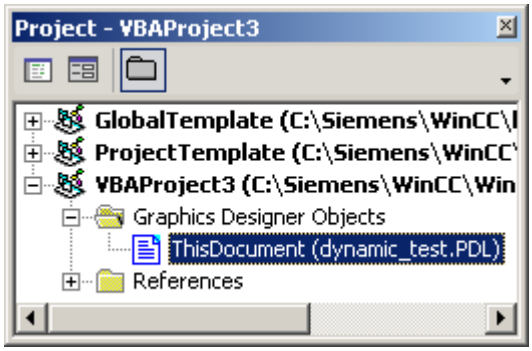
5.3.3.2 How to Create Picture-specific Menus and Toolbars

Introduction

Picture-specific menus and toolbars are linked to a specific picture and remain visible for as long as the You should use picture-specific menus and toolbars when the VBA macros used there are relevant only for that particular picture.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor").
2. Open the document "ThisDocument" in the Project Explorer:



3. To create a picture-specific menu, you can for example insert a "CreateDocumentMenus()" procedure in the document "ThisDocument":

```
Sub CreateDocumentMenus()
'VBA25
'Declare menuobjects:
Dim objMenu1 As HMIMenu
Dim objMenu2 As HMIMenu
'Insert Menus ("InsertMenu"-Methode) with
'Parameters - "Position", "Key", "DefaultLabel":
Set objMenu1 = ActiveDocument.CustomMenus.InsertMenu(1,
"DocMenu1", "Doc_Menu_1")
Set objMenu2 = ActiveDocument.CustomMenus.InsertMenu(2,
"DocMenu2", "Doc_Menu_2")
End Sub
```

4. In order to create a picture-specific toolbar, insert a procedure like "CreateDocumentToolbars()" into the document "ThisDocument":

```
Sub CreateDocumentToolbars()
'VBA26
'Declare required number of toolbarobjects:
Dim objToolbar1 As HMIToolbar
Dim objToolbar2 As HMIToolbar
'
'Insert toolbars ("Add"-Methode) with
'Parameter - "Key":
Set objToolbar1 = ActiveDocument.CustomToolbars.Add("DocToolbar1")
Set objToolbar2 = ActiveDocument.CustomToolbars.Add("DocToolbar2")
End Sub
```

5. Always start the procedure with <F5>.

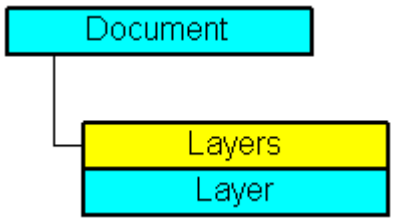
5.3.3.3 Editing Layers with VBA

Introduction

You can arrange objects in 32 layers in the Graphics Designer. The layers are differentiated according to CS layers and RT layers so that the visibility of the layers in the picture (CS) and in runtime (RT) can be controlled separately. In VBA a layer is represented by the Layer object:



In the Graphics Designer the lowest layer is "Layer 0". To give back the lowest layer with VBA, use the index "1":

```
ActiveDocument.Layers(1)
```

Using the Layer object

You use the Layer object in order to specify the minimum and maximum zoom for a layer and to assign a name. In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer
'VBA27
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'Configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
End Sub
```

Controlling the visibility of CS and RT layers

You control the visibility of the CS layers via the View object. Use the Document object in order to determine which layers are to be displayed or hidden in runtime. You can control the visibility of the CS and RT layers with the following methods:

- Methode "IsCSLayerVisible(Index)": Checks whether the specified CS layer is displayed.
- Methode "SetCSLayerVisible(Index, Val)": Shows or hides the specified CS layer.

Use the IsRTLayerVisible and SetRTLayerVisible methods for the RT layers in the same way.

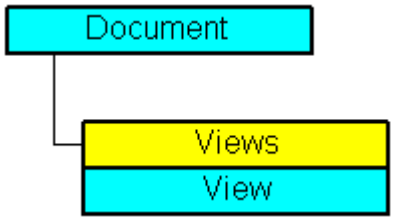
5.3.3.4 Editing a Copy of a Picture with VBA

Introduction

You can create copies of a picture with VBA in order to display different views of a picture. Each view is shown in a separate window. The copy of a picture is represented in VBA by the View object:



In the properties of the View object you can among other things set the zoom factor and specify which picture section is to be displayed.

Creating a copy of a picture

Use the Add method to create a copy of the specified picture. In this example a copy of the active picture is created and activated:

```
Sub CreateAndActivateView()
'VBA28
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

Editing a copy of a picture

You can edit each copy of a screen as follows:

- Adjust zoom factor: Use the zoom property.
- Specify picture zoom area: Specify the picture section: use the "ScrollPosX" and "ScrollPosY" properties to specify the picture zoom area using the scroll bars.
- Showing and Hiding CS layers: You can use the SetCSLayerVisible(Index) method for example to show or hide the specified layer. You can select the layer on which you want to edit the objects with the ActiveLayer property.

In the following example a copy of the active picture is created and activated. The zoom factor is set to 150% and the position of the scrollbars is changed:

```
Sub SetZoomAndScrollPositionInActiveView()
'VBA29
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
With objView
.Activate
.ScrollPosX = 40
.ScrollPosY = 10
.Zoom = 150
End With
End Sub
```

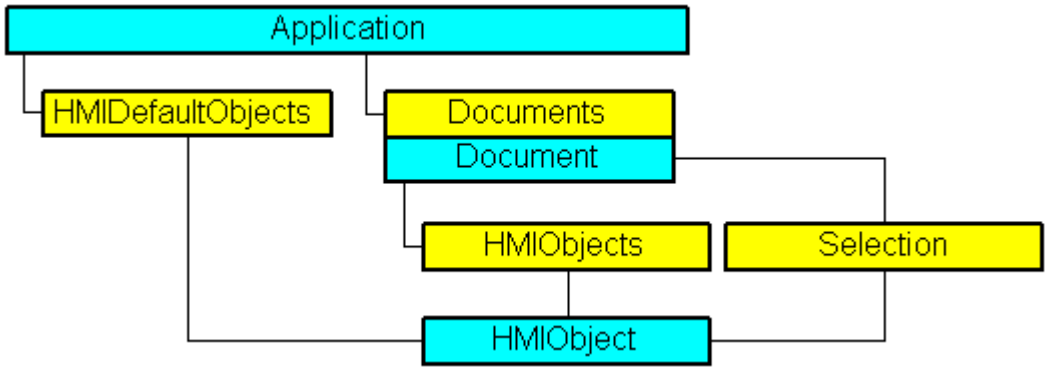
5.3.4 Editing Objects with VBA

5.3.4.1 Editing Objects with VBA

Access to objects in the Graphics Designer



In VBA all object types of the current picture are contained in the "HMIObjects" listing. They are not divided according to object type (Standard, Smart, Windows and Controls objects) as in the Graphics Designer. With VBA you can therefore run through all objects in one or more pictures with a loop.

When you have selected objects in the picture, these objects are contained in the "Selection" listing. Use the "HMIDefaultObjects" listing if you want to change the default settings of the properties of an object.

To address an object in a picture with VBA, use either the object name, e.g. "ActiveDocument.HMIObjects("Circle1"), or the index number. " ActiveDocument.HMIObjects(1)" references for example the first object in the active picture.

Editing objects with VBA

You have the following possibilities for editing objects with VBA:

- Create a new object in a picture
- Delete an existing object
- Copy an existing object
- Group existing objects or cancel the grouping
- Search for objects
- Display or change object properties

When you insert a new object into a picture with VBA, the object behaves in the same way as if you double-clicked it in the Graphics Designer object palette.

The object is given the predefined property values and is inserted in the top left-hand corner of the picture.

Access to the object properties is dependent on how you created the object. Two examples illustrate this:

Example 1:

In this example a circle of the type "HMIObject" is inserted into the current picture. You can use a VBA object of the "HMIObject" type or all objects in the Graphics Designer. However, you have to address individual properties of the respective object explicitly via the "Properties(Index)" property:

```
Sub AddObject()
'VBA30
Dim objObject As HMIObject
Set objObject = ActiveDocument.HMIObjects.AddHMIObject("CircleAsHMIObject", "HMICircle")
'
'standard-properties (e.g. the position) are available every time:
objObject.Top = 40
objObject.Left = 40
'
'non-standard properties can be accessed using the Properties-collection:
objObject.Properties("FlashBackColor") = True
End Sub
```

Example 2:

In this example a circle of the type "HMICircle" is inserted into the current picture. In contrast with Example 1 you can only use the "objCircle" object for objects of the "HMICircle" type, however:

```
Sub AddCircle()
'VBA31
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("CircleAsHMICircle", "HMICircle")
'
'The same as in example 1, but here you can set/get direct the
'specific properties of the circle:
objCircle.Top = 80
objCircle.Left = 80
objCircle.FlashBackColor = True
End Sub
```

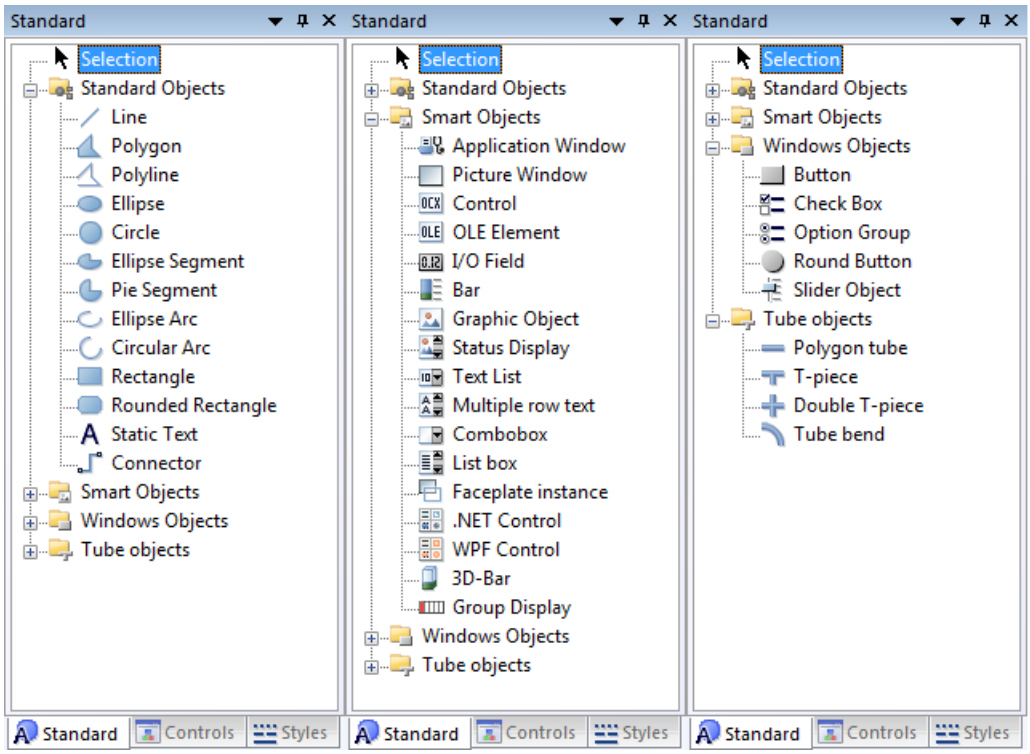
5.3.4.2 Default objects, Smart objects, Windows objects and Tube objects

Default objects, Smart objects, Windows objects and Tube objects

Introduction

You use the Standard, Smart and Windows objects to design your pictures. In the Graphics Designer, these objects are available in the "Default" selection window:



VBA enables you to access these objects in all pictures in your project. If, for example, you want to change the background color of all circles in a project with several pictures, you can do this with a VBA macro.

Paste Object into Picture

Use the "AddHMIObject(ObjectName, ProgID)" method to insert a new object in a picture. ObjectName" stands for the name of the object (e.g. "my Circle"), and "ProgID" for the VBA object designation (e.g. "HMICircle"):

```
Sub AddCircle()
'VBA32
'Creates object of type "HMICircle"
Dim objCircle As HMICircle
'
'Add object in active document
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("My Circle", "HMICircle")
End Sub
```

Edit Object

VBA gives you access to all object properties, which you can edit via the object's properties dialog. You can change and output object properties, and select objects in the picture. If you have not selected an object, you can use the following methods:

- "Find()" method: Searches for an object in the "HMIObjects" listing
- "Delete()" Method: Deletes an HMIObject object.

If you have selected objects, you can edit them via the "Selection" listing with the following methods, among others:

- "AlignLeft()", "AlignRight()", "AlignTop()", "AlignBottom()": These methods align objects.
- "CreateGroup()", "CreateCustomizedObject()": These methods create a group object or customized object.
- "DeselectAll()" method: Cancels the selection of all objects

Remove VBA:references with "Nothing"

Always remove the references used for the Controls, the standard objects, and for the document after you closed the document. For this purpose, set the objects to "Nothing". The following example shows the code for a Control:

```
Public Sub DrawNewControl
   Const strFct = "CreatePdls"
   Dim objControl As HMIObject
   Dim objDoc As Document
   On Local Error GoTo errorhandler
   'open the document
   Set objDoc =
grafexe.Application.Documents.Open(grafexe.Application.ApplicationDa
taPath & "PDL1.pdl", hmiOpenDocumentTypeInvisible)
    'create new object
   Set objControl = objDoc.HMIObjects.AddActiveXControl("Control1",
"CCAxUserArchiveControl.AxUserArchiveControl.1")
   If objControl Is Nothing Then
      GoTo errorhandler
```

```
   End If
   'doing something with the control
   '......
      'delete reference to new control
   Set objControl = Nothing
   'saving PDL and deleting reference to it
   objDoc.Save
   objDoc.Close
   Set objDoc = Nothing
   Exit Sub
' errorhandler
errorhandler:
   If MsgBox("Error occurred" & vbNewLine & "Yes - resume next" &
vbNewLine & "No - stop script", vbOKCancel + vbCritical, strFct) =
vbOK Then
      Resume Next
   End If
End Sub
```

Application Property (Page 3486)

How to edit Default objects, Smart objects, Windows objects and Tube objects

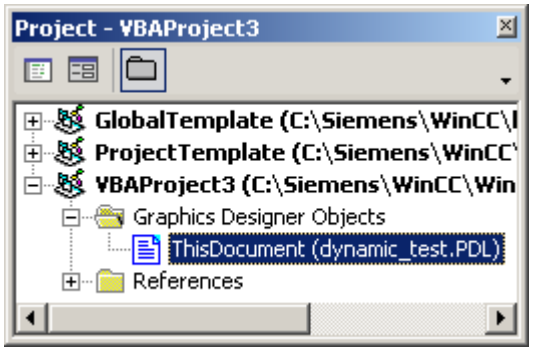
Introduction

Here you will find the following instructions for editing Standard, Smart and Windows objects:

- Define properties of a specific object
- Define properties of a nonspecific object
- Select an object in the active picture
- Find objects in the active picture
- Delete object

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. Open the document "ThisDocument" in the Project Explorer:



3. To define the properties of a specific object type (e.g. "HMICircle"), you can for example insert an "EditDefinedObjectType()" procedure in the document "ThisDocument". In this example a circle is inserted in the active picture and its line weight and color are modified:

```
Sub EditDefinedObjectType()
'VBA33
Dim objCircle As HMICircle
Set objCircle =
ActiveDocument.HMIObjects.AddHMIObject("myCircleAsCircle",
"HMICircle")
With objCircle
'direct calling of objectproperties available
.BorderWidth = 4
.BorderColor = RGB(255, 0, 255)
End With
End Sub
```

4. To change the properties of a nonspecific object type ("HMIObject"), insert a "EditHMIObject()" procedure in the document "ThisDocument", for example. In this example a circle is inserted in the active picture and its line weight and color are modified:

```
Sub EditHMIObject()
'VBA34
Dim objObject As HMIObject
Set objObject =
ActiveDocument.HMIObjects.AddHMIObject("myCircleAsObject",
"HMICircle")
With objObject
'Access to objectproperties only with property "Properties":
.Properties("BorderWidth") = 4
.Properties("BorderColor") = RGB(255, 0, 0)
End With
End Sub
```

5. To select an object in the current picture, insert a "SelectObject()" procedure in the document "ThisDocument", for example. In this example, a circle will be inserted in the active picture and selected:

```
Sub SelectObject()
'VBA35
Dim objObject As HMIObject
Set objObject =
ActiveDocument.HMIObjects.AddHMIObject("mySelectedCircle",
"HMICircle")
ActiveDocument.HMIObjects("mySelectedCircle").Selected = True
End Sub
```

6. To search for an object in the current picture, insert a "FindObjectsByName()", "FindObjectsByType()," or "FindObjectsByProperty()" procedure in the document "ThisDocument", for example. In this example, objects containing the string "Circle" in their name are searched for:

```
Sub FindObjectsByName()
'VBA36
Dim colSearchResults As HMICollection
Dim objMember As HMIObject
Dim iResult As Integer
Dim strName As String
'
'Wildcards (?, *) are allowed
Set colSearchResults =
ActiveDocument.HMIObjects.Find(ObjectName:="*Circle*")
For Each objMember In colSearchResults
iResult = colSearchResults.Count
strName = objMember.ObjectName
MsgBox "Found: " & CStr(iResult) & vbCrLf & "Objectname: " &
strName
Next objMember
End Sub
```

In this example a search is run in the active picture for objects of the type "HMICircle":

```
Sub FindObjectsByType()
'VBA37
Dim colSearchResults As HMICollection
Dim objMember As HMIObject
Dim iResult As Integer
Dim strName As String
Set colSearchResults =
ActiveDocument.HMIObjects.Find(ObjectType:="HMICircle")
For Each objMember In colSearchResults
iResult = colSearchResults.Count
strName = objMember.ObjectName
MsgBox "Found: " & CStr(iResult) & vbCrLf & "Objektname: " &
strName
Next objMember
End Sub
```

In this example a search is run in the active picture for objects with the property "BackColor":

```
Sub FindObjectsByProperty()
'VBA38
Dim colSearchResults As HMICollection
Dim objMember As HMIObject
Dim iResult As Integer
Dim strName As String
Set colSearchResults =
ActiveDocument.HMIObjects.Find(PropertyName:="BackColor")
For Each objMember In colSearchResults
iResult = colSearchResults.Count
strName = objMember.ObjectName
MsgBox "Found: " & CStr(iResult) & vbCrLf & "Objectname: " &
strName
Next objMember
```

```
End Sub
```

7. To delete an object, you can for example insert a "DeleteObject()" procedure in the document "ThisDocument". In this example the first object in the active picture will be deleted.

```
Sub DeleteObject()
'VBA39
'Delete first object in active document:
ActiveDocument.HMIObjects(1).Delete
End Sub
```

8. Start the procedure with <F5>.

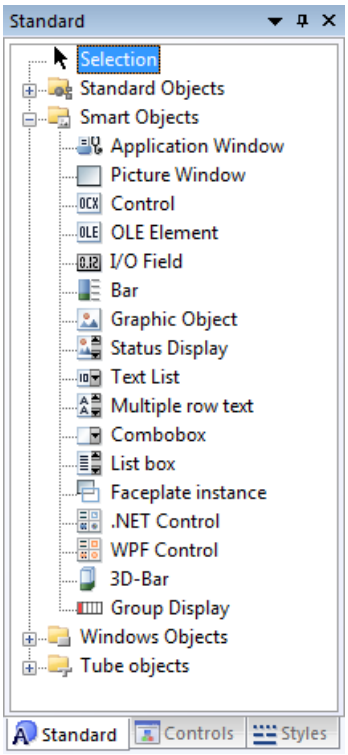
Editing Objects with VBA (Page 3053)

OLE Objects

Introduction

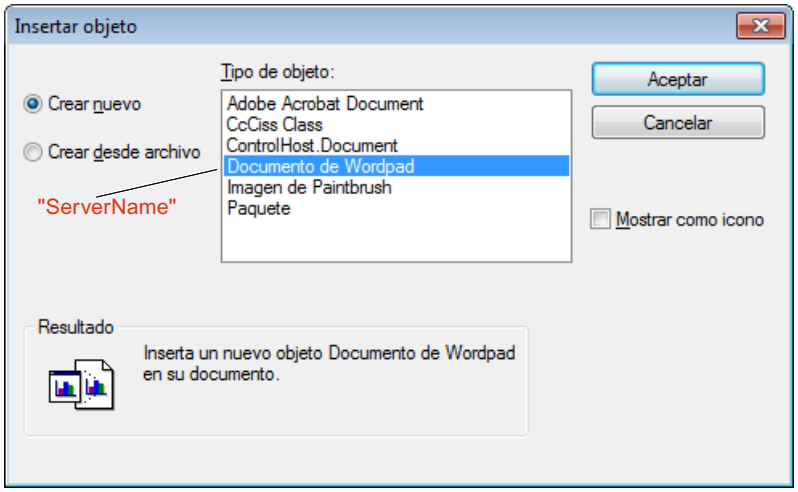
You can use VBA to insert OLE Elements into a picture. The OLE Element belongs to the Smart objects. In the Graphics Designer, the object is available in the "Default" selection window:



Paste OLE Element in Picture

Use the "AddOLEControl(ObjectName, ServerName, [CreationType], [UseSymbol]) method to insert an OLE Element into a picture. ObjectName" stands for the object name, and "ServerName" for the application that is to be contained in the OLE Element. The

"ServerName" parameter corresponds to the object type in the "object insertion dialog. The last two parameters are optional and represent the possible settings" in the dialog displayed:



You will find further information on the parameters in this documentation under "AddOLEObject method".

In the following example an OLE Element containing a Wordpad document will be inserted into the active picture:

```
Sub AddOLEObjectToActiveDocument()
'VBA40
Dim objOLEObject As HMIOLEObject
Set objOLEObject = ActiveDocument.HMIObjects.AddOLEObject("MS Wordpad Document1",
"Wordpad.Document.1")
End Sub
```

The OLEObject object is added to the "HMIObjects" listing as the last element and inherits the properties of the HMIObject object.

See also

OLEObject Object (Page 3393)

AddOLEObject Method (Page 3184)

How to edit Default objects, Smart objects, Windows objects and Tube objects (Page 3057)

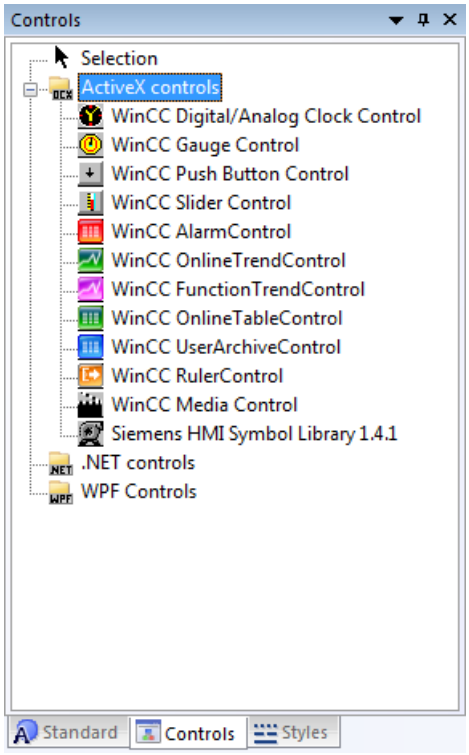
Default objects, Smart objects, Windows objects and Tube objects (Page 3055)

Editing Objects with VBA (Page 3053)

ActiveX controls

Introduction

You can use VBA to insert ActiveX controls into a picture. In the Graphics Designer, you can find the ActiveX controls supplied with WinCC in the "Controls" selection window:



Further information is provided under "AddActiveXControl method" in this documentation and under "Working with controls" in the WinCC documentation.

Integrating standard ActiveX controls

As well as the ActiveX controls supplied with WinCC, you can insert all standard ActiveX controls registered in the operating system into a picture. This means that you also have the option of using ActiveX controls that you have programmed yourself in your pictures. A list of the standard ActiveX controls tested with WinCC is given in the WinCC documentation.

Inserting an ActiveX control into a picture

Use the "AddActiveXControl(ObjectName, ProgID)" method to insert a new ActiveX control into a picture. ObjectName" stands for the name of the ActiveX control (e.g. "WinCC Gauge"), and "ProgID" for the VBA object designation (e.g. "XGauge.XGauge.1"):

```
Sub AddActiveXControl()
'VBA41
```

```
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
End Sub
```

The ActiveXControl object is added to the "HMIObjects" listing as the last element and inherits the properties of the HMIObject object.

Access to the properties of the ActiveX control

You must address the object-specific properties of the ActiveX control via the "Properties(Index)" property. You can find out which properties a ActiveX control possesses from the "Object Properties" dialog in the Graphics Designer or from the Properties listing:

```
Sub AddActiveXControl()
'VBA42
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge2",
"XGAUGE.XGaugeCtrl.1")
'
'move ActiveX-control:
objActiveXControl.Top = 40
objActiveXControl.Left = 60
'
'Change individual property:
objActiveXControl.Properties("BackColor").value = RGB(255, 0, 0)
End Sub
```

Restricted access to background graphics of Controls

The background graphic cannot be configured in VBA for the following Controls:

Control	Attribute
WinCC Digital/Analog Clock Control	Background graphic
WinCC Gauge Control	Background picture Frame picture
WinCC Push Button Control	PictureSelected PictureUnselected
WinCC slider control	Background picture Slider picture

How to edit Default objects, Smart objects, Windows objects and Tube objects (Page 3057)

Default objects, Smart objects, Windows objects and Tube objects (Page 3055)

Editing Objects with VBA (Page 3053)

.Net controls

Introduction

You can use VBA to insert .Net controls into a picture. In the Graphics Designer, you can find the .Net controls in the "Controls" selection window.

Additional information is provided under "AddDotNetControl method" in this documentation and under "Creating process pictures > Working with controls > .Net controls" in the WinCC documentation.

Inserting a .Net control into a picture

Use the "AddDotNetControl(ObjectName, ControlType, InGAC, AssemblyInfo)" method to insert a new .Net control into a picture. "ObjectName" represents the name of the .Net control. "ControlType" shows the name space of the object. If "InGAC" is "TRUE", the object is registered in the Global Assembly Cache and the associated information is available in "AssemblyInfo".

```
Sub AddDotNetControl()
'VBA851
Dim DotNetControl As HMIDotNetControl
Set DotNetControl = ActiveDocument.HMIObjects.AddDotNetControl("MyVBAControl",
"System.Windows.Forms.Label", True,"Assembly=System.Windows.Forms, Version=2.0.0.0,
Culture=neutral, PublicKeyToken=b77a5c561934e089")
End Sub
```

The .Net control object is added to the "HMIObjects" listing as an element and inherits the properties of the HMIObject object.

Access to the properties of the .Net control

You can find out which properties a .Net control has from the "Object Properties > Control Properties" dialog in Graphics Designer.

WPF controls

Introduction

You can use VBA to insert WPF controls into a picture. In the Graphics Designer, you can find the WPF controls in the "Controls" selection window.

Additional information is provided under "AddWPFControl method" in this documentation and under "Creating process pictures > Working with controls > WPF controls" in the WinCC documentation.

Inserting a WPF control into a picture

Use the "AddWPFControl(ObjectName, ControlType, InGAC, AssemblyInfo)" method to insert a new WPF control into a picture. "ObjectName" represents the name of the .Net control. "ControlType" shows the name space of the object. If "InGAC" is "TRUE", the object is registered in the Global Assembly Cache and the associated information is available in "AssemblyInfo".

```
Sub AddWPFControl()
'VBA852
Dim WPFControl As HMIWPFControl
Set WPFControl = ActiveDocument.HMIObjects.AddWPFControl("MyWPFVBAControl",
"WinCCWPFControl.TestControl", False, "Assembly=Z:\TestControl\WinCCWPFControl.dll")
End Sub
```

The ActiveXControl object is added to the "HMIObjects" listing as an element and inherits the properties of the HMIObject object.

Access to the properties of the WPF control

You can find out which properties a WPF control has from the "Object Properties > Control Properties" dialog in Graphics Designer.

5.3.4.3 Group Objects

Group Objects

Introduction

With VBA you can create a group object from selected objects in the Graphics Designer. You can add objects to the group object, or remove objects, without having to ungroup the group object itself. You have unrestricted access to the object properties of the individual objects in the group object. You can also ungroup a group object again, or delete it entirely.

The following object types cannot be part of a group object:

- CustomizedObject (Customized object)
- ActiveXControl
- OLEObject

Further information regarding group objects can be found in the WinCC documentation under "Group Object".

Creating a group object

To create a group object, select the objects that you want to be part of the group object in the Graphics Designer. The selected objects are then contained in the "Selection" listing. You create the group with the "CreateGroup()" method:

```
Sub CreateGroup()
'VBA43
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
objGroup.ObjectName = "myGroup"
End Sub
```

The group object is inserted at the end of the "HMIObjects" listing. The objects that are contained in the group object retain their index numbers and continue to be available in the "HMIObjects" listing.

The objects in the group object are also included in the "GroupedHMIObjects" listing, although the index numbers are reassigned.

Give the group object a name (objGroup.Name = "My Group") so that you can uniquely identify it. If you do not assign a name, the group object is given the default designation for the group object (e.g. "Group1").

The group object has the same properties as the objects of the "Object" type.

Editing a group object

You can edit a group object as follows:

- Methode "Add(Index)": Adds a new object to the group object.
- Methode "Remove(Index)": Removes a object from the group object.
- "UnGroup()" method: Ungroups the group object (ungroup).
- "Delete()" Method: Deletes the group object and the objects that it contains.

Editing objects in a group object

Use the "GroupedHMIObjects" listing in order to select an object in the group object. In order to access its object property you must access the name of the object property via the "Properties" property, for example:

```
Sub ModifyPropertyOfObjectInGroup()
'VBA44
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.HMIObjects("myGroup")
objGroup.GroupedHMIObjects(1).Properties("BorderColor") = RGB(255, 0, 0)
End Sub
```

How to Edit the Group Objects Using VBA (Page 3071)

Editing Objects with VBA (Page 3053)

VBA in the Graphics Designer (Page 3015)

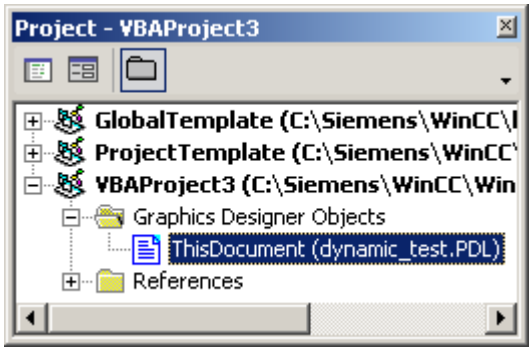
How to Edit the Group Objects Using VBA

Requirements

You must have created at least two graphic objects in the Graphics Designer and you must have selected them.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor").
2. Open the document "ThisDocument" in the Project Explorer:



3. To create a group object from selected objects, you can for example insert a "CreateGroup()" procedure in the document "ThisDocument". In this example the group object "My Group" is created from a number of objects.

```
Sub CreateGroup()
'VBA45
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle",
"HMICircle")
Set objRectangle =
ActiveDocument.HMIObjects.AddHMIObject("sRectangle",
"HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
'The name identifies the group-object
objGroup.ObjectName = "My Group"
End Sub
```

4. To add an object to the "My Group" group object, insert a "AddObjectToGroup()" procedure in the document "ThisDocument", for example. In this example, an ellipse is added to the "My Group" group object:

```
Sub AddObjectToGroup()
'VBA46
Dim objGroup As HMIGroup
Dim objEllipseSegment As HMIEllipseSegment
'Adds new object to active document
Set objEllipseSegment =
ActiveDocument.HMIObjects.AddHMIObject("EllipseSegment",
"HMIEllipseSegment")
Set objGroup = ActiveDocument.HMIObjects("My Group")
'Adds the object to the group
objGroup.GroupedHMIObjects.Add ("EllipseSegment")
End Sub
```

5. To remove an object from the "My Group" group object, insert a "RemoveObjectFromGroup()" procedure in the document "ThisDocument", for example. In this example the first object will be removed from the "My Group" group object:

```
Sub RemoveObjectFromGroup()
'VBA47
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.HMIObjects("My Group")
'delete first object of the group-object
objGroup.GroupedHMIObjects.Remove (1)
End Sub
```

6. To ungroup the "My Group" group object again, insert a procedure "UnGroup()" into the document "ThisDocument". In this example, the "My Group" group object is ungrouped:

```
Sub UnGroup()
'VBA48
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.HMIObjects("My Group")
objGroup.UnGroup
End Sub
```

7. To delete the "My Group" group object, insert a procedure "DeleteGroup()" into the document "ThisDocument". In this example, the "My Group" group object is deleted, together with the objects it contains:

```
Sub DeleteGroup()
'VBA49
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.HMIObjects("My Group")
objGroup.Delete
End Sub
```

8. Always start the procedure with <F5>.

See also

Ungroup Method (Page 3267)

How to Edit Objects in Group Objects Using VBA

Introduction

Here you will find the following instructions for editing objects in a group object with VBA:

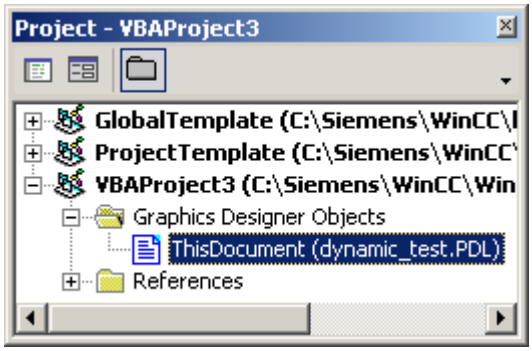
- Editing a property of an object in the group object
- Editing a property of all objects in the group object

Requirement

You must have created at least two graphic objects in the Graphics Designer and you must have grouped them.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor").
2. Open the document "ThisDocument" in the Project Explorer:



3. To edit a property of an object within the group object, you can for example insert a "ChangePropertiesOfGroupMembers()" procedure into the document "ThisDocument". In this example the properties of three different objects are modified in the group object "My Group":

```
Sub ChangePropertiesOfGroupMembers()
'VBA50
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle",
"HMICircle")
Set objRectangle =
ActiveDocument.HMIObjects.AddHMIObject("sRectangle",
"HMIRectangle")
Set objEllipse =
ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
With objEllipse
.Top = 120
.Left = 120
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
objGroup.ObjectName = "My Group"
'Set bordercolor of 1. object = "red":
objGroup.GroupedHMIObjects(1).Properties("BorderColor") =
RGB(255, 0, 0)
'set x-coordinate of 2. object = "120" :
objGroup.GroupedHMIObjects(2).Properties("Left") = 120
'set x-coordinate of 3. object = "90" :
objGroup.GroupedHMIObjects(3).Properties("Top") = 90
End Sub
```

4. To change the properties of all the objects in the group object, insert a "ChangePropertiesOfAllGroupMembers()" procedure in the document In this example, the "BorderColor" property of each object in the "My Group" group object is changed. This example will not work unless you have created the "My Group" group object:

```
Sub ChangePropertiesOfAllGroupMembers()
'VBA51
Dim objGroup As HMIGroup
Dim iMaxMembers As Integer
Dim iIndex As Integer
Set objGroup = ActiveDocument.HMIObjects("My Group")
iIndex = 1
'
'Get number of objects in group-object:
iMaxMembers = objGroup.GroupedHMIObjects.Count
'
'set linecolor of all objects = "yellow":
For iIndex = 1 To iMaxMembers
objGroup.GroupedHMIObjects(iIndex).Properties("BorderColor") =
RGB(255, 255, 0)
Next iIndex
End Sub
```

5. Always start the procedure with <F5>.

5.3.4.4 Customized Objects

Customized Objects

Introduction

You can use VBA to create a customized object from selected objects in the Graphics Designer. In contrast to the group object, in the case of a customized object only those object properties

are available which you have selected in the "Configuration Dialog" for the customized object. It is not possible to configure a customized object with VBA.

Further information regarding customized objects can be found in the WinCC documentation under "Customized Object".

Creating a customized object with VBA

Use the "CreateCustomizedObject()" method to create a customized object from selected objects:

```
Sub CreateCustomizedObject()
'VBA52
Dim objCustomizedObject As HMICustomizedObject
Set objCustomizedObject = ActiveDocument.Selection.CreateCustomizedObject
objCustomizedObject.ObjectName = "My Customized Object"
End Sub
```

When you apply the "CreateCustomizedObject()" method, the "Configuration Dialog" appears in which you select the object properties. The customized object that you have created is added to the "HMIObjects" listing. Give the customized object an appropriate name (objCustomizedObject.Name = "My Customized Object") so that you can uniquely identify it.

Note

If you open a document as invisible, do not create a user object there with a VBA script. Program execution will otherwise be interrupted by a configuration dialog.

Editing Customized Objects

You can edit a customized object as follows:

- "Destroy" method: Ungroups the customized object.
- "Delete" Method: Deletes the customized object and the objects that it contains.

Editing objects in a customized object

Use the "Properties" property to access the selected object properties of the objects contained in the customized object.

```
Sub EditCustomizedObjectProperty()
'VBA53
Dim objCustomizedObject As HMICustomizedObject
Set objCustomizedObject = ActiveDocument.HMIObjects(1)
objCustomizedObject.Properties("BackColor") = RGB(255, 0, 0)
End Sub
```

If you have selected more than one identical property (for example the background color of a circle and of a rectangle), these properties will be numbered ("BackColor" and "BackColor1").

How to Edit a Customized Object with VBA

Introduction

Here you will find the following instructions for editing a customized object with VBA:

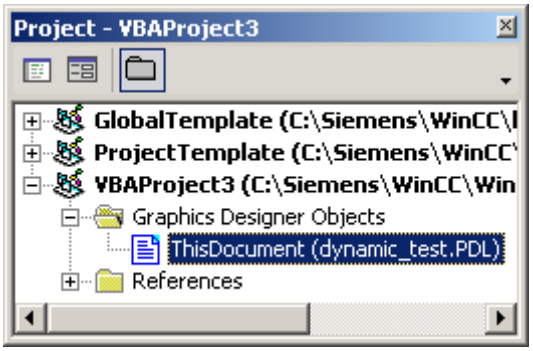
- Creating a customized object from selected objects
- Ungrouping Customized Objects
- Deleting a customized object

Note

It is not possible to configure a customized object with VBA.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor").
2. Open the document "ThisDocument" in the Project Explorer:



3. To create a customized object from selected objects, you can for example insert a "CreateCustomizedObject()" procedure in the document "ThisDocument". In this example the customized object "My Customized Object" is created from selected objects:

```
Sub CreateCustomizedObject()
'VBA54
Dim objCustomizedObject As HMICustomizedObject
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle",
"HMICircle")
Set objRectangle =
ActiveDocument.HMIObjects.AddHMIObject("sRectangle",
"HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objCustomizedObject =
ActiveDocument.Selection.CreateCustomizedObject
'
'*** The "Configurationdialog" started. ***
'*** Configure the costumize-object with the "configurationdialog"
***
'
objCustomizedObject.ObjectName = "My Customized Object"
End Sub
```

4. To delete an object, you can for example insert a "DeleteObject()" procedure in the document "ThisDocument". In this example the customized object "My Customized Object" created beforehand is deleted again:
```
Sub DestroyCustomizedObject()
'VBA55
Dim objCustomizedObject As HMICustomizedObject
Set objCustomizedObject = ActiveDocument.HMIObjects("My
Customized Object")
objCustomizedObject.Destroy
End Sub
```
5. To delete a customized object, you can for example insert a "DeleteCustomizedObject()" procedure in the document "ThisDocument". In this example the customized object "My Customized Object" created beforehand is deleted:
```
Sub DeleteCustomizedObject()
'VBA56
Dim objCustomizedObject As HMICustomizedObject
Set objCustomizedObject = ActiveDocument.HMIObjects("My
Customized Object")
objCustomizedObject.Delete
End Sub
```
6. Always start the procedure with <F5>.

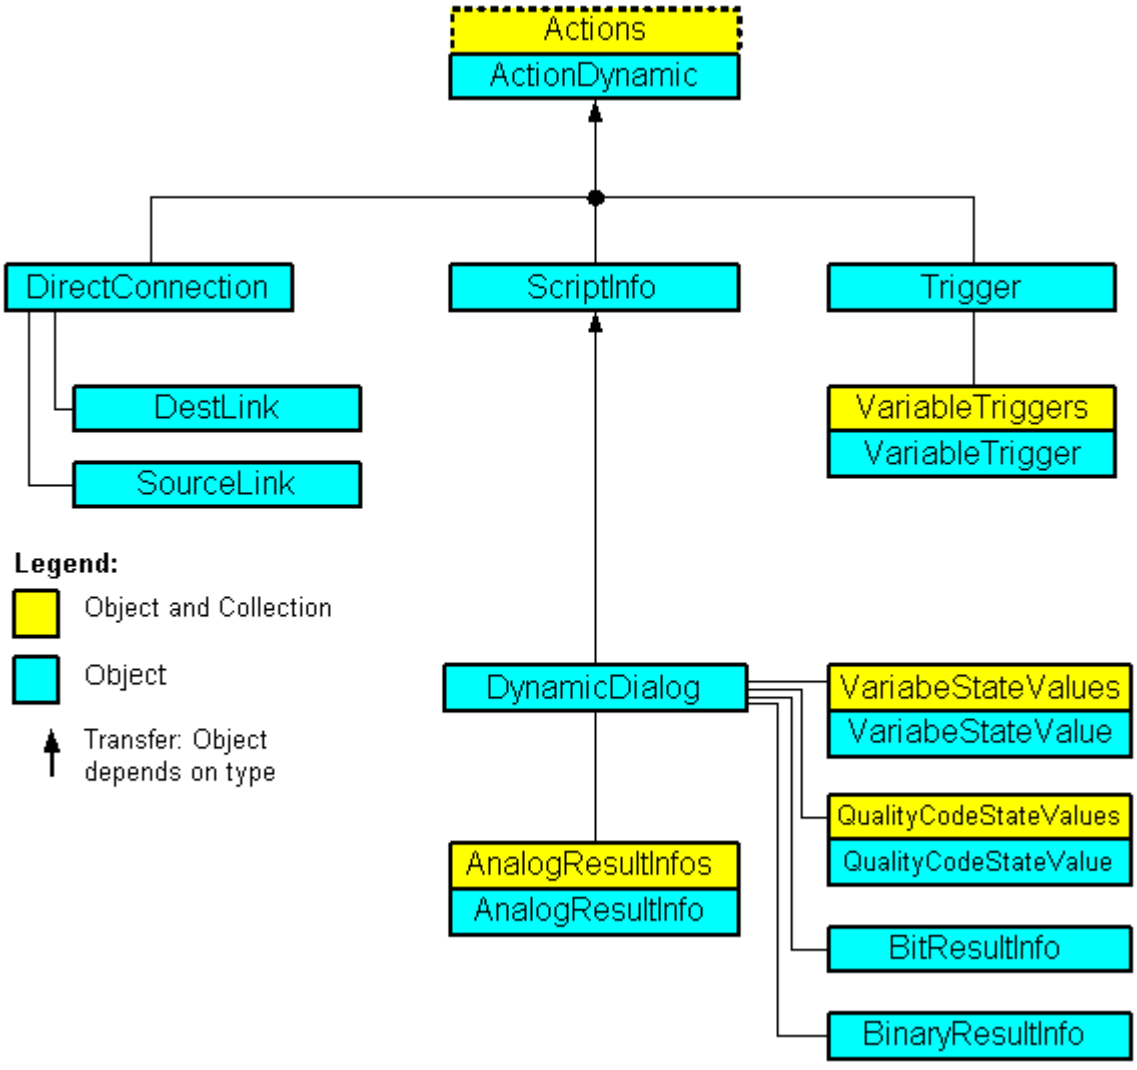
5.3.5 Creating Dynamics with VBA

5.3.5.1 Creating Dynamics with VBA

Introduction

VBA allows you to add dynamics to properties of pictures and objects and to configure event-controlled actions. VBA provides you with the ActionDynamic object for this purpose:



The ActionDynamic object represents an interface that is dependent on the object type:

- When you configure a dynamic for a property (Property object), the ActionDynamic object inherits the properties of the ScriptInfo, Trigger and DynamicDialog objects.
- When you configure an event-controlled action (Event object), the ActionDynamic object inherits the properties of the ScriptInfo and DirectConnection objects.

Adding dynamics to properties of pictures and objects

VBA enables you to add dynamics to properties of pictures and objects. You can use tags, scripts or the Dynamic dialog to add dynamics. Using dynamics enables you for example to configure a color change for an object in runtime when the value of a variable changes.

Configuring event-controlled actions

You can configure event-controlled actions with VBA. An action (script or direct connection) is triggered then the defined event occurs in runtime. An event may be a change to an object property, for example, or the clicking of a button.

Editing Triggers

You can edit triggers with VBA. Triggers are required when you use dynamics. They determine when a dynamic value is updated in runtime. This may occur at regular intervals, for example, or in the event of a picture change.

When you configure event-controlled actions, the event is the trigger.

Configuring Dynamics in the Properties of Pictures and Objects (Page 3082)

5.3.5.2 Configuring Dynamics in the Properties of Pictures and Objects

Configuring Dynamics in the Properties of Pictures and Objects

Introduction

VBA enables you to add dynamics to properties of pictures and objects. Dynamic object properties can be changed as a function of a variable value in Runtime, for example. The following methods of adding dynamics are possible:

- Tag connection
- Dynamic dialog
- Scripts

Principle

The following example illustrates the principle of the procedure for adding dynamics to an object property:

```
Sub CreateDynamicOnProperty()
'VBA57
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
'
'Create dynamic with type "direct Variableconnection" at the
'property "Radius":
Set objVariableTrigger =
objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVariableDirect, "'NewDynamic1'")
'
'To complete dynamic, e.g. define cycle:
With objVariableTrigger
.CycleType = hmiVariableCycleType_2s
End With
End Sub
```

Note

Note that a variable is not created simply by specifying the variable name. Use the variable selection dialog to create the variable.

Tag connection

Use the VariableTrigger object to add a dynamic to a property with a direct or indirect variable connection. The dynamic property then responds in runtime to a change in value to the specified variable. To allow this, in VBA you need to specify the variable name (VarName property) and the cycle (CycleTime property).

Dynamic dialog

Use the DynamicDialog object to add a dynamic to a property with the aid of the Dynamic dialog. The dynamic property responds in runtime to a variable's value ranges. The following objects are available for specifying the value range:

- AnalogResultInfos-Objekt: Use this object to assign a fixed value to value ranges of a variable or a script. The fixed value is assigned to the dynamic property when the variable value or return value of the script is within the specified value range.
- BinaryResultInfo Object: Use this object to assign a fixed value to binary value ranges (zero and non-zero) of a variable or a script. The fixed value is assigned to the dynamic property when the variable value or return value of the script returns one of the two values.
- VariableStateValue Object Use this object to assign a fixed value to the state (e.g. "Upper limit exceeded") of a specified variable. The fixed value is then allocated to the dynamic property when the state occurs.

Scripts

Use the ScriptInfo object to add a dynamic to a property with a C or VB script. The property with the dynamic reacts to a script in Runtime and is controlled via a trigger. Use the Trigger object for configuring the trigger.

Creating Dynamics with VBA (Page 3079)

How to dynamize a property with a tag connection

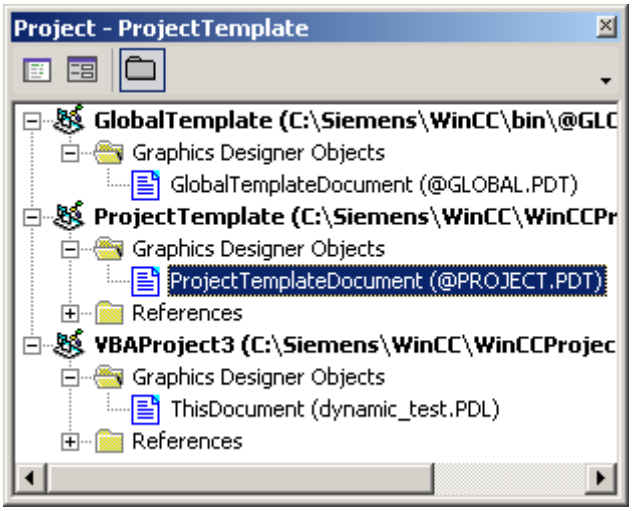
Introduction

Here you will find the following instructions for dynamizing a property with tag connection:

- Dynamizing a property with direct tag connection
- Dynamizing a property with indirect tag connection

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To dynamize an object property with a direct tag connection, you can for example insert an "AddDynamicAsVariableDirectToProperty()" procedure in the document. "In this example a circle property "Top" will be made dynamic with the aid of the tag Otto:

```
Sub AddDynamicAsVariableDirectToProperty()
'VBA58
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1",
"HMICircle")
'Create dynamic at property "Top"
Set objVariableTrigger =
objCircle.Top.CreateDynamic(hmiDynamicCreationTypeVariableDirect,
"Otto")
'
'define cycle-time
With objVariableTrigger
.CycleType = hmiVariableCycleType_2s
End With
End Sub
```

4. To dynamize an object property with an indirect tag connection, you can for example insert an "AddDynamicAsVariableInDirectToProperty"() procedure in the document. "In this example a circle property Left" will be made dynamic with the aid of the tag "Anton":

```
Sub AddDynamicAsVariableIndirectToProperty()
'VBA59
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle2",
"HMICircle")
'Create dynamic on property "Left":
Set objVariableTrigger =
objCircle.Left.CreateDynamic(hmiDynamicCreationTypeVariableIndirec
t, "Anton")
'
'Define cycle-time
With objVariableTrigger
.CycleType = hmiVariableCycleType_2s
End With
End Sub
```

5. Start the procedure with <F5>.

Configuring Dynamics in the Properties of Pictures and Objects (Page 3080)

Creating Dynamics with VBA (Page 3079)

How to dynamize a property with the Dynamic dialog

Introduction

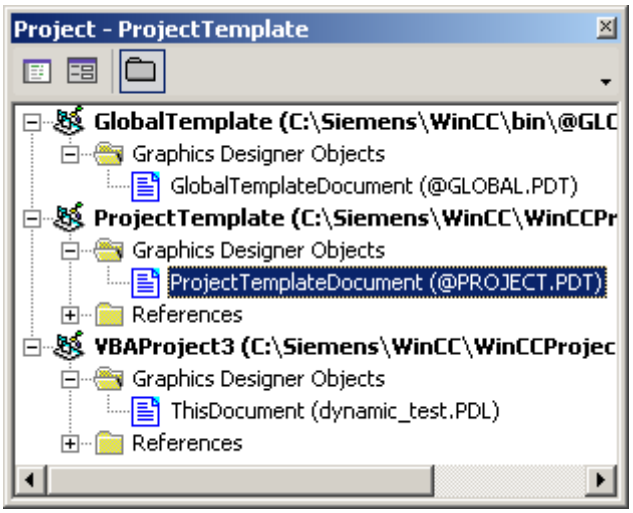
You can use the Dynamic dialog to dynamize properties of pictures and objects depending on certain value ranges or variable states. The following value ranges are available for selection:

- Analog
- Binary
- Bit
- Direct

With VBA you specify the type of value range with the ResultType property. These instructions illustrate the addition of dynamics to an object property with analog value ranges. Additional information dynamization with the dynamic dialog is provided under "DynamicDialog object" in the VBA reference in this documentation.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To dynamize an object property with the Dynamic dialog, you can for example insert an "AddDynamicDialogToCircleRadiusTypeAnalog()" procedure in the document. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and three analog value ranges will be created:
4. Start the procedure with <F5>.

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA60
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
'
'Create dynamic
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog, "'NewDynamic1'")
'
'Configure dynamic. "ResultType" defines the type of valuerange:
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
```

```
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

New VBA method to configure dynamization using the Dynamic Dialog

For optimization reasons, an additional new method has been provided:

- CreateDynamicDialog([Code as String], iResultType as Long) as HMIActionDynamic

The parameter "IResultType" has the following constants:

- hmiResultTypeDirect = 0
- hmiResultTypeAnalog= 1
- hmiResultTypeBool = 2
- hmiResultTypeBit = 3

In the following example the radius of a circle is given dynamics with the A tag name and a "ResultType" are assigned to the dynamic dialog.

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA820
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
'Create Object
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("myCircle","HMICircle")
'Create dynamic (Tag "myTest" must exist")
Set objDynDialog = objCircle.Radius.CreateDynamicDialog("'myTest'",0)
End Sub
```

Initializing a string property

A string property must be initialized before being made dynamic by assigning a text to it. In the following ToolTipText example, this is done in "objCircle.ToolTipText = "Text".

```
Sub Dyn()
'VBA823
Dim objCircle As HMICircle
Dim doc As Document
Dim objDynDialog As HMIDynamicDialog
Set doc = ActiveDocument
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle","HMICircle")
objCircle.ObjectName = "Circle1"
objCircle.BorderColor = RGB(255, 0, 0)
```

```
objCircle.BackColor = RGB(0, 255, 0)
objCircle.ToolTipText = "Text"
Set objDynDialog = objCircle.ToolTipText.CreateDynamic(hmiDynamicCreationTypeDynamicDialog, "'Var'")
End Sub
```

ToolTipText Property (Page 3786)

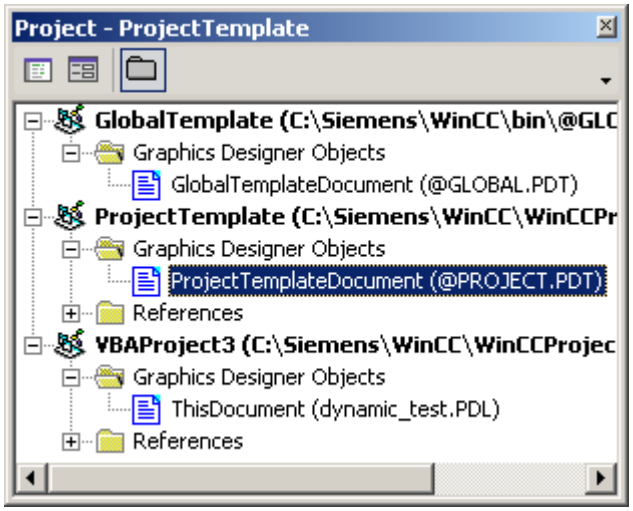
How to dynamize a property with a C script

Introduction

When you dynamize a property with a C script, you can assign the C code to the "SourceCode" property. The C script is compiled in the background. The "Compiled" property returns "True" when the C code has been successfully compiled.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To add dynamics to an object property with a C script, you can for example insert an "AddDynamicAsCScriptToProperty()" procedure in the document. In this example the height of a circle is increased by 5 pixels every two seconds in runtime:

```
Sub AddDynamicAsCSkriptToProperty()
'VBA61
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
Dim strCode As String
strCode = "long lHeight;" & vbCrLf & "int check;" & vbCrLf
strCode = strCode & "GetHeight(""events.PDL"",""myCircle"");" &
vbCrLf
strCode = strCode & "lHeight = lHeight+5;" & vbCrLf
strCode = strCode & "check = SetHeight(""events.PDL"",
""myCircle"", lHeight );"
strCode = strCode & vbCrLf & "//Return-Type: BOOL" & vbCrLf
strCode = strCode & "return check;"
Set objCircle =
ActiveDocument.HMIObjects.AddHMIObject("myCircle", "HMICircle")
'Create dynamic for Property "Height":
Set objCScript =
objCircle.Height.CreateDynamic(hmiDynamicCreationTypeCScript)
'
'set Sourcecode and cycletime:
With objCScript
.SourceCode = strCode
.Trigger.Type = hmiTriggerTypeStandardCycle
.Trigger.CycleType = hmiCycleType_2s
.Trigger.Name = "Trigger1"
End With
End Sub
```

4. Start the procedure with <F5>.

Creating Dynamics with VBA (Page 3079)

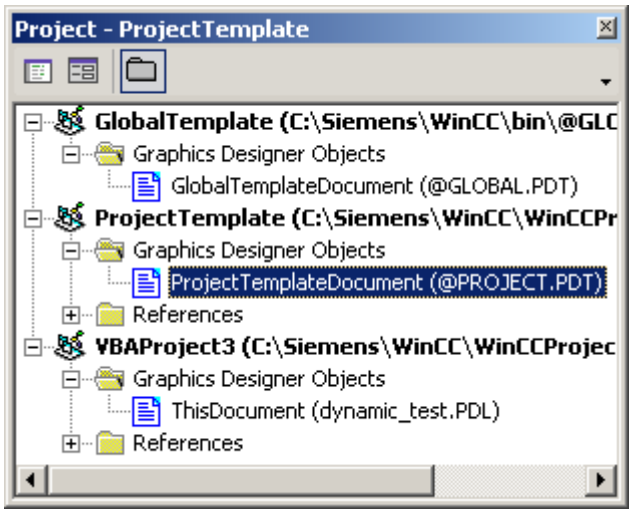
How to dynamize a property with a VB script

Introduction

When you dynamize a property with a VB script, you can assign the VB code to the "SourceCode" property. The VB script is compiled in the background. The "Compiled" property returns "True" if the VB code is syntactically correct.

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To add dynamics to an object property with a VB script, you can for example insert an "AddDynamicAsVBScriptToProperty()" procedure in the document. In this example the radius of a circle is increased by 5 pixels every two seconds in Runtime:

```
Sub AddDynamicAsVBSkriptToProperty()
'VBA62
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
Dim strCode As String
strCode = "Dim myCircle" & vbCrLf & "Set myCircle = "
strCode = strCode &
"HMIRuntime.ActiveScreen.ScreenItems(""myCircle"")"
strCode = strCode & vbCrLf & "myCircle.Radius = myCircle.Radius +
5"
Set objCircle =
ActiveDocument.HMIObjects.AddHMIObject("myCircle", "HMICircle")
'
'Create dynamic of property "Radius":
Set objVBScript =
objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
'
'Set SourceCode and cycletime:
With objVBScript
.SourceCode = strCode
.Trigger.Type = hmiTriggerTypeStandardCycle
.Trigger.CycleType = hmiCycleType_2s
.Trigger.Name = "Trigger1"
End With
End Sub
```

4. Start the procedure with <F5>.

5.3.5.3 Configuring Event-Driven Actions with VBA

Configuring Event-Driven Actions with VBA

Introduction

With VBA you can configure actions for pictures and objects which are triggered when predefined events occur. For example, when the mouse is clicked on an object in Runtime a C script is called whose return value is used for the dynamics of an object property. The following methods of adding dynamics are possible:

- Direct connection
- Scripts

The events that are used for configuring event-controlled actions occur only in Runtime and have nothing to do with the VBA event handlers.

General Procedure

You use the Events property for configuring event-controlled actions with VBA. The way this property is used depends on whether you are configuring an action on an object or picture or a property.

Configuring an action on an object or picture

An action that you configure on a picture or object is triggered when a predefined event occurs, for example when the object is clicked on with the mouse. You configure an action on an object with VBA by using the "Events(Index)" property, where "Index" stands for the triggering event:

```
Sub AddActionToObjectTypeCScript()
'VBA63
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
'Create circle. Click on object executes an C-action
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
Set objEvent = objCircle.Events(1)
Set objCScript = objEvent.Actions.AddAction(hmiActionCreationTypeCScript)
'
'Assign a corresponding custom-function to the property "SourceCode":
objCScript.SourceCode = ""
End Sub
```

Configuring an action on a property

An action that you configure on a property of a picture or object is triggered when the property value changes. You configure an action on a property with VBA by using the "Events(1)" property, where the index "1" stands for the event "Upon change":

```
Sub AddActionToPropertyTypeCScript()
'VBA64
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
'Create circle. Changing of the Property
'"Radius" should be activate C-Aktion:
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
Set objEvent = objCircle.Radius.Events(1)
Set objCScript = objEvent.Actions.AddAction(hmiActionCreationTypeCScript)
'
'Assign a corresponding custom-function to the property "SourceCode":
objCScript.SourceCode = ""
End Sub
```

Direct connection

Use the DirectConnection object to configure a direct connection.

Scripts

Use the ScriptInfo object if you want an event to trigger a C or VB action.

See also

How to configure a VB action with VBA on an event (Page 3100)

Events Property (Page 3583)

ScriptInfo Object (Page 3426)

How to configure a direct connection with VBA (Page 3095)

Event Handling (Page 3105)

Creating Dynamics with VBA (Page 3079)

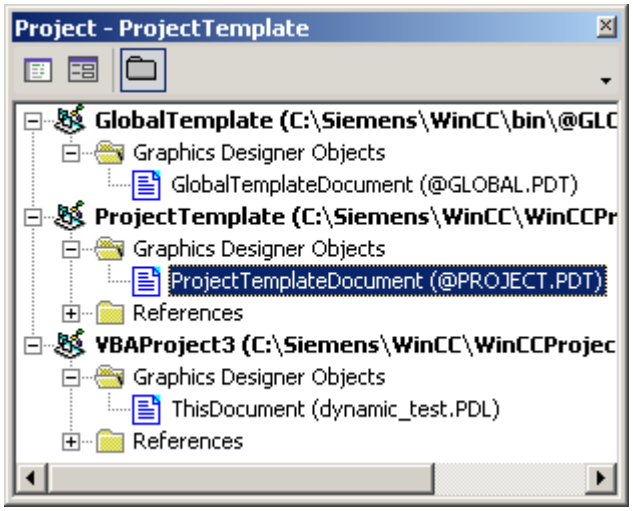
How to configure a direct connection with VBA

Introduction

These instructions show you how to configure a direct connection on the basis of two object properties. Further information on the configuring of direct connections with VBA is given in the VBA reference in this documentation under "AutomationName property" and "ObjectName property"

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To configure a direct connection to an object property, you can for example insert an "AddDirectConnectionToObject()" procedure in the document. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA65
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDConnection As HMIDirectConnection
'
'Create objects:
Set objRectangleA =
ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A",
"HMIRectangle")
Set objRectangleB =
ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B",
"HMIRectangle")
Set objButton =
ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectC
onnection)
With objDConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Destinationobject: Property "Left" of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
```

```
End Sub
```

4. Start the procedure with <F5>.

DestLink Object (Page 3318)

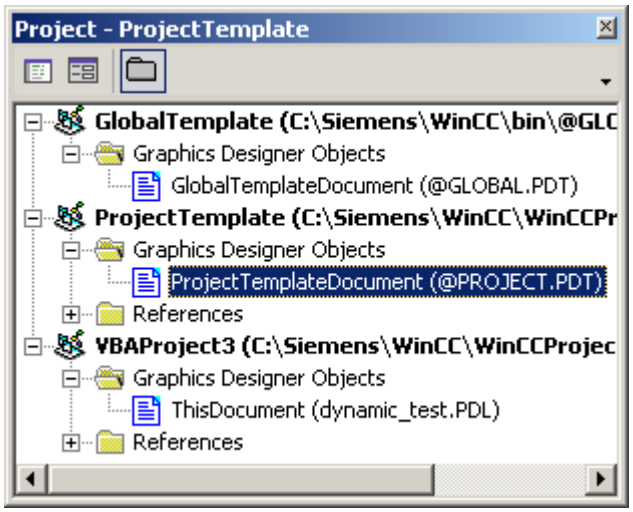
DirectConnection Object (Page 3320)

Configuring Event-Driven Actions with VBA (Page 3092)

How to configure a C action with VBA on an event

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To configure a C action on an event with VBA, you can for example insert a "CreateCActionToClickedEvent()" procedure in the document. In this example a button and a circle will be inserted in the active picture. In Runtime the height increases every time you click the button:

```
Sub CreateCActionToClickedEvent()
'VBA66
Dim objButton As HMIButton
Dim objCircle As HMICircle
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim strCode As String
strCode = "long lHeight;" & vbCrLf & "int check;" & vbCrLf
strCode = strCode & "lHeight = GetHeight (""events.PDL"",
""myCircle"");"
strCode = strCode & vbCrLf & "lHeight = lHeight+5;" & vbCrLf &
"check = "
strCode = strCode & "SetHeight(""events.PDL"",
""myCircle"",lHeight);"
strCode = strCode & vbCrLf & "//Return-Type: Void"
Set objCircle =
ActiveDocument.HMIObjects.AddHMIObject("myCircle", "HMICircle")
Set objButton =
ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircle
.Top = 100
.Left = 100
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Text = "Increase height"
End With
'Configure directconnection:
Set objCScript =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeCScript
)
With objCScript
'
'Note: Replace "events.PDL" with your picturename
.SourceCode = strCode
End With
End Sub
```

4. Start the procedure with <F5>.

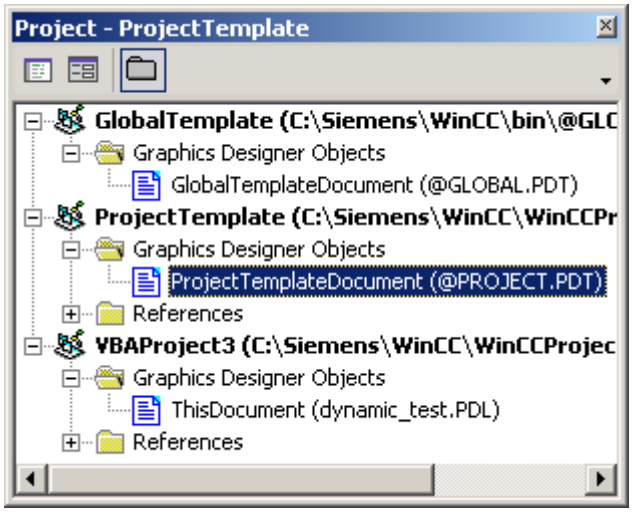
Actions Object (Listing) (Page 3273)

Configuring Event-Driven Actions with VBA (Page 3092)

How to configure a VB action with VBA on an event

Procedure

1. Open the VBA editor in Graphics Designer (<ALT+F11> or "Tools" > "Macros" > "Visual Basic Editor")
2. In Project Explorer, open the document in which you want to write the VBA code:



3. To configure an event-oriented VB action with VBA, you can for example insert a "CreateVBActionToClickedEvent()" procedure in the document. In this example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle enlarges every time you click the button:

```
Sub CreateVBActionToClickedEvent()
'VBA67
Dim objButton As HMIButton
Dim objCircle As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Dim strCode As String
strCode = "Dim myCircle" & vbCrLf & "Set myCircle = "
strCode = strCode &
"HMIRuntime.ActiveScreen.ScreenItems(""Circle_VB"")"
strCode = strCode & vbCrLf & "myCircle.Radius = myCircle.Radius +
5"
Set objCircle =
ActiveDocument.HMIObjects.AddHMIObject("Circle_VB", "HMICircle")
Set objButton =
ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircle
.Top = 100
.Left = 100
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 120
.Text = "Increase Radius"
End With
'Define event and assign sourcecode:
Set objVBScript =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScrip
t)
With objVBScript
.SourceCode = strCode
End With
End Sub
```

4. Start the procedure with <F5>.

5.3.5.4 Editing Triggers

Editing Triggers

Introduction

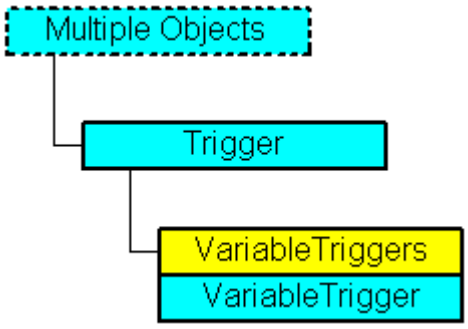
You use triggers in connection with dynamics for graphics objects and for triggering actions on object properties. Examples of triggers include:

- Tags: When the value of a tag is changed or its limit is exceeded at either extreme
- Standard cycle: Cyclic execution of the action. The length of the cycles is selectable between 250 ms and 1 h. In addition, you can also use customized cycles that you define yourself.
- Picture cycle: A cyclic trigger is used as the trigger. This cycle provides the option of defining the cycles of all the actions, tag connections and dynamic dialogs used in a picture centrally.
- Window Cycle: A cyclic trigger is used as the trigger. This values applies to all actions, tag links and dynamic dialogs, which were configured with the trigger type "Window cycle".

When you configure an action that responds to an event on a graphics object, the triggering event is the trigger.

Configuring triggers with VBA

Use the Trigger object to configure a trigger with VBA. If you intend to use a variable as the trigger, use the VariableTrigger object:



You determine the type of trigger with the Type property. Use the VariableTriggers property when you configure a variable as the trigger.

See also

Examples of Editing Triggers with VBA (Page 3103)

VariableTrigger Object (Page 3466)

Trigger Object (Page 3454)

ScriptInfo Object (Page 3426)

Examples of Editing Triggers with VBA

Introduction

The four examples below illustrate how you can create the following triggers with VBA:

- Standard cycle
- Tag
- Picture cycle
- Window Cycle

In all of these examples a circle is inserted into the active picture, with the radius of the circle being dynamized with a VB action.

The procedure for adding dynamics to a property with variable connection is explained under "Adding dynamics to a property with a variable connection" in this documentation.

Example 1: Standard cycle

```
Sub DynamicWithStandardCycle()
'VBA68
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_Standard", "HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
.Trigger.Type = hmiTriggerTypeStandardCycle
'"CycleType"-specification is necessary:
.Trigger.CycleType = hmiCycleType_10s
.Trigger.Name = "VBA_StandardCycle"
.SourceCode = ""
End With
End Sub
```

Example 2: Tag

```
Sub DynamicWithVariableTriggerCycle()
'VBA69
Dim objVBScript As HMIScriptInfo
Dim objVarTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VariableTrigger",
"HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
Set objVarTrigger = .Trigger.VariableTriggers.Add("VarTrigger", hmiVariableCycleType_10s)
.SourceCode = ""
End With
```

```
End Sub
```

Example 3: Picture cycle

```
Sub DynamicWithPictureCycle()
'VBA70
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_Picture", "HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
.Trigger.Type = hmiTriggerTypePictureCycle
.Trigger.Name = "VBA_PictureCycle"
.SourceCode = ""
End With
End Sub
```

Example 4: Window Cycle

```
Sub DynamicWithWindowCycle()
'VBA71
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_Window", "HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
.Trigger.Type = hmiTriggerTypeWindowCycle
.Trigger.Name = "VBA_WindowCycle"
.SourceCode = ""
End With
End Sub
```

5.3.6 Event Handling

Introduction

In the Graphics Designer, events occur when certain actions are taken (for example when a picture is opened). You can respond to an event with a predefined VBA event handler in order to execute instructions.

The events occur only during configuring in the Graphics Designer and are not available in Runtime. These events must not be confused with the events (e.g. mouse click, property change) occurring on graphic objects and pictures.

Note

When the Graphics Designer is open, events are also triggered by other editors.

. This applies, for example, to the modification of picture properties in WinCCExplorer. Close the Graphics Designer when you are making changes to pictures in other editors. This prevents events from being executed when you do not want them to be.

Note

If you open a picture in Graphics Designer, not only the "DocumentOpened event" of the active picture but also that of the "Project Template" and of the "Global Template" are triggered. The VBA code of the "DocumentOpened event" is thereby executed twice.

You must intercept this behavior with the event handler.

General Procedure

In event handling there are events with and without forwarding. You can recognize an event with forwarding by the presence of the "CancelForwarding" parameter. An event without forwarding does not have this parameter. When an event occurs, it is sent to the active picture and then forwarded to the "Global Template".

An event with forwarding is therefore forwarded by default via the document "Project Template" to the document "Global Template".

Preventing forwarding

You can prevent the forwarding of an event by setting the "CancelForwarding" parameter to "True" in the VBA event handler:

```
Sub Document_HMIObjectPropertyChanged(ByVal Property As IHMIProperty, CancelForwarding As
Boolean)
'VBA72
CancelForwarding = True
```

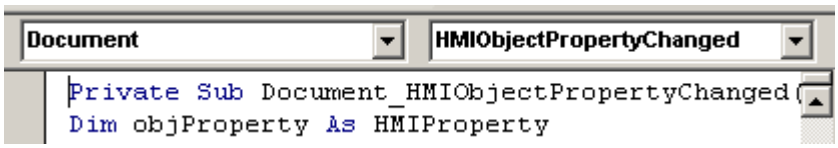
```
MsgBox "Object's property has been changed!"
End Sub
```

Picture-specific and application-specific events

Quite apart from the information given above about events with and without forwarding, the Graphics Designer differentiates between picture-specific and application-specific events:

Picture-specific events

Picture-specific events always respond to actions that occur in the active picture in the Graphics Designer. Such actions include, for example, the changing of object properties or saving the active picture. You can obtain a list of available picture-specific events by choosing "Document" in the VBA editor:



Application-specific events

Application-specific events respond to actions that occur in the "Graphics Designer" application. Such actions include, for example, starting the Graphics Designer or creating an object in the component library.

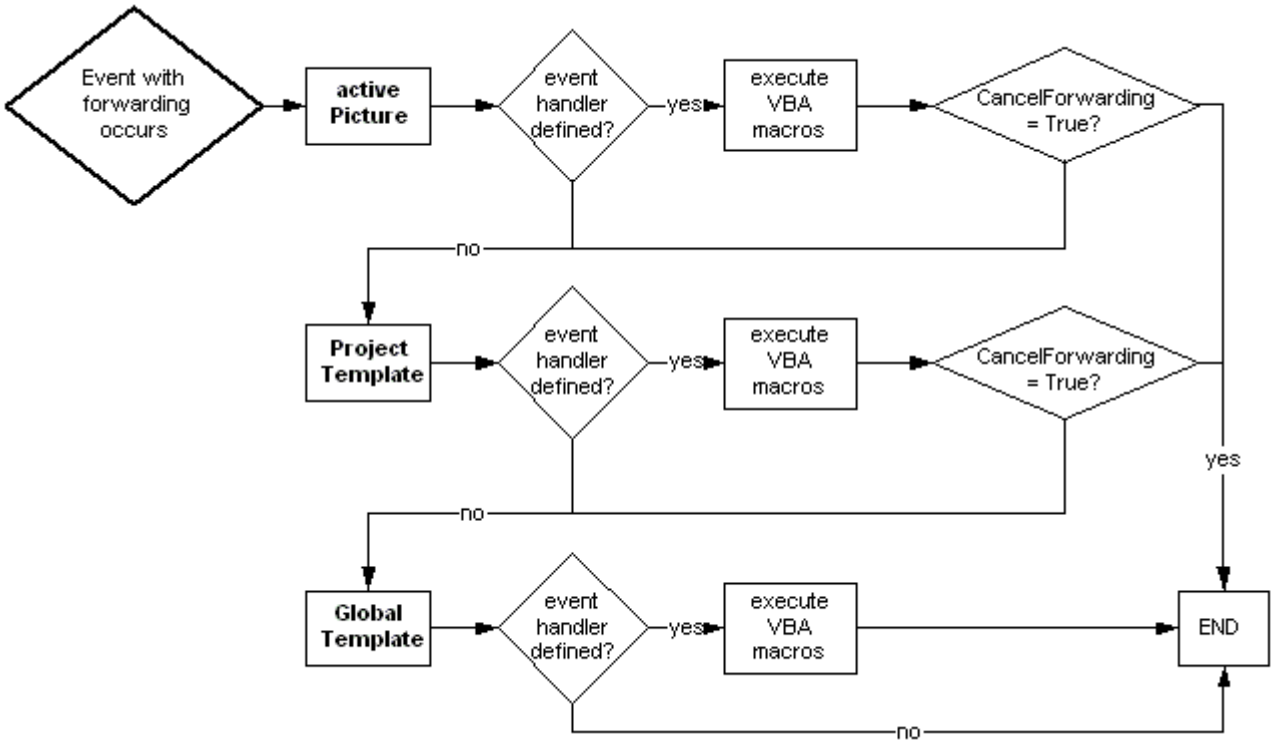
To make the application-specific events available, write the following statement in the VBA editor at the start of the document (preferably the "Project Template" or "Global Template"):

```
Dim WithEvents <Name> As grafexe.Application
```

The effect of this statement is that it will now also be possible to select the application-specific events from the list in the Graphics Designer:

Example 1: Occurrence of an event with forwarding

The illustration shows the sequence that follows from the occurrence of an event with forwarding:

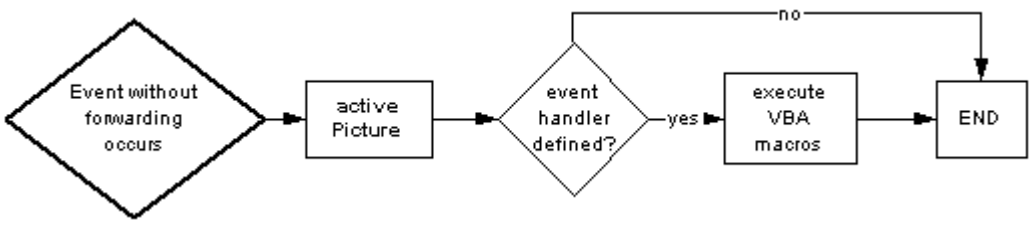


Note

There are events which are both picture-specific and application-specific (for example BeforeDocumentSave). When such an event occurs, the program checks whether the corresponding application-specific event handler has been defined. The sequence shown above does not begin until after that.

Example 2: Occurrence of an event without forwarding

The illustration shows the sequence that follows from the occurrence of an event without forwarding:



Disabling event handling

You can disable event handling by setting the "DisableVBAEvents" property for the Application object to "True".

See also

DisableVBAEvents Property (Page 3574)

Organizing VBA Code in a WinCC Project (Page 3009)

5.3.7 Accessing External Applications with VBA

5.3.7.1 Accessing External Applications with VBA

Introduction

You can use VBA to access programs which support VBA, for example products in the Microsoft Office family. This enables you, for example, to read out values from an MS Excel worksheet and then assign these to object properties.

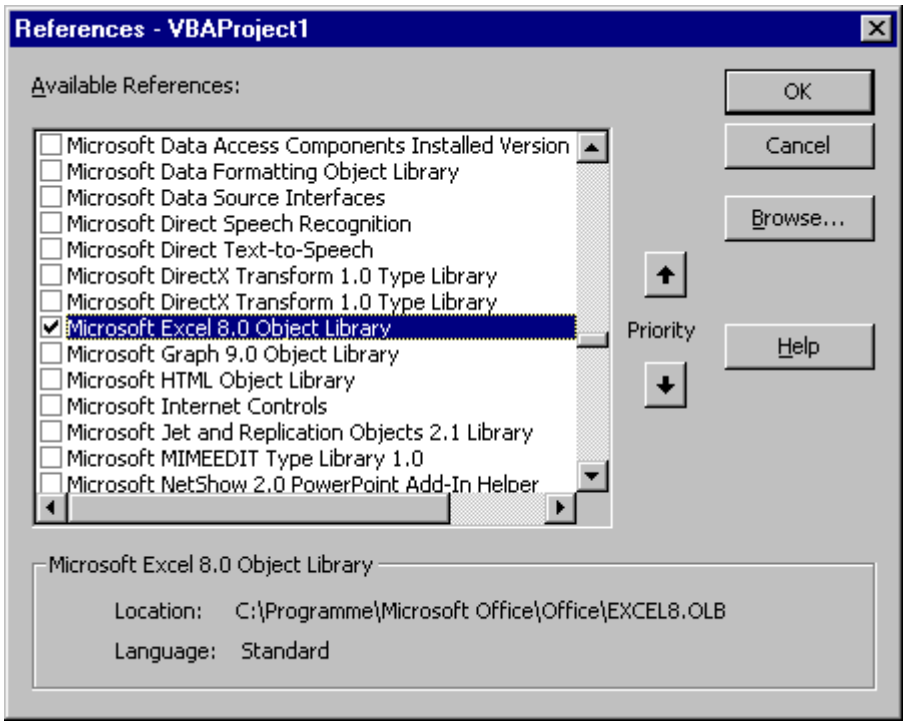
Note

No direct usage of Unicode in Excel VBA and Word VBA

Excel VBA and Word VBA supports the use of Unicode characters only by means of <ChrW(unicode-id) function.

Registering an external application

You have to integrate an external application in the VBA editor in order to make its object library available. To do this, select the "References" option in the "Tools" menu in the VBA editor. In the "References" dialog you can then select the required object library:



Note

You must attach the external application to all projects which you want to be able to access the external application; do this in the VBA editor Project Explorer.

See also

Example: Accessing MS Excel with VBA (Page 3109)

5.3.7.2 Example: Accessing MS Excel with VBA

Introduction

The following three examples illustrate how to access MS Excel. For these examples to work, the MS Excel object library must be integrated via a reference.

Note

No direct usage of Unicode in Excel VBA and Word VBA

Excel VBA and Word VBA supports the use of Unicode characters only by means of <ChrW(unicode-id) function.

Example 1

In this example the default object list of the Graphics Designer is exported in an Excel worksheet. The object properties are taken into account, as is the question of whether dynamics can be used with these properties. The VBA data type is also displayed.

```
Sub ExportDefObjListToXLS()
'VBA73
'Microsoft Excel Object Library needs to be referenced
Dim objGDApplication As grafexe.Application
Dim objHMIObject As grafexe.HMIObject
Dim objProperty As grafexe.HMIProperty
Dim objXLS As Excel.Application
Dim objWSheet As Excel.Worksheet
Dim objWBook As Excel.Workbook
Dim rngSelection As Excel.Range
Dim lRow As Long
Dim lRowGroupStart As Long

'define local errorhandler
On Local Error GoTo LocErrTrap

'Set references to the applications Excel and GraphicsDesigner
Set objGDApplication = grafexe.Application
Set objXLS = New Excel.Application

'Create workbook
Set objWBook = objXLS.Workbooks.Add()
objWBook.SaveAs objGDApplication.ApplicationDataPath & "DefaultObjekte.xls"

'Adds new worksheet to the new workbook
Set objWSheet = objWBook.Worksheets.Add
objWSheet.Name = "DefaultObjekte"
lRow = 1

'Every object of the DefaultHMIObjects-collection will be written
'to the worksheet with their objectproperties.
'For better overview the objects will be grouped.
For Each objHMIObject In objGDApplication.DefaultHMIObjects
DoEvents
objWSheet.Cells(lRow, 1).value = objHMIObject.ObjectName
objWSheet.Cells(lRow, 2).value = objHMIObject.Type
lRow = lRow + 1
lRowGroupStart = lRow
```

```
For Each objProperty In objHMIObject.Properties
'Write displayed name and automationname of property
'into the worksheet
objWSheet.Cells(lRow, 2).value = objProperty.DisplayName
objWSheet.Cells(lRow, 3).value = objProperty.Name
'Write the value of property, datatype and if their dynamicable
'into the worksheet
If Not IsEmpty(objProperty.value) Then _
        objWSheet.Cells(lRow, 4).value = objProperty.value
objWSheet.Cells(lRow, 5).value = objProperty.IsDynamicable
objWSheet.Cells(lRow, 6).value = TypeName(objProperty.value)
objWSheet.Cells(lRow, 7).value = VarType(objProperty.value)
lRow = lRow + 1
Next objProperty
'Select and groups the range of object-properties in the worksheet
Set rngSelection = objWSheet.Range(objWSheet.Rows(lRowGroupStart), _
                   objWSheet.Rows(lRow - 1))
rngSelection.Select
rngSelection.Group
Set rngSelection = Nothing
'Insert empty row
lRow = lRow + 1
Next objHMIObject
objWSheet.Columns.AutoFit
Set objWSheet = Nothing
objWBook.Save
objWBook.Close
Set objWBook = Nothing
objXLS.Quit
Set objXLS = Nothing
Set objGDApplication = Nothing
Exit Sub
LocErrTrap:
MsgBox Err.Description, , Err.Source
Resume Next
End Sub
```

Example 2

In this example all objects of the active picture are exported to an Excel worksheet. The properties taken into account are Position X, Position Y, Width, Height and Layer:

```
Sub ExportObjectListToXLS()
'VBA74
Dim objGDApplication As grafexe.Application
Dim objDoc As grafexe.Document
Dim objHMIObject As grafexe.HMIObject
Dim objProperty As grafexe.HMIProperty
Dim objXLS As Excel.Application
Dim objWSheet As Excel.Worksheet
Dim objWBook As Excel.Workbook
Dim lRow As Long
```

```
'Define local errorhandler
On Local Error GoTo LocErrTrap

'Set references on the applications Excel and GraphicsDesigner
Set objGDApplication = grafexe.Application
Set objDoc = objGDApplication.ActiveDocument
Set objXLS = New Excel.Application

'Create workbook
Set objWBook = objXLS.Workbooks.Add()
objWBook.SaveAs objGDApplication.ApplicationDataPath & "Export.xls"

'Create worksheet in the new workbook and write headline
'The name of the worksheet is equivalent to the documents name
Set objWSheet = objWBook.Worksheets.Add
objWSheet.Name = objDoc.Name
objWSheet.Cells(1, 1) = "Objektname"
objWSheet.Cells(1, 2) = "Objekttyp"
objWSheet.Cells(1, 3) = "ProgID"
objWSheet.Cells(1, 4) = "Position X"
objWSheet.Cells(1, 5) = "Position Y"
objWSheet.Cells(1, 6) = "Width"
objWSheet.Cells(1, 7) = "Höhe"
objWSheet.Cells(1, 8) = "Ebene"
lRow = 3

'Every objects will be written with their objectproperties width,
'height, pos x, pos y and layer to Excel. If the object is an
'ActiveX-Control the ProgID will be also exported.
For Each objHMIObject In objDoc.HMIObjects
DoEvents
objWSheet.Cells(lRow, 1).value = objHMIObject.ObjectName
objWSheet.Cells(lRow, 2).value = objHMIObject.Type
If UCase(objHMIObject.Type) = "HMIACTIVEXCONTROL" Then
objWSheet.Cells(lRow, 3).value = objHMIObject.ProgID
End If
objWSheet.Cells(lRow, 4).value = objHMIObject.Left
objWSheet.Cells(lRow, 5).value = objHMIObject.Top
objWSheet.Cells(lRow, 6).value = objHMIObject.Width
objWSheet.Cells(lRow, 7).value = objHMIObject.Height
objWSheet.Cells(lRow, 8).value = objHMIObject.Layer
lRow = lRow + 1
Next objHMIObject
objWSheet.Columns.AutoFit
Set objWSheet = Nothing
objWBook.Save
objWBook.Close
Set objWBook = Nothing
objXLS.Quit
Set objXLS = Nothing
Set objDoc = Nothing
Set objGDApplication = Nothing
Exit Sub
LocErrTrap:
MsgBox Err.Description, , Err.Source
Resume Next
```

```
End Sub
```

Example 3

In this example objects are imported from the Excel worksheet created in example 2. The properties taken into account are Position X, Position Y, Width, Height and Layer:

```
Sub ImportObjectListFromXLS()
'VBA75
Dim objGDApplication As grafexe.Application
Dim objDoc As grafexe.Document
Dim objHMIObject As grafexe.HMIObject
Dim objXLS As Excel.Application
Dim objWSheet As Excel.Worksheet
Dim objWBook As Excel.Workbook
Dim lRow As Long
Dim strWorkbookName As String
Dim strWorksheetName As String
Dim strSheets As String

'define local errorhandler
On Local Error GoTo LocErrTrap

'Set references on the applications Excel and GraphicsDesigner
Set objGDApplication = Application
Set objDoc = objGDApplication.ActiveDocument
Set objXLS = New Excel.Application

'Open workbook. The workbook have to be in datapath of GraphicsDesigner
strWorkbookName = InputBox("Name of workbook:", "Import of objects")
Set objWBook = objXLS.Workbooks.Open(objGDApplication.ApplicationDataPath &
strWorkbookName)
If objWBook Is Nothing Then
MsgBox "Open workbook fails!" & vbCrLf & "This function is cancled!", vbCritical, "Import
od objects"
Set objDoc = Nothing
Set objGDApplication = Nothing
Set objXLS = Nothing
Exit Sub
End If

'Read out the names of all worksheets contained in the workbook
For Each objWSheet In objWBook.Sheets
strSheets = strSheets & objWSheet.Name & vbCrLf
Next objWSheet
strWorksheetName = InputBox("Name of table to import:" & vbCrLf & strSheets, "Import of
objects")
Set objWSheet = objWBook.Sheets(strWorksheetName)
lRow = 3

'Import the worksheet as long as in actual row the first column is empty.
'Add with the outreaded data new objects to the active document and
'assign the values to the objectproperties
```

```
With objWSheet
While (.Cells(lRow, 1).value <> vbNullString) And (Not IsEmpty(.Cells(lRow, 1).value))
'Add the objects to the document as its objecttype,
'do nothing by groups, their have to create before.
If (UCase(.Cells(lRow, 2).value) = "HMIGROUP") Then
Else
  If (UCase(.Cells(lRow, 2).value) = "HMIACTIVEXCONTROL") Then
    Set objHMIObject = objDoc.HMIObjects.AddActiveXControl(.Cells(lRow,
1).value, .Cells(lRow, 3).value)
Else
    Set objHMIObject = objDoc.HMIObjects.AddHMIObject(.Cells(lRow, 1).value, .Cells(lRow,
2).value)
  End If
  objHMIObject.Left = .Cells(lRow, 4).value
  objHMIObject.Top = .Cells(lRow, 5).value
  objHMIObject.Width = .Cells(lRow, 6).value
  objHMIObject.Height = .Cells(lRow, 7).value
  objHMIObject.Layer = .Cells(lRow, 8).value
End If
Set objHMIObject = Nothing
lRow = lRow + 1
Wend
End With
objWBook.Close
Set objWBook = Nothing
objXLS.Quit
Set objXLS = Nothing
Set objDoc = Nothing
Set objGDApplication = Nothing
Exit Sub
LocErrTrap:
MsgBox Err.Description, , Err.Source
Resume Next
End Sub
```

5.4 AddIns

5.4.1 AddIns

Introduction

An AddIn is a code which cannot be viewed and is stored as a DLL. Addins can make new functions available by registering the DLL concerned in the operating system and loading

To you as a user, the advantage of addins is that they provide functions which are tailor made for the associated application. For example if you working on different computers during configuration and frequently use VBA macros, you can combine these VBA macros in one or more addins. When you change to a different computer you need only copy the addin and you can then access the customary functions on the new workstation.

As a developer, you can use the Graphics Designer program library in a development environment to create MS Visual Studio 6.0 addins, for example, and protect your code from intrusion.

Addins in the Graphics Designer

In the Graphics Designer you can use all the addins that have been developed for the Graphics Designer and registered in the operating system of the computer you are using for configuration.

You can automatically load an addin when you start the Graphics Designer if you frequently need the functions the addins contain.

When you no longer need the functions of an addin, you can unload it again at any time.

See also

How to Configure an AddIn in the Graphics Designer (Page 3118)

Example: Creating Add Ins (Page 3119)

Linking Add Ins (Page 3115)

5.4.2 Linking Add Ins

Introduction

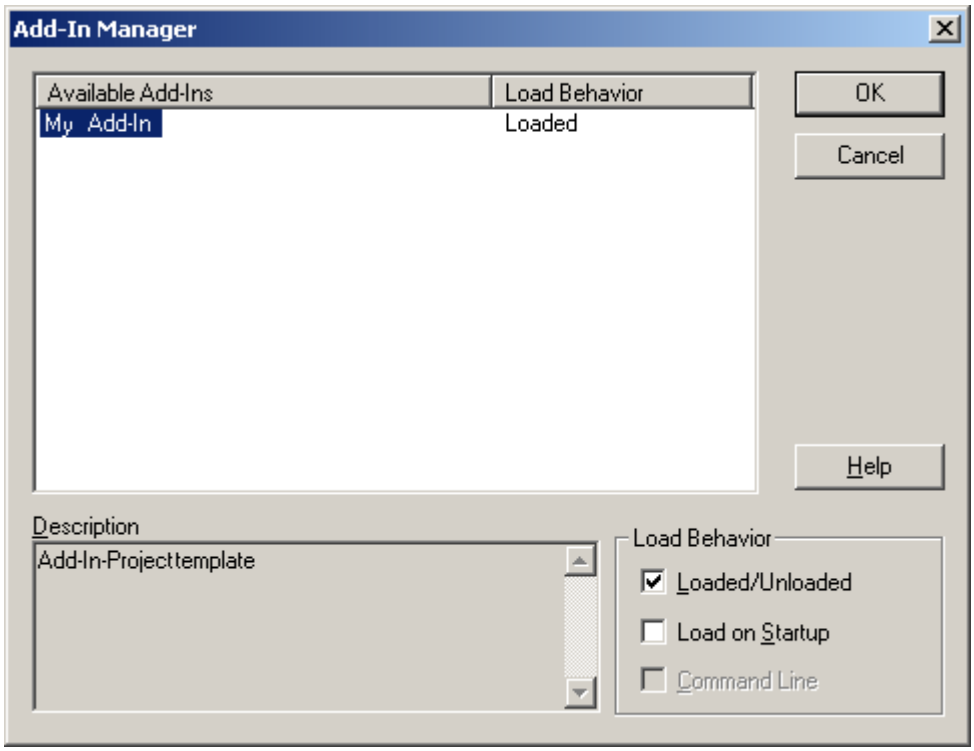
In the Graphics Designer use the Addin Manager to define the way addins that can be used in the Graphics Designer will behave on loading.

Requirements

- An add-in must be registered in the operating system, e.g. by entering the "regsvr32 filename.dll" command at the input prompt.
- To register VBA addins, "Microsoft Visual Basic for Applications" must be installed. The installation is available in the following ways:
  - Microsoft Office: During installation of Microsoft Office products, for example MS Excel or MS Word, Visual Basic for Applications is automatically installed at the same time.
  - Later installation from Microsoft Office Setup: You can select to only install Visual Basic for Applications in Microsoft Office Setup with the user-defined installation.
  - Download of the VBA Runtime environment: Microsoft offers a download of the VBA Runtime environment at the following links:
    - "VBRun60.exe" file for V6.0: http://support.microsoft.com/kb/192461/ (http://support.microsoft.com/kb/192461/)
    - "VBRun60sp6.exe" file for V6.0 SP6: http://support.microsoft.com/kb/290887/ (http://support.microsoft.com/kb/290887/)
- Make sure that the current file "MSAddndr.DLL" is integrated together with the VB6 add-in DLL. For more detailed information, refer to:
  - http://support.microsoft.com/kb/192136/ (http://support.microsoft.com/kb/192136/)
  - http://support.microsoft.com/kb/2792179/ (http://support.microsoft.com/kb/2792179/)
  - http://support.microsoft.com/kb/957924/ (http://support.microsoft.com/kb/957924/)

Starting AddIn Manager

To start the Addin Manager, go to the Graphics Designer and select the command "Macros > "AddIn Manager":



Automatically Loading an Addin

If the addin contains new functions that you always need in the Graphics Designer, you can load the addin automatically when you open the Graphics Designer.

To do this go to the Addin Manager, select the addin and enable the "Load on Startup" checkbox.

Note

Depending on how the addin is programmed, the function contained in the addin can also be entered in the menu "Tools > Macros > AddIns". You can then start the function just by clicking on it.

Manually Loading or Unloading an Addin

You can also load an addin manually if you need its functions for particular purposes only (such as test routines).

To load or unload an addin manually, go to the Addin Manager, select the addin and enable the "Loaded/Unloaded" checkbox.

See also

How to Configure an AddIn in the Graphics Designer (Page 3118)

Example: Creating Add Ins (Page 3119)

AddIns (Page 3113)

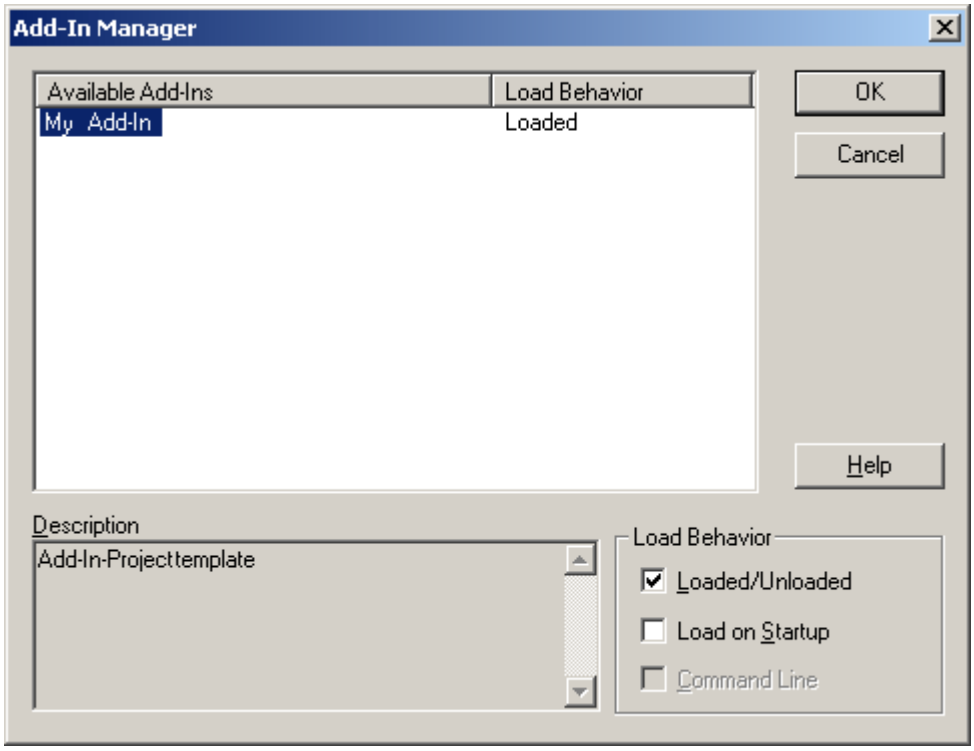
5.4.3 How to Configure an AddIn in the Graphics Designer

Requirements

An add-in must be registered in the operating system, e.g. by entering the "regsvr32 filename.dll" command at the input prompt.

Procedure

1. Start the Graphics Designer and open the project to which you want to link the addin.
2. To call the Addin Manager, select the menu command "Tools" > "AddIn Manager". The Addin Manager opens. The "Available Add-Ins" list shows all the addins that are available, together with their current load status:



3. For each addin define whether it is to be loaded and if so when. To do this select the addin concerned and enable the appropriate checkbox under "Load Behavior".

4. To unload an addin, select the addin concerned and disable the "Load/Unload" checkbox under "Load Behavior".
5. Click OK.

Result

Depending how the addin is programmed, the function contained in the addin is either listed in the "Tools" > "AddIns" menu or reacts to an event handler in the Graphics Designer.

If the addin is started by means of an event handler (e.g. Started Event), the "On Startup" checkbox should be enabled for the addin.

See also

Linking Add Ins (Page 3113)

AddIns (Page 3113)

5.4.4 Example: Creating Add Ins

5.4.4.1 Example: Creating Add Ins

Introduction

In order to create Addins, this documentation contains an example for Visual Basic 6.0, which creates a runable Addin for use in the Graphic Designer.

Requirements

MS Visual Studio 6.0 must be installed on the configuration computer.

You should have programming experience if you wish to use the sample code as a basis for developing addins of your own.

Example: Program Template for Visual Basic 6.0

Use the event handler "AddInInstance_OnConnection" to generate an instance of the Graphics Designer. In order for the addin to be able to access the Graphics Designer, it is mandatory to declare the application.

See also

Example: Creating an Add In with Visual Basic 6.0 (Page 3120)

Linking Add Ins (Page 3113)

5.4.4.2 Example: Creating an Add In with Visual Basic 6.0

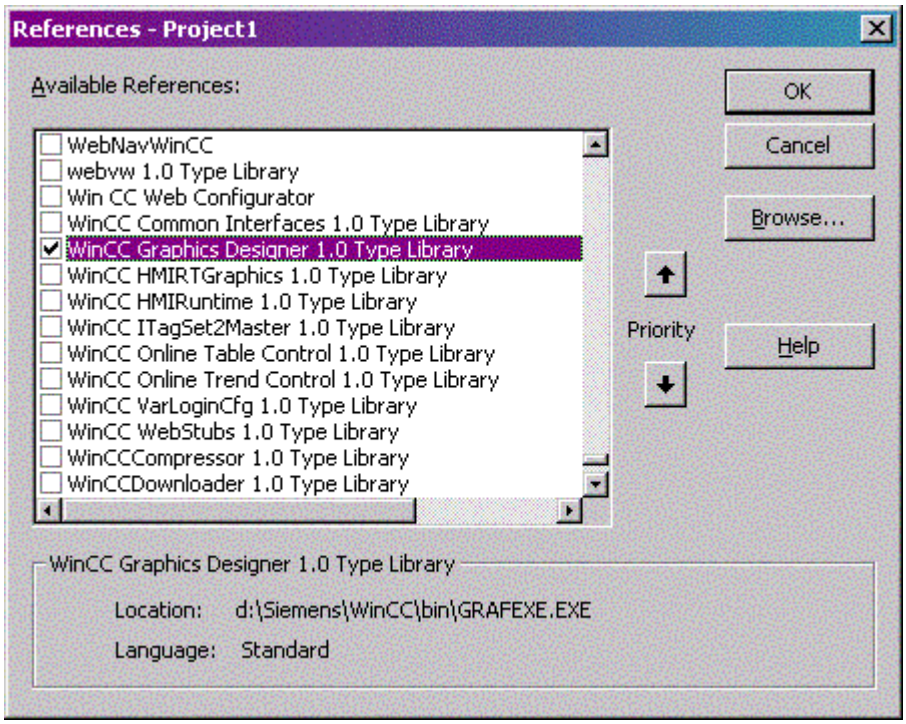
Introduction

The program code in this example produces a file called "MyAddIn.DLL". So that the add-in will work in Graphics Designer, you must enable the "Load on Startup" checkbox for this add-in in the AddIn Manager of Graphics Designer. For this purpose you can also use the "LoadOnStartup" function in the add-in.

When you open Graphics Designer the add-in generates a user-defined menu. You can also use the "Tools" > "AddIns" menu to call the function contained in the add-in.

Requirement

In order to create an executable add-in from the sample code, "MS Visual Studio 6.0" must be installed on your computer. You must also have referenced "WinCC Graphics Designer 1.0 Type Library" in "MS Visual Studio 6.0":



Procedure

1. Open "MS Visual Studio 6.0" and create a new project. To create a project, go to the "New Project" dialog, select the "AddIn" entry and click on OK.
2. In Project Explorer, open the "Designer" folder and double click the entry called "Connect". The "Connect (AddIn Designer)" dialog opens.
3. Under "Application", select the entry for "Graphics Designer" and select the "Initial Behavior on Loading" for the add-in. Close the "Connect (AddIn Designer)" dialog.

4. In Project Explorer, open the "Designer" folder and use the shortcut menu to select the command "Display Code" for the "Connect" entry.

5. Replace the entire program code with the following program code:

```
Option Explicit
'-----------------------------------------------------
'Member Variables
'-----------------------------------------------------
'Reference to the add-in connection
Dim WithEvents ThisAddin As grafexe.AddInHook
'Reference to the Graphics Designer Application
Dim WithEvents GrafApp As grafexe.Application
'-----------------------------------------------------
'WithEvents AddInInstance IDTExtensibility2 (automatic)
'-----------------------------------------------------
'-----------------------------------------------------
'This method connects the add-in to the Graphic Designer
Application
'-----------------------------------------------------
Private Sub AddInInstance_OnConnection(ByVal Application As
Object, _
                                       ByVal ConnectMode As
AddInDesignerObjects.ext_ConnectMode, _
                                       ByVal AddInInst As Object,
custom() As Variant)
On Error GoTo AddInInstance_OnConnection_Error

    '-----------------------------------------------------
    ' Hook up to the Graphics Designer application.IAddInHookEvents
interface.
    ' It is necessary referencing the application this add-in hooks
up to
    '-----------------------------------------------------
    Dim GDApplication As grafexe.Application
    Set GDApplication = Application
    If (Not GDApplication Is Nothing) Then
        '-----------------------------------------------------
        ' Explanation on filters ( first parameter to
AddIns.Attach() )
        '

'can be executed by clicking "Extras\Macros\AddIns\<Registered
Name>"
'-------------------------------------------------------
Private Sub ThisAddin_Execute()
    MsgBox ("AddIn : Execute! Will create a new Rectangle now")
```

```
    Dim NewShape As HMIObject
    Set NewShape =
GrafApp.ActiveDocument.HMIObjects.AddHMIObject("Rectangle1",
"HMIRectangle")
    With NewShape
        .Top = 40
        .Left = 40
        .BackColor = 255
    End With
    MsgBox (NewShape.ObjectName)
End Sub
```

6. Create the add-in, and load it in the Graphics Designer.

Result

The next time you open it, Graphics Designer contains a user-defined menu titled "Doc_Menu_1". The menu "Tools > AddIns" contains an entry called "Create Rectangle", which pastes a rectangle into the active picture:

5.5.1.5 Events

A-D

Activated event

Description

Occurs when a picture is activated in the Graphics Designer. This happens when you switch between two pictures, for example.

syntax

```
Document_Activated(CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when the picture is activated:

```
Private Sub Document_Activated(CancelForwarding As Boolean)
'VBA76
MsgBox "The document got the focus." & vbCrLf &_
"This event (Document_Activated) is raised by the document itself"
End Sub
```

See also

VBA Reference (Page 3124)

Event Handling (Page 3103)

BeforeClose Events

Description

Occurs immediately before a picture is closed.

syntax

```
Document_BeforeClose(Cancel As Boolean, CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
Cancel (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output before the picture is closed:

```
Private Sub Document_BeforeClose(Cancel As Boolean, CancelForwarding As Boolean)
'VBA77
MsgBox "Event Document_BeforeClose is raised"
End Sub
```

See also

VBA Reference (Page 3124)

BeforeDocumentClose Event

Description

Occurs immediately before the picture is closed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeDocumentClose(Document As HMIDocument, Cancel
As Boolean)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that is going to be closed.
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output before the picture is closed:

```
Private Sub objGDApplication_BeforeDocumentClose(ByVal Document As IHMIDocument, Cancel As
Boolean)
'VBA78
MsgBox "The document " & Document.Name & " will be closed after press ok"
End Sub
```

See also

VBA Reference (Page 3124)

BeforeDocumentSave event

Description

Occurs immediately before the picture is saved.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeDocumentSave(Document As HMIDocument, Cancel
As Boolean)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that is going to be closed.
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output before the picture is closed:

```
Private Sub objGDApplication_BeforeDocumentSave(ByVal Document As IHMIDocument, Cancel As
Boolean)
'VBA79
MsgBox Document.Name & "-saving will start after press ok."
End Sub
```

See also

VBA Reference (Page 3124)

BeforeHMIObjectDelete-Ereignis

Description

Occurs immediately before an object in a picture is deleted.

syntax

```
BeforeHMIObjectDelete(ByVal HMIObject As IHMIObject, Cancel As
Boolean, CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
HMIObject (IHMIObject)	Identifies the object to be deleted.
Cancel (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the object to be deleted:

```
Private Sub Document_BeforeHMIObjectDelete(ByVal HMIObject As IHMIObject, Cancel As
Boolean, CancelForwarding As Boolean)
'VBA80
Dim strObjName As String
Dim strAnswer As String
'
'"strObjName" contains the name of the deleted object
strObjName = HMIObject.ObjectName
strAnswer = MsgBox("Are you sure to delete " & strObjName & "?", vbYesNo)
If strAnswer = vbNo Then
'if pressed "No" -> set Cancel to true for prevent delete
Cancel = True
End If
End Sub
```

VBA Reference (Page 3124)

BeforeLibraryFolderDelete event

Description

Occurs immediately before a folder in the components library is deleted.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeLibraryFolderDelete(LibObject As
HMIFolderItem, Cancel As Boolean)
```

Parameter (Optional)

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The folder that is going to be deleted.
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output before a folder in the components library is deleted:

```
Private Sub objGDApplication_BeforeLibraryFolderDelete(ByVal LibObject As HMIFolderItem,
Cancel As Boolean)
'VBA81
MsgBox "The library-folder " & LibObject.Name & " will be delete..."
End Sub
```

See also

VBA Reference (Page 3124)

BeforeLibraryObjectDelete event

Description

Occurs immediately before an object in the components library is deleted.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeLibraryObjectDelete(LibObject As
HMIFolderItem, Cancel As Boolean)
```

Parameter (Optional)

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The object that is going to be deleted.
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output before a folder in the components library is deleted:

```
Private Sub objGDApplication_BeforeLibraryObjectDelete(ByVal LibObject As HMIFolderItem,
Cancel As Boolean)
'VBA82
MsgBox "The object " & LibObject.Name & " will be delete..."
End Sub
```

See also

VBA Reference (Page 3124)

BeforeQuit Event

Description

Occurs immediately before the Graphics Designer is closed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_BeforeQuit(Cancel As Boolean)
```

Parameters

Parameter (Data Type)	Description
Cancel (Boolean)	TRUE if command processing is to be canceled.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In this example a message is output shortly before the Graphics Designer is closed.

```
Private Sub objGDApplication_BeforeQuit(Cancel As Boolean)
'VBA83
MsgBox "The Graphics Designer will be shut down"
End Sub
```

See also

VBA Reference (Page 3124)

BeforeSave Event

Description

Occurs immediately before a picture is saved.

syntax

```
Document_BeforeSave(Cancel As Boolean, CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
Cancel (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output before the picture is saved:

```
Private Sub Document_BeforeSave(Cancel As Boolean, CancelForwarding As Boolean)
'VBA84
MsgBox "The document will be saved..."
End Sub
```

See also

VBA Reference (Page 3124)

BeforeVisibleFalse event

Description

Occurs immediately before the Graphics Designer application is set from Visible to Invisible.

syntax

```
Document_BeforeVisibleFalse(Cancel As Boolean, CancelForwarding As
Boolean)
```

Parameters

Parameter (Data Type)	Description
Cancel (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

--

See also

VBA Reference (Page 3124)

ConnectionEvent Event

Description

Occurs when two objects are connected via the connector.

syntax

```
ConnectionEvent(eConnEventType, HMIConnector, HMIConnectedObject,
CancelProcess, CancelForwarding)
```

Parameter (Optional)

Parameter (Data Type)	Description
eConnEventType (HMIConnectionEventType)	--
HMIConnector (HMIObject)	--
HMIConnectedObject (HMIObject)	--
CancelProcess (Boolean)	TRUE if command processing is to be canceled.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

--

See also

VBA Reference (Page 3124)

DataLanguageChanged Event

Description

Occurs when the project language has been changed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DataLanguageChanged(lCID As Long)
```

Parameters

Parameter (Data Type)	Description
lCID (Long)	The project language identifier

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the newly set project language is output:

```
Private Sub objGDApplication_DataLanguageChanged(ByVal lCID As Long)
'VBA87
MsgBox "The datalanguage is changed to " & Application.CurrentDataLanguage & "."
End Sub
```

See also

Language-Dependent Configuration with VBA (Page 3018)

VBA Reference (Page 3124)

DesktopLanguageChanged event

Description

Occurs when the user interface language has been changed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DesktopLanguageChanged(lCID As Long)
```

Parameters

Parameter (Data Type)	Description
lCID (Long)	The user interface language identifier

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the newly set desktop language is output:

```
Private Sub objGDApplication_DesktopLanguageChanged(ByVal lCID As Long)
'VBA88
MsgBox "The desktop-language is changed to " & Application.CurrentDesktopLanguage & "."
End Sub
```

DocumentActivated Event

Description

Occurs when a picture is activated in the Graphics Designer. This happens when you switch between two pictures, for example.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DocumentActivated(Document As HMIDocument)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that is to be activated.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output identifying the picture that has been activated:

```
Private Sub objGDApplication_DocumentActivated(ByVal Document As IHMIDocument)
'VBA89
MsgBox "The document " & Document.Name & " got the focus." & vbCrLf &_
"This event is raised by the application."
End Sub
```

VBA Reference (Page 3124)

DocumentCreated Event

Description

Occurs when a new picture has been created in the Graphics Designer.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DocumentCreated(Document As HMIDocument)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that has been created.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the name of the newly created picture is output:

```
Private Sub objGDApplication_DocumentCreated(ByVal Document As IHMIDocument)
'VBA90
MsgBox Document.Name & " will be created."
End Sub
```

DocumentOpened Event

Description

Occurs when a picture has been opened.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DocumentOpened(Document As HMIDocument)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that has been opened.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output identifying the picture that has been opened:

```
Private Sub objGDApplication_DocumentOpened(ByVal Document As IHMIDocument)
'VBA91
MsgBox Document.Name & " is opened."
End Sub
```

VBA Reference (Page 3124)

DocumentSaved Event

Description

Occurs when a picture has been saved in the Graphics Designer.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_DocumentSaved(Document As HMIDocument)
```

Parameters

Parameter (Data Type)	Description
Document (HMIDocument)	The picture that has been saved.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output identifying the picture that has been saved:

```
Private Sub objGDApplication_DocumentSaved(ByVal Document As IHMIDocument)
'VBA92
MsgBox Document.Name & " is saved."
End Sub
```

VBA Reference (Page 3124)

DocumentPropertyChanged event

Description

Occurs when a picture property is changed.

syntax

```
Document_DocumentPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
Property (IHMIProperty)	Identifies the changed property.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the picture property being changed:

```
Private Sub Document_DocumentPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
'VBA93
Dim strPropName As String
'"strPropName" contains the name of the modified property
strPropName = Property.Name
MsgBox "The picture-property " & strPropName & " is modified..."
End Sub
```

F-Z

HMIObjectAdded Event

Description

Occurs when an object is added.

syntax

```
Document_HMIObjectAdded(ByVal HMIObject As IHMIObject,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
HMIObject (IHMIObject)	Identifies the object being added.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the object that has been added:

```
Private Sub Document_HMIObjectAdded(ByVal HMIObject As IHMIObject, CancelForwarding As
Boolean)
'VBA94
Dim strObjName As String
'
'"strObjName" contains the name of the added object
strObjName = HMIObject.ObjectName
MsgBox "Object " & strObjName & " is added..."
End Sub
```

See also

VBA Reference (Page 3124)

HMIObjectMoved Event

Description

Occurs when an object is moved.

syntax

```
Document_HMIObjectMoved(ByVal HMIObject As IHMIObject,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
HMIObject (IHMIObject)	Identifies the object being moved.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the object that has been moved:

```
Private Sub Document_HMIObjectMoved(ByVal HMIObject As IHMIObject, CancelForwarding As
Boolean)
'VBA95
Dim strObjName As String
'
'"strObjName" contains the name of the moved object
strObjName = HMIObject.ObjectName
MsgBox "Object " & strObjName & " was moved..."
End Sub
```

See also

VBA Reference (Page 3124)

HMIObjectPropertyChanged Event

Description

Occurs when an object property is changed.

syntax

```
Document_HMIObjectPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
Property (IHMIProperty)	Identifies the changed property.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output identifying the object property that has been changed:

```
Private Sub Document_HMIObjectPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
'VBA96
Dim strObjProp As String
Dim strObjName As String
Dim varPropValue As Variant
'
'"strObjProp" contains the name of the modified property
'"varPropValue" contains the new value
strObjProp = Property.Name
varPropValue = Property.value
'
'"strObjName" contains the name of the selected object,
'which property is modified
strObjName = Property.Application.ActiveDocument.Selection(1).ObjectName
MsgBox "The property " & strObjProp & " of object " & strObjName & " is modified... " &
vbCrLf & "The new value is: " & varPropValue
End Sub
```

VBA Reference (Page 3124)

HMIObjectResized Event

Description

Occurs when the size of an object is changed.

syntax

```
Document_HMIObjectResized(ByVal HMIObject As IHMIObject,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
HMIObject (IHMIObject)	Identifies the object that is being resized.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when an object has been resized:

```
Private Sub Document_HMIObjectResized(ByVal HMIObject As IHMIObject, CancelForwarding As
Boolean)
'VBA97
Dim strObjName As String
'
'"strObjName" contains the name of the modified object
strObjName = HMIObject.ObjectName
MsgBox "The size of " & strObjName & " was modified..."
End Sub
```

LibraryFolderRenamed Event

Description

Occurs when a folder in the components library has been renamed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_LibraryFolderRenamed(LibObject As HMIFolderItem,
OldName As String)
```

Parameters

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The renamed folder.
OldName (String)	The original name of the renamed folder.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the old and new folder names are output:

```
Private Sub objGDApplication_LibraryFolderRenamed(ByVal LibObject As HMIFolderItem, ByVal
OldName As String)
'VBA98
MsgBox "The Library-folder " & OldName & " is renamed in: " & LibObject.DisplayName
End Sub
```

LibraryObjectRenamed Event

Description

Occurs when an object in the components library has been renamed.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_LibraryObjectRenamed(LibObject As HMIFolderItem,
OldName As String)
```

Parameters

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The renamed object.
OldName (String)	The original name of the renamed object.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the old and new object names are output:

```
Private Sub objGDApplication_LibraryObjectRenamed(ByVal LibObject As IHMIFolderItem, ByVal
OldName As String)
'VBA99
MsgBox "The object " & OldName & " is renamed in: " & LibObject.DisplayName
End Sub
```

LibraryObjectAdded Event

Description

Occurs when an object has been added to the components library.

syntax

```
HMIObjectPropertyChanged(ByVal Property As IHMIProperty,
CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
LibObject (IHMIFolderItem)	Identifies the library object.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when an object has been added to the components library:

```
Private Sub Document_LibraryObjectAdded(ByVal LibObject As IHMIFolderItem,
CancelForwarding As Boolean)
'VBA100
Dim strObjName As String
'
'"strObjName" contains the name of the added object
strObjName = LibObject.DisplayName
MsgBox "Object " & strObjName & " was added to the picture."
End Sub
```

VBA Reference (Page 3124)

MenuItemClicked Event

Description

Occurs when an entry in a user-defined menu is clicked.

Note

This event is both application-specific and document-specific.

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

syntax

```
Document_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
```

Parameters

Parameter (Data Type)	Description
MenuItem (IHMIMenuItem)	Identifies the user-defined menu.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output when the first entry in a user-defined menu is clicked:

```
Private Sub Document_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
'VBA101
Dim objMenuItem As HMIMenuItem
Dim varMenuItemKey As Variant
Set objMenuItem = MenuItem
'
'"objMenuItem" contains the clicked menu-item
'"varMenuItemKey" contains the value of parameter "Key"
'from the clicked userdefined menu-item
```

```
varMenuItemKey = objMenuItem.Key
Select Case MenuItem.Key
Case "mItem1_1"
MsgBox "The first menu-item was clicked!"
End Select
End Sub
```

NewLibraryFolder Event

Description

Occurs when a folder has been created in the components library.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_NewLibraryFolder(LibObject As HMIFolderItem)
```

Parameters

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The newly created folder.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the new folder name is output:

```
Private Sub objGDApplication_NewLibraryFolder(ByVal LibObject As IHMIFolderItem)
'VBA102
MsgBox "The library-folder " & LibObject.DisplayName & " was added."
End Sub
```

See also

VBA Reference (Page 3124)

NewLibraryObject Event

Description

Occurs when an object has been created in the components library.

syntax

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

```
objGDApplication_NewLibraryObject(LibObject As HMIFolderItem)
```

Parameters

Parameter (Data Type)	Description
LibObject (HMIFolderItem)	The newly created object.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
```

```
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the new object name is output:

```
Private Sub objGDApplication_NewLibraryObject(ByVal LibObject As IHMIFolderItem)
'VBA103
MsgBox "The object " & LibObject.DisplayName & " was added."
End Sub
```

Opened Event

Description

Occurs when a picture is opened.

syntax

```
Document_Opened(CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when the picture is opened:

```
Private Sub Document_Opened(CancelForwarding As Boolean)
'VBA104
MsgBox "The Document is open now..."
End Sub
```

See also

VBA Reference (Page 3124)

Saved Event

Description

Occurs after a picture has been saved.

syntax

```
Document_Saved(CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when the picture has been saved:

```
Private Sub Document_Saved(CancelForwarding As Boolean)
'VBA105
MsgBox "The document is saved..."
End Sub
```

See also

VBA Reference (Page 3124)

SelectionChanged Event

Description

Occurs when the selection has been changed.

syntax

```
Document_SelectionChanged(CancelForwarding As Boolean)
```

Parameters

Parameter (Data Type)	Description
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

In the following example a message is output when a new object has been selected:

```
Private Sub Document_SelectionChanged(CancelForwarding As Boolean)
'VBA106
MsgBox "The selection is changed..."
End Sub
```

See also

VBA Reference (Page 3124)

Started Event

Description

Occurs when the Graphics Designer has been started.

Syntax

```
objGDApplication_Started()
```

Note

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

In the following example, the name "objGDApplication" is substituted for <Name>.

Parameters

--

Example

Declare application.

```
Dim WithEvents objGDApplication As grafexe.Application
```

Set event tag.

```
Private Sub Document_Opened(CancelForwarding As Boolean)
 Set objGDApplication = Me.Application
End Sub
```

Query "Started" event and output message.

```
Private Sub objGDApplication_Started()
'VBA107
'This event is raised before objGDApplication_Started()
 MsgBox "The Graphics Designer is started!"
End Sub
```

See also

VBA Reference (Page 3124)

ToolbarItemClicked Event

Description

Occurs when an icon in a user-defined toolbar has been clicked

Note

This event is both application-specific and document-specific.

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

syntax

```
Document_ToolbarItemClicked(ByVal ToolbarItem As IHMIToolbarItem)
```

Parameters

Parameter (Data Type)	Description
ToolbarItem (IHMIToolbarItem)	Identifies the symbol.

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example a message is output when the first user-defined icon is clicked:

```
Private Sub Document_ToolbarItemClicked(ByVal ToolbarItem As IHMIToolbarItem)
'VBA108
Dim objToolbarItem As HMIToolbarItem
Dim varToolbarItemKey As Variant
Set objToolbarItem = ToolbarItem
'
'"varToolbarItemKey" contains the value of parameter "Key"
'from the clicked userdefined toolbar-item
varToolbarItemKey = objToolbarItem.Key
'
Select Case varToolbarItemKey
Case "tItem1_1"
MsgBox "The first Toolbar-Icon was clicked!"
End Select
End Sub
```

ViewCreated Event

Description

Occurs when a copy of a picture has been created.

Note

This event is both application-specific and document-specific.

To ensure that the application-specific event is available in the project, the application must be made known to Graphics Designer. This is done by means of the following statement:

Dim WithEvents <Name> As grafexe.Application

syntax

```
Document_ViewCreated(ByVal pView As IHMIView, CancelForwarding As
Boolean)
```

Parameters

Parameter (Data Type)	Description
pView (IHMIView)	Identifies the copy of the picture.
CancelForwarding (Boolean)	TRUE if the event is not intended to be forwarded. Default setting is "False".

Example:

Carry out the following procedure so that the example shown below will work:

```
Private Sub SetApplication()
'This procedure have to execute with "F5" first
Set objGDApplication = grafexe.Application
End Sub
```

In the following example the number of copy pictures is output when a new copy of the picture has been created.

```
Private Sub Document_ViewCreated(ByVal pView As IHMIView, CancelForwarding As Boolean)
'VBA109
Dim iViewCount As Integer
'
'To read out the number of views
iViewCount = pView.Application.ActiveDocument.Views.Count
```

```
MsgBox "A new copy of the picture (number " & iViewCount & ") was created."
End Sub
```

See also

VBA Reference (Page 3124)

WindowStateChange Event

Description

Occurs when the window size is changed (e.g. from "Minimized" to "Maximized").

syntax

```
objGDApplication_WindowStateChanged()
```

Parameter (Optional)

--

Example:

In the following example a message is output when the window size is changed:

```
Private Sub objGDApplication_WindowStateChanged()
'VBA110
MsgBox "The state of the application-window is changed!"
End Sub
```

VBA Reference (Page 3124)

5.5.1.6 Methods

A-C

Activate Method

Description

Activates the specified object.

syntax

Expression.`Activate()`

Expression

Necessary. An expression or element which returns an object of the "Application" or "View" type.

Parameters

--

Example:

In the following example a copy of the active picture is created and then activated:

```
Sub CreateAndActivateView()
'VBA111
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

See also

View Object (Page 3468)

Application Object (Page 3284)

VBA Reference (Page 3124)

Add Method

Description

Adds another element to a listing.

The following table shows you the listings to which the Add method can be applied. The parameters and syntax for the respective Add methods can be found under "Methods".

Listing	Application for the Add Method
AnalogResultInfos Listing	Adds a new, analog value range in the Dynamic dialog.
Documents Listing	Creates a new picture in the Graphics Designer
GroupedObjects Listing	Adds a new object to a group object.
Toolbars Listing	Creates a new, user-defined toolbar.
Tag Triggers Listing	Creates a new tag trigger.
Views Listing	Creates a copy of the specified picture.

See also

Add Method (Views Listing) (Page 3175)

Add Method (TagTriggers Listing) (Page 3174)

Add Method (CustomToolbars Listing) (Page 3170)

Add Method (GroupedObjects Listing) (Page 3172)

Add Method (Documents Listing) (Page 3171)

Add Method (AnalogResultInfos Listing) (Page 3168)

Add Method (AnalogResultInfos Listing)

Description

Adds a new, analog value range in the Dynamic dialog.

syntax

Expression.`Add(RangeTo, ResultValue)`

Expression

Necessary. An expression or element which returns an object of the "AnalogResultInfos" type.

Parameters

Parameter (Data Type)	Description
RangeTo (Variant)	The value range to which the change of property gives rise.
ResultValue (Variant)	The value to which the object property is assigned when the value range is reached.

Example:

In the following example the radius of a circle is given dynamics with the In the following example a tag name is assigned and three analog value ranges are created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA112
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

The diagram shows the Dynamic dialog after the procedure has been carried out:

DynamicDialog Object (Page 3327)

AnalogResultInfos Object (Listing) (Page 3283)

CreateDynamic Method (Page 3206)

How to dynamize a property with the Dynamic dialog (Page 3084)

Add Method (CustomToolbars Listing)

Description

Creates a new, user-defined toolbar. There is a difference between application-specific and picture-specific user-defined toolbars:

- Application-specific toolbar: This is linked to the Graphics Designer and is also only visible when all the pictures in the Graphics Designer are closed. "Place the VBA code in the document called "GlobalTemplateDocument" or "ProjectTemplateDocument" and use the Application property.
- Picture-specific toolbar: Is linked with a specific picture and remains visible as long as the picture is visible. Place the VBA code in the document called "ThisDocument" for the desired picture and use the ActiveDocument property.

syntax

Expression.`Add(Key)`

Expression

Necessary. An expression or element which returns an object of the "CustomToolbars" type.

Parameters

Parameter (Data Type)	Description
Key (Variant)	Identifies the user-defined toolbar. Use unique names for "Key" (e.g. "DocToolbar1")

Example:

In the following example a user-defined toolbar with two icons is created in the active picture. These icons are separated by a dividing line:

```
Sub AddDocumentSpecificCustomToolbar()
'VBA115
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
```

```
Set objToolbar = ActiveDocument.CustomToolbars.Add("DocToolbar")

'Add toolbar-items to the userdefined toolbar
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "My first
Symbol-Icon")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(3, "tItem1_3", "My second
Symbol-Icon")
'
'Insert seperatorline between the two tollbaritems
Set objToolbarItem = objToolbar.ToolbarItems.InsertSeparator(2, "tSeparator1_2")
End Sub
```

InsertSeparator Method (Page 3230)

InsertFromMenuItem Method (Page 3226)

VBA Reference (Page 3124)

Creating Customized Menus and Toolbars (Page 3021)

Add Method (Documents Listing)

Description

Creates a new picture in the Graphics Designer

syntax

Expression.`Add [HMIOpenDocumentType]`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Parameters

Parameter (Data Type)	Description
HMIOpenDocumentType (HMIDocumentType)	Defines how the picture will be opened: • HMIDocumentTypeVisible: Opens the picture for direct processing. This is the default setting if you do not specify the parameter. • HMIDocumentTypeInvisible: Opens the picture in invisible mode, i.e. it is not displayed in the Graphics Designer. You can only address the picture via the Documents listing, and make it visible again by means of the Hide property.

Example:

In the following example a new picture is created in the Graphics Designer:

```
Sub AddNewDocument()
'VBA113
Application.Documents.Add hmiOpenDocumentTypeVisible
End Sub
```

See also

Hide Property (Page 3627)

Documents Object (Listing) (Page 3324)

VBA Reference (Page 3124)

Add Method (GroupedObjects Listing)

Description

Adds an existing object to the specified group object.

syntax

Expression.`Add(Index)`

Expression

Necessary. An expression or element which returns an object of the "GroupedObjects" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	The object that is intended to be added. You can either use the index number or the object name.

Example:

In this example the group object "My Group" is created from a number of objects. An ellipse segment is then added to the group object:

```
Sub CreateGroup()
'VBA114
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipseSegment As HMIEllipseSegment
Dim objGroup As HMIGroup

Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With

MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup

'Set name for new group-object
'The name identifies the group-object
objGroup.ObjectName = "My Group"

'Add new object to active document...
Set objEllipseSegment = ActiveDocument.HMIObjects.AddHMIObject("EllipseSegment",
"HMIEllipseSegment")
Set objGroup = ActiveDocument.HMIObjects("My Group")

'...and add it to the group:
objGroup.GroupedHMIObjects.Add ("EllipseSegment")
End Sub
```

See also

GroupedObjects Object (Listing) (Page 3355)

Add Method (TagTriggers Listing)

Description

Creates a new tag trigger.

syntax

Expression.`Add(VarName, Type)`

Expression

Necessary. An expression or element which returns an object of the "TagTriggers" type.

Parameters

Parameter (Data Type)	Description
VarName (String)	The name of the tag that is intended to be used as a trigger. Please note that you have to create the tag in the Tag Selection dialog.
Type (CycleType)	This is the cycle type. Select the cycle type from a list in the VBA Editor when you use this method.

Example:

In the following example the radius of a circle is made dynamic using a trigger tag:

```
Sub DynamicWithVariableTriggerCycle()
'VBA69
Dim objVBScript As HMIScriptInfo
Dim objVarTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VariableTrigger",
"HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
Set objVarTrigger = .Trigger.VariableTriggers.Add("VarTrigger", hmiVariableCycleType_10s)
.SourceCode = ""
End With
End Sub
```

See also

VariableTriggers Object (Listing) (Page 3467)

VBA Reference (Page 3124)

Add Method (Views Listing)

Description

Creates a copy of the specified picture.

syntax

Expression.`Add()`

Expression

Necessary. An expression or element which returns an object of the "Views" type.

Parameters

--

Example:

In the following example a copy of the active picture is created and then activated:

```
Sub CreateViewAndActivateView()
'VBA117
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

AddAction Method

Description

Configures an action on an object or property. This action is triggered when a defined event occurs.

syntax

Expression.`Method(HMIActionCreationType)`

Expression

Necessary. An expression or element which returns an object of the "Actions" type.

Parameters

Parameter (Data Type)	Description
HMIActionCreationType (Variant)	Defines the action: • hmiActionCreationTypeCScript: Configures a C action • hmiActionCreationTypeVBScript: Configures a VBS action • hmiActionCreationTypeDirectConnection: Configures a direct connection

Example:

In the following example a VBS action for changing the radius of a circle is configured:

```
Sub AddActionToPropertyTypeVBScript()
'VBA118
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
'Create circle in picture. By changing of property "Radius"
'a VBS-action will be started:
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
Set objEvent = objCircle.Radius.Events(1)
Set objVBScript = objEvent.Actions.AddAction(hmiActionCreationTypeVBScript)
End Sub
```

See also

Actions Object (Listing) (Page 3273)

AddActiveXControl Method

Description

Adds a new ActiveXControl object to the "HMIObjects" listing. The object is inserted in the upper left corner of the specified picture.

syntax

Expression.AddActiveXControl("ObjectName", "ProgID")

Expression

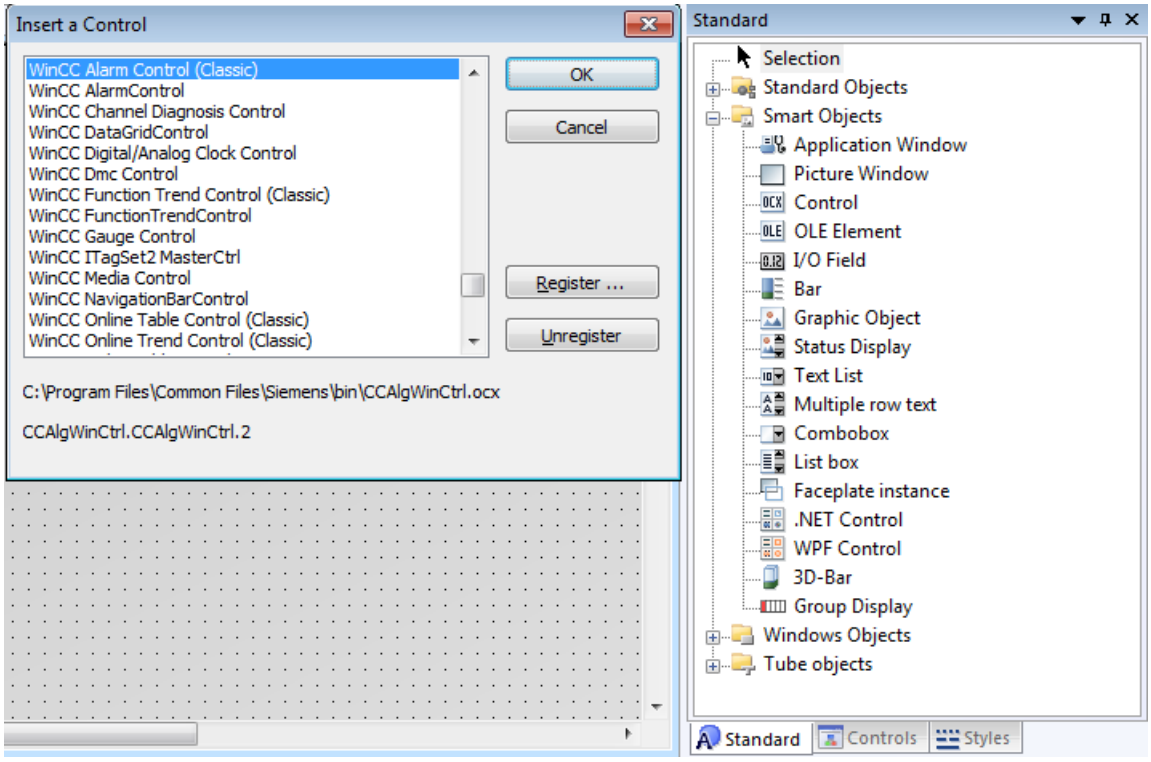
Required. An expression or element which returns an object of the "HMIObjects" type.

Parameter

Parameter (data type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ProgID (String)	The ActiveX Control that is to be inserted.

Determining the ProgID

To determine the ProgID for an ActiveX control, go to the "Object Palette" in the Graphics Designer and in the Default tab under "Smart Objects" insert the control object into the picture. The "Insert a Control" dialog displays the path and ProgID for the selected control:



The following table shows a list of ProgIDs of WinCC controls that are installed by WinCC:

Name of the WinCC control	ProgID
Siemens HMI Symbol Library	SiemensHMI.SymbolLibrary.1
WinCC AlarmControl	CCAxAlarmControl.AxAlarmControl.1
WinCC digital/analog clock control	DACLOCK.DaclockCtrl.1
WinCC FunctionTrendControl	CCAxFunctionTrendControl.AxFunctionTrendControl.1

Name of the WinCC control	ProgID
WinCC gauge control	XGAUGE.XGaugeCtrl.1
WinCC media control	CCMediaControl.CCMediaControl.1
WinCC OnlineTableControl	CCAxOnlineTableControl.AxOnlineTableControl.1
WinCC OnlineTrendControl	CCAxOnlineTrendControl.AxOnlineTrendControl.1
WinCC push button control	PBUTTON.PbuttonCtrl.1
WinCC slider control	SLIDER.SliderCtrl.1
WinCC RulerControl	CCAxTrendRulerControl.AxRulerControl.1
WinCC UserArchiveControl	CCAxUserArchiveControl.AxUserArchiveControl.1

Example:

In the following example, the ActiveX Control "WinCC Gauge Control" is inserted in the active picture.

```
Sub AddActiveXControl()
'VBA119
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
With ActiveDocument
.HMIObjects("WinCC_Gauge").Top = 40
.HMIObjects("WinCC_Gauge").Left = 40
End With
End Sub
```

Note

After executing the method, the Graphics Designer will not be fully shut down. The "Grafexe.exe" file remains in the memory. In order to restart the Graphics Designer, exit the "Grafexe.exe" application in the Task Manager.

ActiveXControl Object (Page 3275)

VBA Reference (Page 3124)

AddDotNetControl method

Description

Adds a new ".Net-Control" object to the "HMIObjects" listing.

Syntax

```
Expression.AddDotNetControl(ObjectName, ControlType, InGAC,
AssemblyInfo)
```

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

Parameter (Data Type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ControlType (String)	The namespace of the object.
InGAC (String)	TRUE: The object is registered in the Global Assembly Cache. FALSE: The object is not registered in the Global Assembly Cache.
AssemblyInfo (String)	If "InGAC=TRUE", then the following information will be specified: Assembly Version Culture PublicKeyToken If "InGAC=FALSE", only the path of the object is specified in "Assembly".

Example

In the following example, the ".NETControl" object from the Global Assembly Cache is inserted in the active picture.

```
'VBA851
Dim DotNetControl As HMIDotNetControl
Set DotNetControl = ActiveDocument.HMIObjects.AddDotNetControl("MyVBAControl",
"System.Windows.Forms.Label", True,"Assembly=System.Windows.Forms, Version=2.0.0.0,
Culture=neutral, PublicKeyToken=b77a5c561934e089")
```

AddFolder Method

Description

Creates a new folder in the components library. The FolderItem object of the "Folder" type is added to the FolderItems listing.

The new folder created in this way receives the internal name "FolderX", where "X" stands for a consecutive number, starting with 1. Use the internal name to address the folder in the FolderItems listing.

syntax

Expression.AddFolder(DefaultName)

Expression

Necessary. An expression or element which returns an object of the "FolderItems" type.

Parameters

Parameter (Data Type)	Description
DefaultName (String)	The name of the folder that is to be created.

Example:

In the following example the folder "My Folder" will be created in the "Project Library":

```
Sub AddNewFolderToProjectLibrary()
'VBA120
Dim objProjectLib As HMISymbolLibrary
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder")
End Sub
```

AddFromClipboard Method

Description

Copies an object from the clipboard into a folder in the Components Library. The FolderItem object of the "Item" type is added to the FolderItems listing.

Note

The clipboard must contain objects from the Graphics Designer. Other contents (such as ASCII text) will not be pasted.

syntax

Expression.AddFromClipboard(DefaultName)

Expression

Necessary. An expression or element which returns an object of the "FolderItems" type.

Parameters

Parameter (Data Type)	Description
DefaultName (String)	The name to be given to the object pasted into the components library.

Example:

In the following example the object "PC" from the "Global Library" will be copied into the folder "Folder 3" in the "Project Library":

```
Sub CopyObjectFromGlobalLibraryToProjectLibrary()
'VBA121
Dim objGlobalLib As HMISymbolLibrary
Dim objProjectLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder3")
'
'copy object from "Global Library" to clipboard
With objGlobalLib
.FolderItems(2).Folder.Item(2).Folder.Item(1).CopyToClipboard
End With
'
'paste object from clipboard into "Project Library"
objProjectLib.FolderItems(objProjectLib.FindByDisplayName("My
Folder3").Name).Folder.AddFromClipBoard ("Copy of PC/PLC")
End Sub
```

AddHMIObject Method

Description

Adds a new standard, smart or Windows object to the "HMIObjects" listing. The object is inserted in the upper left corner of the specified picture.

Note

Use the AddActiveXControl method to insert an ActiveXControl.

Use the AddOLEObject method to insert an OLE Element.

syntax

Expression.AddHMIObject("ObjectName", "ProgID")

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

Parameter (Data Type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ProgID (String)	The object type that is to be inserted. "Obtain the "ProgID" by prefixing the VBA object name with "HMI" "(e.g. HMICircle or HMIRectangle)

Example:

In the following example a circle will be inserted into the active picture and its background color set to "Red":

```
Sub AddCircleToActiveDocument()
'VBA122
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("VBA_Circle", "HMICircle")
objCircle.BackColor = RGB(255, 0, 0)
End Sub
```

AddItem Method

Description

Copies an object from the specified picture into a folder in the Components Library. The FolderItem object of the "Item" type is added to the FolderItems listing.

syntax

Expression.`Folder.AddItem "DefaultName", pHMIObject`

Expression

Necessary. An expression or element which returns an object of the "FolderItems" type.

Parameters

Parameter (Data Type)	Description
DefaultName (String)	The name to be given to the object pasted into the components library.
pHMIObject (HMIObject)	The object that is to be inserted into the Components Library from the specified picture.

Example:

In the following example a circle will be copied into the "Project Library". For this purpose the circle will be pasted into the active picture and the folder "My Folder 2" will

```
Sub VBA123()
'VBA123
Dim objProjectLib As HMISymbolLibrary
Dim objCircle As HMICircle

Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle", "HMICircle")
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder2")
objProjectLib.FindByDisplayName("My Folder2").Folder.AddItem "ProjectLib Circle",
ActiveDocument.HMIObjects("Circle")
End Sub
```

See also

FolderItems Object (Listing) (Page 3345)

Accessing the component library with VBA (Page 3040)

AddOLEObject Method

Description

Adds a new OLE Element to the "HMIObjects" listing. The object is inserted in the upper left corner of the specified picture.

syntax

```
Expression.AddOLEObject(ObjectName, ServerName, [CreationType],
[UseSymbol])
```

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

Parameter (Data Type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ServerName (String)	The name of the application which is to contain the OLE Element, or the file name complete with path. The value for "ServerName" corresponds to the "Object Type" in the "Insert Object" dialog: CreationType (HMIOLEObjectCreation Type-)	Defines whether the OLE Element will be newly created or an existing file will be used: • HMIOLEObjectCreationTypeDirect: Corresponds to setting "Create New". This setting is used if you do not specify the parameter. • HMIOLEObjectCreationTypeByLink: Corresponds to setting "Create from File". This creates a copy of the file. Any changes made to the OLE Element have no effect on the original file. Assign a name to the file via the "ServerName" parameter. • HMIOLEObjectCreationTypeByLinkWithReference: Same as above, except that changes in OLE Element affect the original file. Assign a name to the file via the "ServerName" parameter.
UseSymbol (Boolean)	TRUE if the standard icon for the file type is to be used. Double clicking on the icon then opens the associated application. The default setting for this parameter is FALSE.

Example:

In the following example, an OLE Element containing a Wordpad document will be inserted into the active picture:

```
Sub AddOLEObjectToActiveDocument()
'VBA124
Dim objOLEObject As HMIOLEObject
Set objOLEObject = ActiveDocument.HMIObjects.AddOLEObject("MS Wordpad Document",
"Wordpad.Document.1")
End Sub
```

In the following example, the AddOLEObject method will be used and the "HMIOLEObjectCreationTypeByLink" parameter will be specified:

```
Sub AddOLEObjectByLink()
'VBA805
Dim objOLEObject As HMIOLEObject
Dim strFilename As String
'
'Add OLEObject by filename. In this case, the filename has to
'contain filename and path.
'Replace the definition of strFilename with a filename with path
'existing on your system
strFilename = Application.ApplicationDataPath & "Test.bmp"
Set objOLEObject = ActiveDocument.HMIObjects.AddOLEObject("OLEObject1", strFilename,
hmiOLEObjectCreationTypeByLink, False)
End Sub
```

In the following example, the AddOLEObject method will be used and the "HMIOLEObjectCreationTypeByLinkWithReference" parameter will be specified:

```
Sub AddOLEObjectByLinkWithReference()
'VBA806
Dim objOLEObject As HMIOLEObject
Dim strFilename As String
'
'Add OLEObject by filename. In this case, the filename has to
'contain filename and path.
'Replace the definition of strFilename with a filename with path
'existing on your system
strFilename = Application.ApplicationDataPath & "Test.bmp"
Set objOLEObject = ActiveDocument.HMIObjects.AddOLEObject("OLEObject1", strFilename,
hmiOLEObjectCreationTypeByLinkWithReference, True)
End Sub
```

See also

HMIObjects Object (Listing) (Page 3361)

VBA Reference (Page 3124)

AddWPFControl method

Description

Adds a new "WPF-Control" object to the "HMIObjects" listing.

Syntax

```
Expression.AddWPFControl(ObjectName, ControlType, InGAC,
AssemblyInfo)
```

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

Parameter (Data Type)	Description
ObjectName (String)	The name of the object. You can address the object by its name in a listing.
ControlType (String)	The namespace of the object.
InGAC (String)	TRUE: The object is registered in the Global Assembly Cache. FALSE: The object is not registered in the Global Assembly Cache.
AssemblyInfo (String)	If "InGAC=TRUE", then the following information will be specified: Assembly Version Culture PublicKeyToken If "InGAC=FALSE", only the path of the object is specified in "Assembly".

Example

In the following example, the "WPF Control" object outside the Global Assembly Cache is inserted in the active picture.

```
'VBA852
Dim WPFControl As HMIWPFControl
Set WPFControl = ActiveDocument.HMIObjects.AddWPFControl("MyWPFVBAControl",
"WinCCWPFControl.TestControl", False, "Assembly=Z:\TestControl\WinCCWPFControl.dll")
```

AlignBottom Method

Description

Aligns the objects selected in the specified picture with In so doing the alignment is oriented on the first object that you select.

syntax

Expression.`AlignBottom()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then aligned with the bottom:

```
Sub AlignSelectedObjectsBottom()
'VBA125
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.AlignBottom
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

VBA Reference (Page 3124)

AlignLeft Method

Description

Left-justifies the objects selected in the specified picture. In so doing the alignment is oriented on the first object that you select.

syntax

Expression.`AlignLeft()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then aligned to the left:

```
Sub AlignSelectedObjectsLeft()
'VBA126
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.AlignLeft
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

VBA Reference (Page 3124)

AlignRight Method

Description

Right-justifies the objects selected in the specified picture. In so doing the alignment is oriented on the first object that you select.

syntax

Expression.`AlignRight()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then aligned to the right:

```
Sub AlignSelectedObjectsRight()
'VBA127
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.AlignRight
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

VBA Reference (Page 3124)

AlignTop Method

Description

Aligns the objects selected in the specified picture with In so doing the alignment is oriented on the first object that you select.

syntax

Expression.`AlignTop()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then aligned with the top:

```
Sub AlignSelectedObjectsTop()
'VBA128
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.AlignTop
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

ArrangeMinimizedWindows Method

Description

Arranges all minimized pictures on the lower margin of the Graphics Designer.

syntax

Expression.`ArrangeMinimizedWindows()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example all minimized pictures are arranged on the lower margin of the Graphics Designer. For this example to work, you must have minimized a number of pictures in the Graphics Designer:

```
Sub ArrangeMinimizedWindows()
'VBA129
Application.ArrangeMinimizedWindows
End Sub
```

See also

Application Object (Page 3284)

VBA Reference (Page 3124)

BackwardOneLevel Method

Description

Moves the selected objects one level backward within their current layer.

syntax

Expression.`BackwardOneLevel()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted in the active picture. The object inserted last is then moved backward one level:

```
Sub MoveObjectOneLevelBackward()
'VBA173
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = False
End With
With objRectangle
.Top = 40
.Left = 40
.Width = 100
.Height = 50
.BackColor = RGB(255, 0, 255)
.Selected = True
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.BackwardOneLevel
End Sub
```

BringToFront Method

Description

Brings the selected objects right to the front within their current layer.

Note

If the "BringToFront" method is used, the sequence of HMI objects can change in the HMIObjects listing.

Syntax

Expression.`BringToFront()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted in the active picture. The object inserted last is then brought to the front:

```
Sub MoveObjectToFront()
'VBA198
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 40
.Left = 40
.Width = 100
.Height = 50
.BackColor = RGB(255, 0, 255)
.Selected = False
End With
MsgBox "The objects circle and rectangle are created" & vbCrLf & "Only the circle is
selected!"
ActiveDocument.Selection.BringToFront
MsgBox "The selection is moved to the front."
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

CascadeWindows Method

Description

Arranges all open pictures in the Graphics Designer in a cascade (i.e. overlapping).

syntax

Expression.`Methode(Parameter)`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are arranged in a cascade. For this example to work, you must have opened a number of pictures in the Graphics Designer:

```
Sub CascadeWindows()
'VBA130
Application.CascadeWindows
End Sub
```

VBA Reference (Page 3124)

Application Object (Page 3284)

CenterHorizontally Method

Description

Using this method, the objects selected in the specified picture are centered horizontally.

syntax

Expression.`CenterHorizontally()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then centered horizontally:

```
Sub CenterSelectedObjectsHorizontally()
'VBA131
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.CenterHorizontally
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

CenterVertically Method

Description

Using this method, the objects selected in the specified picture are centered vertically.

syntax

Expression.`CenterVertically()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then centered vertically:

```
Sub CenterSelectedObjectsVertically()
'VBA132
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.CenterVertically
End Sub
```

CheckSyntax Method

Description

Checks whether the syntax of the specified C script is correct.

Use the CheckSyntax method in conjunction with the Compiled Property.

syntax

Expression.`CheckSyntax(CheckOK, Error)`

Expression

Necessary. An expression or element which returns an object of the "DynamicDialog" type.

Parameters

Parameter (Data Type)	Description
CheckOK (Boolean)	TRUE if the syntax of the specified C script is correct.
Error (String)	The message text that is output if the C script is incorrect.

Example:

--

See also

DynamicDialog Object (Page 3327)

VBA Reference (Page 3124)

Close Method

Description

Closes the specified picture and removes it from the document listing.

Note

Changes that have not been saved will be lost.

Syntax 1

Expression.`Close(FileName)`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Syntax 2

Expression.`Close()`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The name of the PDL file to be closed.

Example:

In the following example the picture "Test.PDL" will For this example to work, you must have opened the picture "Test.PDL":

```
Sub CloseDocumentUsingTheFileName()
'VBA134
Dim strFile As String
strFile = Application.ApplicationDataPath & "test.pdl"
Application.Documents.Close (strFile)
End Sub
In the following example the active picture in the Graphics Designer will be closed:
Sub CloseDocumentUsingActiveDocument()
'VBA135
ActiveDocument.Close
End Sub
```

See also

Document Object (Page 3321)

CloseAll Method

Description

Closes all the pictures opened in the Graphics Designer and removes them from the documents listing.

Note

Changes that have not been saved will be lost.

syntax

Expression.`CloseAll()`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are closed:

```
Sub CloseAllDocuments()
'VBA136
Application.Documents.CloseAll
End Sub
```

See also

Documents Object (Listing) (Page 3324)

VBA Reference (Page 3124)

ConvertToScript Method

Description

Converts the specified Dynamic dialog into a C script.

On conversion the associated DynamicDialog object is deleted.

Note

You cannot undo the conversion.

syntax

Expression.`ConvertToScript()`

Expression

Necessary. An expression or element which returns an object of the "DynamicDialog" type.

Parameters

--

Example:

In the following example a circle will be inserted into the active picture and its radius will be dynamically configured using the Dynamic dialog. The Dynamic dialog will then be converted into a C script.

```
Sub ConvertDynamicDialogToScript()
'VBA137
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
'
'Create dynamic
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
'
'configure dynamic. "ResultType" defines the valuerange-type:
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
MsgBox "The dynamic-dialog will be changed into a C-script."
.ConvertToScript
End With
End Sub
```

DynamicDialog Object (Page 3327)

VBA Reference (Page 3124)

ConvertWM method

Description

Is used internally for PowerCC.

CopySelection Method

Description

Using this method, the objects selected in the picture are copied to the clipboard.

syntax

Expression.`CopySelection()`

Expression

Necessary. An expression or element which returns an object of the "Document" or "Selection" type.

Parameters

--

Example:

In the following example two of the objects inserted in the active picture are selected. The selection is copied and pasted to a new picture:

```
Sub CopySelectionToNewDocument()
'VBA138
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim iNewDoc As Integer
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
'Instead of "ActiveDocument.CopySelection" you can also write:
'"ActiveDocument.Selection.CopySelection".
ActiveDocument.CopySelection
Application.Documents.Add hmiOpenDocumentTypeVisible
iNewDoc = Application.Documents.Count
Application.Documents(iNewDoc).PasteClipboard
End Sub
```

CopyToClipboard Method

Description

Copies an object from a folder in the Components Library to the clipboard.

Syntax

Expression.`CopyToClipboard()`

Expression

Necessary. An expression or element which returns a FolderItem object of the "Item" type.

Parameters

--

Example:

In the following example the object "PC" from the "Global Library" will be copied into the folder "My Folder3" in the "Project Library":

```
Sub CopyObjectFromGlobalLibraryToProjectLibrary()
'VBA139
Dim objGlobalLib As HMISymbolLibrary
Dim objProjectLib As HMISymbolLibrary
Dim objFolderItem As HMIFolderItem

Set objGlobalLib = Application.SymbolLibraries(1)
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder3")
'
'copy object from "Global Library" to clipboard
With objGlobalLib
.FolderItems(2).Folder.Item(2).Folder.Item(1).CopyToClipboard
End With
'
'paste object from clipboard into "Project Library"
Set objFolderItem = objProjectLib.FindByDisplayName("My Folder3")
objFolderItem.Folder.AddFromClipBoard ("Copy of PC/PLC")

End Sub
```

CreateCustomizedObject Method

Description

Creates a customized object from the objects selected in the specified picture. You then have to configure the customized object in the "Configuration Dialog".

For further information on this topic please refer to "Customized Objects" in this documentation and "Customized Object" in the WinCC documentation.

syntax

Expression.`CreateCustomizedObject()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and a customized object is then created:

```
Sub CreateCustomizedObject()
'VBA140
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objCustObject As HMICustomizedObject
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objCustObject = ActiveDocument.Selection.CreateCustomizedObject
objCustObject.ObjectName = "myCustomizedObject"
```

```
End Sub
```

See also

Customized Objects (Page 3074)

CreateDynamicDialog method

Description

Dynamizing properties of pictures and objects depending on specific value ranges or variable statuses.

Syntax

Expression.`CreateDynamicDialog([Code as String],iResultType as Long)`

Expression

Required. An expression or element which returns an object of the "Property" type.

Parameter

Parameter (Data Type)	Description
Code (String)	Defines the function or tag that is used for dynamic purposes. Also specify the tag name in single quotation marks: "Tag name"
iResultType (Long)	Defines the type of value range: • hmiResultTypeDirect = 0 • hmiResultTypeAnalog= 1 • hmiResultTypeBool = 2 • hmiResultTypeBit = 3

Example

In the following example the radius of a circle is given dynamics with the dynamic dialog. A tag name and a "ResultType" are assigned to the dynamic dialog.

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA820
```

```
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
'Create Object
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("myCircle","HMICircle")
'Create dynamic (Tag "myTest" must be exist")
Set objDynDialog = objCircle.Radius.CreateDynamicDialog("'myTest'",1)
End Sub
```

See also

FaceplateProperty object (Page 3343)

CreateDynamic Method

Description

Makes the specified property dynamic.

syntax

Expression.`CreateDynamic(DynamicType, [SourceCode])`

Expression

Necessary. An expression or element which returns an object of the "Property" type.

Parameters

You only need use the "SourceCode" parameter if you want to make the specified property dynamic with the aid of the Dynamic dialog.

In all other types of dynamics you can omit the parameter.

Parameter (Data Type)	Description
DynamicType (HMIDynamicCreationType)	Defines the type of dynamics: • hmiDynamicCreationTypeVariableDirect: Dynamics with a tag • hmiDynamicCreationTypeVariableIndirect: Dynamics with a tag In this type of dynamics you specify only the name of the tag whose value will be used for dynamic purposes. • hmiDynamicCreationTypeScript: Dynamics with a script (C, VB). • hmiDynamicCreationTypeDynamicDialog: Dynamizing with the dynamic dialog box:
SourceCode (String)	Defines the function or tag that will be used for dynamic purposes. Also specify the tag name in single quote marks: "Tag name"

Example:

In this example a circle property "Top" will be made dynamic with the aid of the tag "NewDynamic":

```
Sub AddDynamicAsVariableDirectToProperty()
'VBA141
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("MyCircle", "HMICircle")
'Make property "Top" dynamic:
Set objVariableTrigger = objCircle.Top.CreateDynamic(hmiDynamicCreationTypeVariableDirect,
"NewDynamic")
'
'Define cycle-time
With objVariableTrigger
.CycleType = hmiCycleType_2s
End With
End Sub
```

CreateGroup Method

Description

Creates a group object from the objects selected in the specified picture.

For further information on this topic please refer to "Group Objects" in this documentation and "Group Object" in the WinCC documentation.

syntax

Expression.`CreateGroup()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and a group object is then created:

```
Sub CreateGroup()
'VBA142
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
objGroup.ObjectName = "myGroup"
End Sub
```

D-M

GetDeclutterObjectSize method

Description

Reads the limits displaying and hiding objects (decluttering) in the specified picture.

Syntax

Expression.`GetDeclutterObjectSize(Min, Max)`

Expression

Required. An expression or element which returns an object of the "Document" type.

Parameter

Parameter (data type)	Description
Min (Long)	Lower size range in pixels.
Max (Long)	Upper size range in pixels.

Example

In the following example, the decluttering limits of the active picture are read and output:

```
Sub ReadSettingsOfPicture()
'VBA848
Dim objectsize_min As Long, objectsize_max As Long

ActiveDocument.GetDeclutterObjectSize objectsize_min, objectsize_max
MsgBox objectsize_min & " " & objectsize_max

End Sub
```

Delete Method

Description

Deletes the specified object and removes it from the listing.

syntax

Expression.`Delete()`

Expression

Necessary. An expression or element which returns objects of the following types.

- Assignment
- FolderItem
- LanguageText
- Menu
- MenuItem
- Object
- Toolbar
- ToolbarItem
- VariableTrigger
- View

Parameters

--

Example:

In the following example the first object in the active picture will be deleted. For this example to work, you must have created at least one object in the active picture:

```
Sub ObjectDelete()
'VBA143
ActiveDocument.HMIObjects(1).Delete
End Sub
```

DeleteAll Method

Description

Deletes all selected objects in the specified picture and removes them from the "Selection" and "HMIObjects" listings.

syntax

Expression.`DeleteAll()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and then selected and deleted:

```
Sub DeleteAllSelectedObjects()
'VBA145
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
```

```
MsgBox "Objects selected!"
ActiveDocument.Selection.DeleteAll
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

VBA Reference (Page 3124)

DeleteDynamic Method

Description

Removes the dynamic characteristic from the specified property.

syntax

Expression.DeleteDynamic

Expression

Necessary. An expression or element which returns an object of the "Property" type.

Parameters

--

Example:

In the following example the dynamic characteristic created with the aid of the CreateDynamic Method will be

```
Sub DeleteDynamicFromObjectMeinKreis()
'VBA146
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects("MyCircle")
objCircle.Top.DeleteDynamic
End Sub
```

See also

Property Object (Page 3411)

CreateDynamic Method (Page 3204)

VBA Reference (Page 3124)

DeselectAll Method

Description

Deselects all selected objects in the specified picture and removes them from the Selection listing.

syntax

Expression.`DeselectAll()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and selected. All selected objects are then deselected:

```
Sub SelectObjectsAndDeselectThemAgain()
'VBA147
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.DeselectAll
MsgBox "Objects deselected!"
End Sub
```

Destroy Method

Description

Ungroups the specified customized object. The objects remain intact.

Syntax

Expression.`Destroy()`

Expression

An expression or element which returns objects of the "CustomizedObject" types.

Parameters

--

Example:

An example showing how to use the Destroy Method can be found in this documentation under the heading "Editing a Customized Object with VBA".

See also

CustomizedObject Object (Page 3312)

Destroy Method (Page 3212)

Delete Method (Page 3208)

CreateCustomizedObject Method (Page 3202)

How to Edit a Customized Object with VBA (Page 3076)

DuplicateSelection Method

Description

Duplicates the objects selected in the specified picture. The objects created in this way are added to the HMIObjects listing. The names of new objects are numbered consecutively with each duplication.

For instance if you duplicate an object called "Circle", the duplicate object is called "Circle1". If you duplicate the object called "Circle" once more, the resulting object is called "Circle2" and so on.

syntax

Expression.`DuplicateSelection()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted at different positions in the current picture and selected. They are then duplicated:

```
Sub DuplicateSelectedObjects()
'VBA149
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.DuplicateSelection
End Sub
```

VBA Reference (Page 3124)

EvenlySpaceHorizontally Method

Description

Using this method, the objects selected in the specified picture are spaced horizontally at an even distance from one another.

syntax

Expression.EvenlySpaceHorizontally()

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects are inserted at different positions in the current picture and selected. They are then positioned horizontally at an even distance from one another:

```
Sub EvenlySpaceObjectsHorizontally()
'VBA150
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.EvenlySpaceHorizontally
End Sub
```

See also

VBA Reference (Page 3124)

SelectedObjects object (Listing) (Page 3428)

EvenlySpaceVertically Method

Description

Using this method, the objects selected in the specified picture are spaced vertically at an even distance from one another.

syntax

Expression.`EvenlySpaceVertically()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects are inserted at different positions in the current picture and selected. They are then positioned vertically at an even distance from one another:

```
Sub EvenlySpaceObjectsVertically()
'VBA151
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects created and selected"
ActiveDocument.Selection.EvenlySpaceVertically
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

Export Method

Description

Saves the specified picture as an EMF file.

Syntax

Expression.`Export(Type, Path)`

Expression

Required. An expression or element which returns an object of the "Document" type.

Parameter

Parameter (Data Type)	Description
Type (HMIImportExportType)	Defines the format in which the exported picture will be saved.
Path (String)	The path in which the picture is going to be exported. The path must exist.

Example

```
Sub ExportAllPicturesAsPDL()
'VBA152
Dim iPictureCounter As Integer
Dim strPath As String

strPath = "C:\WinCC_PDL_Export\"

'Count Pictures in Graphics Designer...
For iPictureCounter = 1 To grafexe.Documents.Count
    '...and export each picture as PDL-file to specified path:
    grafexe.Documents(iPictureCounter).Export hmiImportExportTypePDL,
strPath
Next iPictureCounter
End Sub
```

View Object (Page 3468)

Document Object (Page 3321)

Find Method

Description

Searches for objects in the specified picture and returns the search result as a collection object. You can search for the following object properties:

- Type
- Name
- Property

syntax

Expression.`Find([ObjectType], [ObjectName], [PropertyName])`

Expression

Necessary. An expression or element which returns an object of the "HMIObjects" type.

Parameters

You must specify at least one of the three parameters.

Parameter (Data Type)	Description
ObjectType (String)	The object type that is to be searched for. Specify the "ProgID" of the object concerned. "Obtain the "ProgID" by prefixing the VBA object name with "HMI" "(e.g. HMICircle or HMIRectangle)
ObjectName (String)	The name of the object that is to be searched for. You can use placeholders (?,*) in the object name in order to find objects with similar names.
PropertyName (String)	The name of the object property that is to be searched for. Specify the VBA property name concerned (e.g. "BackColor" in place of "Background Color").

Example:

In the following example, objects of the "HMICircle" type will be searched for in the active picture and the search result will be output:

```
Sub FindObjectsByType()
```

```
'VBA153
Dim colSearchResults As HMICollection
Dim objMember As HMIObject
Dim iResult As Integer
Dim strName As String
Set colSearchResults = ActiveDocument.HMIObjects.Find(ObjectType:="HMICircle")
For Each objMember In colSearchResults
iResult = colSearchResults.Count
strName = objMember.ObjectName
MsgBox "Found: " & CStr(iResult) & vbCrLf & "objectname: " & strName)
Next objMember
End Sub
```

Note

Further information on using the Find Method can be found in this documentation under the heading "Editing Standard Objects, Smart Objects and Windows Objects".

VBA Reference (Page 3124)

FindByDisplayName Method

Description

Searches the entire Components Library for the specified object. A FolderItem object is returned as the search result.

Note

The display name of the object is language-dependent. Only the language currently set will be taken into account when searching. The search ends with the first object found.

syntax

Expression.`FindByDisplayName(DisplayName)`

Expression

Necessary. An expression or element which returns an object of the "SymbolLibrary" type or the "FolderItems" listing.

Parameters

Parameter (Data Type)	Description
DisplayName (String)	The display name of the object that is to be searched for in the Components Library.

Example:

In the following example the entire library will be searched for the object "PC" and its display name will be output:

```
Sub FindObjectInSymbolLibrary()
'VBA154
Dim objGlobalLib As HMISymbolLibrary
Dim objFItem As HMIFolderItem
Set objGlobalLib = Application.SymbolLibraries(1)
Set objFItem = objGlobalLib.FindByDisplayName("PC")
MsgBox objFItem.DisplayName
End Sub
```

See also

FolderItem Object (Page 3344)

FireConnectionEvents method

Description

Is used internally by the Graphics Designer.

FlipHorizontally Method

Description

Mirrors the selected objects in the specified picture along the horizontal midline.

The object type determines whether it is allowed to be mirrored (for instance an OLE Element cannot be mirrored). The properties are appropriately modified when mirroring is performed. For example, if you mirror an object of the "StaticText" type along the horizontal midline, the value of the "AlignmentTop" property changes from "0" to "2".

syntax

Expression.`FlipHorizontally()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example a StaticText object will be inserted into the active picture and mirrored along the horizontal midline:

```
Sub FlipObjectHorizontally()
'VBA155
Dim objStaticText As HMIStaticText
Dim strPropertyName As String
Dim iPropertyValue As Integer
Set objStaticText = ActiveDocument.HMIObjects.AddHMIObject("Textfield", "HMIStaticText")
strPropertyName = objStaticText.Properties("Text").Name
With objStaticText
.Width = 120
.Text = "Sample Text"
.Selected = True
iPropertyValue = .AlignmentTop
MsgBox "Value of '" & strPropertyName & "' before flip: " & iPropertyValue
ActiveDocument.Selection.FlipHorizontally
iPropertyValue = objStaticText.AlignmentTop
MsgBox "Value of '" & strPropertyName & "' after flip: " & iPropertyValue
End With
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

VBA Reference (Page 3124)

FlipVertically Method

Description

Mirrors the selected objects in the specified picture along the vertical midline.

The object type determines whether it is allowed to be mirrored (for instance an OLE Element cannot be mirrored). The properties are appropriately modified when mirroring is performed.

For example if you mirror an object of the "StaticText" type along the vertical midline, the value of the "AlignmentLeft" property changes from "0" to "2".

syntax

Expression.`FlipVertically()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example a StaticText object will be inserted into the active picture and mirrored along the vertical midline:

```
Sub FlipObjectVertically()
'VBA156
Dim objStaticText As HMIStaticText
Dim strPropertyName As String
Dim iPropertyValue As Integer
Set objStaticText = ActiveDocument.HMIObjects.AddHMIObject("Textfield", "HMIStaticText")
strPropertyName = objStaticText.Properties("Text").Name
With objStaticText
.Width = 120
.Text = "Sample Text"
.Selected = True
.AlignmentLeft = 0
iPropertyValue = .AlignmentLeft
MsgBox "Value of '" & strPropertyName & "' before flip: " & iPropertyValue
ActiveDocument.Selection.FlipVertically
iPropertyValue = objStaticText.AlignmentLeft
MsgBox "Value of '" & strPropertyName & "' after flip: " & iPropertyValue
End With
End Sub
```

ForwardOneLevel Method

Description

Moves the selected objects one level forward within their current layer.

syntax

Expression.`ForwardOneLevel()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted in the active picture. The object inserted first is then moved forward one level:

```
Sub MoveObjectOneLevelForward()
'VBA174
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 40
.Left = 40
.Width = 100
.Height = 50
.BackColor = RGB(255, 0, 255)
.Selected = False
End With
MsgBox "Objects created and selected!"
ActiveDocument.Selection.ForwardOneLevel
End Sub
```

GetItemByPath Method

Description

Returns a FolderItem object (folder or object) located on the specified internal access path in the Components Library.

Note

To obtain the internal access path, select the "Copy Path" command from The internal access path to the folder or object will then be copied to the clipboard.

syntax

Expression.`GetItemByPath(PathName)`

Expression

Necessary. An expression or element which returns an object of the "SymbolLibrary" type.

Parameters

Parameter (Data Type)	Description
PathName (String)	The internal access path on which the object is located in the Components Library.

Example:

In this example one object from the entire library will be returned and its display name will be output:

```
Sub ShowDisplayName()
'VBA157
Dim objGlobalLib As HMISymbolLibrary
Dim objFItem As HMIFolderItem
Set objGlobalLib = Application.SymbolLibraries(1)
Set objFItem = objGlobalLib.GetItemByPath("\Folder1\Folder2\Object1")
MsgBox objFItem.DisplayName
End Sub
```

InsertFromMenuItem Method

Description

Inserts into an existing, user-defined toolbar a new icon that references an existing menu entry in a user-defined menu.

Use this method if you wish to set up a toolbar so that it contains the same commands as an existing user-defined menu.

Syntax

Expression.`InsertFromMenuItem(Position, Key, pMenuItem, DefaultToolTipText)`

Expression

Required. An expression or element which returns an object of the "ToolbarItems" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the icon within the user-defined toolbar.
Key (Variant)	Identifies the symbol. Use unique names for "Key" "(e.g. tItem1_1).
pMenuItem (HMIMenuItem)	The MenuItem object that is intended to be referenced.
DefaultToolTipText (String)	Defines for the icon concerned the tool tip text that will be displayed when you move the mouse over the icon.

Example:

In this example a user-defined menu and a user-defined toolbar will be inserted in the active picture. The icon calls up the menu entry "Hello World" from the user-defined menu:

```
Sub ToolbarItem_InsertFromMenuItem()
'VBA158
Dim objMenu As HMIMenu
Dim objToolbarItem As HMIToolbarItem
Dim objToolbar As HMIToolbar
Dim objMenuItem As HMIMenuItem
Set objMenu = Application.CustomMenus.InsertMenu(1, "Menu1", "TestMenu")
'
'***********************************************
'* Note:
'* The object-reference has to be unique.
'***********************************************
```

```
'
Set objMenuItem = Application.CustomMenus(1).MenuItems.InsertMenuItem(1, "MenuItem1",
"Hello World")
Application.CustomMenus(1).MenuItems(1).Macro = "HelloWorld"
Set objToolbar = Application.CustomToolbars.Add("Toolbar1")
Set objToolbarItem = Application.CustomToolbars(1).ToolbarItems.InsertFromMenuItem(1,
"ToolbarItem1", objMenuItem, "Call's Hello World of TestMenu")
End Sub

Sub HelloWorld()
MsgBox "Procedure 'HelloWorld()' is execute."
End Sub
```

ToolbarItems Object (Listing) (Page 3452)

InsertSeparator Method (Page 3230)

Add Method (CustomToolbars Listing) (Page 3168)

VBA Reference (Page 3124)

Creating Customized Menus and Toolbars (Page 3021)

InsertMenu Method

Description

Creates a new, user-defined menu. There is a difference between application-specific and picture-specific user-defined menus:

- Application-specific menu: This is linked to the Graphics Designer and is also only visible when all the pictures in the Graphics Designer are closed. "Place the VBA code in the document called "GlobalTemplateDocument" or "ProjectTemplateDocument" and use the Application property.
- Picture-specific menu: Is linked with a specific picture and remains visible as long as the picture is visible. Place the VBA code in the document called "ThisDocument" for the desired picture and use the ActiveDocument property.

syntax

Expression.`InsertMenu(Position, Key, DefaultLabel)`

Expression

Necessary. An expression or element which returns an object of the "CustomMenus" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the user-defined menu within the menu bar. However, picture-specific menus are always positioned to the right of application-specific menus.
Key (Variant)	Identifies the user-defined menu. Use unique names for "Key" (e.g. "DocMenu1")
DefaultLabel (String)	The name of the user-defined menu.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA159
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "First MenuItem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "Second MenuItem")
'
'Insert a dividing rule into custumized menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "First SubMenu")
'
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "First item in sub-
menu")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "Second item in sub-
menu")
End Sub
```

The diagram shows the generated menu structure.

InsertMenuItem Method

Description

Inserts a new entry in a user-defined menu.

syntax

Expression.`InsertMenuItem(Position, Key, DefaultLabel)`

Expression

Necessary. An expression or element which returns an object of the "MenuItems" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the submenu within the user-defined menu.
Key (Variant)	Identifies the submenu. Use unique names for "Key" "(e.g. dSubMenu1_4).
DefaultLabel (String)	Defines the name of the submenu.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA160
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
```

```
'
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "First MenuItem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "Second MenuItem")
'
'Insert a dividing rule into customized menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "First SubMenu")
'
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "First item in sub-
menu")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "Second item in sub-
menu")
End Sub
```

The diagram shows the menu structure.

InsertSeparator Method

Description

Inserts a dividing line in a user-defined menu or user-defined toolbar.

syntax

Expression.`InsertSeparator(Position, Key)`

Expression

Necessary. An expression or element which returns an object of the "MenuItems" or "ToolbarItems" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the dividing line within the user-defined menu or user-defined toolbar.
Key (Variant)	Identifies the dividing line. Use unique names for "Key" (e.g. "tSeparator1_2").

Example:

In the following example a user-defined toolbar with two icons is created in the active picture. These icons are separated by a dividing line:

```
Sub AddDocumentSpecificCustomToolbar()
'VBA161
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Set objToolbar = ActiveDocument.CustomToolbars.Add("DocToolbar")
'Add toolbar-item to userdefined toolbar
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "First
symbol-icon")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(3, "tItem1_3", "Second
symbol-icon")
'
'Insert dividing rule between first and second symbol-icon
Set objToolbarItem = objToolbar.ToolbarItems.InsertSeparator(2, "tSeparator1_2")
End Sub
```

InsertSubmenu Method

Description

Inserts a submenu into an existing user-defined menu.

syntax

Expression.`InsertSubmenu(Position, Key, DefaultLabel)`

Expression

Necessary. An expression or element which returns an object of the "MenuItem" type

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the submenu within the user-defined menu.
Key (Variant)	Identifies the submenu. Use unique names for "Key" "(e.g. dSubMenu1_4).
DefaultLabel (String)	Defines the name of the submenu.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA162
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "First MenuItem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "Second MenuItem")
'
'Insert a dividing rule into customized menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "First SubMenu")
'
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "First item in sub-
menu")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "Second item in sub-
menu")
End Sub
```

The diagram shows the menu structure:

InsertToolbarItem Method

Description

Inserts a new icon in an existing user-defined toolbar.

syntax

Expression.`InsertToolbarItem(Position, Key, DefaultToolTipText)`

Expression

Necessary. An expression or element which returns an object of the "ToolbarItems" type.

Parameters

Parameter (Data Type)	Description
Position (Long)	Defines the position of the icon within the user-defined toolbar.
Key (Variant)	Identifies the symbol. Use unique names for "Key" "(e.g. tItem1_1).
DefaultToolTipText (String)	Defines for the icon concerned the tool tip text that will be displayed when you move the mouse over the icon.

Example:

In the following example a user-defined toolbar with two icons is created in the active picture. These icons are separated by a dividing line:

```
Sub AddDocumentSpecificCustomToolbar()
'VBA163
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Set objToolbar = ActiveDocument.CustomToolbars.Add("DocToolbar")
'Add toolbar-item to userdefined toolbar
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "tItem1_1", "First
symbol-icon")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(3, "tItem1_3", "Second
symbol-icon")
'
'Insert dividing rule between first and second symbol-icon
Set objToolbarItem = objToolbar.ToolbarItems.InsertSeparator(2, "tSeparator1_2")
End Sub
```

IsCSLayerVisible Method

Description

Returns TRUE if the specified CS layer is visible.

syntax

Expression.`IsCSLayerVisible(Index)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	Defines the CS layer. Value range from 1 to 32. Layer0 corresponds to the index value "1".

Example:

The following example determines whether CS layer 1 in the copy of the active picture is visible and outputs the result:

```
Sub IsCSLayerVisible()
'VBA164
Dim objView As HMIView
Dim strLayerName As String
Dim iLayerIdx As Integer
Set objView = ActiveDocument.Views(1)
objView.Activate
iLayerIdx = 2
strLayerName = ActiveDocument.Layers(iLayerIdx).Name
If objView.IsCSLayerVisible(iLayerIdx) = True Then
MsgBox "CS " & strLayerName & " is visible"
Else
MsgBox "CS " & strLayerName & " is invisible"
End If
End Sub
```

IsRTLayerVisible Method

Description

Returns TRUE if the specified RT layer is visible.

syntax

Expression.`IsRTLayerVisible(Index)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	Defines the RT layer. Value range from 1 to 32. Layer0 corresponds to the index value "1".

Example:

The following example determines whether RT layer 1 is visible and outputs the result:

```
Sub RTLayerVisibility()
'VBA165
Dim strLayerName As String
Dim iLayerIdx As Integer
iLayerIdx = 2
strLayerName = ActiveDocument.Layers(iLayerIdx).Name
If ActiveDocument.IsRTLayerVisible(iLayerIdx) = True Then
MsgBox "RT " & strLayerName & " is visible"
Else
MsgBox "RT " & strLayerName & " is invisible"
End If
End Sub
```

Item Method

Description

Returns an element from a listing.

syntax

Expression.`Item(Index)`

Expression

Necessary. An expression or element which returns an object.

Parameters

Parameter (Data Type)	Description
Index (Variant)	The name or index number of an element from the listing. You can use the Object Name as the name. As the index number you can use a numerical expression (from 1 up to the value of the Count property of the listing). If the entered value fails to match any element in the listing, this counts as an error.

Example:

Note

The Item Method is the default method for listings. Both the following examples give the same result.

In the following example the name of the first picture in the Graphics Designer is output:

```
Sub ShowDocumentNameLongVersion()
'VBA166
Dim strDocName As String
strDocName = Application.Documents.Item(3).Name
MsgBox strDocName
End Sub

Sub ShowDocumentNameShortVersion()
'VBA167
Dim strDocName As String
strDocName = Application.Documents(3).Name
MsgBox strDocName
End Sub
```

ItemByLcid Method

Description

Selects the language for which you wish to enter the font settings. Read only access.

Note

You can only select languages in which you have already configured.

Syntax

Expression.`ItemByLcid(LangID)`

Expression

Required. An expression or element which returns an object of the "LanguageFonts" type.

Parameter

Parameter (Data Type)	Description
LangID (Long)	This is the language identifier. The list of language identifiers is contained, for example, in the "Languages.csv" file that is found in the index of the WinCC documentation.

Example

The following example sets the font attributes of a button for French and English. In contrast to English, French is displayed on the button in a smaller font with a constant tracking (Courier New, 12pt):

```
Sub ExampleForLanguageFonts()
'VBA168
Dim objLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "Hello"
Set objLangFonts = objButton.LDFonts
'
'To make fontsettings for English:
With objLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
'
'To make fontsettings for French:
With objLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With

End Sub
```

See also

LanguageFonts Object (Listing) (Page 3368)

LoadDefaultConfig Method

Description

Loads the file in which the default settings for objects are saved. The PDD file is located in the "GraCS" folder of the current project.

syntax

Expression.`LoadDefaultConfig(FileName)`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The name of the PDD file which it is intended to load.

Example:

In the following example the file "Test.PDD" will be loaded. For this example to work, you must have previously saved the file. You can do this with the aid of the SaveDefaultConfig Method:

```
Sub LoadDefaultConfig()
'VBA169
Application.LoadDefaultConfig ("Test.PDD")
End Sub
```

Application Object (Page 3284)

SaveDefaultConfig Method (Page 3257)

VBA Reference (Page 3124)

MoveOneLayerDown Method

Description

Moves the selected object in the specified picture into the next lowest layer.

syntax

Expression.MoveOneLayerDown()

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example a circle in the active picture is inserted in the third layer and then moved to the next lowest layer:

```
Sub MoveObjectOneLayerDown()
'VBA170
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
.Layer = 3
MsgBox "Circle is inserted into layer" & Str(.Layer)
ActiveDocument.Selection.MoveOneLayerDown
MsgBox "Circle is moved into layer" & Str(.Layer)
End With
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

VBA Reference (Page 3124)

MoveOneLayerUp Method

Description

Moves the selected object in the specified picture into the next highest layer.

syntax

Expression.MoveOneLayerUp()

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example a circle in the active picture is inserted in the third layer and then moved to the next highest layer:

```
Sub MoveObjectOneLayerUp()
'VBA171
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
.Layer = 3
MsgBox "Circle is inserted into layer" & Str(.Layer)
ActiveDocument.Selection.MoveOneLayerUp
MsgBox "Circle is moved into layer" & Str(.Layer)
End With
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

VBA Reference (Page 3124)

MoveSelection Method

Description

Moves one or more objects selected in the picture by the specified coordinates.

Note

When you want to reposition one or more selected objects, use the properties "Left" and "Top".

syntax

Expression.MoveSelection(PosX, PosY)

Expression

Required. An expression or element which returns an object of the "Document" or "Selection" type.

Parameters

Parameter (Data Type)	Description
PosX (Long)	The number of pixels by which the selection is to be moved horizontally.
PosY (Long)	The number of pixels by which the selection is to be moved vertically.

Example:

In the following example two objects are inserted at different positions in the current picture and selected. The selection is then moved 30 pixels to the right and 40 pixels down:

```
Sub MoveSelectionToNewPostion()
'VBA172
Dim nPosX As Long
Dim nPosY As Long
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
nPosX = 30
nPosY = 40
ActiveDocument.MoveSelection nPosX, nPosY
End Sub
```

O-Z

Open Method

Description

Opens an existing picture in the Graphics Designer and adds it to the documents listing.

syntax

Expression.`Open(FileName, [HMIOpenDocumentType])`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The name of the PDL file to be opened. Unless you saved the PDL file in the "GraCS" folder of the open project, you must also specify the path at the same time.
HMIOpenDocumentType (HMIDocumentType)	Defines how the picture will be opened: • HMIDocumentTypeVisible: Opens the picture for direct processing. This is the default setting if you do not specify the parameter. • HMIDocumentTypeInvisible: Opens the picture in invisible mode, i.e. it is not displayed in the Graphics Designer. You can only address the picture via the Documents listing, and make it visible again by means of the Hide property.

Example:

In the following example the picture "Test" will be opened. For this example to work, you must have previously saved a picture with the name "Test" in the "GraCS" folder of the open project.

```
Sub OpenDocument()
'VBA175
Application.Documents.Open "Test.PDL", hmiOpenDocumentTypeVisible
```

```
End Sub
```

Hide Property (Page 3627)

Documents Object (Listing) (Page 3324)

VBA Reference (Page 3124)

PasteClipboard Method

Description

Pastes the contents of the clipboard into the specified picture.

Note

The clipboard must contain objects from the Graphics Designer. Other contents (such as ASCII text) will not be pasted.

syntax

Expression.`PasteClipboard()`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

--

Example:

In the following example all the objects selected in the active picture are copied to the clipboard and then pasted into a new picture. For this example to work, you must have selected at least one object in the active picture:

```
Sub CopySelectionToNewDocument()
'VBA176
Dim iNewDoc As String
ActiveDocument.CopySelection
Application.Documents.Add hmiOpenDocumentTypeVisible
iNewDoc = Application.Documents.Count
Application.Documents(iNewDoc).PasteClipboard
End Sub
```

VBA Reference (Page 3124)

PrintDocument Method

Description

Prints the specified copy of the picture using the current printer settings.

syntax

Expression.`PrintDocument()`

Expression

Necessary. An expression or element which returns an object of the "View" type.

Parameters

--

Example:

In the following example a copy of the active picture is created and then activated and printed:

```
Sub CreateAndPrintView()
'VBA177
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
objView.PrintDocument
End Sub
```

See also

View Object (Page 3468)

VBA Reference (Page 3124)

PrintProjectDocumentation Method

Description

Prints out the project documentation for the current picture complete with all the objects it contains and their properties via the reporting system in WinCC (Report Designer).

You must first have set the print settings (such as page range) in the "Print Job Properties" dialog. To do this, go to the Graphics Designer and select the menu command "File" > "Project Documentation - Setup".

Note

The project documentation will be output on the printer that was set up in the Report Designer. You can design the print layout to suit your needs with the aid of the Report Designer.

syntax

Expression.`PrintProjectDocumentation()`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

--

Example:

In the following example the project documentation for the active picture will be printed:

```
Sub ToPrintProjectDocumentation()
'VBA178
ActiveDocument.PrintProjectDocumentation
End Sub
```

See also

Document Object (Page 3321)

VBA Reference (Page 3124)

Remove Method

Description

Removes an object from a selection of objects or from a group object.

syntax

Expression.`Remove(Index)`

Expression

Necessary. An expression or element which returns an object of the "GroupedObjects" or "Selection" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	The name or index number of the object that is intended to be removed. You can use the Object Name as the name. As the index number you can use a numerical expression (from 1 up to the value of the Count property of the listing). If the entered value fails to match any element in the listing, this counts as an error.

Example:

In the following example three objects will first be inserted in the active picture and selected. Then one object will be removed from the selection and the remaining objects will be grouped. Then the first object will be removed from the group object:

```
Sub RemoveObjectFromGroup()
'VBA179
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Selected = True
End With
With objRectangle
.Top = 80
```

```
.Left = 42
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
MsgBox "Group-object is created."
objGroup.GroupedHMIObjects.Remove ("sEllipse")
MsgBox "The ellipse is removed from group-object."
End Sub
```

See also

SelectedObjects object (Listing) (Page 3428)

GroupedObjects Object (Listing) (Page 3355)

VBA Reference (Page 3124)

Rotate Method

Description

Rotates the object selected in the specified picture by 90° clockwise.

syntax

Expression.`Rotate()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects will be inserted in the active picture and then grouped. The group object will then be rotated once:

```
Sub RotateGroupObject()
```

```
'VBA180
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objGroup As HMIGroup
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
With objRectangle
.Top = 30
.Left = 30
.Width = 80
.Height = 40
.Selected = True
End With
With objCircle
.Top = 30
.Left = 30
.BackColor = RGB(255, 255, 255)
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
MsgBox "Group-object created."
objGroup.Selected = True
ActiveDocument.Selection.Rotate
End Sub
```

SameHeight Method

Description

Sets the "Height" property for all selected objects in the specified picture to the smallest available value.

syntax

Expression.`SameHeight()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects of different sizes will be inserted in the active picture. Then all objects will be selected and set to the same height:

```
Sub ApplySameHeightToSelectedObjects()
'VBA181
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Height = 15
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Height = 40
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.Height = 120
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.SameHeight
End Sub
```

SameWidth Method

Description

Sets the "Width" property for all selected objects in the specified picture to the smallest available value.

syntax

Expression.`SameWidth()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects of different sizes will be inserted in the active picture. Then all objects will be selected and set to the same width:

```
Sub ApplySameWidthToSelectedObjects()
'VBA182
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Width = 15
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Width = 40
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 120
.BackColor = RGB(255, 0, 0)
.Selected = True
```

```
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.SameWidth
End Sub
```

SameWidthAndHeight Method

Description

Sets the "Height" and "Width" properties for all selected objects in the specified picture to the smallest available value.

syntax

Expression.`SameWidthAndHeight()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects of different sizes will be inserted in the active picture. Then all objects will be selected and set to the same height:

```
Sub ApplySameWidthAndHeightToSelectedObjects()
'VBA183
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
```

```
.Height = 15
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Width = 25
.Height = 40
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.Height = 120
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
ActiveDocument.Selection.SameWidthAndHeight
End Sub
```

Save Method

Description

Saves the specified picture under its current name.

syntax

Expression.`Save()`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

--

Example:

In the following example the active picture in the Graphics Designer will be saved:

```
Sub SaveDocument()
'VBA184
ActiveDocument.Save
End Sub
```

See also

ActiveDocument Property (Page 3474)

SaveAll Method

Description

Saves all the open pictures in the Graphics Designer under their current names.

syntax

Expression.`SaveAll()`

Expression

Necessary. An expression or element which returns an object of the "Documents" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are saved:

```
Sub SaveAllDocuments()
'VBA185
Application.Documents.SaveAll
End Sub
```

See also

Documents Object (Listing) (Page 3324)

VBA Reference (Page 3124)

SaveAs Method

Description

Saves the specified picture under a new name.

If a previously existing picture is to be overwritten, it must be ascertained prior to the SaveAs method call that this picture is permitted to be overwritten. You must inquire the LockedByCreatorID property of the picture to be overwritten to do so. Otherwise an error will be triggered in VBA.

syntax

Expression.`SaveAs(FileName)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The file name under which the picture is to be saved.

Example:

In the following example the active picture will be saved under the name "Test2.PDL":

```
Sub SaveDocumentAs()
'VBA186
ActiveDocument.SaveAs ("Test2.PDL")
End Sub
```

See also

SaveDefaultConfig Method

Description

Saves the default settings for objects to a PDD file. The file is saved to the "GraCS" folder of the current project.

syntax

Expression.`SaveDefaultConfig(FileName)`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

Parameter (Data Type)	Description
FileName (String)	The name of the PDD file.

Example:

In the following example the default settings for objects are saved to the file "Test.PDD".

```
Sub SaveDefaultConfig()
'VBA187
Application.SaveDefaultConfig ("Test.PDD")
End Sub
```

See also

Application Object (Page 3284)

LoadDefaultConfig Method (Page 3238)

VBA Reference (Page 3124)

SelectAll Method

Description

Selects all the objects in the specified picture and adds them to the selection listing.

syntax

Expression.`SelectAll()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example three objects will be inserted in the active picture and then selected.

```
Sub SelectAllObjectsInActiveDocument()
'VBA188
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Height = 15
End With
With objRectangle
.Top = 80
.Left = 42
.Width = 25
.Height = 40
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.Height = 120
.BackColor = RGB(255, 0, 0)
End With
ActiveDocument.Selection.SelectAll
End Sub
```

SendToBack Method

Description

Sends the selected objects right to the back within their current layer.

Note

If the "SendToBack" method is used, the sequence of HMI objects can change in the HMIObjects listing.

Syntax

Expression.`SendToBack()`

Expression

Necessary. An expression or element which returns an object of the "Selection" type.

Parameters

--

Example:

In the following example two objects are inserted in the active picture. The object inserted first is then sent to the back:

```
Sub SendObjectToBack()
'VBA197
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = False
End With
With objRectangle
.Top = 40
.Left = 40
.Width = 100
.Height = 50
.BackColor = RGB(255, 0, 255)
.Selected = True
End With
MsgBox "The objects circle and rectangle are created" & vbCrLf & "Only the rectangle is
selected!"
ActiveDocument.Selection.SendToBack
```

```
MsgBox "The selection is moved to the back."
End Sub
```

SetCSLayerVisible Method

Description

Shows or hides the specified CS layer.

syntax

Expression.`SetCSLayerVisible(Index, Val)`

Expression

Necessary. An expression or element which returns an object of the "View" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	Defines the CS layer that is going to be shown or hidden. Value range from 1 up to 32.
Val (Boolean)	TRUE if the specified CS layer is intended to be visible.

Example:

In the following example the second CS layer in the copy of the active picture is hidden (i.e. made invisible):

```
Sub SetCSLayerVisible()
'VBA189
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
objView.SetCSLayerVisible 2, False
End Sub
```

See also

Document Object (Page 3321)

VBA Reference (Page 3124)

Editing Layers with VBA (Page 3050)

SetOpenContext method

Description

The SetOpenContext method sets the password. Password-protected process pictures or faceplate types can then be opened.

Syntax

Expression.`SetOpenContext (Password)`

Expression

Required. An expression or element which returns an object of the "Documents" type.

Parameter

Parameter (Data Type)	Description
Password (String)	Password of the available picture.

Example

Several pictures ("A.pdl", "B.pdl" und "C.pdl") are opened in the following example using the same password string "Test123". Enter the password for the pictures to open these. Terminate the SetOpenContext method with an empty string "" to prevent further access to the password.

```
Sub OpenProtectedPicture()
'VBA853
Documents.SetOpenContext ("Test123")
Documents.Open ("A.pdl")
Documents.Open ("B.pdl")
Documents.Open ("C.pdl")
Documents.SetOpenContext ("")
End Sub
```

SetDeclutterObjectSize Method

Description

Specifies the size area for fading in and out of objects in the specified picture. If height and width of the object are outside the specified size area, the objects are faded out.

The "ObjectSizeDecluttering" property must be set to TRUE.

syntax

Expression.SetDeclutterObjectSize(Min, Max)

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
Min (Long)	Lower size range in pixels.
Max (Long)	Upper size range in pixels.

Example:

In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer()
'VBA190
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'Configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
'Define decluttering of objects:
With ActiveDocument
.LayerDecluttering = True
.ObjectSizeDecluttering = True
.SetDeclutterObjectSize 50, 100
End With
End Sub
```

See also

SetRTLayerVisible Method

Description

Shows or hides the specified RT layer.

syntax

Expression.`SetRTLayerVisible(Index, Val)`

Expression

Necessary. An expression or element which returns an object of the "Document" type.

Parameters

Parameter (Data Type)	Description
Index (Variant)	Defines the RT layer that is going to be shown or hidden. Value range from 1 to 32.
Val (Boolean)	TRUE if the specified RT layer is intended to be visible.

Example:

In the following example the first RT layer in the active picture will be made visible:

```
Sub SetRTLayerVisibleWithVBA()
'VBA191
ActiveDocument.SetRTLayerVisible 1, False
End Sub
```

ShowPropertiesDialog Method

Description

Opens the "Object Properties" dialog.

syntax

Expression.`ShowPropertiesDialog()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example the "Object Properties" dialog is opened:

```
Sub ShowPropertiesDialog()
'VBA192
Application.ShowPropertiesDialog
End Sub
```

See also

Application Object (Page 3284)

VBA Reference (Page 3124)

ShowSymbolLibraryDialog Method

Description

Opens the Components Library.

syntax

Expression.`ShowSymbolLibraryDialog()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example the Components Library is opened:

```
Sub ShowSymbolLibraryDialog()
'VBA193
Application.ShowSymbolLibraryDialog
End Sub
```

See also

Application Object (Page 3284)

VBA Reference (Page 3124)

ShowTagDialog Method

Description

Opens the "Tags" dialog.

syntax

Expression.`ShowTagDialog()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example the "Tags" dialog is opened:

```
Sub ShowTagDialog()
'VBA194
Application.ShowTagDialog
End Sub
```

See also

Application Object (Page 3284)

TileWindowsHorizontally Method

Description

Arranges all open pictures in the Graphics Designer so that they are tiled horizontally.

syntax

Expression.Methode()

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are tiled horizontally. For this example to work, you must have opened a number of pictures in the Graphics Designer:

```
Sub TileWindowsHorizontally()
'VBA195
Application.TileWindowsHorizontally
End Sub
```

See also

Application Object (Page 3284)

VBA Reference (Page 3124)

TileWindowsVertically Method

Description

Arranges all open pictures in the Graphics Designer so that they are tiled vertically.

syntax

Expression.`Methode()`

Expression

Necessary. An expression or element which returns an object of the "Application" type.

Parameters

--

Example:

In the following example all open pictures in the Graphics Designer are tiled vertically. For this example to work, you must have opened a number of pictures in the Graphics Designer:

```
Sub TileWindowsVertically()
'VBA196
Application.TileWindowsVertically
End Sub
```

TransformDisplayCoordinate method

Description

Is used internally for PowerCC.

TransformPixelCoordinate method

Description

Is used internally for PowerCC.

Ungroup Method

Description

Ungroups a group object. The objects remain intact.

syntax

Expression.Ungroup(Parameter)

Expression

Necessary. An expression or element which returns an object of the "Group" type.

Parameters

--

Example:

In the following example three objects are created in the current picture and a group object is then created from them: The group object is then moved and ungrouped.

```
Sub DissolveGroup()
'VBA199
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipse As HMIEllipse
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("sEllipse", "HMIEllipse")
With objCircle
.Top = 30
.Left = 0
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 42
.Selected = True
End With
With objEllipse
.Top = 48
.Left = 162
.Width = 40
.BackColor = RGB(255, 0, 0)
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
MsgBox "Group-object is created."
With objGroup
.Left = 120
.Top = 300
MsgBox "Group-object is moved."
.UnGroup
MsgBox "Group is dissolved."
End With
End Sub
```

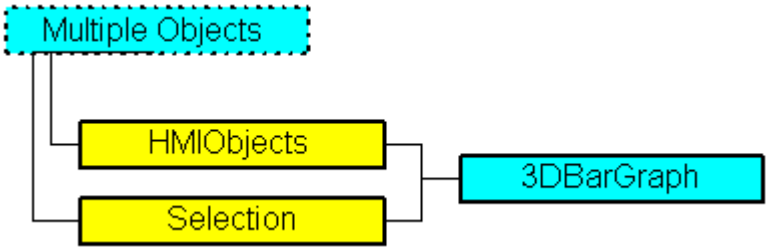
5.5.1.7 Objects and Lists

0-9, A-C

3DBarGraph Object

Description



Represents the "3D Bar" object. The 3DBarGraph object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMI3DBarGraph

Application

Use the Add method to create a new "3D Bar" object in a picture:

```
Sub Add3DBarGraph()
'VBA200
Dim obj3DBarGraph As HMI3DBarGraph
Set obj3DBarGraph = ActiveDocument.HMIObjects.AddHMIObject("3DBar", "HMI3DBarGraph")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub Edit3DBarGraph()
'VBA201
Dim obj3DBarGraph As HMI3DBarGraph
Set obj3DBarGraph = ActiveDocument.HMIObjects("3DBar")
obj3DBarGraph.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA202
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Object properties

The 3D Bar object possesses the following properties:

- AngleAlpha
- AngleBeta
- Application
- Axe
- BackColor
- Background
- BarDepth
- BarHeight
- BarWidth
- BaseX
- BaseY
- BorderColor
- BorderStyle
- BorderWidth
- Direction
- FillColor
- FillStyle
- GlobalColorScheme
- GlobalShadow
- GroupParent

- Height
- Layer
- Layer00Checked ... Layer10Checked
- Layer00Color ... Layer10Color
- Layer00FillColor ... Layer10FillColor
- Layer00FillStyle ... Layer10FillStyle
- Layer00Value ... Layer10Value
- Left
- LightEffect
- Max.
- Min.
- ObjectName
- Operation
- Parent
- PasswordLevel
- PredefinedAngles
- Process
- Selected
- ShowBadTagState
- TabOrderAlpha

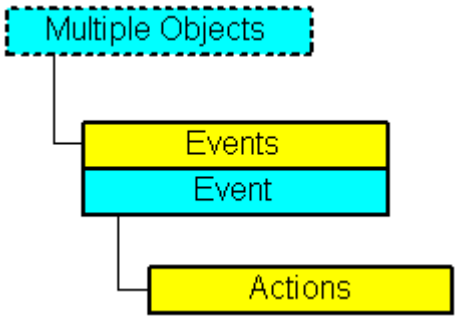
Actions Object (Listing)

Description



Displays a listing of the actions that are configured on an event.

VBA Object Name

HMIActions

Usage

Use the AddAction method to configure one or more actions on an event. In this example a button and a circle will be inserted in the active picture. In runtime the radius of the circle enlarges every time you click the button:

```
Sub CreateVBActionToClickedEvent()
'VBA203
Dim objButton As HMIButton
Dim objCircle As HMICircle
Dim objVBScript As HMIScriptInfo
Dim strVBCode As String
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VB", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircle
.Top = 100
.Left = 100
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Text = "Increase Radius"
End With
'define event and assign sourcecode to it:
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
strVBCode = "Dim myCircle" & vbCrLf & "Set myCircle = "
strVBCode = strVBCode & "HMIRuntime.ActiveScreen.ScreenItems(""Circle_VB"")"
strVBCode = strVBCode & vbCrLf & "myCircle.Radius = myCircle.Radius + 5"
With objVBScript
.SourceCode = strVBCode
End With
End Sub
```

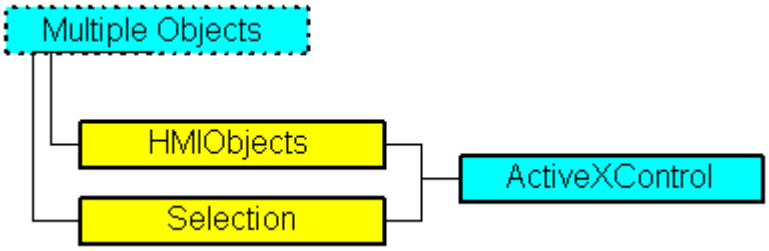
ActiveXControl Object

Description



Represents the ActiveX Control object. The ActiveXControl object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIActiveXControl

Usage

Use the AddActiveXControl method to insert an ActiveX Control in a picture, for instance. In the following example the ActiveX Control "WinCC Gauge Control" is inserted in the active picture.

```
Sub AddActiveXControl()
'VBA204
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
With ActiveDocument
.HMIObjects("WinCC_Gauge").Top = 40
.HMIObjects("WinCC_Gauge").Left = 40
End With
End Sub
```

AdvancedAnalogDisplay object

Description

Represents the "Analog Display (Advanced)" object. The "AdvancedAnalogDisplay" object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIAdvancedAnalogDisplay

Application

Use the AddHMIObject method to create a new "Analog Display (Advanced)" object in a picture:

```
Sub AddAdvancedAnalogDisplay()
'VBA857
Dim objAdvancedAnalogDisplay As HMIAdvancedAnalogDisplay
Set objAdvancedAnalogDisplay = ActiveDocument.HMIObjects.AddHMIObject("Analogdisplay1",
"HMIAdvancedAnalogDisplay")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditAdvancedAnalogDisplay()
'VBA858
Dim objAdvancedAnalogDisplay As HMIAdvancedAnalogDisplay
Set objAdvancedAnalogDisplay = ActiveDocument.HMIObjects("Analogdisplay1")
objAdvancedAnalogDisplay.BackColor_Simulation = RGB(255, 0, 0)
End Sub
```

AdvancedStateDisplay object

Description

Represents the "State Display (Advanced)" object. The "AdvancedStateDisplay" object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIAdvancedStateDisplay

Application

Use the AddHMIObject method to create a new "State Display (Advanced)" object in a picture:

```
Sub AddAdvancedStateDisplay()
'VBA859
Dim objAdvancedStateDisplay As HMIAdvancedStateDisplay
Set objAdvancedStateDisplay = ActiveDocument.HMIObjects.AddHMIObject("Statedisplay1",
"HMIAdvancedStateDisplay")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditAdvancedStateDisplay()
'VBA860
Dim objAdvancedStateDisplay As HMIAdvancedStateDisplay
Set objAdvancedStateDisplay = ActiveDocument.HMIObjects("Statedisplay1")
objAdvancedStateDisplay.PaintColor_QualityCodeBad = RGB(255, 0, 0)
End Sub
```

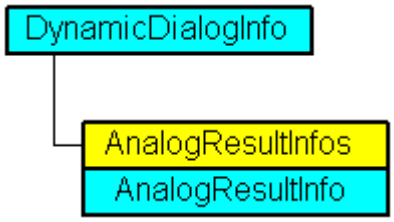
AnalogResultInfo Object

Description



Displays an analog value range and associated property value in the Dynamic dialog. The AnalogResultInfo object is an element of the AnalogResultInfos listing:

VBA Object Name

HMIAnalogResultInfo

Usage

Use the AnalogResultInfo object to return an individual value range and property value. For a detailed example, please refer to "AnalogResultInfos Object (Listing)" in this documentation.

See also

AnalogResultInfos Object (Listing) (Page 3283)

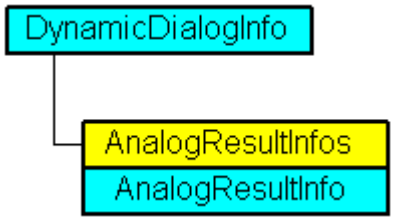
Application Property (Page 3486)

AnalogResultInfos Object (Listing)

Description



A listing of AnalogResultInfo objects that contain all the analog value ranges and the associated property value in the Dynamic dialog.

VBA Object Name

HMIAnalogResultInfos

Usage

Use the Add method to add a new value range in the Dynamic dialog. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and three analog value ranges will be created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA206
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

Use AnalogResultInfos to return the AnalogResultInfos listing. In this example the value ranges created in the above example will be output:

```
Sub ShowAnalogResultInfosOfCircleRadius()
```

```
'VBA207
Dim colAResultInfos As HMIAnalogResultInfos
Dim objAResultInfo As HMIAnalogResultInfo
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Dim iAnswer As Integer
Dim varRange As Variant
Dim varValue As Variant
Set objCircle = ActiveDocument.HMIObjects("Circle_A")
Set objDynDialog = objCircle.Radius.Dynamic
Set colAResultInfos = objDynDialog.AnalogResultInfos
For Each objAResultInfo In colAResultInfos
varRange = objAResultInfo.RangeTo
varValue = objAResultInfo.value
iAnswer = MsgBox("Ranges of values from Circle_A-Radius:" & vbCrLf & "Range of value to: "
& varRange & vbCrLf & "Value of property: " & varValue, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objAResultInfo
End Sub
```

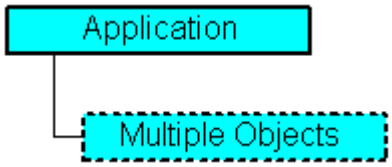
Application Object

Description



Represents the Graphics Designer editor. The Application object contains properties and methods that return objects from the top layer. For example ActiveDocument returns a Document object.

VBA Object Name

HMIApplication

Usage

Use Application to return the Application object. In the following example the application version is output:

```
Sub ShowApplicationVersion()
'VBA208
MsgBox Application.Version
End Sub
```

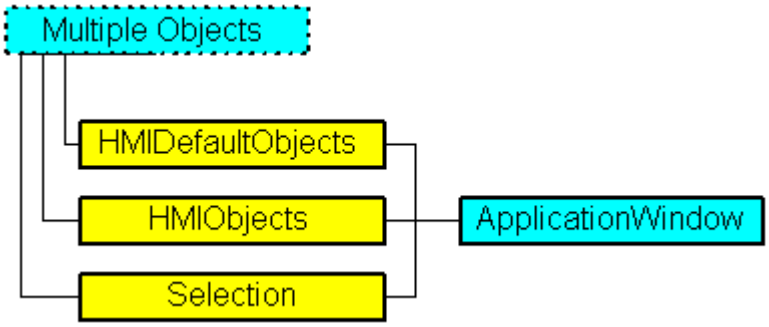
ApplicationWindow Object

Description



Represents the "Application Window" object. The ApplicationWindow object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIApplicationWindow

Usage

Use the Add method to create a new "Application Window" object in a picture:

```
Sub AddApplicationWindow()
'VBA209
Dim objApplicationWindow As HMIApplicationWindow
Set objApplicationWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow",
"HMIApplicationWindow")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditApplicationWindow()
'VBA210
Dim objApplicationWindow As HMIApplicationWindow
Set objApplicationWindow = ActiveDocument.HMIObjects("AppWindow")
objApplicationWindow.Sizeable = True
End Sub
Use "Selection"(Index) to return an object from the Selection listing:
Sub ShowNameOfFirstSelectedObject()
'VBA211
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

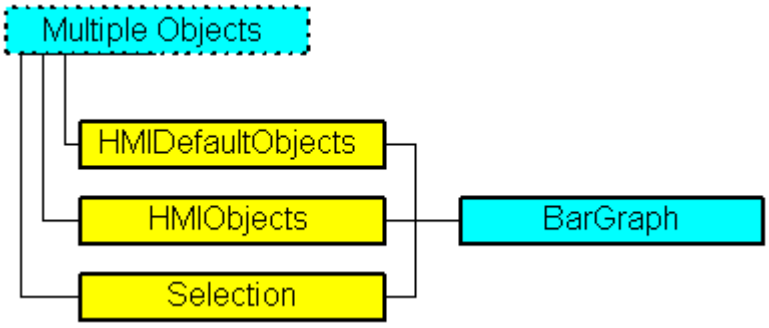
BarGraph Object

Description



Represents the "Bar" object. The BarGraph object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default settings of property values of all Standard, Windows and Smart objects.

VBA Object Name

HMIBarGraph

Application

Use the Add method to create a new "Bar" object in a picture:

```
Sub AddBarGraph()
'VBA212
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditBarGraph()
'VBA213
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects("Bar1")
objBarGraph.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA214
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

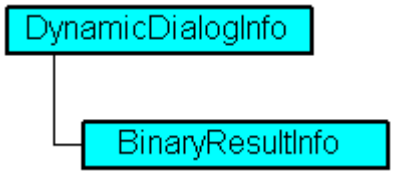
BinaryResultInfo Object

Description



Displays both the binary (boolean) value ranges and the associated property values in the Dynamic dialog.

VBA Object Name

HMIBinaryResultInfo

Usage

Use BinaryResultInfo to return the BinaryResultInfo object. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and the associated property values will be assigned to both the binary value ranges:

```
Sub AddDynamicDialogToCircleRadiusTypeBinary()
'VBA215
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBool
.BinaryResultInfo.NegativeValue = 20
.BinaryResultInfo.PositiveValue = 40
End With
End Sub
```

BitResultInfo Object

Description

Displays both the value ranges for bit set/not set and the associated property values in the Dynamic dialog.

VBA Object Name

HMIBitResultInfo

Usage

Use BitResultInfo to return a BitResultInfo object. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned, the bit to be set will be defined and the associated property values will be assigned to the "set"/"not set" states:

```
Sub AddDynamicDialogToCircleRadiusTypeBit()
'VBA216
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_B", "HMICircle")
'Tag "NewDynmic1" must exist
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBit
.BitResultInfo.BitNumber = 1
.BitResultInfo.BitSetValue = 40
.BitResultInfo.BitNotSetValue = 80
End With
End Sub
```

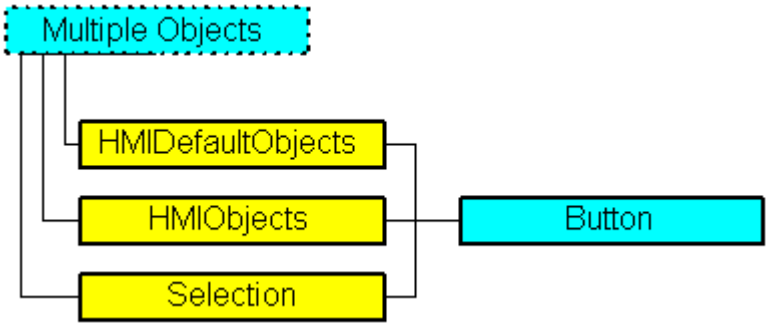
Button Object

Description



Represents the "Button" object. The Button object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default settings of property values of all Standard, Windows and Smart objects.

VBA Object Name

HMIButton

Application

Use the Add method to create a new "Button" object in a picture:

```
Sub AddButton()
'VBA217
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button", "HMIButton")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditButton()
'VBA218
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects("Button")
```

```
objButton.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA219
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

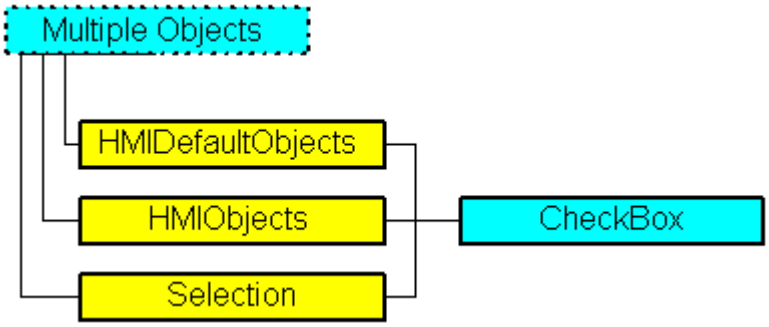
CheckBox Object

Description



Represents the "Check Box" object. The CheckBox object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default settings of property values of all Standard, Windows and Smart objects.

VBA Object Name

HMICheckBox

Application

Use the Add method to create a new "Check Box" object in a picture:

```
Sub AddCheckBox()
'VBA220
Dim objCheckBox As HMICheckBox
Set objCheckBox = ActiveDocument.HMIObjects.AddHMIObject("CheckBox", "HMICheckBox")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditCheckBox()
'VBA221
Dim objCheckBox As HMICheckBox
Set objCheckBox = ActiveDocument.HMIObjects("CheckBox")
objCheckBox.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA222
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

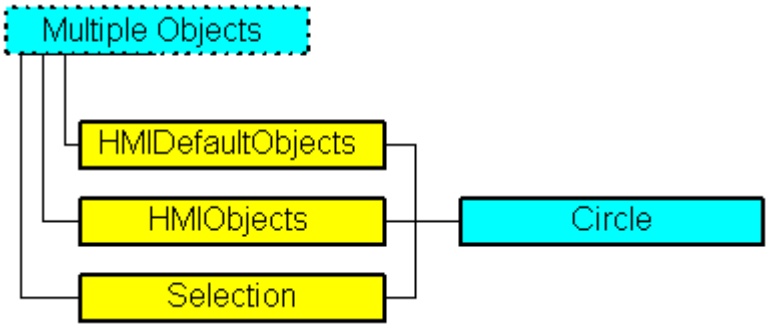
Circle Object

Description



Represents the "Circle" object. The Circle object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMICircle

Usage

Use the Add method to create a new "Circle" object in a picture:

```
Sub AddCircle()
'VBA223
```

```
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle", "HMICircle")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditCircle()
'VBA224
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects("Circle")
objCircle.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA225
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

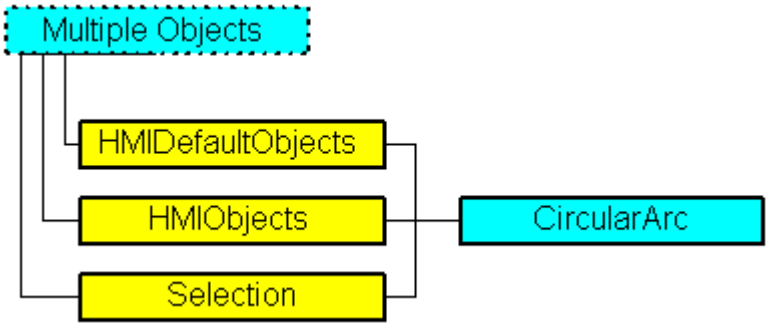
CircularArc Object

Description



Represents the "Circular Arc" object. The CircularArc object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMICircularArc

Usage

Use the Add method to create a new "Circular Arc" object in a picture:

```
Sub AddCiruclarArc()
'VBA226
Dim objCiruclarArc As HMICircularArc
Set objCiruclarArc = ActiveDocument.HMIObjects.AddHMIObject("CircularArc",
"HMICircularArc")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditCiruclarArc()
'VBA227
Dim objCiruclarArc As HMICircularArc
Set objCiruclarArc = ActiveDocument.HMIObjects("CircularArc")
objCiruclarArc.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA228
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

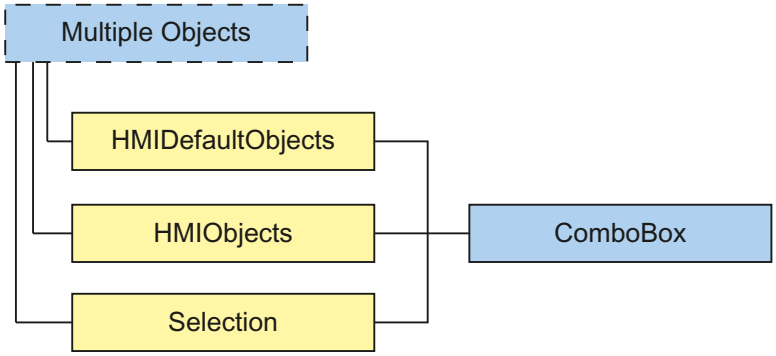
ComboBox object

Description



Represents the "ComboBox" object. The ComboBox object is an element of the following lists:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMIComboBox

Usage

Use the Add method to create a new "ComboBox" object in a picture:

```
Sub AddComboBox()
'VBA822
Dim objComboBox As HMIComboBox
Set objComboBox = ActiveDocument.HMIObjects.AddHMIObject("ComboBox", "HMIComboBox")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditComboBox()
'VBA850
Dim objComboBox As HMIComboBox
Set objComboBox = ActiveDocument.HMIObjects("ComboBox")
objComboBox.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA824
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

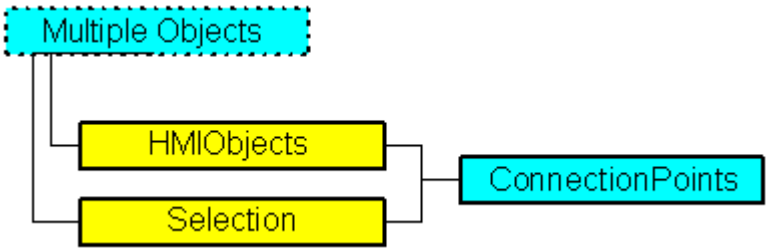
ConnectorObjects property (Page 3560)

ConnectionPoints Object (Listing)

Description



The listing returns the number of points to which the connector can be appended in the specified object.

VBA object name

HMIConnectionPoints

Object properties

The ConnectionPoints object possesses the following properties:

- Application
- Count
- Item
- Parent

Example 1

In this example, a rectangle is inserted and the number of connection points is output:

```
Sub CountConnectionPoints()
'VBA229
Dim objRectangle As HMIRectangle
Dim objConnPoints As HMIConnectionPoints
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
Set objConnPoints = ActiveDocument.HMIObjects("Rectangle1").ConnectionPoints
MsgBox "Rectangle1 has " & objConnPoints.Count & " connectionpoints."
End Sub
```

Example 2:

In this example, a text field is inserted and the connection points are accessed via "ConnectionPoints.Item". The coordinates of the connection points are shown in an output window.

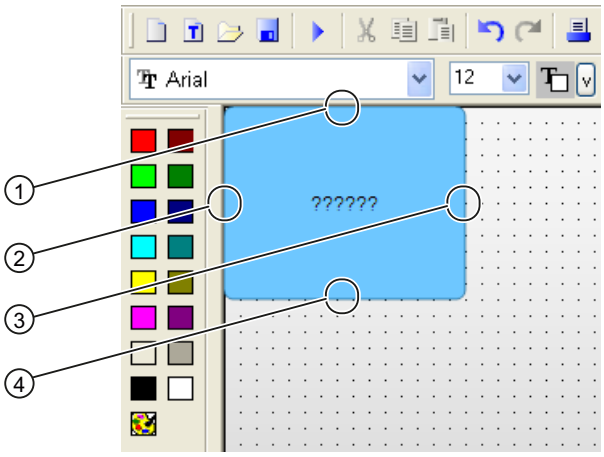
```
Sub GetConnectionPoints()
'VBA825
Dim xPos As Long
Dim yPos As Long
Dim objConnPoints As HMIConnectionPoints

Set objDoc = Application.ActiveDocument
Set objObject = objDoc.HMIObjects.AddHMIObject("Text","HMIStaticText")
Set objConnPoints = ActiveDocument.HMIObjects("Text").ConnectionPoints

For i = 1 To objConnPoints.Count
    xPos = objObject.ConnectionPoints.Item(i)(0)
    yPos = objObject.ConnectionPoints.Item(i)(1)
    MsgBox "Coordinates " & i & ". ConnectionPoint:" & Chr(13) & "x: " & xPos & Chr(13) &
"y: " & yPos
Next

   End Sub
```

The diagram below shows the positions of the 4 connection points of the text field.



Note

If you activate the connection points of a connector with VBA, the connection point index begins with "1".

If you determine the connection points in the property window of the connector in the graphical interface, the connection point index begins with "0".

The index numbers e.g. of the lower connection point in the picture are assigned as follows:

- VBA: Index = 3
- Graphical interface: Index = 2

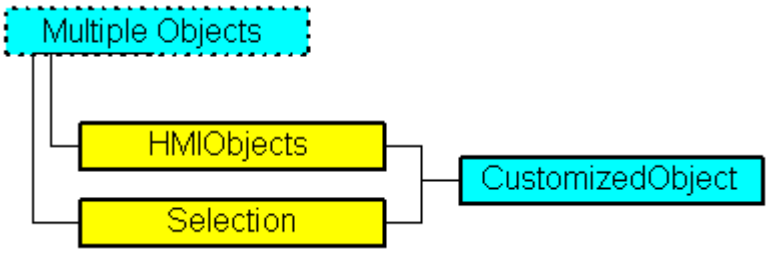
Item Property (Page 3639)

Count Property (Page 3562)

Application Property (Page 3486)

CustomizedObject Object

Description



Represents the object called "Customized Object". The CustomizedObject object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

In the case of the CustomizedObject object, the only properties that are available in the object are those that you have selected in the "Configuration" dialog for the customized object concerned.

Note

You cannot configure the CustomizedObject object with VBA.

Further information regarding customized objects can be found in the WinCC documentation under "Customized Object".

VBA Object Name

HMICustomizedObject

Application

Use the CreateCustomizedObject Method with the Selection listing to create a new "Customized Object" object in a picture:

```
Sub CreateCustomizedObject()
'VBA230
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objCustomizedObject As HMICustomizedObject
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
With objCircle
.Left = 10
.Top = 10
.Selected = True
End With
With objRectangle
.Left = 50
.Top = 50
.Selected = True
End With
MsgBox "objects created and selected!"
Set objCustomizedObject = ActiveDocument.Selection.CreateCustomizedObject
objCustomizedObject.ObjectName = "Customer-Object"
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name:

```
Sub EditCustomizedObject()
'VBA231
Dim objCustomizedObject As HMICustomizedObject
Set objCustomizedObject = ActiveDocument.HMIObjects("Customer-Object")
MsgBox objCustomizedObject.ObjectName
End Sub
```

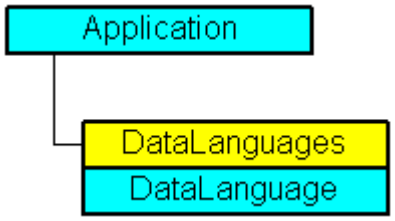
D-I

DataLanguage Object

Description



Represents the installed project language, which is identified by its name and language identifier. The DataLanguage object is an element of the DataLanguages listing:

The list of language codes is available in the WinCC documentation (Index > Language Code). The hexadecimal value specified in the list has to be converted to its equivalent decimal value.

VBA Object Name

HMIDataLanguage

Usage

Use the DataLanguages property to return an individual DataLanguage object. In the following example the first installed project language is output:

```
Sub ShowFirstObjectOfCollection()
'VBA232
Dim strName As String
strName = ActiveDocument.Application.AvailableDataLanguages(1).LanguageName
MsgBox strName
End Sub
```

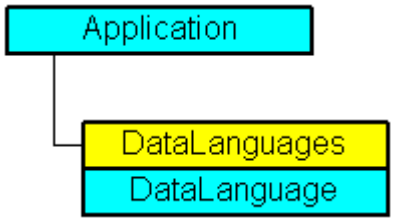
DataLanguages Object (Listing)

Description



A listing of the DataLanguage objects that represent all the installed project languages.

VBA Object Name

HMIDataLanguages

Usage

Use the AvailableDataLanguages property to return the DataLanguages listing. In the following example the installed project language is output:

```
Sub ShowDataLanguage()
'VBA233
Dim colDataLanguages As HMIDataLanguages
Dim objDataLanguage As HMIDataLanguage
Dim strLanguages As String
Dim iCount As Integer
iCount = 0
Set colDataLanguages = Application.AvailableDataLanguages
For Each objDataLanguage In colDataLanguages
If "" <> strLanguages Then strLanguages = strLanguages & "/"
strLanguages = strLanguages & objDataLanguage.LanguageName & " "
'Every 15 items of datalanguages output in a messagebox
If 0 = iCount Mod 15 And 0 <> iCount Then
MsgBox strLanguages
```

```
strLanguages = ""
End If
iCount = iCount + 1
Next objDataLanguage
MsgBox strLanguages
End Sub
```

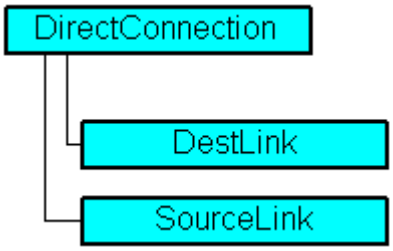
DestLink Object

Description



Represents the destination for a direct connection.

VBA Object Name

HMIDestLink

Usage

Use the DestinationLink property to return the DestLink object. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA234
```

```
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 90
.Height = 50
.Text = "SetPosition"
End With
'
'Directconnection is initiated on mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of "Rectangle_A"
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of "Rectangle_B"
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

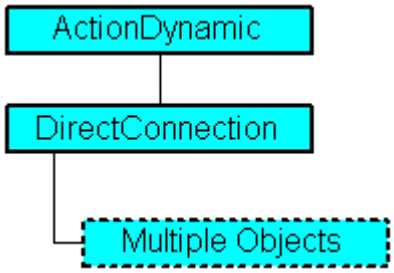
DirectConnection Object

Description



Represents a direct connection.

VBA Object Name

HMIDirectConnection

Usage

Use the DestinationLink and SourceLink properties to configure the source and destination of a direct connection. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA235
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 90
.Height = 50
.Text = "SetPosition"
```

```
End With
'
'Directconnection is initiated on mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of "Rectangle_A"
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of "Rectangle_B"
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

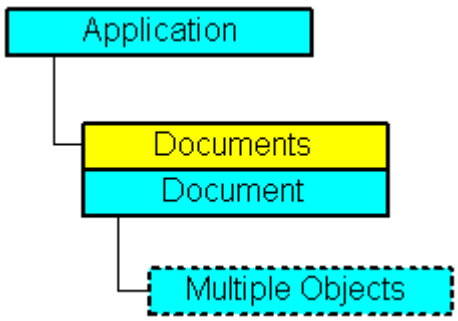
Document Object

Description



Displays a picture in Graphics Designer. The document object is an element of the documents listing.

VBA Object Name

HMIDocument

Usage

Use Documents(Index) to return an individual document object. In the following example the file name of the first picture is displayed:

```
Sub ShowFirstObjectOfCollection()
'VBA236
Dim strName As String
strName = Application.Documents(3).Name
MsgBox strName
End Sub
```

You may also use the object "Me" if you wish to address the current document:

```
Sub ShowDocumentName()
'VBA812
Dim obj As Document
set obj = Me
MsgBox obj.Name
End Sub
```

For example, use the SaveAs method to save the picture under a different name. In the following example the first picture will be saved under the name "CopyOfPicture1":

```
Sub SaveDocumentAs()
'VBA237
Application.Documents(3).SaveAs ("CopyOfPicture1")
End Sub
```

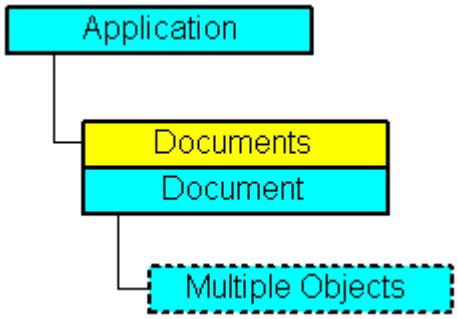
Documents Object (Listing)

Description



VBA Object Name

HMIDocuments

Usage

Note

Use the "ActiveDocument" property if you wish to refer to the active picture.

Use the Documents property to return the Documents listing. In the following example the names of all open pictures are output:

```
Sub ShowDocuments()
'VBA238
Dim colDocuments As Documents
Dim objDocument As Document
Set colDocuments = Application.Documents
For Each objDocument In colDocuments
MsgBox objDocument.Name
Next objDocument
End Sub
```

Use the Add method to add a new Document object to the Documents listing. In the following example a new picture is created:

```
Sub AddNewDocument()
'VBA239
Dim objDocument As Document
Set objDocument = Application.Documents.Add
End Sub
```

DotNetControl object

Description

Represents the "DotNetControl" object. The DotNetControl object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIDotNetControl

Application

Use the AddDotNetControl method to insert a DotNetControl in a picture.

In the following example, the ".NETControl" object from the Global Assembly Cache is inserted in the active picture.

```
'VBA851
Dim DotNetControl As HMIDotNetControl
Set DotNetControl = ActiveDocument.HMIObjects.AddDotNetControl("MyVBAControl",
"System.Windows.Forms.Label", True,"Assembly=System.Windows.Forms, Version=2.0.0.0,
Culture=neutral, PublicKeyToken=b77a5c561934e089")
```

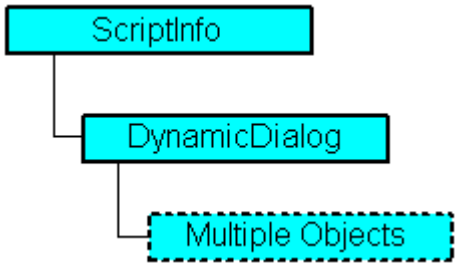
DynamicDialog Object

Description



Represents the Dynamic dialog. You can use the dynamic dialog to make the properties of pictures and objects respond dynamically to different value ranges.

Define the value range with the aid of the ResultType property.

VBA Object Name

HMIDynamicDialog

Usage

Use the DynamicDialog object to make an object property dynamic. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and three analog value ranges will be created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA240
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.Trigger.VariableTriggers.Add "NewDynamic2", hmiVariableCycleType_5s
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

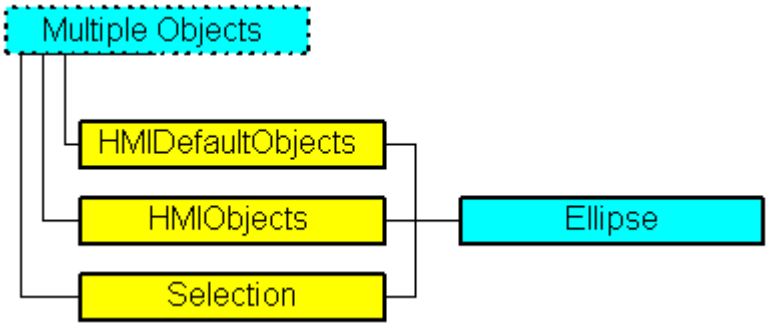
Ellipse Object

Description



Represents the "Ellipse" object. The Ellipse object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIEllipse

Usage

Use the Add method to create a new "Ellipse" object in a picture:

```
Sub AddEllipse()
'VBA241
Dim objEllipse As HMIEllipse
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("Ellipse", "HMIEllipse")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditEllipse()
'VBA242
Dim objEllipse As HMIEllipse
Set objEllipse = ActiveDocument.HMIObjects("Ellipse")
```

```
objEllipse.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing.

```
Sub ShowNameOfFirstSelectedObject()
'VBA243
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

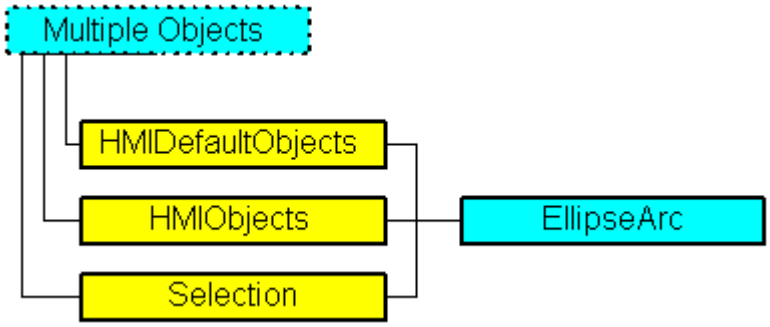
EllipseArc Object

Description



Represents the "Ellipse Arc" object. The EllipseArc object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIEllipseArc

Usage

Use the Add method to create a new "Ellipse Arc" object in a picture:

```
Sub AddEllipseArc()
'VBA244
Dim objEllipseArc As HMIEllipseArc
Set objEllipseArc = ActiveDocument.HMIObjects.AddHMIObject("EllipseArc", "HMIEllipseArc")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditEllipseArc()
'VBA245
Dim objEllipseArc As HMIEllipseArc
Set objEllipseArc = ActiveDocument.HMIObjects("EllipseArc")
objEllipseArc.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA246
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Use the "HMIDefaultObjects(Index)" to return an object from the HMIDefaultObjects Listing:

```
Sub EditDefaultPropertiesOfEllipseArc()
'VBA247
Dim objEllipseArc As HMIEllipseArc
Set objEllipseArc = Application.DefaultHMIObjects("HMIEllipseArc")
objEllipseArc.BorderColor = RGB(255, 255, 0)
'create new "EllipseArc"-object
Set objEllipseArc = ActiveDocument.HMIObjects.AddHMIObject("EllipseArc2", "HMIEllipseArc")
End Sub
```

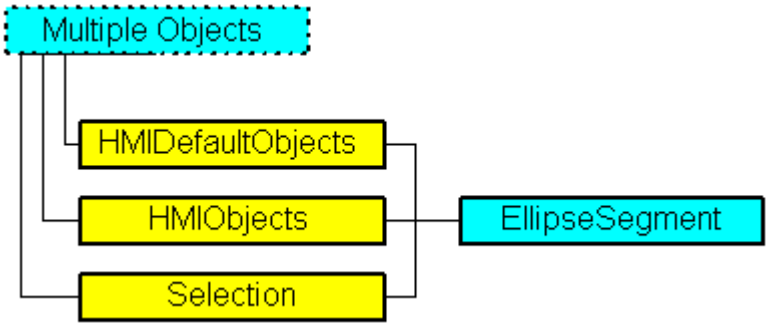
EllipseSegment Object

Description



Represents the "Ellipse Segment" object. The EllipseSegment object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIEllipseSegment

Usage

Use the Add method to create a new "Ellipse Segment" object in a picture:

```
Sub AddEllipseSegment()
'VBA248
Dim objEllipseSegment As HMIEllipseSegment
Set objEllipseSegment = ActiveDocument.HMIObjects.AddHMIObject("EllipseSegment",
"HMIEllipseSegment")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditEllipseSegment()
'VBA249
Dim objEllipseSegment As HMIEllipseSegment
Set objEllipseSegment = ActiveDocument.HMIObjects("EllipseSegment")
objEllipseSegment.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA250
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

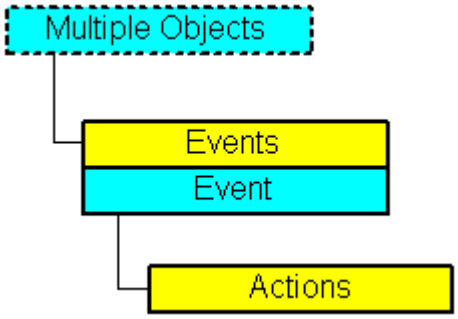
Event Object

Description



Represents an event that triggers one or more actions in Runtime (e.g. a direct connection). An event can be configured onto an object and a property.

VBA Object Name

HMIEvent

Usage

Use the AddAction method to configure an action on an event. In this example a C action is to be triggered in the event of a change of radius in Runtime:

```
Sub AddActionToPropertyTypeCScript()
'VBA251
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
'Create circle in the picture. If property "Radius" is changed,
'a C-action is added:
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
Set objEvent = objCircle.Radius.Events(1)
Set objCScript = objEvent.Actions.AddAction(hmiActionCreationTypeCScript)
End Sub
```

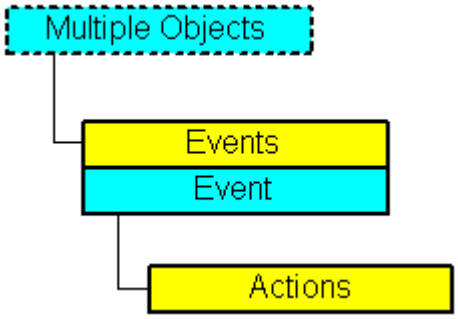
Events Object (Listing)

Description



A listing of the Event objects that represent all the events configured onto an object. Use the Item method to define the event that is intended to be configured:

- You configure an action on a property with VBA by using the "Events(1)" property, where the index "1" stands for the event "Upon change":
- To configure an action onto an object with the aid of VBA, use the "Events(Index)" property, where "Index" stands for the trigger event (see table):

Index	EventType (depending upon the object used)
0	hmiEventTypeNotDefined
1	hmiEventTypeMouseClick
2	hmiEventTypeMouseLButtonDown
3	hmiEventTypeMouseLButtonUp
4	hmiEventTypeMouseRButtonDown
5	hmiEventTypeMouseRButtonUp
6	hmiEventTypeKeyboardDown
7	hmiEventTypeKeyboardUp
8	hmiEventTypeFocusEnter
9	hmiEventTypeObjectChange
10	hmiEventTypePictureOpen

VBA Object Name

HMIEvents

Usage

Use the Item method to return an individual Event object. In this example the event names and event types of all objects in the active pictures are put out. In order for this example to work, insert some objects into the active picture and configure different events.

```
Sub ShowEventsOfAllObjectsInActiveDocument()
'VBA252
Dim colEvents As HMIEvents
Dim objEvent As HMIEvent
Dim iMax As Integer
Dim iIndex As Integer
Dim iAnswer As Integer
Dim strEventName As String
Dim strObjectName As String
Dim varEventType As Variant
iIndex = 1
iMax = ActiveDocument.HMIObjects.Count
For iIndex = 1 To iMax
Set colEvents = ActiveDocument.HMIObjects(iIndex).Events
strObjectName = ActiveDocument.HMIObjects(iIndex).ObjectName
For Each objEvent In colEvents
strEventName = objEvent.EventName
varEventType = objEvent.EventType
iAnswer = MsgBox("Objectname: " & strObjectName & vbCrLf & "Eventtype: " & varEventType &
vbCrLf & "Eventname: " & strEventName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objEvent
If vbCancel = iAnswer Then Exit For
Next iIndex
End Sub
```

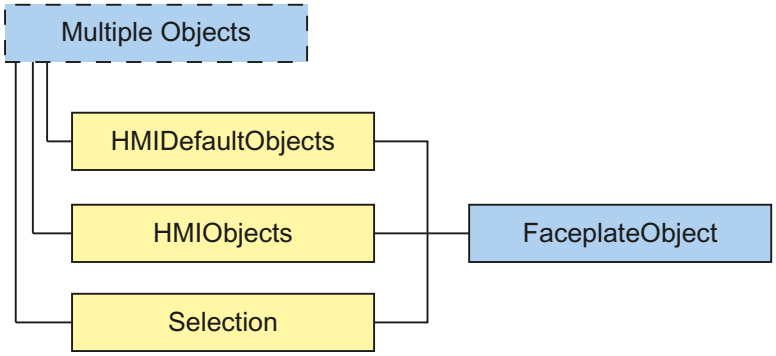
ExternalShapeInfo object

Description

Is used for internal purposes in Graphics Designer.

FaceplateObject object

Description



Represents the "faceplate instance" object. The FaceplateObject object is an element of the following lists:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMIFaceplateObject

Usage

Use the Add method to create a new "faceplate instance" object in a picture:

```
Sub AddFaceplateInstance()
'VBA826
Dim objFaceplateInstance As HMIFaceplateObject
Set objFaceplateInstance = ActiveDocument.HMIObjects.AddHMIObject("faceplate instance",
"HMIFaceplateObject")
objFaceplateInstance.Properties.Item(3).value = "Faceplate1.fpt"
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditFaceplateInstance()
'VBA827
Dim objFaceplateInstance As HMIFaceplateObject
Set objFaceplateInstance = ActiveDocument.HMIObjects("faceplate instance")
objFaceplateInstance.visible = True
```

```
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA828
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

VBA Object Name

HMIFaceplateObjects

See also

Parent Property (Page 3710)

OriginalPropertyName property (Page 3708)

FaceplateProperty object

Description

Represents the property of a faceplate object. In the case of the FaceplateProperty object, the use of the Value property is set as the default. For this reason you can use the following notation, for example, to assign a new value to an object property:

```
<FaceplateObject>.<FaceplateProperty> = <Value>
```

You can use the "Dynamic" property to make an object property dynamic with VBA. Use the "Events" listing to configure actions with VBA.

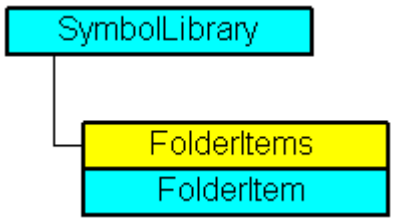
FolderItem Object

Description



Represents a folder or object in the Components Library. A FolderItem object of the "Folder" type is an element of the FolderItems listing. A FolderItem object of the "Item" type is an element of the Folder listing.

VBA Object Name

HMIFolderItem

Usage

Use the FolderItems property to return the FolderItems listing. In the following example the names of folders in the "Global Library will be output:

```
Sub ShowFolderItemsOfGlobalLibrary()
'VBA253
Dim colFolderItems As HMIFolderItems
Dim objFolderItem As HMIFolderItem
Set colFolderItems = Application.SymbolLibraries(1).FolderItems
For Each objFolderItem In colFolderItems
MsgBox objFolderItem.Name
Next objFolderItem
End Sub
```

Use the CopyToClipboard method to copy a "FolderItem" object of the "Item" type to the clipboard. In the following example the object "PC" will be copied to the clipboard.

```
Sub CopyFolderItemToClipboard()
'VBA254
Dim objGlobalLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
objGlobalLib.FolderItems("Folder2").Folder("Folder2").Folder.Item("Object1").CopyToClipboa
rd
End Sub
```

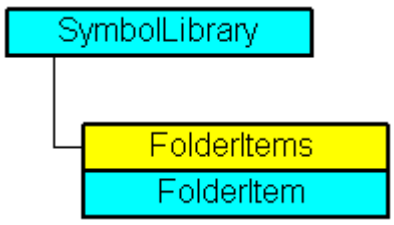
FolderItems Object (Listing)

Description



A listing of the FolderItem objects that represent all the folders and objects in the Components Library.

VBA Object Name

HMIFolderItems

Usage

Use the FolderItems property to return the FolderItems listing. In the following example the names of folders in the "Global Library will be output:

```
Sub ShowFolderItemsOfGlobalLibrary()
'VBA255
Dim colFolderItems As HMIFolderItems
Dim objFolderItem As HMIFolderItem
Set colFolderItems = Application.SymbolLibraries(1).FolderItems
For Each objFolderItem In colFolderItems
MsgBox objFolderItem.Name
Next objFolderItem
End Sub
```

Use the AddFolder method, for instance, to create a new folder in the Components Library. In the following example the folder "Project Folder" will be created in the "Project Library":

```
Sub AddNewFolderToProjectLibrary()
'VBA256
Dim objProjectLib As HMISymbolLibrary
Set objProjectLib = Application.SymbolLibraries(2)
objProjectLib.FolderItems.AddFolder ("My Folder")
End Sub
```

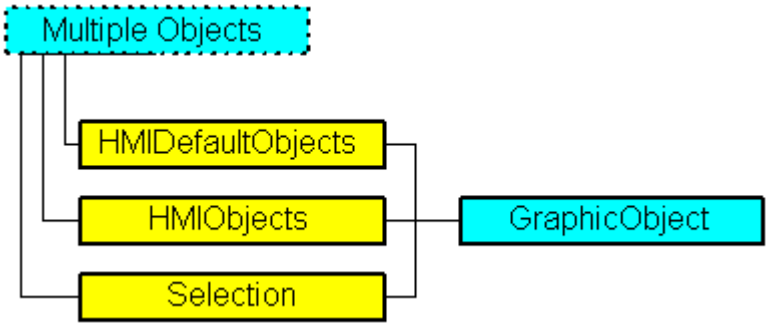
GraphicObject Object

Description



Represents the object called "Graphic Object". The GraphicObject object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIGraphicObject

Usage

Use the Add method to create a new "Graphic Object" object in a picture:

```
Sub AddGraphicObject()
'VBA257
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects.AddHMIObject("Graphic-Object",
"HMIGraphicObject")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditGraphicObject()
'VBA258
```

```
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects("Graphic-Object")
objGraphicObject.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA259
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

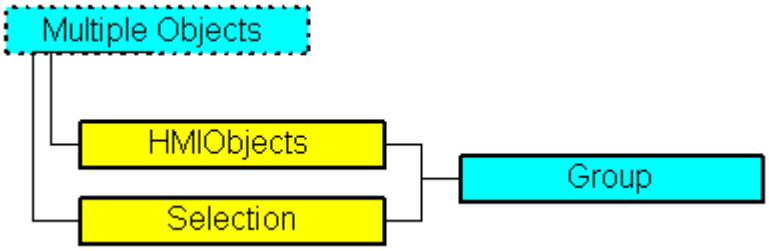
Group Object

Description



Represents the object called "Group Object". The Group Object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

A group object is created from the objects selected in a picture. The objects in the Group Object are also saved in the "GroupedHMIObjects" listing and index numbers are newly allocated.

You have unrestricted access to the properties of all objects in the Group Object.

Further information regarding group objects can be found in the WinCC documentation under "Group Object".

VBA Object Name

HMIGroup

Usage

Use the CreateGroup Method with the Selection listing to create a new "Group Object" object in a picture:

```
Sub DoCreateGroup()
'VBA260
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.Selection.CreateGroup
objGroup.ObjectName = "Group-Object"
End Sub
```

Use the following methods to edit an existing Group Object:

- Methode "Add(Index)": Adds a new object to the group object.
- Methode "Remove(Index)": Removes a object from the group object.
- "UnGroup()" method: Ungroups the group object (ungroup).
- "Delete()" Method: Deletes the group object and the objects that it contains.

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditGroup()
'VBA261
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.HMIObjects("Group-Object")
MsgBox objGroup.ObjectName
End Sub
```

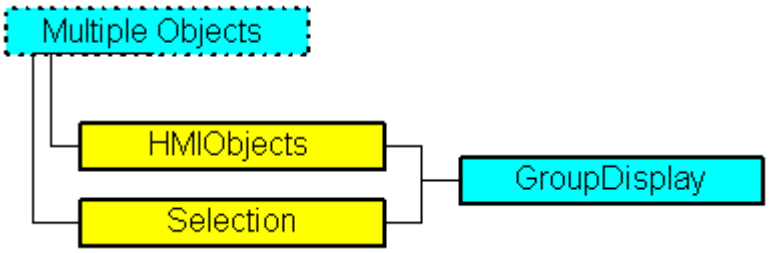
GroupDisplay Object

Description



Represents the "Group Display" object. The GroupDisplay object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIGroupDisplay

Usage

Use the Add method to create a new "Group Display" object in a picture:

```
Sub AddGroupDisplay()
'VBA262
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("Groupdisplay",
"HMIGroupDisplay")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditGroupDisplay()
'VBA263
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects("Groupdisplay")
objGroupDisplay.BackColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA264
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

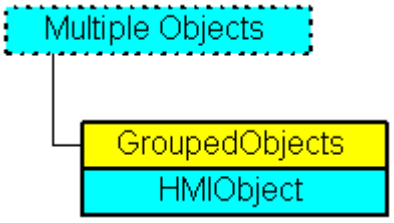
GroupedObjects Object (Listing)

Description



A listing of the HMIObject objects that represent all the objects in the group object.

VBA Object Name

HMIGroupedObjects

Usage

Use the GroupedHMIObjects property to return the GroupedObjects listing. In the following example all the objects in the first group object are output in the active picture. The group object called "Group1" must first have been created:

```
Sub ShowGroupedObjectsOfFirstGroup()
'VBA265
Dim colGroupedObjects As HMIGroupedObjects
Dim objObject As HMIObject
Set colGroupedObjects = ActiveDocument.HMIObjects("Group1").GroupedHMIObjects
For Each objObject In colGroupedObjects
MsgBox objObject.ObjectName
Next objObject
End Sub
```

Use the Remove method, for instance, to remove an object from the group object. In the following example the first object will be removed from the group object called "Group1":

```
Sub RemoveObjectFromGroup()
'VBA266
Dim objGroup As HMIGroup
Set objGroup = ActiveDocument.HMIObjects("Group1")
objGroup.GroupedHMIObjects.Remove (1)
End Sub
```

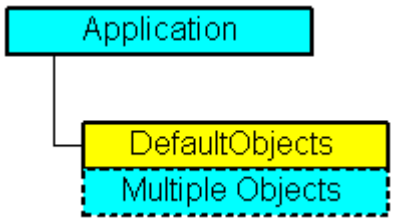
HMIDefaultObjects Object (Listing)

Description



A listing of the following HMIObject objects:

Object	VBA object name
Line	HMILine
Polygon	HMIPolygon
Polyline	HMIPolyLine
Ellipse	HMIEllipse
Circle	HMICircle
Ellipse segment	HMIEllipseSegment

Object	VBA object name
Pie segment	HMIPieSegment
Ellipse arc	HMIEllipseArc
Circular arc	HMICircularArc
Rectangle	HMIRectangle
Rounded rectangle	HMIRoundRectangle
Application window	HMIApplicationWindow
Screen Window	HMIPictureWindow
Static text	HMIStaticText
I/O Field	HMIIOField
Button	HMIButton
Check box	HMICheckBox
Radio box	HMIOptionGroup
Round button	HMIRoundButton
Bar	HMIBarGraph
Slider object	HMISlider
Graphic Object	HMIGraphicObject
Status display	HMIStatusDisplay
Text list	HMITextList
Connector	HMIObjConnection
Multiple row text	HMIMultiLineEdit
Combo box	HMIComboBox
List box	HMIListBox
Polygon tube	HMITubePolyline
T-piece	HMITubeTeeObject
Double T-piece	HMITubeDoubleTeeObject
Tube bend	HMITubeArcObject
3D bar	HMI3DBarGraph
Group display	HMIGroupDisplay
Faceplate instance	HMIFaceplateObject

VBA object name

HMIDefaultObjects

Usage

Use the DefaultHMIObjects property to change the default property values of the included objects. In this example all the objects contained in the listing will be output:

```
Sub ShowDefaultObjects()
'VBA267
Dim strType As String
Dim strName As String
```

```
Dim strMessage As String
Dim iMax As Integer
Dim iIndex As Integer
iMax = Application.DefaultHMIObjects.Count
iIndex = 1
For iIndex = 1 To iMax
With Application.DefaultHMIObjects(iIndex)
strType = .Type
strName = .ObjectName
strMessage = strMessage & "Element: " & iIndex & " / Objecttype: " & strType & " /
Objectname: " & strName
End With
If 0 = iIndex Mod 10 Then
MsgBox strMessage
strMessage = ""
Else
strMessage = strMessage & vbCrLf & vbCrLf
End If
Next iIndex
MsgBox "Element: " & iIndex & vbCrLf & "Objecttype: " & strType & vbCrLf & "Objectname: "
& strName
End Sub
```

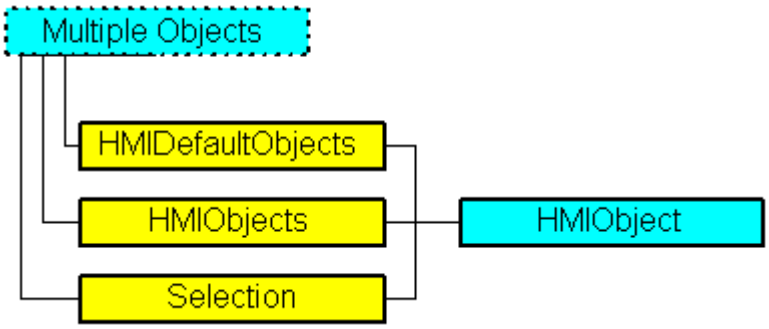
HMIObject Object

Description



Represents an object from the Object Palette of the Graphics Designer. The HMIObject object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

This object contains the object properties that apply to all standard, smart and Windows objects (incl. Width, Height, Top and Left).

VBA Object Name

HMIObject

Usage

Use HMIObjects(Index), for instance, to return an individual HMIObject object. "For Index you can use either the index number or the name of the object. In the following example the name of the first object in the active picture is output:

```
Sub ShowFirstObjectOfCollection()
'VBA268
Dim strName As String
strName = ActiveDocument.HMIObjects(1).ObjectName
MsgBox strName
End Sub
```

Use the Delete method to remove an object from the HMIObjects listing. In the following example the first object in the active picture will be removed:

```
Sub DeleteObject()
'VBA269
ActiveDocument.HMIObjects(1).Delete
End Sub
```

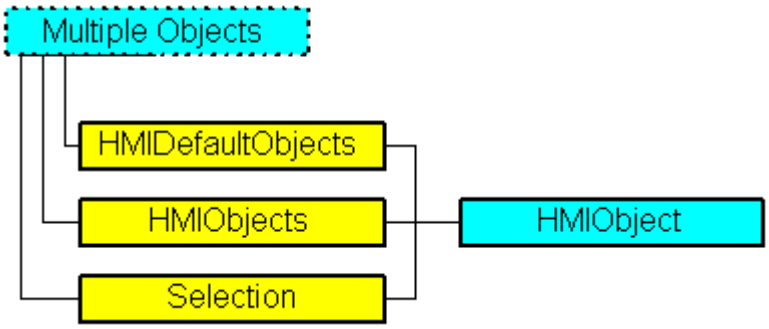
HMIObjects Object (Listing)

Description



A listing of the HMIObject objects that represent all the objects in the picture.

VBA Object Name

HMIObjects

Note

The sequence of HMI objects in the HMIObjects list can be altered by adding and/or deleting HMI objects.

The sequence of listing can also change if HMI objects are processed in the current listing. This behavior can occur if the Layers property is modified and/or if the methods "SendToBack" and "BringToFront" are used.

Usage

Use the HMIObjects property to return the HMIObjects listing. In the following example all the object names in the active picture are output:

```
Sub ShowObjectsOfDocument()
'VBA270
Dim colObjects As HMIObjects
Dim objObject As HMIObject
Set colObjects = ActiveDocument.HMIObjects
For Each objObject In colObjects
MsgBox objObject.ObjectName
Next objObject
End Sub
```

Use the AddHMIObject method to create a new object in the picture. In the following example a circle will be inserted into the active picture:

```
Sub AddCircle()
'VBA271
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_1", "HMICircle")
End Sub
```

Use the Find method to search for one or more objects in the picture. In the following example, objects of the "HMICircle" type will be searched for in the active picture:

```
Sub FindObjectsByType()
'VBA272
Dim colSearchResults As HMICollection
Dim objMember As HMIObject
Dim iResult As Integer
Dim strName As String
Set colSearchResults = ActiveDocument.HMIObjects.Find(ObjectType:="HMICircle")
For Each objMember In colSearchResults
iResult = colSearchResults.Count
strName = objMember.ObjectName
MsgBox "Found: " & CStr(iResult) & vbCrLf & "Objectname: " & strName
Next objMember
End Sub
```

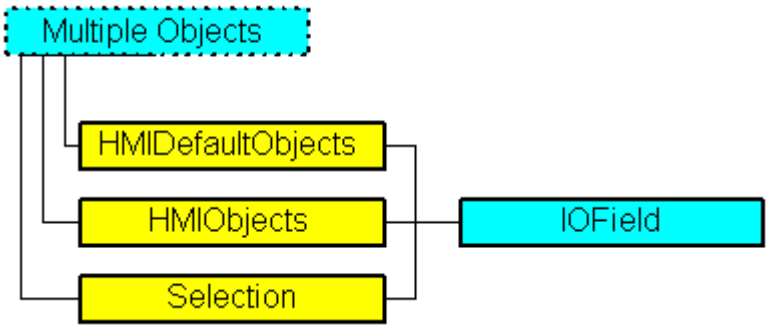
IOField Object

Description



Represents the "I/O Field" object. The IOField object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIIOField

Usage

Use the Add method to create a new "I/O Field" object in a picture:

```
Sub AddIOField()
'VBA273
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IO-Field", "HMIIOField")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditIOField()
'VBA274
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects("IO-Field")
objIOField.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA275
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Use the "HMIDefaultObjects(Index)" to return an object from the HMIDefaultObjects Listing:

```
Sub EditDefaultPropertiesOfIOField()
'VBA276
Dim objIOField As HMIIOField
Set objIOField = Application.DefaultHMIObjects("HMIIOField")
objIOField.BorderColor = RGB(255, 255, 0)
End Sub
```

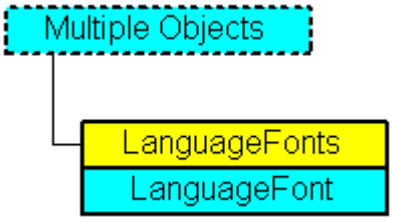
L-Q

LanguageFont Object

Description



Contains the font settings for the project language. The LanguageFont object is an element of the LanguageFonts listing.

VBA Object Name

HMILanguageFont

Usage

Use LDFonts(Index) to return an individual LanguageFont object. In the following example a Button object will be created and the name of the first configured font will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA277
Dim strName As String
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button", "HMIButton")
strName = objButton.LDFonts(1).Family
MsgBox strName
End Sub
```

Object properties

The LanguageFont object possesses the following properties:

See also

LanguageFonts Object (Listing) (Page 3368)

VBA Reference (Page 3124)

Underlined Property (Page 3801)

Size Property (Page 3764)

Parent Property (Page 3710)

LanguageID Property (Page 3645)

Italic Property (Page 3638)

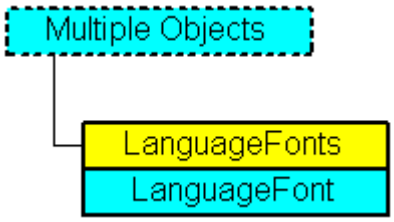
Family Property (Page 3589)

Bold Property (Page 3515)

Application Property (Page 3486)

LanguageFonts Object (Listing)

Description



A listing of the LanguageFont objects that represent all the language-dependent fonts in an object.

VBA Object Name

HMILanguageFonts

Usage

Use the LDFonts property to return the LanguageFonts listing. In the following example the language identifiers of the configured fonts will be output:

```
Sub ShowLanguageFont()
'VBA278
Dim colLanguageFonts As HMILanguageFonts
Dim objLanguageFont As HMILanguageFont
Dim objButton As HMIButton
Dim iMax As Integer
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
Set colLanguageFonts = objButton.LDFonts
iMax = colLanguageFonts.Count
For Each objLanguageFont In colLanguageFonts
MsgBox "Planned fonts: " & iMax & vbCrLf & "Language-ID: " & objLanguageFont.LanguageID
Next objLanguageFont
End Sub
```

Use the ItemByLcid method to define the language for which it is intended to enter font settings. The following example sets the font attributes of a button for French and English.

Note

For this example to work, you must already have configured in the languages concerned.

```
Sub ExampleForLanguageFonts()
'VBA279
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "DefText"
Set colLangFonts = objButton.LDFonts

'Adjust fontsettings for french:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'Adjust fontsettings for english:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

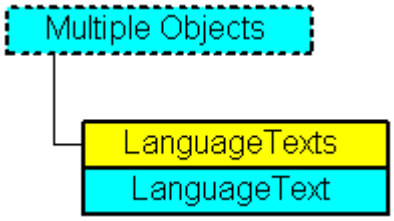
LanguageText Object

Description



Contains the multilingual labels for an object. The LanguageText object is an element of the LanguageTexts listing.

VBA Object Name

HMILanguageText

Usage

In the following example a German label and an English label will be assigned to the button called "myButton":

```
Sub AddLanguagesToButton()
'VBA280
Dim objLabelText As HMILanguageText
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
'
'Add text in actual datalanguage:
objButton.Text = "Actual-Language Text"
'
'Add english text:
Set objLabelText = ActiveDocument.HMIObjects("myButton").LDTexts.Add(1033, "English Text")
End Sub
```

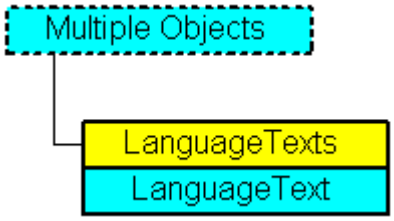
Application Property (Page 3486)

LanguageTexts Object (Listing)

Description



A listing of the LanguageText objects that represent all the multilingual texts in an object.

VBA Object Name

HMILanguageTexts

Usage

Use one of the following properties to return the LanguageTexts listing:

- LDLabelTexts Property
- LDNames Property
- LDStatusTexts Property
- LDTexts Property
- LDTooltipTexts Property

An example showing how to use the LanguageTexts listing can be found in this documentation under the heading "LDStatusTexts Property".

Use the Add method to add multilingual texts to an object. In the following example a German label and an English label will be assigned to the button called "myButton":

```
Sub AddLanguagesToButton()
'VBA281
Dim objLabelText As HMILanguageText
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
'
'Add text in actual datalanguage:
objButton.Text = "Actual-Language Text"
'
'Add english text:
Set objLabelText = ActiveDocument.HMIObjects("myButton").LDTexts.Add(1033, "English Text")
End Sub
```

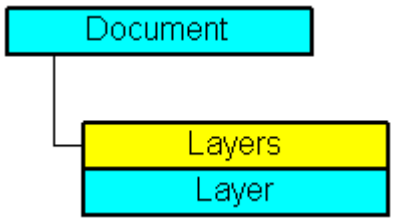
Layer Object

Description



Represents one of the 32 layers that are available in the picture.

VBA Object Name

HMILayer

Usage

Use the Layer object to define a name and the minimum and maximum zoom for a layer. You define the visibility of layers separately by CS and RT layers:

- Document Object: Controls the visibility of the RT layers.
- View Object: Controls the visibility of the RT layers.

Use the Layers listing to return a Layer object. In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer()
'VBA282
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
End Sub
```

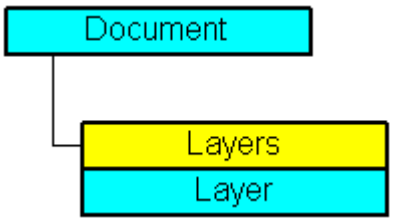
ActiveLayer Property (Page 3474)

Layers Object (Listing)

Description



A listing of the Layer objects that represent the 32 layers in the picture.

VBA Object Name

HMILayer

Usage

Use the LayersCS or LayersRT property to return the Layers listing. In the following example the layer names in the copy of the active picture will be output:

```
Sub ShowLayer()
'VBA283
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim strLayerList As String
Dim iCounter As Integer
iCounter = 1
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
If 1 = iCounter Mod 2 And 32 > iCounter Then
strLayerList = strLayerList & vbCrLf
ElseIf 11 > iCounter Then
strLayerList = strLayerList & "       "
Else
strLayerList = strLayerList & "     "
End If
strLayerList = strLayerList & objLayer.Name
iCounter = iCounter + 1
Next objLayer
MsgBox strLayerList
End Sub
```

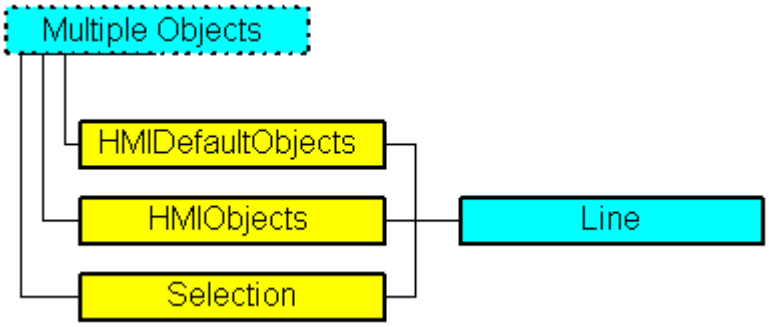
Line Object

Description



Represents the "Line" object. The Line object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMILine

Usage

Use the Add method to create a new "Line" object in a picture:

```
Sub AddLine()
'VBA285
Dim objLine As HMILine
Set objLine = ActiveDocument.HMIObjects.AddHMIObject("Line1", "HMILine")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditLine()
'VBA286
Dim objLine As HMILine
Set objLine = ActiveDocument.HMIObjects("Line1")
objLine.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA287
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

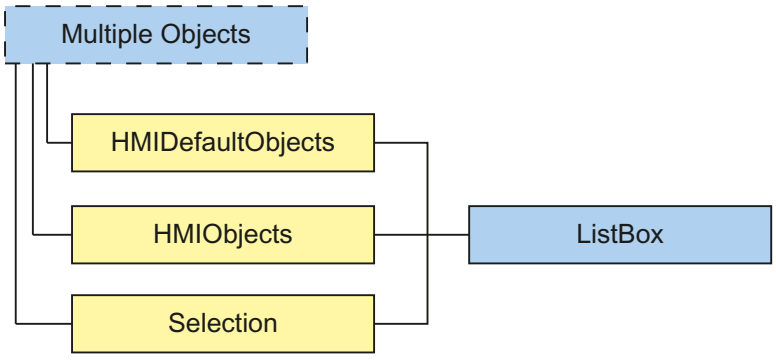
ListBox object

Description



Represents the "ListBox" object. The ListBox object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMIListBox

Usage

Use the Add method to create a new "ListBox" object in a picture:

```
Sub AddListBox()
'VBA829
Dim objListBox As HMIListBox
Set objListBox = ActiveDocument.HMIObjects.AddHMIObject("ListBox", "HMIListBox")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditListBox()
'VBA830
Dim objListBox As HMIListBox
Set objListBox = ActiveDocument.HMIObjects("ListBox")
objListBox.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA831
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

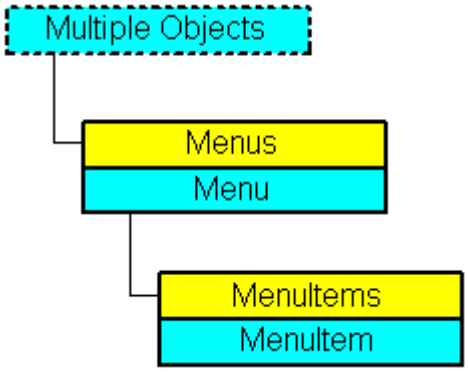
Menu Object

Description



Represents the "User Defined Menu" object. The Menu object is an element of the CustomMenus listing.

VBA Object Name

HMIMenu

Usage

Use CustomMenus(Index) to return an individual Menu object. "For Index you can use either the index number or the name of the object. In order for the following example to work, create a user defined menu. For an example of this, please refer to "Creating a New Application-Specific Menu" in this documentation. In the following example the name of the first user-defined menu in the active picture will be output:

```
Sub ShowFirstMenuOfMenucollection()
'VBA288
Dim strName As String
strName = ActiveDocument.CustomMenus(1).Label
MsgBox strName
End Sub
```

Use the Delete method to remove a "Menu" object from the "CustomMenus" listing. In the following example the first user-defined menu in the active picture will be removed:

```
Sub DeleteMenu()
'VBA289
Dim objMenu As HMIMenu
Set objMenu = ActiveDocument.CustomMenus(1)
objMenu.Delete
End Sub
```

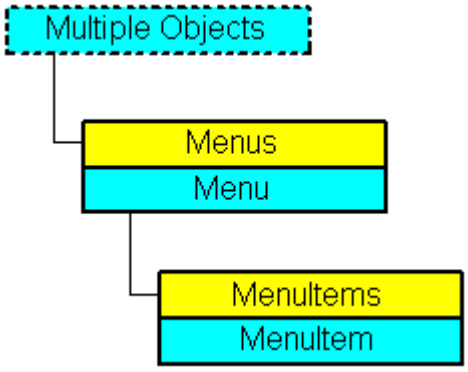
Enabled Property (Page 3581)

Application Property (Page 3486)

Menus Object (Listing)

Description



A listing of the Menu objects that represent all the user-defined menus in the Graphics Designer.

VBA Object Name

HMIMenus

Usage

Use the CustomMenus property to return the Menus listing. In the following example all the user-defined menus in the active picture will be output.

Note

The Menus listing does not distinguish between application-specific and picture-specific menus in the output.

```
Sub ShowCustomMenusOfDocument()
'VBA290
Dim colMenus As HMIMenus
Dim objMenu As HMIMenu
Dim strMenuList As String
Set colMenus = ActiveDocument.CustomMenus
For Each objMenu In colMenus
strMenuList = strMenuList & objMenu.Label & vbCrLf
Next objMenu
MsgBox strMenuList
End Sub
```

Use the Application property and the InsertMenu method if you want to create an application-specific menu. Create the VBA code in either the "Project Template" document or the "Global

Template" document. In the following example a user-defined menu called "myApplicationMenu" will be created:

```
Sub InsertApplicationSpecificMenu()
'VBA291
Dim objMenu As HMIMenu
Set objMenu = Application.CustomMenus.InsertMenu(1, "a_Menu1", "myApplicationMenu")
End Sub
```

Use the ActiveDocument property and the InsertMenu method if you want to create a picture-specific menu. Create the VBA code in the document called "ThisDocument": In the following example a picture-specific menu called "myDocumentMenu" will be created:;

```
Sub InsertDocumentSpecificMenu()
'VBA292
Dim objMenu As HMIMenu
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "d_Menu1", "myDocumentMenu")
End Sub
```

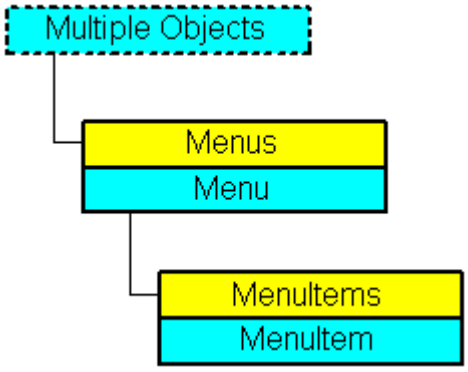
Application Property (Page 3486)

MenuItem Object

Description



Represents a menu entry for a user-defined menu in the Graphics Designer. The MenuItem object is an element of the MenuItems listing.

VBA Object Name

HMIMenuItem

Usage

Note

In order for the examples to work, first create a user-defined menu. For an example of this, please refer to "Adding a New Entry to the Menu" in this documentation.

Use MenuItems(Index) to return an individual MenuItem object. "For Index you can use either the index number or the name of the object. In the following example the first entry in the first user-defined menu in the active picture will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA293
Dim strName As String
strName = ActiveDocument.CustomMenus(1).MenuItems(1).Label
MsgBox strName
End Sub
```

Use the Delete method to remove an object from the "MenuItems" listing. In the following example the first entry in the first user-defined menu in the active picture will be deleted:

```
Sub DeleteMenuItem()
'VBA294
ActiveDocument.CustomMenus(1).MenuItems(1).Delete
```

```
End Sub
```

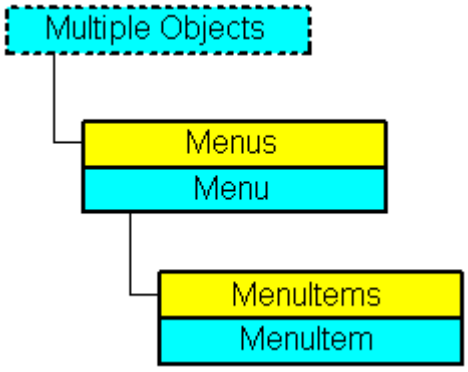
Application Property (Page 3486)

MenuItems Object (Listing)

Description



A listing of the MenuItem objects that represent all the entries in a user-defined menu.

Usage

Note

In order for the examples to work, first create a user-defined menu. For an example of this, please refer to "Adding a New Entry to the Menu" in this documentation.

Use the MenuItems property to return the MenuItems listing. In the following example all the entries in the first user-defined menu in the active picture will be output:

Note

The MenuItems listing does not distinguish between an application-specific and a picture-specific menu in the output.

```
Sub ShowMenuItems()
'VBA295
Dim colMenuItems As HMIMenuItems
Dim objMenuItem As HMIMenuItem
Dim strItemList As String
Set colMenuItems = ActiveDocument.CustomMenus(1).MenuItems
For Each objMenuItem In colMenuItems
strItemList = strItemList & objMenuItem.Label & vbCrLf
Next objMenuItem
MsgBox strItemList
End Sub
```

Use the InsertMenuItem method, for instance, to insert an entry into an existing user-defined menu. In the following example the picture-specific menu "DocMenu2" will be created in the active picture and the menu entry "MenuItem1" is inserted:

```
Sub InsertMenuItem()
'VBA296
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(2, "d_Menu2", "DocMenu2")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "m_Item2_1", "MenuItem 1")
End Sub
```

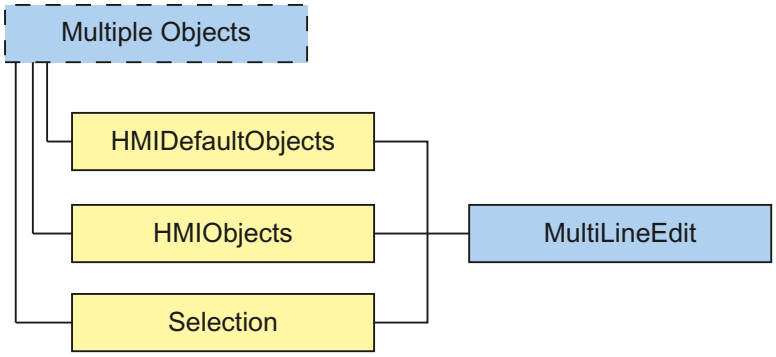
MultiLineEdit object

Description



Represents the "MultiLineEdit" object. The MultiLineEdit object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMIMultiLineEdit

Usage

Use the Add method to create a new "MultiLineEdit" object in a picture:

```
Sub AddMultiLineEdit()
'VBA832
Dim objMultiLineEdit As HMIMultiLineEdit
Set objMultiLineEdit = ActiveDocument.HMIObjects.AddHMIObject("MultiLineEdit",
"HMIMultiLineEdit")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditMultiLineEdit()
'VBA833
Dim objMultiLineEdit As HMIMultiLineEdit
Set objMultiLineEdit = ActiveDocument.HMIObjects("MultiLineEdit")
objMultiLineEdit.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA834
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

ObjConnection object

Description

Represents the "Connector" object. The ObjConnection object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

Note

You have read-only access to the properties of the ObjConnection object.

VBA Object Name

HMIObjConnection

Application

From the properties of the ObjConnection object you can find out which objects are connected.

Example

In order for the following example to work you must have connected two objects to the connector in the active picture of the Graphics Designer. You can find the Connector object in the Graphics Designer in the Object Palette under "Standard Objects". For this example to work, give the connector the name "Connector1".

In the user-defined menu "Connector Info" you can click on the "Connector Info" entry and display the objects connected via the connector:

```
Sub ShowConnectorInfo_Menu()
'VBA297
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim strDocName As String
strDocName = Application.ApplicationDataPath & ActiveDocument.Name
Set objMenu = Documents(strDocName).CustomMenus.InsertMenu(1, "ConnectorMenu",
"Connector_Info")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "ShowConnectInfo", "Info Connector")
End Sub

Sub ShowConnectorInfo()
Dim objConnector As HMIObjConnection
Dim iStart As Integer
Dim iEnd As Integer
Dim strStart As String
Dim strEnd As String
```

```
Dim strObjStart As String
Dim strObjEnd As String
Set objConnector = ActiveDocument.HMIObjects("Connector1")
iStart = objConnector.BottomConnectedConnectionPointIndex
iEnd = objConnector.TopConnectedConnectionPointIndex
strObjStart = objConnector.BottomConnectedObjectName
strObjEnd = objConnector.TopConnectedObjectName
Select Case iStart
Case 0
strStart = "top"
Case 1
strStart = "right"
Case 2
strStart = "bottom"
Case 3
strStart = "left"
End Select
Select Case iEnd
Case 0
strEnd = "top"
Case 1
strEnd = "right"
Case 2
strEnd = "bottom"
Case 3
strEnd = "left"
End Select
MsgBox "The selected connector links the objects " & vbCrLf & "'" & strObjStart & "' and '"
& strObjEnd & "'" & vbCrLf & "Connected points: " & vbCrLf & strObjStart & ": " & strStart
& vbCrLf & strObjEnd & ": " & strEnd
End Sub

Private Sub Document_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
Select Case MenuItem.Key
Case "ShowConnectInfo"
Call ShowConnectorInfo
End Select
End Sub
```

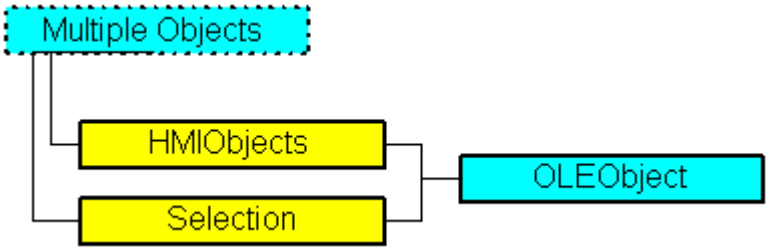
OLEObject Object

Description



Represents the object called "OLE Element". The OLEObject object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIOLEObject

Usage

Use the AddOLEObject method to create a new "OLE Element" object in a picture: In the following example an OLE Element containing a Wordpad document will be inserted into the active picture:

```
Sub AddOLEObjectToActiveDocument()
'VBA298
Dim objOleObject As HMIOLEObject
Set objOleObject = ActiveDocument.HMIObjects.AddOLEObject("Wordpad Document",
"Wordpad.Document.1")
End Sub
```

Use "HMIObjects(Index)" to return an object from the HMIObjects listing, where "Index" in this case identifies the object by name: In this example the X coordinate of the OLE Element "Wordpad Document" is set to 140:

```
Sub EditOLEObject()
'VBA299
Dim objOleObject As HMIOLEObject
Set objOleObject = ActiveDocument.HMIObjects("Wordpad Document")
objOleObject.Left = 140
End Sub
```

Use "Selection(Index)" to return an object from the Selection listing. "For Index you can use either the index number or the name of the object. In this example the name of the first selected object will be output:

```
Sub ShowNameOfFirstSelectedObject()
'VBA300
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

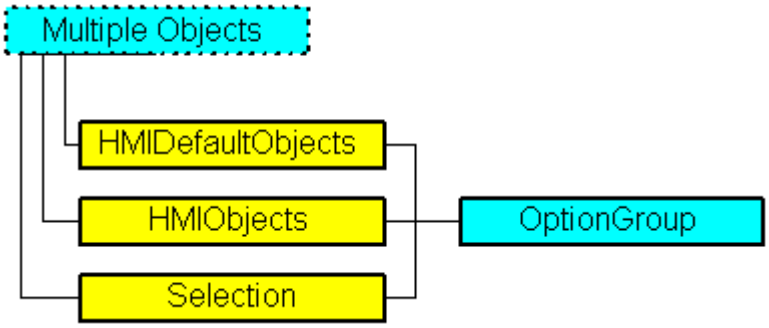
OptionGroup Object

Description



Represents the "Radio Box" object. The OptionGroup object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIOptionGroup

Usage

Use the Add method to create a new "Option Group" object in a picture:

```
Sub AddOptionGroup()
'VBA301
Dim objOptionGroup As HMIOptionGroup
Set objOptionGroup = ActiveDocument.HMIObjects.AddHMIObject("Radio-Box", "HMIOptionGroup")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditOptionGroup()
'VBA302
Dim objOptionGroup As HMIOptionGroup
Set objOptionGroup = ActiveDocument.HMIObjects("Radio-Box")
objOptionGroup.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA303
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

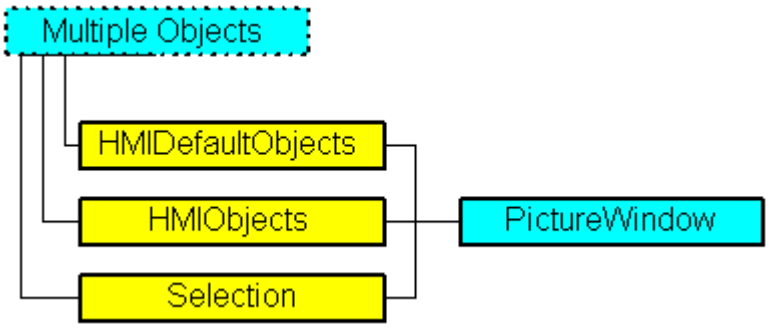
PictureWindow Object

Description



Represents the "Picture Window" object. The PictureWindow object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIPictureWindow

Usage

Use the Add method to create a new "Picture Window" object in a picture:

```
Sub AddPictureWindow()
'VBA304
Dim objPictureWindow As HMIPictureWindow
Set objPictureWindow = ActiveDocument.HMIObjects.AddHMIObject("PictureWindow1",
"HMIPictureWindow")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditPictureWindow()
'VBA305
Dim objPictureWindow As HMIPictureWindow
Set objPictureWindow = ActiveDocument.HMIObjects("PictureWindow1")
objPictureWindow.Sizeable = True
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA306
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

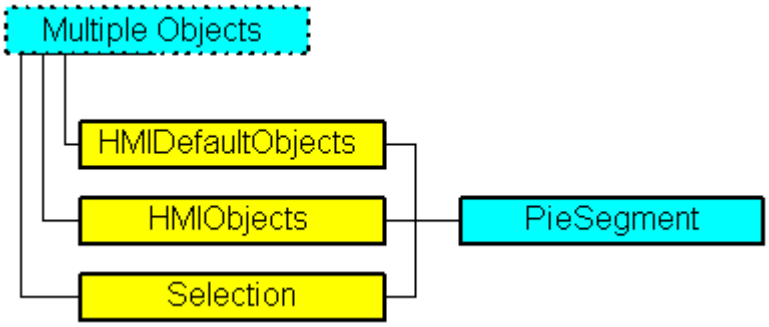
PieSegment Object

Description



Represents the "Pie Segment" object. The PieSegment object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIPieSegment

Usage

Use the Add method to create a new "Pie Segment" object in a picture:

```
Sub AddPieSegment()
'VBA307
Dim objPieSegment As HMIPieSegment
Set objPieSegment = ActiveDocument.HMIObjects.AddHMIObject("PieSegment1", "HMIPieSegment")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditPieSegment()
'VBA308
Dim objPieSegment As HMIPieSegment
Set objPieSegment = ActiveDocument.HMIObjects("PieSegment1")
objPieSegment.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA309
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

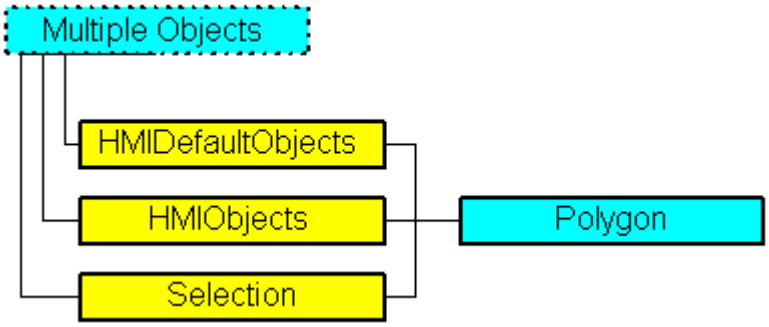
Polygon Object

Description



Represents the "Polygon" object. The Polygon object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIPolygon

Usage

Use the Add method to create a new "Polygon" object in a picture:

```
Sub AddPolygon()
'VBA310
Dim objPolygon As HMIPolygon
Set objPolygon = ActiveDocument.HMIObjects.AddHMIObject("Polygon", "HMIPolygon")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditPolygon()
'VBA311
Dim objPolygon As HMIPolygon
Set objPolygon = ActiveDocument.HMIObjects("Polygon")
objPolygon.BorderColor = RGB (255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA312
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

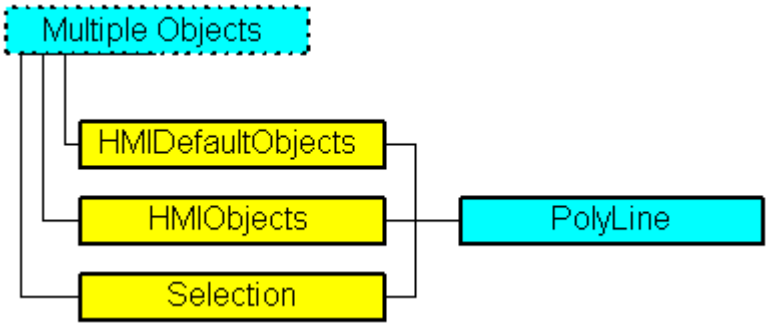
PolyLine Object

Description



Represents the "Polyline" object. The PolyLine object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIPolyLine

Usage

Use the Add method to create a new "Polyline" object in a picture:

```
Sub AddPolyLine()
'VBA313
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects.AddHMIObject("PolyLine1", "HMIPolyLine")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditPolyLine()
'VBA314
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects("PolyLine1")
objPolyLine.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA315
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

Use the "HMIDefaultObjects(Index)" to return an object from the HMIDefaultObjects Listing:

```
Sub EditDefaultPropertiesOfPolyLine()
'VBA316
Dim objPolyLine As HMIPolyLine
Set objPolyLine = Application.DefaultHMIObjects("HMIPolyLine")
objPolyLine.BorderColor = RGB(255, 255, 0)
End Sub
```

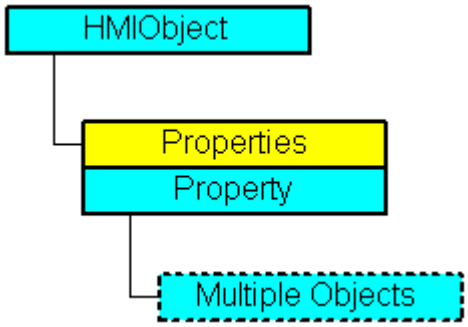
Properties Object (Listing)

Description



A listing of the Property objects that represent all the properties of an object.

VBA Object Name

HMIProperties

Usage

Use the Properties(Index) property in order to return a Property object if you cannot access an object property directly. For "Index" you can use either the index number or the VBA property name of the object. In the following example the Properties property has to be used to access the individual properties of a circle. The circle will be inserted into the picture as an HMIObject object:

```
Sub AddObject()
'VBA319
Dim objObject As HMIObject
Set objObject = ActiveDocument.HMIObjects.AddHMIObject("CircleAsHMIObject", "HMICircle")
'
'Standard properties (e.g. "Position") are available every time:
objObject.Top = 40
objObject.Left = 40
'
'Individual properties have to be called using
'property "Properties":
objObject.Properties("FlashBackColor") = True
End Sub
```

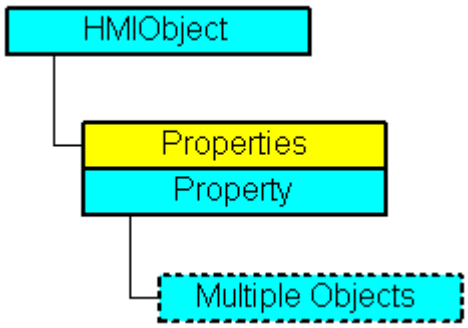
Property Object

Description



Represents the property of an object. In the case of the Property object the use of the Value property is set as the default. For this reason you can use the following notation in order for example to assign a new value to an object property:

```
<Object>.<Property> = <Value>
```

You can use the "Dynamic" property in order to make an object property dynamic with VBA. Use the "Events" listing in order to configure actions with VBA.

The Property object is an element of the Properties listing.

VBA Object Name

HMIProperty

Usage

Use Properties(Index) to return an individual Property object. For "Index" you can use either the index number or the name of the object property. In the following example the name of the first property of the Circle object will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA317
Dim objCircle As HMICircle
Dim strName As String
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle", "HMICircle")
strName = objCircle.Properties(1).Name
MsgBox strName
End Sub
```

Use the CreateDynamic method to make an object property dynamic. In the following example the "Radius" property of a circle object will be made dynamic with the aid of the tag "Otto", which is updated every two seconds:

```
Sub DynamicToRadiusOfNewCircle()
'VBA318
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects("Circle")
Set objVariableTrigger =
objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVariableDirect, "NewDynamic1")
objVariableTrigger.CycleType = hmiCycleType_2s
End Sub
```

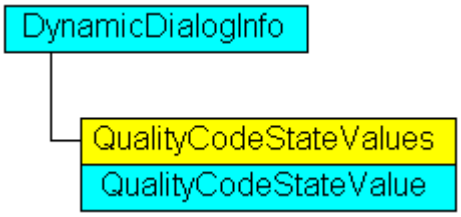
QualityCodeStateValue Object

Description



Represents the quality code of a tag which is assigned in the dynamic dialog and used for dynamization.

VBA Object Name

HMIQualityCodeStateValue

Object properties

The object QualityCodeStateValue has the following properties:

- Application
- Parent
- VALUE_BAD_COMMLUV
- VALUE_BAD_COMMLUV
- VALUE_BAD_CONFERROR
- VALUE_BAD_DEVICE
- VALUE_BAD_MISCSTATES
- VALUE_BAD_NONSPECIFIC
- VALUE_BAD_NOTCONNECTED
- VALUE_BAD_OUTOFSERV
- VALUE_BAD_PROCRELNOM
- VALUE_BAD_PROCRELSUB
- VALUE_HIGHLIMITED
- VALUE_LOWLIMITED
- VALUE_UNCERT_ENGVHIGHLIM
- VALUE_UNCERT_ENGVLOWLIM
- VALUE_UNCERT_ENGVONLIM
- VALUE_UNCERT_INITVAL
- VALUE_UNCERT_LUV

- VALUE_UNCERT_MAINTDEM
- VALUE_UNCERT_MISCSTATES
- VALUE_UNCERT_NONSPECIFIC
- VALUE_UNCERT_PROCRELNOM
- VALUE_UNCERT_SIMVAL
- VALUE_UNCERT_SUBSTSET
- VarName

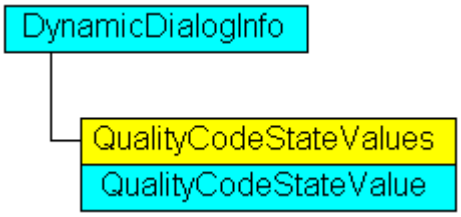
QualityCodeStateValues Object (Listing)

Description



A listing of QualityCodeStateValue objects which contain all quality codes in Dynamic dialog and are used for dynamization.

VBA Object Name

HMIQualityCodeStateValues

Application

For example, use the Item property to define values in Dynamic dialog which will be used for dynamization when the specified tag returns the configured quality code. In the following example the radius of a circle is given dynamics with the dynamic dialog. Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA813
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'Activate qualitycode-statecheck
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
```

```
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

Object properties

The object QualityCodeStateValues has the following properties:

- Application
- Count
- Item
- Parent

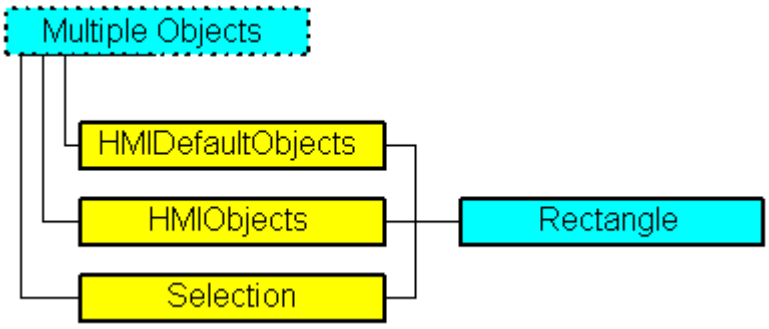
R-Z

Rectangle Object

Description



Represents the "Rectangle" object. The Rectangle object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIRectangle

Usage

Use the Add method to create a new "Rectangle" object in a picture:

```
Sub AddRectangle()
'VBA320
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditRectangle()
'VBA321
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects("Rectangle1")
objRectangle.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA322
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

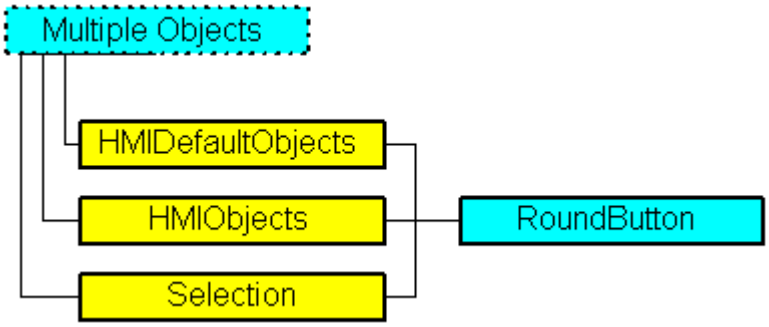
RoundButton Object

Description



Represents the "Round Button" object. The RoundButton object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIRoundButton

Usage

Use the Add method to create a new "Round Button" object in a picture:

```
Sub AddRoundButton()
'VBA323
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("Roundbutton1",
"HMIRoundButton")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditRoundButton()
'VBA324
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects("Roundbutton1")
objRoundButton.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing.:

```
Sub ShowNameOfFirstSelectedObject()
'VBA325
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

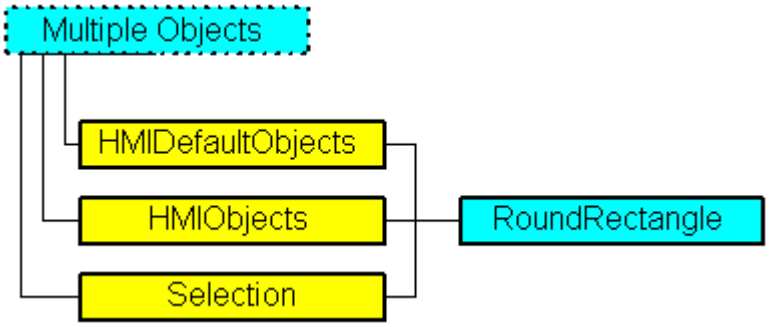
RoundRectangle Object

Description



Represents the "Rounded Rectangle" object. The RoundRectangle object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIRoundRectangle

Usage

Use the Add method to create a new "Rounded Rectangle" object in a picture:

```
Sub AddRoundRectangle()
'VBA326
Dim objRoundRectangle As HMIRoundRectangle
Set objRoundRectangle = ActiveDocument.HMIObjects.AddHMIObject("Roundrectangle1",
"HMIRoundRectangle")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditRoundRectangle()
'VBA327
Dim objRoundRectangle As HMIRoundRectangle
Set objRoundRectangle = ActiveDocument.HMIObjects("Roundrectangle1")
objRoundRectangle.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA328
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

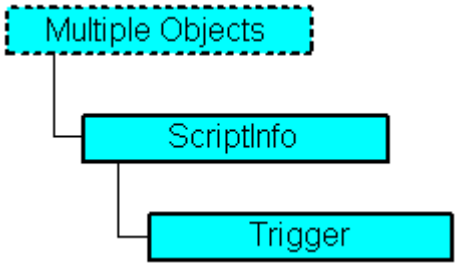
ScriptInfo Object

Description



Represents a script (C, VB) that is configured for adding dynamics to a property or action to an event.

VBA Object Name

HMIScriptInfo

Usage

Use the CreateDynamic method to make a property dynamic with the aid of a script. In the following example...

```
Sub AddDynamicAsCSkriptToProperty()
'VBA329
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
Set objCScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeCScript)
'
'Define triggertype and cycletime:
With objCScript
.SourceCode = ""
.Trigger.Type = hmiTriggerTypeStandardCycle
.Trigger.CycleType = hmiCycleType_2s
.Trigger.Name = "Trigger1"
End With
End Sub
```

Use the AddAction method to configure an action on an event. In the following example...

```
Sub AddActionToPropertyTypeCScript()
'VBA330
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
'Add circle to picture. By changing of property "Radius"
'a C-action is added:
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
Set objEvent = objCircle.Radius.Events(1)
Set objCScript = objEvent.Actions.AddAction(hmiActionCreationTypeCScript)
End Sub
```

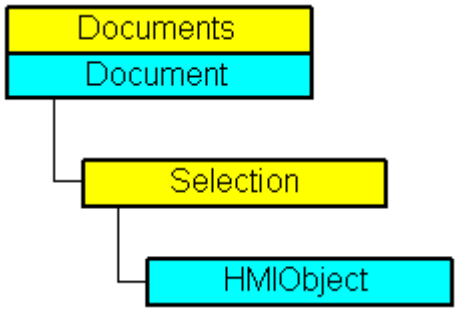
SelectedObjects object (Listing)

Description



A listing of the HMIObject objects that represent all the selected objects in a picture.

VBA Object Name

HMISelectedObjects

Usage

Use the Selection property to return the Selection listing. In the following example the names of all the selected objects in the active picture will be output:

```
Sub ShowSelectionOfDocument()
'VBA331
Dim colSelection As HMISelectedObjects
Dim objObject As HMIObject
Dim strObjectList As String
Set colSelection = ActiveDocument.Selection
If colSelection.Count <> 0 Then
strObjectList = "List of selected objects:"
For Each objObject In colSelection
strObjectList = strObjectList & vbCrLf & objObject.ObjectName
Next objObject
Else
```

```
strObjectList = "No objects selected"
End If
MsgBox strObjectList
End Sub
```

Use the SelectAll method, for example, to select all the objects in the picture. In the following example all the objects in the active picture are selected:

```
Sub SelectAllObjects()
'VBA332
ActiveDocument.Selection.SelectAll
End Sub
```

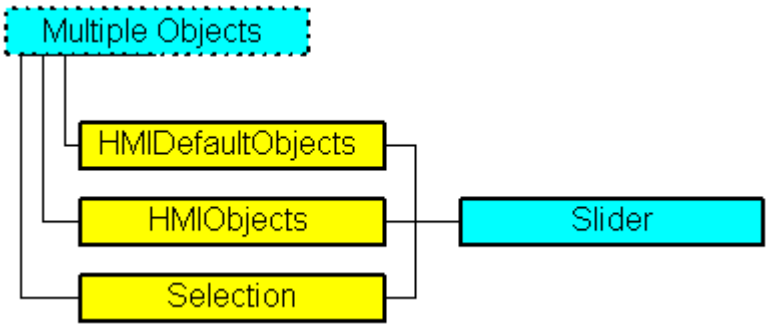
Slider object

Description



Represents the object called "Slider Object". The Slider object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMISlider

Usage

Use the Add method to create a new "Slider Object" object in a picture:

```
Sub AddSlider()
'VBA333
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("Slider1", "HMISlider")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditSlider()
'VBA334
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects("Slider1")
objSlider.ButtonColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA335
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

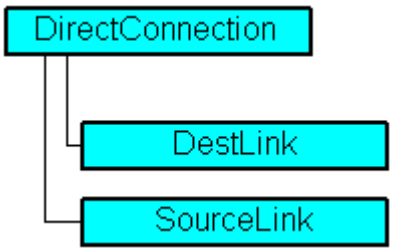
SourceLink Object

Description



Represents the source for a direct connection.

VBA Object Name

HMISourceLink

Usage

Use the SourceLink property to return the SourceLink object. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA336
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
'
'Add objects to active document:
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Text = "SetPosition"
End With
'
'Initiation of directconnection by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Top-property of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Left-property of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

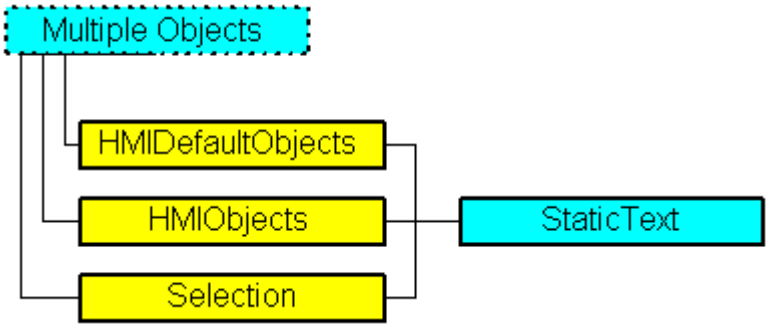
StaticText Object

Description



Represents the "Static Text" object. The StaticText object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIStaticText

Usage

Use the Add method to create a new "Static Text" object in a picture:

```
Sub AddStaticText()
'VBA337
Dim objStaticText As HMIStaticText
Set objStaticText = ActiveDocument.HMIObjects.AddHMIObject("Static_Text1", "HMIStaticText")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditStaticText()
'VBA338
Dim objStaticText As HMIStaticText
Set objStaticText = ActiveDocument.HMIObjects("Static_Text1")
objStaticText.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA339
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

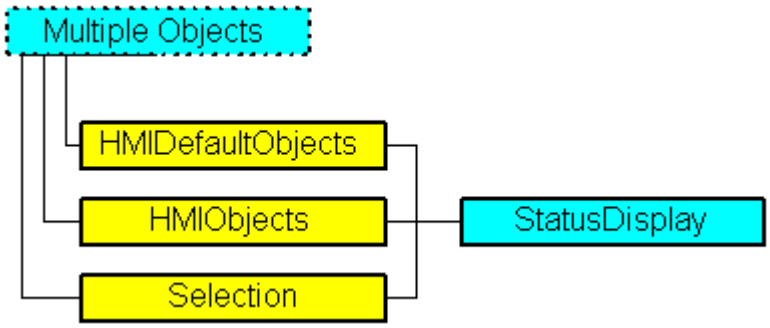
StatusDisplay Object

Description



Represents the "Status Display" object. The "StatusDisplay" object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMIStatusDisplay

Usage

Use the Add method to create a new "Status Display" object in a picture:

```
Sub AddStatusDisplay()
'VBA340
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditStatusDisplay()
'VBA341
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects("Statusdisplay1")
objStatusDisplay.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA342
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

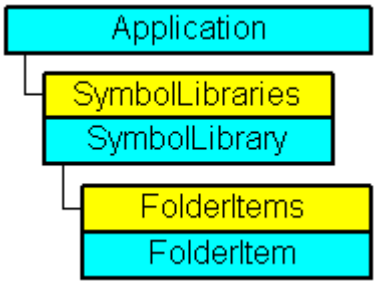
SymbolLibraries Object (Listing)

Description



A listing of the SymbolLibrary objects that represent the Components Library. The listing contains two objects: The first object is the "Global Library" and the second object is the "Project Library".

VBA Object Name

HMISymbolLibraries

Usage

Use the SymbolLibraries property to return the SymbolLibraries listing. In the following example the names of the libraries will be output:

```
Sub ShowSymbolLibraries()
'VBA344
Dim colSymbolLibraries As HMISymbolLibraries
Dim objSymbolLibrary As HMISymbolLibrary
Dim strLibraryList As String
Set colSymbolLibraries = Application.SymbolLibraries
For Each objSymbolLibrary In colSymbolLibraries
strLibraryList = strLibraryList & objSymbolLibrary.Name & vbCrLf
Next objSymbolLibrary
MsgBox strLibraryList
End Sub
```

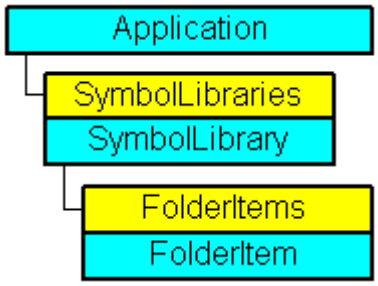
SymbolLibrary Object

Description



Represents the "Global Library" or "Project Library". The SymbolLibrary object is an element of the SymbolLibraries listing.

VBA Object Name

HMISymbolLibrary

Usage

Use SymbolLibraries(Index) to return an individual SymbolLibrary object. "For Index you can use either the index number or the name of the object. In the following example the name of the "Global Library" will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA343
Dim strName As String
strName = Application.SymbolLibraries(1).Name
MsgBox strName
End Sub
```

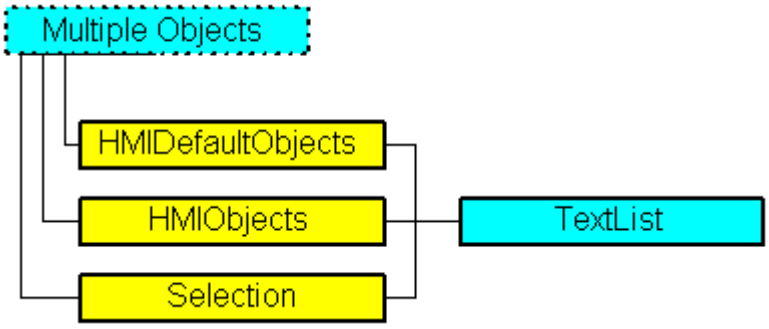
TextList Object

Description



Represents the "Text List" object. The TextList object is an element of the following listings:

- Objects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all standard, Windows, and smart objects.

VBA Object Name

HMITextList

Usage

Use the Add method to create a new "Text List" object in a picture:

```
Sub AddTextList()
'VBA345
```

```
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("Textlist1", "HMITextList")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTextList()
'VBA346
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects("Textlist1")
objTextList.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA347
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name of the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

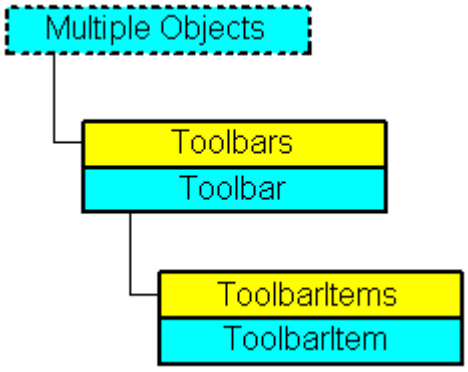
Toolbar Object

Description



Represents the "User Defined Toolbar" object. The Toolbar object is an element of the CustomToolbars listing.

VBA Object Name

HMIToolbar

Usage

Use CustomToolbars(Index) to return an individual Toolbar object. "For Index you can use either the index number or the name of the object. In the following example the "Key" parameter of the first user-defined toolbar in the active picture will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA348
Dim strName As String
strName = ActiveDocument.CustomToolbars(1).Key
MsgBox strName
End Sub
```

Use the Delete method to remove a "Toolbar" object from the "CustomToolbars" listing. In the following example the first user-defined toolbar in the active picture will be removed:

```
Sub DeleteToolbar()
'VBA349
Dim objToolbar As HMIToolbar
Set objToolbar = ActiveDocument.CustomToolbars(1)
objToolbar.Delete
End Sub
```

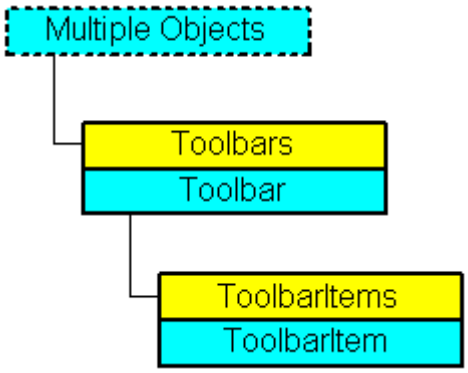
Parent Property (Page 3710)

Application Property (Page 3486)

Toolbars Object (Listing)

Description



A listing of the Toolbar objects that represent all the user-defined toolbars in the Graphics Designer.

VBA Object Name

HMICustomToolbars

Usage

Note

In order for the examples to work, first create a user-defined toolbar. For an example of this, please refer to "Creating a New Application-Specific Toolbar" in this documentation.

Use the CustomToolbars property to return the Toolbars listing. In the following example, values for the "Key" property of all user-defined toolbars in the active picture will be output:

Note

The Toolbars listing does not distinguish between application-specific and picture-specific toolbars in the output.

```
Sub ShowCustomToolbarsOfDocument()
'VBA350
Dim colToolbars As HMIToolbars
Dim objToolbar As HMIToolbar
Dim strToolbarList As String
Set colToolbars = ActiveDocument.CustomToolbars
If 0 <> colToolbars.Count Then
For Each objToolbar In colToolbars
strToolbarList = strToolbarList & objToolbar.Key & vbCrLf
Next objToolbar
Else
strToolbarList = "No toolbars existing"
End If
MsgBox strToolbarList
End Sub
```

Use the Application property and the Add method if you want to create an application-specific toolbar. Create the VBA code in either the "Project Template" document or the "Global Template" document.

```
Sub InsertApplicationSpecificToolbar()
'VBA351
Dim objToolbar As HMIToolbar
Set objToolbar = Application.CustomToolbars.Add("a_Toolbar1")
End Sub
```

Use the ActiveDocument property and the Add method if you want to create a picture-specific toolbar. Create the VBA code in the document called "ThisDocument":

```
Sub InsertDocumentSpecificToolbar()
'VBA352
Dim objToolbar As HMIToolbar
Set objToolbar = ActiveDocument.CustomToolbars.Add("d_Toolbar1")
End Sub
```

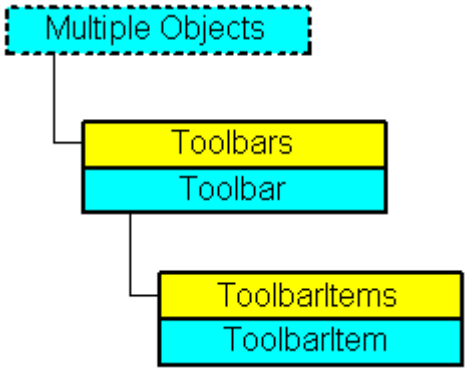
ToolbarItem Object

Description



Represents an object (icon or dividing line) in a user-defined toolbar in the GraphicsDesigner. The ToolbarItem object is an element of the ToolbarItems listing.

VBA Object Name

HMIToolbarItem

Usage

Note

In order for the examples to work, first create a user-defined toolbar. For an example of this, please refer to "Creating a New Application-Specific Toolbar" in this documentation.

Use ToolbarItems(Index) to return an individual ToolbarItem object. "For Index you can use either the index number or the name of the object. In the following example the type of the first object in the first user-defined toolbar in the active picture will be output:

```
Sub ShowFirstObjectOfCollection()
'VBA353
Dim strType As String
strType = ActiveDocument.CustomToolbars(1).ToolbarItems(1).ToolbarItemType
MsgBox strType
End Sub
```

Use the Delete method to remove an object from the "ToolbarItems" listing. In the following example the first object will be deleted from the first user-defined toolbar in the active picture:

```
Sub DeleteToolbarItem()
'VBA354
ActiveDocument.CustomToolbars(1).ToolbarItems(1).Delete
End Sub
```

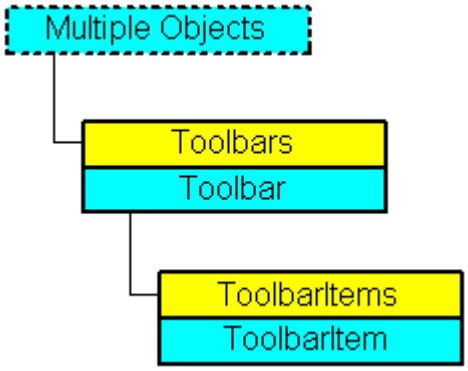
ToolbarItems Object (Listing)

Description



A listing of the ToolbarItem objects that represent all the objects in a user-defined toolbar.

VBA Object Name

HMIToolbarItems

Usage

Use the ToolbarItems property to return the ToolbarItems listing. In the following example, all object types in the first user-defined toolbar in the active picture will be output:

Note

The ToolbarItems listing does not distinguish between application-specific and picture-specific toolbars in the output.

```
Sub ShowToolbarItems()
'VBA355
Dim colToolbarItems As HMIToolbarItems
Dim objToolbarItem As HMIToolbarItem
Dim strTypeList As String
Set colToolbarItems = ActiveDocument.CustomToolbars(1).ToolbarItems
If 0 <> colToolbarItems.Count Then
For Each objToolbarItem In colToolbarItems
strTypeList = strTypeList & objToolbarItem.ToolbarItemType & vbCrLf
Next objToolbarItem
Else
strTypeList = "No Toolbaritems existing"
```

```
End If
MsgBox strTypeList
End Sub
```

Use the InsertToolbarItem method, for instance, to insert an icon into an existing user-defined toolbar. In the following example a picture-specific toolbar will be created in the active picture and an icon will be added:

```
Sub InsertToolbarItem()
'VBA356
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Set objToolbar = ActiveDocument.CustomToolbars.Add("d_Toolbar2")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "t_Item2_1",
"ToolbarItem 1")
End Sub
```

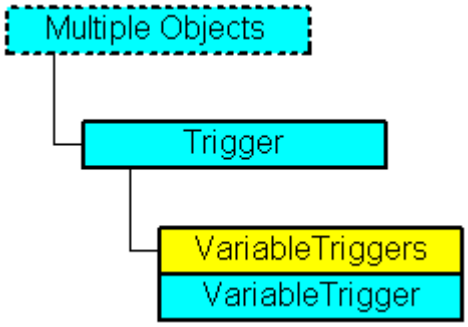
Trigger Object

Description



Represents the trigger (e.g. Picture Cycle) that is necessary for adding dynamics to properties with the aid of scripts. A trigger can possess multiple tag triggers.

VBA Object Name

HMITrigger

Usage

Use the Trigger property to return the Trigger object. In this example the "Radius" property of a circle will be made dynamic with the aid of a VB script (the output value sets the radius):

```
Sub AddDynamicAsVBSkriptToProperty()
'VBA357
Dim objVBScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
'
'Define cycletime and sourcecode
With objVBScript
.SourceCode = ""
.Trigger.Type = hmiTriggerTypeStandardCycle
.Trigger.CycleType = hmiCycleType_2s
.Trigger.Name = "Trigger1"
End With
End Sub
```

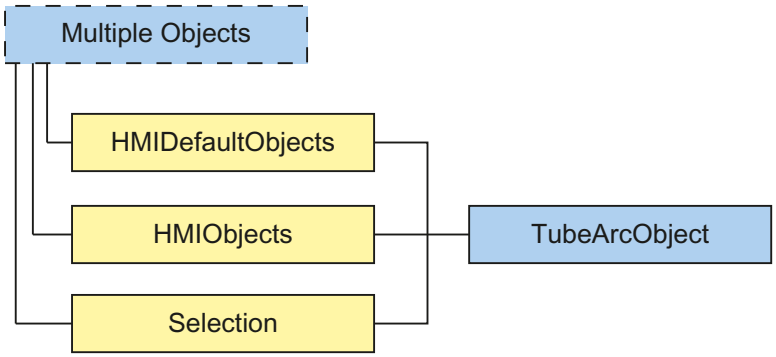
TubeArcObject object

Description



Represents the "Tube arc" object. The TubeArcObject object is an element of the following lists:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMITubeArcObject

Usage

Use the Add method to create a new "Tube arc" object in a picture:

```
Sub AddTubeArcObject()
'VBA835
Dim objTubeArcObject As HMITubeArcObject
Set objTubeArcObject = ActiveDocument.HMIObjects.AddHMIObject("TubeArcObject",
"HMITubeArcObject")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTubeArcObject()
'VBA836
Dim objTubeArcObject As HMITubeArcObject
Set objTubeArcObject = ActiveDocument.HMIObjects("TubeArcObject")
objTubeArcObject.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA837
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

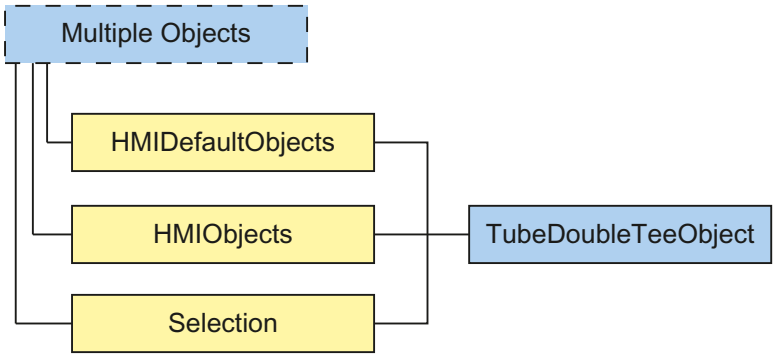
TubeDoubleTeeObject object

Description



Represents the "Double T-piece" object. The TubeDoubleTeeObject object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMITubeDoubleTeeObject

Usage

Use the Add method to create a new "Double T-piece" object in a picture:

```
Sub AddTubeDoubleTeeObject()
'VBA838
Dim objTubeDoubleTeeObject As HMITubeDoubleTeeObject
Set objTubeDoubleTeeObject = ActiveDocument.HMIObjects.AddHMIObject("Double T-piece",
"HMITubeDoubleTeeObject")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTubeDoubleTeeObject()
'VBA839
Dim objTubeDoubleTeeObject As HMITubeDoubleTeeObject
Set objTubeDoubleTeeObject = ActiveDocument.HMIObjects("Double T-piece")
objTubeDoubleTeeObject.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA840
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

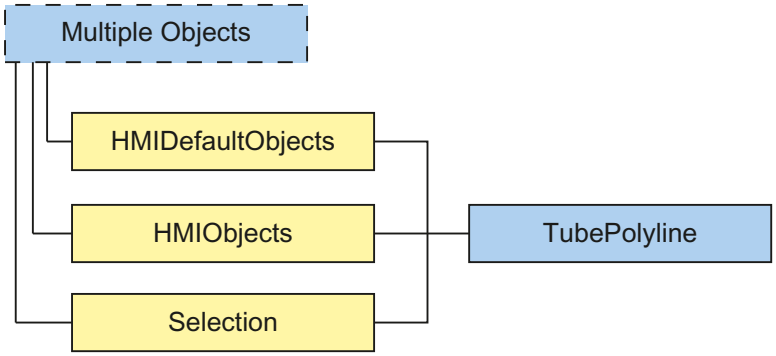
TubePolyline object

Description



Represents the "TubePolyline" object. The TubePolyline object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMITubePolyline

Usage

Use the Add method to create a new "TubePolyline" object in a picture:

```
Sub AddTubePolyline()
'VBA841
Dim objTubePolyline As HMITubePolyline
Set objTubePolyline = ActiveDocument.HMIObjects.AddHMIObject("TubePolyline",
"HMITubePolyline")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTubePolyline()
'VBA842
Dim objTubePolyline As HMITubePolyline
Set objTubePolyline = ActiveDocument.HMIObjects("TubePolyline")
objTubePolyline.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA843
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

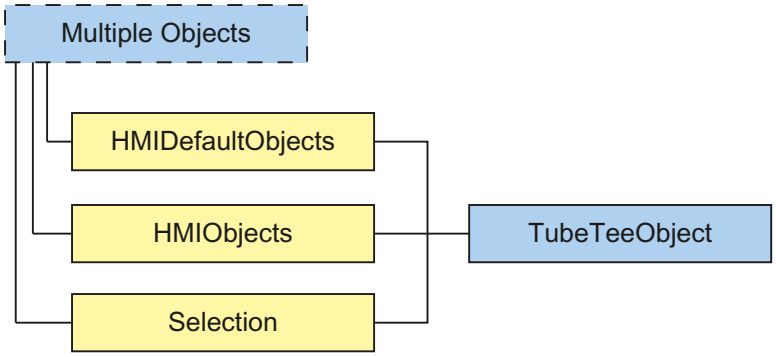
TubeTeeObject object

Description



Represents the "T-piece" object. The TubeTeeObject object is an element of the following lists:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.
- HMIDefaultObjects: Contains the default property values of all default, smart, window and tube objects.

VBA object name

HMITubeTeeObject

Usage

Use the Add method to create a new "T-piece" object in a picture:

```
Sub AddTubeTeeObject()
'VBA844
Dim objTubeTeeObject As HMITubeTeeObject
Set objTubeTeeObject = ActiveDocument.HMIObjects.AddHMIObject("T-piece",
"HMITubeTeeObject")
End Sub
```

Use "HMIObjects"(Index)" to return an object from the HMIObjects listing, where Index in this case identifies the object by name:

```
Sub EditTubeTeeObject()
'VBA845
Dim objTubeTeeObject As HMITubeTeeObject
Set objTubeTeeObject = ActiveDocument.HMIObjects("T-piece")
objTubeTeeObject.BorderColor = RGB(255, 0, 0)
End Sub
```

Use "Selection"(Index) to return an object from the Selection listing:

```
Sub ShowNameOfFirstSelectedObject()
'VBA846
'Select all objects in the picture:
ActiveDocument.Selection.SelectAll
'Get the name from the first object of the selection:
MsgBox ActiveDocument.Selection(1).ObjectName
End Sub
```

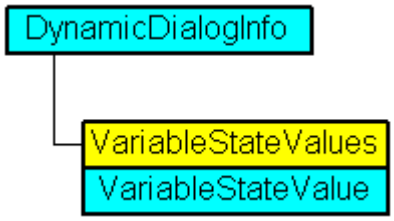
VariableStateValues Object (Listing)

Description



A listing of VariableStateValue objects containing all tag statuses in Dynamic dialog to be used for dynamization.

VBA Object Name

HMIVariableStateValues

Usage

Use the Item property in the Dynamic dialog to define values that will be used for creating dynamics when the specified tag returns the configured state. In the following example the radius of a circle is given dynamics with the The dynamization takes place be evaluating the

status of a tag. If the tag does not return a status, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA358
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'Activate variable-statecheck
.VariableStateChecked = True
End With
With objDynDialog.VariableStateValues(1)
'define a value for every state:
.VALUE_ACCESS_FAULT = 20
.VALUE_ADDRESS_ERROR = 30
.VALUE_CONVERSION_ERROR = 40
.VALUE_HANDSHAKE_ERROR = 60
.VALUE_HARDWARE_ERROR = 70
.VALUE_INVALID_KEY = 80
.VALUE_MAX_LIMIT = 90
.VALUE_MAX_RANGE = 100
.VALUE_MIN_LIMIT = 110
.VALUE_MIN_RANGE = 120
.VALUE_NOT_ESTABLISHED = 130
.VALUE_SERVERDOWN = 140
.VALUE_STARTUP_VALUE = 150
.VALUE_TIMEOUT = 160
End With
End Sub
```

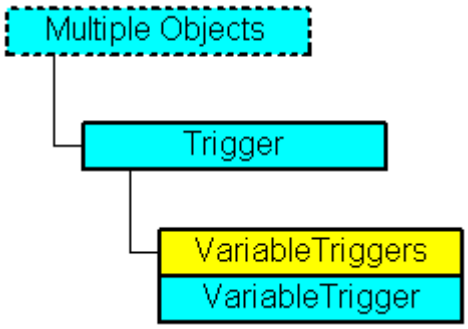
VariableTrigger Object

Description



Represents a tag trigger.

VBA Object Name

HMIVariableTrigger

Application

Use the VariableTrigger object in order to edit or delete an existing tag trigger. In this example a circle property "Top" is made dynamic with the aid of the tag "NewDynamic1":

```
Sub AddDynamicAsVariableDirectToProperty()
'VBA359
Dim objVariableTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
Set objVariableTrigger = objCircle.Top.CreateDynamic(hmiDynamicCreationTypeVariableDirect,
"'NewDynamic1'")
'
```

```
'Define cycletime
With objVariableTrigger
.CycleType = hmiCycleType_2s
End With
End Sub
```

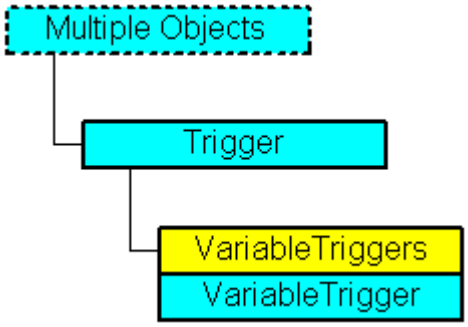
VarName Property (Page 3878)

VariableTriggers Object (Listing)

Description



A listing of the VariableTrigger objects that represent all the tag triggers in use.

VBA Object Name

HMIVariableTriggers

Usage

Use the Add method to create a new tag trigger. In the following example the radius of a circle is made dynamic with the aid of a VB script. A tag trigger is used as the trigger:

```
Sub DynamicWithVariableTriggerCycle()
'VBA360
Dim objVBScript As HMIScriptInfo
Dim objVarTrigger As HMIVariableTrigger
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VariableTrigger",
"HMICircle")
Set objVBScript = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVBScript)
With objVBScript
'Definition of triggername and cycletime is to do with the Add-methode
Set objVarTrigger = .Trigger.VariableTriggers.Add("VarTrigger", hmiVariableCycleType_10s)
.SourceCode = ""
End With
End Sub
```

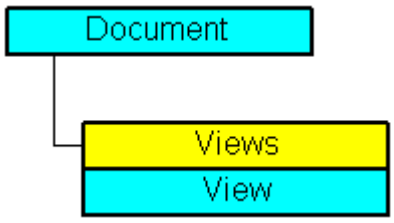
View Object

Description



Represents a copy of a picture. The View object is an element of the Views listing.

You can use the properties of the View object among other things to control the visibility of the CS layers and to define the zoom.

VBA Object Name

HMIView

Usage

Use Views(Index) to return an individual View object. In the following example the number of copies of the active picture will be output:

```
Sub ShowNumberOfExistingViews()
'VBA361
Dim iMaxViews As Integer
iMaxViews = ActiveDocument.Views.Count
MsgBox "Number of copies from active document: " & iMaxViews
End Sub
```

Use the Add method to add a new View object to the "Views" listing. In the following example a copy of the active picture is created and then activated:

```
Sub AddView()
'VBA362
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

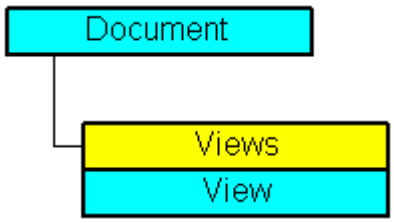
Views Object (Listing)

Description



A listing of the View objects that represent a copy of a picture.

VBA Object Name

HMIViews

Usage

Use the Views listing to return a View object. In the following example the number of existing copies of the active picture will be output:

```
Sub ShowNumberOfExistingViews()
'VBA363
Dim iMaxViews As Integer
iMaxViews = ActiveDocument.Views.Count
MsgBox "Number of copies from active document: " & iMaxViews
End Sub
```

Use the Add method to create a copy of a picture. In the following example a copy of the active picture is created and then activated:

```
Sub AddViewToActiveDocument()
'VBA364
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
End Sub
```

WPFControl object

Description

Represents the "WPFControl" object. The WPFControl object is an element of the following listings:

- HMIObjects: Contains all objects of a picture.
- Selection: Contains all selected objects of a picture.

VBA Object Name

HMIWPFControl

Application

Use the AddWPFControl method to insert a WPFControl in a picture.

In the following example, the "WPF Control" object outside the Global Assembly Cache is inserted in the active picture.

```
'VBA852
Dim WPFControl As HMIWPFControl
Set WPFControl = ActiveDocument.HMIObjects.AddWPFControl("MyWPFVBAControl",
"WinCCWPFControl.TestControl", False, "Assembly=Z:\TestControl\WinCCWPFControl.dll")
```

5.5.1.8 Properties

A

Actions Property

Description

Returns the Actions listing. Use the Actions property to configure an event-driven action.

Example:

In this example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle enlarges every time you click the button:

```
Sub CreateVBActionToClickedEvent()
'VBA365
Dim objButton As HMIButton
Dim objCircle As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_VB", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircle
.Top = 100
.Left = 100
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 120
.Text = "Increase Radius"
End With
'Define event and assign sourcecode:
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
With objVBScript
.SourceCode = "Dim myCircle" & vbCrLf & _
              "Set myCircle = HMIRuntime.ActiveScreen.ScreenItems(""Circle_VB"")" & _
              vbCrLf & "myCircle.Radius = myCircle.Radius + 5"
End With
End Sub
```

See also

Actions Object (Listing) (Page 3271)

AddAction Method (Page 3173)

Configuring Event-Driven Actions with VBA (Page 3092)

ActionType property

Description

Only used internally.

See also

VBA Reference: ActionDynamic (Page 3126)

ActiveDocument Property

Description

Returns an object of the "Document" type which represents the active picture in the Graphics Designer. If there is no open or active picture in the Graphics Designer, you receive an error message.

Note

The "ActiveDocument" property refers to the window that possesses the input focus. If other editors (e.g. CrossReference) access a picture, the input focus can change. To prevent this situation leading to errors, reference the picture unambiguously via the Documents listing.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles").

```
Sub CreateMenuItem()
'VBA366
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
'
'Create new menu "Delete Objects":
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete Objects")
'
'Add two menuitems to the menu "Delete Objects
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
Rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete Circles")
End Sub
```

See also

Documents Object (Listing) (Page 3322)

ActiveLayer Property

Description

Defines or returns the active layer for the View object. The value range is from 0 to 31, where "0" represents the uppermost layer and "31" the lowest layer.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example a new View object is created and layer 1 is set to "Active":

```
Sub ActiveDocumentConfiguration()
'VBA367
Application.ActiveDocument.Views.Add
Application.ActiveDocument.Views(1).ActiveLayer = 2
End Sub
```

See also

View Object (Page 3466)

ActualPointLeft Property

Description

Defines or returns the X coordinate of the current corner point by reference to the picture origin (top left) for the objects "Polygon" and "Polyline". Each corner point is identified by an index which is derived from the number ("PointCount") of corner point available.

A change of the value can affect the properties "Width" (object width) and "Left" (x-coordinate of the object position).

Example:

The "PolygonCoordinatesOutput()" procedure outputs the coordinates of all the corner points in the first polyline in the current picture:

```
Sub PolygonCoordinatesOutput()
'VBA368
Dim objPolyline As HMIPolyLine
Dim iPosX As Integer
Dim iPosY As Integer
Dim iCounter As Integer
Dim strResult As String
iCounter = 1
Set objPolyline = ActiveDocument.HMIObjects.AddHMIObject("Polyline1", "HMIPolyLine")
For iCounter = 1 To objPolyline.PointCount
With objPolyline
.index = iCounter
iPosX = .ActualPointLeft
iPosY = .ActualPointTop
End With
strResult = strResult & vbCrLf & "Corner " & iCounter & ": x=" & iPosX & " y=" & iPosY
Next iCounter
```

```
MsgBox strResult
End Sub
```

See also

PointCount Property (Page 3728)

Index Property (Page 3633)

ActualPointTop Property (Page 3476)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

Line Object (Page 3373)

ActualPointTop Property

Description

Defines or returns the Y coordinate of the current corner point by reference to the picture origin (top left) for the objects "Polygon" and "Polyline". Each corner point is identified by an index which is derived from the number ("PointCount") of corner point available.

A change of the value can affect the properties "Height" (object height) and "Top" (y-coordinate of the position).

Example:

The "Polygon()" procedure outputs the coordinates of all the corner points in the first polyline in the current picture:

```
Sub PolygonCoordinatesOutput()
'VBA369
Dim objPolyline As HMIPolyLine
Dim iPosX As Integer
Dim iPosY As Integer
Dim iCounter As Integer
Dim strResult As String
iCounter = 1
Set objPolyline = ActiveDocument.HMIObjects.AddHMIObject("Polyline1", "HMIPolyLine")
For iCounter = 1 To objPolyline.PointCount
With objPolyline
.index = iCounter
iPosX = .ActualPointLeft
iPosY = .ActualPointTop
End With
strResult = strResult & vbCrLf & "Corner " & iCounter & ": x=" & iPosX & " y=" & iPosY
Next iCounter
MsgBox strResult
```

```
End Sub
```

Polygon Object (Page 3402)

Line Object (Page 3373)

AdaptBorder Property

Description

TRUE if the field border is intended to adapt dynamically to the size of the text. BOOLEAN write-read access.

Note

Changing the contents of a field dynamically can cause pumping in the field.

Performance is improved in Runtime by using "AdaptBorder = False".

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text size is dynamically adapted to the field size.

```
Sub IOFieldConfiguration()
'VBA372
Dim objIOField As HMIIOField
'
'Add new IO-Feld to active document:
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AdaptBorder = True
End With
End Sub
```

AdaptPicture Property

Description

TRUE if the picture size is to be adapted to the picture window size. BOOLEAN write-read access.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA373
Dim objPicWindow As HMIPictureWindow
'
'Add new picturewindow into active document:
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

AdaptSize Property

Description

TRUE if the picture window size is to be adapted to the picture size. BOOLEAN write-read access.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA374
Dim objPicWindow As HMIPictureWindow
'
'Add new picturewindow into active document:
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

AddIns property

Description

Only used internally.

See also

Application Object (Page 3282)

AlarmGoneVisible property

Description

Defines whether an outgoing state is visible.

Assigned Value	Description
True	The outgoing state is visible.
False	The outgoing state is suppressed.

AlarmHigh Property

Description

Defines the top limit value at which an alarm should be triggered or returned.

The type of the evaluation (in percent or absolute) is defined in the "TypeAlarmHigh" property.

The "CheckAlarmHigh" property defines whether the monitoring function for the limit value is activated.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "50".

```
Sub BarGraphLimitConfiguration()
'VBA375
Dim objBarGraph As HMIBarGraph
'
'Add new BarGraph to active document:
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolut
.TypeAlarmHigh = False
'Activate monitoring
.CheckAlarmHigh = True
'Set barcolor to "yellow"
.ColorAlarmHigh = RGB(255, 255, 0)
'set upper limit to "50"
.AlarmHigh = 50
End With
End Sub
```

See also

TypeAlarmHigh Property (Page 3793)

ColorAlarmHigh Property (Page 3544)

CheckAlarmHigh Property (Page 3533)

BarGraph Object (Page 3286)

AlarmLow Property

Description

Defines the bottom limit value at which an alarm should be triggered or returned.

The type of the evaluation (in percent or absolute) is defined in the "TypeAlarmLow" property.

The "CheckAlarmLow" property defines whether the monitoring function for the limit value is activated.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "10".

```
Sub BarGraphLimitConfiguration()
'VBA376
Dim objBarGraph As HMIBarGraph
'
'Add new BarGraph to active document:
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolut
.TypeAlarmLow = False
'Activate monitoring
.CheckAlarmLow = True
'Set Barcolor to "yellow"
.ColorAlarmLow = RGB(255, 255, 0)
'set lower limit to "10"
.AlarmLow = 10
End With
End Sub
```

See also

TypeAlarmLow Property (Page 3793)

CheckAlarmLow Property (Page 3534)

BarGraph Object (Page 3286)

Alignment Property

Description

Defines or returns the scale display (left/right or top/bottom) depending on the position of the BarGraph object. The Scaling property must be set to TRUE for the scale to be displayed.

Display	Assigned Value
Right or bottom	TRUE
Left or top	FALSE

Example:

The "BarGraphConfiguration()" procedure configures In this example the scale is to be located to the right of the bar:

```
Sub BarGraphConfiguration()
'VBA377
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Alignment = True
.Scaling = True
End With
End Sub
```

See also

Scaling Property (Page 3751)

Direction Property (Page 3573)

BarGraph Object (Page 3286)

AlignmentLeft Property

Description

Defines or returns the horizontal alignment of the text. Value range from 0 to 2.

Horizontal Alignment	Assigned Value
Left	0
Centered	1
Right	2

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text in the I/O field will be centered horizontally:

```
Sub IOFieldConfiguration()
'VBA378
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AlignmentLeft = 1
End With
End Sub
```

AlignmentTop Property

Description

Defines or returns the vertical alignment of the text. Value range from 0 to 2.

Horizontal Alignment	Assigned Value
Up	0
Centered	1
Down	2

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text in the I/O field will be centered in the middle:

```
Sub IOFieldConfiguration()
'VBA379
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AlignmentLeft = 1
.AlignmentTop = 1
End With
End Sub

AnalogResultInfos Property

Description

Returns the AnalogResultInfos listing. Use the AnalogResultInfos property to define value ranges and property values in the Dynamic dialog.

Example:

An example showing how to use the AnalogResultInfos property can be found in this documentation under the heading "AnalogResultInfos Object (Listing)".

See also

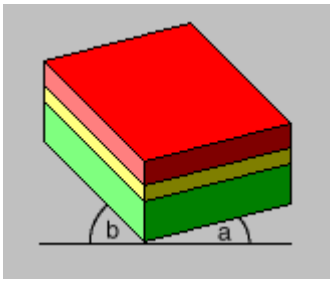
DynamicDialog Object (Page 3325)

AnalogResultInfos Object (Listing) (Page 3281)

AngleAlpha Property

Description

Defines or returns depth angle a for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.



Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example depth angles A and B will be assigned the values "15" and 45:

```
Sub HMI3DBarGraphConfiguration()
'VBA380
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
'Depth-angle a = 15 degrees
.AngleAlpha = 15
'Depth-angle b = 45 degrees
.AngleBeta = 45
End With
End Sub
```

See also

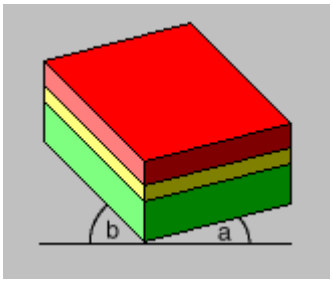
AngleBeta Property (Page 3486)

3DBarGraph Object (Page 3267)

AngleBeta Property

Description

Defines or returns depth angle b for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.



Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example depth angles A and B will be assigned the values "15" and 45:

```
Sub HMI3DBarGraphConfiguration()
'VBA381
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
'Depth-angle a = 15 degrees
.AngleAlpha = 15
'Depth-angle b = 45 degrees
.AngleBeta = 45
End With
End Sub
```

See also

AngleAlpha Property (Page 3483)

3DBarGraph Object (Page 3267)

Application Property

Description

Returns the Graphics Designer application when the application property is used without an object identifier. If the application property is used with object identifier, it returns an application object which displays the application with which the defined object was created. Read only access.

Example:

In this example an Excel object is created and the application name is output:

```
Sub CreateExcelApplication()
'VBA382
'
'Open Excel invisible
Dim objExcelApp As New Excel.Application
MsgBox objExcelApp
'Delete the reference to Excel and close it
Set objExcelApp = Nothing
End Sub
```

See also

Application Object (Page 3282)

ApplicationDataPath Property

Description

Returns the complete path of the active picture in the Graphics Designer. Read-only access.

Example:

The "ShowApplicationDataPath()" procedure outputs the path of the current picture:

```
Sub ShowApplicationDataPath()
'VBA383
MsgBox Application.ApplicationDataPath
End Sub
```

See also

Application Property (Page 3484)

Application Object (Page 3282)

AssemblyInfo property

Description

Displays the information of the object registered in the Global Assembly Cache. The information is made up of "Assembly", "Version", "Culture" and "PublicKeyToken".

If the object is not registered in the Global Assembly Cache, the path of the object is only displayed in "Assembly".

Assignments Property

Description

A list which contains the assignments between the output values and the actual output texts to be output.

The assignments are dependent on the list type set. The list type is defined with the ListType property.

The number of entries depends on the total length of the string passed to the "Assignments" property. This string cannot be longer than 500,000 bytes. This may be checked prior to dropping access to the "Assignments" property by using the function LenB().

Example:

--

ListType Property (Page 3666)

TextList Object (Page 3441)

AssumeOnExit Property

Description

TRUE, if the entered text is assumed after exiting the input field (by using the <TAB> key or mouse click, for example). BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text that has been entered will be taken over as input on exit from the input field.

```
Sub IOFieldConfiguration()
'VBA385
```

```
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AssumeOnExit = True
End With
End Sub
```

See also

TextList Object (Page 3441)

IOField Object (Page 3361)

AssumeOnFull Property

Description

TRUE, when the content of the input field is full (specified number of characters have been entered) and should be exited automatically and the input accepted. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the text that has been entered will be taken over as input on exit from the input field.

```
Sub IOFieldConfiguration()
'VBA386
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.AssumeOnFull = True
End With
End Sub
```

OutputFormat Property (Page 3708)

DataFormat Property (Page 3571)

IOField Object (Page 3361)

AutomationName Property

Description

Depending on the source and destination object types for the direct connection, either defines or returns the name of a property.

The two tables show you when you must use the AutomationName property. A "--" means that the property is assigned an empty string (") by default when the DirectConnection object is created.

Source object type (SourceLink Property)

Type Property	AutomationName Property	ObjectName Property
hmiSourceTypeConstant	--	Name of the constant (e.g. the picture name)
hmiSourceTypeProperty	Property of the source object (e.g. "Top")	Name of the source object (e.g. "Rectangle_A")
hmiSourceTypePropertyOfThisObject	--	--
hmiSourceTypeVariableDirect	--	Tag name
hmiSourceTypeVariableIndirect	--	Tag name

Destination object type (DestinationLink Property)

Type Property	AutomationName Property	ObjectName Property
hmiDestTypeProperty	Property of the destination object (e.g. "Left")	Name of the destination object (e.g. "Rectangle_A")
hmiDestTypePropertyOfThisObject	--	--
hmiDestTypePropertyOfActualWindow	Property of the destination object (e.g. "Left")	--
hmiDestTypeVariableDirect	--	Tag name
hmiDestTypeVariableIndirect	--	Tag name
hmiDestTypeDirectMessage	--	Tag name
hmiDestTypeIndirectMessage	--	Tag name

Example:

In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA387
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
```

```
Dim objDynConnection As HMIDirectConnection
'
'Add objects to active document:
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
'
'to position and configure objects:
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Text = "SetPosition"
End With
'
'Directconnection is initiate by mouseclick:
Set objDynConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDynConnection
'Sourceobject: Top-Property of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Left-Property of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

DestLink Object (Page 3316)

AvailableDataLanguages Property

Description

Returns a listing of the available project languages.

Example:

The "AusgabetDataLanguages()" procedure outputs all the existing project languages together with their language identifiers (as a decimal value):

```
Sub OutputDataLanguages()
'VBA388
Dim colDataLang As HMIDataLanguages
Dim objDataLang As HMIDataLanguage
Dim strLangList As String
Dim iCounter As Integer
'
'Save collection of datalanguages
'into variable "colDataLang"
Set colDataLang = Application.AvailableDataLanguages
iCounter = 1
'
'Get every languagename and the assigned ID
For Each objDataLang In colDataLang
With objDataLang
If 0 = iCounter Mod 3 Or 1 = iCounter Then
 strLangList = strLangList & vbCrLf & .LanguageID & " " & .LanguageName
Else
 strLangList = strLangList & " / " & .LanguageID & " " & .LanguageName
End If
End With
iCounter = iCounter + 1
Next objDataLang
MsgBox strLangList
End Sub
```

Average Property

Description

TRUE, if the mean value is calculated based on the last 10 values. A value change is conditional for calculation of a new mean value. The mean value is reset when you change a picture. If only one value is available when you change the picture, the following mean value is calculated: (5+0+0+0+0+0+0+0+0+0)/10=0,5.

BOOLEAN write-read access.

Example

The "BarGraphConfiguration()" procedure configures In this example, value averaging will be activated:

```
Sub BarGraphConfiguration()
'VBA389
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Average = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

Axe Property

Description

Defines or returns the axis for displaying the measured value. Value range from 0 to 2.

Axis	Assigned Value
X	0
Y	1
Z	2

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the Y axis for displaying the measured value will be defined:

```
Sub HMI3DBarGraphConfiguration()
'VBA390
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.Axe = 1
End With
End Sub
```

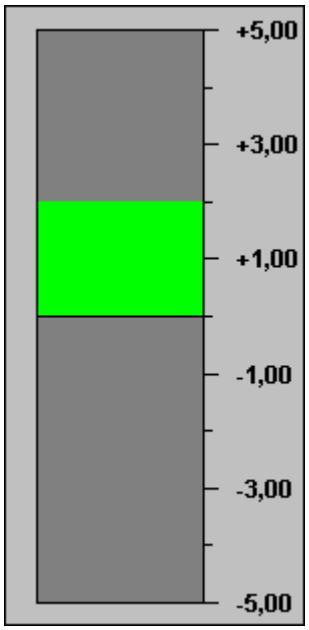
See also

3DBarGraph Object (Page 3267)

AxisSection Property

Description

Defines or returns the distance between two long axis sections. The information on the distance is given in scale units and is dependent on the minimum and maximum values configured.



BarGraph Object (Minimum/Maximum Value: -5/5; AxisSection = 2)

Example

The "BarGraphConfiguration()" procedure accesses the properties of the BarGraph object. In this example the axis section will be set to "2".

```
Sub BarGraphConfiguration()

'VBA391

Dim objBar As HMIBarGraph

Set objBar = ActiveDocument.HMIObjects.AddHMIObject("Bar1",
"HMIBarGraph")

With objBar

.AxisSection = 2

End With

   End Sub
```

BarGraph Object (Page 3286)

B

BackBorderWidth Property

Description

Defines or returns the width of the 3D border in pixels. The value for the width is dependent on the size of the object.

Slider

Defines or returns the width of the border in pixels. BackBorderWidth = 0 prevents the border being displayed on the Slider object.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the width of the 3D border will be set to "2".

```
Sub ButtonConfiguration()
'VBA392
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.BackBorderWidth = 2
End With
End Sub
```

BackColor Property

Description

Defines or returns the background color for the object. LONG read-write access.

The background color is not displayed if "transparent" is defined as the fill pattern.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the background color will be set to "Yellow".

```
Sub RectangleConfiguration()
'VBA393
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BackColor = RGB(255, 255, 0)
End With
End Sub
```

BackColor2 Property

Description

Defines or returns the bar color for the display of the current value. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphConfiguration()" procedure configures In this example the bar color for displaying the current value will be set to "Yellow":

```
Sub BarGraphConfiguration()
'VBA394
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.BackColor2 = RGB(255, 255, 0)
End With
End Sub
```

See also

BarGraph Object (Page 3286)

BackColor3 Property

Description

Defines or returns the color of the bar background. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphConfiguration()" procedure configures In this example the color of the bar background will be set to "Blue":

```
Sub BarGraphConfiguration()
'VBA395
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.BackColor3 = RGB(0, 0, 255)
End With
End Sub
```

BarGraph Object (Page 3286)

BackColor_Alarm.._Warning property

Description

Defines the color used for the background of one of the following states or message types:

- Alarm
- Warning
- Tolerance
- AS Process Control Error
- AS Control System Fault

- Operator request
- OK
- Simulation

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

BackColorBottom Property

Description

Defines or returns the color for the bottom/right part of the slider. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the color of the bottom part of the slider will be set to "Blue":

```
Sub SliderConfiguration()
'VBA396
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.BackColorBottom = RGB(0, 0, 255)
End With
End Sub
```

See also

Slider object (Page 3428)

BackColorTop Property

Description

Defines or returns the color for the top/left part of the slider. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the color of the top part of the slider will be set to "Yellow":

```
Sub SliderConfiguration()
'VBA397
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.BackColorTop = RGB(255, 255, 0)
End With
End Sub
```

See also

Slider object (Page 3428)

BackFillColor property

Description

Defines the color with which the background is filled at an advanced analog display.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

BackFillColor_OK property

Description

Defines the color with which the background is filled at the state "OK".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

BackFillColor_Simulation property

Description

Defines the color with which the background is filled at the "Simulation" state.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

BackFillStyle property

Description

Defines the pattern with which the background is filled at an advanced analog display.

There is a choice of 50 fill patterns. The fill pattern 0 "Solid" fills the object with the set background color; the fill pattern 1 "Transparent" defines that neither a background nor a fill pattern is displayed.

BackFillStyle_OK property

Description

Defines the pattern with which the background is displayed at the state "OK".

There is a choice of 50 fill patterns. The fill pattern 0 "Solid" fills the object with the set background color; the fill pattern 1 "Transparent" defines that neither a background nor a fill pattern is displayed.

BackFillStyle_Simulation property

Description

Defines the pattern with which the background is displayed at the "Simulation" state.

There is a choice of 50 fill patterns. The fill pattern 0 "Solid" fills the object with the set background color; the fill pattern 1 "Transparent" defines that neither a background nor a fill pattern is displayed.

BackFlashColorOff Property

Description

Defines or returns the color of the object background for the flash status "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the color when the flash status is "Off" will be set to "Yellow":

```
Sub RectangleConfiguration()
'VBA398
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BackFlashColorOff = RGB(255, 255, 0)
End With
End Sub
```

BackFlashColorOn Property

Description

Defines or returns the color of the object background for the flash status "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the color when the flash status is "On" will be set to "Blue":

```
Sub RectangleConfiguration()
'VBA399
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BackFlashColorOn = RGB(0, 0, 255)
End With
End Suba
```

Background Property

Description

TRUE, when the background of the 3D-bar graph object should be visible. BOOLEAN write-read access.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the background will be set to "Transparent":

```
Sub HMI3DBarGraphConfiguration()
'VBA400
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.Background = False
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BackPictureAlignment property

Description

As the "Display type" attribute, defines the position and scaling for the background image of the process picture.

normal	The background picture is centered in the original size. When opening the picture in runtime, it remains in the location.
Stretched (window)	The background picture is scaled to the runtime window and process picture of the larger of the two windows. In runtime, it is scaled to the size of the runtime window and is scaled when you resize the picture.
Tiled	Graphics Designer and process picture are exhibited with the picture in its original size.
Stretched (picture)	The background picture is scaled to the configured size of the process picture. When opening the picture in runtime, it retains its size.

BackPictureName property

Description

Defines or returns the path and name of the file used as the background image in the process picture.

Files of format EMF, WMF, DB, BMP, GIF, JPG, JPEG and ICO are suitable.

If no path is specified, the file is searched for in the subdirectory \GraCS. If you specify a different path, a copy is created in the \GraCS directory.

Path specifications

The following path specification formats are possible:

- Absolute: z.B. "C:\Siemens\WinCC\Icons\myIcon.ICO.
- Relative: The starting folder for relative path specification is the "GraCS" folder of the current project.
- <global>: Refers to the installation path for WinCC. The path specification "<global>\Icons \myIcon" is the same as the path specification under "Absolute".
- <project>: Refers to the current project directory.

BarDepth Property

Description

Defines or returns the depth of the bar in pixels.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the bar depth will be set to "40":

```
Sub HMI3DBarGraphConfiguration()
'VBA401
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BarDepth = 40
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BarHeight Property

Description

Defines or returns the height of the bar in pixels.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the bar height will be set to "60":

```
Sub HMI3DBarGraphConfiguration()
'VBA402
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BarHeight = 60
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BarWidth Property

Description

Defines or returns the width of the bar in pixels.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the bar width will be set to "80":

```
Sub HMI3DBarGraphConfiguration()
'VBA403
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BarWidth = 80
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BasePicReferenced Property

Description

TRUE, when the picture assigned in the object status display should be saved. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the picture assigned in the Status Display object is to be saved.

```
Sub StatusDisplayConfiguration()
'VBA404
Dim objStatDisp As HMIStatusDisplay
Set objStatDisp = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
With objStatDisp
```

```
.BasePicReferenced = True
End With
End Sub
```

See also

StatusDisplay Object (Page 3436)

BasePicTransColor Property

Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "BasePicUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the color "Yellow" will be set to "Transparent".

```
Sub StatusDisplayConfiguration()
'VBA405
Dim objStatDisp As HMIStatusDisplay
Set objStatDisp = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
With objStatDisp
.BasePicTransColor = RGB(255, 255, 0)
.BasePicUseTransColor = True
End With
End Sub
```

See also

BasePicUseTransColor Property (Page 3510)

StatusDisplay Object (Page 3436)

BasePicture Property

Description

Defines or returns the basic picture for the Status Display object.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

In this context, the "BasePicReferenced" property defines whether the basic picture should be saved together with the object status display or referenced.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the picture "Testpicture.BMP" will be used as the basic picture:

```
Sub StatusDisplayConfiguration()
'VBA406
Dim objStatDisp As HMIStatusDisplay
Set objStatDisp = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
With objStatDisp
'
'To use this example copy a Bitmap-Graphic
'to the "GraCS"-Folder of the actual project.
'Replace the picturename "Testpicture.BMP" with the name of
'the picture you copied
.BasePicture = "Testpicture.BMP"
End With
End Sub
```

See also

BasePicReferenced Property (Page 3505)

StatusDisplay Object (Page 3436)

BasePicture property

Description

Specifies which picture is to be displayed for the currently selected status. Pictures with the following formats can be inserted: EMF, WMF, BMP, GIF, JPG.

If no picture that you want to display is defined for a status, the symbol for the status display is shown as a placeholder.

BasePicUseTransColor Property

Description

TRUE, when the configured color ("BasePicTransColor" property) of the bitmap objects should be set to "transparent". BOOLEAN write-read access.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the color "Yellow" will be set to "Transparent":

```
Sub StatusDisplayConfiguration()
'VBA407
Dim objStatDisp As HMIStatusDisplay
Set objStatDisp = ActiveDocument.HMIObjects.AddHMIObject("Statusdisplay1",
"HMIStatusDisplay")
With objStatDisp
.BasePicTransColor = RGB(255, 255, 0)
.BasePicUseTransColor = True
End With
End Sub
```

See also

BasePicTransColor Property (Page 3506)

StatusDisplay Object (Page 3436)

BaseX Property

Description

Defines or returns for the 3DBarGraph object the horizontal distance in pixels between the right-hand border of the bar and the left-hand border of the object field.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the horizontal distance will be set to "80".

```
Sub HMI3DBarGraphConfiguration()
'VBA408
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BaseX = 80
```

```
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BaseY Property

Description

Defines or returns for the 3DBarGraph object the vertical distance in pixels between the lower border of the bar and the upper border of the object field.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the vertical distance will be set to "100".

```
Sub HMI3DBarGraphConfiguration()
'VBA409
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.BaseY = 100
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

BinaryResultInfo Property

Description

Returns the BinaryResultInfo object.

Example:

An example showing how to use the BinaryResultInfo property can be found in this documentation under the heading "BinaryResultInfo Object".

See also

BinaryResultInfo Object (Page 3291)

BitNotSetValue Property

Description

Defines or returns the value for the dynamic property if the specified bit of a configured tag is not set.

To define which bit must be set in order to trigger a change of value, use the BitNumber property.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned, the bit to be set will be defined and the associated property values will be assigned to the "set"/"not set" states:

```
Sub AddDynamicDialogToCircleRadiusTypeBit()
'VBA410
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_B", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBit
.Trigger.VariableTriggers(1).CycleType = hmiVariableCycleType_5s
.BitResultInfo.BitNumber = 1
.BitResultInfo.BitSetValue = 40
.BitResultInfo.BitNotSetValue = 80
End With
End Sub
```

See also

BitNumber Property (Page 3512)

BitResultInfo Object (Page 3292)

BitNumber Property

Description

Defines or returns the bit whose status must change in order to trigger a change of value. The tag used must be of the type BYTE, WORD or DWORD.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned, the bit to be set will be defined and the associated property values will be assigned to the "set"/"not set" states:

```
Sub AddDynamicDialogToCircleRadiusTypeBit()
'VBA411
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_B", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBit
.BitResultInfo.BitNumber = 1
.BitResultInfo.BitSetValue = 40
.BitResultInfo.BitNotSetValue = 80
End With
End Sub
```

See also

BitResultInfo Object (Page 3292)

VBA Reference (Page 3124)

BitPosition0..3 property

Description

Specifies the bit position of the selected tag for which the respective bit (0 to 3) of the status value is used. The content is only evaluated when a tag is selected for the respective property "BitSelect0..3". The tags are specified using "Process" and "Process1..3".

You can enter a value from "0" to "31". Each value can only be assigned once.

BitResultInfo Property

Description

Returns the BitResultInfo object.

Example:

An example showing how to use the BitResultInfo property can be found in this documentation under the heading "BitResultInfo Object".

See also

BitResultInfo Object (Page 3292)

BitSelect0..3 property

Description

Specifies the status tag for which the respective (first to fourth) bit of the status value is specified. The tags are specified using the properties "Process" and "Process1..3".

0	The respective bit of the status value is not evaluated. No status tag is used.
1	Status tag "Process" is used for the respective bit of the status value.
2	Status tag "Process1" is used for the respective bit of the status value.
3	Status tag "Process2" is used for the respective bit of the status value.
4	Status tag "Process3" is used for the respective bit of the status value.

BitSetValue Property

Description

Defines or returns the value for the dynamic property if the specified bit of a configured tag is set.

To define which bit must be set in order to trigger a change of value, use the BitNumber property.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned, the bit to be set will be defined and the associated property values will be assigned to the "set"/"not set" states:

```
Sub AddDynamicDialogToCircleRadiusTypeBit()
'VBA412
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_B", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBit
.BitResultInfo.BitNumber = 1
.BitResultInfo.BitSetValue = 40
.BitResultInfo.BitNotSetValue = 80
End With
End Sub
```

See also

BitNumber Property (Page 3510)

BitResultInfo Object (Page 3292)

Bold Property

Description

TRUE if the font attribute "Bold" is set for the language-dependent text in the object. BOOLEAN write-read access.

Example:

Note

For this example to work, you must already have configured in the languages concerned.

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA413
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "Displaytext"
Set colLangFonts = objButton.LDFonts
'Set french fontproperties:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'Set english fontproperties:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

BorderBackColor Property

Description

Defines or returns the background color of the line for the object. LONG write-read access.

The background color is only visible if the BorderStyle property is set >0.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the background color for the line will be set to "Yellow":

```
Sub RectangleConfiguration()
'VBA415
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BorderBackColor = RGB(255, 255, 0)
End With
End Sub
```

BorderColor Property

Description

Defines or returns the line color for the object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the line color will be set to "Blue":

```
Sub RectangleConfiguration()
'VBA416
```

```
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BorderColor = RGB(0, 0, 255)
End With
End Sub
```

BorderColorBottom Property

Description

Defines or returns the color for the bottom right-hand part of the 3D-border. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the 3D-border color will be defined:

```
Sub ButtonConfiguration()
'VBA417
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.BorderColorBottom = RGB(255, 0, 0)
.BorderColorTop = RGB(0, 0, 255)
End With
End Sub
```

See also

RoundButton Object (Page 3418)

Button Object (Page 3293)

BorderColorTop Property

Description

Defines or returns the color for the top left-hand part of the 3D-border. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the 3D-border color will be defined:

```
Sub ButtonConfiguration()
```

```
'VBA418
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.BorderColorBottom = RGB(255, 0, 0)
.BorderColorTop = RGB(0, 0, 255)
End With
End Sub
```

See also

RoundButton Object (Page 3418)

Button Object (Page 3293)

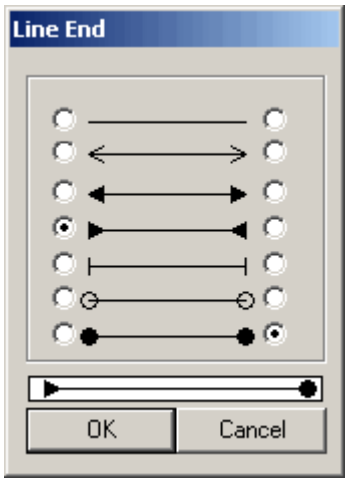
BorderEndStyle Property

Description

Defines or returns the line end style of the object. LONG read-write access.

Determination of Line End Style

Determine the line end type with the aid of a five-character hexadecimal value which you then convert into its equivalent decimal value.



To determine the line ends for the object, go to the "Line End Style" window and proceed as follows:

- Left column: Configures the start of the line. Value range (from the top down) 0 to 6. The start of the line corresponds to the first character in the hexadecimal value. In the configuration shown, the value of the first character is "3".
- Right Column: Configures the end of the line. Value range (from the top down) 0 to 6. The line end corresponds to the fifth character in the hexadecimal value. In the configuration shown, the value of the fifth character is "6".

This gives a hexadecimal value of "60003". This corresponds to a decimal value of "393219", which you then assign to the BorderEndStyle property.

Example:

The "LineConfiguration()" procedure accesses the properties of the line. In this example the type of line end will be set to the configuration illustrated above:

```
Sub LineConfiguration()
'VBA419
Dim objLine As HMILine
Set objLine = ActiveDocument.HMIObjects.AddHMIObject("Line1", "HMILine")
With objLine
.BorderEndStyle = 393219
End With
End Sub
```

See also

PolyLine Object (Page 3405)

Line Object (Page 3373)

BorderFlashColorOff Property

Description

Defines or returns the color of the object lines for the flashing status "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the color when the flash status is "Off" will be set to "Black":

```
Sub RectangleConfiguration()
'VBA420
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
```

```
.BorderFlashColorOff = RGB(0, 0, 0)
End With
End Sub
```

BorderFlashColorOn Property

Description

Defines or returns the color of the object lines for the flashing status "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the color when the flash status is "On" will be set to "Red":

```
Sub RectangleConfiguration()
'VBA421
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BorderFlashColorOn = RGB(255, 0, 0)
End With
End Sub

BorderStyle Property

Description

Defines or returns the line style for the object. Value range from 0 to 4:

Line style	Assigned Value
———	0
— —	1
------	2
— · —	3
—·· —	4

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the line style will be set to "1":

```
Sub RectangleConfiguration()
'VBA422
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.BorderStyle = 1
End With
End Sub

BorderWidth Property

Description

Defines or returns the line weight (in pixels) for the object.

Example:

in the following example the line weight of a newly added circle will be set to "2".

```
Sub CircleConfiguration()
'VBA423
Dim objCircle As IHMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
With objCircle
.BorderWidth = 2
End With
End Sub

BottomConnectedObjectName Property

Description

Returns the name of the starting object to which the connector is Read only access.

Example:

An example showing how to use the BottomConnectedObjectName property can be found in this documentation under the heading "ObjConnection Object".

See also

ObjConnection object (Page 3388)

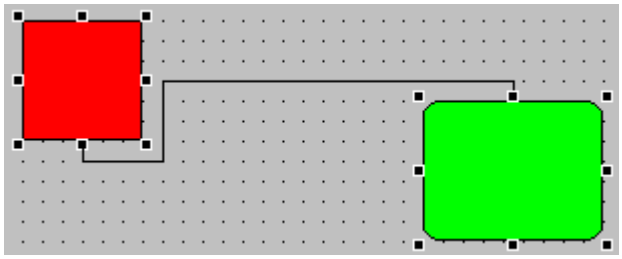
BottomConnectedConnectionPointIndex Property

Description

Returns the connection point on the object to which the connector is connected.

Connection Point	Assigned Value
Up	0
Right	1

Connection Point	Assigned Value
Down	2
Left	3



Example:

An example showing how to use the BottomConnectedObjectName property can be found in this documentation under the heading "ObjConnection Object".

See also

ObjConnection object (Page 3388)

BoxAlignment Property

Description

TRUE, when the fields are arranged aligned to the right. BOOLEAN write-read access.

Example:

The "CreateOptionGroup()" procedure creates the OptionGroup object with four option buttons. Each option button is assigned the default name "myCustomText<Nummer>":

```
Sub CreateOptionGroup()
'VBA424
Dim objRadioBox As HMIOptionGroup
Dim iCounter As Integer
Set objRadioBox = ActiveDocument.HMIObjects.AddHMIObject("RadioBox_1", "HMIOptionGroup")
iCounter = 1
With objRadioBox
.Height = 100
.Width = 180
.BoxCount = 4
.BoxAlignment = False
For iCounter = 1 To .BoxCount
.index = iCounter
.Text = "CustomText" & .index
Next iCounter
```

```
End With
End Sub
```

See also

BoxCount Property (Page 3528)

OptionGroup Object (Page 3393)

CheckBox Object (Page 3297)

BoxCount Property

Description

Defines or returns the number of fields. Value range from 1 to 32.

Example:

The "CreateOptionGroup()" procedure creates the OptionGroup object with four option buttons. Each option button is assigned the default name "myCustomText<Nummer>":

```
Sub CreateOptionGroup()
'VBA425
Dim objRadioBox As HMIOptionGroup
Dim iCounter As Integer
Set objRadioBox = ActiveDocument.HMIObjects.AddHMIObject("RadioBox_1", "HMIOptionGroup")
iCounter = 1
With objRadioBox
.Height = 100
.Width = 180
.BoxCount = 4
.BoxAlignment = True
For iCounter = 1 To .BoxCount
.index = iCounter
.Text = "CustomText" & .index
Next iCounter
End With
End Sub
```

See also

BoxAlignment Property (Page 3525)

OptionGroup Object (Page 3393)

CheckBox Object (Page 3297)

BoxType Property

Description

Defines or returns the field type. Value range from 0 to 2.

Field type	Assigned Value
Edition	0
Input	1
I/O field	2

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the field type is configured as "Input":

```
Sub IOFieldConfiguration()
'VBA426
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.BoxType = 1
End With
End Sub
```

See also

IOField Object (Page 3361)

Button1..8MessageClasses

Description

Defines one or more message events in the group display for representing the respective command button. This is done by entering the numbers of the bits in the collective value.

If you want to assign several message events, delimit the numbers with a comma. The order of assignment defines the priority. If there is more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

Button1..8Width property

Description

Defines or returns for the "Group Display" object the width of the respective button in pixels.

When the "SameSize" property is set to "TRUE", all buttons are set to the same width.

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the width of button "1" is set to "50":

```
Sub GroupDisplayConfiguration()
'VBA427
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.Button1Width = 50
End With
End Sub
```

See also

SameSize Property (Page 3749)

GroupDisplay Object (Page 3350)

ButtonColor Property

Description

Defines or returns the color of the slider for the Slider object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the color of the slider will be set to "Yellow".

```
Sub SliderConfiguration()
'VBA431
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.ButtonColor = RGB(255, 255, 0)
End With
End Sub
```

Slider object (Page 3428)

C

Caption Property

Description

TRUE, when the application or picture window has a title bar in Runtime. BOOLEAN write-read access.

The Caption property must be set to "True" if the intention is that the application window or picture window shall have Maximize and Close buttons.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will

```
Sub ApplicationWindowConfig()
'VBA432
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow",
"HMIApplicationWindow")
With objAppWindow
.Caption = True
.CloseButton = False
.Height = 200
.Left = 10
.MaximizeButton = True
.Moveable = False
.OnTop = True
```

```
.Sizeable = True
.Top = 20
.Visible = True
.Width = 250
.WindowBorder = True
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ApplicationWindow Object (Page 3284)

CaptionText Property

Description

Defines or returns the window title that will be displayed for the PictureWindow object in Runtime.

The Caption property must be set to TRUE."

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will

```
Sub PictureWindowConfig()
'VBA433
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

CBackColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Came In" which color the background of the value to be displayed assumes for flashing status "Off" (CBackColorOff) or "On" (CBackColorOn).

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

CBackFlash property

Description

Specifies for the selected message type and status "Came In" whether the background of the value to be displayed flashes when a message is received.

CheckAlarmHigh Property

Description

TRUE if the "Alarm High" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties AlarmHigh, ColorAlarmHigh and TypeAlarmHigh.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "50".

```
Sub BarGraphLimitConfiguration()
'VBA434
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
```

```
'Set analysis to absolute
.TypeAlarmHigh = False
'Activate monitoring
.CheckAlarmHigh = True
'Set barcolor to "yellow"
.ColorAlarmHigh = RGB(255, 255, 0)
'Set upper limit to "50"
.AlarmHigh = 50
End With
End Sub
```

AlarmHigh Property (Page 3478)

BarGraph Object (Page 3286)

CheckAlarmLow Property

Description

TRUE if the "Alarm Low" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties AlarmLow, ColorAlarmLow and TypeAlarmLow.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "10".

```
Sub BarGraphLimitConfiguration()
'VBA435
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeAlarmLow = False
'Activate monitoring
.CheckAlarmLow = True
'Set barcolor to "yellow"
.ColorAlarmLow = RGB(255, 255, 0)
'Set lower limit to "10"
.AlarmLow = 10
End With
```

```
End Sub
```

Checked Property

Description

TRUE if a check mark is to appear in front of the user-defined menu entry. BOOLEAN write-read access.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"): The first menu entry is also marked with a tick:

```
Sub CreateMenuItem()
'VBA436
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
'
'Add new menu "Delete objects" to menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to the new menu
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
Rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete Circles")
With objMenu.MenuItems
.Item("DeleteAllRectangles").Checked = True
End With
End Sub
```

CheckLimitHigh4 Property

Description

TRUE if the "Reserve 4" high limit value of the bar graph object is to be monitored. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties LimitHigh4, ColorLimitHigh4 and TypeLimitHigh4.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "70".

```
Sub BarGraphLimitConfiguration()
'VBA437
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh4 = False
'Activate monitoring
.CheckLimitHigh4 = True
'set barcolor to "red"
.ColorLimitHigh4 = RGB(255, 0, 0)
'Set upper limit to "70"
.LimitHigh4 = 70
End With
End Sub
```

CheckLimitHigh5 Property

Description

TRUE if the "Reserve 5" high limit value of the bar graph object is to be monitored. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties LimitHigh5, ColorLimitHigh5 and TypeLimitHigh5.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "80".

```
Sub BarGraphLimitConfiguration()
'VBA438
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh5 = False
'Activate monitoring
.CheckLimitHigh5 = True
'set barcolor to "black"
.ColorLimitHigh5 = RGB(0, 0, 0)
'Set upper limit to "80"
.LimitHigh5 = 80
End With
End Sub
```

CheckLimitLow4 Property

Description

TRUE if the "Reserve 4" low limit value of the bar graph object is to be monitored. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties LimitLow4, ColorLimitLow4 and TypeLimitLow4.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "5".

```
Sub BarGraphLimitConfiguration()
'VBA439
```

```
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitLow4 = False
'Activate monitoring
.CheckLimitLow4 = True
'Set barcolor to "green"
.ColorLimitLow4 = RGB(0, 255, 0)
'set lower limit to "5"
.LimitLow4 = 5
End With
End Sub
```

CheckLimitLow5 Property

Description

TRUE if the "Reserve 5" low limit value of the bar graph object is to be monitored. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties LimitLow5, ColorLimitLow5 and TypeLimitLow5.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "0".

```
Sub BarGraphLimitConfiguration()
'VBA440
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitLow5 = False
'Activate monitoring
.CheckLimitLow5 = True
'Set barcolor to "white"
.ColorLimitLow5 = RGB(255, 255, 255)
```

```
'set lower limit to "0"
.LimitLow5 = 0

CheckToleranceHigh Property

Description

TRUE if the "Tolerance High" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties ToleranceHigh, ColorToleranceHigh and TypeToleranceHigh.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "45".

```
Sub BarGraphLimitConfiguration()
'VBA441
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeToleranceHigh = False
'Activate monitoring
.CheckToleranceHigh = True
'Set barcolor to "yellow"
.ColorToleranceHigh = RGB(255, 255, 0)
'Set upper limit to "45"
.ToleranceHigh = 45
End With
End Sub
```

CheckToleranceLow Property

Description

TRUE if the "Tolerance Low" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties ToleranceLow, ColorToleranceLow and TypeToleranceLow.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "15".

```
Sub BarGraphLimitConfiguration()
'VBA442
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeToleranceLow = False
'Activate monitoring
.CheckToleranceLow = True
'Set barcolor to "yellow"
.ColorToleranceLow = RGB(255, 255, 0)
'Set lower limit to "15"
.ToleranceLow = 15
End With
End Sub
```

CheckWarningHigh Property

Description

TRUE if the "Warning High" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties WarningHigh, ColorWarningHigh and TypeWarningHigh.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "75".

```
Sub BarGraphLimitConfiguration()
'VBA443
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeWarningHigh = False
'Activate monitoring
.CheckWarningHigh = True
'Set barcolor to "red"
.ColorWarningHigh = RGB(255, 0, 0)
'Set upper limit to "75"
.WarningHigh = 75
End With
End Sub
```

CheckWarningLow Property

Description

TRUE if the "Warning Low" limit value is being monitored for the BarGraph object. BOOLEAN write-read access.

The limit value, the display on reaching the limit value and the type of evaluation are defined via the properties WarningLow, ColorWarningLow and TypeWarningLow.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "12".

```
Sub BarGraphLimitConfiguration()
'VBA444
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeWarningLow = False
'Activate monitoring
.CheckWarningLow = True
'Set barcolor to "magenta"
.ColorWarningLow = RGB(255, 0, 255)
'Set lower limit to "12"
.WarningLow = 12
End With
End Sub
```

ClearOnError Property

Description

TRUE if the entry in the I/O field is automatically deleted when the input is incorrect. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the I/O field is to be cleared when the input is incorrect:

```
Sub IOFieldConfiguration()
'VBA445
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.ClearOnError = True
```

```
End With
End Sub
```

See also

IOField Object (Page 3361)

ClearOnNew Property

Description

TRUE if the entry in the I/O field is deleted as soon as the I/O field gets the focus. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the entry in the I/O field is deleted as soon as the field gets the focus:

```
Sub IOFieldConfiguration()
'VBA446
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.ClearOnNew = True
End With
End Sub
```

See also

IOField Object (Page 3361)

CloseButton Property

Description

TRUE if the ApplicationWindow and PictureWindow objects possess a "Close" button in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will have a "Close" button in Runtime:

```
Sub ApplicationWindowConfig()
'VBA447
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
With objAppWindow
.CloseButton = True
End With
End Sub
```

CollectValue property

Description

The CollectValue property specifies as an initial value the current status of the active message classes in each case.

The "Relevant" property has to have the value "TRUE" so that the advanced analog display is taken into account when forming the group display .

ColorAlarmHigh Property

Description

Defines or returns the bar color for the "Alarm High" limit value. LONG write-read access.

The "CheckAlarmHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "50 " and the bar color will change to Red.

```
Sub BarGraphLimitConfiguration()
'VBA449
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeAlarmHigh = False
'Activate monitoring
.CheckAlarmHigh = True
'Set barcolor to "red"
.ColorAlarmHigh = RGB(255, 0, 0)
'Set upper limit to "50"
.AlarmHigh = 50
End With
End Sub
```

ColorAlarmLow Property

Description

Defines or returns the bar color for the "Alarm Low" limit value. LONG write-read access.

The "CheckAlarmLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "10 " and the bar color will change to Red.

```
Sub BarGraphLimitConfiguration()
'VBA450
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeAlarmLow = False
'Activate monitoring
.CheckAlarmLow = True
'Set barcolor to "red"
.ColorAlarmLow = RGB(255, 0, 0)
'Set lower limit to "10"
.AlarmLow = 10
End With
End Sub
```

CheckAlarmLow Property (Page 3532)

BarGraph Object (Page 3286)

ColorBottom Property

Description

Defines or returns the color for the bottom/right stop of the slider object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the color for the lower/right view will be set to "Red":

```
Sub SliderConfiguration()
'VBA451
```

```
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.ColorBottom = RGB(255, 0, 0)
End With
End Sub
```

Slider object (Page 3428)

ColorChangeType Property

Description

TRUE if a color change in the BarGraph object (for instance when a limit value is reached) is to take place segment by segment. If set to FALSE, it defines the change of color for the entire bar. BOOLEAN write-read access.

Example:

The "BarGraphLimitConfiguration()" procedure configures In this example the color change will apply to the whole bar:

```
Sub BarGraphLimitConfiguration()
'VBA452
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.ColorChangeType = False
End With
End Sub
```

BarGraph Object (Page 3286)

ColorLimitHigh4 Property

Description

Defines or returns the color for the "Reserve 4" upper limit value. LONG write-read access.

The "CheckLimitHigh4" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "70 " and the bar color will change to Red.

```
Sub BarGraphLimitConfiguration()
'VBA453
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh4 = False
'Activate monitoring
.CheckLimitHigh4 = True
'Set barcolor to "red"
.ColorLimitHigh4 = RGB(255, 0, 0)
'Set upper limit to "70"
.LimitHigh4 = 70
End With
End Sub
```

ColorLimitHigh5 Property

Description

Defines or returns the color for the "Reserve 5" upper limit value. LONG write-read access.

The "CheckLimitHigh5" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "80" and the bar color will change to "Black".

```
Sub BarGraphLimitConfiguration()
'VBA454
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh5 = False
'Activate monitoring
.CheckLimitHigh5 = True
'Set barcolor to "black"
.ColorLimitHigh5 = RGB(0, 0, 0)
'Set upper limit to "80"
.LimitHigh5 = 80
End With
End Sub
```

ColorToleranceHigh Property

Description

Defines or returns the color for the "Tolerance High" high limit value. LONG write-read access.

The "CheckToleranceHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "45" and the bar color will change to "Yellow".

```
Sub BarGraphLimitConfiguration()
'VBA457
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeToleranceHigh = False
'Activate monitoring
.CheckToleranceHigh = True
'Set barcolor to "yellow"
.ColorToleranceHigh = RGB(255, 255, 0)
'Set upper limit to "45"
.ToleranceHigh = 45
End With
End Sub
```

ColorToleranceLow Property

Description

Defines or returns the color for the "Tolerance Low" low limit value. LONG write-read access.

The "CheckToleranceLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "12" and the bar color will change to "Yellow".

```
Sub BarGraphLimitConfiguration()
'VBA458
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeToleranceLow = False
'Activate monitoring
.CheckToleranceLow = True
'Set barcolor to "yellow"
.ColorToleranceLow = RGB(255, 255, 0)
'Set lower limit to "15"
.ToleranceLow = 15
End With
End Sub
```

Slider object (Page 3428)

ColorWarningHigh Property

Description

Defines or returns the color for the "Warning High" high limit value. LONG write-read access.

The "CheckWarningHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "75" and the bar color will change to "Red".

```
Sub BarGraphLimitConfiguration()
'VBA460
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeWarningHigh = False
'Activate monitoring
.CheckWarningHigh = True
'Set barcolor to "red"
.ColorWarningHigh = RGB(255, 0, 0)
'Set upper limit to "75"
.WarningHigh = 75
End With
End Sub
```

ColorWarningLow Property

Description

Defines or returns the color for the "Warning Low" low limit value. LONG write-read access.

The "CheckWarningLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "12" and the bar color will change to "Magenta".

```
Sub BarGraphLimitConfiguration()
'VBA461
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeWarningLow = False
'Activate monitoring
.CheckWarningLow = True
'Set barcolor to "magenta"
.ColorWarningLow = RGB(255, 0, 255)
'Set lower limit to "12"
.WarningLow = 12
End With
End Sub
```

CheckWarningLow Property (Page 3539)

BarGraph Object (Page 3286)

CommonVBSCode Property

Description

Defines the higher-level common declaration section of the actions for the active picture or returns it.

The action editor of the Graphics Designer is used to configure actions at events and properties. In the declaration section of the actions, you can declare tags for a process image as well as create functions and procedures. In Runtime, each VBS action can access these tags, functions and procedures if the picture is active.

If you set "CommonVBSCode", the string is copied to the "Event" and "Property" declaration sections in the action editor. Any code there is overwritten. Therefore, set "CommonVBSCode" first before setting the subordinate declaration sections with "CommonVBSEventArea" or "CommonVBSPropertyArea".

Example

In the following example, a tag that is common to all picture objects is declared in the active picture. The common declaration section is then output :

```
Sub DefineTagInActiveDocument
ActiveDocument.CommonVBSCode = "DIM actionIsdone" & vbCrLf
MsgBox ActiveDocument.CommonVBSCode
End Sub
```

See also

Document Object (Page 3319)

CommonVBSEventArea property

Description

Defines the "Event" declaration section of the actions for the active picture or returns it.

The action editor of the Graphics Designer is used to configure actions, for example, at events. To this purpose, you can declare tags for a process image as well as create functions and procedures in the "Event" declaration section of the actions. In Runtime each VBS action that was configured for an event can access these tags, functions and procedures if the picture is active.

If you set "CommonVBSEventArea", the string is copied to the "Event" declaration section in the action editor. Any code there is overwritten. Therefore, first read the code set, for example with "CommonVBSCode" before you set the declaration section with "CommonVBSEventArea".

Example

In the following example, two tags are declared in the active picture. The "Event" declaration section is the output:

```
Sub DefineTagInActiveDocument
ActiveDocument.CommonVBSCode = "DIM actionIsdone" & vbCrLf
ActiveDocument.CommonVBSEventArea = ActiveDocument.CommonVBSEventArea & "DIM
"eventHasOccurred"
MsgBox ActiveDocument.CommonVBSEventArea
End Sub
```

CommonVBSPropertyArea property

Description

Defines the "Property" declaration section of the actions for the active picture or returns it.

The action editor of the Graphics Designer is used to configure actions for example at properties. To this purpose you can declare tags for a process image as well as create functions and procedures in the "Property" declaration section of the actions. In Runtime each VBS action that was configured for a property can access these tags, functions and procedures if the picture is active.

If you set "CommonVBSPropertyArea", the string is copied to the "Property" declaration section in the action editor. Any code there is overwritten. Therefore, first read the code set, for example with "CommonVBSCode" before you set the declaration section with "CommonVBSPropertyArea".

Example

In the following example, two tags are declared in the active picture. The "Property" declaration section is then output:

```
Sub DefineTagInActiveDocument
ActiveDocument.CommonVBSCode = "DIM actionIsdone" & vbCrLf
ActiveDocument CommonVBSPropertyArea = ActiveDocument.CommonVBSPropertyArea & "DIM
propertyIsChanged"
MsgBox ActiveDocument.CommonVBSPropertyArea
End Sub
```

CommandLine Property

Description

Returns the start parameter as a string if the application is opened via Start>Execute "Grafexe.exe start parameter". Read only access.

Example:

In this example a message containing the start parameter is output on opening the document.

```
Sub Document_Opened(CancelForwarding As Boolean)
'VBA462
MsgBox Application.Commandline
End Sub
```

See also

Application Object (Page 3282)

Compiled Property

Description

TRUE if the source code of a C script or VB script was successfully compiled. BOOLEAN read access.

Example:

In the following example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle will enlarge every time you click the button. A VB script will be used for this purpose:

```
Sub IncreaseCircleRadiusWithVBScript()
'VBA463
Dim objButton As HMIButton
Dim objCircleA As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Dim strCode As String
strCode = "Dim objCircle" & vbCrLf & "Set objCircle = "
strCode = strCode & "hmiRuntime.ActiveScreen.ScreenItems(""CircleVB"")"
strCode = strCode & vbCrLf & "objCircle.Radius = objCircle.Radius + 5"
Set objCircleA = ActiveDocument.HMIObjects.AddHMIObject("CircleVB", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircleA
.Top = 100
.Left = 100
End With
With objButton
.Top = 10
.Left = 10
.Width = 200
.Text = "Increase Radius"
End With
'On every mouseclick the radius will be increased:
```

```
Set objEvent = objButton.Events(1)
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
objVBScript.SourceCode = strCode
Select Case objVBScript.Compiled
Case True
MsgBox "Compilation OK!"
Case False
MsgBox "Errors by compilation!"
End Select
End Sub
```

SourceCode Property (Page 3768)

ScriptInfo Object (Page 3424)

ConfigurationFileName Property

Description

Returns the file name and full path of the configuration file for the open project. STRING read access.

Example:

The "ShowConfigurationFileName() procedure outputs the configuration file path for the current picture:

```
Sub ShowConfigurationFileName()
'VBA464
MsgBox ActiveDocument.Application.ConfigurationFileName
End Sub
```

Application Property (Page 3484)

Application Object (Page 3282)

ConnectionPoints property

Description

Returns the number of connection points of an object.

Example: Number of connection points of a rectangle

In this example, a rectangle is inserted and the number of connection points is output:

```
Sub CountConnectionPoints()
'VBA229
Dim objRectangle As HMIRectangle
Dim objConnPoints As HMIConnectionPoints
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
Set objConnPoints = ActiveDocument.HMIObjects("Rectangle1").ConnectionPoints
MsgBox "Rectangle1 has " & objConnPoints.Count & " connectionpoints."
End Sub
```

ConnectorObjects property

Description

Only used internally.

ConnectorType property

Description

Defines the type of connector:

Automatic	Both objects are connected by a polyline made up of horizontal and vertical parts.
Simple	Both objects are connected by a straight line between the connecting points.

ControlType property

Description

Returns the name range of the control.

CopyPasteSettings property

Description

Only used internally.

See also

Application Object (Page 3282)

CornerRadius property

Description

Defines the rounding radius of the rectangle which enclose objects in the advanced analog display. The values are defined in pixels.

The range of values which can be displayed for the corner radius depends on the values set for the "height" and "width" properties. The maximum corner radius value which can be displayed is equivalent to 50% of the lower one of the "height" or "width" values. The maximum value is used if higher values are entered.

Count Property

Description

Returns the number of elements in the specified listing. LONG read access

Example:

In the following example a new picture will be created and a pair of objects will be inserted. The number of inserted objects will be output at the end:

```
Sub ObjectsInActiveDocument()
'VBA465
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objDocument As Document
Set objDocument = Application.Documents.Add(hmiOpenDocumentTypeVisible)
Dim iIndex As Integer
iIndex = 1
For iIndex = 1 To 5
Set objCircle = objDocument.HMIObjects.AddHMIObject("Circle" & iIndex, "HMICircle")
Set objRectangle = objDocument.HMIObjects.AddHMIObject("Rectangle" & iIndex,
"HMIRectangle")
With objCircle
.Top = (10 * iIndex)
.Left = (10 * iIndex)
End With
With objRectangle
.Top = ((10 * iIndex) + 50)
.Left = (10 * iIndex)
End With
Next iIndex
MsgBox "There are " & objDocument.HMIObjects.Count & " objects in the document"
End Sub
```

CQBackColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Came In Acknowledged" which color the background of the value to be displayed assumes for flashing status "Off" (CBackColorOff) or "On" (CBackColorOn) when the arrival of a message is acknowledged..

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

CQBackFlash property

Description

Specifies for the selected message type and status "Came In Acknowledged" whether the background of the value to be displayed flashes when the arrival of a message is acknowledged.

CQTextColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Came In Acknowledged" which color the text of the value to be displayed assumes for flashing status "Off" (CTextColorOff) or "On" (CTextColorOn) when the arrival of a message is acknowledged..

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

CQTextFlash property

Description

Specifies for the selected message type and status "Came In Acknowledged" whether the background of the text to be displayed flashes when the arrival of a message is acknowledged.

CTextColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Came In" which color the text of the value to be displayed assumes for flashing status "Off" (CTextColorOff) or "On" (CTextColorOn).

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

CTextFlash property

Description

Specifies for the selected message type and status "Came In" whether the text of the value to be displayed flashes when a message is received.

CurrentDataLanguage Property

Description

Defines the project language or returns the language identifier as a decimal value. LONG read-write access.

Example:

The "ShowDataLanguage()" procedure outputs the currently set project language:

```
Sub ShowDataLanguage()
```

```
'VBA466
MsgBox Application.CurrentDataLanguage
End Sub
```

See also

Application Property (Page 3484)

DataLanguageChanged Event (Page 3141)

Language-Dependent Configuration with VBA (Page 3018)

CurrentDesktopLanguage Property

Description

Returns the language identifier of the currently set user interface language as a decimal value. LONG read access.

Example:

The "ShowDesktopLanguage()" procedure outputs the currently set user interface language:

```
Sub ShowDesktopLanguage()
'VBA467
MsgBox Application.CurrentDesktopLanguage
End Sub
```

CursorControl Property

Description

TRUE, when Alpha Cursor mode is activated, the cursor skips to the next field in the TAB sequence after exiting the field. BOOLEAN write-read access.

The CursorMode property must be set to TRUE.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the cursor will skip into the next field when another field is exited. For this to work, the Cursor mode property must first be set to TRUE.

```
Sub IOFieldConfiguration()
'VBA468
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
Application.ActiveDocument.CursorMode = True
With objIOField
.CursorControl = True
End With
End Sub
```

IOField Object (Page 3361)

CursorMode Property

Description

TRUE if the "Alpha Cursor" mode is to be activated. FALSE if the "Tab order" mode is to be activated. BOOLEAN write-read access.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the "Alpha Cursor" mode will be activated:

```
Sub ActiveDocumentConfiguration()
'VBA469
Application.ActiveDocument.CursorMode = True
End Sub
```

CustomMenus Property

Description

Returns a listing of the available user-defined menus.

Example:

The "ShowCustomMenuInformation()" procedure outputs the Key and Label of all user-defined menus in the current picture:

```
Sub ShowCustomMenuInformation()
'VBA470
Dim strKey As String
Dim strLabel As String
Dim strOutput As String
Dim iIndex As Integer
For iIndex = 1 To ActiveDocument.CustomMenus.Count
strKey = ActiveDocument.CustomMenus(iIndex).Key
strLabel = ActiveDocument.CustomMenus(iIndex).Label
strOutput = strOutput & vbCrLf & "Key: " & strKey & "  Label: " & strLabel
Next iIndex
If 0 = ActiveDocument.CustomMenus.Count Then
strOutput = "There are no custommenus for the document created."
End If
MsgBox strOutput
End Sub
```

See also

Application Property (Page 3484)

ActiveDocument Property (Page 3472)

Menu Object (Page 3378)

CustomToolbars Property

Description

Returns a listing of the available user-defined toolbars.

Example:

The "ShowCustomToolbarInformation()" procedure outputs the Key values of all user-defined toolbars in the current picture:

```
Sub ShowCustomToolbarInformation()
'VBA471
Dim strKey As String
Dim strOutput As String
Dim iIndex As Integer
For iIndex = 1 To ActiveDocument.CustomToolbars.Count
strKey = ActiveDocument.CustomToolbars(iIndex).Key
strOutput = strOutput & vbCrLf & "Key: " & strKey
Next iIndex
If 0 = ActiveDocument.CustomToolbars.Count Then
strOutput = "There are no toolbars created for this document."
End If
MsgBox strOutput
End Sub
```

Application Property (Page 3484)

ActiveDocument Property (Page 3472)

Toolbar Object (Page 3445)

CycleName Property

Description

Returns the name of the specified tag trigger. Read only access.

Example:

--

See also

VariableTrigger Object (Page 3464)

CycleTime Property

Description

Returns the cycle time of the specified tag trigger. Read only access.

Example:

--

See also

VariableTrigger Object (Page 3464)

CycleType Property

Description

Defines or returns the cycle type.

Example:

The "DynamicToRadiusOfNewCircle(hmiCircle As IHMICircle)" procedure creates a dynamic for the radius of a circle. In this example the radius of the circle will be set every two seconds:

```
Sub DynamicToRadiusOfNewCircle()
'VBA474
Dim objCircle As hmiCircle
Dim VariableTrigger As HMIVariableTrigger
Set objCircle = Application.ActiveDocument.HMIObjects.AddHMIObject("Circle1", "HMICircle")
Set VariableTrigger = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeVariableDirect,
"NewDynamic1")
VariableTrigger.CycleType = hmiVariableCycleType_2s
End Sub
```

See also

VariableTrigger Object (Page 3464)

Configuring Dynamics in the Properties of Pictures and Objects (Page 3080)

D

DataFormat Property

Description

Defines or returns the data type of the IOField object. Value range from 0 to 3.

Data type	Assigned Value
Binary	0
Decimal	1
String	2
Hexadecimal	3

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, data type "Decimal" will be set for the I/O field:

```
Sub IOFieldConfiguration()
'VBA475
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.DataFormat = 1
End With
End Sub
```

See also

IOField Object (Page 3361)

DefaultHMIObjects Property

Description

Returns the HMIDefaultObjects listing.

Example:

The "ShowDefaultObjectNames()" procedure outputs all the object names contained in the HMIDefaultObjects listing:

```
Sub ShowDefaultObjectNames()
'VBA476
Dim strOutput As String
Dim iIndex As Integer
For iIndex = 1 To Application.DefaultHMIObjects.Count
strOutput = strOutput & vbCrLf & Application.DefaultHMIObjects(iIndex).ObjectName
Next iIndex
MsgBox strOutput
End Sub
```

See also

HMIDefaultObjects Object (Listing) (Page 3354)

DestinationLink Property

Description

Returns the Destination object. Use the DestinationLink property to configure the destination object in the case of a direct connection.

Example:

Use the DestinationLink property to return the DestLink object. In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA477
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
```

```
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 100
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

See also

AutomationName Property (Page 3488)

ObjectName Property (Page 3700)

Type Property (Page 3792)

DirectConnection Object (Page 3318)

Direction Property

Description

Defines or returns the bar direction. BOOLEAN write-read access.

Slider

Defines or returns the position of the Slider object. BOOLEAN write-read access.

Position/Bar Axis	Assigned Value
Vertical/Negative	TRUE
Horizontal/Positive	FALSE

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the position of the Slider object will be set to "Vertical":

```
Sub SliderConfiguration()
'VBA478
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.Direction = True
End With
End Sub
```

DisablePerformanceWarnings property

Description

Only used internally.

See also

Application Object (Page 3282)

DisableVBAEvents Property

Description

TRUE if Event Handling is disabled. BOOLEAN write-read access.

Example:

The "DisableVBAEvents()" procedure disables Event Handling:

```
Sub DisableVBAEvents()
'VBA479
Application.DisableVBAEvents = False
End Sub
```

See also

Application Object (Page 3282)

Event Handling (Page 3103)

Display property

Description

Only used internally.

See also

ObjConnection object (Page 3388)

DisplayName Property

Description

Returns the name of the property attribute. STRING read access.

Thus the expression "MsgBox ActiveDocument.HMIObjects("Circle_1").Properties("Height").DisplayName" would output the result "Height".

Example:

The "ShowAllObjectDisplayNames()" procedure outputs all the property attribute names of standard objects contained in the message box:

```
Sub ShowAllObjectDisplayNames()
'VBA480
Dim strOutput As String
Dim iIndex1 As Integer
iIndex1 = 1
strOutput = "List of all properties-displaynames from object """ &
Application.DefaultHMIObjects(1).ObjectName & """" & vbCrLf & vbCrLf
For iIndex1 = 1 To Application.DefaultHMIObjects(1).Properties.Count
strOutput = strOutput & Application.DefaultHMIObjects(1).Properties(iIndex1).DisplayName &
" / "
Next iIndex1
MsgBox strOutput
End Sub
```

See also

Property Object (Page 3409)

DisplayOptions Property

Description

Defines the assignment of the "Button" or "Round button" object or returns its value. Value range from 0 to 3.

Assignment	Assigned Value
Graphic or text	0
Graphic and text	1
Text only	2
Graphic only	3

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button.

In this example the button is assigned "Graphic and text":

```
Sub ButtonConfiguration()
'VBA814
Dim objbutton As HMIButton
Set objbutton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objbutton
.DisplayOptions = 1
End With
End Sub
```

See also

Button Object (Page 3293)

DisplayText Property

Description

Returns the value for the "Label" or "TooltipText" property of the following objects (STRING read access):

- Menu Object
- MenuItem Object
- ToolbarItem Object

Example:

The "ShowLabelTexts()" procedure outputs all the labels of the first user-defined menu in the current picture:

```
Sub ShowLabelTexts()
'VBA481
Dim objLangText As HMILanguageText
Dim iIndex As Integer
For iIndex = 1 To ActiveDocument.CustomMenus(1).LDLabelTexts.Count
Set objLangText = ActiveDocument.CustomMenus(1).LDLabelTexts(iIndex)
MsgBox objLangText.DisplayName
Next iIndex
End Sub
```

ToolbarItem Object (Page 3448)

LanguageText Object (Page 3368)

MenuItem Object (Page 3382)

Menu Object (Page 3378)

Documents Property

Description

Returns the Documents listing containing all open pictures. The open pictures are in chronological order.

Example:

In the following example the names of all open pictures are output:

```
Sub ShowDocuments()
'VBA482
Dim colDocuments As Documents
Dim objDocument As Document
Dim strOutput As String
Set colDocuments = Application.Documents
strOutput = "List of all opened documents:" & vbCrLf
For Each objDocument In colDocuments
strOutput = strOutput & vbCrLf & objDocument.Name
Next objDocument
MsgBox strOutput
```

```
End Sub
```

See also

Application Property (Page 3484)

Application Object (Page 3282)

DrawInsideFrame property

Description

Defines for all line thicknesses greater than "1" whether the border lines are to be drawn inside the object frame or symmetrically on the frame.

Yes	The border lines are drawn inside the object frame.
No	The border lines are drawn symmetrically on the object frame.

DropDownListStyle property

Description

Defines whether the entries in the "TextList" object are displayed in a drop-down list box.

Dynamic Property

Description

Returns the dynamics of a property.

Example:

Use the Dynamic property if you wish to return, say, an existing dynamic. In the following example all possibly available object property dynamics are output in the active picture:

```
Sub ShowPropertiesDynamicsofAllObjects()
'VBA483
Dim objObject As HMIObject
Dim colObjects As HMIObjects
Dim colProperties As HMIProperties
Dim objProperty As HMIProperty
Dim strOutput As String
Set colObjects = Application.ActiveDocument.HMIObjects
For Each objObject In colObjects
```

```
Set colProperties = objObject.Properties
For Each objProperty In colProperties
If 0 <> objProperty.DynamicStateType Then
  strOutput = strOutput & vbCrLf & objObject.ObjectName & " - " & objProperty.DisplayName
& ": Statetype " & objProperty.Dynamic.DynamicStateType
End If
Next objProperty
Next objObject
MsgBox strOutput
End Sub
```

See also

Property Object (Page 3409)

DynamicStateType property

Description

Only used internally.

VBA Reference: ActionDynamic (Page 3126)

E

EditAtOnce Property

Description

TRUE, if accessing the field with the <TAB> key permits input immediately and without further action. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example it shall be possible to enter input on skipping into the I/O field:

```
Sub IOFieldConfiguration()
'VBA484
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.EditAtOnce = True
```

```
End With
End Sub
```

See also

TextList Object (Page 3441)

IOField Object (Page 3361)

ElseCase Property

Description

Defines or returns the value for the dynamic property outside of the configured value range.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and three analog value ranges will be created:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA485
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.Add 50, 40
.AnalogResultInfos.Add 100, 80
.AnalogResultInfos.ElseCase = 100
End With
End Sub
```

See also

AnalogResultInfos Object (Listing) (Page 3281)

AnalogResultInfo Object (Page 3280)

Add Method (AnalogResultInfos Listing) (Page 3166)

Enabled Property

Description

TRUE if the menu, the menu entry or the icon is activated and can be selected. Applies only to user-defined menus and toolbars. BOOLEAN write-read access.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"): In this example the second menu point in user-defined menu "Delete Objects" is grayed out and cannot be selected in the Graphics Designer:

```
Sub DisableMenuItem()
'VBA486
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
'
'Add a new menu "Delete objects"
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to the new menu
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete circles")
'
'Disable menuitem "Delete circles"
With ActiveDocument.CustomMenus("DeleteObjects").MenuItems("DeleteAllCircles")
.Enabled = False
End With
End Sub
```

Menu Object (Page 3378)

Configuring Menus and Toolbars (Page 3020)

EnableFlashing property

Description

Specifies whether the value for status "OK" and "Simulation" appears flashing or not in the advanced analog display in Runtime.

For the flashing to be visible in Runtime, the font flashing color must be different to the background flashing color.

EndAngle Property

Description

Defines or returns the end of the object for the CircularArc, EllipseArc, EllipseSegment and PieSegment objects. The information is in counterclockwise direction in degrees, beginning at the 12:00 clock position.

Example:

The "PieSegmentConfiguration()" procedure accesses the properties of the Pie Segment. In this example the pie segment begins at 40° and ends at 180°:

```
Sub PieSegmentConfiguration()
'VBA487
Dim objPieSegment As HMIPieSegment
Set objPieSegment = ActiveDocument.HMIObjects.AddHMIObject("PieSegment1", "HMIPieSegment")
With objPieSegment
.StartAngle = 40
.EndAngle = 180
End With
End Sub
```

See also

StartAngle Property (Page 3769)

PieSegment Object (Page 3399)

EllipseSegment Object (Page 3333)

EllipseArc Object (Page 3330)

CircularArc Object (Page 3303)

EventQuitMask property

Description

The events "Operator request" and "Measuring point blocked" are not acknowledgeable events in the PCS 7 environment. Using the "@EventQuit" tag and the "EventQuitMask" property in Runtime, these events are automatically indicated as acknowledged to prevent flashing during the calculation of the group displays. The start value of the attribute is then 0x00000011 (17). The value of the "EventQuitMask" property should be identical for all group display objects, advanced analog display and advanced status display, and for the "@EventQuit" tag.

By setting further acknowledgment bits, you can indicate other events as being acknowledged as well with the display of the group display object and the advanced analog and status display.

Events Property

Description

Returns the Events listing. Use the Events property to define the event that will trigger an action. Use the index number to define the event that is intended to be configured:

- You configure an action on a property with VBA by using the "Events(9)" property, where the index "1" stands for the event "Upon change":
- To configure an action onto an object with the aid of VBA, use the "Events(Index)" property, where "Index" stands for the trigger event (see table):

Index	EventType (depending upon the object used)
0	hmiEventTypeNotDefined
1	hmiEventTypeMouseClick
2	hmiEventTypeMouseLButtonDown
3	hmiEventTypeMouseLButtonUp
4	hmiEventTypeMouseRButtonDown
5	hmiEventTypeMouseRButtonUp
6	hmiEventTypeKeyboardDown
7	hmiEventTypeKeyboardUp
8	hmiEventTypeFocusEnter
9	hmiEventTypeObjectChange
10	hmiEventTypeOpenPicture
11	hmiEventTypePictureOpen
12	hmiEventTypePictureClose
13	hmiEventTypeObjectDefined
14	hmiEventTypeFocusEnter
15	hmiEventTypeLastTriggerType
16	hmiEventTypeObjSpecificTriggerStart

Example:

In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA488
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
```

```
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 100
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

See also

Events Object (Listing) (Page 3337)

Configuring Event-Driven Actions with VBA (Page 3092)

EventName property

Description

Returns the name of the "Event" object.

Example

In this example the event names and event types of all objects in the active pictures are put out. In order for this example to work, insert some objects into the active picture and configure different events.

```
Sub ShowEventsOfAllObjectsInActiveDocument()
'VBA252
Dim colEvents As HMIEvents
Dim objEvent As HMIEvent
Dim iMax As Integer
Dim iIndex As Integer
Dim iAnswer As Integer
Dim strEventName As String
Dim strObjectName As String
Dim varEventType As Variant
iIndex = 1
iMax = ActiveDocument.HMIObjects.Count
For iIndex = 1 To iMax
Set colEvents = ActiveDocument.HMIObjects(iIndex).Events
strObjectName = ActiveDocument.HMIObjects(iIndex).ObjectName
For Each objEvent In colEvents
strEventName = objEvent.EventName
varEventType = objEvent.EventType
iAnswer = MsgBox("Objectname: " & strObjectName & vbCrLf & "Eventtype: " & varEventType &
vbCrLf & "Eventname: " & strEventName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objEvent
If vbCancel = iAnswer Then Exit For
Next iIndex
End Sub
```

EventType Property

Description

Returns the event type that is configured on the specified object.

Index	EventType (depending upon the object used)
0	hmiEventTypeNotDefined
1	hmiEventTypeMouseClick
2	hmiEventTypeMouseLButtonDown
3	hmiEventTypeMouseLButtonUp
4	hmiEventTypeMouseRButtonDown
5	hmiEventTypeMouseRButtonUp
6	hmiEventTypeKeyboardDown
7	hmiEventTypeKeyboardUp
8	hmiEventTypeFocusEnter
9	hmiEventTypeObjectChange

Index	EventType (depending upon the object used)
10	hmiEventTypeOpenPicture
11	hmiEventTypePictureOpen
12	hmiEventTypePictureClose
13	hmiEventTypeObjectDefined
14	hmiEventTypeFocusEnter
15	hmiEventTypeLastTriggerType
16	hmiEventTypeObjSpecificTriggerStart

Example:

Use the EventType property to edit a previously configured event. In the following example the event "Mouse Action" will be configured, but then changed to "Pressed":

```
Sub AddActionToObjectTypeCScript()
'VBA489
Dim objEvent As HMIEvent
Dim objCScript As HMIScriptInfo
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_AB", "HMICircle")
'
'C-action is initiated by click on object circle
Set objEvent = objCircle.Events(1)
Set objCScript = objEvent.Actions.AddAction(hmiActionCreationTypeCScript)
MsgBox "the type of the projected event is " & objEvent.EventType
End Sub
```

See also

Events Object (Listing) (Page 3337)

Configuring Event-Driven Actions with VBA (Page 3092)

Exponent Property

Description

TRUE if numbers are to be displayed on the BarGraph object using exponents (e.g. "1.00e +000"). BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example numbers are to be displayed on the bar using exponents:

```
Sub BarGraphConfiguration()
```

```
'VBA490
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Exponent = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

ExtendedOperation Property

Description

TRUE if the slider on the Slider object is set to the associated end value (minimum value/ maximum value). This is done by clicking the mouse in an area outside the current regulator setting. BOOLEAN write-read access.

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the ExtendedOperation property will be set to TRUE:

```
Sub SliderConfiguration()
'VBA491
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.ExtendedOperation = True
End With
End Sub
```

See also

Slider object (Page 3428)

ExtendedZoomingEnable Property

Description

TRUE, if the selected process picture in Runtime may be zoomed in or out using the mouse wheel. This happens by pushing the <CTRL> key while the mouse wheel is turned. If the mouse wheel is turned away from the palm of the hand, the zoom factor increases.

BOOLEAN write-read access.

Requirements for using the zoom function:

- Mouse driver by Logitech or Microsoft Intellimouse
- Mouse wheel must be set to "Autoscroll".
- In the computer properties, the "Graphics Runtime" tab control must have the "Extended zooming" function enabled for all process pictures.

Example:

The procedure "DocConfiguration()" accesses picture properties.

In this example, the property ExtendedZoomingEnable is set to TRUE:

```
Sub DocConfiguration()
'VBA815
Dim objDoc As Document
Set objDoc = ActiveDocument
With objDoc
.ExtendedZoomingEnable = True
End With
End Sub
```

F

FaceplateType property

Description

Sets the faceplate type of the faceplate instance and returns its name. The faceplate type is "Const" and can therefore only be set once.

Usage

Use the Add method to create a new "faceplate instance" object in a picture. "Properties.Item(3)" is used to access the FaceplateType property:

```
Sub FaceplateInstance_and_Properties()
'VBA847
Dim objFaceplateInstance As HMIFaceplateObject

Set objFaceplateInstance = ActiveDocument.HMIObjects.AddHMIObject("faceplate instance",
"HMIFaceplateObject")
objFaceplateInstance.Properties.Item(3).value = "Faceplate1.fpt"
MsgBox "Faceplate """ & objFaceplateInstance.Properties.Item(3).value & """ is used."
```

```
End Sub
```

Family Property

Description

Defines or returns the language-dependent font.

Example:

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA492
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Dim iStartLangID As Integer
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
iStartLangID = Application.CurrentDataLanguage
With objButton
.Text = "Command"
.Width = 100
End With
Set colLangFonts = objButton.LDFonts
'
'To do typesettings for french:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'
'To do typesettings for english:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
With objButton
Application.CurrentDataLanguage = 1036
.Text = "Command"
MsgBox "Datalanguage is changed in french"
Application.CurrentDataLanguage = 1033
.Text = "Command"
MsgBox "Datalanguage is changed in english"
Application.CurrentDataLanguage = iStartLangID
MsgBox "Datalanguage is changed back to startlanguage."
```

```
End With
End Sub
```

FillBackColor property

Description

Only used internally.

See also

Document Object (Page 3319)

FillColor Property

Description

Defines or returns the fill pattern color for the object. LONG read-write access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the background color will be set to "Yellow".

```
Sub RectangleConfiguration()
'VBA493
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FillColor = RGB(255, 255, 0)
End With
End Sub
```

Filling Property

Description

TRUE if an object with closed frame lines (such as a Circle or Rectangle) can be filled (as in the fill level of a tank, for example). BOOLEAN write-read access.

To set the fill level of the object, use the FillingIndex property.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example a rectangle can be used to display the fill level:

```
Sub RectangleConfiguration()
'VBA494
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.Filling = True
End With
End Sub
```

CheckBox Object (Page 3297)

Button Object (Page 3293)

FillingIndex Property

Description

Defines the percentage value (relative to the height of the object) to which to fill an object with closed frame lines (such as a Circle or Rectangle).

The fill level is represented by the current background color. The unfilled background is transparent.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the rectangle will be filled to 50%:

```
Sub RectangleConfiguration()
'VBA495
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.Filling = True
.FillingIndex = 50
End With
End Sub
```

FillingDirection property

Description

0 = the object enclosed in a frame line is filled from bottom to top.

1 = the object enclosed in a frame line is filled from top to bottom.

2 = the object enclosed in a frame line is filled from left to right.

3 = the object enclosed in a frame line is filled from right to left.

Write/Read access.
Use the "FillingDirection" property to set the object fill direction.

Example

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example, the object is filled from left to right.

```
Sub RectangleConfiguration()
'VBA906
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FillingDirection = 2
End With
End Sub
```

FillStyle Property

Description

Defines or returns the fill style for the object.

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
< Transparent >	65536				
< Solid >	0				
	1048576		196611		196627
	1048577		196612		196628
	1048578		196613		196629
	1048579		196614		196630

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	1048832		196615		196631
	1048833		196616		196632
	1048834		196617		196633
	1048835		196618		196634
	131072		196619		196635
	131073		196620		196636
	131074		196621		196637
	131075		196622		196638
	131076		196623		196639
	196608		196624		196640
	196609		196625		196641
	196610		196626		196642

Example

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the fill pattern will be set to the value "196642":

```
Sub RectangleConfiguration()
'VBA496
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FillStyle = 196642
End With
End Sub
```

CheckBox Object (Page 3297)
Button Object (Page 3293)
BarGraph Object (Page 3286)

FillStyle2 Property

Description

Defines or returns the fill pattern of the bar for the BarGraph object.

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
< Transparent >	65536				
< Solid >	0				
	1048576		196611		196627
	1048577		196612		196628
	1048578		196613		196629
	1048579		196614		196630

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	1048832		196615		196631
	1048833		196616		196632
	1048834		196617		196633
	1048835		196618		196634
	131072		196619		196635
	131073		196620		196636
	131074		196621		196637
	131075		196622		196638
	131076		196623		196639
	196608		196624		196640
	196609		196625		196641
	196610		196626		196642

Example

The "BarGraphConfiguration()" procedure configures In this example the bar pattern will be set to "196642":

```
Sub BarGraphConfiguration()
'VBA497
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.FillStyle2 = 196642
End With
End Sub
```

See also

BarGraph Object (Page 3286)

FillStyleAlignment property

Description

Defines the alignment of the fill pattern for the process picture.

Normal	The fill pattern refers to the process picture. In runtime, no scaling is performed when opening the picture.
Stretched (window)	The fill pattern refers to the window in the Graphics Designer. In runtime, scaling is performed when opening the picture.

FlashBackColor Property

Description

TRUE, when flashing of the background is activated. BOOLEAN write-read access

Note

A change to the attribute does not automatically deactivate the "Windows Style" attribute.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example, background flashing is activated:

```
Sub RectangleConfiguration()
'VBA498
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FlashBackColor = True
End With
End Sub
```

FlashBorderColor Property

Description

TRUE, when flashing of the object lines is activated. BOOLEAN write-read access.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example, flashing of the border is activated:

```
Sub RectangleConfiguration()
'VBA499
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.FlashBorderColor = True
End With
End Sub
```

FlashFlashPicture Property

Description

TRUE, when flashing of the flash picture is activated. BOOLEAN write-read access

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example, flashing of the Flash Picture is activated:

```
Sub StatusDisplayConfiguration()
'VBA500
Dim objsDisplay As HMIStatusDisplay
Set objsDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objsDisplay
.FlashFlashPicture = True
End With
End Sub
```

See also

StatusDisplay Object (Page 3436)

FlashForeColor Property

Description

TRUE, when flashing of the text is activated. BOOLEAN write-read access.

Note

A change to the attribute does not automatically deactivate the "Windows Style" attribute.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example, text flashing is activated:

```
Sub ButtonConfiguration()
'VBA501
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FlashForeColor = True
End With
End Sub
```

Button Object (Page 3293)

FlashPicReferenced Property

Description

TRUE if the Flash Picture assigned in the Status Display object is to be saved. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the picture assigned in the Status Display object is to be saved.

```
Sub StatusDisplayConfiguration()
'VBA502
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
.FlashPicReferenced = True
End With
End Sub
```

See also

StatusDisplay Object (Page 3436)

FlashPicTransColor Property

Description

Defines which color of the bitmap object (.bmp, .dib) assigned to the flash picture should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "FlashPicUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the color "Yellow" will be set to "Transparent".

```
Sub StatusDisplayConfiguration()
'VBA503
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
.FlashPicTransColor = RGB(255, 255, 0)
.FlashPicUseTransColor = True
```

```
End With
End Sub
```

See also

FlashPicUseTransColor Property (Page 3604)

StatusDisplay Object (Page 3436)

FlashPicture Property

Description

Defines or returns the Flash Picture for the Status Display object.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

The "FlashPicReferenced" property defines in this case whether the flash picture will be saved with the Status Display object or referenced.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the picture "Testpicture.BMP" will be used as the flash picture:

```
Sub StatusDisplayConfiguration()
'VBA504
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
'
'To use this example copy a Bitmap-Graphic
'to the "GraCS"-Folder of the actual project.
'Replace the picturename "Testpicture.BMP" with the name of
'the picture you copied
.FlashPicture = "Testpicture.BMP"
End With
End Sub
```

See also

FlashPicReferenced Property (Page 3599)

StatusDisplay Object (Page 3436)

FlashPicture property

Description

Specifies which flashing picture is to be displayed for the currently selected status. Pictures with the following formats can be inserted: EMF, WMF, BMP, GIF, JPG.

The flash picture should have the same picture size as the basic picture, otherwise its display is distorted.

FlashPictureState property

Description

Only used internally.

See also

AdvancedStateDisplay object (Page 3278)

FlashPicUseTransColor Property

Description

TRUE, when the configured color ("FlashPicTransColor" property) of the bitmap objects assigned to the flash picture should be set to "transparent". BOOLEAN write-read access.

Example:

The "StatusDisplayConfiguration()" procedure accesses the properties of the Status Display. In this example the color "Yellow" will be set to "Transparent":

```
Sub StatusDisplayConfiguration()
'VBA505
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
.FlashPicTransColor = RGB(255, 255, 0)
.FlashPicUseTransColor = True
End With
End Sub
```

See also

FlashPicTransColor Property (Page 3600)

StatusDisplay Object (Page 3436)

FlashRate Property

Description

Defines or returns the flash frequency of the "GroupDisplay", "AdvancedAnalogDisplay" and "AdvancedStateDisplay" objects. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the flash frequency will be set to "Medium":

```
Sub GroupDisplayConfiguration()
'VBA506
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.FlashRate = 1
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

FlashRateBackColor Property

Description

Defines or returns the flash frequency for the object background. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the flash frequency for the background will be set to "Medium":

```
Sub ButtonConfiguration()
'VBA507
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FlashRateBackColor = 1
End With
End Sub
```

FlashRateBorderColor Property

Description

Defines or returns the flash frequency for the lines of the object. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the flash frequency for the border will be set to "Medium":

```
Sub ButtonConfiguration()
'VBA508
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FlashRateBorderColor = 1
End With
End Sub
```

FlashRateFlashPic Property

Description

Defines or returns the flash frequency for the status display. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the status display. In this example the flash frequency for the flash picture will be set to "Medium":

```
Sub StatusDisplayConfiguration()
'VBA509
Dim objStatusDisplay As HMIStatusDisplay
Set objStatusDisplay = ActiveDocument.HMIObjects.AddHMIObject("StatusDisplay1",
"HMIStatusDisplay")
With objStatusDisplay
.FlashRateFlashPic = 1
End With
End Sub
```

See also

StatusDisplay Object (Page 3436)

FlashRateForeColor Property

Description

Defines or returns the flash frequency for the object label. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.5 Hz)	0
Medium (approx. 2 Hz)	1
Fast (approx. 8 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Example

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the flash frequency for the label will be set to "Medium":

```
Sub ButtonConfiguration()
'VBA510
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FlashRateForeColor = 1
End With
End Sub
```

FlashState property

Description

Only used internally.

See also

AdvancedAnalogDisplay object (Page 3274)

Folder Property

Description

Returns a folder from the components library.

Example:

The "ShowFolderItems()" procedure accesses the symbol libraries. In this example all the folder names in the global symbol library and project symbol library will be output:

```
Sub ShowFolderItems()
'VBA511
Dim colFolderItems As HMIFolderItems
Dim objFolderItem As HMIFolderItem
Dim iAnswer As Integer
Dim iMaxFolder As Integer
Dim iMaxSymbolLib As Integer
Dim iSymbolLibIndex As Integer
Dim iSubFolderIndex As Integer
Dim strSubFolderName As String
Dim strFolderItemName As String
'To determine the number of symbollibraries:
iMaxSymbolLib = Application.SymbolLibraries.Count
iSymbolLibIndex = 1
For iSymbolLibIndex = 1 To iMaxSymbolLib
With Application.SymbolLibraries(iSymbolLibIndex)
Set colFolderItems = .FolderItems
'
'To determine the number of folders in actual symbollibrary:
iMaxFolder = .FolderItems.Count
MsgBox "Number of FolderItems in " & .Name & " : " & iMaxFolder
'
'Output of all subfoldernames from actual folder:
For Each objFolderItem In colFolderItems
  iSubFolderIndex = 1
  For iSubFolderIndex = 1 To iMaxFolder
    strFolderItemName = objFolderItem.DisplayName
    If 0 <> objFolderItem.Folder.Count Then
      strSubFolderName = objFolderItem.Folder(iSubFolderIndex).DisplayName
      iAnswer = MsgBox("SymbolLibrary: " & .Name & vbCrLf & "act. Folder: " &
strFolderItemName & vbCrLf & "act. Subfolder: " & strSubFolderName, vbOKCancel)
      '
      'If "Cancel" is clicked, continued with next FolderItem
      If vbCancel = iAnswer Then
        Exit For
      End If
    Else
      MsgBox "There are no subfolders in " & objFolderItem.DisplayName
      Exit For
    End If
  Next iSubFolderIndex
Next objFolderItem
End With
Next iSymbolLibIndex
End Sub
```

SymbolLibrary Object (Page 3440)

FolderItems Object (Listing) (Page 3343)

FolderItem Object (Page 3342)

Accessing the component library with VBA (Page 3040)

FolderItems Property

Description

Returns a listing containing all the folders in the symbol library.

Example:

The "ShowFolderItems()" procedure accesses the symbol libraries. In this example all the folder names in the global symbol library and project symbol library will be output:

```
Sub ShowFolderItems()
'VBA512
Dim colFolderItems As HMIFolderItems
Dim objFolderItem As HMIFolderItem
Dim iAnswer As Integer
Dim iMaxFolder As Integer
Dim iMaxSymbolLib As Integer
Dim iSymbolLibIndex As Integer
Dim iSubFolderIndex As Integer
Dim strSubFolderName As String
Dim strFolderItemName As String
'To determine the number of symbollibraries:
iMaxSymbolLib = Application.SymbolLibraries.Count
iSymbolLibIndex = 1
For iSymbolLibIndex = 1 To iMaxSymbolLib
With Application.SymbolLibraries(iSymbolLibIndex)
Set colFolderItems = .FolderItems
'
'To determine the number of folders in actual symbollibrary:
iMaxFolder = .FolderItems.Count
MsgBox "Number of FolderItems in " & .Name & " : " & iMaxFolder
'
'Output of all subfoldernames from actual folder:
For Each objFolderItem In colFolderItems
  iSubFolderIndex = 1
  For iSubFolderIndex = 1 To iMaxFolder
    strFolderItemName = objFolderItem.DisplayName
    If 0 <> objFolderItem.Folder.Count Then
      strSubFolderName = objFolderItem.Folder(iSubFolderIndex).DisplayName
      iAnswer = MsgBox("SymbolLibrary: " & .Name & vbCrLf & "act. Folder: " &
strFolderItemName & vbCrLf & "act. Subfolder: " & strSubFolderName, vbOKCancel)
```

```
      '
      'If "Cancel" is clicked, continued with next FolderItem
      If vbCancel = iAnswer Then
      Exit For
End If
Else
      MsgBox "There are no subfolders in " & objFolderItem.DisplayName
      Exit For
End If
  Next iSubFolderIndex
Next objFolderItem
End With
Next iSymbolLibIndex
End Sub
```

FontBold Property

Description

TRUE, when the text in the object should be assigned the "bold" attribute. BOOLEAN write-read access.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font attribute will be set to "Bold":

```
Sub ButtonConfiguration()
'VBA513
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FontBold = True
End With
End Sub
```

FontItalic Property

Description

TRUE, when the text in the object should be assigned the "italic" attribute. BOOLEAN write-read access.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font attribute will be set to "Italic":

```
Sub ButtonConfiguration()
'VBA514
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FontItalic = True
End With
End Sub
```

FontName Property

Description

Defines or returns the font name of the text in the object.

All the fonts installed in Windows are available for selection.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font is set to Arial:

```
Sub ButtonConfiguration()
'VBA515
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FontName = "Arial"
End With
End Sub

FontSize Property

Description

Defines or returns the font size of the text in the object in points.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font size will be set to 10 points:

```
Sub ButtonConfiguration()
'VBA516
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FONTSIZE = 10
End With
End Sub
```

FontUnderline Property

Description

TRUE, when the text in the object should be assigned the "underline" attribute. BOOLEAN write-read access.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font attribute will be set to "Underline":

```
Sub ButtonConfiguration()
'VBA517
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.FontUnderline = True
End With
```

```
End Sub
```

ForeColor Property

Description

Defines or returns the color of the font for the text in the object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font color will be set to "Red":

```
Sub ButtonConfiguration()
'VBA518
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.ForeColor = RGB(255, 0, 0)
End With
End Sub
```

ForeColor_Alarm.._Warning property

Description

Defines the color used for the foreground of one of the following states or message types:

- Alarm
- Warning
- Tolerance
- AS Process Control Error
- AS Control System Fault
- Operator request
- OK
- Simulation

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

ForeFlashColorOff Property

Description

Defines or returns the color of the text for flash status "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font color when the flash status is "Off" will be set to "Red":

```
Sub ButtonConfiguration()
'VBA519
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.ForeFlashColorOff = RGB(255, 0, 0)
End With
End Sub
```

ForeFlashColorOn Property

Description

Defines or returns the color of the text for flash status "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the font color when the flash status is "On" will be set to "White":

```
Sub ButtonConfiguration()
'VBA520
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.ForeFlashColorOn = RGB(255, 255, 255)
End With
End Sub
```

Format property

Description

Specifies the format in which the value is displayed in the advanced analog display.

No Character	Displays the number without formatting.
(0)	Displays a digit or a zero.
(#)	Displays a digit or no output.
(.)	Placeholder for decimal character.
(%)	Placeholder for percentage.
(,)	Thousand separator.
((E- E+ e- e+)	Scientific format.
- + $ ( )	Display of a literal character.
(\ )	Display the next character in the format character sequence.
("ABC")	Displays the string in inverted commas (" ").

G-H

GlobalColorScheme property

Description

Defines whether the colors defined for the current design in the global color scheme will be used for this object.

yes	Uses the colors from the global color scheme defined for this type of object.
No	Uses the colors from the color scheme defined for this type of object under "Colors".

Example

--

GlobalShadow property

Description

Defines whether the object will be displayed with the shadowing defined in the active design.

yes	Uses the global shadowing defined for this object type.
No	No shadowing.

Example

--

GNQBackColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Went Out Unacknowledged" which color the background of the value to be displayed assumes for flashing status "Off" (GNQBackColorOff) or "On" (GNQBackColorOn).

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

GNQBackFlash property

Description

Specifies for the selected message type and status "Went Out Unacknowledged" whether the background of the value to be displayed flashes when a message goes out unacknowledged.

GNQTextColorOff..ColorOn property

Description

Specifies for the selected message type and the state "Went Out Unacknowledged" which color the text of the value to be displayed assumes for flashing status "Off" (GNQTextColorOff) or "On" (GNQTextColorOn).

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

GNQTextFlash property

Description

Specifies for the selected message type and status "Went Out Unacknowledged" whether the text of the value to be displayed flashes when a message goes out unacknowledged.

Grid Property

Description

TRUE if the grid is enabled for the active picture. BOOLEAN write-read access.

The grid is only visible during the configuration phase.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the grid for the active picture will be enabled:

```
Sub ActiveDocumentConfiguration()
'VBA521
Application.ActiveDocument.Grid = True
End Sub
```

Document Object (Page 3319)

Application Object (Page 3282)

GridColor Property

Description

Defines or returns the color of the grid during the configuration phase. The Grid property must be set to TRUE for the grid to be displayed. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the grid color for the active picture will be set to "Blue":

```
Sub ActiveDocumentConfiguration()
'VBA522
Application.ActiveDocument.Grid = True
Application.ActiveDocument.GridColor = RGB(0, 0, 255)
End Sub
```

Application Object (Page 3282)

GridHeight Property

Description

Defines or returns the height (in pixels) of the grid in the current picture during the configuration phase. The Grid property must be set to TRUE for the grid to be displayed.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the grid height for the active picture will be set to "8":

```
Sub ActiveDocumentConfiguration()
'VBA523
Application.ActiveDocument.Grid = True
Application.ActiveDocument.GridHeight = 8
End Sub
```

GridWidth Property

Description

Defines or returns the width (in pixels) of the grid in the current picture during the configuration phase. The Grid property must be set to TRUE for the grid to be displayed.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the grid width for the active picture will be set to "8":

```
Sub ActiveDocumentConfiguration()
'VBA524
Application.ActiveDocument.Grid = True
```

```
Application.ActiveDocument.GridWidth = 8
End Sub
```

Application Property (Page 3484)

Document Object (Page 3319)

Application Object (Page 3282)

GroupParent Property

Description

Returns the higher-ranking object in the specified group object. Read-only access.

Example:

--

See also

Group Object (Page 3348)

ActiveDocument Property (Page 3472)

GroupedObjects Object (Listing) (Page 3353)

Document Object (Page 3319)

Application Object (Page 3282)

GroupedHMIObjects Property

Description

Returns a listing containing all the objects in the current group.

Example:

In this example the group object "Group1" is created from a number of objects. An ellipse segment is then added to the group object:

```
Sub CreateGroup()
'VBA526
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objEllipseSegment As HMIEllipseSegment
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
Set objGroup = ActiveDocument.Selection.CreateGroup
objGroup.ObjectName = "Group1"
Set objEllipseSegment = ActiveDocument.HMIObjects.AddHMIObject("EllipseSegment",
"HMIEllipseSegment")
'
'Add one object to the existing group
objGroup.GroupedHMIObjects.Add ("EllipseSegment")
End Sub
```

See also

Group Object (Page 3348)

Height Property

Description

Defines or returns the height of the object (Document, View, Object) in pixels.

Note concerning the Document and View objects:

The default value corresponds to the vertical screen resolution set by the operating system. The specified value can be higher than the current screen resolution. The picture can then be moved with the aid of scroll bars.

The maximum picture height that can be set is 10000 pixels.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the height of the current picture will be set to "1600":

```
Sub ActiveDocumentConfiguration()
'VBA527
Application.ActiveDocument.Height = 1600
End Sub
```

See also

View Object (Page 3466)

HMIObject Object (Page 3357)

Document Object (Page 3319)

Hide Property

Description

TRUE if the specified picture is opened as "Visible". BOOLEAN write-read access.

Use the Hide property in order to test, for example, whether a picture is to be visible or invisible when opened. Other WinCC editors (such as CrossReference) open pictures so that they are invisible, i.e. they are not displayed in the Graphics Designer. If you use the DocumentOpened event, for example, you can use the Hide property to prevent the code in the event from being executed by testing that the Hide property is FALSE.

Use the Add and Open methods to define whether a picture is to be visible or invisible when opened.

Note

If you set a picture to "Invisible" (Hide = FALSE), you can then only address it via the Documents listing. The picture is no longer available in the Graphics Designer.

Example:

In the following example, when a picture opens an output indicates whether the picture was opened as visible or invisible:

```
Private Sub Document_Opened(CancelForwarding As Boolean)
'VBA802
MsgBox Me.Hide
End Sub
```

See also

Open Method (Page 3242)

Add Method (Documents Listing) (Page 3169)

Document Object (Page 3319)

HiddenInput Property

Description

TRUE, when the input value should not be displayed when being entered. Each character entered is substituted by a *. BOOLEAN write-read access.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the input will be hidden:

```
Sub IOFieldConfiguration()
'VBA528
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.HiddenInput = True
End With
End Sub
```

See also

IOField Object (Page 3361)

HMIObjects Property

Description

Returns a listing containing all the objects in the specified picture.

To return an element from the HMIObjects listing you can use either the index number or the object name.

Example:

Use the "AddHMIObject(ObjectName, ProgID)" method to insert a new object in a picture: :

```
Sub AddCircle()
```

```
'VBA529
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("my Circle", "HMICircle")
End Sub
```

See also

Document Object (Page 3319)

HMIUdoObjects property

Description

Supplies a collection of HMIObject objects that represent the inner objects of the "CustomizedObjects" object.

See also

CustomizedObject Object (Page 3310)

Hotkey Property

Description

Defines or returns the function key for a mouse action in the case of the Button object.

Function key	Assigned Value
F1	112
F2	113
F3	114
F4	115
F5	116
F6	117
F7	118
F8	119
F9	120
F10	121
F11	122
F12	123

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example it is intended that the button can also be launched with function key "F5":

```
Sub ButtonConfiguration()
'VBA530
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.Hotkey = 116
End With
End Sub
```

See also

Button Object (Page 3293)

Hysteresis Property

Description

TRUE if the display must include hysteresis (deadband) in the case of the BarGraph object. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example the display shall take place with hysteresis:

```
Sub BarGraphConfiguration()
'VBA531
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Hysteresis = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

HysteresisRange Property

Description

Defines or returns the hysteresis (deadband) as a percentage of the display value.

The Hysteresis property must be set to TRUE for the hysteresis to be calculated.

Example:

The "BarGraphConfiguration()" procedure configures In this example the hysteresis will be set to "4%":

```
Sub BarGraphConfiguration()
'VBA532
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Hysteresis = True
.HysteresisRange = 4
End With
End Sub
```

See also

BarGraph Object (Page 3286)

Hysteresis Property (Page 3628)

I - K

Icon Property

Description

Defines the icon (*.ICO, full path and file name) or returns the path and file name for a button on a user-defined toolbar.

Path specifications

The following path specification formats are possible:

- Absolute: z.B. "C:\Siemens\WinCC\Icons\myIcon.ICO.
- Relative: The starting folder for relative path specification is the "GraCS" folder of the current project.
- <global>: Refers to the installation path for WinCC. The path specification "<global>\Icons \myIcon" is the same as the path specification under "Absolute".
- <project>: Refers to the current project directory (see example).

Example:

The "CreateToolbar()" procedure creates a user-defined toolbar with two icons:

```
Sub CreateToolbar()
'VBA533
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Dim strFileWithPath
Set objToolbar = ActiveDocument.CustomToolbars.Add("Tool1_1")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "ti1_1",
"myFirstToolbaritem")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(2, "ti1_2",
"mySecondToolbaritem")
'
'To use this example copy a *.ICO-Graphic
'to the "GraCS"-Folder of the actual project.
'Replace the filename "EZSTART.ICO" in the next commandline
'with the name of the ICO-Graphic you copied
strFileWithPath = Application.ApplicationDataPath & "EZSTART.ICO"
'
'To assign the symbol-icon to the first toolbaritem
objToolbar.ToolbarItems(1).Icon = strFileWithPath
End Sub
```

How to Create an Application-specific Toolbar (Page 3029)

IndependentWindow property

Description

Defines whether the display of the picture window in Runtime depends on the process picture in which the picture window was configured.

yes	Size and position of the picture window are independent of the process picture and only defined by the "Window mode" attribute
No	Size and position of the picture window change with the shift or scaling of the process picture

Index Property

Description

Status display

Defines the status (0 bis 255) or returns it. A basic picture and flash picture can be defined for each status value.

Line Object

Defines the start and end point for a line, and so also defines the direction. Use the ActualPointLeft and ActualPointTop properties to define the coordinates for each starting and finishing point.

Polygon object, PolyLine object and TubePolyline object

Defines or returns the number of the corner point whose position coordinates you want to change or display.

CheckBox and OptionGroup objects

Defines or returns the number (1 to 32) of the field whose text is to be defined.

ComboBox and ListBox object

Defines or returns the number (1 to 32) of the line whose text is to be defined.

Example 1: Line

In the following example a line will be inserted into the active picture and the starting and finishing points will be defined:

```
Sub LineAdd()
'VBA682
Dim objLine As HMILine
Dim objEvent As HMIEvent
Set objLine = ActiveDocument.HMIObjects.AddHMIObject("myLine", "HMILine")
With objLine
.BorderColor = RGB(255, 0, 0)
.index = hmiLineIndexTypeStartPoint
.ActualPointLeft = 12
.ActualPointTop = 34
.index = hmiLineIndexTypeEndPoint
.ActualPointLeft = 74
.ActualPointTop = 64
End With
End Sub
```

Example 2: Polyline

For this example to work, insert a polyline called "Polyline1" into the active picture: The "PolyLineCoordsOutput" procedure then outputs the coordinates of all the corner points in the polyline:

```
Sub PolyLineCoordsOutput()
'VBA534
Dim iPcIndex As Integer
Dim iPosX As Integer
Dim iPosY As Integer
Dim iIndex As Integer
Dim objPolyLine As HMIPolyLine
Set objPolyLine = Application.ActiveDocument.HMIObjects.AddHMIObject("PolyLine1",
"HMIPolyLine")
'
'Determine number of corners from "PolyLine1":
iPcIndex = objPolyLine.PointCount
'
'Output of x/y-coordinates from every corner:
For iIndex = 1 To iPcIndex
With objPolyLine
.index = iIndex
iPosX = .ActualPointLeft
iPosY = .ActualPointTop
MsgBox iIndex & ". corner:" & vbCrLf & "x-coordinate: " & iPosX & vbCrLf & "y-coordinate:
" & iPosY
End With
Next iIndex
End Sub
```

Example 3: Check box

The "CreateOptionGroup()" procedure creates the OptionGroup object with four option buttons. Each option button is assigned the default name "myCustomText<Nummer>":

```
Sub CreateOptionGroup()
'VBA535
Dim objRadioBox As HMIOptionGroup
Dim iIndex As Integer
Set objRadioBox = ActiveDocument.HMIObjects.AddHMIObject("RadioBox_1", "HMIOptionGroup")
With objRadioBox
.Height = 100
.Width = 180
.BoxCount = 4
For iIndex = 1 To .BoxCount
.index = iIndex
.Text = "myCustomText" & .index
Next iIndex
End With
End Sub
```

InheritState property

Description

Defines whether the "Display" and "Operator Control Enable" properties of the user object can be inherited by the individual objects of the user object.

InputValue property

Description

Defines the value to be entered by the user in the I/O field. The value is not displayed in the I/O field when the property is set.

If you want the value to be displayed in the I/O field after confirmation with the <Return> key, configure a direct connection between the properties "input value" and "output value". The direct connection is only practical when no tag is connected to the output value, but the user can nevertheless query the specified value, for example, through a script.

Example:

IsActive Property

Description

Returns TRUE if a copy of the current picture is active. BOOLEAN read access.

Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example a copy of the current picture will be created and an output will indicate whether the copy is active.

```
Sub ActiveDocumentConfiguration()
'VBA537
Application.ActiveDocument.Views.Add
'If you comment out the following line
'and recall the procedure, the output of
'the messagebox is different
Application.ActiveDocument.Views(1).Activate
'
'Output state of copy:
MsgBox Application.ActiveDocument.Views(1).IsActive
End Sub
```

See also

ActiveDocument Property (Page 3472)

View Object (Page 3466)

IsConnectedToProject Property

Description

Returns TRUE if the project connection is available. BOOLEAN read access.

Example:

The "ConnectCheck()" procedure checks whether a project connection exists and outputs the result:

```
Sub ConnectCheck()
'VBA538
Dim bCheck As Boolean
Dim strStatus As String
bCheck = Application.IsConnectedToProject
If bCheck = True Then
strStatus = "yes"
Else
strStatus = "no"
End If
MsgBox "Connection to project available: " & strStatus
End Sub
```

See also

Application Object (Page 3282)

IsDynamicable Property

Description

TRUE if a property can be made dynamic. BOOLEAN read access.

Example:

The HMIObjectPropertyChanged event always occurs when you change an object property in the Graphics Designer. In this example the property name and value will be output. A check will also be made on whether the property can be made dynamic:

```
Sub Document_HMIObjectPropertyChanged(ByVal Property As IHMIProperty, CancelForwarding As
Boolean)
'VBA539
Dim objProp As HMIProperty
Dim strStatus As String
Set objProp = Property
'
'Checks whether property is dynamicable
If objProp.IsDynamicable = True Then
 strStatus = "yes"
Else
 strStatus = "no"
End If
MsgBox "Property: " & objProp.Name & vbCrLf & "Value: " & objProp.value & vbCrLf &
"Dynamicable: " & strStatus
End Sub
```

Further information on the "Events" topic can be found under the heading "Executing VBA macros in Graphics Designer".

FaceplateProperty object (Page 3341)

Property Object (Page 3409)

Italic Property

Description

TRUE if the font attribute "Italic" is set for the language-dependent text in the object. BOOLEAN write-read access.

Example:

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA540
Dim objLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "Hello"
Set objLangFonts = objButton.LDFonts
'
'To make fontsettings for french:
With objLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'
'To make fontsettings for english:
With objLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

LanguageFont Object (Page 3365)

Item Property

Description

Returns an element from a listing. Depending on the specified object, you can use either the index number or the name to return a particular element.

Example:

This example shows both kinds of indexing. In order for the example to work, create a group object ("Group1") with two objects. The example outputs the height of the second object in a group:

```
Sub GetHeight()
'VBA541
Dim objGroup As HMIGroup
'Next line uses the property "Item" to get a group by name
Set objGroup = ActiveDocument.HMIObjects.Item("Group1")
'Otherwise next line uses index to identify a groupobject
MsgBox "The height of object 2 is: " & objGroup.GroupedHMIObjects.Item(2).Height
End Sub
```

AnalogResultInfos Object (Listing) (Page 3281)

ItemBorderBackColor Property

Description

Defines or returns the background color of the separation lines in the selection list for the TextList object. LONG write-read access.

The background color is only visible with the property setting ItemBorderStyle > 0.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the background color for the separation lines will be set to "Red":

```
Sub TextListConfiguration()
'VBA542
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.ItemBorderStyle = 1
.ItemBorderBackColor = RGB(255, 0, 0)
End With
End Sub
```

See also

ItemBorderStyle Property (Page 3641)

TextList Object (Page 3441)

ItemBorderColor Property

Description

Defines or returns the color of the separation lines in the selection list for the TextList object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the color for the separation lines will be set to "White":

```
Sub TextListConfiguration()
'VBA543
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.ItemBorderStyle = 1
.ItemBorderColor = RGB(255, 255, 255)
End With
End Sub
```

See also

TextList Object (Page 3441)

ItemBorderStyle Property

Description

Defines or returns the dividing line style in the selection list for the TextList object. Value range from 0 to 4.

Line style	Assigned Value
———	0
— —	1
------	2
— · —	3
—·· —	4

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the dividing line style will be set to "1":

```
Sub TextListConfiguration()
'VBA544
Dim objTextList As HMITextList
```

```
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.ItemBorderStyle = 1
.ItemBorderBackColor = RGB(255, 0, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

ItemBorderWidth Property

Description

Defines or returns the weight in pixels of the dividing lines in the selection list for the TextList object.

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the dividing line width will be set to "4":

```
'Sub E_628_TextListConfiguration()

Sub E_629_TextListConfiguration()

'VBA545

Dim objTextList As HMITextList

Set objTextList =
ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")

With objTextList

.ItemBorderWidth = 4

End With

End Sub
```

See also

TextList Object (Page 3441)

Key Property

Description

Returns the name that identifies the entry (menu point or icon) in the user-defined menu or user-defined toolbar. Read only access.

Use the Key property to determine which entry was clicked. For this purpose you can use, say, the events "MenuItemClicked" and "ToolBarItemClicked".

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"):

```
Sub CreateMenuItem()
'VBA546
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
'
'Add new menu "Delete objects" to menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Adds two menuitems to menu "Delete objects"
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
Rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete Circles")
End Sub
```

In connection with the "MenuItemClicked" event, you can connect the menu entries with procedure calls, for instance. In this example the names of the menu entries will be output:

```
Sub Document_MenuItemClicked(ByVal MenuItem As IHMIMenuItem)
'VBA547
Dim strClicked As String
Dim objMenuItem As HMIMenuItem
Set objMenuItem = MenuItem
'
'"strClicked can get two values:
'(1) "DeleteAllRectangles" and
'(2) "DeleteAllCircles"
strClicked = objMenuItem.Key
'
'To analyse "strClicked" with "Select Case"
Select Case strClicked
Case "DeleteAllRectangles"
'
'Instead of "MsgBox" a procedurecall (e.g. "Call <Prozedurname>") can stay here
MsgBox "'Delete rectangle' was clicked"
Case "DeleteAllCircles"
MsgBox "'Delete Circles' was clicked"
```

```
End Select
End Sub
```

L

Label Property

Description

Returns the label of the user-defined menu or menu entry in the currently set language. Read only access.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"): In this example the labels will then be output:

```
Sub CreateMenuItem()
'VBA548
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim iIndex As Integer
iIndex = 1
'
'Add new menu "Delete objects" to menubar
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Adds two menuitems to menu "Delete objects"
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete circles")
MsgBox ActiveDocument.CustomMenus(1).Label
For iIndex = 1 To objMenu.MenuItems.Count
MsgBox objMenu.MenuItems(iIndex).Label
```

```
Next iIndex
End Sub
```

See also

CustomMenus Property (Page 3566)

Menu Object (Page 3378)

LanguageID Property

Description

Returns the language identifier of the project language as a decimal value. LONG read access

Example:

The "DataLanguages()" procedure outputs the project languages together with their language identifiers:

```
Sub DataLanguages()
'VBA549
Dim colDataLang As HMIDataLanguages
Dim objDataLang As HMIDataLanguage
Dim nLangID As Long
Dim strLangName As String
Dim iAnswer As Integer
Set colDataLang = Application.AvailableDataLanguages
For Each objDataLang In colDataLang
nLangID = objDataLang.LanguageID
strLangName = objDataLang.LanguageName
iAnswer = MsgBox(nLangID & " " & strLangName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objDataLang
End Sub
```

See also

DataLanguages Object (Listing) (Page 3314)

DataLanguage Object (Page 3313)

LanguageName Property

Description

Returns the project language. STRING read access.

Example:

The "DataLanguages()" procedure outputs the project languages together with their language identifiers:

```
Sub DataLanguages()
'VBA550
Dim colDataLang As HMIDataLanguages
Dim objDataLang As HMIDataLanguage
Dim nLangID As Long
Dim strLangName As String
Dim iAnswer As Integer
Set colDataLang = Application.AvailableDataLanguages
For Each objDataLang In colDataLang
nLangID = objDataLang.LanguageID
strLangName = objDataLang.LanguageName
iAnswer = MsgBox(nLangID & " " & strLangName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objDataLang
End Sub
```

See also

DataLanguages Object (Listing) (Page 3314)

DataLanguage Object (Page 3313)

LanguageSwitch Property

Description

Defines where the language-dependent assignment texts are stored or returns the value. BOOLEAN write-read access.

TRUE, when the texts in the Text Library are managed. Translation to other language occurs in the Text Library.

FALSE, when the texts are managed directly in the object. Translation to other language can be carried out using Text Distributor.

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the texts will be managed in the Text Library:

```
Sub TextListConfiguration()
'VBA551
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.LanguageSwitch = True
End With
End Sub
```

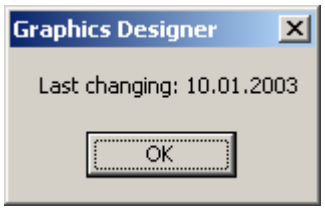
See also

TextList Object (Page 3441)

LastChange Property

Description

Returns the date on which the current picture was last changed. READ access.



Example:

The "ActiveDocumentConfiguration()" procedure accesses the properties of the current picture in the Graphics Designer. In this example the date of the last change to the current picture will be output:

```
Sub ActiveDocumentConfiguration()
'VBA552
Dim varLastDocChange As Variant
varLastDocChange = Application.ActiveDocument.LastChange
MsgBox "Last changing: " & varLastDocChange
End Sub
```

See also

Document Object (Page 3319)

Layer Property

Description

Defines which layer of the picture an object is located in, or returns that information. There is a total of 32 layers available, whereby Layer "0" is the bottom layer and Layer "31" the top layer.

The configured objects are initially in the background of a layer.

Note

In VBA the numbering starts at "1". An entry of "objRectangle.Layer = 1" is therefore located in the lowest layer.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the Rectangle object will be inserted in layer "4":

```
Sub RectangleConfiguration()
'VBA553
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
With objRectangle
.Layer = 4
End With
End Sub
```

See also

HMIObject Object (Page 3357)

Editing Layers with VBA (Page 3050)

Layer00..10Checked property

Description

TRUE if the respective limit "0" to "10" is monitored in the case of the "3DBarGraph" object. BOOLEAN write-read access.

The limit and the color representation are specified with the properties "Layer00..10Value" and "Layer00..10Color".

The bar fill color and the fill pattern are specified with the properties "Layer00..10FillColor" and "Layer00..10FillStyle".

Example

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example, limit "0" is to be monitored:

```
Sub HMI3DBarGraphConfiguration()
'VBA554
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.Layer00Checked = True
End With
End Sub
```

See also

Layer00..10Value property (Page 3650)

Layer00..10Color property (Page 3649)

3DBarGraph Object (Page 3267)

Layer00..10Color property

Description

Defines or returns the color for the respective limit "0" to "10" of the "3DBarGraph" object. LONG write-read access.

When monitoring of the limit value is activated using the "Layer00..10Checked" property, the bar turns to the color defined by this attribute on reaching the limit value.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

Example

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the color for limit "0" is defined as "Magenta":

```
Sub HMI3DBarGraphConfiguration()
'VBA555
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
```

```
.Layer00Checked = True
.Layer00Color = RGB(255, 0, 255)
End With
End Sub
```

See also

Layer00..10Checked property (Page 3646)

3DBarGraph Object (Page 3267)

Layer00..10FillColor property

Description

Defines or returns the bar fill color for the respective limit "0" to "10" of the "3DBarGraph" object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0).

Layer00..10FillStyle property

Description

Defines or returns the bar fill pattern for the respective limit "0" to "10" of the "3DBarGraph" object.

The bar fill color has to differ from the bar color to make the fill pattern visible.
There is a choice of 50 fill patterns. The "0" fill pattern fills the object with the set background color. The "1" fill pattern means neither a background nor a fill pattern is displayed.

Layer00..10Value property

Description

Defines or returns the value for "Limit 0" to "Limit 10" in the case of the "3DBarGraph" object.

Monitoring only takes effect when the "Layer00..10Checked" property value is set to "TRUE".

Example

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the value for limit "0" is defined as "0":

```
Sub HMI3DBarGraphConfiguration()
'VBA556
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.Layer00Checked = True
.Layer00Value = 0
End With
End Sub
```

See also

Layer00..10Checked property (Page 3646)

3DBarGraph Object (Page 3267)

LayerDecluttering Property

Description

TRUE if showing and hiding objects dependent upon the minimum and maximum zoom set for a layer has been enabled. BOOLEAN write-read access.

Example:

In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer()
'VBA587
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
'define fade-in and fade-out of objects:
With ActiveDocument
.LayerDecluttering = True
.ObjectSizeDecluttering = True
.SetDeclutterObjectSize 50, 100
End With
End Sub
```

See also

Document Object (Page 3319)

Editing Layers with VBA (Page 3050)

Layers Property

Description

Returns a listing containing the properties of the layers in the current picture.

Note

If the "Layers" property is used, the sequence of HMI objects in the HMIObjects listing can change.

Example:

The "LayerInfo()" procedure outputs the name and zoom configuration for each layer of the current picture:

```
Sub LayerInfo()
'VBA588
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim iAnswer As Integer
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
With objLayer
iAnswer = MsgBox("Layername: " & .Name & vbCrLf & "max. zoom:  " & .MaxZoom & vbCrLf & "min.
zoom:  " & .MinZoom, vbOKCancel)
End With
If vbCancel = iAnswer Then Exit For
Next objLayer
End Sub
```

LDAssignments property

Description

Returns a listing with the (foreign language) assignments of display texts that are displayed depending on the current "Output Value" in the "TextList" object.

The assignments depend on the set list type. Specify the list type with the "ListType" property.

LDFonts Property

Description

Returns a listing containing the language identifiers for the configured fonts.

Example:

Use the LDFonts property to return the LanguageFonts listing. In the following example the language identifiers of the configured fonts will be output:

```
Sub ShowLanguageFont()
'VBA589
Dim colLanguageFonts As HMILanguageFonts
Dim objLanguageFont As HMILanguageFont
Dim objButton As HMIButton
Dim iMax As Integer
Dim iAnswer As Integer
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
Set colLanguageFonts = objButton.LDFonts
iMax = colLanguageFonts.Count
For Each objLanguageFont In colLanguageFonts
iAnswer = MsgBox("Projected fonts: " & iMax & vbCrLf & "Language-ID: " &
objLanguageFont.LanguageID, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objLanguageFont
End Sub
```

LDLabelTexts Property

Description

Returns a listing containing the multilingual labels of the user-defined menu or menu entry.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"): In this example, multilingual menu labels will be created:

```
Sub CreateMenuItem()
'VBA590
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objLangText As HMILanguageText
'
'Add new menu "Delete objects" to menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to the new menu
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete circles")
'
'Define foreign-language labels for menu "Delete objects":
Set objLangText = objMenu.LDLabelTexts.Add(1033, "English_Delete objects")
Set objLangText = objMenu.LDLabelTexts.Add(1032, "Greek_Delete objects")
Set objLangText = objMenu.LDLabelTexts.Add(1034, "Spanish_Delete objects")
Set objLangText = objMenu.LDLabelTexts.Add(1036, "French_Delete objects")
End Sub
```

The "LDLabelInfo()" procedure outputs the labels configured for the "Delete Objects" menu:

```
Sub LDLabelInfo()
'VBA591
Dim colLangTexts As HMILanguageTexts
```

```
Dim objLangText As HMILanguageText
Dim iAnswer As Integer
'
'Save all labels of menu into collection "colLangTexts":
Set colLangTexts = ActiveDocument.CustomMenus("DeleteObjects").LDLabelTexts
For Each objLangText In colLangTexts
iAnswer = MsgBox(objLangText.DisplayName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objLangText
End Sub
```

LDNames Property

Description

Returns a listing containing the multilingual names of a folder in the Components Library or of a layer.

Example:

Use the LDNames property to return the LanguageTexts listing. In the following example all multilingual layer names will be output:

Explanation: What the example shows

```
Sub LDLabelInfo()
'VBA592
Dim colLayerLngTexts As HMILanguageTexts
Dim objLayerLngText As HMILanguageText
Dim iIndex As Integer
Dim iAnswer As Integer
Dim strResult As String
iIndex = 1
For iIndex = 1 To ActiveDocument.Layers.Count
'
'Save all labels of layers into collection of "colLayerLngTexts":
Set colLayerLngTexts = ActiveDocument.Layers(iIndex).LDNames
For Each objLayerLngText In colLayerLngTexts
strResult = strResult & vbCrLf & objLayerLngText.LanguageID & " - " &
objLayerLngText.DisplayName
Next objLayerLngText
iAnswer = MsgBox(strResult, vbOKCancel)
strResult = ""
If vbCancel = iAnswer Then Exit For
```

```
Next iIndex
End Sub
```

Layer Object (Page 3370)

LanguageTexts Object (Listing) (Page 3369)

FolderItem Object (Page 3342)

LDStatusTexts Property

Description

Returns a listing containing the multilingual status line texts of a user-defined icon or menu entry.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"). In this example, multilingual status line texts will be created:

```
Sub CreateMenuItem()
'VBA593
Dim objMenu As HMIMenu
Dim objMenuItem1 As HMIMenuItem
Dim objMenuItem2 As HMIMenuItem
Dim objLangStateText As HMILanguageText
'
'Add new menu "Delete objects" to menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to the new menu
Set objMenuItem1 = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem2 = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete
circles")
'
'Define foreign-language labels for menuitem "Delete rectangles":
Set objLangStateText = objMenuItem1.LDStatusTexts.Add(1033, "English_Delete rectangles")
Set objLangStateText = objMenuItem1.LDStatusTexts.Add(1032, "Greek_Delete rectangles")
Set objLangStateText = objMenuItem1.LDStatusTexts.Add(1034, "Spanish_Delete rectangles")
Set objLangStateText = objMenuItem1.LDStatusTexts.Add(1036, "French_Delete rectangles")
End Sub
```

The "LDStatusTextInfo()" procedure outputs the status line texts configured for the "Delete Objects" menu:

```
Sub LDStatusTextInfo()
'VBA594
Dim colMenuItems As HMIMenuItems
Dim objMenuItem As HMIMenuItem
Dim colStatusLngTexts As HMILanguageTexts
Dim objStatusLngText As HMILanguageText
Dim strResult As String
Dim iAnswer As Integer
Set colMenuItems = ActiveDocument.CustomMenus("DeleteObjects").MenuItems
For Each objMenuItem In colMenuItems
strResult = "Statustexts of menuitem """ & objMenuItem.Label & """"
Set colStatusLngTexts = objMenuItem.LDStatusTexts
For Each objStatusLngText In colStatusLngTexts
strResult = strResult & vbCrLf & objStatusLngText.DisplayName
Next objStatusLngText
iAnswer = MsgBox(strResult, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objMenuItem
End Sub
```

LDTexts Property

Description

Returns a listing containing the multilingual labels of an object.

Example:

The "LDTextInfo()" procedure outputs the labels configured for the Button object. For this example to work, create the object "myButton" in the Graphics Designer and configure a number of multilingual labels:

```
Sub LDTextInfo()
'VBA595
Dim colLDLngTexts As HMILanguageTexts
Dim objLDLngText As HMILanguageText
Dim objButton As HMIButton
Dim iAnswer As Integer
Set objButton = ActiveDocument.HMIObjects("myButton")
Set colLDLngTexts = objButton.LDTexts
For Each objLDLngText In colLDLngTexts
```

```
iAnswer = MsgBox(objLDLngText.DisplayName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objLDLngText
End Sub
```

LDTooltipTexts Property

Description

Returns a listing containing the multilingual Tooltip texts for a user-defined icon or for an object.

Example

The "CreateToolbar()" procedure creates a user-defined toolbar with two icons. Two multilingual Tooltip texts are assigned to the first icon:

```
Sub CreateToolbar()
'VBA596
Dim objToolbar As HMIToolbar
Dim objToolbarItem As HMIToolbarItem
Dim objLangText As HMILanguageText
Dim strFileWithPath
'
'Create toolbar with two toolbar-items:
Set objToolbar = ActiveDocument.CustomToolbars.Add("Tool1_1")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(1, "ti1_1",
"myFirstToolbaritem")
Set objToolbarItem = objToolbar.ToolbarItems.InsertToolbarItem(2, "ti1_2",
"mySecondToolbaritem")
'
'In order that the example runs correct copy a *.ICO-Graphic
'into the "GraCS"-Folder of the actual project.
'Replace the filename "EZSTART.ICO" in the next commandline
'with the name of the ICO-Graphic you copied
strFileWithPath = Application.ApplicationDataPath & "EZSTART.ICO"
'
'
'To assign the symbol-icon to the first toolbaritem
objToolbar.ToolbarItems(1).Icon = strFileWithPath
'
'Define foreign-language tooltiptexts
```

```
Set objLangText = objToolbar.ToolbarItems(1).LDTooltipTexts.Add(1036, "French_Tooltiptext")
Set objLangText = objToolbar.ToolbarItems(1).LDTooltipTexts.Add(1034,
"Spanish_Tooltiptext")
End Sub
```

The "LDTooltipInfo()" procedure outputs all the Tooltip texts configured for the first icon in the first user-defined toolbar:

```
Sub LDTooltipInfo()
'VBA597
Dim colLangTexts As HMILanguageTexts
Dim objLangText As HMILanguageText
Dim iAnswer As Integer
Set colLangTexts = ActiveDocument.CustomToolbars(1).ToolbarItems(1).LDTooltipTexts
For Each objLangText In colLangTexts
iAnswer = MsgBox(objLangText.DisplayName, vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next objLangText
End Sub
```

ToolbarItem Object (Page 3448)

HMIObject Object (Page 3357)

Left Property

Description

Defines or returns the X coordinate of the object (measured from the top left-hand edge of the picture) in pixels. The X-coordinate relates to the top left corner of the rectangle enclosing the object.

View Object

Defines or returns the X coordinate of the window (measured from the top left-hand edge of the Graphics Designer working area) in pixels.

Example:

The "RectangleConfiguration()" procedure accesses the properties of the rectangle. In this example the rectangle will be moved 40 pixels to the right:

```
Sub RectangleConfiguration()
'VBA598
Dim objRectangle As HMIRectangle
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("Rectangle1", "HMIRectangle")
```

```
With objRectangle
.Left = 40
End With
End Sub
```

See also

View Object (Page 3466)

HMIObject Object (Page 3357)

LeftComma Property

Description

Defines or returns the number of digits to the left of the decimal point (0 to 20) for the BarGraph object.

Example:

The "BarGraphConfiguration()" procedure configures In this example the number of digits to the left of the decimal point will be set to "4".

```
Sub BarGraphConfiguration()
'VBA599
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.LeftComma = 4
End With
End Sub
```

See also

BarGraph Object (Page 3286)

LightEffect Property

Description

TRUE if the light effect of the 3DBarGraph object is activated. BOOLEAN write-read access.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the light effect will be activated:

```
Sub HMI3DBarGraphConfiguration()
'VBA600
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
.LightEffect = True
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

LimitHigh4 Property

Description

Defines or returns the high limit value for "Reserve 4" in the case of the BarGraph object.

The CheckLimitHigh4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh4 property.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "70".

```
Sub BarGraphLimitConfiguration()
'VBA601
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh4 = False
'Activate monitoring
.CheckLimitHigh4 = True
'Set barcolor to "red"
.ColorLimitHigh4 = RGB(255, 0, 0)
'Set upper limit to "70"
.LimitHigh4 = 70
End With
```

```
End Sub
```

See also

LimitHigh5 Property

Description

Defines or returns the high limit value for "Reserve 5" in the case of the BarGraph object.

The CheckLimitHigh5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh5 property.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the high limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "80".

```
Sub BarGraphLimitConfiguration()
'VBA602
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitHigh5 = False
'Activate monitoring
.CheckLimitHigh5 = True
'Set barcolor to "black"
.ColorLimitHigh5 = RGB(0, 0, 0)
'Set upper limit to "80"
.LimitHigh4 = 80
End With
End Sub
```

BarGraph Object (Page 3286)

LimitLow4 Property

Description

Defines or returns the low limit value for "Reserve 4" in the case of the BarGraph object.

The CheckLimitLow4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow4 property.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "5".

```
Sub BarGraphLimitConfiguration()
'VBA603
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitLow4 = False
'Activate monitoring
.CheckLimitLow4 = True
'Set barcolor to "green"
.ColorLimitLow4 = RGB(0, 255, 0)
'Set lower limit to "5"
.LimitLow4 = 5
End With
End Sub
```

LimitLow5 Property

Description

Defines or returns the low limit value for "Reserve 5" in the case of the BarGraph object.

The CheckLimitLow5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.

The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow5 property.

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the low limit value for an alarm. In this example the type of evaluation will be set to "Absolute". The alarm will be triggered at a value of "0".

```
Sub BarGraphLimitConfiguration()
'VBA604
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis to absolute
.TypeLimitLow5 = False
'Activate monitoring
.CheckLimitLow5 = True
'Set barcolor to "white"
.ColorLimitLow5 = RGB(255, 255, 255)
'Set lower limit to "0"
.LimitLow5 = 0
End With
End Sub
```

See also

BarGraph Object (Page 3286)

TypeLimitLow5 Property (Page 3797)

CheckLimitLow5 Property (Page 3536)

LimitMax Property

Description

Defines or returns the high limit value as an absolute value dependent on the data format in the case of the IOField object.

If the value to be displayed exceeds the upper limit value, it is identified by a series of *** , indicating it cannot be displayed.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the high limit for a decimal value will be set to "100":

```
Sub IOFieldConfiguration()
'VBA605
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
```

```
.DataFormat = 1
.LimitMax = 100
End With
End Sub
```

See also

DataFormat Property (Page 3569)

IOField Object (Page 3361)

LimitMin Property

Description

Defines or returns the low limit value as an absolute value dependent on the data format in the case of the IOField object.

If the value to be displayed exceeds the upper limit value, it is identified by a series of *** , indicating it cannot be displayed.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example the high limit for a decimal value will be set to "0":

```
Sub IOFieldConfiguration()
'VBA606
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.DataFormat = 1
.LimitMin = 0
End With
End Sub
```

See also

DataFormat Property (Page 3569)

IOField Object (Page 3361)

LineJoinStyle property

Description

Defines the way that corners are displayed in a tube polygon.

Angle	The tubes are joined at corner points without rounding.
Round	The tubes are rounded at the outside corner points.

Example

ListType Property

Description

Defines or returns the list type in the case of the TextList object. Value range from 0 to 2.

List type	Assigned Value
Decimal	0
Binary	1
Bit	2

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the list type will be set to "Decimal":

```
Sub TextListConfiguration()
'VBA607
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.ListType = 0
End With
End Sub
```

See also

TextList Object (Page 3441)

LockBackColor Property

Description

Defines or returns the background color of the button for a locked measuring point in the case of the GroupDisplay object. LONG write-read access.

The LockStatus property must be set to TRUE for the background color to be displayed.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color for a locked measuring point will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA608
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.LockStatus = True
.LockBackColor = RGB(255, 0, 0)
End With
End Sub
```

See also

LockStatus Property (Page 3669)

GroupDisplay Object (Page 3350)

LockedByCreatorID Property

Description

TRUE, if a picture was created and/or referenced by SIMATIC Manager. BOOLEAN read access.

If a picture was created in SIMATIC Manager, you may process and subsequently save it in WinCC. You may, however, not delete this picture in WinCC. SIMATIC Manager administers a code for each picture, the so-called CreatorID, which cannot be changed in WinCC.

You may process the picture in WinCC, however, overwriting the picture with a WinCC picture (LockedByCreatorID = FALSE) will be prevented. This may be checked by examining the LockedByCreatorID property of an existing file prior to writing during the SaveAs method. If such a picture is saved into a new (not yet existing) or an existing WinCC picture using the SaveAs method, the CreatorID will not be passed on.

Example 1

Inn the following example, a picture created with SIMATIC Manager (LockedByCreatorID = TRUE) is opened, processed, and saved. The value of the LockedByCreatorID property is not changed.

```
Sub SaveDocAs_1()
'VBA810
'open an existing file, change it and save it
Dim docOld As Document
Const strFile As String = "Simatic_001.Pdl"
'
Set docOld = Application.Documents.Open(Application.ApplicationDataPath & strFile,
hmiOpenDocumentTypeInvisible)
docOld.Width = docOld.Width + 1
docOld.Save
'
MsgBox "LockedByCreatorID = " & docOld.LOckedByCreatorID, vbOKOnly, "Result"
'
docOld.Close
Set docOld = Nothing
'
End Sub
```

Example 2

In this example, a new picture is saved as a new file using the SaveAs method. To check if the picture is permitted to be saved, the LockedByCreatorID property is checked. In the new file the LockedByCreator property is reset.

```
Sub SaveDocAs_2()
'VBA811
'create a new file and overwrite it to an existing file,
'if it is not 'locked by CreatorID'
Dim docNew As Document
Dim docOld As Document
Const strFile As String = "Simatic_001.Pdl"
'
Set docNew = Application.Documents.Add(hmiOpenDocumentTypeInvisible)
Set docOld = Application.Documents.Open(Application.ApplicationDataPath & strFile,
hmiOpenDocumentTypeInvisible)
'
If docOld.LockedByCreatorID = False Then
docOld.Close
```

```
docNew.SaveAs(Application.ApplicationDataPath & strFile)
Else
MsgBox "File cannot be stored (LockedByCreatorID). ", vbOKOnly, "Result"
End If
'
docOld.Close
docNew.Close
Set docOld = Nothing
Set docNew = Nothing
'
End Sub
```

See also

SaveAs Method (Page 3254)

Document Object (Page 3319)

LockStatus Property

Description

TRUE if a locked measuring point is to be displayed with the Object GroupDisplay. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color for a locked measuring point will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA609
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.LockStatus = True
.LockBackColor = RGB(255, 0, 0)
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

LockText Property

Description

Defines the button labels for a locked measuring point in the case of the GroupDisplay object.

The LockStatus property must be set to TRUE for the label to be displayed.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the label for a locked measuring point will be set to "Locked":

```
Sub GroupDisplayConfiguration()
'VBA610
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.LockStatus = True
.LockText = "gesperrt"
End With
End Sub
```

See also

LockStatus Property (Page 3667)

GroupDisplay Object (Page 3350)

LockTextColor Property

Description

Defines or returns the color of the button label for a locked measuring point in the case of the GroupDisplay object. LONG write-read access.

The LockStatus property must be set to TRUE for the background color to be displayed.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the button label for a locked measuring point will be set to "Yellow":

```
Sub GroupDisplayConfiguration()
'VBA611
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.LockStatus = True
.LockTextColor = RGB(0, 255, 255)
End With
End Sub
```

See also

LockStatus Property (Page 3667)

GroupDisplay Object (Page 3350)

LongStrokesBold Property

Description

TRUE if the long strokes on the scale of the BarGraph object are to be displayed in bold. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example the long strokes will not be displayed in bold:

```
Sub BarGraphConfiguration()
'VBA612
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.LongStrokesBold = False
End With
End Sub
```

See also

BarGraph Object (Page 3286)

LongStrokesOnly Property

Description

TRUE if just the long strokes on the scale of the BarGraph object are to be displayed.
BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example, only the long strokes will be displayed:

```
Sub BarGraphConfiguration()
'VBA613
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.LongStrokesOnly = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

LongStrokesSize Property

Description

The "BarGraphConfiguration()" procedure configures

Example:

In this example the length of the axis section strokes will be set to "10".

```
Sub BarGraphConfiguration()
'VBA614
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.LongStrokesSize = 10
End With
End Sub
```

See also

AxisSection Property (Page 3492)

BarGraph Object (Page 3286)

LongStrokesTextEach Property

Description

Defines or returns which strokes will be labeled when displaying the scale on the BarGraph object (1 = every stroke, 2 = every second stroke, etc.).

Example:

The "BarGraphConfiguration()" procedure configures In this example every third stroke will be labeled:

```
Sub BarGraphConfiguration()
'VBA615
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
LongStrokesTextEach = 3
End With
End Sub
```

See also

BarGraph Object (Page 3286)

M

Macro Property

Description

For a user-defined menu entry or icon, defines the VBA macro that will be executed upon selection.

Example:

In the following example, a user-defined menu with two menu entries is created, which retrieve two different VBA macros:

```
Sub CreateDocumentMenusUsingMacroProperty()
'VBA616
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "My first menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second menuitem")
'
'To assign a macro to every menuitem:
With ActiveDocument.CustomMenus("DocMenu1")
.MenuItems("dmItem1_1").Macro = "TestMacro1"
.MenuItems("dmItem1_2").Macro = "TestMacro2"
End With
End Sub
```

You can call the following two procedures via the menu items in the user-defined menu "DocMenu1":

```
Sub TestMacro1()
MsgBox "TestMacro1 is executed"
End Sub
```

```
Sub TestMacro2()
MsgBox "TestMacro2 is executed"
End Sub
```

How to assign VBA macros to menus and toolbars (Page 3036)

Marker Property

Description

TRUE if the limit values are to be displayed as a scale value in the case of the BarGraph object. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures In this example, the limit values will be displayed as scale values:

```
Sub BarGraphConfiguration()
'VBA617
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Marker = True
End With
End Sub
```

See also

BarGraph Object (Page 3286)

Max Property

Description

Defines or returns the absolute value in the case of a full value display.

This value is displayed if the scale display is active.

Example:

The "BarGraphConfiguration()" procedure configures In this example the absolute value will be set to "10".

```
Sub BarGraphConfiguration()
'VBA618
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Max = 10
End With
End Sub
```

MaxIndex property

Description

Shows the highest index of all configurable alarm and status combinations at the "HMIAdvancedStateDisplay" object.

MaximizeButton Property

Description

TRUE if the ApplicationWindow object can be maximized in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will receive a Maximize button in Runtime:

```
Sub ApplicationWindowConfig()
'VBA619
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
With objAppWindow
.MaximizeButton = True
End With
End Sub
```

See also

ApplicationWindow Object (Page 3284)

MaxZoom Property

Description

Defines or returns the maximum zoom level for the layer.

Example:

The "LayerInfo()" procedure outputs the name and zoom configuration for each layer of the current picture:

```
Sub LayerInfo()
'VBA620
Dim colLayers As HMILayers
Dim objSingleLayer As HMILayer
Dim iAnswer As Integer
Set colLayers = ActiveDocument.Layers
For Each objSingleLayer In colLayers
With objSingleLayer
iAnswer = MsgBox("Layername: " & .Name & vbCrLf & "Min. zoom:  " & .MinZoom & vbCrLf & "Max.
zoom:  " & .MaxZoom, vbOKCancel)
End With
If vbCancel = iAnswer Then Exit For
Next objSingleLayer
End Sub
```

MCGUBackColorOff-Eigenschaft

Description

In the case of the GroupDisplay object, defines or returns the background color for the "Went Out Unacknowledged" status when the flash status is "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color when the flash status is "Off" will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA621
Dim objGroupDisplay As HMIGroupDisplay
```

```
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUBackColorOff = RGB(255, 0, 0)
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCGUBackColorOn Property

Description

In the case of the GroupDisplay object, defines or returns the background color for the "Went Out Unacknowledged" status when the flash status is "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color when the flash status is "On" will be set to "White":

```
Sub GroupDisplayConfiguration()
'VBA622
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUBackColorOn = RGB(255, 255, 255)
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCGUBackFlash Property

Description

TRUE if the background to the GroupDisplay object is to flash when a message goes out unacknowledged. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color is to flash when a message goes out unacknowledged:

```
Sub GroupDisplayConfiguration()
'VBA623
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUBackFlash = True
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCGUTextColorOff Property

Description

In the case of the GroupDisplay object, defines or returns the text color for the "Went Out Unacknowledged" status when the flash status is "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color to the text when the flash status is "Off" will be set to "Blue":

```
Sub GroupDisplayConfiguration()
'VBA624
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUTextColorOff = RGB(0, 0, 255)
End With
End Sub
```

MCGUTextColorOn Property

Description

In the case of the GroupDisplay object, defines or returns the background color to the text for the "Went Out Unacknowledged" status when the flash status is "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color to the text when the flash status is "On" will be set to "Black":

```
Sub GroupDisplayConfiguration()
'VBA625
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUTextColorOn = RGB(0, 0, 0)
End With
```

```
End Sub
```

See also

GroupDisplay Object (Page 3350)

MCGUTextFlash Property

Description

TRUE if the font for the GroupDisplay object is to flash when a message goes out unacknowledged. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the font is to flash when a message goes out unacknowledged:

```
Sub GroupDisplayConfiguration()
'VBA626
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCGUTextFlash = True
End With
End Sub
```

GroupDisplay Object (Page 3350)

MCKOBackColorOff Property

Description

In the case of the GroupDisplay object, defines or returns the background color for the "Came In" status when the flash status is "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color when the flash status is "Off" will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA627
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCKOBackColorOff = RGB(255, 0, 0)
End With
End Sub
```

MCKOBackColorOn Property

Description

In the case of the GroupDisplay object, defines or returns the background color for the "Came In" status when the flash status is "On". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color when the flash status is "On" will be set to "White":

```
Sub GroupDisplayConfiguration()
'VBA628
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCKOBackColorOn = RGB(255, 255, 255)
End With
End Sub
```

MCKOBackFlash Property

Description

TRUE if the background to the GroupDisplay object is to flash when a message goes out unacknowledged. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color is to flash when a message goes out unacknowledged:

```
Sub GroupDisplayConfiguration()
'VBA629
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCKOBackFlash = True
End With
End Sub
```

GroupDisplay Object (Page 3350)

MCKOTextColorOff Property

Description

In the case of the GroupDisplay object, defines or returns the text color for the "Came In" status when the flash status is "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color to the text when the flash status is "Off" will be set to "Blue":

```
Sub GroupDisplayConfiguration()
'VBA630
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCKOTextColorOff = RGB(0, 0, 255)
End With
End Sub
```

MCKQBackColorOff Property

Description

In the case of the GroupDisplay object, defines or returns the background color for the "Went Out Acknowledged" status when the flash status is "Off". LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color when the flash status is "Off" will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA633
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MCKQBackColorOff = RGB(255, 0, 0)
End With
End Sub
```

GroupDisplay Object (Page 3350)

MCText Property

Description

Defines or returns the label for the appropriate message class in the case of the GroupDisplay object.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the label for the "Alarm High" message class will be set to "Alarm High":

```
Sub GroupDisplayConfiguration()
'VBA639
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MessageClass = 0
.MCText = "Alarm High"
End With
End Sub
```

See also

MessageClass Property (Page 3692)

GroupDisplay Object (Page 3350)

MenuItems Property

Description

Returns a listing containing all the menu entries in the user-defined menu.

Example:

The "CreateMenuItem()" procedure creates the "Delete Objects" menu and adds two menu entries ("Delete Rectangles" and "Delete Circles"). In this example the labels will then be output:

```
Sub CreateMenuItem()
'VBA640
Dim objMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim iIndex As Integer
iIndex = 1
'
'Add new menu "Delete objects" to the menubar:
Set objMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DeleteObjects", "Delete objects")
'
'Add two menuitems to menu "Delete objects"
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(1, "DeleteAllRectangles", "Delete
rectangles")
Set objMenuItem = objMenu.MenuItems.InsertMenuItem(2, "DeleteAllCircles", "Delete circles")
'
'Output label of menu:
```

```
MsgBox ActiveDocument.CustomMenus(1).Label
'
'Output labels of all menuitems:
For iIndex = 1 To objMenu.MenuItems.Count
MsgBox objMenu.MenuItems(iIndex).Label
Next iIndex
End Sub
```

See also

Menu Object (Page 3378)

MenuItem Object (Page 3382)

MenuItemType Property

Description

Returns the type for a user-defined menu entry. Read only access.

Returned Value	Type of Menu Entry
0	Separator (Separator)
1	Submenu (SubMenu)
2	Menu Entry (MenuItem)

Example:

The "ShowMenuTypes()" procedure outputs the types for the menu entries in the first user-defined menu:

```
Sub ShowMenuTypes()
'VBA641
Dim iMaxMenuItems As Integer
Dim iMenuItemType As Integer
Dim strMenuItemType As String
Dim iIndex As Integer
iMaxMenuItems = ActiveDocument.CustomMenus(1).MenuItems.Count
For iIndex = 1 To iMaxMenuItems
iMenuItemType = ActiveDocument.CustomMenus(1).MenuItems(iIndex).MenuItemType
Select Case iMenuItemType
Case 0
 strMenuItemType = "Trennstrich (Separator)"
Case 1
 strMenuItemType = "Untermenü (SubMenu)"
Case 2
 strMenuItemType = "Menüeintrag (MenuItem)"
End Select
MsgBox iIndex & ". Menuitemtype: " & strMenuItemType
```

```
Next iIndex
End Sub
```

See also

MenuItem Object (Page 3382)

Menu Object (Page 3378)

MenuToolBarConfig Property

Description

Specifies the configuration file with the user-defined menu and toolbars for the "HMIPictureWindow" object or returns the name of the configuration file. STRING write-read access.

MessageClass Property

Description

Specifies the respective message type (Alarm High, Alarm Low, Warning High, Warning Low, etc.) for which the attribute settings "Display Text", "Came In", "Came In Acknowledged" and "Went Out Unacknowledged" are configured for the "GroupDisplay" and "AdvancedAnalogDisplay" objects.

MessageClass	Assigned Value
AlarmHigh	0
AlarmLow	1
WarningHigh	2
WarningLow	3
Tolerance High	4
Tolerance Low	5
AS Control System Fault	6
AS Process Control Error	7
OS Process Control Error	8

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the background color for the "AlarmHigh" message type when the flash status is "Off" will be set to "Red":

```
Sub GroupDisplayConfiguration()
'VBA642
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.MessageClass = 0
.MCGUBackColorOff = RGB(255, 0, 0)
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

Min Property

Description

Defines or returns the absolute value in the case of the smallest value display.

This value is displayed if the scale display is active.

Example:

The "BarGraphConfiguration()" procedure configures In this example the absolute value will be set to "1".

```
Sub BarGraphConfiguration()
'VBA643
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Min = 1
End With
End Sub
```

3DBarGraph Object (Page 3267)

MinZoom Property

Description

Defines or returns the minimum zoom level for the layer.

Example:

The "LayerInfo()" procedure outputs the name and zoom configuration for each layer of the current picture:

```
Sub LayerInfo()
'VBA644
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim strMaxZoom As String
Dim strMinZoom As String
Dim strLayerName As String
Dim iAnswer As Integer
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
With objLayer
strMinZoom = .MinZoom
strMaxZoom = .MaxZoom
strLayerName = .Name
iAnswer = MsgBox("Layername: " & strLayerName & vbCrLf & "Min. zoom:  " & strMinZoom &
vbCrLf & "Max. zoom:  " & strMaxZoom, vbOKCancel)
End With
If vbCancel = iAnswer Then Exit For
Next objLayer
End Sub
```

See also

Layer Object (Page 3370)

Editing Layers with VBA (Page 3050)

Modified Property

Description

TRUE if the source code for a script or picture has been changed. BOOLEAN read access.

Example:

In the following example a check will be made on whether the active picture has been changed:

```
Sub CheckModificationOfActiveDocument()
'VBA645
Dim strCheck As String
Dim bModified As Boolean
bModified = ActiveDocument.Modified
Select Case bModified
Case True
strCheck = "Active document is modified"
Case False
strCheck = "Active document is not modified"
End Select
MsgBox strCheck
End Sub
```

ScriptInfo Object (Page 3424)

Document Object (Page 3319)

Moveable Property

Description

TRUE if the ApplicationWindow and PictureWindow objects can be moved in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example it shall be possible to move the application window in Runtime:

```
Sub ApplicationWindowConfig()
'VBA646
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
```

```
With objAppWindow
.Moveable = True
End With
End Sub
```

PictureWindow Object (Page 3396)

ApplicationWindow Object (Page 3284)

N-O

Name Property

Description

Returns the name of the object. STRING read access.

Example:

The "LayerInfo()" procedure outputs the name and zoom configuration for each layer of the current picture:

```
Sub LayerInfo()
'VBA647
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim strMaxZoom As String
Dim strMinZoom As String
Dim strLayerName As String
Dim iAnswer As Integer
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
With objLayer
strMinZoom = .MinZoom
strMaxZoom = .MaxZoom
strLayerName = .Name
iAnswer = MsgBox("Layername: " & strLayerName & vbCrLf & "Min. zoom:  " & strMinZoom &
vbCrLf & "Max. zoom:  " & strMaxZoom, vbOKCancel)
End With
If vbCancel = iAnswer Then Exit For
Next objLayer
End Sub
```

Name Property (FolderItem)

Description

Returns the internal name of the specified object of the "FolderItem" type. Read only access.

Example:

In this example the internal name is output for the "PC" object contained in the Global Components Library:

```
Sub ShowInternalNameOfFolderItem()
'VBA536
Dim objGlobalLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
MsgBox objGlobalLib.FolderItems(2).Folder(2).Folder.Item(1).Name
End Sub
```

See also

NegativeValue Property

Description

Use the BinaryResultInfo property to return the BinaryResultInfo object.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and the associated property values will be assigned to both the binary value ranges:

```
Sub AddDynamicDialogToCircleRadiusTypeBinary()
'VBA648
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBool
.BinaryResultInfo.NegativeValue = 20
.BinaryResultInfo.PositiveValue = 40
End With
End Sub
```

AdvancedStateDisplay object (Page 3278)

Number Property

Description

Returns the layer number of a "Layer" type object. The counting starts with 1. The first layer, "Layer0", returns the value "0". READ access.

Example:

This example outputs the name, number and index of a layer:

```
Sub ShowLayerWithNumbers()
'VBA803
Dim colLayers As HMILayers
Dim objLayer As HMILayer
Dim iAnswer As Integer
Dim iIndex As Integer
iIndex = 1
Set colLayers = ActiveDocument.Layers
For Each objLayer In colLayers
iAnswer = MsgBox("Layername: " & objLayer.Name & vbCrLf & "Layernumber: " & objLayer.Number
& vbCrLf & "Layersindex: " & iIndex, vbOKCancel)
iIndex = iIndex + 1
If vbCancel = iAnswer Then Exit For
Next objLayer
End Sub
```

See also

Layer Object (Page 3370)

NumberLines Property

Description

TextList

Defines for the "TextList object" how many lines the selection list should contain or returns the value. If the configured lines with their number, font size and font do not fit into the dimensions of the object, a vertical scroll bar is added to the selection list.

Combo box and list box

Defines or returns the number of lines of text for the "Combo box" and "List box" objects. You can define a maximum of 32,000 lines.

At the same time, the value of the "Number of rows" attribute specifies the high limit value for the "Index" attribute in the "Font" property group. Changing the value can have the following effects:

- Increasing the number: New lines are added at the bottom. The default labeling of the new filed can be changed using the "Text" attribute in the "Font" property group.
- Reducing the number: All lines are removed for which the value of the "Index" attribute is higher than the new number.

Example

The "TextListConfiguration()" procedure accesses the properties of the "TextList" object. In this example a selection list is created and the number of visible lines is set to three:

```
Sub TextListConfiguration()
'VBA649
Dim objTextList As HMITextList
'
'Insert new TextList in current picture:
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.NumberLines=3
End With
End Sub
```

See also

TextList Object (Page 3441)

ObjectName Property

Description

Depending on the source and destination object types for the direct connection, either defines or returns the name of the constant, object or tag.

The two tables show you when you must use the ObjectName property. A "--" means that the property is assigned an empty string (") by default when the DirectConnection object is created.

Source object type (SourceLink Property)

Type Property	AutomationName Property	ObjectName Property
hmiSourceTypeConstant	--	Name of the constant (e.g. the picture name)
hmiSourceTypeProperty	Property of the source object (e.g. "Top")	Name of the source object (e.g. "Rectangle_A")
hmiSourceTypePropertyOfThisObject	--	--
hmiSourceTypeVariableDirect	--	Tag name
hmiSourceTypeVariableIndirect	--	Tag name

Destination object type (DestinationLink Property)

Type Property	AutomationName Property	ObjectName Property
hmiDestTypeProperty	Property of the destination object (e.g. "Left")	Name of the destination object (e.g. "Rectangle_A")
hmiDestTypePropertyOfThisObject	--	--

Type Property	AutomationName Property	ObjectName Property
hmiDestTypePropertyOfActualWindow	Property of the destination object (e.g. "Left")	--
hmiDestTypeVariableDirect	--	Tag name
hmiDestTypeVariableIndirect	--	Tag name
hmiDestTypeDirectMessage	--	Tag name
hmiDestTypeIndirectMessage	--	Tag name

Example:

In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA650
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 100
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of Rectangle_B
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
```

```
End With
End Sub
```

DestLink Object (Page 3316)

ObjectSizeDecluttering Property

Description

TRUE, if objects of the specified picture outside of two configured sizes are to be faded out. BOOLEAN write-read access.

Define the size range with the aid of the SetDeclutterObjectSize method.

Example:

In the following example the settings for the lowest layer are configured in the active picture:

```
Sub ConfigureSettingsOfLayer()
'VBA651
Dim objLayer As HMILayer
Set objLayer = ActiveDocument.Layers(1)
With objLayer
'Configure "Layer 0"
.MinZoom = 10
.MaxZoom = 100
.Name = "Configured with VBA"
End With
'Define fade-in and fade-out of objects:
With ActiveDocument
.LayerDecluttering = True
.ObjectSizeDecluttering = True
.SetDeclutterObjectSize 50, 100
End With
End Sub
```

Document Object (Page 3319)

Editing Layers with VBA (Page 3050)

OffsetLeft Property

Description

Defines or returns the distance of the picture from the left edge of the picture window.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured

```
Sub PictureWindowConfig()
'VBA652
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

OffsetTop Property

Description

Defines or returns the distance of the picture from the top edge of the picture window.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured

```
Sub PictureWindowConfig()
'VBA653
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

OnTop Property

Description

TRUE if the ApplicationWindow object is always in the foreground in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example the application window will always be in the foreground in Runtime:

```
Sub ApplicationWindowConfig()
'VBA654
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
With objAppWindow
```

```
.OnTop = True
End With
End Sub
```

See also

ApplicationWindow Object (Page 3284)

Operation Property

Description

TRUE if the object can be used or operated in Runtime. BOOLEAN write-read access.

Example:

In this example the status of the operator-control enables will be output for all objects in the active picture:

```
Sub ShowOperationStatusOfAllObjects()
'VBA655
Dim objObject As HMIObject
Dim bStatus As Boolean
Dim strStatus As String
Dim strName As String
Dim iMax As Integer
Dim iIndex As Integer
Dim iAnswer As Integer
iMax = ActiveDocument.HMIObjects.Count
iIndex = 1
For iIndex = 1 To iMax
strName = ActiveDocument.HMIObjects(iIndex).ObjectName
bStatus = ActiveDocument.HMIObjects(iIndex).Operation
Select Case bStatus
Case True
 strStatus = "yes"
Case False
 strStatus = "no"
End Select
iAnswer = MsgBox("Object: " & strName & vbCrLf & "Operator-Control enable: " & strStatus,
vbOKCancel)
If vbCancel = iAnswer Then Exit For
Next iIndex
If 0 = iMax Then MsgBox "No objects in the active document."
End Sub
```

See also

HMIObject Object (Page 3357)

Document Object (Page 3319)

OperationMessage Property

Description

TRUE, if a message should be output upon successful operation. The reason for the operation can only be input if the "OperationReport" property is set to "True". BOOLEAN write-read access.

The operation is sent to the message system, and is archived. Using the message system, a message may be output in a message line, for example.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, an operation is supposed to be sent to the message system:

```
Sub IOFieldConfiguration()
'VBA656
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.OperationReport = True
.OperationMessage = True
End With
End Sub
```

IOField Object (Page 3361)

CheckBox Object (Page 3297)

OperationReport Property

Description

TRUE, if the reason for an operation should be recorded. BOOLEAN write-read access.

When the object is used or operated in Runtime, a dialog opens in which the operator can input the reason for the operation in the form of text. The operation is sent to the message system, and is archived.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, an operation is supposed to be sent to the message system:

```
Sub IOFieldConfiguration()
'VBA657
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.OperationReport = True
.OperationMessage = True
End With
End Sub
```

Slider object (Page 3428)

OptionGroup Object (Page 3393)

IOField Object (Page 3361)

CheckBox Object (Page 3297)

Orientation Property

Description

TRUE, when the text in the object should be displayed horizontally. BOOLEAN write-read access.

Note

It is only the text that is displayed either horizontally or vertically. The position of the object remains unchanged.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the text will be displayed vertically:

```
Sub ButtonConfiguration()
'VBA658
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.Width = 150
.Height = 150
.Text = "Text is displayed vertical"
.Orientation = False
End With
End Sub
```

Description

Only used internally.

See also

FaceplateObjects object (Page 3341)

OutputFormat Property

Description

Defines how the output value shall be displayed, or returns the set value. The representation is dependent on the data format.

Example:

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, data type "Decimal" will be set for the I/O field: The output value will be displayed with two decimals and three digits to the right of the decimal point:

```
Sub IOFieldConfiguration()
'VBA659
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.DataFormat = 1
.OutputFormat = "99,999"
End With
End Sub
```

See also

DataFormat Property (Page 3569)

IOField Object (Page 3361)

OutputValue Property

Description

Defines or returns presetting for the value to be displayed.

This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

Example

The "IOFieldConfiguration()" procedure accesses the properties of the I/O field. In this example, the output value is set to "0":

```
Sub IOFieldConfiguration()
'VBA660
Dim objIOField As HMIIOField
Set objIOField = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
With objIOField
.OutputValue = "0"
End With
End Sub
```

See also

TextList Object (Page 3441)

IOField Object (Page 3361)

OutputValue property

Description

Specifies the interconnection with any analog / text tag. The analog display represents the value of this tag in the configured colors depending on the alarm state.

P-Q

PaintColor_QualityCodeBad property

Description

Defines the color in which the grid is shown when a poor status exists, for example, if the connection to the server is interrupted.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

PaintColor_QualityCodeUnCertain property

Description

Defines the color with which the grid is shown in an uncertain status.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Parent Property

Description

Returns the higher-ranking object in the specified object. Read only access.

Example:

In the following example a copy of the active picture is created and the name of the picture is then output with the aid of the Parent property:

```
Sub ExampleForParent()
'VBA661
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
MsgBox objView.Parent.Name
End Sub
```

FaceplateProperty object (Page 3341)

PasswordLevel Property

Description

Defines the authorization for operation (e.g. no input or no triggering actions) of the object.

PasswordLevel	Assigned Value
<No Access Security>	0
User Administration	1
Value input	2
Process controlling	3

PasswordLevel	Assigned Value
Picture editing	4
Screen change	5
Window selection	6
Hard copy	7
Confirm alarms	8
Lock alarms	9
Free alarms	10
Message editing	11
Start archive	12
Stop archive	13
Edit archive values	14
Archive editing	15
Action editing	16
Project Manager	17
Activate remote	1000
Configure remote	1001
Just monitor	1002

You must first define the operator authorizations in the User Administrator.

Example:

--

See also

HMIObject Object (Page 3357)

Path Property

Description

Returns the full path of the folder in which the specified picture is stored. Read only access.

Example:

In this example the path to the folder of the active picture will be output:

```
Sub ShowDocumentPath()
'VBA663
MsgBox ActiveDocument.Path
End Sub
```

See also

Document Object (Page 3319)

Pathname Property

Description

Returns the internal access path to the Components Library for the specified object of the "FolderItem" type. Read only access.

Example:

In this example the internal access path is output for the "PC" object contained in the Global Components Library:

```
Sub ShowInternalNameOfFolderItem()
'VBA664
Dim objGlobalLib As HMISymbolLibrary
Set objGlobalLib = Application.SymbolLibraries(1)
MsgBox objGlobalLib.FolderItems(2).Folder(2).Folder.Item(1).PathName
End Sub
```

See also

FolderItem Object (Page 3342)

Accessing the component library with VBA (Page 3040)

PdlProtection property

Description

Sets a password for a process picture or faceplate type or deletes the password. Write access.

Note

Significance of the password protection

With the PdlProtection property, you can only assign a password to process pictures or faceplate types to, for example, protect the VBA scripts contained in the pictures against unauthorized access.

Examples

In this example, a password is set for the active picture:

```
Sub ProtectPicture()
'VBA854
ActiveDocument.PdlProtection = "Test123"
End Sub
```

Password protection for the active picture is removed in this example:

```
Sub UnprotectPicture()
'VBA855
ActiveDocument.PdlProtection = ""
End Sub
```

Note

Write access only

Read access to the password is prevented due to security reasons.

PicDeactReferenced-Eigenschaft

Description

TRUE if the picture assigned to the "Deactivated" status is to be saved in the RoundButton object. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the picture assigned to the "Deactivated" status will be referenced:

```
Sub RoundButtonConfiguration()
'VBA665
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDeactReferenced = False
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PicDeactTransparent Property

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Disabled" status should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "PicDeactUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Red" assigned in the Bitmap object is to be displayed transparent when in the "Deactivated" status.

```
Sub RoundButtonConfiguration()
'VBA666
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDeactTransparent = RGB(255, 0, 0)
.PicDeactUseTransColor = True
End With
End Sub
```

See also

PicDeactUseTransColor Property (Page 3717)

RoundButton Object (Page 3418)

PicDeactUseTransColor Property

Description

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Red" assigned in the Bitmap object is to be displayed transparent when in the "Deactivated" status:

```
Sub RoundButtonConfiguration()
'VBA667
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDeactTransparent = RGB(255, 0, 0)
.PicDeactUseTransColor = True
End With
End Sub
```

See also

PicDeactTransparent Property (Page 3715)

RoundButton Object (Page 3418)

PicDownReferenced Property

Description

TRUE if the picture assigned to the "On" status is to be saved in the RoundButton object. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the picture assigned to the "On" status will be referenced:

```
Sub RoundButtonConfiguration()
'VBA668
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDownReferenced = False
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PicDownTransparent Property

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "On" status should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "PicDownUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Yellow" assigned in the Bitmap object is to be displayed transparent when in the "Deactivated" status.

```
Sub RoundButtonConfiguration()
'VBA669
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDownTransparent = RGB(255, 255, 0)
.PicDownUseTransColor = True
End With
End Sub
```

See also

PicDownUseTransColor Property (Page 3719)

RoundButton Object (Page 3418)

PicDownUseTransColor Property

Description

TRUE, when the transparent color defined by the "PicDownTransparent" property for the "On" status should be used. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Yellow" assigned in the Bitmap object is to be displayed transparent when in the "Deactivated" status:

```
Sub RoundButtonConfiguration()
'VBA670
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicDownTransparent = RGB(255, 255, 0)
.PicDownUseTransColor = True
End With
End Sub
```

See also

PicDownTransparent Property (Page 3717)

RoundButton Object (Page 3418)

PicReferenced Property

Description

TRUE if the picture assigned to the GraphicObject object is to be referenced and not saved in the object. BOOLEAN write-read access.

Example:

The "GraphicObjectConfiguration()" procedure accesses the properties of the graphics object. In this example the assigned picture will be referenced:

```
Sub GraphicObjectConfiguration()
'VBA671
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects.AddHMIObject("GraphicObject1",
"HMIGraphicObject")
With objGraphicObject
.PicReferenced = True
End With
End Sub
```

See also

GraphicObject Object (Page 3345)

PictAlignment property

Description

As the "Picture alignment" attribute, it defines the position and scaling of the picture placed on the button or round button.

centered	The picture is positioned, centered in the original proportions.
Left justified	The picture is positioned with original proportions, with left justification on the left side of the button.
Right justified	The picture is positioned with original proportions, with right justification on the right side of the button.
Stretched	The picture is scaled to a square and is adapted to the size of the button.

PicTransColor Property

Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "PicUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "GraphicObjectConfiguration()" procedure accesses the properties of the graphics object. In this example the color "Blue" assigned in the Bitmap object is to be displayed transparent:

```
Sub GraphicObjectConfiguration()
'VBA672
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects.AddHMIObject("GraphicObject1",
"HMIGraphicObject")
With objGraphicObject
.PicTransColor = 16711680
.PicUseTransColor = True
End With
End Sub
```

See also

GraphicObject Object (Page 3345)

PictureDeactivated Property

Description

Defines the picture to be displayed in the "Disable" status or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the round button. In this example the pictures for the "On" and "Off" states will be defined:

```
Sub ButtonConfiguration()
'VBA673
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
'
'Toi use this example copy a Bitmap-Graphic
'to the "GraCS"-Folder of the actual project.
'Replace the picturename "TestPicture1.BMP" with the name of
'the picture you copied
.PictureDeactivated = "TestPicture1.BMP"
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PicReferenced Property (Page 3718)

PictureDown Property

Description

Defines the picture to be displayed in the "On" status or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the round button. In this example the pictures for the "On" and "Off" states will be defined:

```
Sub ButtonConfiguration()
'VBA674
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
'
'To use this example copy two Bitmap-Graphics
'to the "GraCS"-Folder of the actual project.
'Replace the picturenames "TestPicture1.BMP" and "TestPicture2.BMP"
'with the names of the pictures you copied
.PictureDown = "TestPicture1.BMP"
.PictureUp = "TestPicture2.BMP"
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PictureName Property

Description

Defines the picture to be displayed in the picture window in Runtime or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA675
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
```

```
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

PictureUp Property

Description

Defines the picture to be displayed in the "Off" status or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the pictures for the "On" and "Off" states will be defined:

```
Sub ButtonConfiguration()
'VBA676
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
'
'To use this example copy two Bitmap-Graphics
'to the "GraCS"-Folder of the actual project.
'Replace the picturenames "TestPicture1.BMP" and "TestPicture2.BMP"
'with the names of the pictures you copied
.PictureDown = "TestPicture1.BMP"
.PictureUp = "TestPicture2.BMP"
End With
End Sub
```

See also

RoundButton Object (Page 3418)

Button Object (Page 3293)

PicUpReferenced Property

Description

TRUE if the picture assigned to the "Off" status is to be saved in the RoundButton object. Otherwise, only the associated object reference is saved. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the picture assigned to the "Off" status will be referenced:

```
Sub RoundButtonConfiguration()
'VBA677
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicUpReferenced = False
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PicUpTransparent Property

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Off" status should be set to "transparent". LONG write-read access.

The color is only set to "Transparent" if the value of the "PicUpUseTransColor" property is "True".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Blue" assigned in the Bitmap object is to be displayed transparent in the status "Off".

```
Sub RoundButtonConfiguration()
'VBA678
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicUpTransparent = RGB(0, 0, 255)
.PicUpUseTransColor = True
End With
End Sub
```

See also

PicUpUseTransColor Property (Page 3726)

RoundButton Object (Page 3418)

PicUpUseTransColor Property

Description

TRUE, when the transparent color defined by the "PicUpTransparent" property for "Off" status should be used. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the color "Blue" assigned in the Bitmap object is to be displayed transparent in the status "Off":

```
Sub RoundButtonConfiguration()
'VBA679
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.PicUpTransparent = RGB(0, 0, 255)
.PicUpUseTransColor = True
End With
End Sub
```

See also

PicUpTransparent Property (Page 3723)

RoundButton Object (Page 3418)

PicUseTransColor Property

Description

TRUE if the transparent color defined with the "PicTransColor" property is to be used for the "Deactivated" status. BOOLEAN write-read access.

Example:

The "GraphicObjectConfiguration()" procedure accesses the properties of the graphics object. In this example the color "Blue" assigned in the Bitmap object is to be displayed transparent:

```
Sub GraphicObjectConfiguration()
'VBA680
Dim objGraphicObject As HMIGraphicObject
Set objGraphicObject = ActiveDocument.HMIObjects.AddHMIObject("GraphicObject1",
"HMIGraphicObject")
With objGraphicObject
.PicTransColor = RGB(0, 0, 255)
.PicUseTransColor = True
End With
End Sub
```

PicTransColor Property (Page 3719)

GraphicObject Object (Page 3345)

Pinnable property

Description

Only used internally.

See also

PictureWindow Object (Page 3396)

Pinned property

Description

Only used internally.

See also

PictureWindow Object (Page 3396)

PointCount Property

Description

Defines or returns the number of corner points in the case of the Polygon and Polyline objects. Each corner point has position coordinates and is identified via an index.

Example:

For this example to work, insert a polyline called "Polyline1" into the active picture: The "PolyLineCoordsOutput" procedure then outputs the coordinates of all the corner points in the polyline:

```
Sub PolyLineCoordsOutput()
'VBA681
Dim iPcIndex As Integer
Dim iPosX As Integer
Dim iPosY As Integer
Dim iIndex As Integer
Dim objPolyLine As HMIPolyLine
Set objPolyLine = Application.ActiveDocument.HMIObjects.AddHMIObject("PolyLine1",
"HMIPolyLine")

'
'Determine number of corners from "PolyLine1":
iPcIndex = objPolyLine.PointCount
'
'Output of x/y-coordinates from every corner:
For iIndex = 1 To iPcIndex
With objPolyLine
.index = iIndex
iPosX = .ActualPointLeft
iPosY = .ActualPointTop
MsgBox iIndex & ". corner:" & vbCrLf & "x-coordinate: " & iPosX & vbCrLf & "y-coordinate:
" & iPosY
End With
Next iIndex
End Sub
```

Position Property

Description

The value for position determines the sequence, in which menu entries and icons are assigned in user-defined menus and toolbars or how user-defined menus are arranged in the menu bar. Write/Read access.

A value of "1" means position 1 (start).

Example:

In the following example the position of all menu entries in the first user-defined menu in the active picture will be output: So that this example will work, first carry out the example shown under the heading "InsertSubMenu".

```
Sub ShowPositionOfCustomMenuItems()
'VBA683
Dim objMenu As HMIMenu
Dim iMaxMenuItems As Integer
Dim iPosition As Integer
Dim iIndex As Integer
Set objMenu = ActiveDocument.CustomMenus(1)
iMaxMenuItems = objMenu.MenuItems.Count
For iIndex = 1 To iMaxMenuItems
iPosition = objMenu.MenuItems(iIndex).Position
MsgBox "Position of the " & iIndex & ". menuitem: " & iPosition
Next iIndex
End Sub
```

Menu Object (Page 3378)

InsertSubmenu Method (Page 3229)

PositiveValue Property

Description

Defines the value for the dynamic property if the configured tag returns a non-zero value, or returns the value.

Example:

Use the BinaryResultInfo property to return the BinaryResultInfo object. In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and the associated property values will be assigned to both the binary value ranges:

```
Sub AddDynamicDialogToCircleRadiusTypeBool()
'VBA684
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBool
.BinaryResultInfo.NegativeValue = 20
.BinaryResultInfo.PositiveValue = 40
End With
End Sub
```

See also

NegativeValue Property (Page 3695)

BinaryResultInfo Object (Page 3291)

VBA Reference (Page 3124)

PredefinedAngels Property

Description

Defines or returns the depth of the display of the 3DBarGraph object. Value range from 0 to 3.

Display	Assigned Value
Cavalier	0
Isometric	1
Axonometric	2
Freely Defined	3

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the depth display will be set to "Isometric":

```
Sub HMI3DBarGraphConfiguration()
'VBA685
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
'Depth-angle a = 15 degrees
.AngleAlpha = 15
.PredefinedAngles = 1
'Depth-angle b = 45 degrees
.AngleBeta = 45
End With
End Sub
```

See also

3DBarGraph Object (Page 3267)

Pressed Property

Description

TRUE, when the Button or RoundButton object is pressed. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the RoundButton object will be set to "Pressed":

```
Sub RoundButtonConfiguration()
'VBA686
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.Pressed = True
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PrioAlarm..Warning property

Description

Specifies the priority at one of the following states or message types:

- Alarm
- Warning
- Tolerance
- AS Process Control Error
- AS Control System Fault
- Operator request

PrioBit16..31 property

Description

The property indicates the priority of the respective bit in the group value for the alarm evaluation for the advanced analog and status display. The alarm evaluation starts at the highest priority (priority 1). Bits that are not used for the alarm evaluation are assigned priority 0.

If the group value contains multiple bits, the priority determines which status is displayed.

Process Property

Description

Defines or returns presetting for the value to be displayed.

This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

Example:

The "HMI3DBarGraphConfiguration()" procedure accesses the properties of the 3DBarGraph object. In this example the default value will be set to "100":

```
Sub HMI3DBarGraphConfiguration()
'VBA687
Dim obj3DBar As HMI3DBarGraph
Set obj3DBar = ActiveDocument.HMIObjects.AddHMIObject("3DBar1", "HMI3DBarGraph")
With obj3DBar
'Depth-angle a = 15 degrees
.AngleAlpha = 15
'Depth-angle b = 45 degrees
```

```
.AngleBeta = 45
.Process = 100
End With
End Sub
```

Process property

Description

Here the first tag is stored that is used for status value calculation for the "HMIAdvancedStateDisplay" object.

Use the "BitPosition0..3" properties to specify the bit position of these tags that is taken into account for the status value calculation. This results in the statuses to which you can then assign pictures.

Process1 property

Description

Here the second tag is stored that is used for status value calculation for the "HMIAdvancedStateDisplay" object.

Use the "BitPosition0..3" properties to specify the bit position of these tags that is taken into account for the status value calculation. This results in the statuses to which you can then assign pictures.

Process2 property

Description

Here the third tag is stored that is used for status value calculation for the "HMIAdvancedStateDisplay" object.

Use the "BitPosition0..3" properties to specify the bit position of these tags that is taken into account for the status value calculation. This results in the statuses to which you can then assign pictures.

Process3 property

Description

Here the fourth tag is stored that is used for status value calculation for the "HMIAdvancedStateDisplay" object.

Use the "BitPosition0..3" properties to specify the bit position of these tags that is taken into account for the status value calculation. This results in the statuses to which you can then assign pictures.

ProfileName Property

Description

Returns the name of the specified application. Read only access.

Example:

In this example the name of the "Graphics Designer" application will be output:

```
Sub ShowProfileName()
'VBA688
MsgBox Application.ProfileName
End Sub
```

See also

Application Object (Page 3282)

ProgID Property

Description

Returns the ProgID of an ActiveX Control. STRING read access.

Example:

In the following example the ActiveX Control "WinCC Gauge Control" is inserted in the active picture. The ProgID is then output:

```
Sub AddActiveXControl()
'VBA689
Dim objActiveXControl As HMIActiveXControl
```

```
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
With ActiveDocument
.HMIObjects("WinCC_Gauge").Top = 40
.HMIObjects("WinCC_Gauge").Left = 40
MsgBox "ProgID of ActiveX-control: " & .HMIObjects("WinCC_Gauge").ProgID
End With
End Sub
```

See also

ActiveXControl Object (Page 3273)

AddActiveXControl Method (Page 3174)

ProjectName Property

Description

Returns the project name. Read access.

Example:

In this example the name and type of the loaded project will be output.

```
Sub ShowProjectInfo()
'VBA690
Dim iProjectType As Integer
Dim strProjectName As String
Dim strProjectType As String
iProjectType = Application.ProjectType
strProjectName = Application.ProjectName
Select Case iProjectType
Case 0
strProjectType = "Single-User System"
Case 1
strProjectType = "Multi-User System"
Case 2
strProjectType = "Client System"
End Select
MsgBox "Projecttype: " & strProjectType & vbCrLf & "Projectname: " & strProjectName
End Sub
```

See also

Application Object (Page 3282)

ProjectType Property

Description

Returns the project type. Value range from 0 to 2. Read access.

Project type	Assigned Value
Single-user project	0
Multi-user project	1
client project	2

Example:

In this example the name and type of the loaded project will be output:

```
Sub ShowProjectInfo()
'VBA691
Dim iProjectType As Integer
Dim strProjectName As String
Dim strProjectType As String
iProjectType = Application.ProjectType
strProjectName = Application.ProjectName
Select Case iProjectType
Case 0
strProjectType = "Single-User System"
Case 1
strProjectType = "Multi-User System"
Case 2
strProjectType = "Client System"
End Select
MsgBox "Projecttype: " & strProjectType & vbCrLf & "Projectname: " & strProjectName
End Sub
```

See also

Application Object (Page 3282)

Properties Property

Description

Returns a Properties listing containing all the properties of the specified object. Read only access.

To return an element from the Properties listing you can use either the index number or the name of the VBA property.

You must use the Properties property if, for example, you wish to access the properties of objects located in a group object.

Example:

Examples showing how to use the Properties property can be found in this documentation under the following headings:

- "Editing Objects with VBA"
- "Group objects"
- "Customized Objects"

See also

HMIObject Object (Page 3357)

Customized Objects (Page 3074)

Group Objects (Page 3067)

Editing Objects with VBA (Page 3053)

Prototype Property

Description

Returns the function heading of a script. The function heading is assigned by default if no source code is configured.

Example:

In the following example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle will enlarge every time you click the button. In this case only the prototype of the VB script is output:

```
Sub ExampleForPrototype()
'VBA692
Dim objButton As HMIButton
Dim objCircleA As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Set objCircleA = ActiveDocument.HMIObjects.AddHMIObject("CircleA", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircleA
.Top = 100
.Left = 100
End With
With objButton
.Top = 10
.Left = 10
```

```
.Width = 200
.Text = "Increase Radius"
End With
'On every mouseclick the radius have to increase:
Set objEvent = objButton.Events(1)
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
MsgBox objVBScript.Prototype
End Sub
```

See also

ScriptInfo Object (Page 3424)

QualityCodeStateChecked Properties

Description

TRUE, if the quality code of the specified tag is used in Dynamic dialog for dynamization. BOOLEAN write-read access.

Example:

In the following example the radius of a circle is given dynamics with the Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA816
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
```

```
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

See also

DynamicDialog Object (Page 3325)

QualityCodeStateValues Property

Description

Returns the QualityCodeStateValues listing. Use the QualityCodeStateValues property with the Item property to assign a value to the quality code status to be used for dynamization.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog Dynamization uses the analysis of the quality code of a tag. If the tag fails to return a quality code, a substitute value (ElseCase property) is defined:

```
Sub AddDynamicDialogToCircleRadiusTypeAnalog()
'VBA817
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_A", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeAnalog
.AnalogResultInfos.ElseCase = 200
'
'Activate analysis of qualitycodestate
.QualityCodeStateChecked = True
```

```
End With
With objDynDialog.QualityCodeStateValues(1)
'
'define a value for every state:
.VALUE_BAD_COMMLUV = 20
.VALUE_BAD_COMMNUV = 30
.VALUE_BAD_CONFERROR = 40
.VALUE_BAD_DEVICE = 60
.VALUE_BAD_MISCSTATES = 70
.VALUE_BAD_NONSPECIFIC = 80
.VALUE_BAD_NOTCONNECTED = 90
.VALUE_BAD_OUTOFSERV = 100
.VALUE_BAD_PROCRELNOM = 110
.VALUE_BAD_PROCRELSUB = 120
.VALUE_HIGHLIMITED = 130
.VALUE_LOWLIMITED = 140
.VALUE_UNCERT_ENGVHIGHLIM = 150
.VALUE_UNCERT_ENGVLOWLIM = 160
.VALUE_UNCERT_INITVAL = 170
.VALUE_UNCERT_LUV = 180
.VALUE_UNCERT_MAINTDEM = 190
.VALUE_UNCERT_MISCSTATES = 200
.VALUE_UNCERT_NONSPECIFIC = 210
.VALUE_UNCERT_PROCRELNOM = 220
.VALUE_UNCERT_SIMVAL = 230
.VALUE_UNCERT_SUBSTSET = 240
End With
End Sub
```

See also

R

Radius Property

Description

Defines or returns the radius in the case of the following objects:

- Circle: Radius in pixels (0 to 10000)
- CircularArc: Radius in pixels (0 to 10000)
- PieSegment: Radius in pixels (0 to 10000)
- RoundButton: Radius in pixels (0 to 10000)

Example:

The "PieSegmentConfiguration()" procedure accesses the properties of the Pie Segment. In this example the radius will be set to "80":

```
Sub PieSegmentConfiguration()
'VBA693
Dim objPieSegment As HMIPieSegment
Set objPieSegment = ActiveDocument.HMIObjects.AddHMIObject("PieSegment1", "HMIPieSegment")
With objPieSegment
.StartAngle = 40
.EndAngle = 180
.Radius = 80
End With
End Sub
```

See also

RoundButton Object (Page 3418)

PieSegment Object (Page 3399)

CircularArc Object (Page 3303)

Circle Object (Page 3300)

RadiusHeight Property

Description

Defines or returns the vertical radius in pixels (0 to 5000) in the case of elliptical objects (Ellipse, EllipseArc, EllipseSegment).

Example:

The "EllipseConfiguration()" procedure accesses the properties of the ellipse object. In this example the horizontal radius will be set to "60":

```
Sub EllipseConfiguration()
'VBA694
Dim objEllipse As HMIEllipse
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("Ellipse1", "HMIEllipse")
With objEllipse
.RadiusHeight = 60
.RadiusWidth = 40
End With
End Sub
```

See also

RadiusWidth Property (Page 3742)

EllipseSegment Object (Page 3333)

EllipseArc Object (Page 3330)

Ellipse Object (Page 3327)

RadiusWidth Property

Description

Defines or returns the horizontal radius in pixels (0 to 5000) in the case of elliptical objects (Ellipse, EllipseArc, EllipseSegment).

Example:

The "EllipseConfiguration()" procedure accesses the properties of the ellipse object. In this example the horizontal radius will be set to "40":

```
Sub EllipseConfiguration()
'VBA695
Dim objEllipse As HMIEllipse
Set objEllipse = ActiveDocument.HMIObjects.AddHMIObject("Ellipse1", "HMIEllipse")
With objEllipse
.RadiusHeight = 60
.RadiusWidth = 40
End With
End Sub
```

See also

RadiusHeight Property (Page 3739)

EllipseSegment Object (Page 3333)

EllipseArc Object (Page 3330)

RangeTo Property

Description

Defines or returns the analog value range.

Example:

An example showing how to use the RangeTo property can be found in this documentation under the heading "AnalogResultInfos Object (Listing)".

See also

Value Property (Page 3809)

AnalogResultInfos Object (Listing) (Page 3281)

AnalogResultInfo Object (Page 3280)

ReferenceRotationLeft Property

Description

Defines or returns the X-coordinate of the reference point about which the object should be rotated in Runtime.

The value of the X-coordinate is relative to the object width. Enter the value in percent starting from the left edge of the rectangle enclosing the object.

Example:

The "PolyLineConfiguration()" procedure accesses the properties of the PolyLine object. In this example, the coordinates of the reference point will be set to 50% of the object width and 50% of the object height:

```
Sub PolyLineConfiguration()
'VBA696
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects.AddHMIObject("PolyLine1", "HMIPolyLine")
With objPolyLine
.ReferenceRotationLeft = 50
.ReferenceRotationTop = 50
End With
End Sub
```

See also

RotationAngle Property (Page 3746)

ReferenceRotationTop Property (Page 3744)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

Line Object (Page 3373)

ReferenceRotationTop Property

Description

Defines or returns the Y-coordinate of the reference point about which the object should be rotated in Runtime.

The value of the Y-coordinate is relative to the object width. Enter the value in percent starting from the top edge of the rectangle enclosing the object.

Example:

The "PolyLineConfiguration()" procedure accesses the properties of the PolyLine object. In this example, the coordinates of the reference point will be set to 50% of the object width and 50% of the object height:

```
Sub PolyLineConfiguration()
'VBA697
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects.AddHMIObject("PolyLine1", "HMIPolyLine")
With objPolyLine
.ReferenceRotationLeft = 50
.ReferenceRotationTop = 50
End With
End Sub
```

RotationAngle Property (Page 3746)

ReferenceRotationLeft Property (Page 3741)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

Line Object (Page 3373)

Relevant Property

Description

TRUE when the "GroupDisplay", "AdvancedAnalogDisplay" or "AdvancedStateDisplay" object is taken into account when forming the group display. BOOLEAN write-read access.

Example

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example the object for forming the group display will be considered:

```
Sub GroupDisplayConfiguration()
'VBA698
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.Relevant = True
End With
End Sub
```

See also

Group Object (Page 3348)

ResultType Property

Description

Defines or returns the value range evaluation type in the Dynamic dialog.

Example:

In the following example the radius of a circle will be dynamically configured using the Dynamic dialog, a tag name will be assigned and the associated property values will be assigned to both the binary value ranges:

```
Sub AddDynamicDialogToCircleRadiusTypeBinary()
'VBA699
Dim objDynDialog As HMIDynamicDialog
Dim objCircle As HMICircle
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("Circle_C", "HMICircle")
Set objDynDialog = objCircle.Radius.CreateDynamic(hmiDynamicCreationTypeDynamicDialog,
"'NewDynamic1'")
With objDynDialog
.ResultType = hmiResultTypeBool
.BinaryResultInfo.NegativeValue = 20
.BinaryResultInfo.PositiveValue = 40
End With
End Sub
```

See also

DynamicDialog Object (Page 3325)

RightComma Property

Description

Defines or returns the number of decimal places (0 to 20) for the BarGraph object.

Example:

The "BarGraphConfiguration()" procedure configures In this example the number of decimal places will be limited to 4.

```
Sub BarGraphConfiguration()
'VBA700
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.RightComma = 4
End With
End Sub
```

See also

BarGraph Object (Page 3286)

RotationAngle Property

Description

Line, Polygon and PolyLine

Defines or returns the rotation angle of the following objects in degrees: Line, Polygon, PolyLine.

The object is displayed in Runtime only rotated clockwise around the reference point by the specified value (starting from the configured starting position).

T-piece

Defines or returns the orientation of a T-piece in degrees. The attribute can only assume one of four values:

0	The standard position of the T-piece is the shape of the letter "T"
90	The "leg" of the "T" points towards the left
180	The "leg" of the "T" points upwards
270	The "leg" of the "T" points to the right

Other values are automatically converted to modulus 360 and rounded up or down to the nearest permissible value.

The T-piece is shown rotated around the center point in the project and in Runtime.

Example:

The "PolyLineConfiguration()" procedure accesses the properties of the PolyLine object. In this example the object will be rotated by 45° in Runtime:

```
Sub PolyLineConfiguration()
'VBA701
Dim objPolyLine As HMIPolyLine
Set objPolyLine = ActiveDocument.HMIObjects.AddHMIObject("PolyLine1", "HMIPolyLine")
With objPolyLine
.ReferenceRotationLeft = 50
.ReferenceRotationTop = 50
.RotationAngle = 45
End With
End Sub
```

See also

ReferenceRotationTop Property (Page 3742)

ReferenceRotationLeft Property (Page 3741)

PolyLine Object (Page 3405)

Polygon Object (Page 3402)

Line Object (Page 3373)

RoundCornerHeight Property

Description

Defines or returns the corner radius of the RoundRectangle object.

Enter the value as a percentage of half the height of the object.

Example:

The "RoundRectangleConfiguration()" procedure accesses the properties of the object RoundRectangle. In this example the corner radius will be set to 25% (height) and 50% (width).

```
Sub RoundRectangleConfiguration()
'VBA702
Dim objRoundRectangle As HMIRoundRectangle
Set objRoundRectangle = ActiveDocument.HMIObjects.AddHMIObject("RoundRectangle1",
"HMIRoundRectangle")
With objRoundRectangle
.RoundCornerHeight = 25
```

```
.RoundCornerWidth = 50
End With
End Sub
```

RoundCornerWidth Property (Page 3748)

RoundRectangle Object (Page 3422)

RoundCornerWidth Property

Description

Defines or returns the corner radius of the RoundRectangle object.

Enter the value as a percentage of half the width of the object.

Example:

The "RoundRectangleConfiguration()" procedure accesses the properties of the object RoundRectangle. In this example the corner radius will be set to 25% (height) and 50% (width):

```
Sub RoundRectangleConfiguration()
'VBA703
Dim objRoundRectangle As HMIRoundRectangle
Set objRoundRectangle = ActiveDocument.HMIObjects.AddHMIObject("RoundRectangle1",
"HMIRoundRectangle")
With objRoundRectangle
.RoundCornerHeight = 25
.RoundCornerWidth = 50
End With
End Sub
```

See also

RoundCornerHeight Property (Page 3745)

RoundRectangle Object (Page 3422)

S

SameSize Property

Description

TRUE, when all four buttons of a Group Display object have the same size. BOOLEAN write-read access.

Example:

The "GroupDisplayConfiguration()" procedure accesses the properties of the Group Display. In this example all four buttons will have the same size.

```
Sub GroupDisplayConfiguration()
'VBA704
Dim objGroupDisplay As HMIGroupDisplay
Set objGroupDisplay = ActiveDocument.HMIObjects.AddHMIObject("GroupDisplay1",
"HMIGroupDisplay")
With objGroupDisplay
.SameSize = True
End With
End Sub
```

See also

GroupDisplay Object (Page 3350)

ScaleColor Property

Description

Defines or returns the color of the scale. LONG write-read access.

The "Scaling" property must be set to TRUE for the color to be displayed.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "BarGraphConfiguration()" procedure configures In this example the scale will be displayed and the scale color will be set to "Red":

```
Sub BarGraphConfiguration()
'VBA705
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScaleColor = RGB(255, 0, 0)
End With
End Sub
```

See also

Scaling Property (Page 3751)

BarGraph Object (Page 3286)

ScaleTicks Property

Description

Defines or returns the number of scale sections for the BarGraph object.

A scale section is a part of the scale bounded by two long scale strokes or division ticks. If you assign a value of "0" to the property, the appropriate scale marks will be calculated automatically.

Example:

The "BarGraphConfiguration()" procedure configures In this example the number of scale sections will be set to "10".

```
Sub BarGraphConfiguration()
'VBA706
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScaleTicks = 10
End With
End Sub
```

See also

BarGraph Object (Page 3286)

Scaling Property

Description

TRUE if a scale is also used to display the values in the case of the BarGraph object. BOOLEAN write-read access.

Example:

The "BarGraphConfiguration()" procedure configures the properties of the BarGraph object. In this example the scale will be displayed and the scale color will be set to "Red":

```
Sub BarGraphConfiguration()
'VBA707
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.Scaling = True
.ScaleColor = RGB(255, 0, 0)
End With
End Sub
```

See also

BarGraph Object (Page 3286)

ScalingMode property

Description

Defines the size to display the objects of the faceplate instance.

Default	Like scaling mode "proportional"
1 : 1	The faceplate type is displayed in the original size in the faceplate instance. If the faceplate instance is too small, the size of the faceplate instance is adapted to the size of the faceplate type.
Proportional	The faceplate type is scaled in proportion with the size of the faceplate instance.

Example

ScalingType Property

Description

Defines or returns the type of bar scaling. Value range from 0 to 2.

The "Scaling" property must be set to TRUE for the color to be displayed.

Bar Scaling	Assigned Value
Linear	0
Logarithmic	1
Automatic	2

Example:

The "BarGraphConfiguration()" procedure configures In this example the bar scaling will be set to "Linear":

```
Sub BarGraphConfiguration()
'VBA708
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
.ScalingType = 0
.Scaling = True
End With
End Sub
```

See also

Scaling Property (Page 3749)

BarGraph Object (Page 3286)

ScriptType Property

Description

Returns the script type (C or VBS) which was used to make a property or event dynamic. Read only access.

Example:

In the following example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle will enlarge every time you click the button. In this case the script type will be output:

```
Sub ExampleForPrototype()
'VBA709
Dim objButton As HMIButton
Dim objCircleA As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
Dim strScriptType As String
Set objCircleA = ActiveDocument.HMIObjects.AddHMIObject("CircleA", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircleA
.Top = 100
.Left = 100
End With
With objButton
.Top = 10
.Left = 10
.Width = 200
.Text = "Increase Radius"
End With
'On every mouseclick the radius have to increase:
Set objEvent = objButton.Events(1)
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
Select Case objVBScript.ScriptType
Case 0
strScriptType = "VB script is used"
Case 1
strScriptType = "C-Skript is used"
End Select
MsgBox strScriptType
End Sub
```

See also

ScriptInfo Object (Page 3424)

ScrollBars Property

Description

TRUE if the picture window has scroll bars in Runtime. BOOLEAN write-read access.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA710
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ScrollPositionX Property

Description

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA808
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ScrollPositionX = 50
.ScrollPositionY = 50
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ScrollPositionY Property

Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA809
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
```

```
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ScrollPositionX = 50
.ScrollPositionY = 50
.ServerPrefix = ""
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ScrollPosX Property

Description

Defines or returns the X position of the scroll bars for the View object.

Example:

In the following example a copy of the active picture is created and then activated. The position of the scroll bars will be set to 40 (X) and 10 (Y):

```
Sub CreateViewAndActivateView()
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
objView.ScrollPosX = 40
objView.ScrollPosY = 10
End Sub
```

See also

ScrollPosY Property (Page 3757)

View Object (Page 3466)

ScrollPosY Property

Description

Defines or returns the Y position of the scroll bars for the View object.

Example:

In the following example a copy of the active picture is created and then activated. The position of the scroll bars will be set to 40 (X) and 10 (Y):

```
Sub CreateViewAndActivateView()
Dim objView As HMIView
Set objView = ActiveDocument.Views.Add
objView.Activate
objView.ScrollPosX = 40
objView.ScrollPosY = 10
End Sub
```

See also

ScrollPosX Property (Page 3754)

View Object (Page 3466)

SelBGColor Property

Description

Defines or returns the background color for the selected entry in the case of the TextList object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the background color for the selected entry will be set to "Red":

```
Sub TextListConfiguration()
Dim objTextList As HMITextList
'
```

```
'Neue TextListe ins aktuelle Bild einfügen:
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.SelBGColor = RGB (255, 0, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

Selected Property

Description

TRUE if an object is selected in the picture. BOOLEAN write-read access.

Example:

In the following example two new objects will be inserted in the active picture and then selected:

```
Sub SelectObjects()
'VBA714
Dim objCircle As HMICircle
Dim objRectangle As HMIRectangle
Dim objGroup As HMIGroup
Set objCircle = ActiveDocument.HMIObjects.AddHMIObject("sCircle", "HMICircle")
Set objRectangle = ActiveDocument.HMIObjects.AddHMIObject("sRectangle", "HMIRectangle")
With objCircle
.Top = 40
.Left = 40
.Selected = True
End With
With objRectangle
.Top = 80
.Left = 80
.Selected = True
End With
MsgBox "Objects selected!"
End Sub
```

See also

HMIObject Object (Page 3357)

Selection Property

Description

Returns a listing containing all the objects selected in the specified picture.

To return an element from the Selection listing you can use either the index number or the object name.

You can use the Selection property, for example, to select all the objects in the picture.

Example:

In the following example all the objects in the active picture are selected:

```
Sub SelectAllObjectsInActiveDocument()
'VBA715
ActiveDocument.Selection.SelectAll
End Sub
```

See also

SelectedObjects object (Listing) (Page 3426)

Document Object (Page 3319)

SelIndex property

Description

Defines or returns the index of which the associated text is highlighted in the combobox or list box.

SelText property

Description

Shows the text defined with the "SelIndex" property which is highlighted in the ComboBox or ListBox object. You cannot directly change the "Selected text" attribute. You change the "Selected text" attribute by changing the "Selected box" attribute or the text itself in the "Font" properties group.

SelTextColor Property

Description

Defines or returns the text color for the selected entry in the TextList object. LONG write-read access.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Specify the corresponding decimal value for each of the three RGB values (value range from 0 to 255).

Use VBA function "RGB" to assign a color to a property. The color "red", for example, is represented as follows: RGB(255, 0, 0)

Example:

The "TextListConfiguration()" procedure accesses the properties of the object TextList. In this example the text color for the selected entry will be set to "Yellow":

```
Sub TextListConfiguration()
'VBA716
Dim objTextList As HMITextList
Set objTextList = ActiveDocument.HMIObjects.AddHMIObject("myTextList", "HMITextList")
With objTextList
.SelTextColor = RGB(255, 255, 0)
End With
End Sub
```

See also

TextList Object (Page 3441)

ServerName Property

Description

Returns the name of the specified ActiveX Control or of the embedded object. Read only access.

Example

In the following example the ActiveX Control "WinCC Gauge Control" will be inserted in the active picture and the name of the ActiveX Control will be output:

```
Sub AddActiveXControl()
'VBA717
```

```
Dim objActiveXControl As HMIActiveXControl
Set objActiveXControl = ActiveDocument.HMIObjects.AddActiveXControl("WinCC_Gauge",
"XGAUGE.XGaugeCtrl.1")
With objActiveXControl
.Top = 40
.Left = 60
MsgBox .Properties("ServerName").value
End With
End Sub
```

See also

ActiveXControl Object (Page 3273)

ServerPrefix Property

Description

Defines the server which will hold the picture that is displayed in the picture window in Runtime, or returns the name of the server.

Enter the server name followed by two colons: "<Servername>::". No check is made as to whether the server actually exists.

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA718
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = "my_Server::"
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ShortCut Property

Description

Defines or returns a shortcut key sequence for a user-defined menu entry or user-defined icon.

The following keys are permitted in combination with <CTRL>, <ALT> and <SHIFT>:

- Function keys <F1> to <F12>
- The letter keys <A> to <Z> and the number keys <0> to <9>.

The following are not supported: the keys on the alphanumeric keypad, the cursor keys (e.g. <Page Up>) and the remaining function keys such as <RETURN> and <ESC>. No distinction is made upper and lower case. Key combinations with two or more letters or numbers are not permitted, such as "CTRL+A+B", but the combination with two additional keys such as <CTRL +ALT+A" is allowed.

Notes on using the ShortCut property

The key sequences used must be unique within the user-defined menus and toolbars in a picture. Key sequences that you configure with VBA have priority over any key sequences that may be present in the Graphics Designer. Within the user-defined menus and toolbars, picture-specific key sequences have priority over application-specific key sequences.

Note

Shortcut key sequences are only executed if the menu entry or the icon is visible and active.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line. The first menu entry receives the shortcut key sequence <CTRL+SHIFT+M> for retrieval:

```
Sub CreateDocumentMenus()
'VBA719
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
'Add menu to menubar:
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
'Add menuitems to the new menu:
```

```
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "&My first Menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second Menuitem")
'
'Add seperator to menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
'Add submenu to the menu:
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "My first submenu")
'
'Add menuitems to the submenu:
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "My first submenuitem")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "My second
submenuitem")
'
ActiveDocument.CustomMenus("DocMenu1").MenuItems(1).ShortCut = "CTRL+SHIFT+M"
End Sub
```

ToolbarItem Object (Page 3448)

MenuItem Object (Page 3382)

ShowBadTagState property

Description

Determines if the object is grayed out when a bad quality code or tag status is detected. At both objects, "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay", the property is used to specify whether the settings for the "PaintColor_QualityCodeBad" and "PaintColor_QualityCodeUnCertain" properties are used.

SignificantMask Property

Description

Needed in Runtime for displaying the active message class with the highest priority in the GroupDisplay object.

The value of the SignificantMask property represents an internal system output value does not require any specific configuration by the user. Updating takes place in Runtime by clicking on the object.

Example:

--

See also

GroupDisplay Object (Page 3350)

Simulation property

Description

Specifies the interconnection with any tag that is used for simulation.

SimulationBit property

Description

Shows the bit position of the linked simulation tags that is used for evaluation.

The value of the simulation tag is only evaluated with the alarm status "OK".

Size Property

Description

Defines or returns the font size in points for a language-dependent font.

Example:

The following example sets the font attributes of a button for French and English:

```
Sub ExampleForLanguageFonts()
'VBA721
Dim colLangFonts As HMILanguageFonts
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
objButton.Text = "DefText"
Set colLangFonts = objButton.LDFonts
'
'Set font-properties for french:
With colLangFonts.ItemByLCID(1036)
.Family = "Courier New"
.Bold = True
.Italic = False
.Underlined = True
.Size = 12
End With
'
'Set font-properties for english:
With colLangFonts.ItemByLCID(1033)
.Family = "Times New Roman"
```

```
.Bold = False
.Italic = True
.Underlined = False
.Size = 14
End With
End Sub
```

Family Property (Page 3587)

Bold Property (Page 3513)

Application Property (Page 3484)

LanguageFont Object (Page 3365)

Sizeable Property

Description

TRUE if the size of the ApplicationWindow and PictureWindow objects can be changed in Runtime. BOOLEAN write-read access.

Example:

The "ApplicationWindowConfig" procedure accesses the properties of the application window. In this example it is intended that the application window can be resized in Runtime:

```
Sub ApplicationWindowConfig()
'VBA722
Dim objAppWindow As HMIApplicationWindow
Set objAppWindow = ActiveDocument.HMIObjects.AddHMIObject("AppWindow1",
"HMIApplicationWindow")
With objAppWindow
.Sizeable = True
End With
End Sub
```

See also

PictureWindow Object (Page 3396)

ApplicationWindow Object (Page 3284)

SmallChange Property

Description

Defines how many steps the controller can be moved with one mouse click or returns the value.

Example:

The "SliderConfiguration()" procedure accesses the properties of the slider. In this example the number of steps will be set to "4":

```
Sub SliderConfiguration()
'VBA723
Dim objSlider As HMISlider
Set objSlider = ActiveDocument.HMIObjects.AddHMIObject("SliderObject1", "HMISlider")
With objSlider
.SmallChange = 4
End With
End Sub
```

See also

Slider object (Page 3428)

SnapToGrid Property

Description

TRUE if objects in the picture are aligned on the grid (which is invisible). BOOLEAN write-read access.

Example:

In the following example, the alignment of objects in the active picture on the grid is activated:

```
Sub ActivateSnapToGrid()
'VBA724
ActiveDocument.SnapToGrid = True
End Sub
```

See also

Document Object (Page 3319)

SourceLink Property

Description

Returns the Source object. Use the SourceLink property to configure the source object in the case of a direct connection.

Example:

In the following example the X position of "Rectangle_A" is copied to the Y position of "Rectangle_B" in Runtime by clicking on the button:

```
Sub DirectConnection()
'VBA725
Dim objButton As HMIButton
Dim objRectangleA As HMIRectangle
Dim objRectangleB As HMIRectangle
Dim objEvent As HMIEvent
Dim objDirConnection As HMIDirectConnection
Set objRectangleA = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_A", "HMIRectangle")
Set objRectangleB = ActiveDocument.HMIObjects.AddHMIObject("Rectangle_B", "HMIRectangle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objRectangleA
.Top = 100
.Left = 100
End With
With objRectangleB
.Top = 250
.Left = 400
.BackColor = RGB(255, 0, 0)
End With
With objButton
.Top = 10
.Left = 10
.Width = 100
.Text = "SetPosition"
End With
'
'Directconnection is initiated by mouseclick:
Set objDirConnection =
objButton.Events(1).Actions.AddAction(hmiActionCreationTypeDirectConnection)
With objDirConnection
'Sourceobject: Property "Top" of Rectangle_A
.SourceLink.Type = hmiSourceTypeProperty
.SourceLink.ObjectName = "Rectangle_A"
.SourceLink.AutomationName = "Top"
'
'Targetobject: Property "Left" of Rectangle_B
```

```
.DestinationLink.Type = hmiDestTypeProperty
.DestinationLink.ObjectName = "Rectangle_B"
.DestinationLink.AutomationName = "Left"
End With
End Sub
```

Type Property (Page 3792)

ObjectName Property (Page 3698)

AutomationName Property (Page 3488)

SourceLink Object (Page 3431)

DirectConnection Object (Page 3318)

SourceCode Property

Description

Defines or returns the source code of a C script or VB script.

If you assign a C script to the SourceCode property, you must enter only the program code located between the braces ("{}").

If you assign a VB script to the SourceCode property, you must enter only the program code located between the Sub and EndSub keywords.

Note

If you use single quote marks (') or double quote marks (") in the program code, you must enter an additional quote mark in front of every single or double quote mark so that the program code can be correctly interpreted in the VBA editor.

The Compiled property returns TRUE if the source code was successfully compiled.

Example:

In the following example a button and a circle will be inserted in the active picture. In Runtime the radius of the circle will enlarge every time you click the button. A VB script will be used for this purpose:

```
Sub IncreaseCircleRadiusWithVBScript()
'VBA726
Dim objButton As HMIButton
Dim objCircleA As HMICircle
Dim objEvent As HMIEvent
Dim objVBScript As HMIScriptInfo
```

```
Dim strCode As String
strCode = "Dim objCircle" & vbCrLf & "Set objCircle = "
strCode = strCode & "hmiRuntime.ActiveScreen.ScreenItems(""CircleVB"")"
strCode = strCode & vbCrLf & "objCircle.Radius = objCircle.Radius + 5"
Set objCircleA = ActiveDocument.HMIObjects.AddHMIObject("CircleVB", "HMICircle")
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("myButton", "HMIButton")
With objCircleA
.Top = 100
.Left = 100
End With
With objButton
.Top = 10
.Left = 10
.Width = 200
.Text = "Increase Radius"
End With
'
'On every mouseclick the radius have to increase:
Set objEvent = objButton.Events(1)
Set objVBScript = objButton.Events(1).Actions.AddAction(hmiActionCreationTypeVBScript)
objVBScript.SourceCode = strCode
Select Case objVBScript.Compiled
Case True
MsgBox "Compilation ok!"
Case False
MsgBox "Error on compilation!"
End Select
End Sub
```

Compiled Property (Page 3556)

ScriptInfo Object (Page 3424)

StartAngle Property

Description

Defines or returns the start of the object for the CircularArc, EllipseArc, EllipseSegment and PieSegment objects. The information is in counterclockwise direction in degrees, beginning at the 12:00 clock position.

Example:

The "PieSegmentConfiguration()" procedure accesses the properties of the Pie Segment. In this example the pie segment begins at 40° and ends at 180°:

```
Sub PieSegmentConfiguration()
'VBA727
```

```
Dim PieSegment As HMIPieSegment
Set PieSegment = ActiveDocument.HMIObjects.AddHMIObject("PieSegment1", "HMIPieSegment")
With PieSegment
.StartAngle = 40
.EndAngle = 180
End With
End Sub
```

See also

EndAngle Property (Page 3580)

PieSegment Object (Page 3399)

EllipseSegment Object (Page 3333)

EllipseArc Object (Page 3330)

CircularArc Object (Page 3303)

StatusText Property

Description

Defines or returns the text that will be displayed in the status bar when you point with the mouse to a user-defined menu entry or user-defined icon.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line. A status bar entry will be defined for each menu entry:

```
Sub CreateDocumentMenus()
'VBA728
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
'Add menu:
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
'Add menuitems to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "My first menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second menuitem")
'
'Add seperator to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
'Add submenu to custom-menu:
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "My first submenu")
```

```
'
'Add menuitems to submenu:
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "My first submenuitem")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "My second
submenuitem")
'
'Assign statustexts to every menuitem
With objDocMenu
.MenuItems(1).StatusText = "My first menuitem"
.MenuItems(2).StatusText = "My second menuitem"
.MenuItems(4).SubMenu.Item(1).StatusText = "My first submenuitem"
.MenuItems(4).SubMenu.Item(2).StatusText = "My second submenuitem"
End With
End Sub
```

MenuItem Object (Page 3382)

SubMenu Property

Description

Returns a MenuItems listing if the specified object is the "SubMenu" type.

Use the SubMenu listing if you wish to create a submenu in a user-defined menu.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA730
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
'Add menu:
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
'Add menuitems to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "My first menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second menuitem")
'
'Add seperator to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
```

```
'
'Add submenu to custom-menu:
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "My first submenu")
'
'Add menuitems to submenu:
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "My first submenuitem")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "My second
submenuitem")
End Sub
```

MenuItem Object (Page 3382)

SymbolLibraries Property

Description

Returns a SymbolLibraries listing containing objects of the "SymbolLibrary" type.

Use SymbolLibraries(1) to return the "Global Library". Use SymbolLibraries(2) to return the "Project Library".

Example:

In the following example the names of the libraries will be output:

```
Sub ShowSymbolLibraries()
'VBA731
Dim colSymbolLibraries As HMISymbolLibraries
Dim objSymbolLibrary As HMISymbolLibrary
Set colSymbolLibraries = Application.SymbolLibraries
For Each objSymbolLibrary In colSymbolLibraries
MsgBox objSymbolLibrary.Name
Next objSymbolLibrary
End Sub
```

T

TabOrderAlpha Property

Description

Defines or returns the position of the object in the TAB sequence for the alpha / tab order cursor.

Example:

In this example two I/O fields will be inserted in the active picture and the TAB sequence will then be defined:

```
Sub IOFieldConfig()
'VBA734
Dim objIOField1 As HMIIOField
Dim objIOField2 As HMIIOField
Set objIOField1 = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
Set objIOField2 = ActiveDocument.HMIObjects.AddHMIObject("IOField2", "HMIIOField")
With objIOField1
.Top = 10
.Left = 10
.TabOrderAlpha = 1
End With
With objIOField2
.Top = 100
.Left = 10
.TabOrderAlpha = 2
End With
End Sub
```

TabOrderAllHMIObjects Property

Description

TRUE if all the objects in a picture are to be included in the configured TAB sequence. BOOLEAN write-read access.

Example:

The "ConfigureTabOrder()" procedure defines which objects in the active picture are to be included in the configured TAB sequence. In this example all the objects will be included in the TAB sequence:

```
Sub ConfigureTabOrder()
'VBA733
With ActiveDocument
.TABOrderAllHMIObjects = True
.TABOrderKeyboard = False
.TABOrderMouse = False
.TABOrderOtherAction = False
End With
End Sub
```

TabOrderKeyboard Property

Description

TRUE if objects with a keyboard operation event configured to them are to be included in the configured TAB sequence. BOOLEAN write-read access.

Example:

The "ConfigureTabOrder()" procedure defines which objects in the active picture are to be included in the configured TAB sequence. In this example objects with a keyboard operation will be included in the TAB sequence:

```
Sub ConfigureTabOrder()
'VBA735
With ActiveDocument
.TABOrderAllHMIObjects = True
.TABOrderKeyboard = False
.TABOrderMouse = False
.TABOrderOtherAction = False
End With
End Sub
```

TabOrderMouse Property

Description

TRUE if objects with a mouse operation event configured to them are to be included in the configured TAB sequence. BOOLEAN write-read access.

Example:

The "ConfigureTabOrder()" procedure defines which objects in the active picture are to be included in the configured TAB sequence. In this example objects with a mouse operation event will be included in the TAB sequence:

```
Sub ConfigureTabOrder()
'VBA736
With ActiveDocument
.TABOrderAllHMIObjects = True
.TABOrderKeyboard = False
.TABOrderMouse = False
.TABOrderOtherAction = False
End With
End Sub
```

TabOrderOtherAction Property

Description

TRUE if objects with an event other than a mouse or keyboard operation event configured to them are to be included in the configured TAB sequence. BOOLEAN write-read access.

Example:

The "ConfigureTabOrder()" procedure defines which objects in the active picture are to be included in the configured TAB sequence. In this example objects with events other than a mouse or keyboard operation will be included in the TAB sequence:

```
Sub ConfigureTabOrder()
'VBA737
With ActiveDocument
.TABOrderAllHMIObjects = True
.TABOrderKeyboard = False
.TABOrderMouse = False
.TABOrderOtherAction = False
End With
End Sub
```

TabOrderSwitch Property

Description

Defines or returns the position of the object in the TAB sequence.

Example:

In this example two I/O fields will be inserted in the active picture and the TAB sequence will then be defined:

```
Sub IOFieldConfig()
'VBA732
Dim objIOField1 As HMIIOField
Dim objIOField2 As HMIIOField
Set objIOField1 = ActiveDocument.HMIObjects.AddHMIObject("IOField1", "HMIIOField")
Set objIOField2 = ActiveDocument.HMIObjects.AddHMIObject("IOField2", "HMIIOField")
With objIOField1
.Top = 10
.Left = 10
.TabOrderSwitch = 1
End With
With objIOField2
.Top = 100
```

```
.Left = 10
.TabOrderSwitch = 2
End With
End Sub
```

HMIObject Object (Page 3357)

Tag Property

Description

Defines or returns information text for a user-defined menu entry or user-defined icon. You can use the Tag property for example to briefly describe what the menu entry does.

Example:

In the following example, a user-defined menu with two menus entries and a submenu with two entries will be created in the active picture. The submenu will be visually distinguished by a dividing line:

```
Sub CreateDocumentMenus()
'VBA738
Dim objDocMenu As HMIMenu
Dim objMenuItem As HMIMenuItem
Dim objSubMenu As HMIMenuItem
'
'Add menu:
Set objDocMenu = ActiveDocument.CustomMenus.InsertMenu(1, "DocMenu1", "Doc_Menu_1")
'
'Add menuitems to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(1, "dmItem1_1", "My first menuitem")
Set objMenuItem = objDocMenu.MenuItems.InsertMenuItem(2, "dmItem1_2", "My second menuitem")
'
'Add seperator to custom-menu:
Set objMenuItem = objDocMenu.MenuItems.InsertSeparator(3, "dSeparator1_3")
'
'Add submenu to custom-menu:
Set objSubMenu = objDocMenu.MenuItems.InsertSubMenu(4, "dSubMenu1_4", "My first submenu")
'
'Add menuitems to submenu:
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(5, "dmItem1_5", "My first submenuitem")
Set objMenuItem = objSubMenu.SubMenu.InsertMenuItem(6, "dmItem1_6", "My second
submenuitem")
'
'To place an additional information:
With objDocMenu
.MenuItems(1).Tag = "This is the first menuitem"
```

```
End With
End Sub
```

ToolbarItem Object (Page 3448)

MenuItem Object (Page 3382)

Tag property

Description

Is used for the "Graphic Object Update Wizard" tool and is not evaluated for the "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay" objects.

tagname property

Description

Is used for the "Graphic Object Update Wizard" tool and is not evaluated for the "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay" objects.

TagPrefix Property

Description

Defines or returns the tag prefix for all the tags contained in the Picture Window object.

Example:

The picture "InputOutput" is to be displayed in the picture window. The picture "InputOutput" contains three I/O fields which are linked to a structure tag. The structure tag consists of the elements EA1, EA2, EA3; one element each for each I/O field.

Three such structure tags have been define in the project, with structure names Struct1, Struct2 and Struct3.

The tag prefix is in this case the structure name followed by a period. Specify the tag prefix as, say, Struct2. (the period is necessary in order to address the elements of the structure tag as structure elements in a syntactically correct way). The I/O fields in the picture "InputOutput" are then linked to the elements in structure tag Struct2:

Tag Prefix: "Struct2."

- Output value (first I/O field): EA1
- Output value (second I/O field): EA2
- Output value (third I/O field): EA3

The current tag connection in the picture window is then

- Output value (first I/O field): Struct2.EA1
- Output value (second I/O field): Struct2.EA2
- Output value (third I/O field): Struct2.EA3

Example:

The "PictureWindowConfig" procedure accesses the properties of the picture window. In this example the picture window will be configured:

```
Sub PictureWindowConfig()
'VBA739
Dim objPicWindow As HMIPictureWindow
Set objPicWindow = ActiveDocument.HMIObjects.AddHMIObject("PicWindow1", "HMIPictureWindow")
With objPicWindow
.AdaptPicture = False
.AdaptSize = False
.Caption = True
.CaptionText = "Picturewindow in runtime"
.OffsetLeft = 5
.OffsetTop = 10
'Replace the picturename "Test.PDL" with the name of
'an existing document from your "GraCS"-Folder of your active project
.PictureName = "Test.PDL"
.ScrollBars = True
.ServerPrefix = "my_Server::"
.TagPrefix = "Struct."
.UpdateCycle = 5
.Zoom = 100
End With
End Sub
```

PictureWindow Object (Page 3396)

TagScaleParam1 property

Description

Sets the value1 for the value range process.

TagScaleParam2 property

Description

Sets the value2 for the value range process.

TagScaleParam3 property

Description

Sets the value3 for the value range process.

TagScaleParam4 property

Description

Sets the value4 for the value range process.

TagStartvaluePersistence property

Description

Defines whether an internal tag is set as persistent. You can only set internal tags as persistent.

tagtype property

Description

Is used for the "Graphic Object Update Wizard" tool and is not evaluated for the "HMIAdvancedAnalogDisplay" and "HMIAdvancedStateAnalogDisplay" objects.

Template property

Description

Returns the template for displaying the window content of the "ApplicationWindow" object. Read only access.

The "ApplicationWindow" object can be supplied from applications of the Global Script and the report system:

GSC Diagnostics	The application window is supplied by applications of the Global Script. The results of the diagnostics system are displayed.
GSC Runtime	The application window is supplied by applications of the Global Script. The analysis results regarding characteristics in Runtime are displayed.
All Jobs	The application window is supplied by the report system. The available reports are displayed as a list.
All Jobs – Shortcut Menu	The application window is supplied by the report system. The available reports are displayed as a list. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the report.

Job Detail View	The application window is supplied by the report system. The available reports are displayed in a selection menu. Detailed information is displayed for the selected report.
Selected Jobs - Shortcut Menu	The application window is supplied by the report system. The available reports are displayed as a list. This list only contains reports which you have activated the option "Mark for print job list" in the "Print Job Properties" dialog. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the report.

ApplicationWindow Object (Page 3284)

Text Property

Description

Defines or returns the labeling for an object.

Example:

The "ButtonConfiguration()" procedure accesses the properties of the button. In this example the label will be defined:

```
Sub ButtonConfiguration()
'VBA740
Dim objButton As HMIButton
Set objButton = ActiveDocument.HMIObjects.AddHMIObject("Button1", "HMIButton")
With objButton
.Text = "Button1"
End With
End Sub
```

Toggle Property

Description

TRUE, if the button or round button should lock after being operated in Runtime. BOOLEAN write-read access.

Example:

The "RoundButtonConfiguration()" procedure accesses the properties of the RoundButton. In this example the round button is intended to latch down when pressed in Runtime:

```
Sub RoundButtonConfiguration()
'VBA741
Dim objRoundButton As HMIRoundButton
Set objRoundButton = ActiveDocument.HMIObjects.AddHMIObject("RButton1", "HMIRoundButton")
With objRoundButton
.Toggle = True
End With
End Sub
```

See also

RoundButton Object (Page 3418)

ToleranceHigh Property

Description

Defines or returns the limit value for "Tolerance high".

The type of the evaluation (in percent or absolute) is defined in the TypeToleranceHigh property.

Monitoring of the limit value only takes effect when the CheckToleranceHigh property is set to "True".

Example:

The "BarGraphLimitConfiguration()" procedure configures the properties of the limit values. In this example the limit value for "Tolerance High" will be configured:

```
Sub BarGraphLimitConfiguration()
'VBA742
Dim objBarGraph As HMIBarGraph
Set objBarGraph = ActiveDocument.HMIObjects.AddHMIObject("Bar1", "HMIBarGraph")
With objBarGraph
'Set analysis = absolute
.TypeToleranceHigh = False
'Activate monitoring
.CheckToleranceHigh = True
'Set barcolor = "yellow"
.ColorToleranceHigh = RGB(255, 255, 0)
'Set upper limit to "40"
.ToleranceHigh = 40
End With
End Sub
```
