Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠ DANGER

indicates that death or severe personal injury **will** result if proper precautions are not taken.

⚠ WARNING

indicates that death or severe personal injury **may** result if proper precautions are not taken.

⚠ CAUTION

indicates that minor personal injury can result if proper precautions are not taken.

NOTICE

indicates that property damage can result if proper precautions are not taken.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

⚠ WARNING

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.

VBS for Creating Procedures and Actions

1

1.1 VBS for creating procedures and actions

Contents

WinCC provides the possibility of dynamizing the Runtime environment using the Visual Basic Script. It is possible to use VBS to program global actions and procedures as well as dynamizing graphic objects and triggering actions in Runtime.

This chapter will show you

- How to work with VBScript editors
- How to create and edit procedures
- How to create and edit actions
- How to activate VBScripts in Runtime
- How to execute diagnostics on scripts in Runtime
- The object model of graphic Runtime system
- Detailed examples on using VBScript

1.2 Using Visual Basic Script in WinCC

Introduction

In addition to the C script, WinCC also provides the VBScript program language as a programming interface in order to make the WinCC Runtime environment dynamic.

Target Group of the Documentation

This documentation is aimed at project engineers with experience of Visual Basic or WinCC Scriptings (C) used to date.

Application Options

VBScript (VBS) provides access to tags and objects of the graphical Runtime system at Runtime and can execute picture-independent functions:

- Tags: Tag values can be read and written in order, for example, to specify tag values for the PLC by clicking the mouse when positioned on a button.
- Objects: Object properties can be made dynamic using actions and actions can be triggered by events influencing objects.
- Picture-independent Actions: Picture-independent actions can be triggered cyclically or according to tag values, e.g. for the daily transfer of values into an Excel table.

VBS can be used at the following points in WinCC:

- In the Global Script Editor: This is used to configure picture-independent actions and procedures. The procedures can be used in picture-dependent and picture-independent actions. Several procedures are compiled in a topic-related module.
- In Graphics Designer: Picture-dependent actions can be configured with which the properties of graphic objects can be made dynamic or caused to respond to events in Runtime.
- In user-defined menus and toolbars: Here you configure procedures called in Runtime using the menu and toolbars.

Note

Updating Changed Configuration in Runtime

A changed VB script that is connected with "Menus and toolbars" is only updated after Runtime is restarted.

If you change the properties of "Menus and toolbars" in Runtime, the changes are only applied in the following cases:

- After a picture change, if the configuration change does not affect the basic picture.
- When you load another configuration file and reload the modified configuration file.

Registered Tags in Menus and Toolbars

The registered tags in the scripts of "Menus and toolbars" remain registered when you unselect the picture. If you read indirectly from a process mapping the tags are registered and unregistered again when you unselect the picture. However, registered tags in the scripts of "Menus and toolbars" remain registered when you unselect the picture.

Application Scenarios

VBS can be used in Runtime, for example:

- to configure setpoint value specification for tags for the operation of a graphic object in order to define a value for the PLC by clicking a mouse, for example.
- to configure switching the Runtime language for the operation of a graphic object.
- to configure the change of color, e.g. cyclically (flashing) or to display statuses (motor on).

Apart from the specific WinCC applications, the general functionality of VBS can also be used to customize the Windows environment, e.g.:

- to transfer data to another application (e.g. Excel).
- to start external applications from WinCC.
- to create files and folders.

The automation objects in your environment are available with which to customize the Windows environment.

Note

All the objects supplied with the Windows Script Host (WSH) from Microsoft can be integrated in the environment using the standard VBS method CreateObject. However, there is no direct access to the WSH object itself using VBS from WinCC.

There is no guarantee nor WinCC support for the VBS functionality with regard to its adaptation to the Windows environment.

Limits to Other Programming Languages in WinCC

VBS and C

VBScript can be used in WinCC parallel to C-Script, but do not mix the script types:

- VBScripts and C-scripts can be configured within a picture and project.
- C-scripts cannot be invoked in VBScripts and vice versa.
- VBS provides internal interfaces to tags and picture objects while the C environment enables access to other WinCC subsystems (e.g. the report system).

VBS and VBA

VBA is used in WinCC Configuration during the configuration in order to adapt Graphics Designer to your individual requirements and to simplify and automate configuration. VBA programs only run in the WinCC configuration environment.

As opposed to VBA, VB scripts only run in WinCC Runtime and, from there, enable access to graphic objects and tags. Objects and pictures can be neither created nor modified on a permanent basis in VBS, as opposed to VBA.

The main language-related differences between VBA and VBS are e.g.:

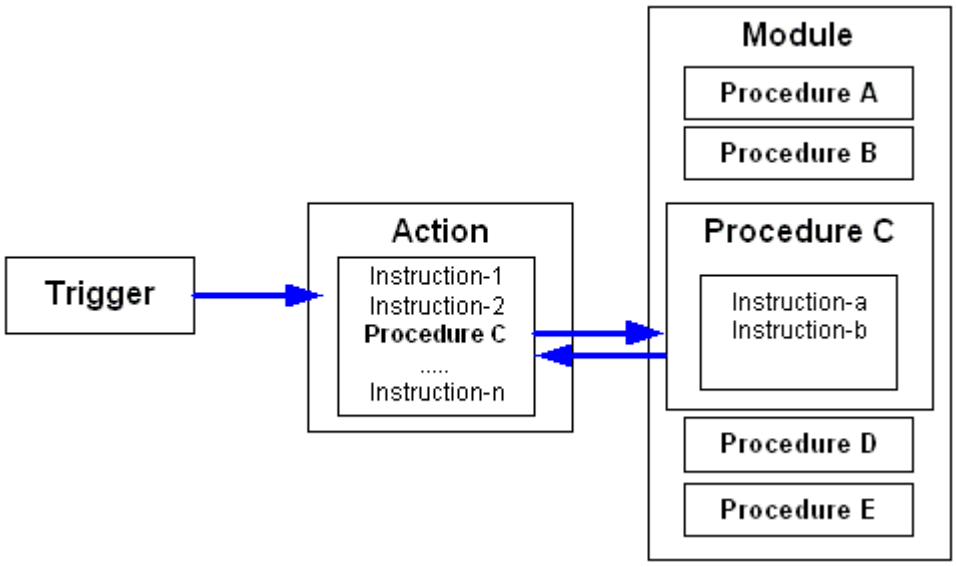
- VBS was developed for use in Internet, VBA for the automation of software applications.
- The data type of VBS tags is always VARIANT. VBA, on the other hand, differentiates the individual data types such as INT, DOUBLE, STRING, etc.
- Certain language constructs from VBA have been removed from or added to VBS.
- Errors are handled differently in VBS compared to VBA.

A complete list of the differences between VBA and VBS is provided in the Appendix in "Basic Principles of VBScript".

Procedures, Modules and Actions

VBS in WinCC allows the use of procedures, modules and actions to make the Runtime environment dynamic:

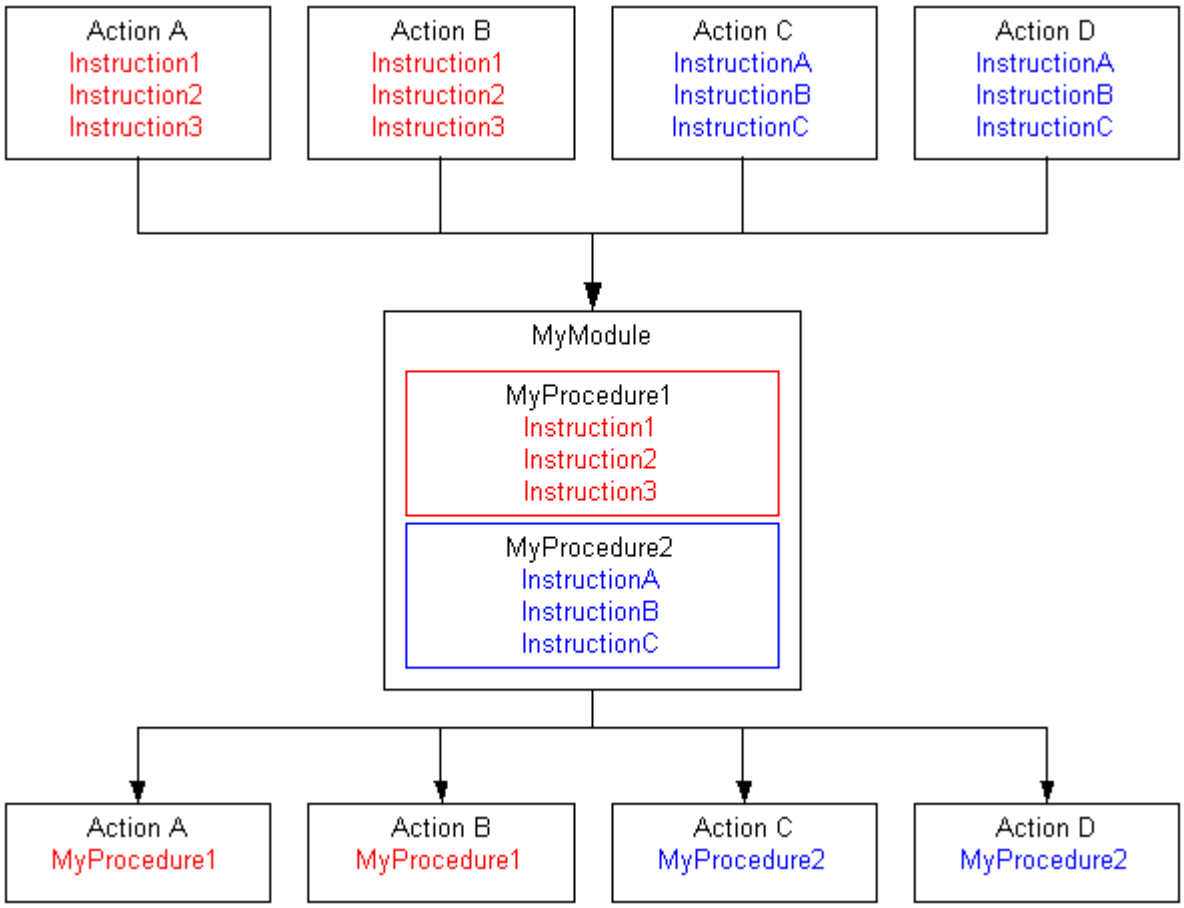
- Procedures: Codes are stored in procedures which are then used at several points in the configuration. Retrieve the code or another procedure in an action by invoking the procedure name. Procedures can be created in WinCC with or without return values. Procedures do not have their own trigger, they are always retrieved by an action.
- Modules: It is advantageous to compile related procedures to units in modules. Create modules for procedures, for example, which must be used in a specific picture or belong to a specific topic, such as auxiliary mathematical functions or database access functions.
- Actions: Actions are always activated by a trigger, namely a triggering event. Actions are configured in graphic object properties, in events which occur on a graphic object or globally in a project. Codes used several times can be called, in the form of procedures, in actions.



1.3 Modules and Procedures

Introduction

Procedures are used to make code, created only once, available at several points in a project. Instead of entering the code several times, simply call in the corresponding procedure. The code is clearer and easier to maintain.

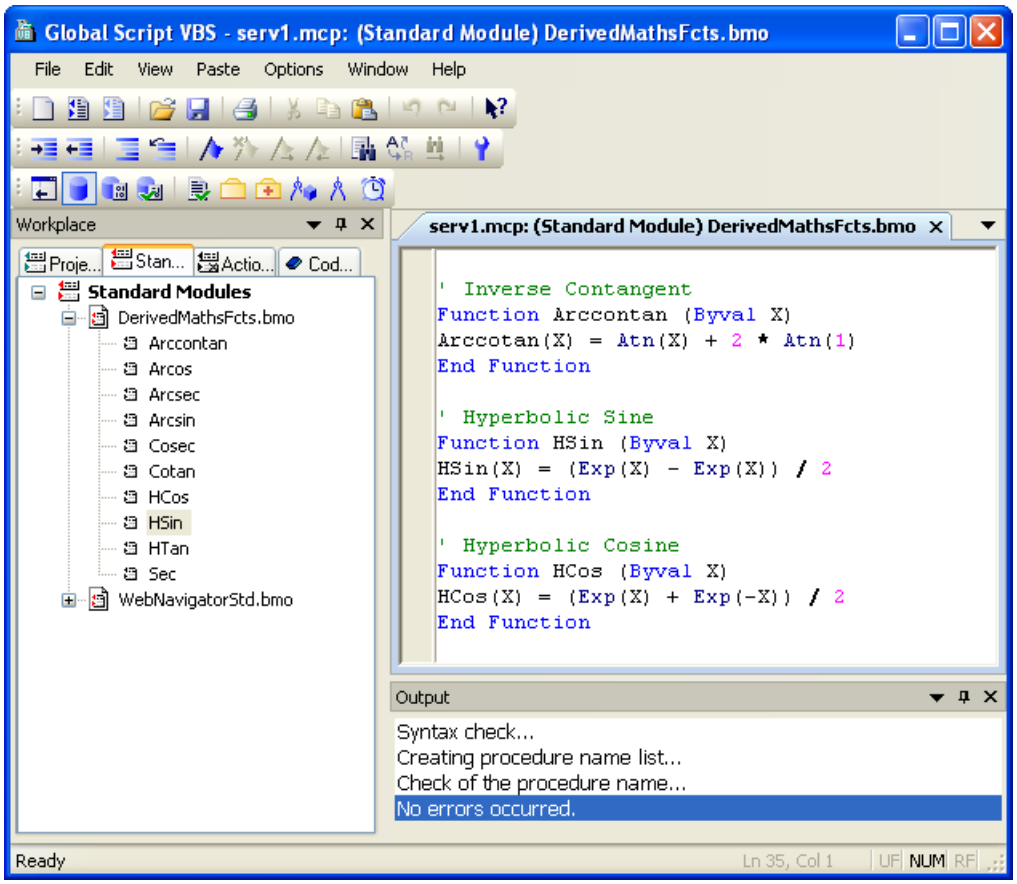


Related procedures should be stored in modules. When a certain procedure is retrieved via an action in Runtime, the module that contains that procedure is loaded. Observe the following when structuring the modules and procedures:

- The more modules that must be loaded when a picture is called in, the worse the performance in Runtime.
- The larger a module, the more procedures are contained and, thus, the longer the loading time for the module.

Organize the modules sensibly, e.g. a module with procedures for a specific system part/ picture.

Another type of structuring of procedures in modules is the functional structuring, e.g. a module containing mathematical functions. Use this structure, for example, for modules which should be used globally for projects. The following example illustrates a module containing mathematical functions derived from the standard functions:



Procedure Features

The procedures in WinCC have the following properties:

- They are created and modified by the user.
- They can be protected against modification and viewing by means of a password.
- They do not have a trigger.
- They are stored in a module.

WinCC does not provide predefined procedures, but does provide code templates and Intellisense, for example, to simplify programming. Procedures differ according to module assignment in:

- Standard procedures apply globally to projects located on the computer on which they were created.
- Project procedures can only be used within the project in which they were created.

Module Features

A module is a file in which one or procedures is stored. The modules in WinCC have the following properties:

- They can be protected against modification and viewing by means of a password.
- The have the file extension *.bmo.

Modules differ according to the validity of their procedures in:

- Standard Modules: Contain procedures which are globally available to the project. Standard modules are stored in the WinCC file system under: <WinCC-Installationsverzeichnis> \ApLib\ScriptLibStd\<Modulname>.bmo
- Project Modules: Contain project-specific procedures. Project modules are stored in the WinCC file system under: <Projektverzeichnis>\ScriptLib\<Modulname>.bmo. Since the project modules are stored in the project directory, they are copied when the WinCC project is copied.

Note

If WinCC must be reinstalled and the standard procedures and modules need to be used again, save the module files prior to the reinstallation in a different directory and copy them in the relevant WinCC directory after the reinstallation has been completed. Otherwise, the standard modules in the WinCC installation directory are deleted during the installation routine.

Using Procedures and Modules

Procedures are used in:

- Actions (in Graphics Designer and Global Script)
- Other procedures (in Global Script)
- User-defined menus and toolbars

Procedures are structured in modules.

VBScript Editors (Page 40)

Basic Principles of VBScript (Page 839)

Actions (Page 32)

Using Visual Basic Script in WinCC (Page 26)

1.4 Actions

Introduction

An action is always started by a trigger. An action, for example, is triggered in Runtime when an object is operated by a mouse click, a certain time has occurred or a tag has been modified.

Action Features

Actions are defined once in Global Script and then available independent of the picture. Global Script actions are only valid in the project in which they were defined. Actions linked to a graphic object are only valid in the picture in which they were defined.

Note

VBS does not currently allow the creation of computer-specific actions.

The following applies for clients in a multi-user system: All global actions configured on a server are also executed on a client when a project is opened.
The following applies to clients in a distributed system: If actions should be used on a client computer, copy all the action files in the corresponding project directory on the client.

Actions have the following properties:

- Actions are created and modified by the user.
- Actions in Global Script can be protected against modification and viewing by means of a password.
- Actions have at least one trigger.
- Actions in Global Script have the file extension *.bac.
- Global Script actions are stored in the WinCC file system under: <Projektverzeichnis> \ScriptAct\Aktionsname.bac

Action Trigger

Triggers are required to execute actions in Runtime. A trigger is linked to an action thus forming the triggering event which calls the action. Actions without triggers will not be carried out.

The following trigger types are available in WinCC:

- Timer: Acyclic or cyclic trigger, e.g. for calling a picture or every hour.
- Tags: Change of value
- Event: Modification of object properties (e.g. change of color) or event on an object (e.g. mouse click).

Processing of Actions in Runtime

In Graphics Designer

Two actions of the same type can be executed simultaneously in Runtime. In order, for example, that cyclic actions are not hindered by an action executed by a mouse click, event triggered actions and cyclic/tag triggered actions in Graphics Designer are executed independently of each other.

Note

Please note that synchronization between both action types in WinCC may only be executed by the DataSet object or by internal WinCC tags. As a result of the separate processing, no common data area exists between event triggered and cyclic/tag triggered actions.

If processing cyclic actions in pictures, for example, is prevented by a high system load or another action, the action is started once at the next opportunity. Cycles which are not executed are not retained in a queue but rejected.

After a change of picture, scripts still running are automatically stopped 1 minute after the change of picture.

Scripts which are still running when Runtime is terminated are stopped after 5 seconds.

In Global Script

Picture-independent actions from Global Script are executed in Runtime in succession after being triggered. If an action is triggered while another action is in progress, the second action is retained in a queue until it can be executed.

Note

Please note that synchronization between actions in Global Script and in Graphics Designer may only be executed by the DataSet object or by internal WinCC tags. There is no common data area between the actions in Graphics Designer and in Global Script.

Using the Actions

Actions can be used as follows:

- In Global Script The global actions defined here run picture-independent in Runtime.
- In Graphics Designer: The actions defined here only run in the configured picture. An action is configured in Graphics Designer on an object property or an event on a graphic object.

Creating and Editing Actions (Page 66)

Basic Principles of VBScript (Page 839)

Modules and Procedures (Page 29)

Using Visual Basic Script in WinCC (Page 26)

1.5 Multiple Use of Procedures and Actions

Introduction

An action configured with VBS in WinCC is always valid for the project in which it was defined.

Procedures have the following areas of application:

- Standard procedures apply globally to projects located on the computer on which they were created.
- Project procedures can only be used in the project in which they were created. If a project is copied, the project procedures (modules) are copied together with the project.

Multiple Use of Procedures and Actions

If actions or procedures/modules are to be used in other projects or on other computers, it is possible either to:

- use the "Save As" function to store the action or module in a different project directory or, for example, on a disk.
- to copy the action or module file in Windows Explorer and paste it in the corresponding project or standard directory on the target computer.

The properties and trigger configured are retained during copying. Copied modules are directly available in Runtime. Copied actions are executed in Runtime after they have been opened and stored once.

Note

Tags used in an action or procedure must also be available on the target computer. If the tag is not available, the action or procedure is not executed.

Procedures which are called in an action must be available on the target computer. If the procedure is not available, a Runtime error occurs during Runtime.

Storing Procedures

If procedures need to be copied in other project directories in order to be able to use then in other projects or different computers, observe the storage path of the procedures in the WinCC file system:

- Standard procedures: <WinCC-Installationsverzeichnis>\ApLib\ScriptLibStd \Modulname.bmo
- Project procedures: <Projektverzeichnis>\ScriptLib\Modulname.bmo

Note

Since procedures are always stored in modules, always copy the module (*.bmo) in which the procedure is contained.

The copied procedures/modules are visible after updating the Global Script navigation window (context menu command "Update") or restarting the editor.

Storing Actions

If actions need to be copied in other project directories in order to be able to use then in other projects or different computers, observe the storage path of the actions in the WinCC file system:

<Projektverzeichnis>\ScriptAct\Aktionsname.bac

Each action is stored in a separate file. When an action is copied, all the triggers related to it are also copied.

Note

Only actions created in Global Script are stored in the WinCC file system. Actions which are programmed in Graphics Designer are always stored with the current picture and cannot be transferred individually. If a Graphics Designer picture is copied into another project directory, the actions stored with the picture are also copied.

The copied actions are visible after updating the Global Script navigation window (context menu command "Update") or restarting the editor.

1.6 Use of CrossReference

CrossReference and Tag Trigger

The CrossReference from WinCC can be used to quickly find all the application points of tags, even in VBS actions. Tag triggers in actions in Graphics Designer can be "linked" using CrossReference, i.e. replaced by other tags at all or selected points.

Note

Tags can also be directly linked in Graphics Designer by marking the graphic object and selecting the "Linking ..." command from the shortcut menu.

Further information on CrossReference is available in the WinCC documentation.

Actions and CrossReference

All the actions used in a picture can be displayed by means of the picture properties. To do this mark the picture in WinCC Explorer and select the "Properties" shortcut menu command. After double clicking on an entry, detailed information on the type of dynamics appears.

It is also possible to display all the tags and pictures used in actions by means of the WinCC CrossReference. CrossReference can also be used for the to link tag connections of Graphics Designer actions easily.

Tags and CrossReference

All tags addressed with the following standard formulation are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

```
' VBS1
HMIRuntime.Tags("Tagname")
```

If tags are addressed with different formulations in the code, this can be notified by the following section of the CrossReference:

```
' WINCC:TAGNAME_SECTION_START
Const TagNameInAction = "TagName"
' WINCC:TAGNAME_SECTION_END
```

The section can be inserted in VBS actions as often as required.

Note

It is not possible to guarantee the compilation of combined tag names from the CrossReference.

Pictures and CrossReference

All pictures addressed with the following standard formulation are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

```
'VBS2
HMIRuntime.BaseScreenName = "Screenname"
```

If pictures are addressed with different formulations in the code, this can be notified by the following section of the CrossReference:

```
' WINCC:SCREENNAME_SECTION_START
Const ScreenNameInAction = "ScreenName"
' WINCC:SCREENNAME_SECTION_END
```

The section can be inserted in VBS actions as often as required.

Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

Basic Principles of VBScript (Page 839)

Actions (Page 32)

Modules and Procedures (Page 29)

Using Visual Basic Script in WinCC (Page 26)

1.7 Using Global Tags in VBS

Introduction

Global tags can be defined in the Global Script Editor which can then be used in all actions and procedures.

Using Global Tags in Graphics Designer and Global Script

Observe the following conditions when using global tags in Graphics Designer and Global Script:

- In order to use a global tag in an action in Graphics Designer, call in the procedure in which the tag is defined so that the associated module is loaded in Runtime.
- In order to use a global tag in an action in Global Script, at least one procedure must be activated from the module in at least one global action in which the tag is defined so that the module is loaded in Global Script Runtime. This does not need to be the procedure in which the tag was defined.

This process is necessary because actions from Global Script and Graphics Designer are processed independently of each other in Runtime. There is no common data area between the two Runtime systems.

If you need to synchronize actions from Global Script and Graphics Designer, use the DataSet object or internal WinCC tags.

Using Global Tags in Graphics Designer

When using global tags in Graphics Designer, observe the following conditions:

- In order to use a global tag in cyclic or tag triggered action in Graphics Designer, call in the procedure in which the tag is defined. This also applies when the tag has already been called in an event triggered action.
- In order to use a global tag in an event triggered action in Graphics Designer, call in the procedure in which the tag is defined. This also applies when the tag has already been called in a cyclic or tag triggered action.

This process is necessary because the cyclic/tag triggered actions and the event triggered actions in Graphics Designer in Runtime are processed independently of each other in Runtime. There is no common data area between the two types of action.

If you need to synchronize cyclic or tag-triggered actions and event-triggered actions, use the DataSet object or internal WinCC tags.

In the case of Graphics Designer, it is also possible to define global tags in a separate declaration section. Because event-triggered and cyclic/tag-triggered actions are processed separately in Runtime, the global tags can only be jointly addressed within the event-triggered or cyclic/tag-triggered actions.

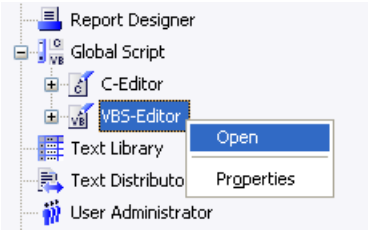
1.8 VBScript Editors

1.8.1 VBScript Editors

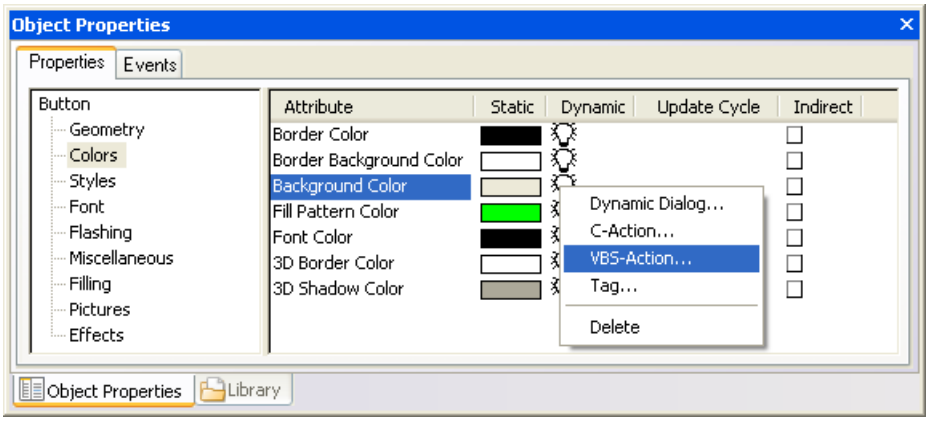
Introduction

VBScripts can be programmed at two points in WinCC:

- In Global Script Global Script is the central editor for VBS programming. Call it in via WinCC Explorer.



- In Graphics Designer: Graphics Designer can be used to program actions related to object properties or events related to graphic objects. The action editor in Graphics Designer is called in via the context menu in the Properties dialog of a graphic object.



Restrictions, Global Script - Graphics Designer

Graphics Designer can be used to program actions and picture-specific procedures but not global procedures valid for the entire project. However, global procedures which were programmed in Global Script can be called in.

Note

This documentation is used primarily to describe Global Script and, if necessary, makes reference to deviations in the functionality compared to Graphics Designer. A detailed description of the Graphics Designer action editor is provided in the WinCC help topic "Dynamization".

Further Information

Further information on "Dynamization" is available in the WinCC documentation.

See also

Global Script Editor (Page 41)

1.8.2 Global Script Editor

Introduction

Global procedures and actions are created and edited in the Global Script editor.

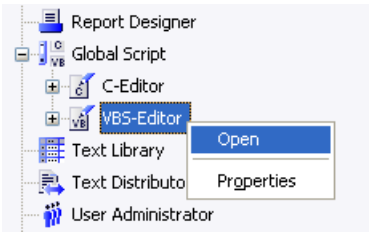
Global Script provides a similar range of functions to that of the C script editor in WinCC.

Note

A detailed description of the action editor for the creation of picture-based actions and procedures in Graphics Designer is provided under the WinCC help topic "Dynamics".

Starting Global Script

Global Script is started using the shortcut menu "Open" command in the WinCC Explorer project window.

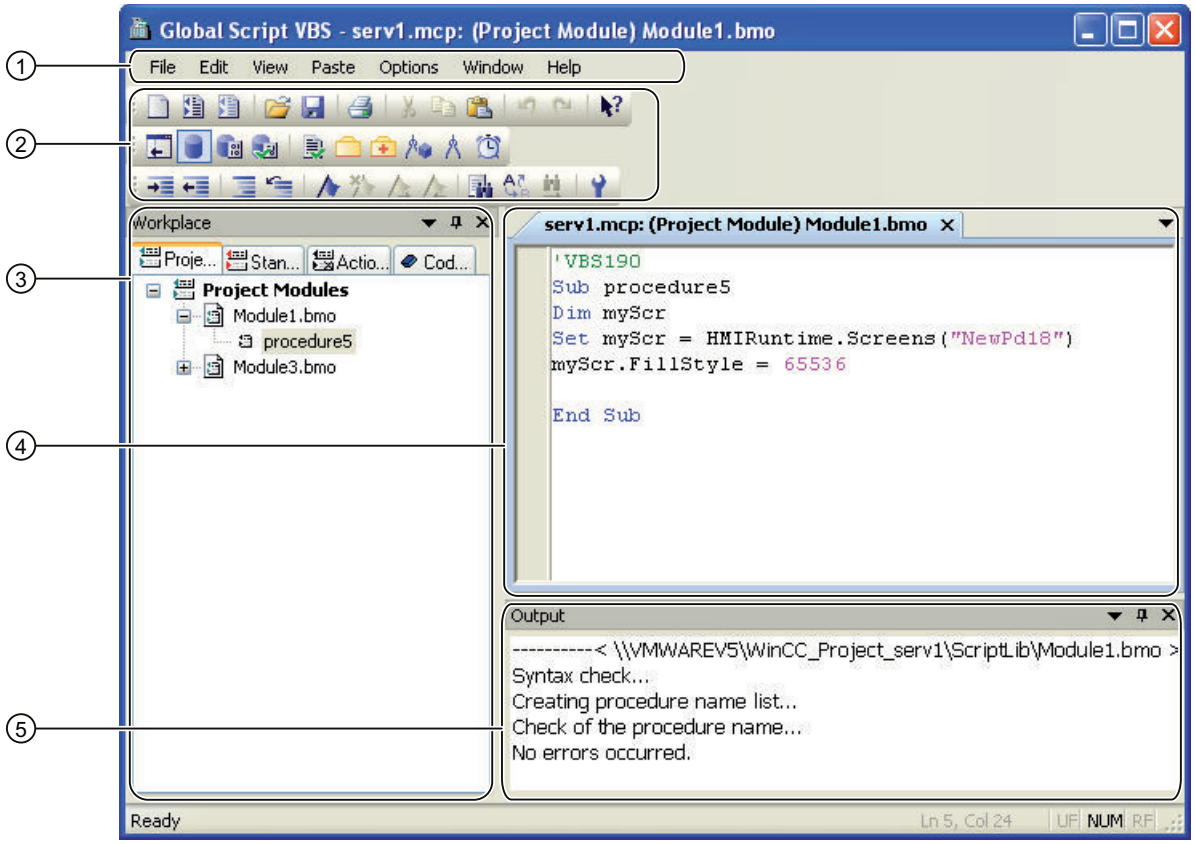


Global Script is also automatically started when a module or action is opened by means of a double click in WinCC Explorer.

Design of Global Script

Global Script editor is designed in accordance with the Windows standards.

The action editor in the Graphics Designer provides a similar range of functions to that of Global Script. A description of the Graphics Designer action editor is provided in the WinCC help topic "Dynamization".



Menu bar (1) and toolbars (2)

All the commands required to create procedures and actions are provided in the menu bar and toolbars.

The toolbars can be displayed and hidden using the "View" > "Toolbars" command and can be moved to any position within the editor.

Navigation window (3)

In the navigation window you manage your procedures, modules and actions. In addition you can find here code templates which you can insert by drag&drop into your action or procedure.

A procedure can be called in another procedure or action by dragging them from the navigation window and dropping them at the relevant point in the code.

The display in the navigation window is always updated during the saving of the edited document. If you change a file, this will be displayed by a * behind the file name.

The procedures contained in a module are displayed in the navigation window underneath the module file. The Actions tab control also displays the trigger and procedures configured for an action, if necessary those directly defined in an action module.

The navigation window can still be used to:

- Create subdirectories for structuring the scripts.
- Move, copy, paste, delete and rename modules and directories directly.

The display in the navigation window can be individually configured with the "View" > "Workplace" menu commands. It is possible to select whether all file types, only script files or only syntactically correct files should be displayed. The navigation window can be shown or hidden with the "View" > "Workplace" > "Display" menu commands.

Editing window (4)

You write and edit your actions in the editing window. Each procedures or action will be opened in its own editing window. Several editing windows can be open at the same time.

The user is supported by in the editing window by Highlight Syntax and Intellisense. All general editor functions (e.g. Undo/Redo, Find/Replace, Copy, Paste, Cut, Font Settings, Printer Settings) remain available.

Output window (5)

Error messages are displayed in the output window following the syntax check. Double click on the corresponding error line to access the related point in the code.

Status bar (6)

The status bar contains information on the currently selected functionality or hints on programming.

Note

If information on individual editor commands or icons is required, select the "?" menu icon. > "What's This?". Then click the mouse button on the corresponding icon/command. This provides fast, direct help on all the operating elements in the editors. Press "ESC" to exit "What's This?" help mode.

Window docking

Window docking is a useful tool for the flexible arrangement of windows. It lets you reposition windows to obtain separate windows, or group windows in tab groups. For example, you can arrange your actions horizontally, vertically, or as tab group. You can automatically hide windows and show them again when needed.

See also

Deleting Actions or Procedures (Page 49)
Working with the Toolbars (Page 47)
Working in an Editing Window (Page 44)

1.8.3 Working in an Editing Window

Introduction

Procedures and actions are edited in the editing window.

Declaration Areas in Actions (Graphics Designer only)

If you create actions in the Action Editor of Graphics Designer, you can display the declaration area of the action in the editing window using the button  .

The declaration area can also be used to make general settings to be used globally for the current picture, e.g.:

- Tag Definitions
- Procedures which you only want to use in this picture

Note

Do not create any directly executable codes in the declaration area!

Please note that when creating a tag, it must not contain a value (Value = VT_EMPTY). Initialize the tags after declaration with the corresponding value.

When making definitions in the declaration area, pay attention to the structure of the Script files, as described under "Structure of VBScript files".

"Option explicit" in Actions

When creating a new action, the "Option explicit" instruction is automatically set and cannot be deleted in the declaration area (Graphics Designer) or entered in the first line of an action (Global Script). The instruction is necessary as it prevents errors caused by the incorrect notation of tags without declaration. The instruction requires that tags are always defined in your code with the "Dim" instruction.

Note

Do not use the "Option explicit" instruction in the code because it may cause Runtime errors.

User Support in the Editing Window

The following functions are available to support working in the editing window.

Color coding and indentation in the editing window

Certain parts of the code have the following default colors:

Color	Description	Example
blue	Key words Functions	Sub, End Sub, Next
green	Comments	' is a comment
red	Strings (character strings and digits)	"Object1"
dark blue	Preprocessor statements	--
bold black	Constants	**vbTrue, vbFalse**
black	Other codes	--

The color coding in the editing window can be customized by means of the editor settings. Select the "Tools" > "Options" menu commands and the "Script Editor Options" dialog to define the settings.

In order to organize the codes clearly, they can be structured by indentations. The "Script Editor Options" dialog can also be used to define the tabulator distance and Automatic Indent while writing.

Intellisense and Highlight Syntax

During text entry, context-sensitive lists appear containing the properties, methods, and objects possible at the current code position. If you insert an element from the list, the required syntax is also indicated automatically.

Note

Full intellisense for all objects can only be utilized in the Graphics Designer if the list is accessed using the object name and the result is assigned to a tag. Otherwise, only a list of standard properties is offered.

Example of full intellisense:

```
Dim Tag
Set Variable = ScreenItems ("Kreis1")
Tag.
```

If picture window limits are exceeded during addressing, it is once again only the standard properties which are offered since the picture of the picture window is not loaded.

Highlight Syntax can be activated and deactivated in the "Script Editor Options" dialog. The dialog can be called in using the "Tools" > "Options" menu commands.

General VBS Functions

Use the "Function List" command of the shortcut menu in the editing window to display a list of general VBS functions.

Lists of Objects, Properties and Methods

Using the shortcut menu in the editing window, you can view a list of the possible objects by calling the "Object List" command in Graphics Designer. Global Script only provides the "HMIRuntime" object in this list because there is no direct access to the objects of Graphics Designer.

Use the "Properties/Methods" command of the shortcut menu to call in a list of possible properties and methods.

The same lists can be called in with the key combination <CTRL + SPACEBAR> according to the context of the script.

Code Templates

In the "Code templates" tab in the Navigation window of the Editor, you will find a selection of frequently used instructions, e.g., for loops and conditional instructions. The templates can be inserted in the procedure code with "drag-and-drop".

If you want to insert a code template into your code, you have to replace the "_XYZ_" placeholder in the templates with the respective data.

Selection Dialogs

If WinCC tags or objects are used in the code, the following selection dialogs are available for use:

- Opens a tag selection dialog and returns the selected tag name as the return value.
- Opens a tag selection dialog and returns the tag name with an associated reference.
- Opens a picture/object browser in which you can select a picture/object whose name is then used for the return value.
- Opens a picture selection dialog for pictures and returns the picture name with the server prefix, if necessary.

Bookmarks

Bookmarks can be set in the code to find certain parts in the code more easily:

- Sets a bookmark in the line where the cursor is currently located.
- Deletes all bookmarks in the active editing window.
- Jumps ahead to the next bookmark in the code.
- Jumps back to the last bookmark in the code.

1.8.4 Working with the Toolbars

Purpose

In their default position, the toolbars are located below the menu bar, at the top of the VBS editor. The buttons arranged on the toolbars enable quick, easy access to the functions provided in Global Script and the action editor in Graphics Designer.

Global Script/Graphics Designer provide the following toolbars:

"Standard" toolbar

Button	Function	Key combination
	Creates a new project module (Global Script only)	<ALT+F1>
	Creates a new standard module (Global Script only)	<ALT+F2>
	Creates a new global action (Global Script only)	<ALT+F3>
	Opens an existing action or existing module (Global Script only)	<CTRL+O>
	Saves the content of the active editing window. This function is only available if an editing window is open. After saving the display in the navigation window is refreshed. (Global Script only)	<CTRL+S>
	Prints the contents of the active editing window as project documentation. This function is only available if an editing window is open.	<CTRL+P>
	Cuts the selected text and copies it to the clipboard. This function is only available if text has been selected.	<CTRL+X>
	Copies the selected text to the clipboard. This function is only available if text has been selected.	<CTRL+C>
	Pastes the contents of the clipboard at the location of the cursor. This function is only available if the clipboard is not empty.	<CTRL+V>
	Undoes the last of a maximum of 30 editor actions. This function is only available if an editor action has been executed.	<CTRL+Z>
	Redoes the last editor action that was undone. This function is only available if an editor action has been undone.	<CTRL+Y>
	Activates the direct help	F1

"Editor" Toolbar Content

Button	Function	Key combination
	Indents the line, in which the cursor is located, one position to the right.	--
	Indents the line, in which the cursor is located, one position to the left.	--
	Marks the lines selected by the mouse as comments. If no lines have been selected by the mouse, the line in which the cursor is located is marked as a comment.	--

Button	Function	Key combination
	Removes the comment marking from the lines selected by the mouse. If no lines have been selected by the mouse, the comment marking in the line in which the cursor is located is removed.	--
	Sets a bookmarks in the current line. Actuating again removed the bookmark from the current line.	<CTRL+F9>
	Removes all bookmarks from the current code in the editing window.	<CTRL+SHIFT+F9>
	Moves the cursor one bookmark further.	<F9>
	Moves the cursor one bookmark back.	<SHIFT+F9>
	Opens the "Find" dialog for text search in the code.	<CTRL+F>
	Opens the "Replace" dialog for search and replace in the code.	<CTRL+H>
	Repeats the search process.	<F3>
	Opens the "Script editor options" dialog.	--

Content of the "Edit" Toolbar

Button	Function	Key combination
	Selects the file in the navigation window to which the current editing window belongs (Global Script only).	--
	Displays all the files in the navigation window (Global Script only).	--
	Only displays the Script files in the navigation window (Global Script only).	--
	Only displays the syntactically correct files in the navigation window (Global Script only).	--
	Executes a Syntax Check in the code of the current editing window.	<F7>
	Opens a tag selection dialog returns the selected tag name as the return value.	<CTRL+U>
	Opens a tag selection dialog and returns the tag name with an associated reference.	<CTRL+W>
	Opens a picture/object browser in which a picture/object can be selected whose name is then used for the return value.	<CTRL+Q>
	Opens a picture selection dialog for pictures and returns the picture name, with the server prefix if necessary.	<CTRL+B>
	Opens the "Info/Trigger" dialog.	<CTRL+T>

Additional Buttons in Graphics Designer

In addition to the buttons provided by Global Script, the action editor in Graphics Designer also has the following buttons:

-  Displaying the declaration area (<CTRL+E>)
-  Hiding the declaration area (<CTRL+A>)

See also

Global Script Editor (Page 41)

1.8.5 Deleting Actions or Procedures

Introduction

If an action, procedure or a module is deleted in a script editor, the code and corresponding file are deleted in the project directory.

Be careful only to delete procedures which are no longer used in other procedures or actions. If an action attempts to call in a procedure which no longer exists, the action is stopped in Runtime at the fault point. A non-existing reference in the code is not detected by the syntax check.

Note

Procedures can only be deleted within a module by deleting the code, not in the editor's navigation window.

Procedure

1. Open Global Script.
2. Select the action or module to be deleted in the navigation window.
3. Select the "Delete" command from the context menu.
4. To delete a procedure: Open the relevant module and delete the corresponding code in the editing window.

See also

Actions (Page 32)

Modules and Procedures (Page 29)

Global Script Editor (Page 41)

1.9 Creating and Editing Procedures

1.9.1 Creating and Editing Procedures

Introduction

Projects and standard procedures can be programmed in WinCC using VBS:

- Project procedures can only be retrieved in the current project. Since procedures are stored in the project directory, they are automatically copied when a project is copied.
- Standard procedures can be called in by all computers linked to a project. When a project is copied onto another computer, the standard procedures must be copied into the corresponding directory on the target computer manually.

The copied procedures are directly available for use in Runtime. The become visible in the editor when the view is updated.

Apart from the procedures programmed by yourself, general VBS functions can also be used (e.g. Abs, Array,... Year). These general VBS functions can be invoked in the code using the "Function List" command from the context menu.

In addition, WinCC provides the most popular instructions as code templates (e.g. If...Then, When...While). The code templates can be moved from the navigation window's Code Templates tab control directly into your code via drag&drop.

If you insert a code template into your code, it is important to note that, for example, conditions in the templates are identified by "_XYZ_". You must replace these placeholders with the appropriate information.

Using Procedures

Procedures are used for the central creation and maintenance of codes which are to be implemented at several point in the configuration. Codes are written and saved in a procedure and the procedure is called in with the current parameters in actions or other procedures instead of repeatedly entering the same code.

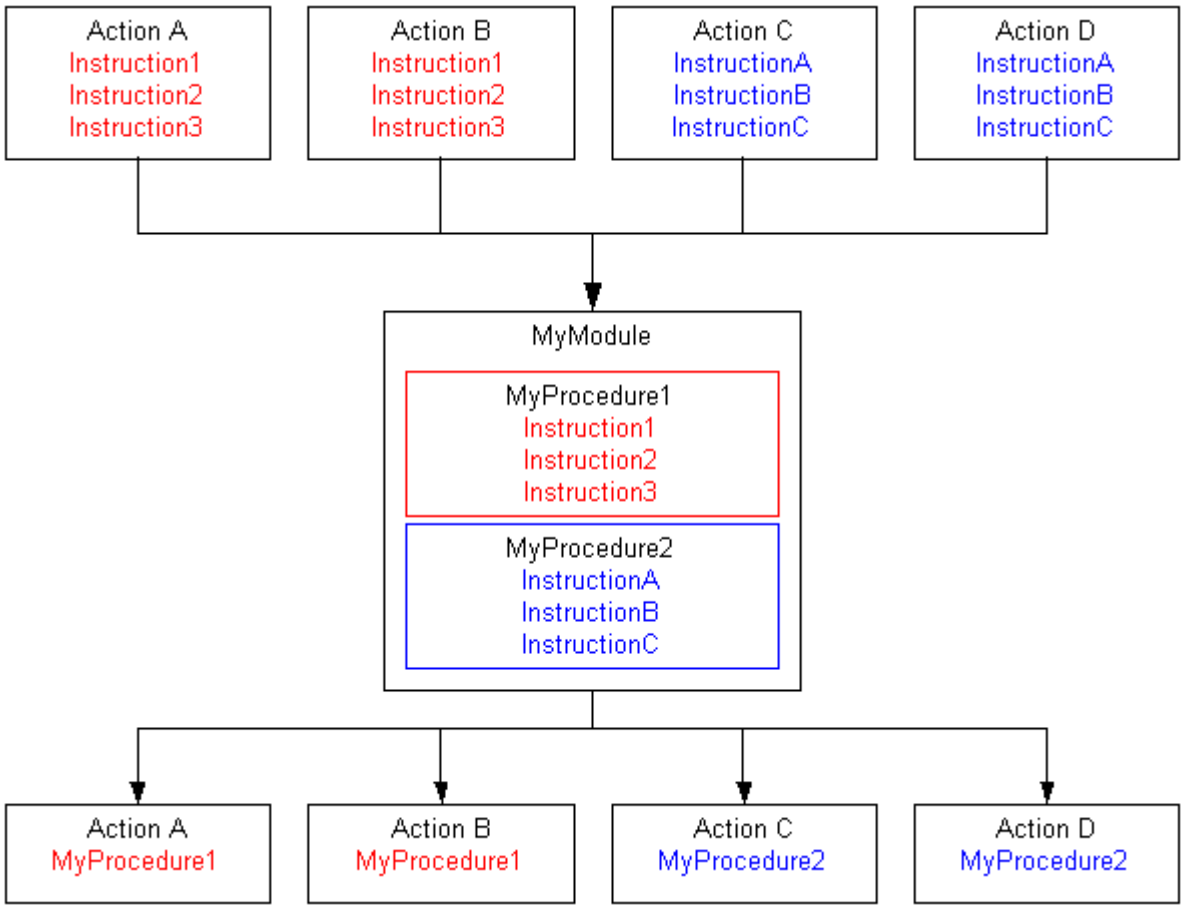
Create procedures for repeated functionalities, e.g.

- Calculations with different starting values (procedure with return value)
- Checking tag values (procedure with return value)
- Executing tasks (procedure with return value)

This is linked to the following advantages:

- The code is only programmed once.
- Modifications are only made at one point, namely in the procedure, not in each action.
- The action code is shorter and, thus, remains clearer.

Related procedures should be stored in modules in WinCC.



Procedures are loaded in Runtime when the calling action is executed.

If a procedure (module) used in a picture is modified, the modification is applied the next time the picture is loaded. This means that a picture currently displayed only works with the modified procedure after the picture has been reloaded.

After having a changed project module and saved the file in the VBS Editor, you must also open and save the corresponding process picture in Graphics Designer. You changes are not

activated in Runtime unless you completed this action. By saving the the picture, you activate the information in the picture file by means of the necessary project modules.

Note

Procedures can be used in actions in Global Script and Graphics Designer.

In order to use a global tag defined in Global Script in an action in Graphics Designer, observe the following:

In order that access can be made to the tag, it is necessary to call in the procedure in which the tag is defined.

In order to use a global tag in picture-independent actions in Global Script, observe the following:

In order that access can be made to the tag, at least one procedure in the module containing the tag must be called in at least one global action.

Procedure - Action Restrictions

Global procedures valid for the entire project can only be created in Global Script. Graphics Designer can only be used to create picture-specific procedures and call in global procedures in actions. Picture-specific procedures in Graphics Designer are defined in the declaration area of an action.

A procedure is not executed without an action.

File Name and Procedure Name

The procedure name is entered in the first line of the procedure code. The procedure is displayed in the navigation window and called in actions under this name. Procedures do not have a file name of their own but are stored in a module.

Module names are assigned in the editor's navigation window. Use the "Save As" command to save a module under another name in the project directory.

Since procedures in Global Script are valid for the entire project, procedure names must always be unique. Module names can be used more than once within a project, e.g. in different subdirectories or stored separately in the standard and project directories.

Displaying Procedures and Modules

 If you save a module that contains at least one syntactically incorrect procedure, this will be displayed in the navigation window with this adjacent symbol.

Note

If a module contains a syntactically incorrect procedure, the module can no longer be loaded. Procedures can no longer be called from the module.

 If you save a module that contains only syntactically incorrect procedures, this will be displayed in the navigation window with this adjacent symbol.

Procedures and Modules

Procedures are classified as standard or project procedures according to their assignment to standard or project modules. Standard and project modules are located o the corresponding tab controls in the Global Script navigation window.

Use the modules in order to compile procedures to practical function groups. Observe the following when structuring the modules and procedures:

- The more modules that must be loaded when a picture is called in, the worse the performance in Runtime.
- The larger a module, the more procedures are contained and, thus, the longer the loading time for the module.

Organize the modules sensibly, e.g. a module with procedures for a specific system part/ picture.

Examples of VBScript (Page 806)

Modules and Procedures (Page 29)

1.9.2 Creating a New Procedure

Introduction

Standard projects and procedures can be programmed with Global Script in WinCC.

The type of procedure is defined by the assignment to a project or standard module. The procedure to create standard or project procedures is identical.

On creating a new procedure, WinCC automatically assigns a standard name "procedure#", in which case # represents a continuos number. If the procedure is edited in the editing window,

assign the procedure a corresponding name via which the procedure can be called in an action later. The name appears in the navigation window when the procedure is saved.

Note

Procedure names must be unique within a project. If a procedure with the same name already exists, the module is identified as syntactically incorrect. Module names can be used twice when the modules are stored in different directories.

Global procedures (valid for the for entire project) can only be programmed Global Script. Procedures can be called via actions in Graphics Designer and picture-related procedures created in the declaration area of an action. Using a global action in Global Script, it is possible to create procedures directly in the code which are then only applicable for this action.

An action must be programmed in order to call in a procedure.

Procedure

The 
bal Script:

1.
2. ules tab control be created.
3. nands "File" > "New"
4. ut return value is
5. code: Sub "Procedure name".
6. nodule: Select the module in the navigation window dure" context menu item. ed:
7. Enter a procedure name and select whether the procedure should have a return value parameter. The definition of a tag for the return value is then entered in the code (Dim RetVal).
8. Confirm your settings with OK.

Note

A new procedure can also be entered directly in a module. In the case of procedures without return value, always begin with the instruction "Sub " and <Procedure Name> and conclude with "End Sub". In the case of procedures with return value, always begin with the instruction "Function " and <Procedure Name> and conclude with "End Function". The new procedure is displayed in the navigation window when the module is saved.

How to add module-related information (Page 59)

Using Standard and Project Procedures (Page 58)

How to Write Procedure Codes (Page 55)

Modules and Procedures (Page 29)

1.9.3 How to Write Procedure Codes

Introduction

Procedure codes are written in the Global Script editor window. The code of each procedure can call in other procedures via their procedure names.

Procedures can be created with or without return values. Use the return value to receive information about successful execution of the procedure, for example.

If you modify a procedure in a picture, the modification will not take effect until the next time you load the picture.

Functions in Global Script

Global Script provides the following functions to support the creation of procedure codes:

Intellisense and Highlight Syntax

During text entry, context-sensitive lists appear containing the properties, methods, and objects possible at the current code position. If you insert an element from the list, the required syntax is also entered automatically.

Note

Full intellisense for all objects can only be utilized in the Graphics Designer if the list is accessed using the object name and the result is assigned to a tag. Otherwise, you are only offered a list of standard properties.

Example of a full intellisense:

```
Dim Variable
Set Variable = ScreenItems ("Circle1")

Variable.<Intellisense selection>
```

If picture window limits are exceeded during addressing, it is once again only the standard properties which are offered since the picture of the picture window is not loaded.

General VBS Functions

Use the "Function List" command of the shortcut menu in the editing window to display a list of general VBS functions.

Lists of Objects, Properties and Methods

Using the shortcut menu in the editing window, you can view a list of the possible objects by calling the "Object List" command in Graphics Designer. Global Script provides only the "HMIRuntime" object in this list because there is no direct access to the objects of Graphics Designer.

Use the "Properties/Methods" command of the shortcut menu to call a list of possible properties and methods.

The same lists can be called in with the key combination <CTRL + SPACEBAR> according to the context of the script.

Code Templates

In the "Code templates" tab in the Navigation window of the Editor, you will find a selection of frequently used instructions, e.g. for loops and conditional instructions. The templates can be inserted in the procedure code with "drag-and-drop".

If you want to insert a code template into your code, you have to replace the "_XYZ_" placeholder in the templates with the respective data.

Selection Dialogs

If WinCC tags or WinCC objects are used in the code, the following selection dialogs are available for use:

- Opens a tag selection dialog and returns the selected tag name as the return value.
- Opens a tag selection dialog and returns the tag name with an associated reference.

- Opens a picture/object browser in which a picture/object can be selected whose name is then used for the return value.
- Opens a picture selection dialog for pictures and returns the picture name, with the server prefix if necessary.

Syntax Check

Global Script supports you with a syntax check which you can perform after the code has been created. Syntax errors in the code are displayed in the output window of the editor. You can move to the erroneous point in the code by double-clicking the error in the output window.

Note

The syntax check can only detect syntax errors in the code. Programming errors, such as missing references, only become visible in Runtime. You should therefore also always check your scripts in the Runtime environment.

Changing a Procedure

If a procedure is modified during Runtime, the modification becomes active at the following times:

- Procedures called from actions or other procedures in pictures become active following a picture change.
- Procedures in Global Script become active directly after being called again.

Procedure

1. Open Global Script.
2. Open the module containing the procedure to be edited.
3. After double clicking on the procedure in the navigation window, the cursor skips to the beginning of the required procedure.
4. Edit the procedure. If you create a procedure with a return parameter, e.g. to program recurring evaluations or reviews, indicate the return value with "procedurename = RetVal" at the end of the procedure.

Creating a New Procedure (Page 53)

Modules and Procedures (Page 29)
Creating and Editing Procedures (Page 50)

1.9.4 Using Standard and Project Procedures

Introduction

Use the drag&drop function in the navigation window or the context menu to insert a procedure in the current code.

Project procedures can only be used within the current project, standard procedures are available for all projects on the computer.

Procedures, once created, can be used in other projects or on other computers. To do this, copy the module containing the procedures in the appropriate project or standard directory.

Using Procedures in Graphics Designer and Global Script

Procedures defined in Global Script can be called in actions in Global Script and Graphics Designer. On executing the action in Runtime, the entire module which contains the procedure is loaded.

Please observe the following in order to use a global tag defined in a procedure in Global Script:

When using Graphics Designer, always call the procedure in which the tag is defined so that the tag can be used. I the procedure is not called in, the corresponding module is not loaded and access cannot be made to the tag.

In the case of picture-independent actions in Global Script, at least one procedure in the module containing the tag must be called in at least one global action.

Note

In the general declaration part of screens, no check is made whether a procedure or function name has already been assigned. Therefore, a name could occur several times and it is not defined which function will be executed. This is standard behavior of the MS Scripting Engine.

Procedure

1. Open the procedure or action in which the procedure should be inserted.
2. Use the drag&drop function to move the procedure to be inserted from the navigation window to the correct position in the code.
   or
3. Place the cursor at the position in the code where you would like to insert teh procedure.
4. Mark the procedure in the navigation window with the mouse.
5. Choose pop-up menu command "Transfer Procedure Retrieval".

1.9.5 How to add module-related information

Introduction

Related information can be added to each module in order to quickly recognize the functionality of the module or the procedures contained in it when edited at a later date. If several operators are involved in configuring a project, you should provide module-related information for your colleagues.

When a new module is created, the creation date is entered in the module-related information automatically and is unchangeable. The Module is also assigned the version number 1.0. The version numbers can be individually assigned when editing a module. When a module is changed and saved, the current date of change is entered automatically and is unchangeable.

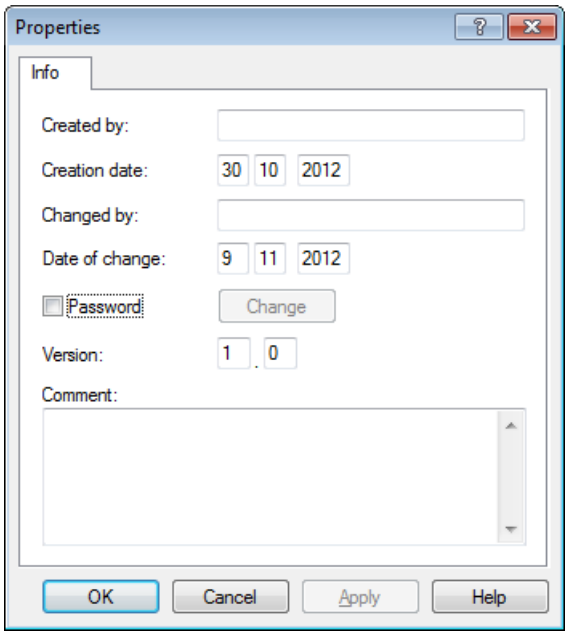
The following information can be added:

- "Created by"
- "Changed by"
- "Comments" e.g. module functionality/procedures contained

It is still possible to define a password for the module. Further information on assigning passwords is provided in "Protecting Modules with a Password".

Procedure

1. Open Global Script.
2. Select the module in which information is to be added in the navigation window.
3. Click the "Info/Trigger" toolbar button, or select the "Info" menu command. The "Properties..." dialog appears.



Enter the required information.

Note

The "Info/Trigger" dialog can also be called if an open procedure is selected in the navigation window. The information stored in this dialog is always valid for the entire module and all the procedures contained in it.

1.9.6 Protecting a Module with a Password

Introduction

A module can be assigned a password to protect it from unauthorized access. The password is a part of the module-related information.

Note

If a module is protected by a password, all the procedures contained in it are also protected by the password.

Procedure

1. Open Global Script.
2. Select the module to be assigned a password in the navigation window.
3. Click the button "Info/Trigger" in the toolbar or choose the pop-up menu command "Info". The "Properties..." dialog appears.
4. Activate the check box "Password".
   The dialog "Enter Password" is displayed.
5. Enter a password and confirm it.
6. Confirm your settings with OK.

Result

If an attempt is made to open the module or a procedure contained in it, a prompt appears requesting the password.

Deactivate Password Protection

To clear the password protection, disable the "Password" check box.

Change Password

To change the password, open in the Properties dialog and click the "Change" button. Then enter the new password.

Note

If you forget the module password, the module cannot be edited.

Note

The "Info/Trigger" dialog can also be called if an open procedure is selected in the navigation window. The information stored in this dialog is always valid for the entire module and all the procedures contained in it.

1.9.7 Saving a Procedure

Introduction

Individual procedures are never stored but the module in which the procedure has been programmed.

Before saving a module, check the code is syntactically correct. When saving a module, the procedures contained are automatically checked and, in the case of syntax errors, a prompt appears as to whether the module should be saved with the errors or not. In this way, for example, modules and procedures can be saved which are not fully programmed. Syntactically incorrect procedures do not run in Runtime.

Note

If a module contains a syntactically incorrect procedure, the module can no longer be loaded. Procedures can no longer be called from the module.

Note

The syntax check can only detect syntax errors in the code. Programming errors, such as missing references, only become visible in Runtime. Therefore, always check the scripts in the Runtime environment and use a debugger, if necessary, to detect and eliminate errors.

Only syntactically correct modules are called in Runtime.

A list of all the possible syntax errors is available in the Appendix under " Basic Principles of VBScript".

If a procedure is subjected to a syntax check prior to saving, any errors are displayed in the lower part of the editor window. Double click on an error line to access the error position in the code directly.

Use the "Save As" command to store the module under another name. Note that the new module is only displayed in the navigation window after updating the view.

Requirement

The procedure/module to be saved must be open in the editor window.

Procedure

1. Click  in the toolbar.
2. If syntax errors appear in the output window, double click on the error line and correct the error in the code. Repeat steps 1 and 2 until the code is correct.
3. Save the module by clicking  in the toolbar.

Note

Pictures with modified procedures must be opened and saved once again in Graphics Designer

In addition to saving in the VBS editor, the corresponding picture must be opened and saved once again in Graphics Designer when the project module is changed. The change is then applied in Runtime. Only once the picture has been saved is the information applied to the picture file via the required project modules.

1.9.8 Renaming a Procedure or Module

Introduction

Procedures and modules are renamed in the following cases:

- When a standard name (procedure# or Modul#), which was automatically assigned when the new module/new procedure was created, is changed to a self-explanatory name.
- When a module or procedure is copied in order, for example, to create a new module with similar content from an existing one.
  Please note that procedure names must be unique within a project. Procedure names which exist twice are issued as errors during the syntax check.
  Contrary to procedure names, the same name can be applied to modules when the modules are stored in different directories.

Note

The module name is always identical to the file name in the WinCC file system. If a module name is changed, e.g. in Windows Explorer, the new module name is taken over from Global Script in the navigation window.

Procedure

Renaming Procedures

1. Open the procedure to be renamed.
2. Enter the new name in the header of the procedure.
3. Save the procedure so that the name is transferred to the navigation window. Procedure names are always unique and may not be used more than once.

Renaming Modules

1. Close the module to be renamed.
2. Select the module in the navigation window and choose the "Rename" option from the context menu.
3. Enter the new name in the navigation window. Module names are always unique at directory level and may not be used more than once.

1.10 Creating and Editing Actions

1.10.1 Creating and Editing Actions

Introduction

When using VBS in WinCC, there is no differentiation between local (valid for entire project) and global (valid on all computers) actions, as opposed to C. A configured action is always valid globally.

A copied action is available for use in Runtime following a restart or opening and saving the action. The become visible in the editor when the view is updated.

VBS actions can be used in to make graphic objects and object properties dynamic in Runtime or to execute picture-independent actions.

Note

Please note that the object name length of objects made dynamic in Graphics Designer is limited to approx. 200 characters, and each special character used in an object name is converted to five characters in the script files. The special characters are represented by a four-place hexadecimal code behind the preceding X. If the name of an object made dynamic is too long, a corresponding error message appears. Further information is available in this help under "Structure of VBScript Files".

Note

If you make an object property dynamic with a VBS action via the return value of a script, the value of the object property is written only if it has changed in relation to the last script run. It is not considered if the value had been changed from another location.

Therefore it is illegal to change properties which have been made dynamic by VBS action via the return value from another location (e.g., other C scripts or VBS scripts).

if you do not observe this, wrong values can be the results.

Using the Actions

Actions can be used as follows:

On graphic objects in Graphics Designer

Making properties dynamic (action with return value), e.g.:

```
Function BackColor_Trigger(ByVal Item)
'VBS143
    BackColor_Trigger = RGB(125,0,0)
End Function
```

Triggered by an event on an object (action without return value), e.g.:

```
Sub OnClick(ByVal Item)
'VBS144
    Item.BackColor = RGB(255,0,0)
End Sub
```

Picture-independent in Global Script

As a cyclic action, e.g. incrementing a tag:

```
Option Explicit
Function action
'VBS145
    Dim objTag1
    Dim lngValue
    Set objTag1 = HMIRuntime.Tags("Tag1")
    lngValue = objTag1.Read
    objTag1.Write lngValue + 1
    action = CLng(objTag1.value)
End Function
```

Executing Actions

An action can be assigned several triggers. The action is always executed when one of the triggering events occurs. Observe the following:

- Actions in Global Script cannot be executed simultaneously. The action triggered last is held in a queue until the action currently being performed is completed.
- When using Graphics Designer, cyclically and tag-driven actions cannot be triggered simultaneously. If the execution of a tag-driven action hinders the execution of a cyclic action, the cyclic action is executed when the tag-driven action has finished. The cyclic action is held in a queue during the non-execution phase. When the current action is completed, the cyclic action is executed with the normal cycle.
- In Graphics Designer, event-driven actions cannot be executed simultaneously.

The action types mentioned do not prevent each other being executed: The execution of actions in Global Script has no influence on actions in Graphics Designer. In the same way, in Graphics Designer, the execution of cyclically or tag-driven actions has no effect on the execution of event-driven actions.

Note

Actions in pictures which are still running one minute after the picture has been deselected are terminated by the system. This is recorded in a logfile entry.

Locating Actions

All the actions used in a picture can be displayed by means of the picture properties. To do this mark the picture in WinCC Explorer and select the "Properties" context menu command. After double clicking on an entry, detailed information on the type of dynamics appears.

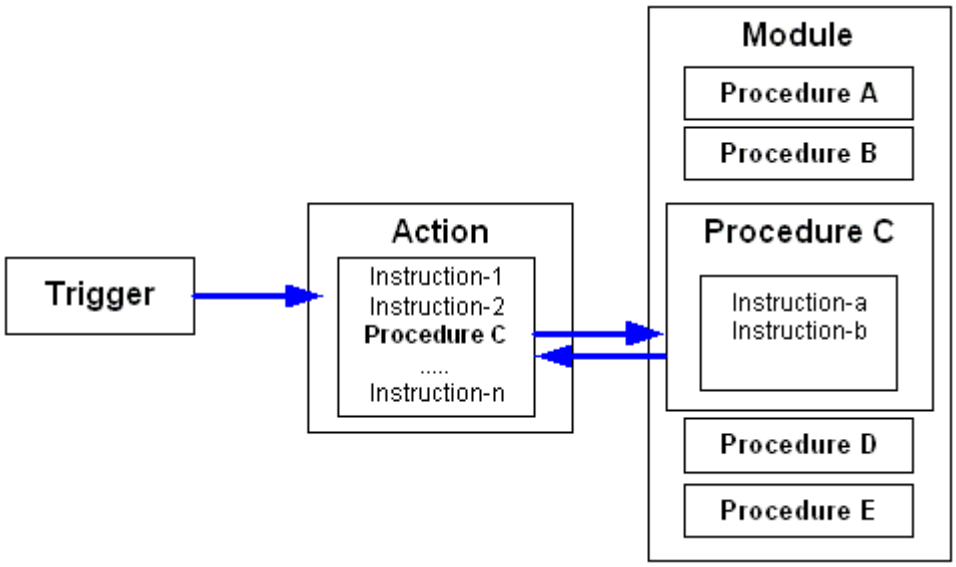
It is also possible to display all the tags and pictures used in actions by means of the WinCC CrossReference. CrossReference can also be used for the to link tag connections of Graphics Designer actions easily.

Note

Use the standard formulations HMIRuntime.BaseScreenName = "Screenname" and HMIRuntime.Tags("Tagname") when addressing pictures and tags in your code in order to ensure that the pictures and tags are registered by the CrossReference.

Procedure - Action Restrictions

Actions can be used to program instructions and call procedures. Codes are programmed within in procedures for use at several points in a configuration. Contrary to procedures, actions always have a trigger.



Creating and Editing Actions

Actions can be configured in Global Script and Graphics Designer. Use Global Script to configure global actions which can be executed independently of the picture currently open. Graphics Designer is used to configure actions related to graphic objects which should be executed when the picture is opened in Runtime or when the configured trigger occurs.

The script editors in WinCC provide the option of checking that scripts have a correct syntax without executing them. Errors in the script are displayed in the output window under the editor window. Double click on the corresponding error line to access the related point in the code.

Note

The syntax check can only check objects known to the system at the moment of execution. Therefore, the tags and objects addressed in the scripts must be created in WinCC.

Only syntactically correct actions are executed in Runtime.

The automation objects "PDLRuntime" and "WinCC Runtime Project" cannot be used in VBS actions.

Display of Actions

 If you save a syntactically incorrect action, it will be displayed in the navigation window with this adjacent symbol.

 If you save a syntactically correct action without trigger, it will be displayed in the Global Script navigation window with this adjacent symbol.

 If you save a syntactically correct action with trigger, it will be displayed in the Global Script navigation window with this adjacent symbol.

Note

Actions can only be saved in the Graphics Designer if they have the correct syntax. If an action with errors should still be retained and exited, however, enter the comments.

System behavior if actions are changed, deleted and saved at Runtime

If a local action is stored at runtime, then all local and global actions of the computer are reset on the computer to which the local action belongs.

If a global action is stored during runtime, then all local and global actions for the entire project – and thus on all computers – are reset.

Such a reset might reinitialize for examples tags and times that are used as triggers for actions, triggering the action at that stage.

Static tags used in the reset actions are reinitialized.

Actions (Page 32)

1.10.2 Creating a New Action

Introduction

When a new action is created, the editor automatically suggests a file name (Action#.bac), which can be changed.

Actions can be configured in Global Script and Graphics Designer.

- Global Script is used to configure actions which can be executed, picture-independently, in Runtime. Open Global Script via WinCC Explorer.
- Graphics Designer is used to configure a new action, related to the properties of a graphic object, by clicking on the right mouse button in the "Dynamic" column of the Properties tab control and selecting VBS Action. An action, related to an event, is created in the same way using the Events tab control.
  In both cases, the Action Editor of the Graphics Designer opens.

Note

The precise procedure for linking actions with graphic objects is described under the WinCC help topic "Dynamics".

Procedure

1. Open Global Script.
2. Activating the Actions Tab Control in the Navigation Window.
3. Click  in the toolbar or choose the menu command "File" > "New" > "Action".
   A new action is opened in the editor window. The action appears in the navigation window after it has been saved.

Note

When creating a new action, the "Option explicit" instruction is automatically entered in the declaration area and cannot be deleted. The instruction is necessary as it prevents errors caused by the incorrect notation of tags without declaration.

The instruction requires that tags are always defined in your code with the "Dim" instruction.

Do not use the "Option explicit" instruction in the code because it may cause Runtime errors.

Triggers (Page 78)

Creating and Editing Actions (Page 66)

Actions (Page 32)

1.10.3 How to Edit Actions

Introduction

An action is edited in the same way as a procedure in the editor window of the editor or in the Graphics Designer action editor.

In order that an action can be executed in Runtime, it requires a trigger. Actions which are triggered by an event in Graphics Designer do not require the assignment of a trigger.

If an action is modified during Runtime, the change is applied when the picture is reloaded (in the case of actions in Graphics Designer) or the next time the action is called (in the case of actions in Global Script).

Note

A change in the code in Runtime cannot be applied when another action is being carried out at the same time.

A procedure call can be inserted in the action by dragging the procedure from the editor navigation window with "drag-and-drop" and dropping it in the corresponding position of the code in the editor window. C scripts cannot be called in VBS actions.

Declaration Area in Actions

If you create actions in Graphics Designer, you can display the declaration area of the action using the button  . When creating a new action, the "Option explicit" instruction is automatically entered in the declaration area and cannot be deleted. The instruction is necessary as it prevents errors caused by the incorrect notation of tags without declaration.

The instruction requires that tags are always defined in your code with the "Dim" instruction.

Do not use the instruction "Option explicit" in your code as this can cause Runtime errors.

In the declaration area, you can also make general settings which you want to use globally for the current picture, e.g.:

- Tag Definitions
- Procedures which you only want to use in this picture

In the declaration area of the actions, you may define global tags independent of each other in the areas "Event" and "Properties" of an object. There is no link between global tags of identical names in both areas.

Note

Always make sure that the procedures in the declaration area have correct syntax, i.e. with "Sub" - "End Sub". Do not create directly executable codes in the declaration area as this can cause Runtime errors.

If global tags are used in the declaration area of actions Graphics Designer, note that the event-driven and cyclic/tag-driven actions are processed separately in Runtime. There is no synchronization of global tags between the two Runtime systems in Runtime. If synchronization of tags is required, configure these using the DataSet object or internal WinCC tags.

When making definitions in the declaration area, pay attention to the structure of the Script files, as described under "Structure of VBScript files".

Functions for Editing Actions

The script editors provide the following functions to assist you in creating action code:

Intellisense and Highlight Syntax

During text entry, context-sensitive lists appear containing the properties, methods, and objects possible at the current code position. If you insert an element from the list, the required syntax is also indicated automatically.

Note

Full intellisense for all objects can only be utilized in the Graphics Designer if the list is accessed using the object name and the result is assigned to a tag. Otherwise, only a list of standard properties is offered.

Example of full intellisense:

```
Dim Variable
Set Variable = ScreenItems ("Circle1")
```

Variable.<Intellisense>

If picture window limits are exceeded during addressing, it is once again only the standard properties which are offered since the picture of the picture window is not loaded.

General VBS Functions

Use the "Function List" command of the shortcut menu in the editing window to display a list of general VBS functions.

Lists of Objects, Properties and Methods

Using the shortcut menu in the editing window, you can view a list of the possible objects by calling the "Object List" command in Graphics Designer. Global Script only provides the "HMIRuntime" object in this list because there is no direct access to the objects of Graphics Designer.

Use the "Properties/Methods" command of the shortcut menu to call in a list of possible properties and methods.

The same lists can be called in with the key combination <CTRL + SPACEBAR> according to the context of the script.

Code Templates

In the "Code templates" tab in the Navigation window of the Editor, you will find a selection of frequently used instructions, e.g., for loops and conditional instructions. The templates can be inserted in the procedure code with "drag-and-drop".

If you want to insert a code template into your code, you have to replace the "_XYZ_" placeholder in the templates with the respective data.

Selection Dialogs

If WinCC tags or WinCC objects are used in the code, the following selection dialogs are available for use:

- Opens a tag selection dialog and returns the selected tag name as the return value.
- Opens a tag selection dialog and returns the tag name with an associated reference.
- Opens a picture/object browser in which a picture/object can be selected whose name is then used for the return value.
- Opens a picture selection dialog for pictures and returns the picture name with the server prefix, if necessary.

Syntax Check

Global Script supports you by providing a syntax check which you can perform after the code has been created. Syntax errors in the code are displayed in the output window of the editor. You can move to the erroneous point in the code directly by double-clicking the error in the output window.

Note

The syntax check can only detect syntax errors in the code. Programming errors, such as missing references, only become visible in Runtime. Therefore, always check the scripts in the Runtime environment and use a debugger, if necessary, to detect and eliminate errors. The way to test scripts with a debugger is described in this documentation under the topics "Diagnostics" > "Testing with the Debugger".

Procedure

1. Open Global Script.
2. Double click on the action on the Action tab control in the navigation window.
3. Edit the action.

1.10.4 How to add action-related information

Introduction

Related information can be added to every action in Global Script in order that the function of an action can be recognized at a later date when editing. If several operators are involved in configuring a project, you should provide action-related information for your colleagues.

When a new action is created, the creation date is entered in the action-related information automatically and is unchangeable. The action is also assigned version number 1.0. The version numbers can be individually assigned when editing an action. When an action is changed and saved, the current date of change is entered automatically and is unchangeable.

The following information can be added:

- "Created by"
- "Changed by"
- "Comments:" e.g. functionality of the action

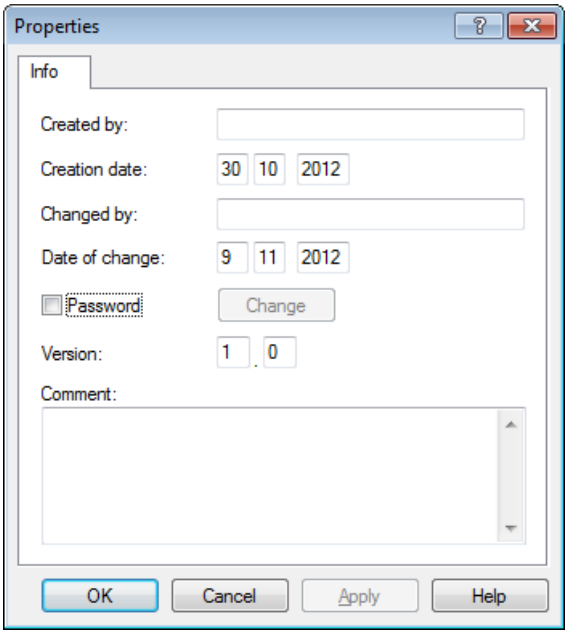
It is also possible to define a password for the action. Further information on assigning passwords is provided in "Protecting Actions with a Password".

Note

Additional information can only be made available actions in Global Script, not for actions in Graphics Designer.

Procedure

1. Open Global Script.
2. Open the action for which information should be added.
3. Click the "Info/Trigger" toolbar button, or select the "Info" menu command. The "Properties..." dialog appears.



4. Enter your information.

1.10.5 Protecting an Action with a Password

Introduction

An action in Global Script can be protected against unauthorized access by assigning a password to it. The password is a part of the action-related information.

Note

Only actions in Global Script can be assigned a password, not actions in Graphics Designer.

Procedure

1. Open Global Script.
2. Open the action to be protected by a password.
3. Click the button "Info/Trigger" in the toolbar or choose the pop-up menu command "Info". The "Properties..." dialog appears.
4. Select the "Password" check box.
5. Click the "Change" button. The "Enter Password" window opens.
6. Enter a password and confirm it.
7. Confirm your settings with OK.

Result

If an attempt is made to open the action, the system requests the password is entered.

Deactivate Password Protection

To clear the password protection, disable the "Password" check box.

Change Password

To change the password, open in the Properties dialog and click the "Change" button. Then enter the new password.

Note

If you forget the action password, the action cannot be edited.

1.10.6 Saving Actions

Introduction

Before an action can be run in Runtime, it must be saved. Save an action as any other Windows file using the "File" > "Save" commands or the corresponding icon.

Note

Actions in Graphics Designer are automatically applied on closing the action editor with the picture. Functions can only be saved in the Graphics Designer if they have the correct syntax. If an action with errors should still be retained and exited, however, enter the comments.

A list of all the possible syntax errors is available in the Appendix under " Basic Principles of VBScript".

In order to save an action under a different name, e.g. to use an action as a basis for another action, use the "Save As" command.

Note that, when using "Save As", only the file name is changed and not the action name.

Prior to Saving

Before saving an action, check the code is syntactically correct. The syntax errors in the code are displayed in the output window of Global Script. Double click on an error line to access the error position in the code directly.

Note

The syntax check can only detect syntax errors in the code. Programming errors, such as missing references, only become visible in Runtime. Therefore, always check the scripts in the Runtime environment and use a debugger, if necessary, to detect and eliminate errors.

If actions are saved without running a syntax check beforehand, the editor comments that a syntactically incorrect action will be saved which cannot subsequently be run in Runtime.

Syntactically incorrect actions are displayed with the adjacent icon in the navigation window.

Procedure

1. Click in the toolbar.
2. If errors are displayed in the lower part of the editor window, double click on the error line and correct the error in the code. Repeat steps 1 and 2 until the code is correct.
3. Save the action by clicking in the toolbar.

Creating a New Action (Page 70)

Triggers (Page 78)

Creating and Editing Actions (Page 66)

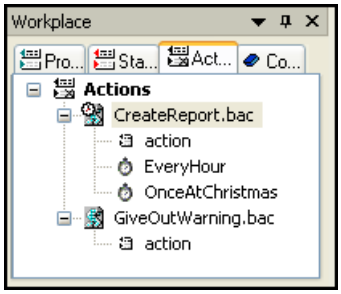
1.10.7 Triggers

1.10.7.1 Triggers

Definition and use

Triggers are used to execute actions at Runtime. To do this, a trigger is linked to an action, forming the triggering event for calling the action. Actions without triggers will not be carried out.

The triggers defined for an action are displayed in the Global Script navigation window .



Trigger types

The following trigger types are available:

Acyclic triggers

They consist of the specification of date and time. The action specified by such a trigger is performed once at the date and time specified.

Cyclic triggers

They consist of the specification of a time interval and start time. The following types of cyclic triggers are available:

- Default cycle. The start of the first time interval coincides with the start of Runtime. The length of the interval is determined by the cycle.
- Hourly. The start of the interval is specified as minute and second. The length of the interval is an hour.
- Daily. The start of the interval is specified by the time (hour, minute and second) festgelegt. The length of the interval is a day.
- Weekly. The start of the interval is specified by the day of the week (Monday, Tuesday, etc.) and the time. The length of the interval is a week.
- Monthly. The start of the interval is specified by the day and time. The length of the interval is a month.
- Annual. The start of the interval is specified by the day, month and time. The length of the interval is a year.

Time-controlled triggers are used for actions Global Script and for actions to make graphic objects dynamic.

Tag triggers

They consist of one or more specified tags. The action associated with such a trigger is performed each time a change in the value of one of these tags is detected.

How the tag values are queried may be customized for each tag. Select from the following modes:

- Cyclic query of the tag value: Specify a standard cycle. The tag value is queried at the defined intervals (e.g. every 2 seconds). The action is triggered when the system detects a change of the tag value.
  Depending on the size of the cycle, it is possible that the tag value is changed but it is not detected by the system.
  If, for example, a cycle of 5 minutes has been set, the tag value may change several times within the 5 minute period but only the value set when the next query is made is detected. The value changes between the two queries are not registered.
- Changes in the tag value: Each change in the tag value is detected by the system. The action is executed each time the tag value changes.

Tag triggers are used for actions Global Script and for actions to make graphic objects dynamic.

Event-driven

When an action is configured related to an event on a graphic object, the action is triggered when a specific event has occurred, e.g. following a mouse click or the change of the background color due to another action.

Animation cycle

As of WinCC V7.0, the "animation cycle" trigger art is available for the dynamization of objects with VBS. The animation cycle allows you to switch actions on and off in Runtime and to change the time, in which the trigger is executed.

You can find additional information in the "Animation trigger" section.

Effects of triggers on actions

If the action is associated with only one trigger, then the action is performed as soon as the triggering event occurs.

However, an action may be associated with multiple triggers, such as a cyclic trigger and a tag trigger. Here the action is performed whenever one of the two triggering events occurs. If two events occur simultaneously, then the action is executed twice sequentially. If two tag triggers fire at the same time, the action will be performed only once.

Processing actions in Graphics Designer

The following rules apply to processing actions in Graphics Designer:

- No event-driven actions can be executed as long as another event-driven action is running.
- No cyclic/tag triggered actions can be executed as long as another cyclic/tag triggered action is running.
- The two action types do not affect each other: An event-driven action can also be executed when a cyclic action is already in progress.
- If the execution of actions is blocked by other actions (e.g. a cyclic action by a tag-triggered action), each action which is blocked is executed once at the next possible moment. Cyclic actions then run in their normal intervals after the one-off execution.

Processing actions in Global Script

Picture-based actions from Global Script are executed in Runtime in succession after being triggered. When an action is triggered while another action is in progress, the second action is kept in a queue until it can be executed.

Actions in Global Script and Graphics Designer do not affect each other.

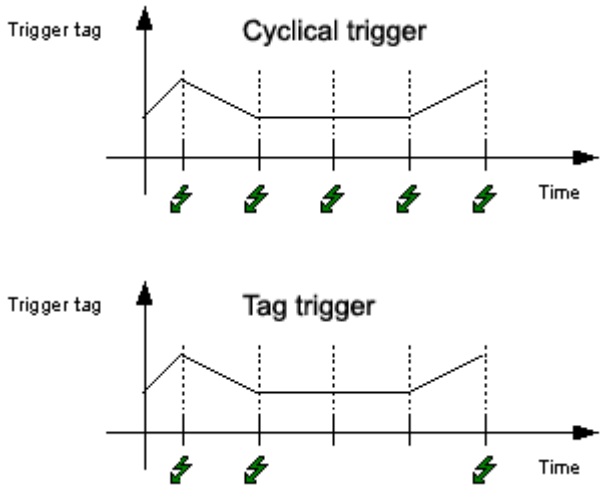
Note

If the action should not be executed at each event, it is possible to define a condition in the action, the result of which controls whether the action is executed or not.

Notes on configuring triggers

Depending on the system, it cannot be guaranteed that an action with a cyclic trigger will be carried out at exactly the specified time. If this is a requirement, then the task (such as a check) should be implemented on the automation device.

The tag triggers should have priority over cyclic triggers: With cyclic actions, the action is always executed, e.g. every 20 seconds. The tag trigger only executes the action if a change in the value of the tag has been detected in the case of cyclic queries. This reduces the load on the system and increases performance.



If a tag trigger is used, configure the "Upon Change" cycle to start as seldom as possible. This query cycle causes the tag to trigger the action following every change. This causes high system loads.

Linking tag triggers

The CrossReference from WinCC can be used to quickly find all the application points of tags, even in VBS actions. Tag triggers in actions in Graphics Designer can be "linked" using CrossReference, i.e. replaced by other tags at all or selected points.

Note

Tags can also be directly linked in Graphics Designer by marking the graphic object and selecting the "Linking ..." command from the context menu.

Use the standard formulations
`HMIRuntime.BaseScreenName = "Screenname"` and
`HMIRuntime.Tags("Tagname")` when addressing pictures and tags in your code in order to ensure that the pictures and tags are registered by the CrossReference.

Further information on CrossReference is available in the WinCC documentation.

1.10.7.2 Animation trigger

Introduction

As of WinCC V7.0, the "animation cycle" trigger art is available for the dynamization of objects with VBS. The animation cycle allows you to switch actions on and off in Runtime and to change the time in which the trigger is executed.

Animation cycles

Name	Cycle	Name	Cycle
CycleTime125ms	125 ms	CycleUser1	User cycle 1
CycleTime250ms	250 ms	CycleUser2	User cycle 2
CycleTime500ms	500 ms	CycleUser3	User cycle 3
CycleTime1s	1 s	CycleUser4	User cycle 4
CycleTime2s	2 s	CycleUser5	User cycle 5
CycleTime5s	5 s	CyclePicture	Picture cycle
CycleTime10s	10 s	CycleWindow	Window Cycle
CycleTime1min	1 min		
CycleTime5min	5 min		
CycleTime10min	10 min		
CycleTime1h	1 h		

You use the trigger by writing an action and using the "animation cycle" trigger type. This action can be activated or deactivated in Runtime with the "ActivateDynamic" and "DeactivateDynamic" methods. The methods are described in the VBS reference of the WinCC Information System. The correct syntax of the methods deviates from the description in the VBS reference and is shown in the following two examples.

Example

With an action at the determined property "Position X" (left), the rectangle is shifted 5 pixels to the right. Select the "animation cycle" event in the action as the trigger.

Enter the following as action in the "Left" property:

```
item.Left = item.Left + 5
```

You can switch the action on and off at the property "Position X" with the following methods. The trigger is switched on in Runtime with the "ActivateDynamic" method:

```
Dim obj
Set obj = ScreenItems.Item("Rectangle1")
obj.ActivateDynamic "Left", "CycleTime1s"
```

The trigger is switched off in Runtime with the "DeactivateDynamic" method:

```
Dim obj
Set obj = ScreenItems.Item("Rectangle1")
obj.DeactivateDynamic "Left"
```

Note

The WinCC tags remain requested even when the trigger is switched off.

See also

ActivateDynamic method (Page 698)

1.10.7.3 How to add a trigger of the type "Timer"

Introduction

"Timer" type triggers execute an action at a certain time. "Timer" type triggers can be cyclic or acyclic triggers.

- Acyclic triggers Trigger an action once at the configured time.
- Cyclic triggers Trigger an action at regular intervals. The time interval and start time for the time must be triggered. If a standard cycle is selected as the cyclic trigger, the start time is always the start of Runtime. User-specific cycles can also be selected as standard cycles.

Note

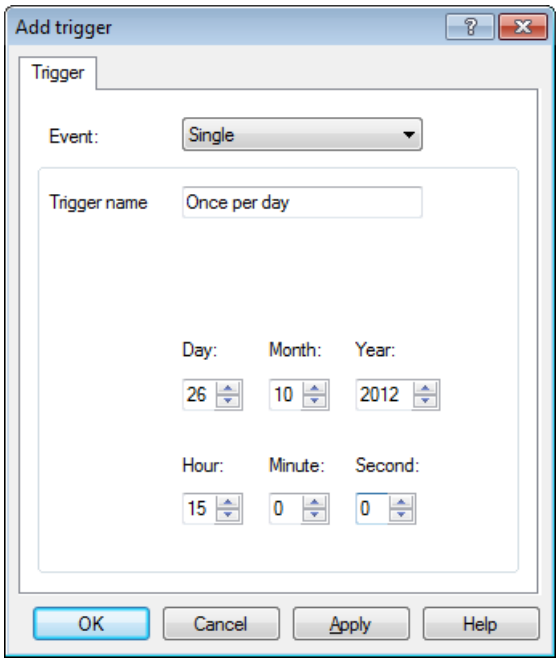
Cyclic triggers guarantee a high updating rate of the system but require high system loads. Choose cyclic triggers only for those actions, where the update is very important. With high system loads, some actions may not be executable.

"Timer" type triggers are used to make the properties in Graphics Designer dynamic and execute global actions.

Procedure

1. Open the action.
2. Click the button "Info/Trigger" in the toolbar or choose the pop-up menu command "Info". The "Properties..." dialog appears.
3. Select the "Triggers" tab.
4. Select the "Timer" trigger and then select the trigger type to be created: cyclic or acyclic.
5. Click on the "Add" button. The "Add Trigger" dialog appears.

6. If the "acyclic" trigger type has been selected: Enter a relevant trigger name and define the time at which the action should be executed.



7. If the "cyclic" trigger type has been selected: Enter a relevant trigger name and define the start time at which the action should be executed for the first time. Enter a cycle at which the action should be repeated.
   Click OK to confirm your entries.

Note

An action can be assigned several triggers. The action is always executed when one of the triggering events occurs.

See also

How to delete a trigger (Page 89)

How to add a trigger of the type "Tag" (Page 86)

Triggers (Page 78)

Creating and Editing Actions (Page 66)

Actions (Page 32)

1.10.7.4 How to add a trigger of the type "Tag"

Introduction

"Tag" type triggers execute an action following the change of a tag value. Any internal or external tag stored in WinCC can be used as a trigger tag.

Actions with tag triggers can be executed at the following times:

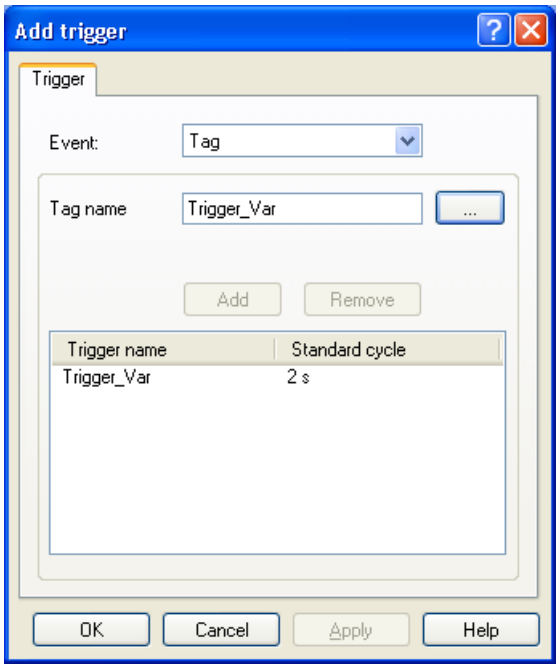
- On change of tag: The action is executed each time the tag value changes. Since this setting causes a very high system utilization, the updating rate should be set as low as possible.
- Query the tag status according to standard cycle (including user cycles): Define a cycle in whose intervals the tag value should be queried. The action is only executed when the tag value has changed when queried. When the query status is a large value, it is possible that the tag value changes but it is not detected by the system. In this case the action will not be performed.

If an action is linked with several tags, the action is executed when one of the tag values changes.

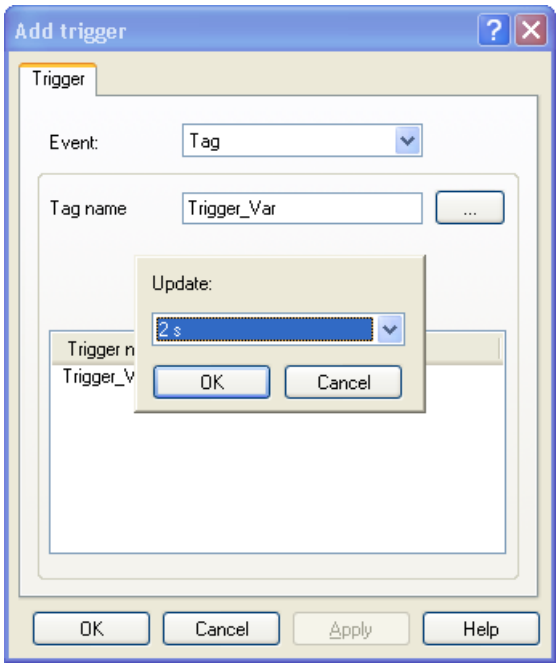
Procedure

1. Open the action.
2. Click the button "Info/Trigger" in the toolbar or choose the pop-up menu command "Info". The "Properties..." dialog appears.
3. Select the "Triggers" tab.
4. Select "Trigger" as the tag.
5. Click on the "Add" button. The "Add Trigger" dialog appears.

6. Enter the name of the tag to be used as the trigger or click the button beside the "Tag Name" field in order to select a tag from the tag selection dialog.



7. Double click on the "Standard cycle" field to open the selection dialog for the tag update cycle:



Select a cycle and click on OK to confirm the selection.

Actions (Page 32)

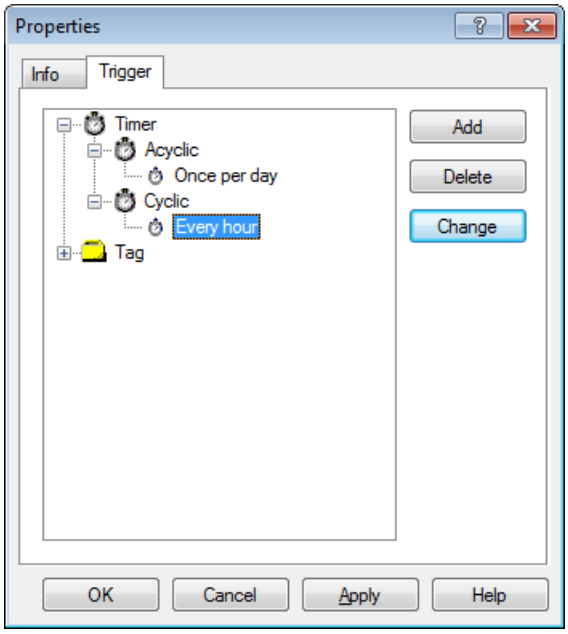
1.10.7.5 How to change a trigger

Introduction

A defined trigger can be modified at any time, even during Runtime.

Procedure

1. Open the action whose triggers should be modified.
2. Click the button "Info/Trigger" in the toolbar
   or choose the pop-up menu command "Info/Trigger". The "Properties..." dialog appears.
   Alternatively, call in the dialog without executing the action by double clicking on the trigger in the navigation window.
3. Select the "Triggers" tab.
4. Select the trigger to be modified and click the "Change" button.



5. Modify the trigger can confirm the entries with OK.

Actions (Page 32)

1.10.7.6 How to delete a trigger

Introduction

Defined triggers can be deleted at any time. Triggers can also be deleted during Runtime.

If a trigger is deleted in Runtime, it only takes effect after the action is saved.

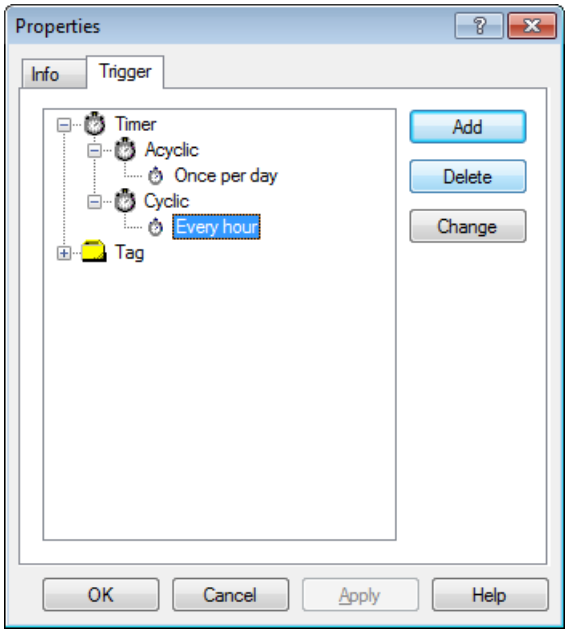
Note

Actions without trigger are not executed in Runtime. None of the actions which used the deleted trigger are executed any longer.

Procedure

1. Open the Global Script Editor or the Graphics Designer action editor.
2. Open the action.
3. Click the "Info/Trigger" toolbar button or select the "Info/Trigger" menu command. The "Properties..." dialog appears.
4. Select the "Triggers" tab.

5. Select the trigger to be deleted and click the "Delete" button.



6. The trigger is deleted immediately.

Note

Triggers can also be deleted directly in the Global Script navigation window using the "Delete" command in the context menu.

1.10.8 How to Rename an Action

Introduction

Actions can be renamed in Global Script. When an action is renamed, the action name and file name are changed.

The action to be renamed must not be open in the editor window.

Procedure

1. Open Global Script.
2. Select the name of the action to be renamed in the editor's navigation window.
3. Select the "Rename" command from the context menu.
4. Enter a new name for the action with the extension *.bac.

1.11 How to activate global actions in Runtime

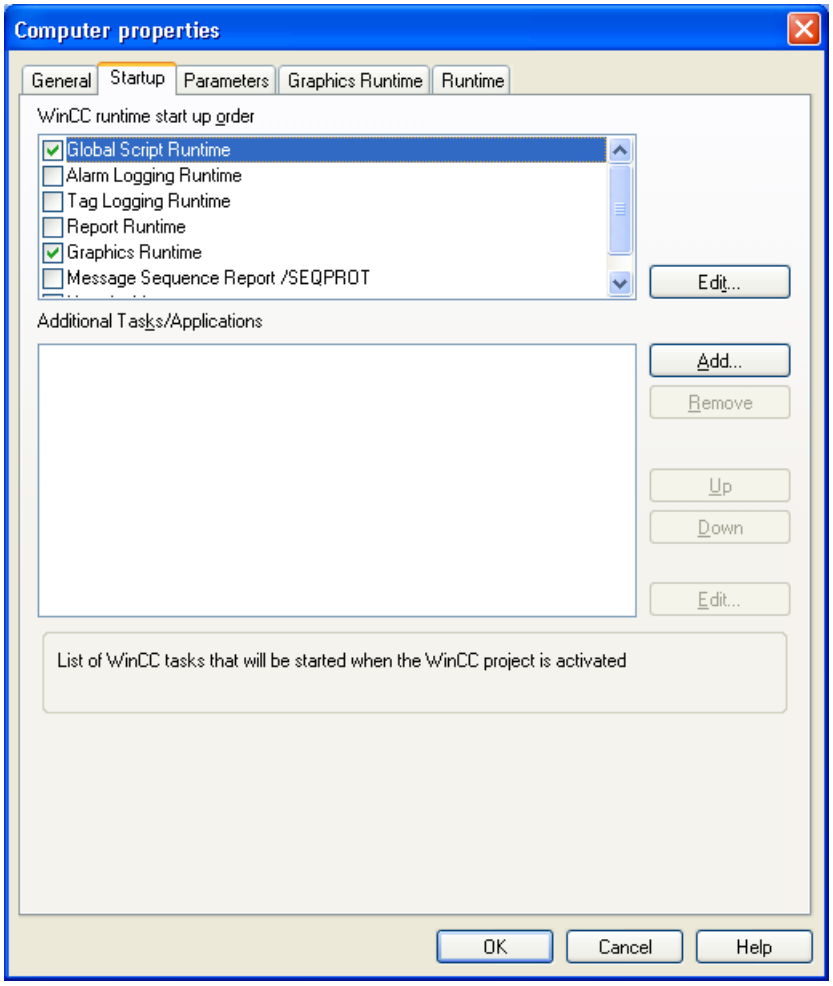
Introduction

Scripts defined in Global Script are always executed when the configured trigger occurs. Scripts in the graphical Runtime system are executed when the picture is called in and the configured event or trigger occurs.

In order that the picture-independent, Global Script global actions can be executed, the Global Script Editor must be registered in the startup list of the Runtime computer.

Procedure

1. Select the "Properties" command in the computer's context menu WinCC Explorer. The "Computer properties" dialog will open.
2. Click on the "Startup" tab
3. Selection option "Global Script Runtime".



4. Click OK to confirm your entries.

1.12 Diagnostics

1.12.1 Diagnostics

Introduction

If the scripts are executed and tested in Runtime, the Diagnostics window can be used to display an analysis quickly.

Diagnostics Tools

WinCC provides a range of tools with which to analyze the behavior of actions in Runtime:

- The GSC Runtime and GSC Diagnostics application windows
- Use of a debugger

GSC Runtime and GCS Diagnostics

The GSC Runtime and GSC Diagnostics application window are used by inserting them in a process screen. This can be a process screen developed for diagnostics purposes which is called in Runtime.

The application windows are used for different strategies:

While Runtime is active, GSC Runtime provides information on the dynamic behavior of all (Global Script) actions, enables the individual startup as well as log on and off of each individual action and offers the access point to the Global Script Editor.

GSC Diagnostics issues the Trace methods contained in the actions in the chronological sequence they are called. This also applies to Trace instructions in procedures which are called in actions. The targeted implementation of Trace instructions, e.g. for the output of tag values, enables the progress of actions and the procedures called in them to be traced. The Trace instructions are entered in the form "HMIRuntime.Trace(<Ausgabe>)".

The GSC Diagnostics displays trace output from C and VBS.

Note

Runtime errors in VBS are not displayed

Some script errors are neither output via trace nor displayed via the error dialog. Use the Microsoft Script Debugger.

Debugger

In order to test the scripts in Runtime, a debugger can be used instead of the Diagnostics window. The utilization of the Microsoft Script Debugger is described in chapter "Testing with the Debugger".

The Microsoft Script Debugger is located in the Microsoft Download-Center under the following URL:

- http://www.microsoft.com/downloads/Search.aspx?displaylang=en

Use the "Search" field to search for "Script Debugger" and select the required download.

GSC Diagnostics (Page 95)

Microsoft Download Center (http://www.microsoft.com/downloads/Search.aspx?displaylang=en)

1.12.2 GSC Diagnostics

1.12.2.1 GSC Diagnostics

Introduction

GSC Diagnostics displays the chronological sequence of calls of the trace methods contained in the actions in the Diagnostics window. This also applies to Trace instructions in procedures which are called in actions. The targeted implementation of Trace instructions, e.g. for the output of tag values, enables the progress of actions and the procedures called in them to be traced.

Application

In order to use GSC Diagnostics, insert a GSC Diagnostics type application window in a process screen. The GSC Diagnostics attributes can be used to control the appearance of the GSC Diagnostics window.

In the case of a picture change, the content of the GSC Diagnostics window is deleted.

Note

Messages are also displayed in the "GSC Diagnostics" window when the debugger is activated.

See also

GSC Diagnostics Toolbar (Page 97)

GSC Diagnostics Attributes (Page 96)

1.12.2.2 Inserting the GSC Diagnostics Window into a Picture

Introduction

In order to use GSC Diagnostics, insert a GSC Diagnostics process screen. The process screen can be an existing picture or a picture which serves customized diagnostics purposes. GSC Diagnostics cannot be inserted directly in the process screen as an application but is inserted as an application in an application window. In this case, the application window is a component part of the process screen.

Requirements

Graphics Designer has been started and the process screen is open.

Procedure

1. Use the "Smart Objects" object palette to insert the "Application Window" in the picture.
2. Select the "Global Script" option from the "Window Contents" dialog and confirm the selection with "OK".
3. Select the "GSC Diagnostics" option from the "Templates" dialog.
4. Confirm the selection with OK in order to insert the Diagnostics window.

GSC Diagnostics (Page 95)

1.12.2.3 GSC Diagnostics Attributes

Overview

GSC Diagnostics has attributes which affect the appearance of the GSC Diagnostics window in Runtime. These relate to the geometric attributes, particularly to the following:

- Display: This attribute defines whether the window should be visible or hidden. The attribute can be made dynamic with the name Visible.
- Sizeable: This attribute defines whether the size of the window should be changeable in Runtime.
- Movable: This attribute defines whether the window should be moveable or not during Runtime.
- Border: This attribute defines whether the without is provided with a border. If the window has a border, its height and width can be modified in Runtime.
- Title: This defines whether the window has a title bar.

- Can be maximized: This attribute defines whether the title bar should contain the button to maximize the window.
- Can be closed: This attribute defines whether the title bar should contain the button to close the window.
- Foreground: This attribute defines whether the window should always be in the foreground.

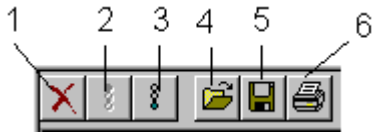
1.12.2.4 GSC Diagnostics Toolbar

Overview

The GSC Diagnostics toolbar enables the output in the diagnostics window to be controlled and to save, print and open window content:



1: Delete the content of the diagnostics window

2: Stop the window being updated

3: Activate the window being updated

4: Opens a text file in the window

5: Saves the window contents in a text file

6: Print the window contents

GSC Diagnostics (Page 95)

1.12.3 GSC Runtime

1.12.3.1 GSC Runtime

Introduction

GSC Runtime is a window which displays the dynamic behavior of all Global Script actions in Runtime. In addition, GSC Runtime can also be used during Runtime to influence the execution of each individual action and provide access to the Global Script editor.

Actions

C actions and VBS actions are differentiated in the GSC Runtime window:

-  Symbolizes a C action
-  Symbolizes a VBS action

The following information is issued:

- Action name: The name of the action
- ID: Action ID. They are used internally by the system. GSC Runtime supplies the corresponding action name together with the Action ID. The link between ID and action name is only valid until Runtime is stopped or, during Runtime, until an action is saved.
- Status: Provides information on the current status of the action. Refer to the table below for the possible statuses.
- Activation Interval: The time in the form Hour:Minute:Second, which should elapse between the action being called.
- Return Value: The return value of the action
- Started On: Date and time the current action was started
- Next Start: Date and time the action will be started again
- Error message: Contains the error text in the case of an error

Actions Status

Possible action status:

- Action was activated.
- Action was deactivated
- Action was stopped.
- Action in progress
- Error logging on the action!
- Error executing the action!

Pop-Up Menu

The following functions are available for every action in the pop-up menu:

- Log off: The relevant action will not be executed again when the current execution has finished.
- Log on: The relevant action will be executed again when the next trigger event occurs
- Start: The relevant action will be executed once.
- Edit: The relevant action will be opened in the Global Script editor for editing. Runtime will remain active. If the edited action is compiled (when necessary) and saved the changes will be applied by the Runtime system immediately.
  The option of opening the pop-up menu for every action can be controlled by assigning an authorization.
  In order to use GSC Runtime, insert a GSC Runtime type application window in a process screen. The GSC Runtime attributes can be used to control the appearance of the GSC Runtime window.

Note

Updating the GSC Runtime window increases the system load. The system load is dependent on how many actions are visible in the window. The system load can be lowered by reducing the height of the window so that fewer lines are visible.

1.12.4 Testing with the Debugger

1.12.4.1 Testing with the Debugger

Overview

A debugger can be used to test the VBScripts in Runtime, e.g.:

- Microsoft Script Debugger
- Debugger "InterDev" (contained in scope of installation material supplied with Developer Studio)
- Microsoft Script Editor (MSE) Debugger (contained in material supplied with Microsoft Office)

The following description relates exclusively to handling the Microsoft Script Debugger.

Download the Microsoft Script Debugger

The Microsoft Script Debugger is located in the Microsoft Download-Center under the following URL:

- http://www.microsoft.com/downloads/Search.aspx?displaylang=en833a6a92-961e-4ce1-9069-528d22605127

Use the "Search" field to search for "Script Debugger" and select the required download.

Notes on the MSE Debugger

The following settings must be changed when using the MSE Debugger so that the running processes will be displayed:

1. Select the "Properties" button in the "Processes" window.
2. Activate the option "Just-In-Time-Debugging" in the "Debuffer properties" dialog.
3. Restart the computer.
4. Deactivate the "Disable script debugging" option in the MS Internet Explorer so that the Internet Explorer cannot prevent the WinCC debugging procedure.

How to Activate the Debugger (Page 102)
Diagnostics (Page 94)
Microsoft Download Center (http://www.microsoft.com/downloads/Search.aspx?displaylang=en)

1.12.4.2 How to Activate the Debugger

Principle

There are several ways of activating the debugger:

- Automatic activation of the debugger when an error occurs in Runtime.
- Opening an error box in Runtime via which the debugger can be activated.
- Starting the debugger from the Start menu and opening a running Runtime scripts.

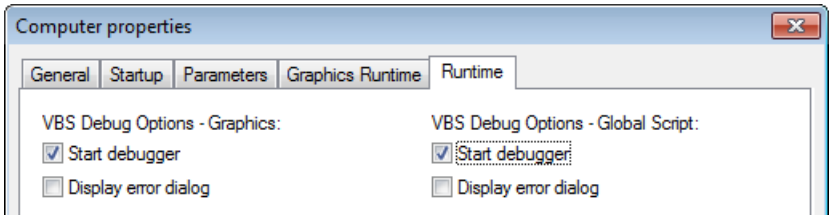
Requirements

The Microsoft Script Debugger must be installed on the configuration computer.

Procedure

The following procedure describes the first two points, activating the debugger in WinCC.

1. In the computer's pop-up menu in WinCC Explorer, select the command "Properties". The "Computer Properties" dialog appears.
2. Select the "Runtime" tab control.
3. Activate the required debug options. The debug behavior for actions in Global Script and Graphics Designer can be set independently of each other:



4. Select "Start debugger" when the debugger should be started directly following an error in the Runtime.

5. Select "Display Error Dialog", if you do not want to start the Debugger directly but wish to display an error dialog with information about the error. The debugger can be started from the error box by means of a button.
6. Click OK to confirm your entries.

Starting the Debugger and Opening a Running Script

The debugger can also be started up later and linked to the system currently running. Define a connection in the debugger to the respective processes, "pdlrt.exe" for the Graphical Runtime System and "gscrt.exe" for the Global Runtime System. The way to open a running script in the debugger is described under the topic "Select Script".

Exiting the Debuggers

It is possible to stop the debugger without exiting the WinCC Runtime.

Diagnostics (Page 94)

1.12.4.3 Principles of Debugging

Introduction

The Microsoft Script Debugger can be used to debug the VBScripts. The Microsoft Script Debugger can be used to:

- View the script source code to be debugged
- Step-by-step processing of the scripts to be checked

- Display and modify tag and property values
- View and monitor the script progress

Note

Please note that the code displayed in the debugger is write-protected. The code cannot be changed directly in the debugger but only test the necessary changes.

Error types

A distinction is made between the following types of error by the debug:

Syntax errors

Syntax errors occur, for example, when a key word is written incorrectly or a parenthesis is not closed. When a syntax check from WinCC is used, syntax errors can be excluded before testing the scripts in Runtime. In principle, only syntactically correct scripts can be saved in Graphics Designer. The WinCC syntax check also checks:

- Whether the procedure names are unique in Global Script
- Whether an action module in Global Script contains only one procedure
- Whether the action part in Graphics Designer contains only one procedure

As a result of the syntax check in WinCC, the script is parsed without being executed. The script is parsed again directly before executing in Runtime. All the script parts are parsed, even those which are executed after a certain action has been executed at a later time.

If the script contains syntax errors, the script is not executed in Runtime.

Runtime error

A Runtime error occurs when an attempt is made to execute an invalid/erroneous action, e.g. because a tag has not been defined. In order to intercept Runtime errors, use the "On Error Resume Next" command in the VBScript. The command causes the subsequent command to be executed following a Runtime error. The error code can subsequently be checked using the Err object. In order to deactivate the processing of Runtime errors in the script, use the "On Error Goto 0" command.

Logical errors

The debugger is particularly helpful in clearing up logical errors. A logical error occurs when an unexpected result is received because, for example, a condition was incorrectly checked. To clear logical errors, go through the scripts step-by-step in order to detect the part which does not function properly.

Basic Procedure

When an error has occurred and the debugger is open, the script appears in a window, write-protected. It is possible to navigate through the script document, set breakpoints, execute the script again in Runtime and to process the script step-by-step.

The most important steps for successful debugging of the scripts are described under "Processing Scripts Step-by-Step".

The source codes of the scripts cannot be edited directly in the scripts. When an error has been detected, the error can be corrected in the original script in WinCC, e.g. load the picture again and update it in the debugger.

Note

Tips and tricks for debugging, frequently occurring error codes and other information is available in the Microsoft Script Debugger online help.

Change Picture During Debug

If a picture change is executed during debugging, the script document of the "old" picture remains open but is no longer valid. If necessary, invalid errors are displayed because the objects called following the picture change are no longer available.

1.12.4.4 Components of the Microsoft Script Debuggers

Introduction

The Microsoft Script Debugger offers several components which assist in debugging:

"Command Window"

The "Command Window" is called in using the "View" > "Command Window" menu commands.

While a script is running in Runtime, the "Command Window" of the debugger can be used, for example, to compile and modify values of tags and properties in the script currently running.

Changes made in the "Command Window" are effected directly in the running script so that planned changes can be tested immediately.

The following actions can be executed in the "Command Window":

- Enter commands: Commands can be entered and executed directly in VBScript.
- Change tag values: Tag values can be compiled and modified directly in the "Command Window". This relates to both tags in the current script as well as global tags.
- Modify properties: It is possible to read and write the properties of all objects in the current script context.

The "Command Window" can always be used when a script has reached a breakpoint or a skip has been made from a breakpoint to other commands.

Note

Please note that the changes executed in the "Command Window" have no effect on the source code of the script but only serve for test purposes in the debugger.

"Running Documents" Window

The "Running Documents" window is called via the "View" > "Running Documents" menu command.

This window displays all the scripts currently running in WinCC Runtime, separated according to scripts, from Global Script ("Global Script Runtime") and scripts from the graphical Runtime system ("PDLRT"). All the running Global Script Runtime actions and modules are displayed. In the graphical Runtime system, the scripts are separated according to trigger-controlled actions (picturename_trigger) and event-controlled actions (picturename_events).

"Call Stack" Window

The "Call Stack" window is called via the "View" > "Call Stack" menu command.

This window displays a list of all running actions and called procedures. When a procedure is called, for example, the name is added to the "Call Stack" list. When the procedure has finished, the name is removed from the list. A procedure can be selected from the list in order to skip to the corresponding position in the script document at which the procedure was called.

1.12.4.5 Structure of VBScript Files

Principle

In order not to hinder the simultaneous processing of cyclic and event-driven scripts in the graphical Runtime system, the event-driven actions and cyclic/tag-driven actions are strictly separated during processing. In this way, a cyclic action, for example, cannot hinder the execution of an action initiated by clicking a button.

To ensure this, the event-driven actions and the cyclic/tag-driven actions are stored in separate script files when saving a picture. If a global picture section has been defined in actions in Graphics Designer, this is copied into both scripts. In the same way, modules which are used in an action are also copied in both script files.

If a tag from a module should be used, the corresponding module must be called in. Otherwise, the module is not copied in the script file and an error is generated.

Note

Since the two script files are handled separately, they have no common data area. Therefore, there is no synchronization of global tags between the two script files. If synchronization is required, implement this using the DataSet object or internal WinCC tags.

Structure of the Script Files

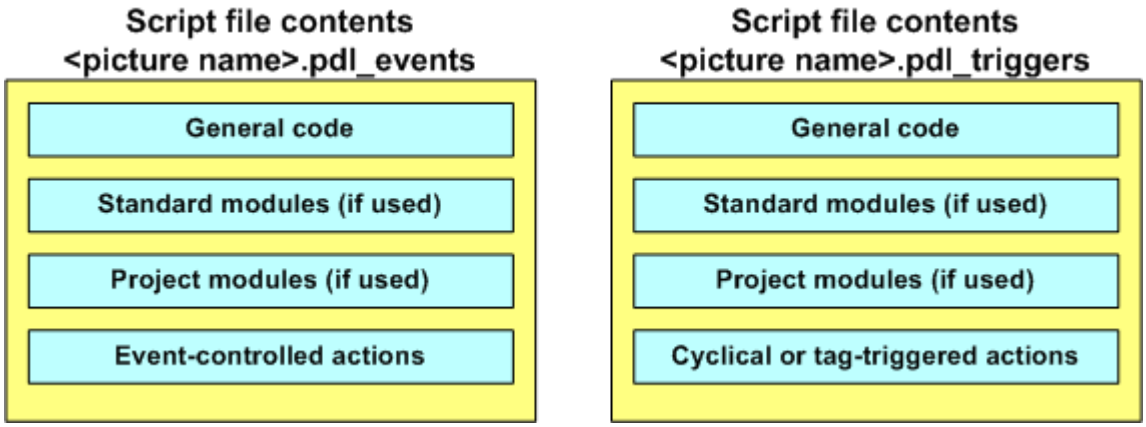
When scripts are debugged with a debugger, the script files always open the different Runtime systems.

In the case of the graphical Runtime system, this means that you receive two script files per picture:

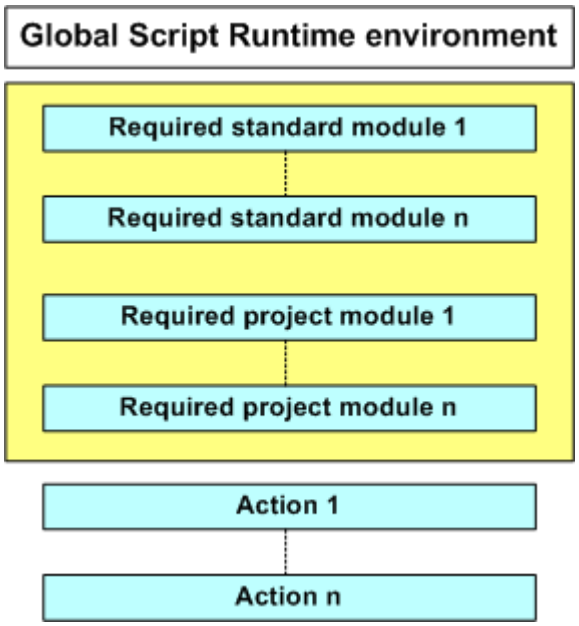
- <Bildname>.pdl_events: Contains the event-driven actions.
- <Bildname>.pdl_triggers: Contains the cyclic and tag-controlled actions.

The following section describes how the script files are structured:

Graphical Runtime system



Global Script Runtime



Note

Please note that the actions and procedures of the graphic Runtime system are not displayed with the action name in the script file under which it was saved in WinCC. The name conventions for actions and procedures in the script files sate described in "Action and Procedure Names in the Debugger".

1.12.4.6 Action and Procedure Names in the Debugger

Action and Procedure Names in the Debugger

The names of procedures and actions in debugger script files differ from the names under which they were saved by the scripts in WinCC.

The action and procedure names in the script files are compiled according to the following rules:

Action type	Name of the script file
Cyclic or tag-driven actions on a property	ObjectName_PropertyName_Trigger
Mouse events	ObjektName_OnClick ObjektName_OnLButtonDown ObjektName_OnLButtonUp ObjektName_OnRButtonDown ObjektName_OnRButtonUp
Keyboard events	ObjektName_OnKeyDown ObjektName_OnKeyUp
Object events	ObjektName_OnObjectChanged ObjektName_OnSetFocus
Events on properties	ObjektName_PropertyName_OnPropertyChanged ObjektName_PropertyName_OnPropertyStateChanged
Picture events	Document_OnOpen Document_OnClosed

Permitted length of action names

The names of the actions in the script files are limited to 255 characters. Each special character used in an object name is converted to five characters. The special characters are represented by a four-place hexadecimal code behind the preceding X. If, for example, an action is configured on a button with the name "PushHere" per mouse click, the script in the script file appears as "PushHere_OnClick".

If the object name compiled is too long, an error message is issued during the syntax check in WinCC. As a result of this restriction, graphic object names cannot be selected with any length during configuration.

Note

If you wish to determine the name of an object in Runtime, press <CTRL+ALT+SHIFT> and position the mouse over the corresponding object. The picture name and object name then appears in a tooltip.

1.12.4.7 Selecting a Script for Editing

Introduction

If the Microsoft Script Debugger is called from the Windows Start menu instead of automatic activation using WinCC, scripts which are currently running can be called in for editing in Runtime.

Prerequisite

Runtime is activated, the picture to be debugged is active.

What to do

1. Start the debugger from the Windows Start menu ("Start" > "Programs" > "Options" > "Microsoft Script Debugger").
2. Activate the "View" > "Running Documents" commands from the menu bar.
   The "Running Documents" window is opened. This window displays all the scripts currently running in WinCC Runtime, separated according to scripts, from Global Script ("Global Script Runtime") and scripts from the graphical Runtime system ("PDLRT").

   The example above, "Startbild.pdl" is active and only event-driven scripts are available in the start picture.
3. Double click on the script document in the "Running Documents" window that is to be debugged.
   The script document is opened "read-only" in the Debugger window.

1.12.4.8 Processing Scripts Step-by-Step

Introduction

The Microsoft Script Debugger can be used to process the scripts step-by-step in order, for example, to locate logical errors systematically. The effect of each individual script line can be tested in Runtime.

The Procedure in Principle

1. Activate the document to be debugged in Runtime.
2. Start the debugger manually from the Start menu and open the required script file or activate the debugger in WinCC. When activated in WinCC, the debugger automatically opens when an attempt is made to execute an erroneous script.
3. Set a breakpoint in the script file. Breakpoints are normally set in front of code lines in which errors are suspected.
4. Switch to WinCC Runtime and trigger an action which causes the script to run.
   The Debugger stops at the first breakpoint and marks the current line.
5. In order to go through the script document step-by-step, select one of the following menu commands:
   "Debug" > "Step Into": Skip to the next code line. If the script calls a procedure in this line, it skips to the procedure using the "Step Into" command. The procedure called can then be processed step-by-step.

   "Debug" > "Step Over": Skips the procedure called. The procedure is called but the debugger does not stop at the individual lines of the procedure. Instead, it moves to the next line of the current script after the procedure has been executed.
6. To interrupt the step-by-step processing of a procedure, select the "Debug" > "Step Out" menu commands. The debugger then skips to the next action.
7. Proceed step-by-step to the end of the document or select the "Debug" > "Run" menu items to start the script again in Runtime.

1.12.4.9 Setting Breakpoints

Introduction

Breakpoints can be set in a script to stop at specific points when processing it and to start the debugger. Set a breakpoint in front of a line, for example, which you suspect contains a script error.

It is possible to:

- Set breakpoints at specific lines to locate logical errors in the script step-by-step.
- Set a breakpoint and call the debugger before the next line in the script is processed. These procedure is used, for example, for events such as "Change picture".

When a script file is updated in the debugger, all the breakpoints are lost.

If a breakpoint is set in one of the script files "<Bildname>.pdl_trigger" or "<Bildname>.pdl_event", all the trigger-driven or all event-driven procedures are stopped, respectively, in Runtime.

Requirements

Runtime is activated, the picture to be debugged is active.

Procedure

Setting a breakpoint

1. Start the debugger and select the script. If automatic activation of the debuggers in WinCC has been selected, the debugger is called in as soon as an erroneous script is executed.
2. Position the cursor on the action in which a breakpoint should be set.
3. Open the "Debug" menu and select the "Toggle Breakpoint" item or the icon from the toolbar.
   The next executable line will be marked by a red dot.
4. Switch to WinCC Runtime and execute the action you wish to debug.
   The Debugger stops at the first breakpoint it finds in the script. The current line is displayed on a yellow background. The script can then be processed step-by-step.

1.12.4.10 Deleting Breakpoints

Introduction

When an error has been cleared properly, the breakpoints in a script can be cleared individually or all together.

Procedure

1. Position the cursor in the line whose breakpoint is to be deleted.
2. Open the "Debug" menu and select the "Toggle Breakpoint" item or the icon  from the toolbar.
   The next line will be displayed without a mark.
3. To delete all the breakpoints in a script, open the "Debug" menu and select the "Clear all Breakpoints" entry or the icon  from the toolbar.

1.12.4.11 How to Set Bookmarks in Scripts

Introduction

During the debug routine, bookmarks can be set on code lines so that they can be found easier again one line later.

Setting or deleting bookmarks

Position the mouse pointer in the row where you wish to set a bookmark, and click <CTRL+F9> to set a bookmark or <CTRL+SHIFT+F9> to delete one.

Skipping to the next bookmark

Press <F9> to go to the next bookmark in the script.

Skipping to the previous bookmark

Press <SHIFT+F9> to go to the previous bookmark in the script.

1.12.4.12 How to Determine and Modify Tag and Property Values

Introduction

While a script is running in Runtime, the "Command Window" of the debugger can be used, for example, to compile and modify values of tags or properties in the script currently running. It is possible, for example, to reset a process value for a script to zero without having to stop the process.

Note

If you wish to determine the name of a WinCC object in Runtime, click <CTRL+ALT+SHIFT> and position the mouse over the corresponding object. The picture name and object name then appears in a tooltip.

Requirements

The script runs in Runtime and the debugger is opened.

Procedure

1. Set at least one breakpoint in the current script.
2. Switch to WinCC Runtime and trigger an action which causes the script to be executed. The Debugger stops at the first breakpoint.
3. Open the "View" menu and activate the "Command Window" entry. The "Command Window" opens.
4. In order to determine the value of a tag or property, enter a "?" followed by a Space and the name of the tag or property whose value is to be determined, e.g. "?myTag". Press <RETURN> to execute the command.
5. In order to modify the value of a tag/property, assign a value in the VBS syntax.

1.12.4.13 Executing Script Commands

Introduction

While a script is running in Runtime, the "Command Window" of the debugger can be used to execute script commands directly and thus manipulate the running of the current script. The script commands can be executed directly for test purposes without creating the command in a script and activating it. It is possible, for example:

- To retrieve methods
- To retrieve procedures
- To manipulate object properties

"Command Window" can basically be used to execute all commands which can also be executed from a VBScript.

Requirements

The script runs in Runtime and the debugger is opened.

Procedure

1. Set at least one breakpoint in the current script.
2. Switch to WinCC Runtime and trigger an action which causes the script to be executed. The Debugger stops at the first breakpoint.
3. Open the "View" menu and activate the "Command Window" entry. The "Command Window" opens.
4. Enter the required command and press "ENTER".

Note

If a faulty command is entered in the Command window, no error message is issued in Runtime. The message "<Script Error> appears in the Command window instead.

1.13 Printing VBScripts

Principle

The actions and procedures configured in both Global Script and in Graphics Designer can be documented in WinCC.

The documentation options are distinguished between:

- Print Feedback Doc: In Graphics Designer, all the configured actions are printed with the feedback of the current picture. The Feed Back contains the C-actions and VBS actions, located beside each other, differentiated by the source text (C or VBScript).
- Print current script: The Feed Back in Global Script always contains the currently open procedure or action.

WinCC provided predefined print layouts for the layout of the Feed Back. Customized print layouts can also be developed and linked to the Print Job tab control with "Project Documentation - Setup".

Procedure

1. Open Global Script or Graphics Designer according to the scripts to be documented.
2. Configure the print job, if necessary, using the "Project Documentation - Setup" command.
3. Use the "View Project Documentation" command to preview the data to be printed.
4. Select the menu commands "File" > "Print Project Documentation" to print the data.

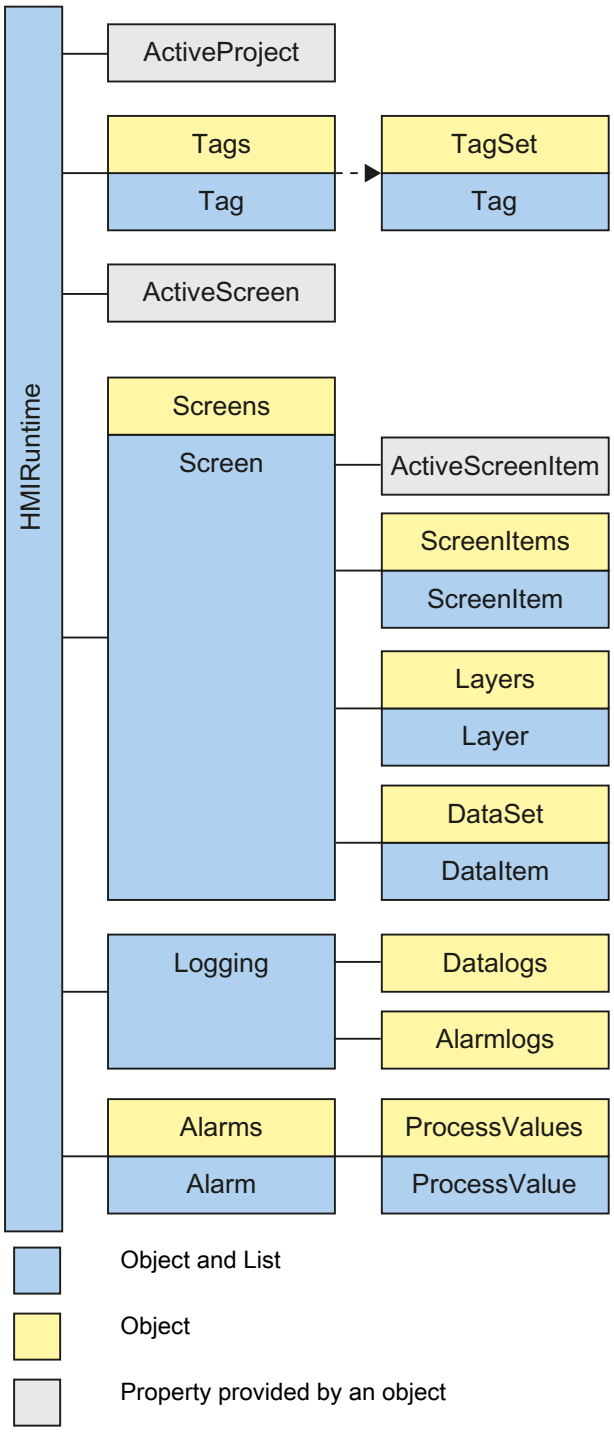
1.14 VBS Reference

1.14.1 VBS Reference

VBS object model in WinCC

The WinCC object model of the graphic Runtime system enables access to graphic objects and tags in Runtime.

When you click on an object name, you are shown a detailed description.



The VBS object model in a faceplate type

The VBS object model is not valid for WinCC in a Faceplate type. It is replaced by a completely new model.

The VBS object model of the Faceplate type provides you with access to the graphic objects and Faceplate tags of the Faceplate type in Runtime.

Objects

Objects and lists are provided for access to all the objects in the graphic Runtime systems: Graphic objects, pictures, layers and tags.

Properties

The properties of the individual objects can be used to modify specific graphic objects and tags in Runtime , e.g. activating an operating element per mouse click or triggering a color change by modifying a tag value.

Methods

Methods, which are applied to individual objects, can be used to read tag values for further processing or display diagnostics messages in Runtime.

1.14.2 Objects and Lists

1.14.2.1 Objects and Lists

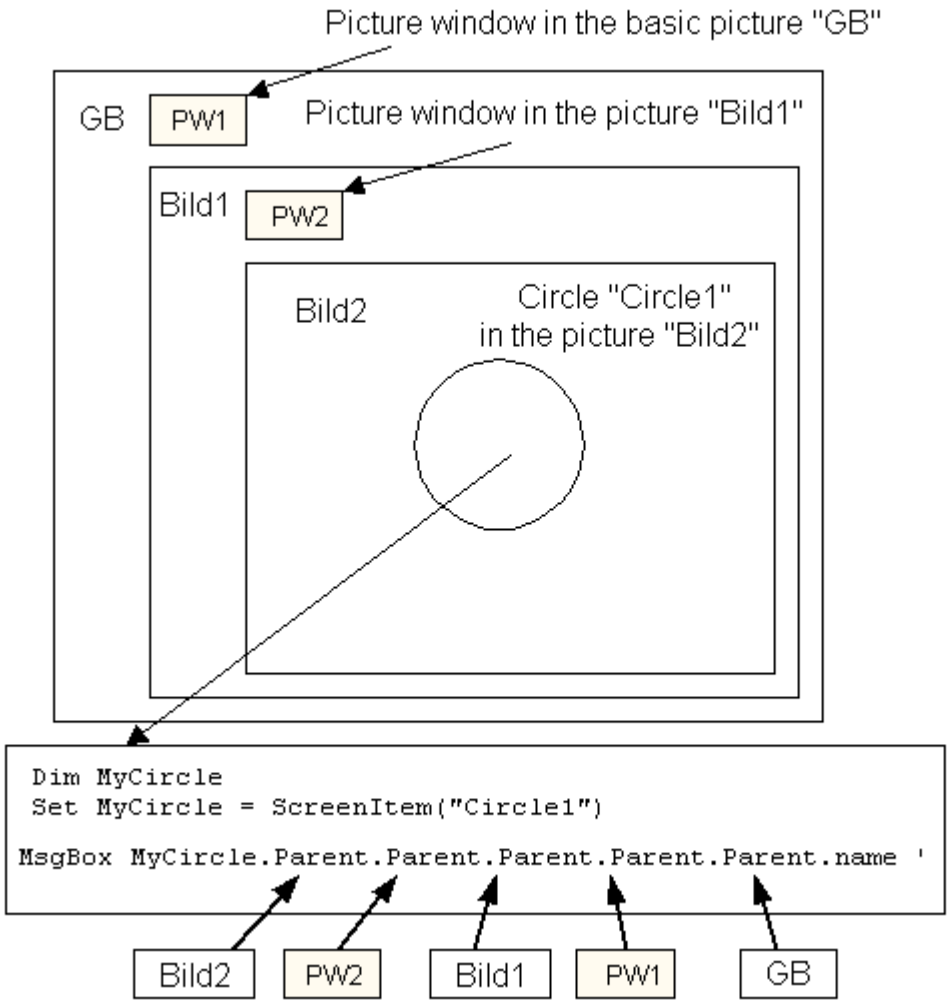
Overview

The objects and lists provided in WinCC object models enables access to graphic objects and tags in Runtime.

Navigation in Object Models

Access is made to objects in the VBS object model in hierarchical sequence. If, for example, a picture element is accessed within a picture, access is made to the picture element in the picture via its parent object (the surrounding picture).

Example:



Only the basic picture name is issued in this example.

Access to Graphic Objects

In WinCC, access is made to pictures, layers and graphic objects in Runtime using the superordinate "HMIRuntime" object. Access to objects and layers is always made via the picture (screen) in which they are contained.

Access to Tags

In WinCC, tags are accessed directly in Runtime using the superordinate "HMIRuntime" object. Tag values can be read out or set anew.

Lists

Lists of WinCC object models behave in the same way as standard collections of VBS.
Exception: The "Tags" list has no Enum function.

Available Objects

- Alarm
- Alarms
- AlarmLogs
- DataItem
- DataLogs
- DataSet
- HMIRuntime
- Item
- Layer
- Layers
- Logging
- ProcessValues
- ProcessValue
- Project
- ScreenItem
- ScreenItems
- Screen
- Screens
- Tag
- Tags
- TagSet

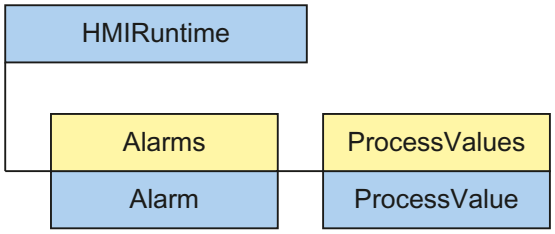
1.14.2.2 Alarm object

Description



The alarm object is used to access the Alarms object list.

Note

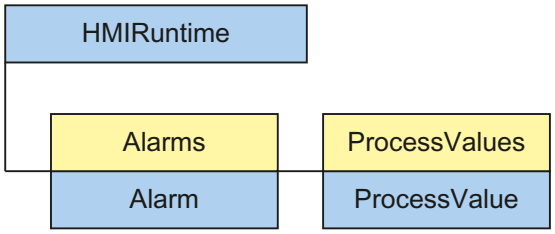
The properties of the alarm object are not automatically updated when the values of the properties change.

See also

Alarms object (list) (Page 126)

1.14.2.3 Alarms object (list)

Description



Use the alarm object to trigger existing messages.

Usage

Using the "Alarms" list you can:

- Access a message in the list (Item method)
- Create a new alarm object (Create method)
- Read the alarm ID of the message (AlarmID attribute)
- Read the status of a message (State property)
- Read the time stamp of the message (Timestamp property)
- Generate an instance of the alarm object (Instance property)
- Read the name of the computer on which the message came (ComputerName property)
- Read or set the name of the user who triggered the message (UserName property)
- Read or set the name of the process value blocks (ProcessValues property)
- Read or set the message commentary (Comment property)
- Read or set the message server prefix (Context property)

Example

In the following example, the message with the alarm number "1" configured in the Alarm Logging Editor will be triggered:

```
'VBS360
Dim MyAlarm
Set MyAlarm = HMIRuntime.Alarms(1)
MyAlarm.State = 5 'hmiAlarmStateCome + hmiAlarmStateComment
MyAlarm.Comment = "MyComment"
MyAlarm.UserName = "Hans-Peter"
MyAlarm.ProcessValues(1) = "Process Value 1"
MyAlarm.ProcessValues(4) = "Process Value 4"
MyAlarm.Create "MyApplication"
```

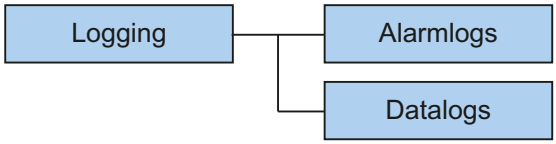
Item Method (Page 754)

1.14.2.4 AlarmLogs Object

Description



Using the object, swapped archive segments of Alarm Logging may be reconnected to Runtime, or previously swapped archive segments of Alarm Logging may be deleted again. Therein

- Archive segments to be swapped are copied to the common archiving directory of the WinCC project, or
- previously swapped archive segments are deleted in the common archiving directory.

Using parameters you may control from where archive segments are to be swapped. You may also specify the time period over which archive segments are to be swapped or deleted. Archive segments are copied to the common archiving directory of the project.

If an error occurred during the operation with archiving segments, the method used returns an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Usage

Previously swapped archive segments of Alarm Logging may be connected with Runtime ("Restore" method).

Previously swapped archive segments of Alarm Logging may be deleted from the Runtime project ("Remove" method).

Example:

In the following example, archive segments from Alarm Logging are swapped and the return value is output as Trace.

```
'VBS187
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

See also

Restore Method (Page 778)

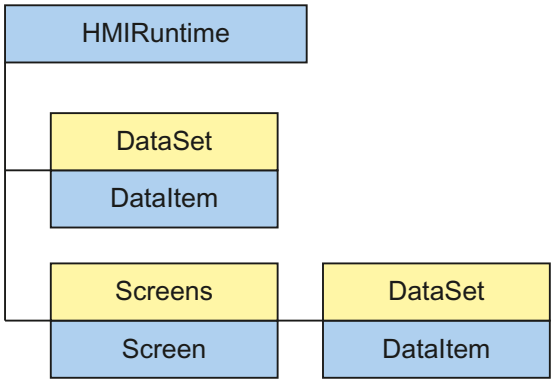
Remove Method (Page 773)

DataLogs Object (Page 130)

Logging Object (Page 138)

1.14.2.5 DataItem Object

Description



The DataItem object is used to access the contents of the DataSet list. Values or object references are stored in the list as DataItem.

Access uses the name under which the value was added to the list. Single access using an index is not recommended since the index changes during adding or deleting of values. The index may be used to output the complete contents of the list. The output is in alphabetical order.

Note

For object references it must be ascertained that objects are multiread-enabled.

Example:

The example shows how the value of 'Motor1' is output as Trace.

```
'VBS163
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
```

The following example enumerates all DataItem objects of the DataSet list. Name and value are output as Trace.

```
'VBS164
Dim data
For Each data In HMIRuntime.DataSet
HMIRuntime.Trace data.Name & ": " & data.Value & vbNewLine
Next
```

Note

For objects, value may possibly not be output directly

See also

HMIRuntime Object (Page 134)

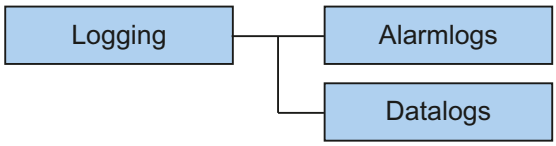
DataSet Object (List) (Page 132)

Value Property (Page 666)

Name Property (Page 496)

1.14.2.6 DataLogs Object

Description



Using the object, swapped archive segments of Tag Logging may be reconnected to Runtime, or previously swapped archive segments of Tag Logging may be deleted again. Therein

- Archive segments to be swapped are copied to the common archiving directory of the WinCC project, or
- previously swapped archive segments are deleted in the common archiving directory.

Using parameters you may control from where archive segments are to be swapped. You may also specify the time period over which archive segments are to be swapped or deleted. In addition, you may set the archive type ("Tag Logging Fast", "Tag Logging Slow", "Tag Logging

Fast and Tag Logging Slow"). Archive segments are copied to the common archiving directory of the project.

If an error occurred during the operation with archiving segments, the method used returns an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Usage

Previously swapped archive segments of Tag Logging may be connected with Runtime ("Restore" method).

Previously swapped archive segments of Tag Logging may be deleted from the Runtime project ("Remove" method).

Example:

In the following example, fast archive segments from Tag Logging are swapped and the return value is output as Trace.

```
'VBS188
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1,1) & vbNewLine
```

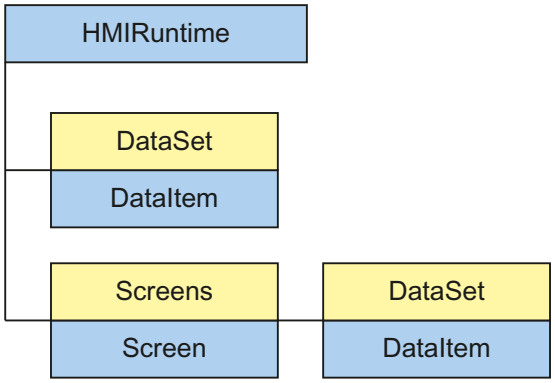
Remove Method (Page 773)

AlarmLogs Object (Page 128)

Logging Object (Page 138)

1.14.2.7 DataSet Object (List)

Description



Using the DataSet object, data may be exchanged across several actions.

A DataSet object is global and defined by the Screen object. Any VBS action may access the data.

The DataSet object at the Screen object must be addressed according to picture hierarchy and shall persist as long as the picture is displayed. The global object persists over the entire Runtime time period.

Access uses the DataItem object.

Note

Objects of type Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet cannot be included in the DataSet list.
The DataSet object does not support any classes.

Usage

Using the "DataSet" list, you may:

- Output or process (enumerate) all objects in the list.
- Output the number of elements contained ("Count" property).
- To process a specific object in the list ("Item" method).
- Add an object to the list ("Add" method).
- Remove a specific object from the list ("Remove" method).
- Remove all objects from the list ("RemoveAll" method).

Access to list elements uses:

```
HMIRuntime.DataSet("Itemname")
```

For a picture-specific list, access uses:

```
HMIRuntime.Screens("Screenname").DataSet("Itemname")
```

In a picture, you may access the DataSet object of the picture by using:

```
DataSet("Itemname")
```

If upon access the stated name does not exist in the list, VT_Empty is returned and an Exception is triggered.

Example:

The example shows how to add a value to the list, how to read it and remove it. It make sense to perform this in several different actions.

```
'VBS162
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet.Remove("motor1")
```

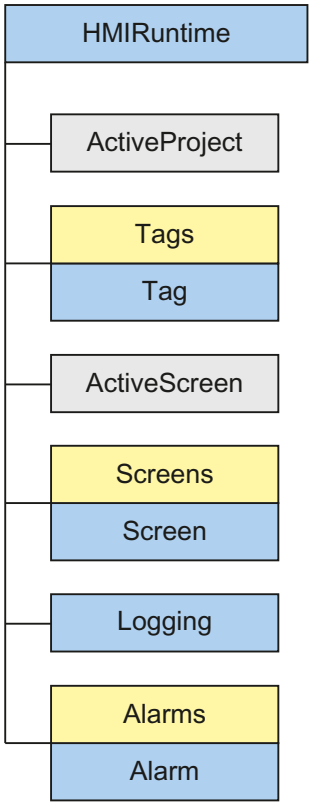
1.14.2.8 HMIRuntime Object

Description



The HMIRuntime object represents the graphic Runtime environment.

Usage

The "HMIRuntime" object can be used for the following, for example:

- Read or set the current Runtime language ("Language" property).
- Read or set the name of the current base picture ("BaseScreenName" property).
- Read the path of the active Runtime project ("ActiveProject" property).
- Access tags ("Tags" property).
- Access tags of a list ("DataSet" property).
- Exit Runtime ("Stop" method).
- Display messages in a diagnostics window ("Trace" method).

Example:

The following command terminates WinCC Runtime:

```
'VBS3
HMIRuntime.Stop
```

1.14.2.9 Item Object

Description

The "Item" object provides a reference to the current object.

Usage

The "Item" object is used, for example, to address the properties of the object currently selected in Graphics Designer.

Example:

In the following example, a rectangle has been created. When the object has been selected, all the properties of the current object can be set a background color red:

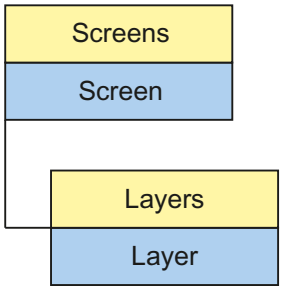
```
'VBS195
Item.BackColor = RGB(255,0,0)
```

See also

Objects and Lists (Page 123)

1.14.2.10 Layer Object

Description



The layer object returns the result of access to the layers list.

Parent Object

Picture, in which the picture layer is.

Usage

Depending on certain events, the Layer object can be used to obtain access to the properties of a complete layer in order, for example, to hide or unhide a layer with operating elements according to the operator authorization.

The "Layer" object can be used to:

- To activate or deactivate the visualization of a layer ("Visible" property).
- To read out the name of a layer ("Name" property).

Note

The layer property specifies the layer in which the object is located. The layer "0" is output as "Layer0".

When accessed, the layers are counted up from 1 in VBS. Therefore, the layer "1" must be addressed with "layers(2)".

Example:

In the following example, Layer 1 is set invisible:

```
'VBS4
Layers(2).Visible = vbFalse
```

See also

Layer Object (Page 136)

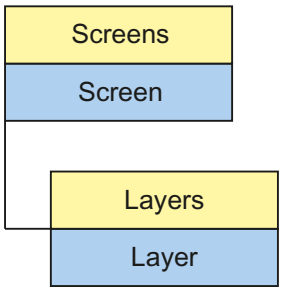
Parent Property (Page 515)

Name Property (Page 496)

1.14.2.11 Layers Object (Listing)

Description



The Layers list enables access to all 32 layers of the graphical Runtime system.

Parent Object

Picture, in which the picture layer is.

Usage

The "Layers" list can be used to:

- Process all layers in the list ("_NewEnum" property).
- Count all layers contained in the list ("Count" property).
- Process a layer from the list ("Item" method).

The properties represent default properties and methods of a list and are not described in detail in the WinCC documentation.

See also

Parent Property (Page 515)

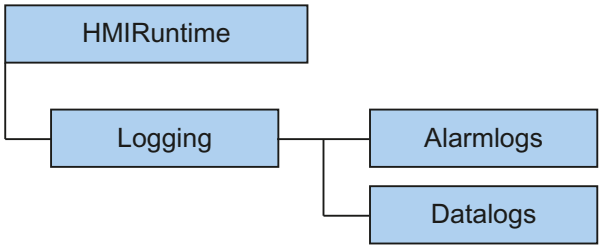
1.14.2.12 Logging Object

Description



Using the object, swapped archive segments may be reconnected to Runtime, or previously swapped archive segments may be deleted again. Therein

- Archive segments to be swapped are copied to the common archiving directory of the WinCC project, or
- previously swapped archive segments are deleted in the common archiving directory.

Using parameters you may control from where archive segments are to be swapped. You may also specify the time period over which archive segments are to be swapped or deleted. Archive segments are copied to the common archiving directory of the project.

If an error occurred during the operation with archiving segments, the method used returns an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Usage

Previously swapped archive segments of Alarm Logging and Tag Logging may be connected with Runtime ("Restore" method).

Previously swapped archive segments of Alarm Logging and Tag Logging may be deleted from the Runtime project ("Remove" method).

Example:

In the following example, archive segments from Alarm Logging and Tag Logging are swapped and the return value is output as Trace.

```
'VBS189
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

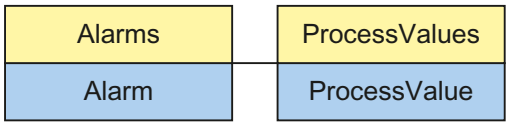
1.14.2.13 ProcessValue Object

Description



The ProcessValue object is used to access the ProcessValues object list.

Note

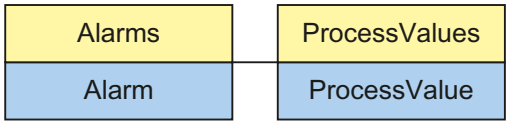
Only the 10 predefined ProcessValues are supported.

See also

ProcessValues Object (List) (Page 140)

1.14.2.14 ProcessValues Object (List)

Description



Usage

Using the "ProcessValues" list, you can:

- Edit a ProcessValue from the list ("Item" method)
- Display or edit all the objects in the list (_NewEnum attribute)
- Count all ProcessValues contained in the list (Count property)
- Read or set the values of the ProcessValue object (Value property)

The properties represent default properties and methods of a list and are not described in detail in the WinCC documentation.

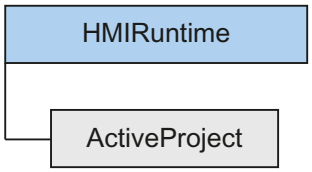
Item Method (Page 754)

1.14.2.15 Project Object

Description



Using the object, information may be requested from the current Runtime project.

The project object is returned as the result of ActiveProject.

Usage

Using the "Project" object, you may:

- Read the path of the current Runtime project ("Path" property).
- Read the name of the current Runtime project, without path or file extension ("Name" property).

Example:

The following example returns name and path of the current Runtime project as Trace:

```
'VBS159
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

See also

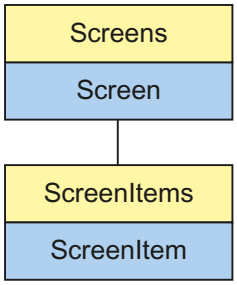
ActiveProject Property (Page 305)

Name Property (Page 496)

Path Property (Page 517)

1.14.2.16 ScreenItem Object

Description



The ScreenItem object returns the result of access to the ScreenItem list.

Parent Object

Picture containing the picture element.

Usage

The ScreenItem object can be used to access the properties of graphic objects within a picture according to certain events.

The "ScreenItem" object can be used for the following, for example:

- To activate or deactivate the visualization of an object ("Visible" property).
- To release or block the operation of an object ("Enabled" property).
- Change the width and height of an object ("Height" and "Width" properties).
- Change the position of an object ("Top" and "Left" properties).
- Read and define a layer in which a graphic object is located ("Layer" property).
- Read or define the name of a graphic object ("ObjectName" property).
- Define a reference to the superordinate picture ("Parent" property).

Using the "Activate" method, the focus is set on the respective ScreenItem object. If the focus cannot be set because the object is non-operable, for example, an error is generated. Using error processing (On Error Resume Next), the error may be evaluated.

Possible features of ScreenItem

The "ScreenItem" object can contain the following object types:

Standard objects	Smart objects	Windows objects	Tube objects	Controls	Others
Ellipse	3D bar	Button	Double T-piece	Siemens HMI Symbol Library	Customized Object
Ellipse arc	Application window	Check box	Polygon tube	WinCC AlarmControl	Group
Ellipse segment	Bar	Radio box	Tube bend	WinCC digital/ analog clock control	
Circle	Picture window	Round button	T-piece	WinCC FunctionTrendControl	
Circular arc	Control	Slider		WinCC gauge control	
Pie segment	I/O field			WinCC OnlineTrendControl	
Line	Faceplate Instance			WinCC OnlineTableControl	
Polygon	Graphic object			WinCC push button control	
Polyline	Combo box			WinCC RulerControl	
Rectangle	List box			WinCC slider control	
Rounded rectangle	Multiple row text			WinCC UserArchiveControl	
Connector	OLE object				

Standard objects	Smart objects	Windows objects	Tube objects	Controls	Others
	Group display				
	Text list				
	Status display				

Detailed descriptions of the individual object types is provided under "ScreenItem Object Types". The ScreenItem object's "Type" property can be used to address the object types via the VBS Type ID.

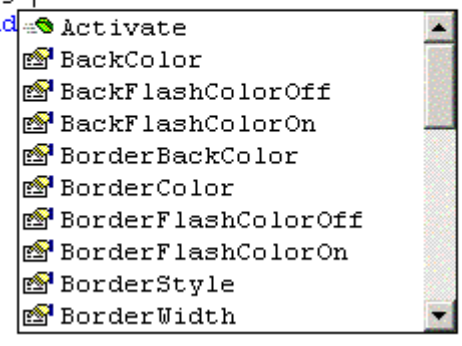
Object properties

The "ScreenItem" object has different properties according to the features. The following section describes the properties which all ScreenItem object types have:

```
Sub OnClick(ByVal Item)
Dim obj
Set obj = ScreenItems("Circle1").
End Sub
```

When a specific object type is addressed, certain further properties are added to the standard properties:

```
Sub OnClick(ByVal Item)
Dim obj
Set obj = ScreenItems("Circle1")
obj.
End
```



The additional properties are indicated in the descriptions of the individual object types.

Example

In the following example, the radius of a circle is set to 2 in Runtime per mouse click:

```
Sub OnClick(ByVal Item)
'VBS5
Dim objCircle
Set objCircle= ScreenItems("Circle1")
objCircle.Radius = 2
End Sub
```

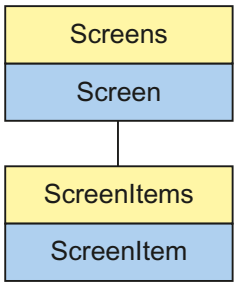
1.14.2.17 ScreenItems Object (List)

Description



The "ScreenItems" list can be used to reference an object in the picture.

Parent Object

Picture containing the picture element.

Usage

The "ScreenItems" list can be used to:

- To display or edit all objects in the list (i.e. all objects within a picture) ("_NewEnum" property).
- To count the objects in a picture ("Count" property).
- To process a specific object in the list ("Item" method).

The properties are standard properties and methods of a collection and are not described in detail in the WinCC documentation.

Special features of the ScreenItem object

If an external control (ActiveX control or OLE object) is embedded in WinCC, it is possible that the properties of the embedded controls have the same name with the general properties of the ScreenItem object. In such cases, the ScreenItem properties have priority.

The properties of the embedded controls can also be addressed via the "object" property:

The "object" property is only provided by ActiveX controls and OLE objects.

Example:

```
'Control1 is an embedded ActiveX-Control with property "type"
'VBS196
Dim Control
Set Control=ScreenItems("Control1")
Control.object.type

'Control1 is a WinCC-Control
'VBS197
Dim Control
Set Control=ScreenItems("Control1")
Control.type
```

Example

In the following example, the name of the objects in the current picture are displayed in a message box:

```
Sub OnClick(ByVal Item)
'VBS6
```

```
Dim lngAnswer
Dim lngIndex
lngIndex = 1
For lngIndex = 1 To ScreenItems.Count
  lngAnswer = MsgBox(ScreenItems(lngIndex).Objectname, vbOKCancel)
  If vbCancel = lngAnswer Then Exit For
Next
End Sub
```

Example: Writing tag values (Page 811)

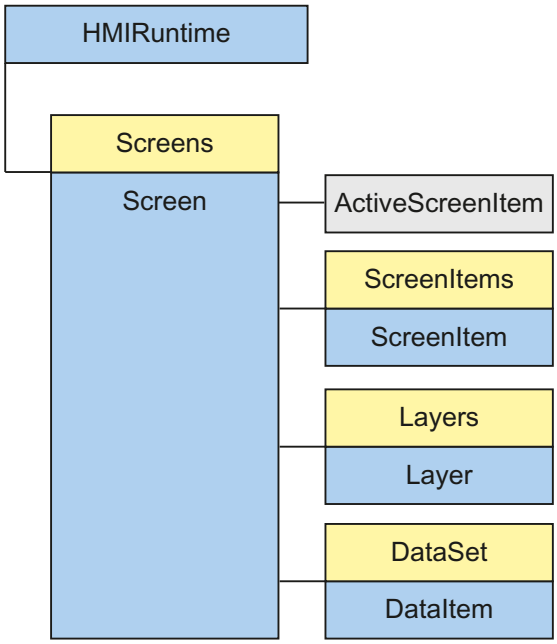
ScreenItem Object (Page 141)

Parent Property (Page 515)

Item Method (Page 754)

1.14.2.18 Screen Object

Description



The Screen object returns the result of access to the Screen list. All the properties and methods of this object can also be edited directly in Runtime. The "Screen" object represents a WinCC picture in Runtime and contains all the properties of the picture document and picture view.

The "Screen" object also contains the following:

- A list of all the graphic objects contained in the addressed picture which can be addressed by the "ScreenItems" object.
- A list of all the layers contained in the addressed picture which can be addressed by the "Layers" object.

Parent Object

A picture window in which the Screen object is embedded.

When the Screen object is the basic picture, the Parent object is not defined and set to zero.

Usage

The "Screen" object can be used for the following, for example:

- To release or block the operation of a screen ("Enabled" property).
- Change the width and height of a screen ("Height" and "Width" properties).
- Zoom a picture ("Zoom" property).
- Modify the fill pattern, background color and fill pattern color ("Fillstyle", "Backcolor" and "Fillcolor" properties).

Note

If a Change Picture is executed, all the open references are invalid for pictures no longer open. It is then no longer possible to work with these references.

Example:

In the following example, the width of the first picture in Runtime is increased by 20 pixels:

```
'VBS7
Dim objScreen
Set objScreen = HMIRuntime.Screens(1)
MsgBox "Screen width before changing: " & objScreen.Width
objScreen.Width = objScreen.Width + 20
MsgBox "Screen width after changing: " & objScreen.Width
```

Notes on Cross References

All the pictures which are addressed with the standard formulation

```
HMIRuntime.BaseScreenName = "Screenname"
```

are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

If pictures are addressed with different formulations in the code, this can be notified by the following section of the CrossReference:

```
' ' WINCC:SCREENNAME_SECTION_START
Const ScreenNameInAction = "ScreenName"
' WINCC:SCREENNAME_SECTION_END
The section can be inserted in VBS actions as often as required.
```

Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

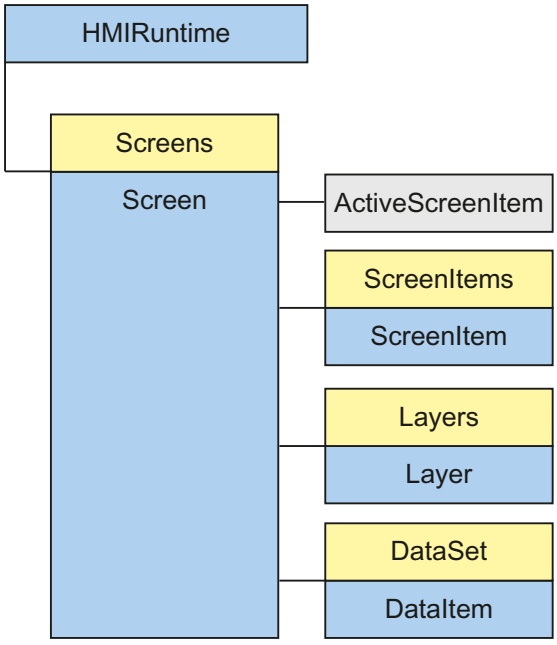
1.14.2.19 Screens Object (List)

Description



By using the picture window technique, several windows can be opened simultaneously in WinCC Runtime but only one basic picture exists. The "Screens" list enables access to all open pictures in Runtime using the picture names. The Screens list contains all invisible pictures.

Usage

When configuring a multi-user project, it is essential to specify the server prefix to access a picture which is not on the local computer.

The "Screens" list can be used to:

- Display or edit all the pictures within the list ("_NewEnum" property).
- To count the pictures in a project ("Count" property).
- To process a specific picture in the list ("Item" method).
- Initiate new drawing of all visible pictures ("Refresh" method).

The properties are standard properties and methods of a collection and are not described in detail in the WinCC documentation.

The access code, required in the VBS environment in the HMIRuntime.Screens(<Zugriffsschlüssel>) instruction, must fulfill the syntax requirements:

```
[<Grundbildname>.]<Bildfenstername>[:<Bildname>] ...
.<Bildfenstername>[:<Bildname>]
```

This means:

- The access code expresses the picture hierarchy.
- The picture names in the code can be omitted at any point.
- The "AccessPath" property of the "Screen" object corresponds to the full access code.
- Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.
- The basic picture can be addressed by the access code ".

In addition, it has been defined that the basic picture can be addressed with Index 1.

Examples

The pictures are addressed by the hierarchy information in the list. There are two options here, with or without use of the picture name. In the following examples, a basic picture "BaseScreenName" is configured with a picture window "ScreenWindow". The picture window contains the picture "ScreenName".

Addressing with the picture name

```
'VBS8
Set objScreen = HMIRuntime.Screens("BaseScreenName.ScreenWindow:ScreenName")
```

Addressing without the picture name

```
'VBS9
Set objScreen = HMIRuntime.Screens("ScreenWindow")
```

Referencing the basic picture in various ways

```
'VBS10
Set objScreen = HMIRuntime.Screens(1)

'VBS11
Set objScreen = HMIRuntime.Screens("")

'VBS12
Set objScreen = HMIRuntime.Screens("BaseScreenName")
```

See also

Item Method (Page 754)

Count Property (Page 381)

1.14.2.20 SmartTags Object

Description

The "HMIRuntime" component was deactivated in the faceplate type. The new "SmartTags" component was added for the faceplate type. With the SmartTags object you can dynamize the faceplate type. You can only access the faceplate variables and the properties of the faceplate type. You cannot access the normal WinCC tag management system. The normal WinCC tag management system is not available in the faceplate type.

Usage

Using the "SmartTags" object, you can:

- Access the faceplate tags in a faceplate type.
  Syntax: SmartTags("<tagname>")
- Access the properties of a faceplate type.
  Syntax: SmartTags("Properties\<propertyname>")

Example 1

Insert a rectangle and a button in a faceplate type. Define a faceplate variable var1. Connect the "Width" property of the rectangle to faceplate variable var1. Dynamize the "OnClick" event of the button as follows with VBS.

```
'VBS306
Dim w
w = SmartTags("var1")
w = w + 10
SmartTags("var1") = w
```

When you activate Runtime, the faceplate variable is incremented by 10 every time you click the button. This increases the rectangle width by 10.

Direct reading and writing with object reference

In the following example, the SmartTags object is used to create an object reference "w" to "var1".

Referencing offers the advantage of being able to access the "var1" tag.

```
'VBS307
Dim w
Set w = SmartTags("var1")
w.value = w.value + 10
```

Example 2:

Insert a rectangle and a button in a faceplate type. Define the instance-specific property "wide". Link the "Width" property of the rectangle to the instance-specific property "wide". Dynamize the "OnClick" event of the button as follows with VBS:

```
'VBS308
Dim w
w = SmartTags("Properties\wide")
SmartTags("Properties\wide") = w + 50
```

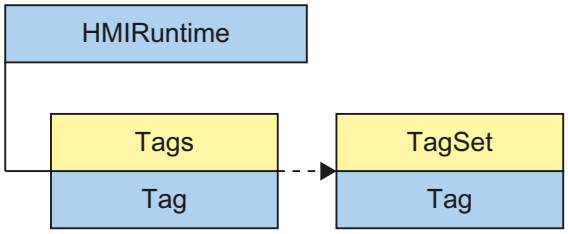
When you activate Runtime, the instance-specific property "wide" is increased by 50 every time you click the button. This increases the rectangle width by 50.

See also

SmartTag property (Page 568)

1.14.2.21 Tag Object

Description



A tag object is returned via the "Tags" list. A tag object can be used to address all the properties and methods of a tag.

When creating a tag object, all the properties are installed with the following values:

- Value = VT_EMPTY
- Name = Tag name
- QualityCode = BAD NON-SPECIFIC
- TimeStamp = 0
- LastError = 0
- ErrorDescription = " "

Note

A summary of possible Quality Codes may be found in WinCC Information System under key word "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

Usage

The "Tag" object can be used to:

- Read out information on the tag ("Name", "QualityCode", "TimeStamp", "LastError" and "ErrorDescription" properties)
- Set a value for a tag ("Write" method, "Value" property)
- Read a value for a tag ("Read" method, "Value" property)

Read the value of a "Tag1" tag:

```
'VBS13
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read()
MsgBox objTag.Value
```

Declaration of tags in WinCC

Always define internal tags in VB script using the "Dim" instruction in order to prevent writing tags wrongly.

When creating a new action, the "Option explicit" instruction is automatically entered in the declaration area and cannot be deleted.

Do not use the "Option explicit" instruction in the code because it may cause Runtime errors.

Example: Declaration of a VBScript "lngVar" tag:

```
'VBS14
Dim lngVar
lngVar = 5
MsgBox lngVar
```

Note

Tag names must not contain any special characters.

Please note that when creating a tag, it must not contain a value (Value = VT_EMPTY). Initialize the tags after declaration with the corresponding value.

Notes on Cross References

All the pictures which are addressed with the standard formulation

```
HMIRuntime.Tags("Tagname")
```

are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

If tags are addressed with different formulations in the code, this can be notified by the following section of the CrossReference:

```
' ' WINCC:TAGNAME_SECTION_START
Const TagNameInAction = "TagName"
' WINCC:TAGNAME_SECTION_END
```

The section can be inserted in VBS actions as often as required.

Note

It is not possible to guarantee the compilation of combined tag names from the CrossReference.

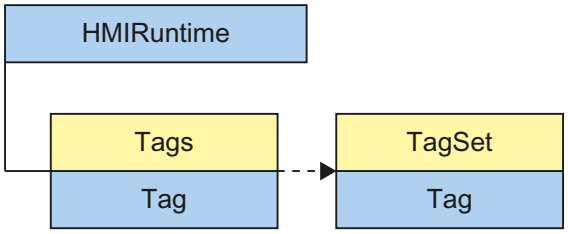
1.14.2.22 Tags Object (List)

Description



The "Tags" list enables access to tags in WinCC Runtime. The result of access to the "Tags" list is returned by an object of the type "Tag". The Tag object can be used to access all the tag properties and methods.

Note

"Tags" is a list with a restricted functional scope. The tags in the list cannot be accessed via the index but only by using the tag names. The standard methods get_Count and get_NewEnum cannot be used in the Tags list.

Usage

Tags in the list are accessed via:

```
HMIRuntime.Tags("Tagname")
```

The Tags list is used to declare tags (tag objects) for read and write access. To ensure that read and write access is carried out without errors, the corresponding tags must be available in WinCC tag management.

In VBS you can address tags directly via the name and set and read values. If you want to access additional tag properties, request the quality code, for example, you will always have to address tags via the tag listing. The tag object returned enables access to all tag properties and methods. You have to form an instance for the object, to write a binary tag with HMIRuntime.Tags("Variable").Value=TRUE, for example.

The "CreateTagSet" method can be used to generate a "TagSet" object that enables simultaneous access to several tags.

Example:

There are two options when creating tags:

- With specification of the server prefix: For tags in multi-user systems which are not stored locally.
- Direct use of the tag name: For tags stored locally on the computer.

Specification of the server prefix

```
'VBS15
Dim objTag
Set objTag = HMIRuntime.Tags("Serverprefix::Tagname")
If the server prefix is entered directly, the "ServerPrefix" property is assigned the
corresponding value.
```

Specification of the tag name

```
'VBS16
Dim objTag
Set objTag = HMIRuntime.Tags("Tagname")
If just the tag name is used, the "ServerPrefix" and "TagPrefix" properties are assigned
the values from the current context (current picture window).
```

Example: How to Read Tag Values (Page 813)

Example: Writing tag values (Page 811)

Item Method (Page 754)

CreateTagSet Method (Page 702)

Tag Object (Page 152)

1.14.2.23 TagSet Object (List)

Description

The object "TagSet" enables simultaneous access to several tags in one call. This features better performance and lower communication load that single access to various tags.

Usage

Using the TagSet object, you may:

- Add tags to the list ("Add" method)
- Access tag objects contained in the list, and their properties ("Item" method)
- Write all tags of the list ("Write" method)
- Read all tags of the list ("Read" method)
- Remove single tags from the list ("Remove" method)
- Remove all tags from the list ("RemoveAll" method)

Tags in the list are accessed via:

```
'VBS169
Dim myTags
myTags = HMIRuntime.Tags.CreateTagSet
myTags("Tagname")
```

In order to have error-free read/write access to tags (tag objects) of the list, the respective tags must exist in WinCC tag management.

If an error occurred during read/write access, the method used will return an error message using the "LastError" and "ErrorDescription" properties.

Synchronous writing and reading of the tags is possible. The optional "Writemode" parameter can be used to write process tags directly to the AS with "1", for example, "group.Write 1". Use the optional "Readmode" parameter to read process tags with "1" directly from the AS or channel, for example, "group.Read 1".

Example:

The following example shows how to generate a TagSet object, how to add tags, and how to write values.

```
'VBS168
Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
'Add Tags to the Collection
group.Add "Motor1"
group.Add "Motor2"
'Set the Values of the Tags
group("Motor1").Value = 3
group("Motor2").Value = 9
'Write the Values to the DataManager
group.Write
```

1.14.3 Object types of the ScreenItem object

1.14.3.1 Object types of the ScreenItem object

Introduction

The following section lists all the available types of the "ScreenItem" object.

The features of the "ScreenItem" object represent all the graphic objects available in WinCC Graphics Designer.

The object types are divided into the following groups according to their arrangement in Graphics Designer:

- Standard objects
- Smart objects
- Windows objects
- Tube objects
- Controls

There are also the object types

- Customized Object
- Group

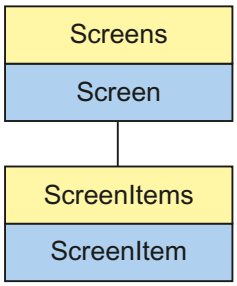
Group (Page 302)
Customized Object (Page 301)
Controls (Page 232)

1.14.3.2 Standard objects

Ellipse

Description



Object Type of ScreenItem Object. Represents the graphic object "Ellipse"

Type Identifier in VBS

HMIEllipse

Usage

In the following example, the object with the name "Ellipse1" is moved 10 pixels to the right:

```
'VBS17
Dim objEllipse
Set objEllipse = ScreenItems("Ellipse1")
objEllipse.Left = objEllipse.Left + 10
```

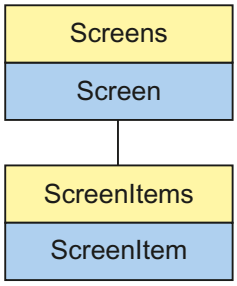
Rectangle

Description



Object Type of ScreenItem Object. Represents the graphic object "Rectangle"

Type Identifier in VBS

HMIRectangle

Usage

In the following example, the object with the name "Rectangle1" is moved 10 pixels to the right:

```
'VBS26
Dim objRectangle
Set objRectangle = ScreenItems("Rectangle1")
objRectangle.Left = objRectangle.Left + 10
```

Notes on Error Handling

The rectangle and rounded rectangle are mapped to an "HMIRectangle" type in the object model. Since the two objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(ByVal Item)
'VBS27
Dim objScreenItem
'
'Activation of errorhandling:
On Error Resume Next
For Each objScreenItem In ScreenItems
If "HMIRectangle" = objScreenItem.Type Then
'
'=== Property "RoundCornerHeight" only available for RoundRectangle
objScreenItem.RoundCornerHeight = objScreenItem.RoundCornerHeight * 2
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.Name & ": no RoundedRectangle" & vbCrLf
'
'Delete error message
Err.Clear
End If
End If
Next
On Error Goto 0  'Deactivation of errorhandling
End Sub
```

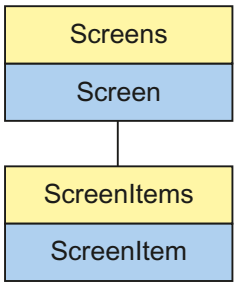
Rounded rectangle

Description



Object Type of ScreenItem Object. Represents the graphic object "Rounded Rectangle".

Type Identifier in VBS

HMIRoundRectangle

Usage

In the following example, the object with the name "RoundedRectangle1" is moved 10 pixels to the right:

```
'VBS28
Dim objRoundedRectangle
Set objRoundedRectangle = ScreenItems("RoundedRectangle1")
objRoundedRectangle.Left = objRoundedRectangle.Left + 10
```

Notes on Error Handling

The rectangle and rounded rectangle are mapped to an "HMIRectangle" type in the object model. Since the two objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(ByVal Item)
```

```
'VBS29
Dim objScreenItem
On Error Resume Next    'Activation of errorhandling
For Each objScreenItem In ScreenItems
If "HMIRectangle" = objScreenItem.Type Then
'
'=== Property "RoundCornerHeight" available only for RoundRectangle
objScreenItem.RoundCornerHeight = objScreenItem.RoundCornerHeight * 2
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.ObjectName & ": no RoundedRectangle" & vbCrLf
Err.Clear    'Delete errormessage
End If
End If
Next
On Error Goto 0    'Deactivation of errorhandling
End Sub
```

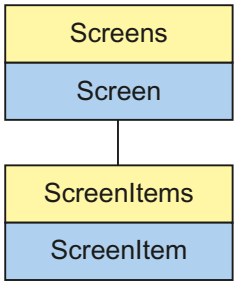
1.14.3.3 Smart objects

3D Bar

Description



Object Type of ScreenItem Object. Represents the graphic object "3D Bar"

Type Identifier in VBS

HMIBar

Usage

In the following example, the object with the name "3DBar1" is moved 10 pixels to the right:

```
'VBS32
Dim objBar
Set objBar = ScreenItems("3DBar1")
objBar.Left = objBar.Left + 10
```

Notes on Error Handling

Bars and 3D bars are imaged in the object model on a "HMIBar" type. Since the two objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
'VBS148
Sub OnClick(ByVal Item)
Dim objScreenItem
'
'Activation of errorhandling:
On Error Resume Next
For Each objScreenItem In ScreenItems
If "HMIBar" = objScreenItem.Type Then
'
'=== Property "Layer00Value" only available for 3D bar
objScreenItem.Layer00Value = objScreenItem.Layer00Value * 2
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.Name & ": no 3D bar" & vbCrLf
'
'Delete error message
Err.Clear
End If
End If
Next
On Error Goto 0 'Deactivation of errorhandling
End Sub
```

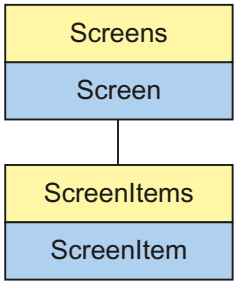
Application Window

Description



Object Type of ScreenItem Object. Represents the graphic object "Application Window"

Type Identifier in VBS

HMIApplicationWindow

Usage

In the following example, the object with the name "ApplicationWindow1" is moved 10 pixels to the right:

```
'VBS33
Dim objAppWindow
Set objAppWindow = ScreenItems("ApplicationWindow1")
objAppWindow.Left = objAppWindow.Left + 10
```

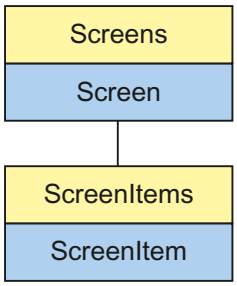
Bar

Description



Object Type of ScreenItem Object. Represents the graphic object "Bar"

Type Identifier in VBS

HMIBar

Usage

In the following example, the object with the name "Bar1" is moved 10 pixels to the right:

```
'VBS34
Dim objBar
Set objBar = ScreenItems("Bar1")
objBar.Left = objBar.Left + 10
```

Notes on Error Handling

Bars and 3D bars are imaged in the object model on a "HMIBar" type. Since the two objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
'VBS147
Sub OnClick(ByVal Item)
Dim objScreenItem
'
'Activation of errorhandling:
On Error Resume Next
For Each objScreenItem In ScreenItems
If "HMIBar" = objScreenItem.Type Then
'
'=== Property "LimitHigh4" only available for bar
objScreenItem.LimitHigh4 = objScreenItem.LimitHigh4 * 2
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.Name & ": no bar" & vbCrLf
```

```
'
'Delete error message
Err.Clear
End If
End If
Next
On Error Goto 0    'Deactivation of errorhandling
End Sub
```

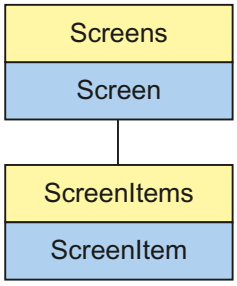
Control

Description



Object Type of ScreenItem Object. Represents the graphic object "Control"

The Control object type always assumes the properties of the Control type selected. In the case of controls provided by WinCC, the properties are indicated under the description of the corresponding Control.

In the case of controls from external suppliers, the control properties are supplied and thus not a part of this description. However, the control properties can be queried using the "Item" property.

Type Identifier in VBS

Special WinCC type descriptions or version-independent ProgID

Usage

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS36
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 10
```

Special feature

The controls provided by WinCC return a special ID as the type. It can be found under the topic "Type Identification in VBS" in the individual descriptions of the WinCC Controls.

Use of Controls from External Suppliers

In the case of non-WinCC controls, the version-independent ProgID is returned as the type.

It is possible to determine the version-dependent ProgID or "User friendly Name" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every Control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS37
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Determine the UserFriendlyName as follows:

```
'VBS38
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property. Address the properties of an external control supplier as follows:

```
Control.object.type
```

The properties of the ScreenItem object are used in the case of identical names, if you use the following form:

```
Control.type
```

WinCC controls available

- WinCC Alarm Control
- WinCC Digital/Analog Clock
- WinCC FunctionTrendControl
- WinCC Gauge Control
- WinCC Media Control
- WinCC OnlineTableControl
- WinCC OnlineTrendControl
- WinCC Push Button Control
- WinCC Slider Control
- WinCC UserArchiveControl
- HMI Symbol Library

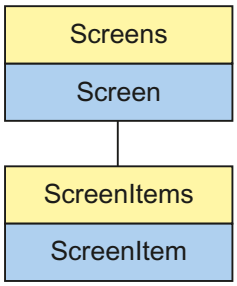
Faceplate Instance

Description



Object Type of ScreenItem Object. Represents the "faceplate instance" graphic object.

Type identifier in VBS

HMIFaceplateObject

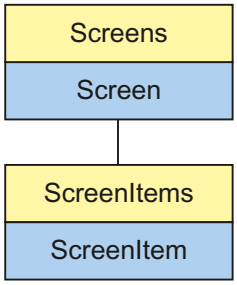
Usage

In the following example, the object with the name "FaceplateInstance1" is moved 10 pixels to the right:

```
'VBS309
Dim objFaceplateObject
Set objFaceplateObject = ScreenItems("FaceplateInstance1")
objFaceplateObject.Left = objFaceplateObject.Left + 10
```

Graphic Object

Description



Object Type of ScreenItem Object. Represents the graphic object "Graphic Object"

Type Identifier in VBS

HMIGraphicView

Usage

In the following example, the object with the name "GraphicObject1" is moved 10 pixels to the right:

```
'VBS40
Dim objGraphicView
Set objGraphicView= ScreenItems("GraphicObject1")
objGraphicView.Left = objGraphicView.Left + 10
```

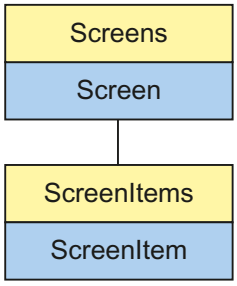
Combobox

Description



Object Type of ScreenItem Object. Represents the "Combobox" graphic object.

Type Identifier in VBS

HMIComboBox

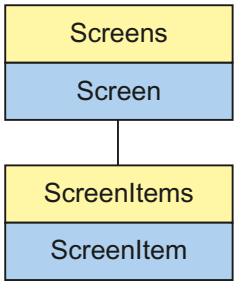
Usage

In the following example, the object with the name "ComboBox1" is moved 10 pixels to the right:

```
'VBS21
Dim objComboBox
Set objComboBox = ScreenItems("ComboBox1")
objComboBox.Left = objComboBox.Left + 10
```

List Box

Description



Object Type of ScreenItem Object. Represents the "List Box" graphic object.

Type Identifier in VBS

HMIListBox

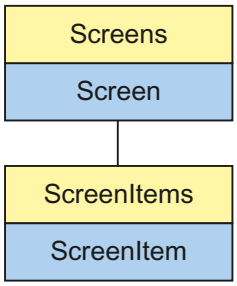
Usage

In the following example, the object with the name "ListBox1" is moved 10 pixels to the right:

```
'VBS21
Dim objListBox
Set objListBox = ScreenItems("ListBox1")
objListBox.Left = objListBox.Left + 10
```

Multiple row text

Description



Object Type of ScreenItem Object. Represents the "Multiline Text" graphic object.

Type Identifier in VBS

HMIMultiLineEdit

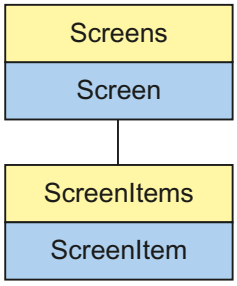
Usage

In the following example, the object with the name "MultiLineEdit1" is moved 10 pixels to the right:

```
'VBS21
Dim objMultiLineEdit
Set objMultiLineEdit = ScreenItems("MultiLineEdit1")
objMultiLineEdit.Left = objMultiLineEdit.Left + 10
```

OLE object

Description



Object Type of ScreenItem Object. Represents the graphic object "OLE Element". The return value is a STRING type.

Type Identifier in VBS

Version-independent ProgID

Usage

In the following example, the object with the name "OLEElement1" is moved 10 pixels to the right:

```
'VBS41
Dim objOLEElement
Set objOLEElement = ScreenItems("OLEElement1")
objOLEElement.Left = objOLEElement.Left + 10
```

Special feature

In the case of OLE Elements, the version-independent ProgID is returned as the type.

It is possible to determine the version-dependent ProgID or "User friendly Name" from the ProgID: In the following example, "OLEObject1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every Control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS42
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("OLEElement1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that the example above works, a Word document should be embedded in the picture as an OLE Element.

Determine the User Friendly Name as follows:

```
'VBS43
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("OLEElement1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that the example above works, a Word document should be embedded in the picture as an OLE Element.

Using OLE Elements

If an OLE Element is used, it is possible that the properties provided by the OLE Element have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an OLE Element can be accessed using the additional "Object" property. Address the properties of an OLE Element as follows:

```
OLEObjekt.object.type
```

Only use the form

```
OLEObjekt.type
```

In the case of identical names, the properties of the ScreenItem object are used.

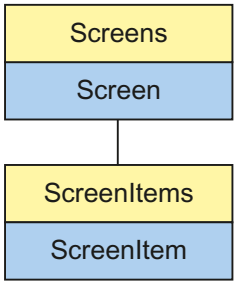
Text list

Description



Object Type of ScreenItem Object. Represents the graphic object "Text List"

Type Identifier in VBS

HMISymbolicIOField

Usage

In the following example, the object with the name "TextList1" is moved 10 pixels to the right:

```
'VBS45
Dim objSymIO
Set objSymIO = ScreenItems("TextList1")
objSymIO.Left = objSymIO.Left + 10
```

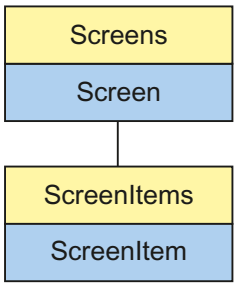
1.14.3.4 Windows objects

Button

Description



Object Type of ScreenItem Object. Represents the graphic object "Button"

Type Identifier in VBS

HMIButton

Usage

In the following example, the object with the name "Button1" is moved 10 pixels to the right:

```
'VBS47
Dim cmdButton
Set cmdButton = ScreenItems("Button1")
cmdButton.Left = cmdButton.Left + 10
```

Notes on Error Handling

Buttons and pushbuttons are mapped in the object model to an "HMIButton" type. Since the objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(ByVal Item)
'VBS48
Dim objScreenItem
On Error Resume Next    'Activation of errorhandling
For Each objScreenItem In ScreenItems
If objScreenItem.Type = "HMIButton" Then
'
'=== Property "Text" available only for Standard-Button
objScreenItem.Text = "Windows"
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.ObjectName & ": no Windows-Button" & vbCrLf
Err.Clear    'Delete error message
End If
```

```
End If
Next
On Error Goto 0    'Deactivation of errorhandling
End Sub
```

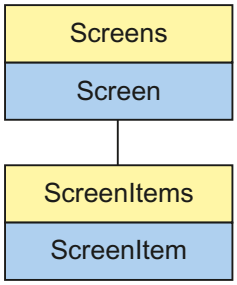
Round Button

Description



Object Type of ScreenItem Object. Represents the graphic object "Round Button"

Type Identifier in VBS

HMISwitch

Usage

In the following example, the object with the name "RoundButton1" is moved 10 pixels to the right:

```
'VBS51
Dim objSwitch
Set objSwitch= ScreenItems("RoundButton1")
```

```
objSwitch.Left = objSwitch.Left + 10
```

```
Sub OnClick(ByVal Item)
'VBS52
Dim objScreenItem
On Error Resume Next    'Activation of errorhandling
For Each objScreenItem In ScreenItems
    If objScreenItem.Type = "HMIButton" Then
 '
         '=== Property "Text" available only for Standard-Button
         objScreenItem.Text = "Windows"
         If 0 <> Err.Number Then
         HMIRuntime.Trace objScreenItem.ObjectName & ": no Windows-Button" & vbCrLf
         Err.Clear   'Delete error message
         End If
'
         '=== Property "Radius" available only for RoundButton
         objScreenItem.Radius = 10
         If 0 <> Err.Number Then
         HMIRuntime.Trace ScreenItem.ObjectName & ": no RoundButton" & vbCrLf
         Err.Clear
         End If
    End If
Next

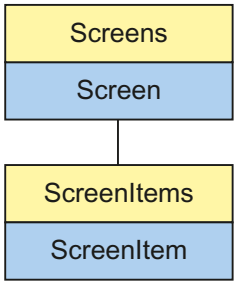
Slider

Description



Object Type of ScreenItem Object. Represents the graphic object "Slider"

Type Identifier in VBS

HMISlider

Usage

In the following example, the object with the name "Slider1" is moved 10 pixels to the right:

```
'VBS53
Dim sldSlider
Set sldSlider = ScreenItems("Slider1")
sldSlider.Left = sldSlider.Left + 10
```

Notes on Error Handling

Sliders and WinCC slider controls are mapped in the object model to an "HMISlider" type. Since the objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(Byval Item)
'VBS194
Dim ScreenItem
' activating error handling:
On Error Resume Next
For Each ScreenItem In ScreenItems
If ScreenItem.Type = "HMISlider" Then
'=== Property "BevelColorUp" only exists for a WinCC Slider Control
ScreenItem.BevelColorUp = 1
If (Err.Number <> 0) Then
HMIRuntime.Trace(ScreenItem.ObjectName + ": no Windows-Slider" + vbCrlf)
' delete error message
Err.Clear
End If
'=== Property "BorderStyle" only exists for a Windows-Slider
ScreenItem.BorderStyle = 1
If (Err.Number <> 0) Then
HMIRuntime.Trace(ScreenItem.ObjectName + ": no WinCC Slider Control" + vbCrlf)
Err.Clear
End If
End If
Next
On Error GoTo 0  ' deactivating error handling
End Sub
```

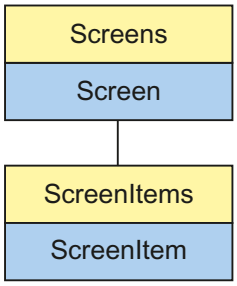
1.14.3.5 Tube objects

Polygon Tube

Description



Object Type of ScreenItem Object. Represents the "Polygon Tube" graphic object.

Type Identifier in VBS

HMITubePolyline

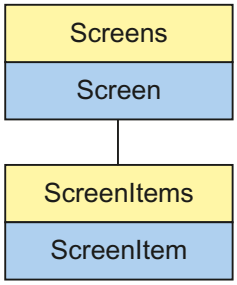
Usage

In the following example, the object with the name "TubePolyline1" is moved 10 pixels to the right:

```
'VBS24
Dim objTubePolyline
Set objTubePolyline = ScreenItems("TubePolyline1")
objTubePolyline.Left = objTubePolyline.Left + 10
```

T-piece

Description



Object Type of ScreenItem Object. Represents the "T-piece" graphic object.

Type Identifier in VBS

HMITubeTeeObject

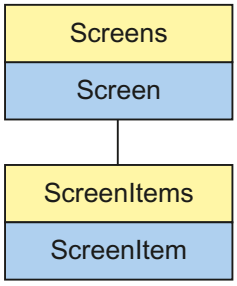
Usage

In the following example, the object with the name "TubeTeeObject1" is moved 10 pixels to the right:

```
'VBS21
Dim objTubeTeeObject
Set objTubeTeeObject = ScreenItems("TubeTeeObject1")
objTubeTeeObject.Left = objTubeTeeObject.Left + 10
```

Double T-piece

Description



Object Type of ScreenItem Object. Represents the "Double T-piece" graphic object.

Type Identifier in VBS

HMITubeDoubleTeeObject

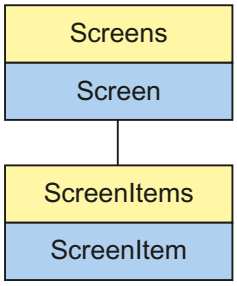
Usage

In the following example, the object with the name "TubeDoubleTeeObject1" is moved 10 pixels to the right:

```
'VBS21
Dim objTubeDoubleTeeObject
Set objTubeDoubleTeeObject = ScreenItems("TubeDoubleTeeObject1")
objTubeDoubleTeeObject.Left = objTubeDoubleTeeObject.Left + 10
```

Tube Bend

Description



Object Type of ScreenItem Object. Represents the "Tube Arc" graphic object.

Type Identifier in VBS

HMITubeArcObject

Usage

In the following example, the object with the name "TubeArcObject1" is moved 10 pixels to the right:

```
'VBS24
Dim objTubeArcObject
Set objTubeArcObject = ScreenItems("TubeArcObject1")
objTubeArcObject.Left = objTubeArcObject.Left + 10
```

1.14.3.6 Controls

Controls

Special features with controls

In the case of non-WinCC controls, the version-independent ProgID is returned as the type.

It is possible to determine the version-dependent ProgID or "User friendly Name" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every Control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS153
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Determine the User Friendly Name as follows:

```
'VBS154
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Restrictions of VBS for Dynamization by Controls

If Controls are to be dynamized with, the following conditions must be fulfilled:

Methods

The "ByRef" declaration may only be implemented as a "Variant" (ByRef xxx as Variant)

The "ByVal" declaration may only be implemented with tag types (ByVal xxx as Long)

Properties

The "ByRef" declaration may only be implemented as a "Variant" (ByRef xxx as Variant)

The "ByVal" declaration may only be implemented with tag types (ByVal xxx as Long)

Events

The "ByRef" declaration is not permitted.

The "ByVal" declaration may only be implemented as a "Variant" (ByVal xxx as Variant)

Arrays

If arrays are used, they must be declared with (ByRef xxx As Variant).

In order that arrays can be transferred in variants, variant tag must also be inserted as an intermediate tag according to the following scheme:

```
'VBS151
Dim arrayPoints(200)
Dim vArrayCoercion      'Variant for array Coercion
```

```
' Make the VBS Array compatibile with the OLE Automation
vArrayCoercion = (arrayPoints)
objTrendControl.DataXY = vArrayCoercion   ' this array will occur in the control
```

Use of Controls from External Suppliers

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property. Address the properties of an external control supplier as follows:

```
Control.object.type
```

If you use the following form, the properties of the ScreenItem object are used in the case of identical names:

```
Control.type
```

Double parameter

When using a Control which is not an internal WinCC control, it is possible that the event prototypes contain a parameter with the name "Item". In this case, the name of the parameter is renamed according to "ObjectItem" in the VBS prototype submitted. If this name already exists, the name is differentiated by numbers being appended.

WinCC controls available

- HMI Symbol Library
- WinCC AlarmControl
- WinCC Alarm Control (before WinCC V7)
- WinCC Digital/Analog Clock
- WinCC FunctionTrendControl
- WinCC Function Trend Control (before WinCC V7)
- WinCC Gauge Control
- WinCC Media Control
- WinCC OnlineTableControl
- WinCC Online Table Control (before WinCC V7)

List of controls

Column object (list)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "Column" listing object to configure the properties of the columns in the WinCC UserArchiveControl.

Use in the controls

- WinCC UserArchiveControl (Page 285)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "colobj.ColumnName", the listing name "Column" is dropped: "colobj.Name".

ColumnAlias (Page 368)	ColumnFlagUnique (Page 370)	ColumnPosition (Page 372)	ColumnSort (Page 375)

HitlistColumn object (list)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "HitlistColumn" listing object to configure the message blocks used in the hitlist of WinCC AlarmControl.

Use in the controls

- WinCC AlarmControl (Page 255)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "hitlistobj.HitlistColumnName", the listing name "HitlistColumn" is dropped: "hitlistobj.Name".

Note that properties are available for WinCC controls that can have the effect of methods. These properties are characterized by the respective names, e.g. "Add", "Remove" or "Rename".

HitlistColumnAdd (Page 433)	HitlistColumnRepos (Page 434)	HitListMaxSourceItems (Page 435)
HitlistColumnCount (Page 433)	HitlistColumnSort (Page 434)	HitListMaxSourceItemsWarn (Page 436)

GetTrendWindowCollection method (Page 743)

ValueAxis object (list)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "ValueAxis" listing object to configure the properties of the value axis in WinCC OnlineTrendControl.

Use in the controls

- WinCC OnlineTrendControl (Page 271)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "valueaxisobj.ValueAxisName", the listing name "ValueAxis" is dropped: "valueaxisobj.Name".

Note that properties are available for WinCC controls that can have the effect of methods. These properties are characterized by the respective names, e.g. "Add", "Remove" or "Rename".

ValueAxisAdd (Page 667)	ValueAxisEndValue (Page 669)	ValueAxisRemove (Page 671)
ValueAxisAlign (Page 667)	ValueAxisExponentialFormat (Page 669)	ValueAxisRename (Page 671)

ValueColumn object (list)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "ValueColumn" listing object to configure the properties of the value column in WinCC OnlineTrendControl.

Use in the controls

- WinCC OnlineTableControl (Page 267)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "valcolobj.ValueColumnName", the listing name "ValueColumn" is dropped: "valcolobj.Name".

Note that properties are available for WinCC controls that can have the effect of methods. These properties are characterized by the respective names, e.g. "Add", "Remove" or "Rename".

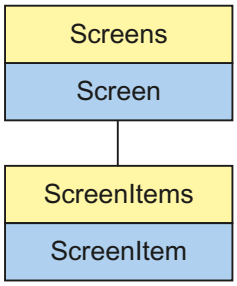
HMI Symbol Library

Description



Object Type of ScreenItem Object. Represents the graphic object "HMI Symbol Library"

Type Identifier in VBS

HMISymbolLibrary

Usage

In the following example, the object with the name "Control1" is moved 20 pixels to the right:

```
'VBS64
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left +20
```

Properties

This object type has the following properties:

Example

A selection of messages is defined in an existing WinCC AlarmControl. The column properties are configured in the script.

Requirements

- A "WinCC AlarmControl" with the name "Control1" has already been inserted in a process picture in Graphics Designer. The picture "C_015_Native_Alarms_Sel.pdl" from the demo project was used for this example.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.

- You have already configured messages in your project. Or you are using the demo project from which we have taken the messages used for the example.
- Messages have already been triggered in Runtime. The buttons "incoming" and "outgoing" were clicked in the demo project.

```
'VBS366
Sub OnClick(ByVal Item)
Dim objControl
Dim objMessColumn
Dim objMessBlock

Set objControl = ScreenItems("Control1")
objControl.ApplyProjectSettings = False
Set objMessBlock = objControl.GetMessageBlock("Date")
objMessBlock.DateFormat = "dd.MM.yy"
Set objMessColumn = objControl.GetMessageColumn("Time")
objMessColumn.Visible = False
objControl.MsgFilterSQL = "MSGNR >= 5 AND Priority = 0"
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

Examples

A trend is displayed in a WinCC FunctionTrendControl that is linked with a user archive. Different properties are configured for the trend in the script. The "StartID" of the user archive and the number of measurement points is changed regarding data connection.

Requirements

- A "WinCC FunctionTrendControl" with the name "Control1" is inserted in a process picture in Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have already configured a user archive in your project. Or you are using the demo project from which we have taken the user archive for the example.

```
'VBS363
Sub OnClick(ByVal Item)
Dim objFXControl
Dim objTrendWindow
Dim objTrend
Dim objXAxis
Dim objYAxis
Dim startID
Dim FXServerDataX(3)
Dim FXServerDataY(3)
' create reference to FXControl
Set objFXControl = ScreenItems("Control1")
' create reference to new window, x and y axis
Set objTrendWindow = objFXControl.GetTrendWindowCollection.AddItem("myWindow")
Set objXAxis = objFXControl.GetXAxisCollection.AddItem("myXAxis")
Set objYAxis = objFXControl.GetYAxisCollection.AddItem("myYAxis")
' assign x and y axis to the window
objXAxis.TrendWindow = objTrendWindow.Name
objYAxis.TrendWindow = objTrendWindow.Name
' add new trend
Set objTrend = objFXControl.GetTrendCollection.AddItem("myTrend1")
' configure trend data connection (UserArchive)
objTrend.Provider = 3
startID = CLng(4)
FXServerDataX(0) = "Setpoint"
FXServerDataX(1) = "ParabelX"
FXServerDataX(3) = startID
FXServerDataY(0) = "Setpoint"
FXServerDataY(1) = "ParabelY"
FXServerDataY(3) = startID
objTrend.MeasurePoints = 50
objTrend.SetTagName "Setpoint\ParabelX", "Setpoint\ParabelY", FXServerDataX, FXServerDataY
' assign trend properties
objTrend.Color = RGB(255,0,0)
objTrend.PointStyle = 1
objTrend.TrendWindow = objTrendWindow.Name
objTrend.XAxis = objXAxis.Name
objTrend.YAxis = objYAxis.Name
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

Example

An additional column is added in an existing WinCC OnlineTableControl that is linked with an archive tag. Different properties are configured for the control and the column in the script.

Requirement

- A "WinCC OnlineTableControl" with the name "Control1" has already been inserted in a process picture in Graphics Designer. The control consists of a time column and three value columns. The picture "B_025_V7_Arch_TableControl.PDL" from the demo project was used for this example.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have already configured archives and archive tags in your project. Or you are using the demo project from which we have taken the archive for the example.

```
'VBS362
Sub OnClick(ByVal Item)
Dim objControl
Dim objTimeColumn
Dim objValueColumn
Set objControl = ScreenItems("Control1")
' Control wide specification
objControl.ColumnResize = False
objControl.TimeBase = 1
objControl.TimeColumnTimeFormat = "HH:mm:ss tt"
objControl.TimeColumnLength = 20
' properties for Time column
Set objTimeColumn = objControl.GetTimeColumn("Time column 1")
objTimeColumn.DateFormat = "dd/MM/yy"
' properties for a new 4th value column with connection to archive tag "Trend_4"
Set objValueColumn = objControl.GetValueColumnCollection.AddItem("Trend 4")
objValueColumn.Caption = "Trend 4"
objValueColumn.Length = 10
objValueColumn.Align = 1
objValueColumn.Provider = 1
objValueColumn.TagName = "G_Archive\Trend_4"
objValueColumn.TimeColumn = "Time column 1"
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

Controls (Page 232)

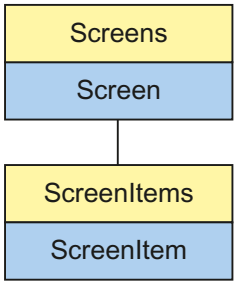
WinCC Push Button Control

Description



Object Type of ScreenItem Object. Represents the graphic object "WinCC Push Button Control"

Type Identifier in VBS

HMIButton

Usage

In the following example, the object with the name "Control1" is moved 17 pixels to the right:

```
'VBS61
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left +17
```

Note

The events KeyDown, KeyUp and KeyPress cannot be addressed by VBS. If it is required to make controls dynamic with the help of VBS, no parameter must be declared with ByRef.

Notes on Error Handling

Buttons and pushbuttons are mapped in the object model to an "HMIButton" type. Since the objects have different properties, the availability of the property (dynamic type compilation in

Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
'VBS62
Dim objScreenItem
On Error Resume Next    'Activation of errorhandling
For Each objScreenItem In ScreenItems
If objScreenItem.Type = "HMIButton" Then
'
'=== Property "Text" available only for Standard-Button
objScreenItem.Text = "Windows"
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.ObjectName & ": no Windows-Button" & vbCrLf
Err.Clear    'Delete error message
End If
'
'=== Property "Caption" available only for PushButton
objScreenItem.Caption = "Push"
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.ObjectName & ": no Control" & vbCrLf
```

```
Err.Clear
End If
End If
Next
On Error Goto 0    'Deactivation of errorhandling
```

Example

A WinCC Ruler Control is inserted in a picture with an existing WinCC OnlineTableControl. The RulerControl contains a statistics window that displays the "Minimum", "Maximum" and "Average" columns. The static values are then displayed for the selected rows of the OnlineTableControl.

Requirements

- A "WinCC OnlineTableControl" with the name "Control1" has already been inserted in a process picture in Graphics Designer. The control is linked with archive tags or process tags. The picture "B_025_V7_Arch_TableControl.PDL" from the demo project was used for this example.
- You have added an additional "WinCC RulerControl" with the name "Control2" in the picture.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have selected some rows in OnlineTableControl.

```
'VBS364
Sub OnClick(ByVal Item)
Dim objRulerControl
Dim objTableControl
Dim objstatColumn
Dim rows

Set objRulerControl = ScreenItems("Control2")
' Use Statistic-window
objRulerControl.RulerType = 2
objRulerControl.SourceControl = "Control1"
' In Statistic-window only columns "Name", "MinValue", MaxValue" and "Average" are shown
Set objstatColumn = objRulerControl.GetStatisticResultColumnCollection
objstatColumn.RemoveItem(4)
objstatColumn.RemoveItem(5)
objstatColumn.RemoveItem(6)
```

```
' Get the selected rows of tablecontrol and calculate statistic
Set objTrendControl = ScreenItems("Control1")
Set rows = objTableControl.SelectAll
objTableControl.CalculateStatistic
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

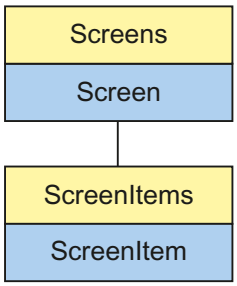
Controls (Page 232)

WinCC Slider Control

Description



Object Type of ScreenItem Object. Represents the graphic object "WinCC Slider Control"

Type Identifier in VBS

HMISlider

Usage

In the following example, the object with the name "Control1" is moved 19 pixels to the right:

```
'VBS63
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left +19
```

Notes on Error Handling

Sliders and WinCC slider controls are mapped in the object model to an "HMISlider" type. Since the objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(Byval Item)
'VBS193
Dim ScreenItem
' activating error handling:
On Error Resume Next
For Each ScreenItem In ScreenItems
If ScreenItem.Type = "HMISlider" Then
'=== Property "BevelColorUp" only exists for a WinCC Slider Control
ScreenItem.BevelColorUp = 1
If (Err.Number <> 0) Then
HMIRuntime.Trace(ScreenItem.ObjectName + ": no Windows-Slider" + vbCrlf)
' delete error message
Err.Clear
```

```
End If
'=== Property "BorderStyle" only exists for a Windows-Slider
ScreenItem.BorderStyle = 1
If (Err.Number <> 0) Then
HMIRuntime.Trace(ScreenItem.ObjectName + ": no WinCC Slider Control" + vbCrlf)
Err.Clear
End If
End If
Next
On Error GoTo 0  ' deactivating error handling
End Sub
```

ColumnScrollbar	RowScrollbar	StatusbarShowTooltips	UseTableColor2
ColumnShowDate	RowTitleAlign	StatusbarText	VerticalGridLines

Example

A user archive is displayed in a WinCC UserArchiveControl.

The following actions are initiated via script:

- Selecting data
- Exporting data
- Printing a table

Requirements

- A "WinCC UserArchiveControl" with the name "Control1" is inserted in a process picture in Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have already configured a user archive in your project. Or you are using the demo project from which you can use a user archive.

```
VBS365
Sub OnClick(ByVal Item)
Dim objUAControl
Dim objColumn
Dim coll
Dim field
' create reference to UserArchivControl
Set objUAControl = ScreenItems("Control1")
' Select user archive and general column properties
objUAControl.SelectArchiveName = True
objUAControl.ColumnResize = False
objUAControl.ColumnTitleAlign = 1
' properties for ID column
Set objColumn = objUAControl.GetColumn("ID")
objColumn.Length = 2
objColumn.Align = 0
' Select data
objUAControl.FilterSQL = "ID >=3"
'export the content as a CSV-file in the "ua" directory of the project folder
objUAControl.ServerExport
' print the control
objUAControl.PrintJobName = "UserArchiveControl - Table"
objUAControl.Print
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

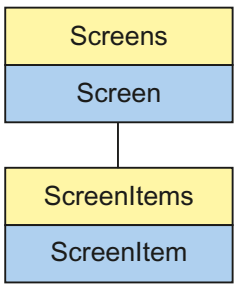
1.14.3.7 Customized Object

Description



Object Type of ScreenItem Object. Represents the graphic object "Customized Object".

Type Identifier in VBS

HMIScreenModule

Usage

You access customized properties in a customized object via the attribute name in VBS. Intellisense is only applicable to the customized object as a whole.

You will locate the attribute name under Properties of the properties placed outside (right-click Property) and can be modified there.

In the following example, the object with the name "CustomizedObject1" is moved 10 pixels to the right:

```
'VBS65
Dim objCustomObject
Set objCustomObject = ScreenItems("CustomizedObject1")
objCustomObject.Left = objCustomObject.Left + 10
```

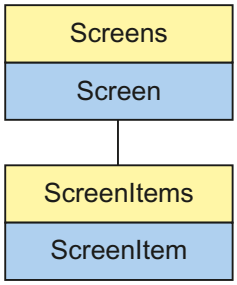
1.14.3.8 Group

Description



Object Type of ScreenItem Object. Represents the graphic object "Group"

Type Identifier in VBS

HMIGroup

Usage

In the following example, the object with the name "Group1" is moved 10 pixels to the right:

```
'VBS66
Dim objGroup
Set objGroup = ScreenItems("Group1")
objGroup.Left = objGroup.Left + 10
```

1.14.4 Properties

1.14.4.1 Properties

Overview

The properties of the individual objects can be used to modify specific graphic objects and tags in Runtime , e.g. activating an operating element per mouse click or triggering a color change by modifying a tag value.

Properties on graphic objects can be addressed via the following syntax:

```
'VBS191
Dim obj
Set obj = ScreenItems("object1")
obj.property = Value
```

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS192
Dim obj
Set obj = ScreenItems("control1")
obj.Left = obj.Left + 10
```

1.14.4.2 A

Aa - Ad

AccessPath Property

Description

Displays the storage path (with hierarchy information) of a screen object (picture). The property corresponds to the full access code on the Screens Collections.

STRING (read only)

Example:

In the following example, the path of the picture "ScreenWindow1" is issued:

```
'VBS67
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
MsgBox objScreen.AccessPath
```

See also

ScreenItem Object (Page 141)

Screens Object (List) (Page 149)

Activate property (before WinCC V7)

Description

The data to be displayed is only requested from the archive server when this attribute is set. In order to reduce the picture opening times, this attribute should not be set and the value only dynamically changed when necessary.

Write/Read access

To differentiate between the "Activate" property form the "Activate" method, the property is accessed via "Object".

Example:

```
Dim ctrl
Set ctrl = ScreenItems("Control")
ctrl.Object.activate = true
```

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

Activate property

Activate

The data to be displayed in the message window are only requested from the message server if you set this attribute. Instead of setting this attribute, it is advisable to change the value dynamically in order to reduce picture activation times.

The attribute can be assigned dynamic properties by means of the name **Activate** . The data type is BOOLEAN.

ActiveProject Property

Description

Returns an object of type "Project".

See also

Path Property (Page 517)

Name Property (Page 496)

Ellipse segment (Page 162)

HMIRuntime Object (Page 134)

ActiveScreen Property

Description

Supplies a reference to the picture which contains the object with the current focus.

Usage

"ActiveScreen" is used in Runtime to address the properties of the picture which contains the currently focussed object.

Example:

The following example assigns the name of the current picture to the tag "strScrName" and outputs it in a message:

```
'VBS68
Dim strScrName
strScrName = HMIRuntime.ActiveScreen.Objectname
MsgBox strScrName
```

See also

Screen Object (Page 146)

HMIRuntime Object (Page 134)

ActiveScreenItem Property

Description

Supplies a reference to the object currently in focus.

Usage

"ActiveScreenItem" is used in Runtime in order to address the properties of the object currently in focus.

Example:

The following example displays the name of the object in the "ScreenWindow1" picture which has the focus:

```
'VBS69
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
MsgBox objScreen.ActiveScreenItem.ObjectName
```

See also

ScreenItem Object (Page 141)

HMIRuntime Object (Page 134)

Actualize Property

Description

The "Index" property references a column pair or a trend. "Actualize" defines whether a static or dynamic representation should be used for this column pair/trend.

- 0: Static display
- -1: Dynamic display

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

ActualPointLeft Property

Description

Defines or returns the x-coordinate of the current corner point in relation to the original picture (top left). Each corner point is identified by an index which is derived from the number ("PointCount") of corner point available.

A change of the value can affect the properties "Width" (object width) and "Left" (x-coordinate of the object position).

See also

Polyline (Page 173)

Polygon (Page 171)

ScreenItem Object (Page 141)

ActualPointTop Property

Description

Defines or returns the y-coordinate of the current corner point in relation to the original picture (top left). Each corner point is identified by an index which is derived from the number ("PointCount") of corner point available.

A change of the value can affect the properties "Height" (object height) and "Top" (y-coordinate of the position).

See also

Polyline (Page 173)

Polygon (Page 171)

ScreenItem Object (Page 141)

AdaptBorder Property

Description

TRUE, when the border should be dynamically adjusted to the size of the text. BOOLEAN write-read access.

For text list and I/O field: Read only access.

See also

Button (Page 215)

Text list (Page 211)

Radio box (Page 221)

Check box (Page 219)

I/O Field (Page 199)

ScreenItem Object (Page 141)

AdaptPicture Property

Description

Defines whether the picture displayed in a picture window should be adapted to the size of the picture window in Runtime or not. Read only access.

TRUE, when the picture adapts to the picture window size.

FALSE, when the picture does not adapt to the picture window size.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

AdaptSize Property

Description

Defines whether the picture window should adapt to the size of the picture displayed in it during Runtime or not. Read only access.

TRUE, when the picture window adapts to the picture size.

FALSE, when the picture window does not adapt to the picture size.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

AdjustRuler Property

Description

Specifies if the ruler window should be adjusted to the trend window upon each appearance.

TRUE, if you move the ruler window and make it appear and disappear again, it will be displayed in its original position and its original size.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

Al - Ap

AlarmID property

Description

Returns the AlarmID of the Alarm object. The AlarmID is unique, and is assigned by the system.

AlarmID (readonly)

See also

Alarms object (list) (Page 126)

AlarmHigh Property

Description

Defines the top limit value at which an alarm should be triggered or returned.
The type of the evaluation (in percent or absolute) is defined in the "TypeAlarmHigh" property.
The "CheckAlarmHigh" property determines whether the monitoring for this limit value is activated.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

AlarmLogs Property

Description

Returns an object of type "AlarmLogs".

AlarmLogs (read-only)

See also

HMIRuntime Object (Page 134)

AlarmLow Property

Description

Defines the bottom limit value at which an alarm should be triggered or returned.
The type of the evaluation (in percent or absolute) is defined in the "TypeAlarmLow" property.
The "CheckAlarmLow" property determines whether the monitoring for this limit value is activated.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

Alignment Property

Description

Defines or returns the representation of the scale (left/right or top/bottom) according to the position of the bar graph object. The "Scaling" property must be set to TRUE for the scale to be displayed.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

AlignmentLeft Property

Description

Defines or returns the horizontal alignment of the text. Value range from 0 to 2.

0 = left

1 = centered

2 = right

See also

Group Display (Page 208)

Static text (Page 180)

I/O Field (Page 199)

ScreenItem Object (Page 141)

AllowPersistence Property

Description

TRUE, when settings regarding persistence are possible. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

AllowXAxisColor - Property

Description

TRUE if the defined color of the common X-axis is displayed in runtime. BOOLEAN write-read access.

AllServer property (before WinCC V7)

Description

Defines that the data to be displayed in the message window is required by all servers participating in a distributed system on which Alarm Logging is activated. Write/Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

AllServer property

All servers - AllServer

Selects all servers whose packages were loaded and on which "Alarm Logging Runtime" is activated in the startup list.

Value	Explanation
TRUE	All servers are activated.
FALSE	Activates only the servers entered in "Server selection".

The attribute can be assigned dynamic properties by means of the name **AllServer**. The data type is BOOLEAN.

Analog Property

Description

TRUE, when the clock is to be displayed as an analog clock. BOOLEAN write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

AnchorRuler Property

Description

TRUE if the ruler window is firmly linked to the curve window. BOOLEAN write-read access.

AngleAlpha Property

Description

Defines or returns depth angle a for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

AngleBeta Property

Description

Defines or returns depth angle b for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

AngleMax Property

Description

Defines or returns the angle on the scale at which the scale graduation ends. LONG write-read access.

The start and end of the scale graduation are described by the attributes "AngleMin" and "AngleMax" in angular degrees. AngleMin < AngleMax applies.

Angle 0 degrees is at the right side of the horizontal diameter of the graduated scale disk. Positive angle values are counted in a counterclockwise direction.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

AngleMin Property

Description

Defines or returns the angle on the scale at which the scale graduation begins. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

Application Property

Description

Returns the Graphics Designer application when the application property is used without an object identifier. If the application property is used with object identifier, it returns an application object which displays the application with which the defined object was created. Read only access.

See also

Application Window (Page 188)

ScreenItem Object (Page 141)

ApplyProjectSettings property

Apply project settings - ApplyProjectSettings

Activates the project settings derived from "Alarm Logging".

Value	Explanation
TRUE	The "Apply project settings" check box is selected. The message blocks configured in "Alarm Logging" and their properties are activated in AlarmControl. The message blocks are displayed with these properties in the message window.
FALSE	The "Apply project settings" check box is deactivated. You can add or remove message blocks, or edit their properties.

The attribute can be assigned dynamic properties by means of the name **ApplyProjectSettings**. The data type is BOOLEAN.

Ar - Ax

Archive Property

Description

The "Index" property references a pair of columns. "Archive" defines process archive values linked to the column pair. The name of the process value archive is specified in the following form: Server name::Archive name

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

ArchiveName property

Name - ArchiveName

Specifies the user archive or view to be displayed. Open the "Package Browser" dialog for configuring an archive or a view by clicking the button.

The attribute can be assigned dynamic properties by means of the name **ArchiveName**. The data type is STRING.

ArchiveType property

Type - ArchiveType

Specifies whether the selected user archive is an archive or a view. The field cannot be edited.

The attribute can be assigned dynamic properties by means of the name **ArchiveType**. The data type is LONG.

AspectRatio property

AspectRatio

Specifies if the aspect ratio is kept in movies.

The attribute can be assigned dynamic properties by means of the name **AspectRatio**. The data type is BOOLEAN.

Assignments Property

Description

A list which contains the assignments between the output values and the actual output texts to be output.
The assignments depend on the set list type. The list type is defined with the ListType property.

Read only access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

AssumeOnExit Property

Description

TRUE, if the entered text is assumed upon exiting the entry field (e.g., with the key or mouse click). BOOLEAN write-read access.

See also

I/O Field (Page 199)

Text list (Page 211)

ScreenItem Object (Page 141)

AssumeOnFull Property

Description

TRUE, when the content of the input field is full (specified number of characters have been entered) and should be exited automatically and the input accepted. BOOLEAN write-read access.

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

AutoCompleteColumns property

Show empty columns - AutoCompleteColumns

Adds empty columns if the Control width is greater than the width of columns configured.

Value	Explanation
TRUE	Enables the display of empty columns.
FALSE	Disables the display of empty columns.

The attribute can be assigned dynamic properties by means of the name **AutoCompleteColumns**. The data type is BOOLEAN.

AutoCompleteRows property

Show empty rows - AutoCompleteRows

Enables the insertion of empty rows if the Control length is greater than the number of rows configured.

Value	Explanation
TRUE	Enables the display of empty rows.
FALSE	Disables the display of empty rows.

The attribute can be assigned dynamic properties by means of the name **AutoCompleteRows**. The data type is BOOLEAN.

AutoPosition property

Automatic positioning - AutoPosition

Defines whether to position the RulerControl exactly below the source control.

The following settings are available:

Value	Explanation
TRUE	The RulerControl is positioned exactly below the source control.
FALSE	The RulerControl is displayed in accordance with your configuration of the control position.

The attribute can be assigned dynamic properties by means of the name **AutoPosition**. The data type is BOOLEAN.

Autorange Property

Description

TRUE, when the value range of the Y-axis is determined automatically or defined by using the "BeginValue" and "EndValue"attributes. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

AutorangeX Property

Description

TRUE, when the value range of the X-axis is determined automatically. FALSE, when it is determined by means of the "BeginX" and "EndX" attributes. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

AutorangeY Property

Description

TRUE, when the value range of the Y-axis is determined automatically. FALSE, when it is determined by means of the "BeginY" and "EndY" attributes. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

AutoScroll property (before WinCC V7)

Description

Defines the behavior of the message window when a new message is received. BOOLEAN write-read access.

TRUE : A newly received message is appended to the list displayed in the message window and is automatically selected. The visible range of the message window is moved, if necessary.

FALSE : A newly received message is not selected. The visible range of the message window is not changed.

The targeted selection of messages is only possible when "AutoScroll" is not active.

The "AutoScroll" property is deactivated when the attribute "MsgCtrlFlag" = "-1" is set. This means that the most recent message is displayed at the top of the list in the message window.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

AutoScroll Property

Auto scrolling - AutoScroll

Defines the behavior of the message window after a new message events.

You can only select message lines if "Auto scrolling" is disabled.

Value	Explanation
TRUE	If "AutoScroll" is activated, a new activated message is appended to the list displayed in the message window and selected automatically. The visible area of the message window is shifted as required.
FALSE	New message events are not selected if "Autoscroll" is disabled. The visible area of the message window is not changed.

The attribute can be assigned dynamic properties by means of the name **AutoScroll**. The data type is BOOLEAN.

AutoSelectionColors property

Automatic selection coloring - AutoSelectionColor

Enables the display of default system colors as selection color for cells and rows.

Value	Explanation
TRUE	The system colors are in use.
FALSE	The custom colors are used.

The attribute can be assigned dynamic properties by means of the name **AutoSelectionColors**. The data type is BOOLEAN.

AutoSelectionRectColor property

Automatic color assignment - AutoSelectionRectColor

Defines a system color for the selection border.

Value	Explanation
TRUE	The system color is in use.
FALSE	The custom color is used.

The attribute can be assigned dynamic properties by means of the name **AutoSelectionRectColors**. The data type is BOOLEAN.

AutoShow property

Show/hide automatically - AutoShow

Enables/disables automatic activation of the RulerControl on the display if you selected the button functions for the ruler, statistics range and for statistics in the source control.

The RulerControl is hidden again if you are no longer using the ruler, statistics range and statistics functions.

Value	Explanation
TRUE	The RulerControl is displayed automatically.
FALSE	The RulerControl is not displayed automatically.

The attribute can be assigned dynamic properties by means of the name **AutoShow**. The data type is BOOLEAN.

AutoSize Property

Description

Defines or returns the size adaptation of the object. The following values can be set:

- 0: No size adaptation.
- 1: The picture ("PictureSelected", "PictureUnselected" properties) is adapted to the button.
- 2: The button is adapted to the picture ("PictureSelected", "PictureUnselected" properties).

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

Autostart property

Autostart

Specifies if movies are started automatically.

The attribute can be assigned dynamic properties by means of the name **Autostart**. The data type is BOOLEAN.

Average Property

Average

TRUE, if the mean value is calculated based on the last 10 values. A value change is conditional for calculation of a new mean value. The mean value is reset when you change a picture. If only one value is available when you change the picture, the following mean value is calculated: (5+0+0+0+0+0+0+0+0+0)/10=0,5.

BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

Axe Property

Description

Defines or returns the position of the 3D bar in the coordinate system. Value range from 0 to 2.

0: The 3D-bar is displayed on the X-axis.

1: The 3D-bar is displayed on the Y-axis.

2: The 3D-bar is displayed on the Z-axis.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

AxisSection Property

Description

Defines or returns the distance between two long axis sections. The information on the distance is given in scale units and is dependent on the minimum and maximum values configured.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

1.14.4.3 B

Ba

BackBorderWidth Property

Description

Defines or returns the width of the 3D border in pixels. The value for the width is dependent on the size of the object.

See also

ScreenItem Object (Page 141)

Button (Page 215)

Round Button (Page 223)

Slider (Page 226)

Group Display (Page 208)

BackColor property

Background - BackColor

Specifies the background color of the control. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **BackColor**. The data type is LONG.

BackColor property

Background Color (BackColor)

Specifies the icon background color in the "Color selection" dialog. The background color is displayed in "opaque" style.

The attribute can be assigned dynamic properties by means of the name **BackColor**. The data type is LONG.

BackColor Property

Function

Defines or returns the background color for the object.

For objects with a fill pattern, the background color is not displayed if "transparent" is defined as the fill style.

Special features of the WinCC slider control

The background color only takes effect when the object is at least partially filled.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Enter the appropriate decimal value for each of the three RGB values.

Example:

RGB(200, 150, 100)

Example:

The following example defines the background of the "ScreenWindow1" picture to red:

```
'VBS70
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.BackColor = RGB(255, 0, 0)
```

ScreenItem Object (Page 141)

BackFlashColorOff Property

Description

Defines or returns the color of the object background for the flash status "Off". LONG write-read access.

See also

ScreenItem Object (Page 141)

BackFlashColorOn Property

Description

Defines or returns the color of the object background for the flash status "On". LONG write-read access.

See also

ScreenItem Object (Page 141)

Background Property

Description

TRUE, when the background of the 3D-bar graph object should be visible. BOOLEAN write-read access.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

BackgroundPicture Property

Description

Returns the picture name of the background picture for the graduated scale disk. Read only access

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

BackPictureAlignment property

Description

Defines or returns the mode of representation of the background image in the process picture.

LONG write-read access.

BackPictureName property

Description

Defines the path and file name of the background image in the process picture or returns it.
LONG write-read access.

BackStyle Property

Description

WinCC Digital/Analog Clock

Defines the type of background of the analog clock:

- 0: The rectangular background of the clock is filled by the specified background color.
- 1: The round numbered face of the clock is filled by the specified background color. This enables a round analog clock to be displayed.
- 2: Numbered face and rectangular background are transparent.

WinCC Gauge Control

Defines the type of background of the gauge:

- 0: The rectangular or square background of the gauge has a border color is filled with the specified color. The circular graduated scale disk is filled by the specified background color.
- 1: The rectangular or square background of the gauge is transparent. The circular graduated scale disk is filled by the specified background color. This enables a circular gauge to be displayed.
- 2: The rectangular or square background and graduated scale disk are transparent.

WinCC Slider Control

Defines whether the object background should be transparent.

- 0: The object background is not transparent
- 1: The object background is transparent

HMI Symbol Library

Defines the icon background transparency. Write/Read access.

- 0: The background is transparent and, thus, invisible.
- 1: The background is visible, the color of the background is defined by the "Background Color" attribute.

ScreenItem Object (Page 141)

BarBackColor Property

Description

Defines the background color in the area of the slider. The area stretches form "RangeMin" to "RangeMax".

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

BarDepth Property

Description

Defines or returns the depth of the bar in pixels.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

BarFillColor Property

Description

Defines the fill color in the area of the slider. The area stretches from "RangeMin" to the position of the slider.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

BarHeight Property

Description

Defines or returns the height of the bar in pixels.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

BarWidth Property

Description

Defines or returns the width of the bar in pixels.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

BasePicReferenced Property

Description

TRUE, when the picture assigned in the object status display should be saved. Otherwise, only the associated object reference is saved. Read only access.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

BasePicTransColor Property

Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "BasePicUseTransColor" property is "True".

See also

Status display (Page 213)

ScreenItem Object (Page 141)

BasePicture Property

Description

Returns the basic picture for the object status display. Read-only access.
The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.
In this context, the "BasePicReferenced" property defines whether the basic picture should be saved together with the object status display or referenced.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

BasePicUseTransColor Property

Description

TRUE, when the configured color ("BasePicTransColor" property) of the bitmap objects should be set to "transparent". BOOLEAN write-read access.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

BaseScreenName Property

Function

Defines or returns the current basic picture.

STRING (write-read access)

A picture change is executed using the

```
HMIRuntime.BaseScreenName = (<Serverpräfix>::)<Neues Grundbild>
```

command.

When reading out the "BaseScreenName" property, only the picture name without server prefix is returned.

Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

Example:

The following example executes a picture change to "bild1.pdl":

```
HMIRuntime.BaseScreenName = "bild1"
```

ScreenItem Object (Page 141)

Be - Bl

BeginTime Property

Description

WinCC Online Trend Control

The "Index" property references a pair of columns. "BeginTime" defines the start time for displaying this column pair. Write/Read access.

WinCC Online Trend Control

The "Index" property references a trend. "BeginTime" defines the start time for displaying this trend. Whether the information is evaluated is dependent on the TimeRange" and "CommonX" properties.

Use the "yyyy-mm-dd hh:mm:ss" format when creating a dynamic time range.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

BeginValue Property

Description

The "Index" property references a trend. "BeginValue" defines the lower limit of the value range to be displayed for the trend. Whether the information is evaluated is dependent on the "Autorange" and "CommonY" properties.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

BeginX Property

Description

Defines or returns the lower limit of the X-axis of a trend referenced with the "Index" property. Whether the information is evaluated is dependent on the "AutorangeX" and "CommonX" properties.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

BeginY Property

Description

Defines or returns the lower limit of the Y-axis of a trend referenced with the "Index" property. Whether the information is evaluated is dependent on the "AutorangeY" and "CommonY" properties.

See also

ScreenItem Object (Page 141)

WinCC Function Trend Control (before WinCC V7) (Page 290)

BevelColorDown Property

Description

Defines the color of the following border sections in the case of 3D representation of the borders:

- with depressed bevel ("BevelStyle" = 1): top and left bevel section
- with raised bevel ("BevelStyle" = 2): bottom and right bevel section

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

BevelColorUp Property

Description

Defines the color of the following border sections in the case of 3D representation of the borders:

- with depressed bevel ("BevelStyle" = 1): bottom and right bevel section
- with raised bevel ("BevelStyle" = 2): top and left bevel section

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

BevelInner Property

Description

Defines or returns the appearance of the inner part of the object bevel. Write/Read access.

- 0: inner part not available
- 1: "depressed" appearance
- 2: "raised" appearance
- 3: uniform gray border
- 4 or higher: uniformly colored order, border color = background color

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

BevelOuter Property

Description

Defines or returns the appearance of the outer part of the object bevel. Write/Read access.

- 0: inner part not available
- 1: "depressed" appearance
- 2: "raised" appearance
- 3: uniform gray border
- 4 or higher: uniformly colored order, border color = background color

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

BevelWidth Property

Description

Defines or returns the border width for the inner part of the border (inner bevel) and for the outer border part (outer bevel) in pixels. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

BitNumber Property

Description

Defines or returns the bit whose status must change in order to trigger a change of value. The tag used must be of the type BYTE, WORD or DWORD.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

BlinkColor Property

Description

Defines the color of the icon in the flash picture. LONG write-read access.

See also

HMI Symbol Library (Page 253)

ScreenItem Object (Page 141)

BlinkMode property

Flash mode (BlinkMode)

Specifies the flash mode of the icon in runtime.

The following settings are available:

Value	Description	Comments
0	No flashing	The icon does not flash.
1	Hidden	The icon flashes in the background color.
2	Shadow	The icon flashes with shading in the foreground color.
3	Solid	The icon flashes in the foreground color.

The attribute can be assigned dynamic properties by means of the name **BlinkMode**. The data type is LONG.

BlinkSpeed property

Flash rate (BlinkSpeed)

Specifies the length of the icon flash interval in Runtime.

The following settings are available:

Value	Description	Comments
250	Fast	Flash interval of 250 ms.
500	Medium	Flash interval of 500 ms.
1000	Slow	Flash interval of 1000 ms.

The attribute can be assigned dynamic properties by means of the name **BlinkSpeed**. You can also use other values. The data type is LONG.

BlockAlign property

Block alignment - BlockAlign

Defines the mode of aligning the caption of blocks in column headers.

The following settings are available:

Value	Description	Explanation
0	left	The block caption is left justified.
1	centered	The block caption is aligned to center.
2	right	The block caption is right justified.

The attribute can be assigned dynamic properties by means of the name **BlockAlign**. The data type is LONG.

BlockAutoPrecisions property

Decimal places automatic - BlockAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The decimal precision is defined automatically. The value in the "Decimal places" field is disabled.
FALSE	The value in the "Decimal places" field is enabled.

The attribute can be assigned dynamic properties by means of the name **BlockAutoPrecisions**. The data type is BOOLEAN.

BlockCaption property

Caption - BlockCaption

Defines the caption of the column header in the control for the selected message block.

The caption is active in all Runtime languages.

The attribute can be assigned dynamic properties by means of the name **BlockCaption**. The data type is STRING.

BlockCount property

BlockCount

Specifies the number of blocks to be made available as columns for the control.

The attribute can be assigned dynamic properties by means of the name **BlockCount**. The data type is LONG.

BlockDateFormat property

Date format - BlockDateFormat

Defines the date format for visualization.

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **BlockDateFormat**. The data type is STRING.

BlockExponentialFormat property

Exponential notation - BlockExponentialFormat

Specifies exponential notation for the display of values of a selected block.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The attribute can be assigned dynamic properties by means of the name **BlockExponentialFormat**. The data type is BOOLEAN.

BlockHideText property

Content as text - BlockHideText

Enables the textual display of the content of a selected block.

Value	Explanation
TRUE	The content is not displayed in text format. The option is disabled.
FALSE	The content is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **BlockHideText**. The data type is BOOLEAN.

BlockHideTitleText property

Title as text - BlockHideTitleText

Enables the display of the header of a selected block in text format.

Value	Explanation
TRUE	The header is not displayed in text format. The option is disabled.
FALSE	The header is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **BlockHideTitleText**. The data type is BOOLEAN.

BlockId property

BlockId

Default assignment of the ID number and of the block in WinCC RulerControl:

Value	Description
0	No block
1	Name
2	Index
3	Designation
4	Display
5	Tag name Y
6	Tag name X
7	Y value
8	X value/time stamp
9	Y value (LL)
10	Time stamp (LL)
11	Y value (UL)
12	Time stamp (UL)
13	Minimum
14	Minimum - Time stamp
15	Maximum
16	Maximum - Time stamp
17	Average
18	Standard deviation
19	Integral
20	Weighted mean value
21	Duration
22	Number of values

The attribute can be assigned dynamic properties by means of the name **BlockID**. The data type is LONG.

BlockIndex property

BlockIndex

References a block. Using this attribute you can assign the values of other attributes to a specific block.

Values between 0 and "BlockCount" minus 1 are valid for "BlockIndex". Attribute "BlockCount" defines the number of available blocks.

The attribute can be assigned dynamic properties by means of the name **BlockIndex**. The data type is LONG.

BlockLength property

Length in characters - BlockLength

Specifies the column width for a selected block.

The attribute can be assigned dynamic properties by means of the name **BlockLength**. The data type is LONG.

BlockName property

Object name - BlockName

Displays the name of the block selected. You cannot edit this name.

The attribute can be assigned dynamic properties by means of the name **BlockName**. The data type is STRING.

BlockPrecisions property

Decimal places - BlockPrecisions

Specifies the number of decimal places of the values in the selected column. You can only enter the value if the "Automatic" option is disabled.

The attribute can be assigned dynamic properties by means of the name **BlockPrecisions**. The data type is SHORT.

BlockShowDate property

Display date - BlockShowDate

Specifies if the "Time" block is displayed with time and date in a field.

Value	Explanation
TRUE	The date and time are displayed. The date format is defined in the "Date format" field.
FALSE	The time is displayed.

The attribute can be assigned dynamic properties by means of the name **BlockShowDate**. The data type is BOOLEAN.

BlockShowIcon property

Content as icon - BlockShowIcon

Enables the display of the content of a selected block as icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **BlockShowIcon**. The data type is BOOLEAN.

BlockShowTitleIcon property

Title as icon - BlockShowTitleIcon

Enables the display of the header of a selected block as icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **BlockShowTitleIcon**. The data type is BOOLEAN.

BlockTimeFormat property

Time format - BlockTimeFormat

Defines the time format to be used for visualization.

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The attribute can be assigned dynamic properties by means of the name **BlockTimeFormat**. The data type is STRING.

BlockUseSourceFormat property

Use source format - BlockUseSourceFormat

Specifies that the format is inherited from the interconnected control. Here the size of the control, the zoom factor and the value range are taken into consideration to display the optimal number of decimal places.

Value	Explanation
TRUE	The formats are derived from the interconnected control.
FALSE	The formats configured in Ruler Control are used, for example, the display of a precisely specified number of decimal places.

The attribute can be assigned dynamic properties by means of the name **BlockUseSouceFormat**. The data type is BOOLEAN.

Bo - Bu

BorderBackColor Property

Description

Defines or returns the background color of the line for the object. LONG write-read access. The background color is only visible with the property setting "BorderWidth" > 0.

See also

ScreenItem Object (Page 141)

BorderColor Property

Description

Defines or returns the line color for the object. LONG write-read access.

See also

ScreenItem Object (Page 141)

BorderColor property

Border color - BorderColor

Specifies the border color. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **BorderColor**. The data type is LONG.

BorderColorBottom Property

Description

Defines or returns the border color for the bottom/right part of the object. LONG write-read access.

See also

ScreenItem Object (Page 141)

Button (Page 215)

Round Button (Page 223)

BorderColorTop Property

Description

Defines or returns the border color for the top/left part of the object. LONG write-read access.

See also

Button (Page 215)

Round Button (Page 223)

ScreenItem Object (Page 141)

BorderEndStyle Property

Description

Defines or returns the line end style of the object. LONG write-read access.

See also

Polyline (Page 173)

Line (Page 169)

ScreenItem Object (Page 141)

BorderFlashColorOff Property

Description

Defines or returns the color of the object lines for the flashing status "Off". LONG write-read access.

See also

ScreenItem Object (Page 141)

BorderFlashColorOn Property

Description

Defines or returns the color of the object lines for the flashing status "On". LONG write-read access.

See also

ScreenItem Object (Page 141)

BorderStyle Property

Description

Defines or returns the line style for the object. Value range from 0 to 4.

0 = solid line

1 = dashed line

2 = dotted line

3 = dash-dotted line

4 = dash-dot-dot line

See also

ScreenItem Object (Page 141)

BorderWidth Property

Description

Defines or returns the line weight (in pixels) for the object.

WinCC Gauge Control:

Defines or returns the width of the middle border part in pixels.

The object border is composed of three parts. The middle part of the object border is described by the "BorderWidth" property.

The color of the middle border part is in the background color.

See also

ScreenItem Object (Page 141)

BorderWidth property

Border width - BorderWidth

Specifies the line weight of the border in pixels.

The attribute can be assigned dynamic properties by means of the name **BorderWidth**. The data type is LONG.

BottomConnectedConnectionPointIndex Property

Description

Specifies or sets the index number of the bottom connecting point.

LONG write-read access.

See also

Connector (Page 182)

ScreenItem Object (Page 141)

BottomConnectedObjectName Property

Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

See also

Connector (Page 182)

ScreenItem Object (Page 141)

BoxAlignment Property

Description

TRUE, when the fields are arranged aligned to the right. BOOLEAN write-read access.

See also

Radio box (Page 221)

Check box (Page 219)

ScreenItem Object (Page 141)

BoxCount Property

Description

Defines or returns the number of fields. Value range from 0 to 31.

See also

Radio box (Page 221)

Check box (Page 219)

ScreenItem Object (Page 141)

BoxType Property

Description

Defines or returns the field type. Value range from 0 to 2:

- 0: Edition
- 1: Input
- 2: I/O field

See also

Text list (Page 211)

I/O Field (Page 199)

ScreenItem Object (Page 141)

ButtonColor Property

Description

Defines or returns the color of the slider. LONG write-read access.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

ButtonCommand Property

Description

Upon changing a value of "ButtonCommand", a message is issued to the WinCC Alarm Control in order to adapt the display in the message window.

Value (hex); value (dec); Retrieved Function:

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

Button1MessageClasses property

Message Types for Button 1 (Button1MessageClasses)

Define one or more message events for displaying the first button in the group display. This is done by entering the numbers of the bits in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

One event can be displayed simultaneously in more than one button.

The "Message Types for Button 1" attribute can be assigned dynamic properties with the name "Button1MessageClasses".

Button2MessageClasses property

Message Types for Button 2 (Button2MessageClasses)

For displaying both buttons, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 2" attribute can be assigned dynamic properties with the name "Button2MessageClasses".

Button3MessageClasses property

Message Types for Button 3 (Button3MessageClasses)

For displaying the third button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 3" attribute can be assigned dynamic properties with the name "Button3MessageClasses".

Button4MessageClasses property

Message Types for Button 4 (Button4MessageClasses)

For displaying the fourth button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 4" attribute can be assigned dynamic properties with the name "Button4MessageClasses".

Button5MessageClasses property

Message Types for Button 5 (Button5MessageClasses)

For displaying the fifth button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 5" attribute can be assigned dynamic properties with the name "Button5MessageClasses".

Button6MessageClasses property

Message Types for Button 6 (Button6MessageClasses)

For displaying the sixth button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, delimit the numbers with a comma. The order of assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 6" attribute can be assigned dynamic properties with the name "Button6MessageClasses".

Button7MessageClasses property

Message Types for Button 7 (Button7MessageClasses)

For displaying the seventh button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, delimit the numbers with a comma. The order of assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 7" attribute can be assigned dynamic properties with the name "Button7MessageClasses".

Button8MessageClasses property

Message Types for Button 8 (Button8MessageClasses)

For displaying the eighth button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, delimit the numbers with a comma. The order of assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 8" attribute can be assigned dynamic properties with the name "Button8MessageClasses".

Button1Width Property

Description

Defines or returns the width of the Button 1 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

Button2Width Property

Description

Defines or returns the width of the Button 2 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

Button3Width Property

Description

Defines or returns the width of the Button 3 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

See also

ScreenItem Object (Page 141)

Group Display (Page 208)

Button4Width Property

Description

Defines or returns the width of the Button 4 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

Group Display (Page 208)

ScreenItem Object (Page 141)

1.14.4.4 C

Ca - Cl

Caption Property

Description

Application and picture windows

TRUE, when the application or picture window has a title bar in Runtime. Read only access.

The Caption property must be set to TRUE when the application or picture window should have Maximize and Close buttons.

Controls before WinCC V7

Defines or returns the text to be displayed on the label on the button or in the title bar (Online Trend Control and Online Table Control). Write/Read access.

See also

Controls (Page 232)

Picture Window (Page 194)

Application Window (Page 188)

ScreenItem Object (Page 141)

Caption property

Text - Caption

Defines the text of the window caption.

The attribute can be assigned dynamic properties by means of the name **Caption**. The data type is STRING.

CaptionColor Property

Description

Defines or returns the color of the element labeling. LONG write-read access.

See also

ScreenItem Object (Page 141)

WinCC Gauge Control (Page 264)

CaptionFont Property

Description

Returns the values for font, font style and font size as well as the "Underline" and "Strikethrough" effects for the element labeling. Read only access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

CaptionOffset Property

Description

Defines or returns the distance of the element labeling in relation to the top edge of the object. The element labeling can only be positioned along the vertical diameter of the graduated scale disk. The value of the attribute is related to the height of the object and is measured from the top edge of the object to the base of the text. Write/Read access.

The value range is 0 to 1:

0: The base of the text is at the top limit of the object. The text is no longer visible because it is outside the object.

1: The base of the text is at the bottom limit of the object.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

CaptionText Property

Description

Defines or returns the window title which is displayed in Runtime.
The Caption property must be set to TRUE.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

CellCut property (before WinCC V7)

Description

TRUE, when the content of the cells in a message line should be cut if the column width is too small. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

CellCut property

Shorten contents - CellCut

Shortens cell contents if the cell width is insufficient.

Value	Explanation
TRUE	Enables shortening of cell contents.
FALSE	Disables shortening of cell contents.

The attribute can be assigned dynamic properties by means of the name **CellCut**. The data type is BOOLEAN.

CellSpaceBottom property

CellSpaceBottom

Defines the bottom margin of the table cells.

The attribute can be assigned dynamic properties by means of the name **CellSpaceBottom**. The data type is LONG.

CellSpaceLeft property

CellSpaceLeft

Defines the left indent of the table cells.

The attribute can be assigned dynamic properties by means of the name **CellSpaceLeft** . The data type is LONG.

CellSpaceRight property

CellSpaceRight

Defines the right indent of the table cells.

The attribute can be assigned dynamic properties by means of the name **CellSpaceRight** . The data type is LONG.

CellSpaceTop property

CellSpaceTop

Defines the top margin of the table cells.

The attribute can be assigned dynamic properties by means of the name **CellSpaceTop** . The data type is LONG.

CenterColor Property

Description

Defines or returns the color of the circular center of the scale (cover of the pointer axis). LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

CenterScale Property

Description

Defines or returns the diameter of the circular center of the scale (cover of the pointer axis) in relation to the smaller value of the geometric width and height attributes. Write/Read access.

The value range is 0.03 to 1:

1: The diameter corresponds to the smaller value of the "Width" or "Height" geometric values.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

CheckAlarmHigh Property

Description

TRUE, when the "AlarmHigh" limit value is to be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmHigh", "ColorAlarmHigh" and "TypeAlarmHigh" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckAlarmLow Property

Description

TRUE, when the "AlarmLow" limit value is to be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmLow", "ColorAlarmLow" and "TypeAlarmLow" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckLimitHigh4 Property

Description

TRUE, when the "Reserve 4" upper limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh4", "ColorLimitHigh4" and "TypeLimitHigh4" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckLimitHigh5 Property

Description

TRUE, when the "Reserve 5" upper limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh5", "ColorLimitHigh5" and "TypeLimitHigh5" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckLimitLow4 Property

Description

TRUE, when the "Reserve 4" lower limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow4", "ColorLimitLow4" and "TypeLimitLow4" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckLimitLow5 Property

Description

TRUE, when the "Reserve 5" lower limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow5", "ColorLimitLow5" and "TypeLimitLow5" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckToleranceHigh Property

Description

TRUE, when the "ToleranceHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceHigh", "ColorToleranceHigh" and "TypeToleranceHigh" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckToleranceLow Property

Description

TRUE, when the "ToleranceLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceLow", "ColorToleranceLow" and "TypeToleranceLow" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckWarningHigh Property

Description

TRUE, when the "WarningHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningHigh", "ColorWarningHigh" and "TypeWarningHigh" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckWarningLow Property

Description

TRUE, when the "WarningLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningLow", "ColorWarningLow" and "TypeWarningLow" properties.

ScreenItem Object (Page 141)

Closeable property

Closeable

Defines whether the control can be closed in Runtime.

Value	Explanation
TRUE	The control can be closed in Runtime.
FALSE	The control cannot be closed in Runtime.

The attribute can be assigned dynamic properties by means of the name **Closeable**. The data type is BOOLEAN.

CloseButton Property

Description

TRUE, when the window is provided with a "Close" button. Read only access.

Picture Window (Page 194)

Application Window (Page 188)

ScreenItem Object (Page 141)

Co

CoarseGrid Property

Description

TRUE when the value axis is scaled by long tick marks. The distance between two long tick marks can be changed using the "CoarseGridValue" property. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

CoarseGridX Property

Description

TRUE, when the X-axis graduation is scaled by long tick marks. The distance between two long tick marks can be changed using the "CoarseGridValueX" property. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

CoarseGridY Property

Description

TRUE, when the Y-axis graduation is scaled by long tick marks. The distance between two long tick marks can be changed using the "CoarseGridValueY" property. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

CoarseGridValue Property

Description

Defines the distance between two long tick marks in the scale. Whether the information is evaluated is dependent on the value of the "CoarseGrid" property.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

CoarseGridValueX Property

Description

Defines or returns the distance between two long tick marks on the graduation scale of the X-axis. Whether the information is evaluated is dependent on the value of the "CoarseGridX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

CoarseGridValueY Property

Description

Defines or returns the distance between two long tick marks on the graduation scale of the Y-axis. Whether the information is evaluated is dependent on the value of the "CoarseGridY" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

CollectValue Property

Description

Contains the respective status of the active message class in Runtime as the start value. LONG write/read access.
The value can be determined from the group display of hierarchically subordinate pictures by making it dynamic using a tag.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

ColMove Property

Description

TRUE, when the arrangement of columns can be changed. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

Color Property

Description

The "Index" property references a column pair or a trend. "Color" defines the color of the font in the column or the trend. LONG write-read access. The color is defined as an RGB value.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ColorAlarmHigh Property

Description

Defines or returns the bar color for the "AlarmHigh" limit value. LONG write/read access. The "CheckAlarmHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorAlarmLow Property

Description

Defines or returns the bar color for the "AlarmLow" limit value. LONG write/read access. The "CheckAlarmLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorBottom Property

Description

Defines or returns the color for the bottom/right stop of the slider object. LONG write-read access.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

ColorChangeType Property

Description

TRUE, if the change of color should occur segment by segment in the case of a color change (e.g. on reaching a limit value). If set to FALSE, it defines the change of color for the entire bar. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorLimitHigh4 Property

Description

Defines or returns the color for the "Reserve 4" upper limit value. LONG write/read access. The "CheckLimitHigh4" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorLimitHigh5 Property

Description

Defines or returns the color for the "Reserve 5" upper limit value. LONG write/read access. The "CheckLimitHigh5" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorLimitLow4 Property

Description

Defines or returns the color for the "Reserve 4" lower limit value. LONG write/read access. The "CheckLimitLow4" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ColorLimitLow5 Property

Description

Defines or returns the color for the "Reserve 5" lower limit value. LONG write/read access. The "CheckLimitLow5" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorToleranceHigh Property

Description

Defines or returns the color for the "ToleranceHigh" upper limit value. LONG write/read access. The "CheckToleranceHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorToleranceLow Property

Description

Defines or returns the color for the "ToleranceLow" lower limit value. LONG write/read access. The "CheckToleranceLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorTop Property

Description

Defines or returns the color for the top/left stop of the slider object. LONG write-read access.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

ColorWarningHigh Property

Description

Defines or returns the color for the "WarningHigh" upper limit value. LONG write/read access. The "CheckWarningHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorWarningLow Property

Description

Defines or returns the color for the "WarningLow" lower limit value. LONG write/read access. The "CheckWarningLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColTitle Property

Description

TRUE, when the columns in the message window should have a title bar. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

ColumnAdd property

Apply - ColumnAdd

Copies the selected column from the list of existing columns to the list of selected columns.

The attribute can be assigned dynamic properties by means of the name **ColumnAdd**. The data type is STRING.

ColumnAlias property

ColumnAlias

Defines the alias specified in the user archive for the column name.

The attribute can be assigned dynamic properties by means of the name **ColumnAlias**. The data type is STRING.

ColumnAlign property

Alignment - ColumnAlign

Specifies the mode of alignment of a selected column.

The following settings are available:

Value	Description	Explanation
0	left	The selected column is aligned left.
1	centered	The selected column is aligned to center.
2	right	The selected column is aligned right.

The attribute can be assigned dynamic properties by means of the name **ColumnAlign**. The data type is LONG.

ColumnAutoPrecisions property

Decimal places automatic - ColumnAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The decimal precision is defined automatically. The value in the "Decimal places" field is disabled.
FALSE	The value in the "Decimal places" field is enabled.

The attribute can be assigned dynamic properties by means of the name **ColumnAutoPrecisions**. The data type is BOOLEAN.

ColumnCaption property

Caption - ColumnCaption

Sets the caption for a selected column.

The attribute can be assigned dynamic properties by means of the name **ColumnCaption**. The data type is STRING.

ColumnCount property

ColumnCount

Defines the number of columns configured.

The attribute can be assigned dynamic properties by means of the name **ColumnCount**. The data type is LONG.

ColumnDateFormat property

Date format - ColumnDateFormat

Defines the date format for visualization.

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **ColumnDateFormat**. The data type is STRING.

ColumnDMVarName property

ColumnDMVarName

Defines the name of the tag you assigned to the column in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnDMVarName**. The data type is STRING.

ColumnExponentialFormat property

Exponential notation - ColumnExponentialFormat

Sets exponential notation for the display of values of a selected column.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The attribute can be assigned dynamic properties by means of the name **ColumnExponentialFormat**. The data type is BOOLEAN.

ColumnFlagNotNull property

ColumnFlagNotNull

Specifies whether the user archive field assigned to the column must have a value.

Value	Explanation
Yes	The column must have a value.
No	The column can have a value.

The attribute cannot be dynamized.

ColumnFlagUnique property

ColumnFlagUnique

Specifies whether the user archive field assigned to the column must have a unique value. Values in this column must not be redundant.

Value	Explanation
TRUE	The column must have a unique value.
FALSE	The column must not have a unique value.

The attribute cannot be dynamized.

ColumnHideText property

Content as text - ColumnHideText

Defines textual display of the contents of a selected column.

Value	Explanation
TRUE	The content is not displayed in text format. The option is disabled.
FALSE	The content is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **ColumnHideText**. The data type is BOOLEAN.

ColumnHideTitleText property

Text header - ColumnHideTitleText

Sets textual display of the header of a selected column.

Value	Explanation
TRUE	The header is not displayed in text format. The option is disabled.
FALSE	The header is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **ColumnHideTitleText**. The data type is BOOLEAN.

ColumnIndex property

ColumnIndex

References a control column. Using this attribute you can assign the values of other properties to a specific column.

Values between 0 and "ColumnCount" minus 1 are valid for "ColumnIndex"; the attribute "ColumnCount" defines the number of available columns.

The "ColumnIndex" attribute can be assigned dynamic properties by means of attribute **ColumnIndex**. The data type is LONG.

ColumnLeadingZeros property

With leading zeros - ColumnLeadingZeros

Enables the display of values with leading zeros for the column selected. Use "Number of digits" or "ColumnLeadingZeros" to specify the number of leading zeros. The maximum number is "11". No leading zeros are displayed with the value "0". The "With leading zeros" option is deactivated.

The attribute can be assigned dynamic properties by means of the name **ColumnLeadingZeros**. The data type is LONG.

ColumnLength property

Length in Characters - ColumnLength

Specifies the width of a selected column.

The attribute can be assigned dynamic properties by means of the name **ColumnLength**. The data type is LONG.

ColumnMaxValue property

ColumnMaxValue

Defines the maximum column value specified in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnMaxValue**. The data type is STRING.

ColumnMinValue property

ColumnMinValue

Defines the minimum column value specified in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnMinValue**. The data type is STRING.

ColumnName property

ColumnName

Defines the name of the column which is referenced by means of "ColumnIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **ColumnName**. The data type is STRING.

ColumnPosition property

ColumnPosition

Displays the field position defined in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnPosition**. The data type is LONG.

ColumnPrecisions property

Decimal places - ColumnPrecisions

Specifies the number of decimal places of the values in the selected column. You can only enter the value if the "Automatic" option is disabled.

The attribute can be assigned dynamic properties by means of the name **ColumnPrecisions**. The data type is SHORT.

ColumnReadAccess property

ColumnReadAccess

Defines authorizations for read access to the column as specified in the user archive. The number corresponds with the number assigned to the authorization in the "User Administrator" editor.

The attribute cannot be dynamized.

ColumnReadonly property

Write protected - ColumnReadonly

Sets the write protection of a selected column.

Value	Explanation
TRUE	This column is write protected.
FALSE	This column is not write protected. You can edit the column values in Runtime by activating the "Change" option in the General" tab.

The attribute can be assigned dynamic properties by means of the name **ColumnReadonly**. The data type is BOOLEAN.

ColumnRemove property

Remove - ColumnRemove

Cuts selected columns from the list of selected columns and pastes these to the list of available columns.

The attribute can be assigned dynamic properties by means of the name **ColumnRemove**. The data type is STRING.

ColumnRepos property

Up/Down - ColumnRepos

Changes the order of columns. "Up" and "Down" move the column selected up or down in the list. This moves the column towards the front or towards the back.

The attribute can be assigned dynamic properties by means of the name **ColumnRepos**. The data type is LONG.

ColumnResize property

Width can be resized - ColumnResize

Enables changes to the width of columns.

Value	Explanation
TRUE	You can change the width of the columns.
FALSE	You cannot change the width of the columns.

The attribute can be assigned dynamic properties by means of the name **ColumnResize**. The data type is BOOLEAN.

ColumnSrollbar properties

Column scroll bars - ColumnScrollbar

Enables the display of column scroll bars.

The following settings are available:

Value	Description	Explanation
0	no	Column scroll bars are not displayed.
1	as required	Column scroll bars are displayed if vertical space requirements of the control are greater than the actually available display area.
2	always	Column scroll bars are always displayed.

The attribute can be assigned dynamic properties by means of the name **ColumnScrollbar**. The data type is LONG.

ColumnShowDate property

Display date - ColumnShowDate

Specifies if the "Time" block is displayed with time and date in a field.

Value	Explanation
TRUE	The date and time are displayed. The date format is defined in the "Date format" field.
FALSE	The time is displayed.

The attribute can be assigned dynamic properties by means of the name **ColumnShowDate**. The data type is BOOLEAN.

ColumnShowIcon property

Content as icon - ColumnShowIcon

Enables the display the contents of a selected column by means of icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **ColumnShowIcon**. The data type is BOOLEAN.

ColumnShowTitleIcon property

Header as icon - ColumnShowTitleIcon

Specifies the display of the header of a selected column by means of icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **ColumnShowTitleIcon**. The data type is BOOLEAN.

ColumnSort property

ColumnSort

Defines the sorting order of the user archive column referenced in the "ColumnIndex" attribute.

The following settings are available:

Value	Description	Explanation
0	No	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **ColumnSort** . The data type is LONG.

ColumnSortIndex property

ColumnSortIndex

Defines the sorting order of the column referenced in "ColumnIndex". The sorting criterion is removed from "ColumnSort" if you set a "0" value..

The attribute can be assigned dynamic properties by means of the name **ColumnSortIndex**. The data type is LONG.

ColumnStartValue property

ColumnStartValue

Defines the column start value specified in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnStartValue**. The data type is STRING.

ColumnStringLength property

ColumnStringLength

Displays the string length of the column as defined in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnStringLength**. The data type is LONG.

ColumnTimeFormat property

Time format - ColumnTimeFormat

Defines the time format to be used for visualization.

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The attribute can be assigned dynamic properties by means of the name **ColumnTimeFormat**. The data type is STRING.

ColumnTitleAlign property

Column title alignment - ColumnTitleAlign

Specifies the type of column title alignment.

The following settings are available:

Value	Description	Explanation
0	left	The column titles are left justified.
1	centered	The column titles are centered.
2	right	The column titles are right justified.
3	Same as table content	The column titles are justified to fit the corresponding column content.

The attribute can be assigned dynamic properties by means of the name **ColumnTitleAlign**. The data type is LONG.

ColumnTitles property

Show column title - ColumnTitles

Enables the display of the column header.

Value	Explanation
TRUE	The column header is displayed.
FALSE	The column header is not displayed.

The attribute can be assigned dynamic properties by means of the name **ColumnTitles**. The data type is BOOLEAN.

ColumnType property

Type - ColumnType

Displays the data type set in the user archive for a selected column.

The attribute can be assigned dynamic properties by means of the name **ColumnType**. The data type is LONG.

ColumnVisible property

ColumnVisible

Enables the display of a column referenced by means of "ColumnIndex" attribute.

Value	Explanation
TRUE	The column is displayed.
FALSE	The column is not displayed.

The attribute can be assigned dynamic properties by means of the name **ColumnVisible** . The data type is BOOLEAN.

ColumnWriteAccess property

ColumnWriteAccess

Defines authorizations for write access to the column as specified in the user archive. The number corresponds with the number assigned to the authorization in the "User Administrator" editor.

The attribute cannot be dynamized.

ColWidth Property

Description

TRUE, when it should be possible to change the widths of the columns in the message window. The width of the columns can only be changed, however, when the "AutoScroll" property is not active. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ComputerName property

Description

Returns the name of the computer on which the alarm object was triggered.

ComputerName (readonly)

See also

Alarms object (list) (Page 126)

Context property

Description

Reads or sets the alarm object server prefix.

See also

Alarms object (list) (Page 126)

ConnectTrendWindows property

Connect trend windows - ConnectTrendWindows

Enables the connection of trend windows configured. You must have configured several trend windows.

The connected trend windows have the following properties:

- They can have a common X axis.
- They have a scroll bar.
- They have a ruler.
- The zoom functions for a trend window affect the connected trend windows.

Value	Description
TRUE	All trend windows configured are connected.
FALSE	The trend windows are displayed separately.

The attribute can be assigned dynamic properties by means of the name **ConnectTrendWindows**. The data type is BOOLEAN.

ContinousChange Property

Description

Defines the type of transfer of the value defined by the slider ("Position" property) in Runtime:

- FALSE : The value of the "Position" property is transferred when the mouse button is released.
- TRUE : The value of the "Position" property is transferred immediately following a change of the slider position.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

Count Property

Description

Supplies the number of elements in a list.

INTEGER (read-only access).

Example:

The example shows how the number of objects in a DataSet list is output.

```
'VBS165
HMIRuntime.Trace "Count: " & HMIRuntime.DataSet.Count & vbNewLine
```

The following example adds two tags to the TagSet list and outputs the count properties as Trace.

```
'VBS177
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "Count: " & group.Count & vbNewLine
```

Cu

CurrentContext Property

Description

In the case of a picture window, the server from which the picture comes and contains the script is read out.

The "CurrentContext" property can return different results: If, for example, a picture window displaying a server picture is set in a local basic picture, distinction is made between two cases:

- The "CurrentContext" property is used in an action of the picture window picture: The result is the return of the symbolic computer name of the server (Package property) extended by two colons, e.g."WinCCProject_MyComputer::“ .
- The "CurrentContext" property is used in an action of the basic picture: The result is returned in the form of an empty character string.

See also

HMIRuntime Object (Page 134)

Cursor Property

Description

Controls the appearance of the cursor in Runtime when positioned over an icon.

- 0: The cursor appears as an arrow and does not change when positioned over the icon.
- 1: The cursor appears as a 3D arrow accompanied by a green lightening symbol. In Runtime, this indicates that the object concerned can be operated.

See also

ScreenItem Object (Page 141)

HMI Symbol Library (Page 253)

Cursor property

Mouse pointer (Cursor)

Specifies whether or not to display the mouse pointer on the icon at runtime.

Value	Explanation
TRUE	The mouse pointer is shown at runtime if positioned on the icon.
FALSE	The mouse pointer is hidden at runtime if positioned on the icon.

The attribute can be assigned dynamic properties by means of the name **Cursor**. The data type is BOOLEAN.

CursorControl Property

Description

TRUE, when Alpha Cursor mode is activated, the cursor skips to the next field in the TAB sequence after exiting the field. BOOLEAN write-read access.

To do this, the "CursorMode" property must be set to TRUE.

ScreenItem Object (Page 141)

CurveForm Property

Description

WinCC Function Trend Control

Defines how the measuring points of a trend referenced by the "Index" property should be connected. Write/Read access.

WinCC Online Trend Control

The "Index" property references a trend. "CurveForm" defines how the measuring points should be connected.

- 0x00000012 Representation of the measuring points.
- 0x00000014 Measuring points are connected linearly.
- 0x00000011 Measuring points are connected via a step curve.
- 0x00000021 The area under the linearly connected trend is filled.
- 0x00000022: The area under the step curve is filled.

ScreenItem Object (Page 141)

CursorMode Property

Description

When the "CursorMode" is set to "yes", you can show all messages from the short-term archive page by page in the long-term archive list. Use the "CursorModePrefetch" property to determine the number of messages shown per page.

The "Autoscroll" option must be unchecked in order to be able to switch between pages. Write/Read access.

CursorModePrefetch Property

Description

Sets the number of message that you want to display page by page in the long-term archive list out of all messages in the short-term archive.

The "CursorMode" object property must be set to "yes".

Write/Read access.

1.14.4.5 D

Da

DangerColor Property

Description

Defines or returns the color of the danger zone on the scale. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

Danger Property

Description

Defines or returns the beginning of the "danger zone". The zone stretches from the "danger" value to the end of the scale. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

DataFormat Property

Description

Returns the data type of the I/O field object. Read only access.

Value range from 0 to 3.

0: Binary

1: Decimal

2: String

3: Hexadecimal

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

DataIndex Property

Description

Returns the current index of the data of the current trend.

Note

The property is only supported for the controls prior to WinCC V7.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DataLogs Property

Description

Returns an object of type "DataLogs".

DataLogs (read-only)

See also

DataLogs Object (Page 130)

HMIRuntime Object (Page 134)

DataSet Property

Description

Returns an object of type "DataSet".

DataSet (read-only)

See also

DataSet Object (List) (Page 132)

HMIRuntime Object (Page 134)

DataX Property

Description

Inserts a single data record and must be set before calling "InsertData".

Note

The property is only supported for the controls prior to WinCC V7.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DataXY Property

Description

Inserts several data records as an array with pairs of values and must be set before calling "InsertData".

The data in the array is assumed when "DataX" is of the VT_EMPTY type. Otherwise, the "InsertData" attribute used the single value pair resulting from “DataX” and “DataY”.

Note

The property is only supported for the controls prior to WinCC V7.

See also

Example: Calling Methods of an ActiveX Control (Page 820)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DataY Property

Description

Inserts a single data record and must be set before calling "InsertData".

Note

The property is only supported for the controls prior to WinCC V7.

De - Do

DefaultMsgFilterSQL property

DefaultMsgFilterSQL

Defines an SQL statement for a fixed selection of messages.

The SQL statements of "DefaultMsgFilterSQL" and "MsgFilterSQL" are linked logically by "AND" operation if you define additional custom selections by means of "MsgFilterSQL" attribute.

The attribute can be assigned dynamic properties by means of the name **DefaultMsgFilterSQL**. The data type is STRING.

DefaultPrecision Property

Description

This attribute defines the number of default decimal places, with which the scale value is specified. Write/Read access.

DefaultRulerPrecision Property

Description

This attribute defines the number of decimal places as standard value with which a measured value should be displayed when it is determined using the "Display value at this position" function. Write/Read access.

DefaultSort property

Default sorting order - DefaultSort

Defines the default sorting order in table columns.

The following settings are available:

Value	Description	Explanation
0	Ascending	The list is updated starting with the bottom line.
1	Descending	The list is updated starting with the top line.

The attribute can be assigned dynamic properties by means of the name **DefaultSort**. The data type is LONG.

DefaultSort2 property

DefaultSort2

Use this function to define the sorting method in table columns if not using the default "Date/time/number" sorting order. Instead, you defined a message block in the "DefaultSort2Column" object property to sort the columns based on the "message block/date/time/number" order.

The following settings are available:

Value	Description	Explanation
0	Ascending	The list is updated starting with the bottom line.
1	Descending	The list is updated starting with the top line.

The attribute can be assigned dynamic properties by means of the name **DefaultSort2**. The data type is LONG.

DefaultSort2Column property

DefaultSort2Column

Use this function to define the sorting method in table columns if not using the default "Date/time/number" sorting order.

Define a message block by its object name.

The table columns are now sorted based on the "message block/date/time/number" order.

The attribute can be assigned dynamic properties by means of the name **DefaultSort2Column**. The data type is STRING.

DeleteData Property

Description

Deletes data in the data buffer of the current trend.

TRUE : All trend data is deleted.

FALSE : The value pair at the "DataIndex" position are deleted.

Note

The property is only supported for the controls prior to WinCC V7.

See also

Delta Property

Description

Defines or returns the value difference between two main scale graduation marks. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

DesiredCurveColor Property

Description

Defines the color of a setpoint trend which belongs to a trend referenced by the "Index" property. The color is defined as an RGB value. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DesiredCurveCurveForm Property

Description

Defines the form of representation of a setpoint trend which belongs to a trend referenced by the "Index" property. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

0x00000011 Measuring points are connected by a solid line via a step curve

0x00000012 Representation of the measuring points

0x00000014 Measuring points are connected linearly with a solid line

0x00000021 The area under the linearly connected trend is filled.

0x00000022: The area under the stepped curve is filled.

0x00000031: Measuring points are connected by a dashed line via a step curve

0x00000032: Measuring points are connected linearly with a dashed line

DisplayName property

Display name (DisplayName)

Specifies the user-defined name of the process picture. The attribute is of type "Multilingual String". You can specify names for all languages installed in WinCC.

The "Display name" attribute can be dynamized with the "DisplayName" name.

DisplayOptions property

Show messages - DisplayOptions

Select the messages to be displayed.

The following selection options are available:

Value	Designation
0	All messages
1	Only displayed messages
2	Only hidden messages

The attribute can be assigned dynamic properties by means of the name **DisplayOptions**. The data type is LONG.

DisplayOptions property (before WinCC V7)

Description

Specifies if a button is assigned to a graphic, text, or both.

0 Picture or text: If a picture exists, the button is assigned with the picture, otherwise it is assigned with text.
1 Graphic and text
2 Text only
3 Graphic only

DoubleClickAction property

Action on double-click - DoubleClickAction

Sepcifies the action to be executed in Runtime by double-clicking on a message line.

The following settings are available:

Value	Description	Explanation
0	none	No action.
1	Loop-in-alarm	Calls the "Loop-in-alarm" function.
2	Open comments dialog	Calls the "Comments dialog" button function.
3	Open Infotext dialog	Calls the "Infotext dialog" button function.
4	Column-dependent	The action is determined by the column in which you double-clicked.

The attribute can be assigned dynamic properties by means of the name **DoubleClickAction**. The data type is LONG.

1.14.4.6 E

Edit Property

Description

Activates Editing mode for a cell as long as the "Editable" property has been set to TRUE for the corresponding column.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

Editable Property

Description

The "Index" property references a pair of columns. "Editable" defines whether the column pair should be editable. BOOLEAN write-read access.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

EditAtOnce Property

Description

TRUE, if accessing the field with the <TAB> key permits input immediately and without further action. BOOLEAN write-read access.

See also

Text list (Page 211)

I/O Field (Page 199)

ScreenItem Object (Page 141)

Enabled Property

Function

Enables or disables possible operation of an object or issues the corresponding value. TRUE : Enable operation, FALSE: Operation is disabled.

BOOLEAN write-read access.

Example:

The following example disables all objects in the picture "NewPDL1":

```
'VBS71
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
```

```
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName    'Read names of objects
Set objScrItem = objScreen.ScreenItems(strName)
objScrItem.Enabled=False    'Lock object
Next
```

See also

Screen Object (Page 146)

ScreenItem Object (Page 141)

EnableDelete property

Delete - EnableDelete

Enables deletion of data from the user archive in Runtime.

Value	Explanation
TRUE	You can delete data from the user archive in Runtime.
FALSE	You cannot delete data from the user archive in Runtime.

The attribute can be assigned dynamic properties by means of the name **EnableDelete**. The data type is BOOLEAN.

EnableEdit property

Modify - EnableEdit

Enables editing of the data displayed during runtime.

Value	Explanation
TRUE	Enables editing of data during runtime.
FALSE	Disables editing of data during runtime.

The attribute can be assigned dynamic properties by means of the name **EnableEdit**. The data type is BOOLEAN.

EnableInsert property

Add - EnableInsert

Enables insertion of data in the user archive in Runtime.

Value	Explanation
TRUE	You can add data to the user archive in Runtime.
FALSE	You cannot add data to the user archive in Runtime.

The attribute can be assigned dynamic properties by means of the name **EnableInsert**. The data type is BOOLEAN.

EnablePopupMenu property

EnablePopupMenu

Specifies if the pop-up menu is enabled in the control.

The attribute can be assigned dynamic properties by means of the name **EnablePopupMenu**. The data type is BOOLEAN.

EndAngle Property

Description

Defines or returns the end of the object. The information is in counterclockwise direction in degrees, beginning at the 12:00 clock position.

See also

Pie segment (Page 167)

Circular arc (Page 166)

Ellipse segment (Page 162)

ScreenItem Object (Page 141)

EndTime Property

Description

Online Table Control

The "Index" attribute references a pair of columns. "EndTime" defines the end time for displaying this column pair. Whether the information is evaluated is dependent on the TimeRange" and "CommonTime" properties. Write/Read access.

Online Trend Control

The "Index" attribute references a trend. "EndTime" defines the end time for displaying this trend. Whether the information is evaluated is dependent on the "Autorange", "TimeRange" and "CommonX" properties.

Use the "yyyy-mm-dd hh:mm:ss" format when creating a dynamic time range.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

EndValue Property

Description

The "Index" property references a trend. "EndValue" defines the upper limit of the value range to be displayed for the trend. Whether the information is evaluated is dependent on the "Autorange" and "CommonY" properties.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

EndX Property

Description

Defines the upper limit of the X-axis of a trend referenced with "Index". Whether the information is evaluated is dependent on the "AutorangeX" and "CommonX" properties.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

EndY Property

Description

Defines the upper limit of the Y-axis of a trend referenced with "Index". Whether the information is evaluated is dependent on the "AutorangeY" and "CommonY" properties.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ErrorDescription Property

Function

Error description of the "LastError" property. The error description is provided in English only.

STRING (read only)

The following error messages are defined:

Output	Description
" "	OK
"Operation Failed"	Execution error
"Variable not found"	Tag error
"Server down"	Server not available.
"An error occured for one or several tags"	Multi Tag Error (Error in one or several tags)

In order that ErrorDescription returns a value, a read process must be executed beforehand.

If an error occurs during read or write of several tags using the TagSet object, the error is set to "Multi Tag Error". In order to determine at which tag the error occurred and what type of error it was, the ErrorDescription property of each tag must be analyzed.

Example:

The following example displays the error description for "Tag1":

```
'VBS72
Dim objTag
```

```
Set objTag = HMIRuntime.Tags("Tag1")
objtag.Read
MsgBox objTag.ErrorDescription
```

The following example adds two tags to the TagSet list and outputs the ErrorDescription property as Trace.

```
'VBS179
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "ErrorDescription: " & group.ErrorDescription & vbNewLine
```

The ErrorDescription property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "ErrorDescription: " & group("Motor1").ErrorDescription & vbNewLine
```

See also

LastError Property (Page 446)

QualityCode Property (Page 533)

TagSet Object (List) (Page 156)

Tag Object (Page 152)

Exponent Property

Description

TRUE, when the display of numbers should be with exponents (e.g."1.00e+000"). BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ExportDirectoryChangeable property

Directory can be changed - ExportDirectoryChangeable

Enables changing of the directory for data export in Runtime.

Value	Explanation
TRUE	The data export directory can be changed in Runtime.
FALSE	The data export directory cannot be changed in Runtime.

The attribute can be assigned dynamic properties by means of the name **ExportDirectoryChangeable**. The data type is BOOLEAN.

ExportDirectoryname property

Directory - ExportDirectoryname

Defines the directory to which the exported Runtime data is written.

You can select or create the directory using the selection button.

The attribute can be assigned dynamic properties by means of the name **ExportDirectoryname**. The data type is STRING.

ExportFileExtension property

ExportFileExtension

Defines the extension of the export file.

Only the file name extension "csv" is currently supported.

The attribute can be assigned dynamic properties by means of the name **ExportFileExtension**. The data type is STRING.

ExportFilename property

File name - ExportFilename

Defines the name of the file which is to receive the exported Runtime data.

The attribute can be assigned dynamic properties by means of the name **ExportFilename**. The data type is STRING.

ExportFilenameChangeable property

File can be renamed - ExportFilenameChangeable

Enables renaming of the export file in Runtime.

Value	Explanation
TRUE	The export file can be renamed in Runtime.
FALSE	The export file cannot be renamed in Runtime.

The attribute can be assigned dynamic properties by means of the name **ExportFilenameChangeable**. The data type is BOOLEAN.

ExportFormatGuid property

ExportFormatGuid

Default assignment of the ID number and export provider.

The attribute can be assigned dynamic properties by means of the name **ExportFormatGuid**. The data type is STRING.

ExportFormatName property

Format - ExportFormatName

Defines the export file format.

Only the "csv" file format is currently available for the export.

The attribute can be assigned dynamic properties by means of the name **ExportFormatName**. The data type is STRING.

See also

How to export Runtime data

ExportParameters property

ExportParameters

Specifies the parameters of the selected format by means of the properties dialog.

The attribute can be assigned dynamic properties by means of the name **ExportParameters**. The data type is VARIANT.

ExportSelection property

Scope of data export - ExportSelection

Specifies the control's Runtime data to be exported.

The following settings are available:

Value	Description	Explanation
0	all	All Runtime data of the control is exported.
1	Selection	Selected Runtime data of the control is exported.

The attribute can be assigned dynamic properties by means of the name **ExportSelection**. The data type is LONG.

ExportShowDialog property

Show dialog - ExportShowDialog

Enables the display of the export dialog during runtime.

Value	Explanation
TRUE	The dialog is displayed during runtime.
FALSE	The dialog is not displayed during runtime.

The attribute can be assigned dynamic properties by means of the name **ExportShowDialog**. The data type is BOOLEAN.

ExportXML property

ExportXML

Only used internally.

The attribute can be assigned dynamic properties by means of the name **ExportXML**.

ExtendedOperation Property

Description

TRUE, when the slider regulator is set at the respective end value (minimum/maximum value). This is done by clicking the mouse in an area outside the current regulator setting. BOOLEAN write-read access.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

ExtendedZoomingEnable Property

Description

Activates/deactivates the ExtendedZooming properties of a picture.

Using ExtendedZooming, the view of a process picture in Runtime may be enlarged or reduced by using the mouse wheel.

BOOLEAN write-read access.

Example:

Activates ExtendedZooming for picture NewPDL1.

```
'VBS155
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
objScreen.ExtendedZoomingEnable = 1
```

See also

Screen Object (Page 146)

1.14.4.7 F

Fe - Fl

FeatureFullscreen property

FeatureFullscreen

Specifies if the "Full screen" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureFullscreen**. The data type is BOOLEAN.

FeaturePause property

FeaturePause

Specifies if the "Pause" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeaturePause**. The data type is BOOLEAN.

FeaturePlay property

FeaturePlay

Specifies if the "Play" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeaturePlay**. The data type is BOOLEAN.

FeatureStepBackward property

FeatureStepBackward

Specifies if the "Step backward" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureStepBackward**. The data type is BOOLEAN.

FeatureStepForward property

FeatureStepForward

Specifies if the "Step forward" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureStepForward**. The data type is BOOLEAN.

FeatureStop property

FeatureStop

Specifies if the "Stop" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureStop**. The data type is BOOLEAN.

FeatureVolume property

FeatureVolume

Specifies if the "Volume" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureVolume**. The data type is BOOLEAN.

FileName property

FileName

Specifies the file whose content you want to display or play.

The attribute can be assigned dynamic properties by means of the name **FileName**. The data type is STRING.

FillColor Property

Description

Defines or returns the fill pattern color for the object.

LONG (write-read access)

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Enter the appropriate decimal value for each of the three RGB values.

Example:

RGB(200, 150, 100)

Example:

The following example defines the fill color for "ScreenWindow1" to blue:

```
'VBS73
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.FillStyle = 131075
objScreen.FillColor = RGB(0, 0, 255)
```

See also

FillStyle Property (Page 408)

BackColor Property (Page 323)

ScreenItem Object (Page 141)

Filling Property

Description

TRUE, when the object can be filled by closed border lines (e.g. representing the fill level of a tank). BOOLEAN write-read access.
The fill level of the object is set by means of the "FillingIndex" property.

See also

ScreenItem Object (Page 141)

FillingDirection properties

Filling direction (FillingDirection)

The "Filling direction" attribute specifies the filling direction for an object enclosed in a frame line.

Bottom to top	The object is filled from bottom to top.
Top to bottom	The object is filled from top to bottom.
Left to right	The object is filled from left to right.
Right to left	The object is filled from right to left.

The attribute can be assigned dynamic properties by means of the name FillingDirection. The data type is LONG.

FillingIndex Property

Description

Defines the %age value (related to the height of the object) to which the object with closed border line is to be filled.
The fill level is represented by the current background color. The unfilled background is transparent.

See also

ScreenItem Object (Page 141)

FillStyle Property

Description

Defines or returns the fill pattern for the object.

LONG (write-read access)

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
< Transparent >	65536				
< Massiv >	0				
	1048576		196611		196627
	1048577		196612		196628
	1048578		196613		196629
	1048579		196614		196630
	1048832		196615		196631
	1048833		196616		196632
	1048834		196617		196633
	1048835		196618		196634
	131072		196619		196635
	131073		196620		196636
	131074		196621		196637
	131075		196622		196638
	131076		196623		196639
	196608		196624		196640

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	196609		196625		196641
	196610		196626		196642

Example

The following example sets the fill pattern for "ScreenWindow1" to transparent:

```
'VBS190
Dim obj
Set obj = ScreenItems("Rectangle1")
obj.FillStyle = 65536
```

See also

FillColor Property (Page 405)

BackColor Property (Page 323)

Screen Object (Page 146)

FillStyle2 Property

Description

Defines or returns the fill style of the bar.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

FillStyleAlignment property

Description

Defines the alignment of the fill pattern for the process picture.

Normal	The fill pattern refers to the process picture. In runtime, no scaling is performed when opening the picture.
Stretched (window)	The fill pattern refers to the window in the Graphics Designer. In runtime, scaling is performed when opening the picture.

FilterSQL property

FilterSQL

Defines an SQL statement for a selection of data in the user archive.

The attribute can be assigned dynamic properties by means of the name **FilterSQL**. The data type is STRING.

FineGrid Property

Description

TRUE, when the value axis is scaled by short tick marks. The distance between two short tick marks can be changed using the "FineGridValue" property. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

FineGridValue Property

Description

Defines the distance between two short tick marks in the scale. Whether the information is evaluated is dependent on the value of the "FineGrid" property.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

FineGridValueX Property

Description

Defines the distance between two short tick marks on the X-axes scaling. Whether the information is evaluated is dependent on the value of the "FineGridX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

FineGridValueY Property

Description

Defines the distance between two short tick marks on the Y-axes scaling. Whether the information is evaluated is dependent on the value of the "FineGridX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

FineGridX Property

Description

TRUE, when the X-axis graduation is scaled by short tick marks. The distance between two short tick marks can be changed using the "FineGridValueX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

FineGridY Property

Description

TRUE, when the Y-axis graduation is scaled by short tick marks. The distance between two short tick marks can be changed using the "FineGridValueY" property.

See also

ScreenItem Object (Page 141)

FlashPicReferenced Property

Description

TRUE, when the assigned flash picture should be saved. Otherwise, only the associated object reference is saved. Read only access.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

FlashPicTransColor Property

Description

Defines which color of the bitmap object (.bmp, .dib) assigned to the flash picture should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "FlashPicUseTransColor" property is "True".

See also

ScreenItem Object (Page 141)

Status display (Page 213)

FlashPicture Property

Description

Returns the flash picture. Read-only access.
The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.
In this context, the "FlashPicReferenced" property defines whether the flash picture should be saved together with the object status display or referenced.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

FlashPicUseTransColor Property

Description

TRUE, when the configured color ("FlashPicTransColor" property) of the bitmap objects assigned to the flash picture should be set to "transparent". BOOLEAN write-read access.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

FlashRate Property

Description

Defines or returns the flashing frequency for the object. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

FlashRateBackColor Property

Description

Defines or returns the flash frequency for the object background. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

See also

ScreenItem Object (Page 141)

FlashRateBorderColor Property

Description

Defines or returns the flash frequency for the lines of the object. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

See also

ScreenItem Object (Page 141)

FlashRateFlashPic Property

Description

Defines or returns the flash frequency for the status display. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

FlashRateForeColor Property

Description

Defines or returns the flash frequency for the object label. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.5 Hz)	0
Medium (approx. 2 Hz)	1
Fast (approx. 8 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Flip property

Flip (Flip)

Specifies flipping of the icon at runtime.

The following settings are available:

Value	Description	Comments
0	None	The icon is not flipped.
1	Horizontal	The object is flipped along the horizontal center axis.
2	Vertical	The object is flipped along the vertical center axis.
3	Both	The object is flipped along the horizontal and vertical center axes.

The attribute can be assigned dynamic properties by means of the name **Flip**. The data type is LONG.

Flip Property

Description

Mirrors the icon on the vertical and/or horizontal middle axis of the icon.

- Zero - 0: The icon is mot mirrored.
- Horizontal - 1: The icon is mirrored on the vertical center axis.
- Vertical - 2: The icon is mirrored on the horizontal, center axis.
- Both - 3: The icon is mirrored both on the horizontal and vertical center axes.

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

FocusWidth Property

Description

If the focus is positioned on the control in Runtime, the labeling and position text are identified by a border. FocusWidth defines the width of the border, value range of 1-10 pixels. LONG write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

Font Property

Name - Font

Sets the font.

The attribute cannot be dynamized.

Font property (before WinCC V7)

Description

Defines or returns the font. Write/Read access.

The font object has the following sub-properties

- Size (Font Size)
- Bold (yes/no)
- Name (font name)
- Italic (yes/no)
- Underline (underline yes/no)
- StrikeThrough (yes/no)

If two font properties are directly assigned, only the default property "Name" is assumed.

Example:

```
'VBS74
Dim objControl1
Dim objControl2
Set objControl1 = ScreenItems("Control1")
Set objControl2 = ScreenItems("Control2")
objControl2.Font = objControl1.Font ' take over only the type of font
```

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

FramePicture Property

Description

Returns the picture name of the background picture for the graduated scale disk. Read only access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

FrameScale Property

Description

Defines or returns the diameter of the graduated scale disk in relation to smallest value of the width and height geometric attributes. Write/Read access.

The value range is (scale distance - scale width) to 1.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

FrameWidth Property

Description

Defines or returns the border width of the button in pixels. Write/Read access.

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

FreezeProviderConnections Property

Description

Enables modification of the data connection properties ("ProviderType", "Source"...), without the change being effective immediately. On changing "SourceTagNameX", for example, impermissible combinations can created with "SourceTagNameY".

Therefore, FreezeProviderConnections" must be set to TRUE before modifying a data connection attribute. After modifying all the data connection, "FreezeProviderConnection" is set to FALSE and the changes take effect.

1.14.4.8 G

GlobalColorScheme property

Description

Defines whether the colors defined for the current design in the global color scheme will be used for this object.

TRUE if the object is displayed with the colors from the global color scheme defined for this object type.

FALSE if the object is displayed with the colors as per the settings in the object.

BOOLEAN write-read access.

GlobalShadow property

Description

Defines whether the object will be displayed with the shadowing defined in the active design.

TRUE if the object is displayed with the global shadow defined for this object type.

FALSE if no shadow is displayed.

BOOLEAN write-read access.

GraphDirection property (before WinCC V7)

Description

Defines which edge of the trend window should display the current values. Write/Read access.

0: Positive values run to the right and upwards.

-1: Positive values run to the left and upwards.

-2: Positive values run to the right and upwards.

-3: Positive values run to the right and downwards.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

GraphDirection Property

Write direction - GraphDirection

Defines the direction of the update of axis values.

Value	Description	Explanation
0	From the right	The updated values are displayed starting at the right side of the trend.
1	From the left	The updated values are displayed starting at the left side of the trend.
2	From the top	The updated values are displayed starting at the top of the trend.
3	From the bottom	The updated values are displayed starting at the bottom of the trend.

True type fonts must be used within the trend window if "From the top" or "From the bottom" is selected for write direction. Only this setting ensures legibility of the labeling of the vertical axis.

The attribute can be assigned dynamic properties by means of the name **GraphDirection**. The data type is LONG.

GridLineColor property

Color of the row divider / content - GridLineColor

Defines the color of row/column dividers in table contents. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **GridLineColor**. The data type is LONG.

GridLineHorz Property

Description

TRUE, when the message window columns are separated by horizontal dividing lines. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

GridLines Property

Description

TRUE, when the trend window is displayed with grid lines parallel to the X-axis. The distance between two grid lines can be changed using the "GridLineValue" property. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

GridlinesValueX Property

Description

Defines or returns the distance between two grid lines on the X-axis. Whether the information is evaluated is dependent on the value of the "GridLinesX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

GridlinesValueY Property

Description

Defines or returns the distance between two grid lines on the Y-axis. Whether the information is evaluated is dependent on the value of the "GridLinesY" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

GridlinesX Property

Description

TRUE, when the trend window is displayed with grid lines parallel to the X-axis. The distance between two grid lines can be changed using the "GridLineValueX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

GridlinesY Property

Description

TRUE, when the trend window is displayed with grid lines parallel to the Y-axis. The distance between two grid lines can be changed using the "GridLineValueX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

GridLineValue Property

Description

Defines the distance between two grid lines. Whether the information is evaluated is dependent on the value of the "GridLines" property.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

GridLineVert Property

Description

TRUE, when the message window columns are separated by vertical dividing lines. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

GridLineWidth property

Width of dividers - GridLineWidth

Defines the line weight of the row/column dividers in pixels.

The attribute can be assigned dynamic properties by means of the name **GridLineWidth**. The data type is LONG.

1.14.4.9 H

Ha - Hi

HandFillColor Property

Description

Defines or returns the fill color of all the hands in the analog clock. In order that the hands are displayed with the fill color defined, the "Handtype" property must be set to "0" (covering). LONG write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

Handtype Property

Description

Defines the representation of the hands:

- 0: The hands are filled in the hand color defined and the edges in the foreground color.
- 1: The hands fill color is transparent and the edges displayed in the foreground color.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

HeaderSort Property

Description

Specifies if sorting of messages by message block column header is possible.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

Height Property

Description

Defines or returns the height of the object in pixels.

LONG (write-read access)

Example:

The following example halves the height of all objects in the "NewPDL1" picture whose names begin with "Circle":

```
'VBS75
```

```
Dim objScreen
Dim objCircle
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'Searching all circles
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
If "Circle" = Left(strName, 6) Then
'
'to halve the height of the circles
Set objCircle = objScreen.ScreenItems(strName)
objCircle.Height = objCircle.Height / 2
End If
Next
```

See also

Width Property (Page 683)

Object types of the ScreenItem object (Page 158)

ScreenItem Object (Page 141)

HiddenInput Property

Description

TRUE, when the input value should not be displayed when being entered. Each character entered is substituted by a *. BOOLEAN write-read access.

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

HideTagNames Property

Description

TRUE if the archive and tag name in the trend should be hidden via the right mouse button, in the status line and in the table to display the coordinates. BOOLEAN write-read access.

HitlistColumnAdd property

HitlistColumnAdd

Transfers the selected message block from the list of available message blocks to the list of selected message blocks.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnAdd** . The data type is STRING.

HitlistColumnCount property

HitlistColumnCount

Specifies the number of message blocks displayed in the hitlist in Runtime.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnCount** . The data type is LONG.

HitlistColumnIndex property

HitlistColumnIndex

References a message block selected for the hitlist. Using this attribute you can assign the values of other attributes to a specific message block of the hitlist.

Values between 0 and "HitlistColumnCount" minus 1 are valid for "HitlistColumnIndex". Attribute "HitlistColumnCount" defines the number of message blocks selected for the hitlist.

The "HitlistColumnIndex" attribute can be assigned dynamic properties by means of attribute **HitlistColumnRepos**. The data type is LONG.

HitlistColumnName property

HitlistColumnName

Displays the name of the message block of the hitlist which is referenced with attribute "HitlistColumnIndex". You cannot edit this name.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnName** . The data type is STRING.

HitlistColumnRemove property

HitlistColumnRemove

Cuts the marked message block from the list of selected message blocks and pastes it to the list of available message blocks.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnRemove**. The data type is STRING.

HitlistColumnRepos

Up/Down - MessageColumnRepos/HitlistColumnRepos

Resorts the message blocks. The "Up" and "Down" commands move the selected message block accordingly in the list. This moves the message block in Runtime Control towards the front or towards the back.

The attribute for the hitlist can be assigned dynamic properties by means of the name **HitlistColumnRepos** .

The attribute for the message list can be assigned dynamic properties by means of the name **MessageColumnRepos**.

The data type is LONG.

HitlistColumnSort property

HitlistColumnSort

Defines the sorting order of the message block referenced in "HitlistColumnIndex" for the hitlist.

The following settings are available:

Value	Description	Explanation
0	none	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnSort** . The data type is LONG.

HitlistColumnSortIndex property

HitlistColumnSortIndex

Defines the sorting order of the message block referenced in "HitlistColumnIndex" in the hitlist. The sorting criterion is removed from "HitlistColumnSort" if you set a "0" value..

The attribute can be assigned dynamic properties by means of the name **HitlistColumnSortIndex**. The data type is LONG.

HitlistColumnVisible

Selected message blocks - MessageColumnVisible/HitlistColumnVisible

Selected message blocks of message list or hitlist that are displayed in Runtime. Defines whether the message block referenced in "MessageColumnIndex" or "HitlistColumnIndex" is displayed.

The attribute for the message list can be assigned dynamic properties by means of the name **MessageColumnVisible**.

The attribute for the hitlist can be assigned dynamic properties by means of the name **HitlistColumnVisible**.

The data type is BOOLEAN.

HitlistDefaultSort property

HitlistDefaultSort

Defines the default sorting order in the table columns of the hitlist.

The following settings are available:

Value	Description	Explanation
0	Ascending	The list is sorted in ascending order based on frequency.
1	Descending	The list is sorted in descending order based on frequency.

The attribute can be assigned dynamic properties by means of the name **HitlistDefaultSort**. The data type is LONG.

HitListMaxSourceItems property

Maximum number of data records - HitListMaxSourceItems

Defines the maximum number of data records for statistics.

The attribute can be assigned dynamic properties by means of the name **HitListMaxSourceItems** . The data type is LONG.

HitListMaxSourceItemsWarn property

Warning when maximum is reached - HitListMaxSourceItemsWarn

Enables the output of a warning notice after the valid number of data records was reached.

Value	Explanation
TRUE	A warning is output after the valid maximum number of data records was reached.
FALSE	A warning is not output after the valid maximum number of data records was reached.

The attribute can be assigned dynamic properties by means of the name **HitListMaxSourceItemsWarn**. The data type is BOOLEAN.

HitListRelTime property

Time range for statistics - HitListRelTime

Sets a time range for the statistics.

Value	Explanation
TRUE	The time range set for statistics is used if this range was not defined in the selection.
FALSE	The time range is not used.

The attribute can be assigned dynamic properties by means of the name **HitListRelTime**. The data type is BOOLEAN.

HitListRelTimeFactor property

Time range - HitListRelTimeFactor

Defines the factor for calculating the time range. Only integer factors are valid.

The attribute can be assigned dynamic properties by means of the name **HitListRelTimeFactor**. The data type is LONG.

HitListRelTimeFactorType property

Time range - HitListRelTimeFactorType

Defines the time unit for calculating the time range.

The following time units are available:

Value	Description
0	Minute
1	Hour

Value	Description
2	Day
3	Week
4	Month

The attribute can be assigned dynamic properties by means of the name **HitListMaxRelTimeFactorType**. The data type is LONG.

Ho - Hy

HorizontalGridLines property

Horizontal - HorizontalGridLines

Defines whether horizontal separating lines will be displayed.

Value	Explanation
TRUE	Enables the display of horizontal dividers.
FALSE	Disables the display of horizontal dividers.

The attribute can be assigned dynamic properties by means of the name **HorizontalGridLines**. The data type is BOOLEAN.

Hotkey Property

Description

Returns the function key related to the mouse operation in respect of a button object.

Read only access.

See also

Button (Page 215)

ScreenItem Object (Page 141)

HourNeedleHeight Property

Description

Defines or returns the length of the hour hand for the analog clock. The specification of the length is entered as a percentage value in relation to half the length of the short side of the rectangular background. Write/Read access.

Example:
The shorter side of the rectangular background is 100 pixels long.

The hour hand length is 50.
This results in a length of the hour hand of (100 pixels / 2) * 0.5 = 25 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

HourNeedleWidth Property

Description

Defines or returns the width of the hour hand for the analog clock. The width is specified as a percentage value related to double the length of the hour hand. Write/Read access.

Example:
The length of the hour hand is 25 pixels.
The hour hand width is 10.
This results in a width of the hour hand of 25 pixels * 2 * 0.1 = 5 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

Hysteresis Property

Description

TRUE, when the display should appear with hysteresis. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

HysteresisRange Property

Description

Defines the hysteresis in % of the displayed value or returns it.
The Hysteresis property must be set to TRUE for the hysteresis to be calculated.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

1.14.4.10 I

IconSpace property

IconSpace

Defines the spacing between the icons and text in the table cells. The value is active if and icon and text are displayed.

The attribute can be assigned dynamic properties by means of the name **IconSpace**. The data type is LONG.

IndependentWindow property

Description

Defines whether the display of the picture window in Runtime depends on the process picture in which the picture window was configured.

TRUE if the size and position of the picture window are independent of the process picture and only defined by the "Window mode" attribute.

FALSE if the size and position of the picture window change with the shift or scaling of the process picture.

Index Property

Description

Check box, radio box

Defines or returns the number (0 to 31) of the field whose text is to be defined.

Combo box, list box

Defines or returns the number (0 to 31) of the line whose text is to be defined.

Polygon, polyline, tube polygon

Defines or returns the number of the corner point whose position coordinates are to be modified or displayed.

WinCC online trend control, WinCC online table control, WinCC function trend control

The "Index" property is evaluated by other properties in order to be able to assign the settings to a specific trend or column pair. The valid values for the index move within the range from 0 to (NumItems - 1). The "NumItems" properties contains the number of the trends/column pairs to be displayed. The index must always be set before you change the properties of a trend / column in runtime.

Status display

Defines the status (0 to 255) or returns it. A basic picture and flash picture can be defined for each status value.

See also

Status display (Page 213)

InnerBevelOffset Property

Description

Defines the distance between the inner and outer bevels.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

InnerBevelStyle Property

Description

Defines the 3D effect for the inner bevel of the object.

- 0: No border.
- 1: The border is displayed depressed.

- 2: The border is displayed raised.
- 3: The border is displayed in one color without a 3D effect. The border color is defined by the "BevelColorDown" property.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

InnerBevelWidth Property

Description

Defines the width of the inner bevel in pixels.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

InputValue property

Description

Defines the value to be entered by the user in the I/O field. The value is not displayed in the I/O field when the property is set.

If you want the value to be displayed in the I/O field after confirmation with the <Return> key, configure a direct connection between the properties "input value" and "output value". The direct connection is only practical when no tag is connected to the output value, but the user can nevertheless query the specified value, for example, through a script.

LONG write-read access.

See also

Example: Calling Methods of an ActiveX Control (Page 820)

InsertData Property

Description

Inserts data for the current trend.

TRUE : "DataIndex" is ignored and the data is appended to that in the data buffer.

FALSE : The data is inserted at the "DataIndex" position in the data buffer.

The trend window is redrawn following each operation involving "Insert Data".

Note

The property is only supported for the controls prior to WinCC V7.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

Instance property

Description

Returns an instance of the alarm object.

See also

Alarms object (list) (Page 126)

ItemBorderBackColor Property

Description

Defines or returns the background color for dividing lines in the selection list of the text list object. LONG write-read access. The background color is only visible with the property setting ItemBorderStyle > 0.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

ItemBorderColor Property

Description

Defines or returns the color for deviding lines in the selection list of the text list object. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

ItemBorderStyle Property

Description

Defines or returns the color for the dividing line style in the selection list of the text list object. Value range from 0 to 4.

0 = solid line

1 = dashed line

2 = dotted line

3 = dash-dotted line

4 = dash-dot-dot line

See also

Text list (Page 211)

ScreenItem Object (Page 141)

ItemBorderWidth Property

Description

Defines or returns the dividing line weight in pixels in the selection list of the text list object.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

ItemProviderCIsid Property

Description

"ItemProviderCIsid" shows, if the trend referenced using Index in Trend Control is connected with an archive tag or an online tag.

Notice: If you assign a value to the "ProviderCIsid" property , you will overwrite the trend-specific property "ItemProviderCIsid".

- {416A09D2-8B5A-11D2-8B81-006097A45D48}: The trend is connected to an archive tag.
- {A3F69593-8AB0-11D2-A440-00A0C9DBB64E}: The trend is connected to an online tag.

If the trends are being supplied with archive and online tags, the property "ProviderCIsid" returns the value "{00000000-0000-0000-0000-000000000000}".

ItemVisible Property

Description

TRUE, when a trend or a column pair reference by the "Index" property is visible. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Function Trend Control (before WinCC V7) (Page 290)

1.14.4.11 L

Lab - Las

Label Property

Description

The "Index" property references a trend. Label is used to define the name of the time axis or value axis in accordance with the value of the "TimeAxis" property.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

LabelColor Property

Description

Defines the color of the scale label.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

LabelX Property

Description

Defines or returns the label on the X-axis for a trend referenced by "Index" according to the value of "TimeAxisX". Write/Read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

LabelY Property

Description

Defines or returns the label on the Y-axis for a trend referenced by "Index" according to the value of "TimeAxisY". Write/Read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

LanguageSwitch Property

Description

Returns the value which defines where the language dependent assigned texts are stored. Read only access.

TRUE, when the texts in the Text Library are managed. Translation to other language occurs in the Text Library.

FALSE, when the texts are managed directly in the object. Translation to other language can be carried out using Text Distributor.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

Language Property

Description

Defines the current Runtime language or reads it.

You specify the Runtime language in VBS by using a country code, e.g., 1031 for German - Default, 1033 for English - USA etc. A summary of all country codes may be found in the Basics of VBScript under the subject header "Regional Scheme ID (LCID) Diagram".

INTEGER (write-read access)

Example:

The following example sets the data language to German:

```
'VBS76
HMIRuntime.Language = 1031
```

See also

HMIRuntime Object (Page 134)

LastError Property

Description

Returns an error code regarding the success of the last operation, e.g. information on a tag write or read process. The "QualityCode" property can provide information on the quality of the returned value. A description of the error can be called in using the "ErrorDescription" property.

LONG (read only)

The following error codes are defined:

Code in hexadecimal notation	Description
0x00000000	OK
0x80040001	Execution error
0x80040002	Tag error
0x80040003	Server not available.
0x80040004	Multi Tag Error (Error in one or several tags)

In order that LastError returns a value, a read must be executed beforehand.

If an error occurs during read or write of several tags using the TagSet object, the error is set to "Multi Tag Error". In order to determine at which tag the error occurred and what type of error it was, the LastError property of each tag must be analyzed.

Example:

The following example displays the error code for "Tag1":

```
'VBS77
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.LastError
```

The following example adds two tags to the TagSet list and outputs the LastError property as Trace.

```
'VBS178
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "LastError: " & group.LastError & vbNewLine
```

The LastError property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "LastError: " & group("Motor1").LastError & vbNewLine
```

See also

TagSet Object (List) (Page 156)

QualityCode Property (Page 533)

ErrorDescription Property (Page 398)

Tag Object (Page 152)

Layer

Layer Property

Description

Returns the layer of the picture in which the object is located. There is a total of 32 layers available, whereby Layer "0" is the bottom layer and Layer "31" the top layer.

The configured objects are initially in the background of a layer.

LONG (read only)

Note

The layer property specifies the layer in which the object is located. The layer "0" is output as "Layer0".

When accessed, the layers are counted up from 1 in VBS. Therefore, the layer "1" must be addressed with "layers(2)".

Example:

The following example displays the name and layer of all the objects in the picture "NewPDL1":

```
'VBS78
Dim objScreen
Dim objScrItem
Dim lngAnswer
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")

Layer00FillColor property

Bar fill color 0 (Layer00FillColor)

The "Layer00FillColor" attribute defines the color with which the bar is filled in relation to "Limit 0".

The "Layer00FillColor" attribute can be made dynamic with the name "Layer00FillColor".

Layer01FillColor property

Layer01FillColor

The "Layer01FillColor" attribute defines the color with which the bar is filled in relation to "Limit 1".

The "Layer01FillColor" attribute can be made dynamic with the name "Layer01FillColor".

Layer02FillColor property

Layer02FillColor

The "Layer02FillColor" attribute defines the color with which the bar is filled in relation to "Limit 2".

The "Layer02FillColor" attribute can be made dynamic with the name "Layer02FillColor".

Layer03FillColor property

Layer03FillColor

The "Layer03FillColor" attribute defines the color with which the bar is filled in relation to "Limit 3".

The "Layer03FillColor" attribute can be made dynamic with the name "Layer03FillColor".

Layer04FillColor property

Layer04FillColor

The "Layer04FillColor" attribute defines the color with which the bar is filled in relation to "Limit 4".

The "Layer04FillColor" attribute can be made dynamic with the name "Layer04FillColor".

Layer05FillColor property

Layer05FillColor

The "Layer05FillColor" attribute defines the color with which the bar is filled in relation to "Limit 5".

The "Layer05FillColor" attribute can be made dynamic with the name "Layer05FillColor".

Layer06FillColor property

Layer06FillColor

The "Layer06FillColor" attribute defines the color with which the bar is filled in relation to "Limit 6".

The "Layer06FillColor" attribute can be made dynamic with the name "Layer06FillColor".

Layer07FillColor property

Layer07FillColor

The "Layer07FillColor" attribute defines the color with which the bar is filled in relation to "Limit 7".

The "Layer07FillColor" attribute can be made dynamic with the name "Layer07FillColor".

Layer08FillColor property

Layer08FillColor

The "Layer08FillColor" attribute defines the color with which the bar is filled in relation to "Limit 8".

The "Layer08FillColor" attribute can be made dynamic with the name "Layer08FillColor".

Layer09FillColor property

Layer09FillColor

The "Layer09FillColor" attribute defines the color with which the bar is filled in relation to "Limit 9".

The "Layer09FillColor" attribute can be made dynamic with the name "Layer09FillColor".

Layer10FillColor property

Layer10FillColor

The "Layer10FillColor" attribute defines the color with which the bar is filled in relation to "Limit 10".

The "Layer10FillColor" attribute can be made dynamic with the name "Layer10FillColor".

Layer00FillStyle property

Layer00FillStyle

The "Layer00FillStyle" attribute defines the style of the bar in relation to "Limit 0". For the fill pattern to become visible, "bar fill color 0" must differ from "bar color 0".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer00FillStyle" attribute can be made dynamic with the name "Layer00FillStyle".

Layer01FillStyle property

Layer01FillStyle

The "Layer01FillStyle" attribute defines the style of the bar in relation to "Limit 1". For the fill pattern to become visible, "bar fill color 1" must differ from "bar color 1".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer01FillStyle" attribute can be made dynamic with the name "Layer01FillStyle".

Layer02FillStyle property

Layer02FillStyle

The "Layer02FillStyle" attribute defines the style of the bar in relation to "Limit 2". For the fill pattern to become visible, "bar fill color 2" must differ from "bar color 2".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer02FillStyle" attribute can be made dynamic with the name "Layer02FillStyle".

Layer03FillStyle property

Layer03FillStyle

The "Layer03FillStyle" attribute defines the style of the bar in relation to "Limit 3". For the fill pattern to become visible, "bar fill color 3" must differ from "bar color 3".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer03FillStyle" attribute can be made dynamic with the name "Layer03FillStyle".

Layer04FillStyle property

Layer04FillStyle

The "Layer04FillStyle" attribute defines the style of the bar in relation to "Limit 4". For the fill pattern to become visible, "bar fill color 4" must differ from "bar color 4".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer04FillStyle" attribute can be made dynamic with the name "Layer04FillStyle".

Layer05FillStyle property

Layer05FillStyle

The "Layer05FillStyle" attribute defines the style of the bar in relation to "Limit 5". For the fill pattern to become visible, "bar fill color 5" must differ from "bar color 5".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer05FillStyle" attribute can be made dynamic with the name "Layer05FillStyle".

Layer06FillStyle property

Layer06FillStyle

The "Layer06FillStyle" attribute defines the style of the bar in relation to "Limit 6". For the fill pattern to become visible, "bar fill color 6" must differ from "bar color 6".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer06FillStyle" attribute can be made dynamic with the name "Layer06FillStyle".

Layer07FillStyle property

Layer07FillStyle

The "Layer07FillStyle" attribute defines the style of the bar in relation to "Limit 7". For the fill pattern to become visible, "bar fill color 7" must differ from "bar color 7".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer07FillStyle" attribute can be made dynamic with the name "Layer07FillStyle".

Layer08FillStyle property

Layer08FillStyle

The "Layer08FillStyle" attribute defines the style of the bar in relation to "Limit 8". For the fill pattern to become visible, "bar fill color 8" must differ from "bar color 8".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer08FillStyle" attribute can be made dynamic with the name "Layer08FillStyle".

Layer09FillStyle property

Layer09FillStyle

The "Layer09FillStyle" attribute defines the style of the bar in relation to "Limit 9". For the fill pattern to become visible, "bar fill color 9" must differ from "bar color 9".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer09FillStyle" attribute can be made dynamic with the name "Layer09FillStyle".

Layer10FillStyle property

Layer10FillStyle

The "Layer10FillStyle" attribute defines the style of the bar in relation to "Limit 10". For the fill pattern to become visible, "bar fill color 10" must differ from "bar color 10".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer10FillStyle" attribute can be made dynamic with the name "Layer10FillStyle".

Layer00Value Property

Description

Determines the value for "Limit 0" or returns it.
Monitoring only takes effect when the Layer00Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer01Value Property

Description

Determines the value for "Limit 1" or returns it.
Monitoring only takes effect when the Layer01Checked property value is set to TRUE.

Layer10Value Property

Description

Determines the value for "Limit 10" or returns it.
Monitoring only takes effect when the Layer10Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

LayerDeclutteringEnable Property

Description

Returns the LayerDecluttering properties of a picture.

LayerDecluttering enables fading in and out of layers depending on the set minimum and maximum zoom.

BOOLEAN Read-only access.

Example:

The example outputs the LayerDecluttering Property NewPDL1 as a trace.

```
'VBS156
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen Object (Page 146)

Layers Property

Description

Returns an object of type "Layers".

Layers (read-only)

See also

Layers Object (Listing) (Page 137)

HMIRuntime Object (Page 134)

Le - Li

Left Property

Description

Defines or returns the X-coordinate of an object (measured from the top left edge of the picture) in pixels. The X-coordinate relates to the top left corner of the rectangle enclosing the object.

LONG (write-read access)

Example:

The following example shifts all objects in the picture "NewPDL1" 5 pixels to the left:

```
'VBS79
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
objScrItem.Left = objScrItem.Left - 5
Next
```

ScreenItem Object (Page 141)

LeftComma Property

Description

Defines or returns the number of digits to the left of the decimal point (0 to 20).

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LightEffect Property

Description

TRUE, when the light effect should be activated. BOOLEAN write-read access.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

LimitHigh4 Property

Description

Determines the upper limit value for "Reserve 4" or returns it.
The CheckLimitHigh4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh4 property.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LimitHigh5 Property

Description

Determines the upper limit value for "Reserve 5" or returns it.
The CheckLimitHigh5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh5 property.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LimitLow4 Property

Description

Determines the lower limit value for "Reserve 4" or returns it.
The CheckLimitLow4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow4 property.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LimitLow5 Property

Description

Determines the lower limit value for "Reserve 5" or returns it.
The CheckLimitLow5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow5 property.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LimitMax Property

Description

Determines the upper limit value as an absolute value depending on the data format or returns it.
If the displayed value exceeds the upper limit value, it is displayed by a sequence of *** (not displayable).

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

LimitMin Property

Description

Determines the lower limit value as an absolute value depending on the data format or returns it. If the displayed value exceeds the upper limit value, it is displayed by a sequence of *** (not displayable).

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

LineColor property

Color of window dividers - LineColor

Specifies the color of the window dividers. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **LineColor**. The data type is LONG.

LineFont Property

Description

TRUE, when the font size should be automatically adapted to the line height. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

LineHeight Property

Description

TRUE, when the line height can be modified. BOOLEAN write-read access.

The "LineHeight" property is only deactivated if both properties "LineHeight" and "LineFont" are set to "FALSE".

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

LineJoinStyle property

Description

Defines the way that corners are displayed in a tube polygon.

Angle	The tubes are joined at corner points without rounding
Round	The tubes are rounded at the outside corner points.

LineTitle Property

Description

TRUE, when the message window a column with consecutive number contains queued messages. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

LineWidth property (before WinCC V7)

Description

Specifies the line width of the trend referenced by "Index". Value range from 0 to 10.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

LineWidth property

Line weight of window dividers - LineWidth

Defines the line weight of the window dividers in pixels.

The attribute can be assigned dynamic properties by means of the name **LineWidth**. The data type is LONG.

ListType Property

Description

Returns the data type displayed in the case of a text list object. Read only access.

Value range from 0 to 2.

0 = decimal

1 = binary

2 = bit

See also

Text list (Page 211)

ScreenItem Object (Page 141)

Lo

LoadDataImmediately property

Load archive data - LoadDataImmediately

Defines whether the tag values for the time range to be displayed are loaded from the archives when the picture is called.

Value	Explanation
TRUE	Loads archived values on picture calls.
FALSE	Loads only current values on picture calls.

The attribute can be assigned dynamic properties by means of the name **LoadDataImmediately**. The data type is BOOLEAN.

LoadDataImmediately property (before WinCC V7)

Description

TRUE, when the tag values for the time range to be displayed are loaded from the archives on opening a picture. BOOLEAN write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

LocaleSpecificSettings Property

Description

TRUE if a font can be assigned and formatted for each Runtime language. BOOLEAN write-read access.

LockBackColor Property

Description

Defines or returns the background color of the button for a locked measuring point. LONG write/read access.
The LockStatus property must be set to TRUE for the background color to be displayed.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

LockStatus Property

Description

TRUE, when a locked measuring point should be displayed. BOOLEAN write-read access.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

LockText Property

Description

Defines the label of a button for a locked measuring point.
The LockStatus property must be set to TRUE for the label to be displayed.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

LockTextColor Property

Description

Defines or returns the color of the button label for a locked measuring point. LONG write/read access.
The LockStatus property must be set to TRUE for the background color to be displayed.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

Logging Property

Description

Returns an object of type "Logging".

Logging (read-only)

See also

HMIRuntime Object (Page 134)

Logging Object (Page 138)

LongStrokesBold Property

Description

TRUE, when the long sections of a scale should be displayed in bold face. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LongStrokesOnly Property

Description

TRUE, when only the long sections of a scale should be displayed . BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LongStrokesSize Property

Description

Defines or returns the length of the axis section in pixels.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LongStrokesTextEach Property

Description

Returns the value which defines which sections of the scale displayed should be labeled (1 = every section, 2 = every second section, etc.). Read only access

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LongTimeArchiveConsistency Property

LongTimeArchiveConsistency

If "LongTimeArchiveConsistency" is set to "No", 1000 messages are displayed in the long-term archive list on the single-user system, server or client for each server, or for each redundant server pair.

If the "LongTimeArchiveConsistency" is set to "yes", the most recent 1000 messages are displayed on the client of all servers or redundant server pair in the long-term archive list.

The attribute can be assigned dynamic properties by means of the name **LongTimeArchiveConsistency** . The data type is BOOLEAN.

LongTimeArchiveConsistency property (before WinCC V7)

Description

If "LongTimeArchiveConsistency" is set to "No", 1000 messages are displayed in the long-term archive list in the single-user system, server or client for each server or for each redundant server pair.

If the "LongTimeArchiveConsistency" is set to "yes", the most recent 1000 messages are displayed on the client of all servers or redundant server pair in the long-term archive list.

Write/Read access.

LowerLimit Property

Description

WinCC Online Trend Control/WinCC Function Trend Control

TRUE, when the "LowerLimitColor" specification is to be used in order to identify the tag values (from a trend referenced via "Index") which lie below the value defined in "LowerLimitValue". BOOLEAN write-read access.

WinCC Online Trend Control

The value of this attribute cannot be changed. Read only access.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

LowerLimitColor Property

Description

WinCC Online Trend Control/WinCC Function Trend Control

Defines the color to be used in order to identify the tag values (from trend referenced via "Index") which lie below the value defined in "LowerLimitValue". Whether the information is evaluated is dependent on the value of the "LowerLimit" property. The color is defined as an RGB value. LONG write-read access.

Online Table Control

The value of this attribute cannot be changed. Read only access.

LowerLimitTagName Property

Description

This defines the lower limit of the trend range, which is automatically taken from the variable properties configured in PCS 7. Write/Read access.

LowerLimitValue Property

Description

WinCC Online Trend Control/WinCC Function Trend Control

Tag values (from a trend referenced via "Index") which lie below the value defined by "LowerLimitValue" are identified by the color specified in "LowerLimitColor". Whether the information is evaluated is dependent on the value of the "LowerLimit" attribute.

Online Table Control

The value of this attribute cannot be changed. Read only access.

MessageBlockAlign property

Alignment - MessageBlockAlign

Aligns the contents of a selected message block in the table.

To change the alignment, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The following settings are available:

Value	Description	Explanation
0	Left	Aligns the contents of a selected message block to the left.
1	Centered	Aligns the contents of a selected message block to the center.
2	Right	Aligns the contents of a selected message block to the right.

The attribute can be assigned dynamic properties by means of the name **MessageBlockAlign**. The data type is LONG.

MessageBlockAutoPrecisions property

Automatic decimal places - MessageBlockAutoPrecisions

Enables automatic setting of the number of decimal places.

Value	Explanation
TRUE	The number of decimal places is set automatically. The value in the "Decimal places" field is disabled.
FALSE	The value in the "Decimal places" field is enabled.

The attribute can be assigned dynamic properties by means of the name **MessageBlockAutoPrecisions**. The data type is BOOLEAN.

MessageBlockCaption property

Label - MessageBlockCaption

Defines the label of the column title in the message window for the selected message block. The label specified is active in all Runtime languages.

To change the label, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockCaption**. The data type is STRING.

MessageBlockCount property

MessageBlockCount

Defines the number of message blocks which are available for the message list and the hitlist.

The attribute can be assigned dynamic properties by means of the name **MessageBlockCount** . The data type is LONG.

MessageBlockDateFormat property

Date format - MessageBlockDateFormat

Defines the date format for displaying messages.

To change the date format, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **MessageBlockDateFormat**. The data type is STRING.

MessageBlockExponentialFormat property

Exponential notation - MessageBlockExponentialFormat

Specifies the exponential notation for visualization of the values of a selected message block.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The attribute can be assigned dynamic properties by means of the name **MessageBlockExponentialFormat**. The data type is BOOLEAN.

MessageBlockFlashMode property

Flash mode - MessageBlockFlashMode

Specifies how the content of the selected message block flashes in Runtime when a message appears. The "Flashing on" option must be selected.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

Value	Description	Explanation
0	Standard	The text color switches between the standard color and the flash color when flashing
1	Switch background color/text color	The color of the background and the text color switch during flashing. You configure the message colors for the type of message in the alarm logging editor.
2	Switch message color/table color	The message colors and the configured table colors switch during flashing. You configure the message colors for the type of message in the alarm logging editor. Set the table colors in the "Layout" tab in the AlarmControl.

The attribute can be assigned dynamic properties by means of the name **MessageBlockFlashMode**. The data type is LONG.

MessageBlockFlashOn property

Flashing on - MessageBlockFlashOn

Enables flashing of the selected message block in Runtime after a message was activated.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

Value	Explanation
TRUE	Flashing message block content.
FALSE	No flashing message block content.

The attribute can be assigned dynamic properties by means of the name **MessageBlockFlashOn**. The data type is BOOLEAN.

MessageBlockHideText property

Content as text - MessageBlockHideText

Enables the textual display of the content of a selected message block.

Value	Explanation
TRUE	The content is not displayed in text format. The option is disabled.
FALSE	The content is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **MessageBlockHideText**. The data type is BOOLEAN.

MessageBlockHideTitleText property

Title as text - MessageBlockHideTitleText

Enables the display of the header of a selected message block in text format.

Value	Explanation
TRUE	The header is not displayed in text format. The option is disabled.
FALSE	The header is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **MessageBlockHideTitleText**. The data type is BOOLEAN.

MessageBlockId property

MessageBlockId

Default assignment of the ID number and message block in WinCC AlarmControl.

The attribute can be assigned dynamic properties by means of the name **MessageBlockID**. The data type is LONG.

MessageBlockInvertUseMessageColor property

MessageBlockInvertUseMessageColor

Specifies for the message block whether or not the message colors are displayed, contrary to the central setting for the AlarmControl . For example, the "UseMessageColor" property is set to "FALSE" for the AlarmControl. You have set the "MessageBlockInvertUseMessageColor" property to "TRUE" for a message block. This causes the message colors to be displayed for this message block in Runtime.

Value	Explanation
TRUE	Contrary to the central setting in "UseMessageColor", the message colors are displayed or not displayed for the message block.
FALSE	Just like the central setting in "UseMessageColor", the message colors are displayed or not displayed for the message block.

The attribute can be assigned dynamic properties by means of the name **MessageBlockInvertUseMessageColor**. The data type is BOOLEAN.

MessageBlockIndex property

MessageBlockIndex

References an existing message block. Using this attribute, you can assign a specific message block values for other attributes.

Values between 0 and "MessageBlockCount" minus 1 are valid for "MessageBlockIndex". Attribute "MessageBlockCount" defines the number of available message blocks.

The attribute can be assigned dynamic properties by means of the name **MessageBlockIndex**. The data type is LONG.

MessageBlockLeadingZeros property

Number of digits - MessageBlockLeadingZeros

Defines the number of leading zeros for the message block content. The maximum number is "11". A "0" value deactivates the "With leading zeros" option.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockLeadingZeros**. The data type is LONG.

MessageBlockLength property

Length in characters - MessageBlockLength

Defines the length of the message block selected based on the number of characters.

To change the length, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockLength**. The data type is LONG.

MessageBlockName property

Object name - MessageBlockName

Displays the object name of the message block selected. You cannot edit this name.

The data type is STRING.

MessageBlockPrecisions property

Decimal places - MessageBlockPrecisions

Specifies the decimal precision of the values of a selected message block. You can only enter the value if the "Automatic" option is disabled.

The attribute can be assigned dynamic properties by means of the name **MessageBlockPrecisions**. The data type is SHORT.

MessageBlockSelected property

Available message blocks - MessageBlockSelected

The available message blocks are blocks that can be used in Runtime for the message list or hitlist.

Select the "Message blocks" tab to activate existing message blocks as required in the Control. Select the "Hitlist" and "Message list" tabs to configure the hitlist and message list based on the available blocks.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockSelected**. The data type is BOOLEAN.

MessageBlockShowDate property

Show date - MessageBlockShowDate

Enables the display of a date in the "Time" message block in addition to the time.

Value	Explanation
TRUE	Date and time are displayed.
FALSE	The time is displayed.

The attribute can be assigned dynamic properties by means of the name **MessageBlockShowDate**. The data type is BOOLEAN.

MessageBlockShowIcon property

Content as icon - MessageBlockShowIcon

Enables the display of the content of a selected message block as icon.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **MessageBlockShowIcon**. The data type is BOOLEAN.

MessageBlockShowTitleIcon property

Title as icon - MessageBlockShowTitleIcon

Enables the display of the title of a selected message block as icon.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **MessageBlockShowTitleIcon**. The data type is BOOLEAN.

MessageBlockTextId property

Text ID - MessageBlockTextId

Specifies the caption of the selected message block using a Text ID which was derived from the text library. The caption is adapted automatically if a user changes the Runtime language.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockTextId**. The data type is LONG.

MessageBlockTimeFormat property

MessageBlockTimeFormat

Defines which time format or duration format is used for displaying the messages.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss	Hours:Minutes:Seconds, e.g. 15:35:44
HH:mm:ss.ms	Hours:Minutes:Seconds.Milliseconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The following time duration formats are available:

Value	Explanation
Automatic	The time duration format is determined automatically.
d H:mm:ss	Day Hours:Minutes:Seconds, e.g. 1 2:03:55.
H:mm:ss.	Hours:Minutes:Seconds, e.g. 26:03:55.
m:ss	Minutes:Seconds, Example: 1563:55.
s	Seconds, e.g. 93835.

The attribute can be made dynamic by means of the name **MessageBlockTimeFormat**. The data type is STRING.

MessageBlockType property

MessageBlockType

Displays the association of the message block.

The following settings are available:

Value	Description	Explanation
0	System block	The message block belongs to the system block category.
1	Text block	The message block belongs to the user text block category.
2	Process value block	The message block belongs to the process value block category.
3	Hitlist block	The message block belongs to the message blocks of the hitlist.

The attribute can be assigned dynamic properties by means of the name **MessageBlockType** . The data type is LONG.

MessageClass Property

Description

Defines the respective message type (Alarm High, Alarm Low, Warning High, Warning Low, ...) for which the "Display Text", "Arrived-", "Arrived Acknowledged -" and "Departed Unacknowledged -" settings have been configured.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

MessageColumnAdd property

MessageColumnAdd

Adds the selected message block from the list of existing message blocks to the list of selected message blocks.

The attribute can be assigned dynamic properties by means of the name **MessageColumnAdd** . The data type is STRING.

MessageColumnCount property

MessageColumnCount

Specifies the number of message blocks to be displayed in the message list in Runtime.

The attribute can be assigned dynamic properties by means of the name **MessageColumnCount** . The data type is LONG.

MessageColumnIndex property

MessageColumnIndex

References a message block selected for the message list. Using this attribute you can assign the values of other attributes to a specific message block of the message list.

Values between 0 and "MessageColumnCount" minus 1 are valid for "MessageColumnIndex". Attribute "MessageColumnCount" defines the number of message blocks selected for the message list.

The "MessageColumnIndex" attribute can be assigned dynamic properties by means of attribute **MessageColumnRepos**. The data type is LONG.

MessageColumnName property

MessageColumnName

Displays the name of the message block of the message list which is referenced with attribute "MessageColumnIndex". You cannot edit this name.

The attribute can be assigned dynamic properties with the name **MessageColumnName**. The data type is STRING.

MessageColumnRemove property

MessageColumnRemove

Cuts the marked message block from the list of selected message blocks and pastes it to the list of available message blocks.

The attribute can be assigned dynamic properties by means of the name **MessageColumnRemove** . The data type is STRING.

MessageColumnRepos property

Up/Down - MessageColumnRepos/HitlistColumnRepos

Resorts the message blocks. The "Up" and "Down" commands move the selected message block accordingly in the list. This moves the message block in Runtime Control towards the front or towards the back.

The attribute for the hitlist can be assigned dynamic properties by means of the name **HitlistColumnRepos** .

The attribute for the message list can be assigned dynamic properties by means of the name **MessageColumnRepos**.

The data type is LONG.

MessageColumnSort property

MessageColumnSort

Defines the sorting order of the message block referenced in "MessageColumnIndex" .

The following settings are available:

Value	Description	Explanation
0	no	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **MessageColumnSort** . The data type is LONG.

MessageColumnSortIndex property

MessageColumnSortIndex

Defines the sorting order of the message block referenced in "MessageColumnIndex". The sorting criterion is removed from "MessageColumnSort" if you set a "0" value.

The attribute can be assigned dynamic properties by means of the name **MessageColumnSortIndex**. The data type is LONG.

MessageColumnVisible property

Selected message blocks - MessageColumnVisible/HitlistColumnVisible

Selected message blocks of message list or hitlist that are displayed in Runtime. Defines whether the message block referenced in "MessageColumnIndex" or "HitlistColumnIndex" is displayed.

The attribute for the message list can be assigned dynamic properties by means of the name **MessageColumnVisible**.

The attribute for the hitlist can be assigned dynamic properties by means of the name **HitlistColumnVisible**.

The data type is BOOLEAN.

MessageListType property

Active list on picture call - MessageListType

Selection field for defining the active list for picture calls.

Value	Description	Explanation
0	Message list	The currently active messages are displayed after a picture was called.
1	Short-term archive list	A short-term archive list displays the logged messages after the picture was called. The display is updated immediately on activation of new messages.
2	Long-term archive list	A long-term archive list displays the logged messages after a picture was called.
3	Lock list	Only the currently locked messages are displayed after a picture was called.
4	Hitlist	The configured statistics data is displayed after a picture was called.
5	List of messages to be hidden	The messages to be hidden are displayed at the call of a picture.

The attribute can be assigned dynamic properties by means of the name **MessageListType**. The data type is LONG.

Mi - Ms

Min Property

Description

Defines or returns the absolute value in the case of the smallest value display. This value is displayed if the scale display is active.

See also

Slider (Page 226)

Bar (Page 189)

3D Bar (Page 184)

ScreenItem Object (Page 141)

MinuteNeedleHeight Property

Description

Defines or returns the length of the minute hand for the analog clock. The specification of the length is entered as a percentage value in relation to half the length of the short side of the rectangular background. Write/Read access.

Example:
The shorter side of the rectangular background is 100 pixels long.
The minute hand length is 80.
This results in a length of the minute hand of (100 pixels / 2) * 0.8 = 40 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

MinuteNeedleWidth Property

Description

Defines or returns the width of the minute hand for the analog clock. The width is specified as a percentage value related to double the length of the minute hand.

Example:
The length of the minute hand is 40 pixels.
The minute hand width is 8.
This results in a width of the minute hand of 40 pixels * 2 * 0.08 = 6 pixels.

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

Moveable Property

Description

TRUE, when the object can be moved in Runtime. Read only access.

See also

Picture Window (Page 194)

Application Window (Page 188)

ScreenItem Object (Page 141)

Moveable Property

Movable

Defines whether the control can be moved in Runtime.

Value	Explanation
TRUE	The control can be moved in Runtime.
FALSE	The control cannot be moved in Runtime.

The attribute can be assigned dynamic properties by means of the name **Moveable**. The data type is BOOLEAN.

MsgCtrlFlags Property

Description

Defines the sorting sequence in Alarm Control. Write/Read access.

- 0: The entries are sorted by the value in the time column and in ascending order, i.e. the oldest messages are displayed at the top of the message window.
- 1: The entries are sorted by the value in the time column in descending order, i.e. the oldest messages are displayed at the bottom of the message window. In the case of this value, the "AutoScroll" property is automatically deactivated, otherwise the current message could be moved out of the display area of the message window.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

MsgFilterSQL property (before WinCC V7)

Description

Defines an SQL Statement to the selected messages displayed in the message window. Write/ Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

MsgFilterSQL property

MsgFilterSQL

Defines one or several SQL statements for the custom selection of messages. Multiple user-defined selections are logically linked by "OR" operation. The SQL statements of "DefaultMsgFilterSQL" and "MsgFilterSQL" are linked logically by "AND" operation if you define a default selection by means of "DefaultMsgFilterSQL".

The attribute can be assigned dynamic properties by means of the name **MsgFilterSQL**. The data type is STRING.

1.14.4.13 N

Name Property

Description of layer and tag object

Returns the object name. STRING (read only)

- In the case of tags, the name of the tag without server and tag prefix
- In the case of layers, the layer name

Tags

The tag "Name" property is used to address the tag via the tag list. The name of a tag can contain a server prefix. In WinCC, tag names are structured according to the following scheme:

<Serverprefix>::<Variablenprefix><Name der Variable>

If the tag name alone is specified, the server prefix and tag prefix are removed from the context of the picture.

If the tag is specified with a server prefix in the tag name, the tags and server prefix of the context are ignored and the server prefix included is used.

WinCC Function Trend Control Description

The "Index" property references a trend. "Name" defines the name of the trend.

Description Project Object

Returns the name of the current Runtime project. STRING (read only)

Example:

The following example returns the name of the current Runtime project as Trace:

```
'VBS160
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
```

Description of DataItem Object

Returns the name of the DataItem object.

See also

ActiveProject Property (Page 305)

WinCC Function Trend Control (before WinCC V7) (Page 290)

Tag Object (Page 152)

Ellipse segment (Page 162)

Layer Object (Page 136)

DataItem Object (Page 129)

NeedleColor Property

Description

Defines or returns the color of the pointer. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

NormalColor Property

Description

Defines the color of the normal area of the scale. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

NumberLines Property

Description

Text list

Defines or return the number of lines the text list object should contain. If the amount of configured text is larger than this value, the selection list receives a vertical scroll bar.

Combobox and list box

Defines or returns for the Combobox and List Box objects the number of entries the object should contain. You can define a maximum of 100,000 lines.

At the same time, the value of the "Number of rows" attribute specifies the upper limit value for the "Index" attribute in the "Font" property group. Changing the value can have the following effects:

- Increasing the number: New lines are added at the bottom. The standard labeling of the new filed can be changed using the "Text" attribute in the "Font" property group.
- Reducing the number: All lines are removed for which the value of the "Index" attribute is higher than the new number.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

NumItems Property

Description

Returns the number of trends or column pairs (visible and invisible) in the window which have been configured. Write/Read access.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

1.14.4.14 O

Ob - On

Object Property

Description

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property.

Example:

Address the properties of an external control supplier as follows:

Control.object.type

If the following form alone is used

Control.type

the properties of the ScreenItem object are used in the case of identical names.

See also

Controls (Page 232)

ScreenItem Object (Page 141)

ObjectName Property

Description

Returns the object name.

- In the case of graphic objects, the object name
- In the case of pictures, the picture name

STRING (read only)

Example:

The following example issues the names of all the objects contained in the picture "NewPDL1":

```
'VBS80
Dim objScreen
Dim lngIndex
Dim lngAnswer
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
lngAnswer = MsgBox("Name of object " & lngIndex & ": " & strName, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

Pictures

Establish the picture name directly from the "ObjectName" property:

```
'VBS81
MsgBox "Screenname: " & HMIRuntime.ActiveScreen.ObjectName
```

See also

Screen Object (Page 146)

ScreenItem Object (Page 141)

ObjectSizeDeclutteringEnable Property

Description

Returns the ObjectSizeDecluttering properties of a picture.

Upon activated ObjectSizeDecluttering, only objects within a set size range are displayed.

You specify the upper and lower limits for the display range in Graphics Designer under "Tools> Settings > Show/Hide".

BOOLEAN Read-only access.

Example:

The example outputs the Decluttering Properties of the picture NewPDL1 as a trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen Object (Page 146)

ObjectSizeDeclutteringMax Property

Description

Using the ObjectSizeDeclutteringMax property, the upper size range of a picture may be read.

Objects which are larger than the stated pixel size are no longer displayed when ObjectSizeDecluttering is activated.

LONG read-only access.

Example:

The example outputs the Decluttering Properties of the picture NewPDL1 as a trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen Object (Page 146)

ObjectSizeDeclutteringMin Property

Description

Using the ObjectSizeDeclutteringMin property, the lower size range of a picture may be read.

Objects which are smaller than the stated pixel size are no longer displayed when ObjectSizeDecluttering is activated.

LONG read-only access.

Example:

The example outputs the Decluttering Properties of the picture NewPDL1 as a trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

Screen Object (Page 146)

OffsetLeft Property

Description

Defines or returns the distance of the picture from the left edge of the picture window.

The picture is displayed as a cutout of the picture window. The picture scroll bars are located at the left and upper edge of the picture. If you wish to display the picture in the picture window by using the horizontal and vertical positioning of the picture scroll bars, use the properties "ScrollPositionX" and "ScrollPositionY" for such positioning.

OneY Property

Description

TRUE if only the Y-axis of the trend is displayed in the foreground instead of all Y-axes of the displayed trends. BOOLEAN write-read access.

Online property (before WinCC V7)

Description

Serves to start or stop updating.

- 0: The updated display is stopped. The values are buffered and updated when the button is clicked again.
- -1: The updated display is resumed.

See also

Online property

Starting refresh - Online

Enables a refresh of displayed values when calling a picture in Runtime.

Value	Description
TRUE	Enables the refresh of values on picture calls.
FALSE	Disables the refresh of values on picture calls.

The attribute can be assigned dynamic properties by means of the name **Online**. The data type is BOOLEAN.

OnTop Property

Description

TRUE, when the object should remain in the foreground in Runtime. Read only access.

OperatorMessageID property

OperatorMessageID

Default assignment of the ID number and trigger event in WinCC OnlineTableControl:

Value	Description	Explanation
5	EditValue	Trigger event "Change archive value"
6	InsertValue	Trigger event "Generate archive value"

The attribute can be assigned dynamic properties by means of the name **OperatorMessageID**. The data type is LONG.

OperatorMessageIndex property

OperatorMessageIndex

References the event of an archive value change for an operator message. Using this attribute you can assign the values of other attributes to a specific operator message.

The following values are available:

Value	Explanation
0	Trigger event "Change archive value"
1	Trigger event "Generate archive value"

The attribute can be assigned dynamic properties by means of the name **OperatorMessageIndex**. The data type is LONG.

OperatorMessageName property

Object name - OperatorMessageName

Displays the name that is referenced with the attribute "OperatorMessageIndex" for message events for operator messages. You cannot edit this name.

The following names are available for message events:

Value	Explanation
Lock	Message event "Lock"
Unlock	Message event "Enable"
Hide	Message event "Hide"
Unhide	Message event "Unhide"
Quit	Message event "Ackn."

The attribute can be assigned dynamic properties by means of the name **OperatorMessageName** . The data type is STRING.

See also

How to configure operator messages

OperatorMessageNumber property

Message number - OperatorMessageNumber

Define a message number for the selected operator message event if you do not want to use the operator message of WinCC.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageNumber**. The data type is LONG.

OperatorMessageSelected property

Operator messages for - OperatorMessageSelected

Activate the message events which trigger operator messages in the list.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSelected**. The data type is BOOLEAN.

OperatorMessageSource1 property

Source - OperatorMessageSource1

Define the message block of an operated message to be added to "Process value block 1" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 1" of the operator message. Select "1" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource1**. The data type is STRING.

OperatorMessageSource2 property

Source - OperatorMessageSource2

Define the message block of an operated message to be added to "Process value block 2" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 2" of the operator message. Select "2" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource2**. The data type is STRING.

OperatorMessageSource3 property

Source - OperatorMessageSource3

Define the message block of an operated message to be added to "Process value block 3" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 3" of the operator message. Select "3" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource3**. The data type is STRING.

OperatorMessageSource4 property

Source - OperatorMessageSource4

Define the message block of an operated message to be added to "Process value block 4" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 4" of the operator message. Select "4" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource4**. The data type is STRING.

OperatorMessageSource5 property

Source - OperatorMessageSource5

Define the message block of an operated message to be added to "Process value block 5" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 5" of the operator message. Select "5" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource5**. The data type is STRING.

OperatorMessageSource6 property

Source - OperatorMessageSource6

Define the message block of an operated message to be added to "Process value block 6" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 6" of the operator message. Select "6" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource6**. The data type is STRING.

OperatorMessageSource7 property

Source - OperatorMessageSource7

Define the message block of an operated message to be added to "Process value block 7" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 7" of the operator message. Select "7" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource7**. The data type is STRING.

OperatorMessageSource8 property

Source - OperatorMessageSource8

Define the message block of an operated message to be added to "Process value block 8" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 8" of the operator message. Select "8" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource8**. The data type is STRING.

OperatorMessageSource9 property

Source - OperatorMessageSource9

Define the message block of an operated message to be added to "Process value block 9" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 9" of the operator message. Select "9" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource9**. The data type is STRING.

OperatorMessageSource10 property

Source - OperatorMessageSource10

Define the message block of an operated message to be added to "Process value block 10" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 10" of the operator message. Select "10" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource10**. The data type is STRING.

OperatorMessageSourceType1 property

Transfer as - OperatorMessageSourceType1

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType1**. The data type is LONG.

OperatorMessageSourceType2 property

Transfer as - OperatorMessageSourceType2

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType2**. The data type is LONG.

OperatorMessageSourceType3 property

Transfer as - OperatorMessageSourceType3

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType3**. The data type is LONG.

OperatorMessageSourceType4 property

Transfer as - OperatorMessageSourceType4

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType4**. The data type is LONG.

OperatorMessageSourceType5 property

Transfer as - OperatorMessageSourceType5

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType5**. The data type is LONG.

OperatorMessageSourceType6 property

Transfer as - OperatorMessageSourceType6

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType6**. The data type is LONG.

OperatorMessageSourceType7 property

Transfer as - OperatorMessageSourceType7

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType7**. The data type is LONG.

OperatorMessageSourceType8 property

Transfer as - OperatorMessageSourceType8

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType8**. The data type is LONG.

OperatorMessageSourceType9 property

Transfer as - OperatorMessageSourceType9

Defines the format for transferring the source.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source as text.
1	Value	Transfer the source as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType9**. The data type is LONG.

OperatorMessageSourceType10 property

Transfer as - OperatorMessageSourceType10

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType10**. The data type is LONG.

OperationReport Property

Description

TRUE, if the reason for an operation should be recorded. BOOLEAN write/read access. When the object is used or operated in Runtime, a dialog opens in which the operator can input the reason for the operation in the form of text. The operation is sent to the message system, and is archived.

1.14.4.15 P

Pa - Pe

PageMode property

Enable paging - PageMode

Enables paging is in the long-term archive list. Allows you to display all messages of the short-term archive in the long-term archive list. Use the "Messages per page" or "PageModeMessageNumber" property to determine the number of messages displayed per page.

The page up/down buttons of the toolbar can be used if paging is enabled.

Value	Explanation
TRUE	Paging is enabled for the long-term archive list.
FALSE	Paging is disabled for the long-term archive list.

The attribute can be assigned dynamic properties by means of the name **PageMode**. The data type is BOOLEAN.

PageModeMessageNumber property

Messages per page - PageModeMessageNumber

Defines the number of messages shown per page when paging the long-term archive list.

The attribute can be assigned dynamic properties by means of the name **PageModeMessageNumber**. The data type is LONG.

Parent Property

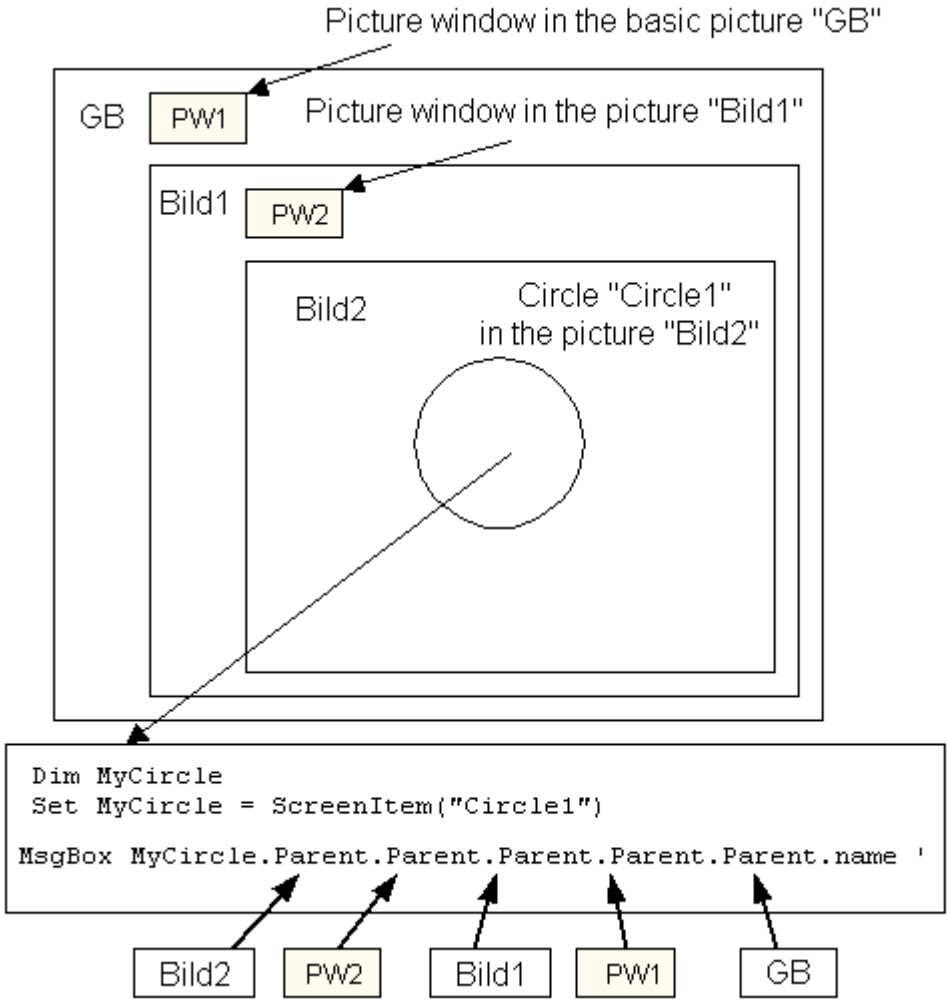
Description

Returns a reference to the superordinate object.

Objects within the VBS object model are accessed by hierarchy. You may descend in the picture hierarchy using Screen and Screenitems. You may ascend in the picture hierarchy by using the Parent property.

Usage

The Parent property can be used as often as required within an object hierarchy. The following section provides a systematic description of how to access all the elements in a hierarchy:



The Command

```
MsgBox MyCircle.Parent.Objectname
```

returns the name of "Picture2" located one layer higher in the object hierarchy than the original ScreenItem object "Circle1".

For example, if you wish to use "Parent" three times, ascend in the object hierarchy by three layers:

```
MsgBox MyCircle.Parent.Parent.Parent.Objectname
```

returns the name of Picture1.

Reasoning:

- Original reference is to ScreenItem "Circle1"
- "Circle1" is within "Picture2" (Layer 1)
- "Picture2" is within Picture Window2 "BF2" (Layer 2)
- "BF2" is within "Picture 1"(Layer 3)

Example

In the following examples, the object name of the parent object is displayed:

```
'VBS120
Dim objCircle
Set objCircle = HMIRuntime.Screens("ScreenWindow1").ScreenItems("Circle1")
MsgBox objCircle.Parent.ObjectName
```

```
'VBS82
Dim objScrItem
Set objScrItem = HMIRuntime.Screens(1).ScreenItems(1)
MsgBox "Name of BaseScreen: " & objScrItem.Parent.ObjectName
```

PasswordLevel Property

Description

Defines the authorization for operation (e.g. no input or no triggering actions) of the object.

See also

ScreenItem Object (Page 141)

Path Property

Description

Returns the path of the current project (without file name). For a WinCC client without its own path, the path is returned in UNC format, otherwise the local path is returned.

STRING (read access only)

Example:

The following example returns the project path as Trace:

```
'VBS161
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

Project Object (Page 140)

PercentageAxis property

PercentageAxis

Enables the additional display of an axis with percentage scaling in a trend window for value axes.

Value	Explanation
TRUE	The display of an axis with percentage scaling is enabled.
FALSE	The display of an axis with percentage scaling is disabled.

The attribute can be assigned dynamic properties by means of the name **PercentageAxis**. The data type is BOOLEAN.

PercentageAxisAlign property

PercentageAxisAlign

Enables axis alignment with percentage scaling in the trend window.

The following settings are available:

Value	Description	Explanation
0	left	The axis with percentage scaling is aligned left.
1	right	The axis with percentage scaling is aligned right.

The attribute can be assigned dynamic properties by means of the name **PercentageAxisAlign**. The data type is LONG.

PercentageAxisColor property

PercentageAxisColor

Specifies the color of an axis with percentage scaling. The button opens the "Color selection" dialog to select the color.

The attribute can be assigned dynamic properties by means of the name **PercentageAxisColor**. The data type is LONG.

PersistentRT Property

Description

TRUE, when modified window settings should be retained following a change of picture. Whether the information is evaluated is dependent on the value of the "AllowPersistance" property.

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

PictureUp Property

Description

Defines the picture to be displayed in the "Off" status or returns the picture name.
The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

See also

Round Button (Page 223)

Button (Page 215)

ScreenItem Object (Page 141)

PicUpReferenced Property

Description

TRUE, when the picture assigned for the "Off" status should be saved in the object. Otherwise, only the associated object reference is saved. Read only access.

See also

Round Button (Page 223)

ScreenItem Object (Page 141)

PicUpTransparent Property

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Off" status should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicUpUseTransColor" property is "True".

See also

Round Button (Page 223)

ScreenItem Object (Page 141)

PicUpUseTransColor Property

Description

TRUE, when the transparent color defined by the "PicUpTransparent" property for "Off" status should be used. BOOLEAN write-read access.

See also

Round Button (Page 223)

ScreenItem Object (Page 141)

PicUseTransColor Property

Description

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

Pl - Pr

PlayEndless property

PlayEndless

Specifies if movies are played endlessly in the control.

The attribute can be assigned dynamic properties by means of the name **PlayEndless**. The data type is BOOLEAN.

PointCount Property

Description

Defines or returns the number of corner points. Each corner point has position coordinates and is identified via an index.

See also

Polyline (Page 173)

Polygon (Page 171)

ScreenItem Object (Page 141)

Position Property

Description

Defines the presetting for the position of the slider.

This value is used as the start value in Runtime.

To operate the process value linked to this attribute, it is necessary that the process value is also linked to the "Position" event. You will find the event "Position" in the "Event" tab, in the topic tree under SliderCtrl\Property Topics\Control Properties\Value.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

Precisions Property

Description

WinCC Online Trend Control

The "Index" property references a pair of columns. "Precision" defines the number of decimal places which should be shown in this value column. A maximum of 16 decimal places can be displayed.

WinCC Online Trend Control

Defines the number of decimal places with which the scale value is specified.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

Description

Defines or returns the number of decimal places with which the scale value for the Y-axis should be specified. Write/Read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

PredefinedAngles Property

Description

Defines or returns the depth of the display of the 3DBarGraph object. Value range from 0 to 3.

0 = cavalier

1 = isometric

2 = axionometric

3 = freely defined

See also

ScreenItem Object (Page 141)

3D Bar (Page 184)

PreferredTarget property

Preferred picture target (PreferredTarget)

The "Preferred picture target" attribute specifies where the picture change is carried out by the Favorites browser.

Yes	The picture change is carried out in this picture screen. In the case of nested picture screens the picture change is carried out at the innermost picture screen with the "Yes" setting.
No	The picture change is carried out in the main screen.

The "Preferred picture target" attribute can be made dynamic with the name "PreferredTarget".

Pressed Property

Description

TRUE, when the Button or RoundButton object is pressed. BOOLEAN write-read access.

See also

Round Button (Page 223)

ScreenItem Object (Page 141)

PrintBackgroundColor Property

Description

TRUE, if the defined background color is also printed while printing the controls. BOOLEAN write-read access.

PrintJob Property

Description

Defines or reads out which print layout should be used for the printed output.

See also

ScreenItem Object (Page 141)

PrintJobName property

Current print job view - PrintJobName

Defines the print job triggered by the print function of the "Print" toolbar button. The recommended print job is set for the control by default.

Open the "Select Print Job" dialog using the selection button.

The attribute can be assigned dynamic properties by means of the name **PrintJobName**. The data type is STRING.

Process Property

Description

Defines or returns presetting for the value to be displayed.
This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

ProviderClsid Property

Description

The "Index" property references a trend. "ProviderClsid" defines whether an archive tag or an internal or external tag should be displayed in this trend.

- {416A09D2-8B5A-11D2-8B81-006097A45D48}: The trend is connected to an archive tag.
- {A3F69593-8AB0-11D2-A440-00A0C9DBB64E}: The trend is connected to an internal or external tag.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

ProviderType Property

Description

Defines the type of values to be displayed in a trend referenced by "Index". In the case of modification of "ProviderType", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "ProviderType", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

0: Values are supplied via the API interface.

-1: Display of online or archive tags

-2: Displaying values from a user archive

1.14.4.16 Q

QualityCode Property

Description

Defines a standard for the quality of a tag value after being read. The quality code is provided as a 16-bit value for automatic evaluation. After a tag has been written, the value is invalid.

SHORT (read only)

Note

A summary of possible Quality Codes is provided in the WinCC Information System under the heading "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

Example:

The following example indicates the quality of the read value when no errors have occurred during the reading process:

```
'VBS83
Dim objTag
Dim lngLastErr
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
lngLastErr = objTag.LastError
```

```
If 0 = lngLastErr Then
MsgBox objTag.QualityCode
End If
```

Rotation property

Rotation (Rotation)

Specifies anticlockwise rotation around the icon center.

The following settings are available:

Value	Comments
0	The icon is not rotated.
90	The icon is rotated by 90 degrees.
180	The icon is rotated by 180 degrees.
270	The icon is rotated by 270 degrees.

The attribute can be assigned dynamic properties by means of the name **Rotation**. The data type is LONG.

RotationAngle Property

Description

Standard objects

Defines or returns the rotation angle in degrees.

In Runtime, the object (starting from the configured starting position) is displayed rotated clockwise around the reference point by the specified value. The changed orientation of the object is only visible in Runtime.

The coordinates of the reference point are defined with the "Rotation Reference X" and "Rotation Reference Y" attributes.

T-piece

Defines or returns the orientation of a T-piece in degrees.

The attribute can assume one of four values. If you enter another value, it is automatically converted to modulus 360 and rounded up or down to the closest permissible value.

The orientation is produced by rotating the T-piece clockwise around the center point by the specified number of degrees.

0 The standard position of the T-piece is the shape of the letter "T"
90 The "leg" of the "T" points towards the left
180 The "leg" of the "T" points upwards
270 The "leg" of the "T" points to the right

RoundCornerHeight Property

Description

Defines or returns the corner radius.
Enter the value as a percentage of half the height of the object.

See also

Rounded rectangle (Page 177)

ScreenItem Object (Page 141)

RoundCornerWidth Property

Description

Defines or returns the corner radius.
Enter the value as a percentage of half the width of the object.

See also

ScreenItem Object (Page 141)

RowCellCount property

RowCellCount

Specifies the number of cells of the Row object of a Table Control. The number of cells corresponds to the number of columns.

RowCellText property

RowCellText

Returns the contents of a cell as a string. The cell is determined from the column number of the Row object. Numbering runs from "1" to "CellCount".

RowCount property

RowCount

Specifies the number of rows of the Row object of a Table Control.

RowNumber property

RowNumber

Specifies the row number of the Row object of a Table Control.

RowScrollbar property

Row scroll bars - RowScrollbar

Enables the display of row scroll bars.

The following settings are available:

Value	Description	Explanation
0	No	No row scroll bars.
1	as required	Row scroll bars are displayed if horizontal space requirements of the control are greater than the actually available display area.
2	always	Row scroll bars are always displayed.

The attribute can be assigned dynamic properties by means of the name **RowScrollbar**. The data type is LONG.

RowTitleAlign property

Row label alignment - RowTitleAlign

Specifies the type of row label alignment.

The following settings are available:

Value	Description	Explanation
0	left	The row headers are aligned left.
1	centered	The row headers are aligned to center.
2	right	The row headers are aligned right.

The attribute can be assigned dynamic properties by means of the name **RowTitleAlign**. The data type is LONG.

RowTitles property

Show row labels - RowTitles

Enables the display of row labels.

Value	Explanation
TRUE	The row labels are displayed.
FALSE	The row labels are not displayed.

The attribute can be assigned dynamic properties by means of the name **RowTitles**. The data type is BOOLEAN.

RTPersistence property

Online configuration at the next picture change - RTPersistence

Enables retention of the online configurations of the control after a picture change.

The following settings are available:

Value	Description	Explanation
0	Discard	The current online configurations are discarded at the next picture change.
1	Retain	The current online configurations are retained at the next picture change.
2	Reset	All online configurations made are lost. The picture is set to the contents found in the configuration system.

The attribute can be assigned dynamic properties by means of the name **RTPersistence**. The data type is LONG.

RTPersistencePasswordLevel property

Operator authorization for online configuration - RTPersistencePasswordLevel

Displays the authorization for online configuration. You can edit the authorization using the selection button. Authorizations are configured in the "User Administrator" editor.

The attribute can be assigned dynamic properties by means of the name **RTPersistencePasswordLevel** . The data type is LONG.

RTPersistenceType property

Online configuration - RTPersistenceType

Defines how to retain online configurations of WinCC.

The following settings are available:

Value	Description	Explanation
0	Do not retain	Online configurations are not retained. These are lost at the next picture change.
1	Retain during runtime	Online configurations are retained during runtime. These are lost on exiting.
2	Retain permanently	Online configurations are retained permanently. These are also available after restart.

The attribute cannot be dynamized.

RulerFont Property

Description

This attribute defines the font of the table of the tag values, which is displayed by the key function "Display value at this position" / "Ruler". Write/Read access.

RulerPrecisions Property

Description

Defines the number of decimal places to which a measured value should be displayed when it is determined using the "Display value at this position" function.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

RulerPrecisionX Property

Description

Defines the number of decimal places used by the "Display value at this position" to display the X-coordinate of a measured value. Whether the information is evaluated is dependent on the value of the "TimeAxisX" attribute.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

RulerPrecisionY Property

Description

Defines the number of decimal places used by the "Display value at this position" to display the Y-coordinate of a measured value.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

RulerType property

Window - RulerType

Specifies window to be displayed during runtime. Depending on the window type, only certain blocks can be used as columns of the WinCC RulerControl.

The following window types can be selected:

Value	Description	Explanation
0	"Ruler" window	The ruler window shows the coordinate values of the trends on a ruler or values of a selected row in the table.
1	"Statistics area" window	The statistics area window shows the values of the low and high limit of trends between two rulers, or displays the selected range in the table.
2	"Statistics" window	The statistics window shows the statistic evaluation of trends between two rulers, or it displays the selected values in the table.

The attribute can be assigned dynamic properties by means of the name **RulerType**. The data type is LONG.

1.14.4.18 S

Sa - Sc

SameSize Property

Description

TRUE, when all four buttons of a Group Display object have the same size. BOOLEAN write-read access.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

SavedTrend Property

Description

Displays the name of the last saved trend that was exported in WinCC Online Trend Control using the Save Report button. Read only access.

ScaleColor Property

Description

Defines or returns the color of the scale. LONG write-read access.
The "Scaling" property must be set to TRUE for the color to be displayed.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ScaleTicks Property

Description

Defines the number of segments into which the bar will be subdivided by large tick marks of the scale:
0-100: Object can be divided into a maximum of 100 segments
= 0: The optimum number of segments is set automatically.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

Scaling Property

Description

TRUE, when a scale should also be used to represent a value. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ScalingType Property

Description of Bar Scaling

Defines or returns the type of bar scaling. Value range from 0 to 6.

0 = linear

1 = logarithmic

2 = negative logarithmic

3 = automatic (linear)

4 = tangent

5 = square

6 = cubic

The "Scaling" property must be set to TRUE for the color to be displayed.

Description of Online Trend Control

Specifies or returns the type of scaling for a trend referenced by "Index". Value range from 0 to 2.

0 = linear

1 = logarithmic

2 = negative logarithmic

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

Bar (Page 189)

ScreenItem Object (Page 141)

ScalingTypeX Property

Description

Defines the type of scaling of the X-axis of a trend referenced with "Index". Whether the information is evaluated is dependent on the value of the "TimeAxisX" attribute.

0: Linear

-1: Logarithmically. This setting prevents the display of negative values.

-2: Logarithmically negated. This setting prevents the display of positive values.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ScalingTypeY Property

Description

Defines the type of scaling of the Y-axis of a trend referenced with "Index".

0: Linear

-1: Logarithmically. This setting prevents the display of negative values.

-2: Logarithmically negated. This setting prevents the display of positive values.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ScreenName Property

Description

Defines the picture to be displayed in the picture window in Runtime or returns the picture name.

Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

Screens Property

Description

Returns an object of type "Screens".

Screens (read only)

Example:

The following example accesses the picture "NewPDL1":

```
'VBS84
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
```

See also

Screens Object (List) (Page 149)

Screen Object (Page 146)

HMIRuntime Object (Page 134)

ScreenItems Property

Description

Returns an object of type "ScreenItems".

ScreenItems (read only)

Example:

The following example issues the number of all the objects contained in the picture "NewPDL1":

```
'VBS85
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
Msgbox objScreen.ScreenItems.Count
```

See also

ScreenItems Object (List) (Page 144)

HMIRuntime Object (Page 134)

ScrollBars Property

Description

TRUE, when the object is equipped with a scroll bar in Runtime. Read only access.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

ScrollPositionX Property

Description

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

See also

ScreenItem Object (Page 141)

OffsetTop Property (Page 501)

OffsetLeft Property (Page 500)

Picture Window (Page 194)

ScrollPositionY Property

Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

See also

OffsetTop Property (Page 501)

OffsetLeft Property (Page 500)

Picture Window (Page 194)

ScreenItem Object (Page 141)

Se

SecondNeedleHeight Property

Description

Defines or returns the length of the second hand for the analog clock. The specification of the length is entered as a percentage value in relation to half the length of the short side of the rectangular background. Write/Read access.

Example:
The shorter side of the rectangular background is 100 pixels long.
The second hand length is 80.
This results in a length of the second hand of (100 pixels / 2) * 0.8 = 40 pixels.

See also

ScreenItem Object (Page 141)

WinCC Digital/Analog Clock (Page 258)

SecondNeedleWidth Property

Description

Defines or returns the width of the second hand for the analog clock. The width is specified as a percentage value related to double the length of the second hand. Write/Read access.

Example:
The length of the second hand is 40 pixels.
The second hand width is 2.
This results in a width of the second hand of 40 pixels * 2 * 0.02 = 2 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

SelBGColor Property

Description

Defines or returns the background color of the selected entry in a text list object. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

SelectArchiveName property

SelectArchiveName

Opens the dialog for selecting the user archive.

Programmers can set this attribute to allow users to select a user archive by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **SelectArchiveName**. The data type is BOOLEAN.

SelectedCellColor property

Background color of selected cell - SelectedCellColor

Specifies the background color of a selected cell. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectedCellColor**. The data type is LONG.

SelectedCellForeColor property

Font color of the selected cell - SelectedCellForeColor

Specifies the font color of the selected cell. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectedCellForeColor**. The data type is LONG.

SelectedRowColor property

Background color of the selected row - SelectedRowColor

Specifies the background color of the selected line. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectedRowColor**. The data type is LONG.

SelectedRowForeColor property

Font color of the selected row - SelectedRowForeColor

Specifies the font color of the selected row. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectedRowForeColor**. The data type is LONG.

SelectedTitleColor property

Background selection color - SelectedTitleColor

Specifies the background color of a selected table header. The button opens the "Color selection" dialog.

The setting is only active in Runtime if the "Selection color" or "UseSelectedTitleColor" option is activated.

The attribute can be assigned dynamic properties by means of the name **SelectedTitleColor**. The data type is LONG.

SelectedTitleForeColor property

Font selection color - SelectedTitleForeColor

Specifies the font color of the table header selected. The button opens the "Color selection" dialog.

The setting is only active in Runtime if the "Selection color" or "UseSelectedTitleColor" option is activated.

The attribute can be assigned dynamic properties by means of the name **SelectedTitleForeColor**. The data type is LONG.

SelectedTrend Property

Description

This property brings a trend to the foreground via its name. Write/Read access.

SelectionColoring property

Selection colors for - SelectionColoring

Enables the use of selection colors for cells or rows.

The following settings are available:

Value	Description	Explanation
0	None	No selection colors for cells and rows.
1	Cell	Selection color for cell.
2	Row	Selection color for row.
3	Cell and row	Selection colors for cell and row.

The attribute can be assigned dynamic properties by means of the name **SelectionColoring**. The data type is LONG.

SelectionMode Property

Description

Defines whether and how a message line can be selected.

- 0 - NoSelection: Prevents the selection of a message. Acknowledgement affects the oldest pending message.
- 1 - Cell: Enables the selection of fields in the message line. Acknowledgement affects the selected message.
- 2 - Line: Enables the selection of a message line. Acknowledgement affects the selected message.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

SelectionRect property

Selection border- SelectionRect

Enables the use of a selection border for selected cells or rows.

The following settings are available:

Value	Description	Explanation
0	None	No selection border is drawn for selected cells or rows.
1	Cell	A selection border is drawn for the selected cell.
2	Row	A selection border is drawn for the selected row.

The attribute can be assigned dynamic properties by means of the name **SelectionRect**. The data type is LONG.

SelectionRectColor property (before WinCC V7)

Description

Specifies the color of the rectangle in the message window if SelectionType equals "1".

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

SelectionRectColor property

Color of the selection border - SelectionRectColor

Specifies the color of the selection border. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectionRectColor**. The data type is LONG.

SelectionRectWidth property (before WinCC V7)

Description

Specifies the line weight of the rectangle in the message window if SelectionType equals "1".

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

SelectionRectWidth property

Line weight of the selection border - SelectionRectWidth

Defines the line weight of the selection border in pixels.

The attribute can be assigned dynamic properties by means of the name **SelectionRectWidth**. The data type is LONG.

SelectionType property (before WinCC V7)

Description

Specifies if the selected message in the message window should be optically emphasized by color change or rectangle.

- 0 - Color Change: selected message is optically emphasized by color change
- 1 - Rectangle: selected message is optically emphasized by a rectangle

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

SelectionType property

Selectable rows - SelectionType

Defines the number of lines you can select. The following settings are available:

Value	Description	Explanation
0	None	No row selection.
1	Single selection	One row can be selected.
2	Multiple selection	Multiple rows can be selected.

The attribute can be assigned dynamic properties by means of the name **SelectionType**. The data type is LONG.

SelIndex property

Description

Defines and returns the index of which the associated text is highlighted in the combobox or list box.

The maximum value is the number of lines (NumberLines) of the object.

SelText property

Description

Shows the text defined with the "Selected field" (SelIndex) attribute which is highlighted in the combobox or list box.

SelTextColor Property

Description

Defines or returns the color of the text of the selected entry in the text list object. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

ServerData Property

Description

The attribute can only be modified using the "Properties of WinCC Online Trend Control" dialog. Read only access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

ServerDataX

ServerDataX

Accesses the configured data connection for the X axis with WinCC FunctionTrendControl.

The attribute can be assigned dynamic properties by means of the name **ServerDataX**. The data type is LONG.

Example: Editing the start ID

You may use the **ServerDataX** attribute to edit the start ID of the X axis.

Prerequisite is that you have an existing trend and trend view, configured X and Y axes, as well as a data connection to the user archive.

In the following example you employ the GetTrend method to set a reference to the object in step one, and then to the trend used in step two. Determine the data connection settings in the third step. Set the start ID to 4 in step 4. The number (3) represents the listing type "user archive" for data transfer. Change the modified data connection settings in step five:

```
Sub OnCklick(ByVal Item)
```

1. Step:
```
Dim fx_ctrl
Set fx_ctrl  ScreenItems.Item("Control1")
```
2. Step:
```
Dim fx_trend
Set fx_trend = fx_ctrl.Getrend("myTrend1")
```
3. Step:
```
Dim vServerDataX, vServerDataY
vServerDataX = fx_trend.ServerDataX
vServerDataY = fx_trend.ServerDataY
```
4. Step:
```
Dim startId
startId = CLng(4)
vServerDataX(3) = startId
vServerDataY(3) = startId
```
5. Step:
```
fx_trend.ServerDataX = ServerDataX
fx_trend.ServerDataY = ServerDataY
```

```
End Sub
```

ServerDataY

ServerDataY

Accesses the configured data connection for the Y axis with WinCC FunctionTrendControl.

The attribute can be assigned dynamic properties by means of the name **ServerDataY**. The data type is LONG.

Example: Editing the start ID

You may use the **ServerDataY** attribute to edit the start ID of the Y axis.

Prerequisite is that you have an existing trend and trend view, configured X and Y axes, as well as a data connection to the user archive.

In the following example you employ the GetTrend method to set a reference to the object and then to the trend used. Determine the data connection settings in the third step. Set the start ID to 4 in step 4. The number (3) represents the listing type "user archive" for data transfer. Change the modified data connection settings in step five:

```
Sub OnCklick(ByVal Item)
```

1. Step:
   ```
   Dim fx_ctrlSet fx_ctrl  ScreenItems.Item("Control1")
   ```
2. Step:
   ```
   Dim fx_trendSet fx_trend = fx_ctrl.Getrend("myTrend1")
   ```
3. Step:
   ```
   Dim vServerDataX, vServerDataYvServerDataX =
   fx_trend.ServerDataXvServerDataY = fx_trend.ServerDataY
   ```
4. Step:
   ```
   Dim startIdstartId = CLng(4)vServerDataX(3) =
   startIdvServerDataY(3) = startId
   ```
5. Step:
   ```
   fx_trend.ServerDataX = ServerDataXfx_trend.ServerDataY =
   ServerDataY
   ```

```
End Sub
```

ServerNames property

Server selection - ServerNames

Defines from which servers within a distributed system the message window obtains the display data.

The attribute can be assigned dynamic properties by means of the name **ServerNames**. The data type is STRING.

ServerNames property (before WinCC V7)

Description

Defines the server in a distributed system to which the data in the message window should relate. Servers are specified as follows: NameServer1;NameServer2;NameServer3. Write/ Read access.

ShareSpaceWithSourceControl property

ShareSpaceWithSourceControl

Defines whether the size of the source control in the picture window is adapted so that the WinCC RulerControl is also displayed in a small picture window.

Value	Explanation
TRUE	The source control in the picture window is adapted.
FALSE	The source control in the picture window is not adapted.

The attribute can be assigned dynamic properties by means of the name **ShareSpaceWithSourceControl**. The data type is BOOLEAN.

ShowBar Property

Description

TRUE, when the bar should be displayed. BOOLEAN write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

ShowDanger Property

Description

Controls the display of the "danger zone" on the instrument scale. BOOLEAN write-read access.

TRUE : The area is identified by the color defined in "DangerColor".

FALSE : The color identification of the area is switched off.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ShowDecimalPoint Property

Description

TRUE, when the labeling of the scale section should be with decimal numbers (decimal point and one decimal place).

FALSE, when the labeling of the scale section should be with whole numbers.

BOOLEAN write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ShowNormal Property

Description

Controls the display of the "normal zone" on the instrument scale. BOOLEAN write-read access.

TRUE : The area is identified by the color defined for normal color.

FALSE : The color identification of the area is switched off.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ShowPeak Property

Description

Defines the display of a slave pointer to display the maximum value. BOOLEAN write-read access.

TRUE : The slave pointer is displayed.

FALSE : The slave pointer is hidden.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ShowPosition Property

Description

TRUE, when the slider position is to be displayed. BOOLEAN write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

ShowRuler property

Show ruler - ShowRuler

Enables the display of a ruler for scanning the coordinate points on picture calls.

Value	Explanation
TRUE	Enables the display of a ruler for scanning the coordinate points.
FALSE	Disables the display of a ruler for scanning the coordinate points.

The attribute can be assigned dynamic properties by means of the name **ShowRuler**. The data type is BOOLEAN.

ShowRulerImmediately Property

Description

TRUE, when the ruler for determining the coordinate values should be displayed when opening a picture. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ShowRulerInAxis property

ShowRulerInAxis

Enables the display of rulers in the time axis.

Value	Explanation
TRUE	Enables the display of rulers in the time axes.
FALSE	Disables the display of rulers in the time axes.

The attribute can be assigned dynamic properties by means of the name **ShowRulerInAxis**. The data type is BOOLEAN.

ShowScrollbars property

Scroll bars - ShowScrollbars

Enables the display of scroll bars.

The following settings are available:

Value	Description	Explanation
0	No	The display of scroll bars is disabled.
1	as required	Scroll bars are displayed if space requirements of the control are greater than the actual display area.
2	always	The scroll bars are always displayed.

The attribute can be assigned dynamic properties by means of the name **ShowScrollbars**. The data type is LONG.

ShowSlider property

ShowSlider

Specifies if a time slider is displayed in the control.

The attribute can be assigned dynamic properties by means of the name **ShowSlider**. The data type is BOOLEAN.

ShowSortButton property

Use sorting button - ShowSortButton

Enables the display of a sorting button above the vertical scroll bar. Click this sorting button to sort the selected column based on the configured sorting criteria. The sorting button is not displayed if the table does not contain a vertical scroll bar.

Value	Explanation
TRUE	Enables sorting of a selected column by means of sorting button.
FALSE	The sorting button is not displayed.

The attribute can be assigned dynamic properties by means of the name **ShowSortButton** . The data type is BOOLEAN.

ShowSortIcon property

Show sorting icon - ShowSortIcon

Enables the display of the sorting icon.

Value	Explanation
TRUE	Enables the display of the sorting icon.
FALSE	Disables the display of the sorting icon.

The attribute can be assigned dynamic properties by means of the name **ShowSortIcon**. The data type is BOOLEAN.

ShowSortIndex property

Show sorting index - ShowSortIndex

Enables the display of a sorting icon.

Value	Explanation
TRUE	Enables the display of a sorting index.
FALSE	Disables the display of a sorting index.

The attribute can be assigned dynamic properties by means of the name **ShowSortIndex**. The data type is BOOLEAN.

ShowSpanNames Property

Description

TRUE, if a section name is also to be displayed in the Value column of Trend Control apart from the measured value and the status display "i" and "u". BOOLEAN write-read access.

ShowStatisticRuler property

ShowStatisticRuler

Enables the display of rulers in the statistics field on picture calls.

Value	Explanation
TRUE	Enables the display of rulers in the statistics field.
FALSE	Disables the display of rulers in the statistics field.

The attribute can be assigned dynamic properties by means of the name **ShowStatisticRuler**. The data type is BOOLEAN.

ShowThumb Property

Description

TRUE, when the slider is to be displayed. BOOLEAN write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

ShowTitle property

Window title - ShowTitle

Defines representation the Control window header.

Value	Designation	Explanation
0	No	No window title.
1	Normal	The window title consists of a WinCC icon and text. The text is entered in the "Text" field.
2	Narrow	The window title consists only of text. The text is entered in the "Text" field.

The attribute can be assigned dynamic properties by means of the name **ShowTitle**. The data type is LONG.

ShowToolbar property

ShowToolbar

Specifies if a toolbar is displayed in the control.

The attribute can be assigned dynamic properties by means of the name **ShowToolbar**. The data type is BOOLEAN.

ShowTrendIcon property

ShowTrendIcon

Enables the display of an icon below the value axes. The icon indicates the trend currently displayed in the foreground.

The attribute can be assigned dynamic properties by means of the name **ShowTrendIcon**. The data type is BOOLEAN.

ShowValuesExponentialX Property

Description

TRUE, when the X-coordinate of a measured value determined via the "Display value at this position" function is displayed in exponential notation by a trend referenced via "Index". Whether the information is evaluated is dependent on the value of the "TimeAxisX" property. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ShowValuesExponentialY Property

Description

TRUE, when the Y-coordinate of a measured value determined via the "Display value at this position" function is displayed in exponential notation by a trend referenced via "Index". BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ShowWarning Property

Description

Controls the display of the "warning zone" on the instrument scale. BOOLEAN write-read access.

TRUE : The area is identified by the color defined by the warning color attribute.

FALSE : The color identification of the area is switched off.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

SignificantMask Property

Description

Is required in Runtime to display the active message class with the highest priority.
The value of the SignificantMask property represents an internal system output value does not require any specific configuration by the user. Updating is initiated in Runtime by clicking on the object.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

Sizeable property

Sizeable

Enables resizing of the control during runtime.

Value	Explanation
TRUE	The control can be resized during runtime.
FALSE	The control cannot be resized during runtime.

The attribute can be assigned dynamic properties by means of the name **Sizeable**. The data type is BOOLEAN.

SkinName property

Style - SkinName

The control style can be defined in this selection field.

The following settings are available:

Value	Designation	Explanation
	Project setting	The style corresponds to the project settings in WinCC Explorer.
0	Simple	"Classic" WinCC style
1	Standard	New WinCC V7 style
	Basic Process Control	The style is reserved for internal use with Basic Process Control.

The attribute can be assigned dynamic properties by means of the name **SkinName**. The data type is STRING.

Sm - Sq

SmallChange Property

Description

Defines how many steps the controller can be moved with one mouse click or returns the value.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

SmartTag property

Description

Returns an object of type "SmartTag".

See also

SmartTags Object (Page 151)

SortOrder Property

Description

Defines the sort sequence of the message blocks in the message window.

SortSequence property

Sorting order by mouse click - SortSequence

Specifies how to change the sorting order by mouse click.

The following sorting orders are available:

Value	Description	Explanation
0	Up/down/none	You can toggle between ascending, descending and no sorting by means of mouse click.
1	Up/down	You can toggle between ascending and descending sorting order by means of mouse click.

The attribute can be assigned dynamic properties by means of the name **SortSequence**. The data type is LONG.

SourceBeginTime Property

Description

In the case of online tags and archive tags ("ProviderType" = -1), it defines the starting time of the time range of a trend referenced via "Index" and to be displayed in the trend window. In the case of modification of "SourceBeginTime", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceBeginTime", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceControl property

Source - SourceControl

Defines the control to be interconnected with WinCC RulerControl.

The attribute can be assigned dynamic properties by means of the name **SourceControl**. The data type is STRING.

SouceControlType property

Type - SourceControlType

Defines the type of control that is interconnected with the WinCC RulerControl in the "Source" field.

Value	Designation	Explanation
0	None	The RulerControl is not connected to any source.
1	OnlineTrend Control	The RulerControl is connected with an OnlineTrendControl.
2	OnlineTable Control	The RulerControl is connected with an OnlineTableControl.
3	FunctionTrend Control	The RulerControl is connected with a FunctionTrendControl.

The attribute can be assigned dynamic properties by means of the name **SourceControlType**. The data type is LONG.

SourceEndTime Property

Description

In the case of online tags and archive tags ("ProviderType" = -1), it defines the stopping time of the time range of a trend referenced via "Index" and to be displayed in the trend window. In the case of modification of "SourceEndTime", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceEndTime", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceNumberOfUAValues Property

Description

For values from the user archives ("ProviderType" = -2) it defines the number of values which should be loaded from the user archive for a trend referenced via "Index". In the case of modification of "SourceNumberOfUAValues", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceNumberOfUAValues", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceNumberOfValues Property

Description

The "Index" property references a trend. In the case of online tags and archive tags ("ProviderType" = -1), "SourceNumberOfValues" defines the number of values which should be displayed in the trend window. Whether the information is evaluated is dependent on the value of the "SourceTimeRange" property.

In the case of modification of "SourceNumberOfValues", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceNumberOfValues", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTagNameX Property

Description

The "Index" property references a trend. In the case of online tags and archive tags ("ProviderType" = -1) "SourceTagNameX" defines the tag which should be displayed along the X-axis. In the case of modification of "SourceTagNameX", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceTagNameX", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTagNameY Property

Description

The "Index" property references a trend. In the case of online tags and archive tags ("ProviderType" = -1) "SourceTagNameY" defines the tag which should be displayed along the X-axis. In the case of modification of "SourceTagNameY", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceTagNameY", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTagProviderDataX Property

Description

The attribute can only be modified using the "Properties of WinCC Function Trend Control" dialog.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTagProviderDataY Property

Description

The attribute can only be modified using the "Properties of WinCC Function Trend Control" dialog.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTimeRange Property

Description

The "Index" property references a trend. In the case of online tags and archive tags ("ProviderType" = -1) "SourceTimeRange" defines how the time range to be displayed in the trend window is defined. In the case of modification of "SourceTimeRange", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceTimeRange", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

0: The time range to be displayed is defined by the starting time (SourceBeginTime) and the number of value pairs (SourceNumberOfValues).

-1: The time range to be displayed is defined by the starting time (SourceBeginTime) and stopping time (SourceEndTime).

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceUAArchive Property

Description

The "Index" property references a trend. In the case of values from the user archives ("ProviderType" = -2), "SourceUAArchive" defines the user archive from which the values should be loaded. In the case of modification of "SourceUAArchive", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceUAArchive" the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceUAArchiveStartID Property

Description

The "Index" property references a trend. In the case of values from the user archives ("ProviderType" = -2), "SourceUAArchiveStartID" defines the data record from which the values should be loaded from the user archive. In the case of modification of "SourceUAArchiveStartID", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceUAArchiveStartID", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

SourceUAColumnX Property

Description

The "Index" property references a trend. In the case of values from the user archives ("ProviderType" = -2), "SourceUAColumnX" defines the column in the user archive from which the values for the X-axis should be loaded. In the case of modification of "SourceUAColumnX", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceUAColumnX", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceUAColumnY Property

Description

The "Index" property references a trend. In the case of values from the user archives ("ProviderType" = -2), "SourceUAColumnY" defines the column in the user archive from which the values for the Y-axis should be loaded. In the case of modification of "SourceUAColumnY", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceUAColumnY", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

StatusbarBackColor property

Background color - StatusbarBackColor

Defines the background color of the status bar. The button opens the "Color selection" dialog to select the color.

For the setting to become active, the "Display" or "StatusbarUseBackColor" option must be activated.

The attribute can be assigned dynamic properties by means of the name **StatusbarBackColor**. The data type is LONG.

StatusbarElementAdd property

New - StatusbarElementAdd

Defines a new, user-defined status bar element. The name set by WinCC can be edited in the "Object name" field.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementAdd** . The data type is STRING.

StatusbarElementAutoSize property

Automatic - StatusbarElementAutoSize

Enables autosizing of the width of a status bar element selected.

Value	Explanation
TRUE	The width of the selected element is set automatically.
FALSE	The width of the selected element is not set automatically.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementAutoSize**. The data type is BOOLEAN.

StatusbarElementCount property

StatusbarElementCount

Defines the number of configurable status bar elements.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementCount**. The data type is LONG.

StatusbarElementIconId property

StatusbarElementIconId

Default assignment of the ID number and icon of a status bar element.

The attribute for custom status bar elements can be made assigned dynamic properties by measn of the name **StatusbarElementIconId**. The data type is LONG.

StatusbarElementID property

Object ID - StatusbarElementID

Unique ID of the status bar element selected. WinCC assigns this read only ID number.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementID**. The data type is LONG.

StatusbarElementIndex property

StatusbarElementIndex

References a status bar element. Using this attribute you can assign the values of other attributes to a specific status bar element.

Values between 0 and "StatusbarElementCount" minus 1 are valid for "StatusbarElementIndex". Attribute "StatusbarElementCount" defines the number of configurable status bar elements.

The "StatusbarElementIndex" attribute can be assigned dynamic properties by means of attribute **StatusbarElementIndex**. The data type is LONG.

StatusbarElementName property

Object name - StatusbarElementName

Displays the object name of the status bar element selected. You can rename the objects of custom status bar elements.

The "StatusbarElementName" attribute can be assigned dynamic properties by means of attribute **StatusbarElementRename**. The data type is STRING.

StatusbarElementRemove property

Remove - StatusbarElementRemove

Removes the selected status bar element. You can only remove user-defined status bar element from the list.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementRemove**. The data type is STRING.

StatusbarElementRename property

StatusbarElementRename

Renames a custom status bar element which is referenced by means of "StatusbarElementIndex" attribute.

The attribute for custom elements can be assigned dynamic properties by means of the name **StatusbarElementRename**. "StatusbarElementRename" also sets a dynamic attribute "StatusbarElementName". The data type is STRING.

StatusbarElementRepos property

Up/Down - StatusbarElementRepos

Changes the sorting order of button functions. "Up" and "Down" moves the selected status bar element up or down in the list. This moves the status bar element of the Control towards the front or towards the back in Runtime.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementRepos** . The data type is LONG.

StatusbarElementText property

StatusbarElementText

Defines the text to be displayed for the status bar element. You can edit the "StatusbarElementText" attribute for custom elements.

The attribute for custom elements can be assigned dynamic properties by means of the name **StatusbarElementText**. The data type is STRING.

StatusbarElementTooltipText property

StatusbarElementTooltipText

Defines the tooltip text for the custom status bar element.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementTooltipText**. The data type is STRING.

StatusbarElementVisible property

Status bar elements - StatusbarElementVisible

Activate the elements in the list of status bar elements for their display in Runtime.

Click a list entry to adapt the properties, or to change its position in the status bar of the Control by means of the "Up" and "Down" buttons.

Value	Explanation
TRUE	The status bar element is displayed.
FALSE	The status bar element is not displayed.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementVisible**. The data type is BOOLEAN.

StatusbarElementUserDefined property

StatusbarElementUserDefined

Indicates whether the project engineer has added the status bar element as a new custom element.

Value	Explanation
TRUE	The status bar element is user-defined.
FALSE	The status bar element is defined by the system.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementUserDefined**. The data type is BOOLEAN.

StatusbarElementWidth property

Width in pixels - StatusbarElementWidth

Shows the width of the status bar element selected in pixels. You can define the width if the "Automatic" option is not activated.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementWidth**. The data type is LONG.

StatusbarFontColor property

Font color - StatusbarFontColor

Defines the color of the text in the status bar.

The attribute can be assigned dynamic properties by means of the name **StatusbarFontColor**. The data type is LONG.

StatusbarPanes Property

Description

Defines the elements to be displayed in the status bar. Write/Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

StatusbarShowTooltips property

Tooltips - StatusbarShowTooltips

Enables the display of tooltips for the status bar elements in Runtime.

Value	Explanation
TRUE	Enables the display of tooltips.
FALSE	Disables the display of tooltips.

The attribute can be assigned dynamic properties by means of the name **StatusbarShowTooltips**. The data type is BOOLEAN.

Attribute "StatusbarElementTooltipText" defines the tooltip text.

StatusbarText property

StatusbarText

Default text in the status bar.

The attribute can be assigned dynamic properties by means of the name **StatusbarText**. The data type is STRING.

StatusbarUseBackColor property

Display background color - StatusbarUseBackColor

Sets a background color for the status bar.

Value	Explanation
TRUE	Enables the display of the background color of the status bar.
FALSE	Disables the display of a background color for the status bar.

The attribute can be assigned dynamic properties by means of the name **StatusbarUseBackColor**. The data type is BOOLEAN.

StatusbarVisible property

Show status bar - StatusbarVisible

Enables the display of the status bar of a control.

Value	Explanation
TRUE	Enables the display of a status bar.
FALSE	Disables the display of a status bar.

The attribute can be assigned dynamic properties by means of the name **StatusbarVisible** . The data type is BOOLEAN.

StepSeconds property

StepSeconds

Specifies the interval for step forward or step backward in movies.

The attribute can be assigned dynamic properties by means of the name **StepSeconds**. The data type is LONG.

Stretch Property

Description

Defines whether the side ratio is retained or adjustable on changing the icon size. BOOLEAN write-read access.

- FALSE : The side ratio is retained on changing the icon size.
- TRUE : The side ratio of the icon can be adjusted parallel to changing the icon size.

HMI Symbol Library (Page 253)

ScreenItem Object (Page 141)

SymbolAppearance property

Foreground mode (SymbolAppearance)

Specifies the appearance of the icon.

The following settings are available:

Value	Description	Comments
0	Original	The appearance of the icon corresponds to the multi-color representation in the selection of the "Icons" tab.
1	Shadow	"Black" lines are maintained as contour lines. Elements of the symbols in other colors are displayed as brightness grades of the current foreground color.
2	Solid	"Black" lines are maintained as contour lines. All icon elements of other colors are assigned the color value of the current foreground color.
3	Outline	Lines of the color "Black" are maintained as contour lines. All the elements of the symbol in other colors are assigned the color value of the current background color.

The attribute can be assigned dynamic properties by means of the name **SymbolAppearance**. The data type is LONG.

1.14.4.19 T

Ta -Tic

TableColor property

Row background color 1 - TableColor

Defines the background color of the rows. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TableColor**. The data type is LONG.

TableColor2 property

Row background color 2 - TableColor2

Specifies the background color of "Row color 2". The button opens the "Color selection" dialog.

The setting is only active in Runtime if the "Row color 2" or "UseTableColor2" option is activated. The background colors of "Row color 2" and "Row color 1" are used alternately in this case.

The attribute can be assigned dynamic properties by means of the name **TableColor2**. The data type is LONG.

TableFocusOnButtonCommand Property

Description

Defines whether the focus is set to the table of the control when a button in a script is clicked.

TableForeColor property

Row font color 1 - TableForeColor

Specifies the font color of the rows. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TableForeColor**. The data type is LONG.

TableForeColor2 property

Row font color 2 - TableForeColor2

Specifies the font color of "Row color 2". The button opens the "Color selection" dialog.

The setting is only active in Runtime if the "Row color 2" or "UseTableColor2" option is activated. The font colors of "Row color 2" and "Row color 1" are used alternately in this case.

The attribute can be assigned dynamic properties by means of the name **TableForeColor2**. The data type is LONG.

TagName Property

Description

The "Index" property references a trend. "TagName" defines the tag linked to this trend. It is specified in the form "Archivname\Variablenname" to display tags in a process value archive or "TasgName" to display an internal or external tag which is not stored in an archive.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TagPrefix Property

Description

Defines or returns the tag prefix which is prefixed to all tags contained in the picture window object. In this way, a picture that is embedded in a picture window retains access to its own tags while another accesses other tags.

Modification of the TagPrefix takes effect when a picture is reloaded. When a picture is changed, this occurs automatically, otherwise the picture name must be reassigned.

The tag prefix can be freely defined, but must match the name of the structure tags.

Note

The TagPrefix property is not available for the controls.

Picture Window (Page 194)

ScreenItem Object (Page 141)

Tags Property

Description

Returns an object of type "Tags".

Tags (read only)

Example:

The following example accesses the tag "Tag1":

```
'VBS86
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
```

See also

Tags Object (List) (Page 155)

HMIRuntime Object (Page 134)

TagProviderClsid Property

Description

The "Index" property references a trend. "TagProviderClsid" defines whether this trend should display an online tag or archived value. The data is only evaluated for online tags and archive tags ("ProviderType" = -1).

{A3F69593-8AB0-11D2-A440-00A0C9DBB64E}: Online tag.

{416A09D2-8B5A-11D2-8B81-006097A45D48}: Values are read from a process value archive or a user archive.

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

Template Property

Description

Returns the template for displaying the window content of the "Application Window" object. Read only access.

The following templates are possible depending on the property value:

Window Contents = Global Script

"GSC diagnostics"
The application window is supplied by applications of the Global Script. The results of the diagnosis system are displayed.

"GSC Runtime"
The application window is supplied by applications of the Global Script. The analysis results regarding characteristics in Runtime are displayed.

Window Contents = Print Jobs

"All Jobs":
The application window is supplied by the logging system. The available reports are displayed as a list.

"All Jobs - Context Menu":
The application window is supplied by the logging system. The available reports are displayed as a list. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

"Job Detail View":
The application window is supplied by the logging system. The available reports are displayed in a selection menu. Detailed information is displayed for the selected report.

"Selected Jobs - Context Menu":
The application window is supplied by the logging system. The available reports are displayed as a list. This list only contains reports which you have activated the option "Mark for print job list" in the "Print Job Properties" dialog. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

TicOffset Property

Description

Defines the diameter of the imaginary circle on which the scale graduation is set. The value is related to the smaller value of the geometric properties Width and Height.

The ends of the main tick marks of the scale graduation point outwards onto this circle.

Value range from 0 to 1.

0: The scale division is in the middle of the graduated scale disk.

1: The diameter of the imaginary circle for the scale tick marks is the smaller value of the geometric properties Width and Height.

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

TicTextColor Property

Description

Defines the color of the labeling of the scale tick marks.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

TicTextOffset Property

Description

Defines the diameter of the imaginary circle on which the labeling of the scale tick marks is set. The value is related to the smaller value of the geometric properties Width and Height.

Value range from 0 to 1.

0: The label is in the middle of the graduated scale disk.

1: The diameter of the imaginary circle for the label is the smaller value of the geometric properties Width and Height. As a result, part of the label can lie outside the object limits and is, thus, invisible.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

TicWidth Property

Description

Defines the length of the long tick marks for the scaling. The value is related to the half the smaller value of the geometric properties Width and Height.

The length of the tick marks for fine scaling is 0.5*scale width.

Value range from 0 to end of scale.

0: No scale graduation is available. The division of the scale into ranges is not visible.

Scaling distance: The scaling division ranges from the middle point of the graduated scale disk to the value defined by the scaling distance.

Ticks Property

Description

TRUE, when the numbered face is displayed. BOOLEAN write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

TicksColor Property

Description

Defines or returns the color of the hour markings on the face of the analog clock. LONG write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

TickStyle Property

Description

This attribute defines the appearance of the scale. Value Range: 0 to 3.

As a result of the automatic scaling, it is possible that, occasionally, two scale tick marks lie directly beside each other (apparently wide tick mark). This effect can be corrected by minimally lengthening or shortening the slider object.

It is also possible to completely suppress display of the scaling ("WithAxes").

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

TimeAxis - TimeBase

TimeAxis Property

Description

Defines whether a common time axis should be used for all trends in the trend window.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TimeAxisActualize property

Refresh - TimeAxisActualize

Enables refreshing of the time axis selected.

Value	Explanation
TRUE	Enables updates of the trend window which is assigned to the time axis.
FALSE	Disables updates of the trend window which is assigned to the time axis. This setting can be useful when comparing a logged trend with a current trend.

The attribute can be assigned dynamic properties by means of the name **TimeAxisActualize**. The data type is BOOLEAN.

TimeAxisAdd property

New - TimeAxisAdd

Creates a new time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisAdd**. The data type is STRING.

TimeAxisAlign property

Alignment - TimeAxisAlign

Specifies the mode of alignment of a selected time axis.

The following settings are available:

Value	Description	Explanation
0	Bottom	The time axis selected is displayed below the trend.
1	Top	The time axis selected is displayed above the trend.

The attribute can be assigned dynamic properties by means of the name **TimeAxisAlign**. The data type is LONG.

TimeAxisBeginTime property

Start time - TimeAxisBeginTime

Defines the start of the time range for a selected time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisBeginTime**. The data type is Date.

Use the "yyyy-mm-dd hh:mm:ss" format when setting a dynamic time range.

TimeAxisColor property

Time axis color - TimeAxisColor

Specifies the color of the time axis. The button opens the "Color selection" dialog to select the color.

The setting is only active if the "Use trend color" option is not activated or if "TimeAxisInTrendColor" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **TimeAxisColor**. The data type is LONG.

TimeAxisCount property

TimeAxisCount

Defines the number of time axes configured.

The attribute can be assigned dynamic properties by means of the name **TimeAxisCount**. The data type is LONG.

TimeAxisDateFormat property

Date format - TimeAxisDateFormat

Defines the date format for visualizing a selected time axis.

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **TimeAxisDateFormat**. The data type is STRING.

TimeAxisEndTime property

End time - TimeAxisEndTime

Defines the end of the time range of a selected time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisEndTime**. The data type is Date.

Use the "yyyy-mm-dd hh:mm:ss" format when setting a dynamic time range.

TimeAxisFormat Property

Description

Defines the format of the information along the time axis.

- 0: The information is provided in hh:mm
- -1: The information is provided in hh:mm:ss
- -2: The information is provided in hh:mm:ss.ms
- -3: The information is provided in hh:mm (full hours)
- -4: The information is provided in hh:mm:ss (full minutes)
- -5: The information is provided in hh:mm:ss.ms (full seconds)

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TimeAxisIndex property

TimeAxisIndex

References a configured time axis. Using this attribute you can assign the values of other attributes to a specific time axis.

Values between 0 and "TimeAxisCount" minus 1 are valid for "TimeAxisIndex". Attribute "TimeAxisCount" defines the number of trends configured.

The "TimeAxisIndex" attribute can be assigned dynamic properties by means of attribute **TimeAxisRepos**. The data type is LONG.

TimeAxisInTrendColor property

Use trend color - TrendAxisInTrendColor

Sets a trend color for displaying the time axis selected. The color of the first trend is activated if several trends are displayed in the trend window. Define the order of trends on the "Trends" tab.

Value	Explanation
TRUE	The trend color is used to display the time axis selected. The setting in the "Color" or "TimeAxisColor" field is disabled.
FALSE	The time axis selected is displayed in the color set in the "Color" or "TimeAxisColor" field.

The attribute can be assigned dynamic properties by means of the name **TimeAxisInTrendColor**. The data type is BOOLEAN.

TimeAxisLabel property

Label - TimeAxisLabel

Defines the label text for a time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisLabel**. The data type is STRING.

TimeAxisMeasurePoints property

Number of measurement points - TimeAxisMeasurePoints

Defines the number of measurement points to be displayed at the time axis selected.

The attribute can be assigned dynamic properties by means of the name **TimeAxisMeasurePoints**. The data type is LONG.

TimeAxisName property

Object name - TimeAxisName

Specifies the name of a selected time axis.

The "TimeAxisName" attribute can be assigned dynamic properties by means of attribute **TimeAxisRename**. The data type is STRING.

TimeAxisRangeType property

Time range setting - TimeAxisRangeType

Specifies the time range for the time axis selected.

Value	Description	Explanation
0	Time range	Defines the start time and the time range for the time axis.
1	Start to end time	Defines the start and end time for the time axis.
2	Number of measurement points	Defines the start time and the number of measurement points for the time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisRangeType**. The data type is LONG.

TimeAxisRemove property

Remove - TimeAxisRemove

Removes the selected time axis from the list.

The attribute can be assigned dynamic properties by means of the name **TimeAxisRemove**. The data type is STRING.

TimeAxisRename property

TimeAxisRename

Renames a time axis which is referenced by means of "TimeAxisIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **TimeAxisRename**. "TimeAxisRename" also sets a dynamic attribute "TimeAxisName". The data type is STRING.

TimeAxisRepos property

Up/Down - TimeAxisRepos

Changes the order of the time axes. "Up" and "Down" move the selected time axis up or down in the list.

The list order determines the time axis position in the trend window. The time axis is moved away from the trend if the listing is the same and the time axis is further up in the list.

The attribute can be assigned dynamic properties by means of the name **TimeAxisRepos**. The data type is LONG.

TimeAxisShowDate property

Show date - TimeAxisShowDate

Enables the display of the date and time at the time axis selected.

Value	Explanation
TRUE	Date and time are displayed. The date format is defined in the "Date format" field.
FALSE	The date is not displayed. Only the time is displayed.

The attribute can be assigned dynamic properties by means of the name **TimeAxisShowDate**. The data type is BOOLEAN.

TimeAxisTimeFormat property

Time format - TimeAxisTimeFormat

Defines the time format for visualizing a selected time axis.

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
hh:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The attribute can be assigned dynamic properties by means of the name **TimeAxisTimeFormat**. The data type is STRING.

TimeAxisTimeRangeBase property

Time range - TimeAxisTimeRangeBase

Defines the time unit for calculating the time range.

The following time units are available:

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

The attribute can be assigned dynamic properties by means of the name **TimeAxisTimeRangeBase**. The data type is LONG.

TimeAxisTimeRangeFactor property

Time range - TimeAxisTimeRangeFactor

Defines the factor for calculating the time range. Only integer factors are valid.

The attribute can be assigned dynamic properties by means of the name **TimeAxisTimeRangeFactor**. The data type is SHORT.

TimeAxisTrendWindow property

Trend window - TimeAxisTrendWindow

Specifies the trend window for displaying the time axis selected. Define the available trend windows in the "Trend window" or "TrendWindowAdd" tab.

The attribute can be assigned dynamic properties by means of the name **TimeAxisTrendWindow**. The data type is STRING.

TImeAxisVisible property

Time axis - TimeAxisVisible

The list shows all time axes you created. Click a time axis entry in the list to adapt the properties and to assign the time axis to a trend window.

Activate the time axes to be displayed in the trend window in the list.

Defines whether the selected time axis is displayed.

Value	Explanation
TRUE	The time axis is displayed.
FALSE	The time axis is not displayed.

The attribute can be assigned dynamic properties by means of the name **TimeAxisVisible**. The data type is BOOLEAN.

TimeAxisX Property

Description

TRUE, when a common axis should be used for all trends in the trend window. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

TimeBase property

Time base - TimeBase

This selection field is used to define the time base for the time stamp in the control.

Value	Designation
0	Local time zone
1	Coordinated Universal Time (UTC)
2	Project setting

The attribute can be assigned dynamic properties by means of the name **TimeBase**. The data type is LONG.

TimeColumn

TimeColumnActualize property

TimeColumnActualize

Enables the update of values in the selected column.

Value	Explanation
TRUE	The time column is updated.
FALSE	The time column is not updated. This setting can be useful when comparing tables.

The attribute can be assigned dynamic properties by means of the name **TimeColumnActualize**. The data type is BOOLEAN.

TimeColumnAdd property

New - TimeColumnAdd

Creates a new time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnAdd**. The data type is STRING.

TimeColumnAlign property

Alignment - TimeColumnAlign

Defines the mode of alignment of the time column selected.

The following settings are available:

Value	Description	Explanation
0	left	The time column selected is displayed on the left.
1	Centered	The time column selected is aligned to center.
2	right	The time column selected is displayed on the right.

The attribute can be assigned dynamic properties by means of the name **TimeColumnAlign**. The data type is LONG.

TimeColumnAlignment Property

Description

The "Index" property references a pair of columns. "TimeColumnAlignment" defines the alignment of the time column for this column pair.

- 0: Time values are entered aligned left.
- 1: Time values are entered centered.
- 2: Time values are entered aligned right.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

TimeColumnBackColor property

Background color - TimeColumnBackColor

Specifies the background color of the time column selected. Use the button to open the "Color selection" dialog.

The setting is useful if:

- The "Use value column colors" option is not activated or "TimeColumnUseValueColumnColors" is "FALSE".
- The "Background color" option is activated or "UseColumnBackColor" is "TRUE in the "Use column color" field of the "General" tab".

The attribute can be assigned dynamic properties by means of the name **TimeColumnBackColor**. The data type is LONG.

TimeColumnBeginTime property

Start time - TimeColumnBeginTime

Defines the start of the time range for a selected time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnBeginTime**. The data type is Date.

Use the "yyyy-mm-dd hh:mm:ss" format when setting a dynamic time range.

TimeColumnCaption property

Caption - TimeColumnCaption

Defines the caption of the time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnCaption**. The data type is STRING.

TimeColumnCount property

TimeColumnCount

Defines the number of time columns configured.

The attribute can be assigned dynamic properties by means of the name **TimeColumnCount**. The data type is LONG.

TimeColumnDateFormat property

Date format - TimeColumnDateFormat

Defines the date format for visualizing a selected time column.

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **TimeColumnDateFormat**. The data type is STRING.

TimeColumnEndTime property

End time - TimeColumnEndTime

Defines the end of the time range of a selected time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnEndTime**. The data type is Date.

Use the "yyyy-mm-dd hh:mm:ss" format when setting a dynamic time range.

TimeColumnForeColor property

Font color - TimeColumnForeColor

Specifies the font color of the time column selected. Use the button to open the "Color selection" dialog.

The setting is useful if:

- The "Use value column colors" option is not activated or "TimeColumnUseValueColumnColors" is "FALSE".
- The "Font color" option is activated or "UseColumnForeColor" is "TRUE" in the "Use column color" field of the "General" tab.

The attribute can be assigned dynamic properties by means of the name **TimeColumnForeColor**. The data type is LONG.

TimeColumnHideText property

TimeColumnHideText

Sets text format for displaying the content of a time column.

Value	Explanation
TRUE	The content is not displayed in text format.
FALSE	The content is displayed in text format.

The attribute can be assigned dynamic properties by means of the name **TimeColumnHideText**. The data type is BOOLEAN.

TimeColumnHideTitleText property

TimeColumnHideTitleText

Sets text format for displaying the time column header.

Value	Explanation
TRUE	The header is not displayed in text format.
FALSE	The header is displayed in text format.

The attribute can be assigned dynamic properties by means of the name **TimeColumnHideTitleText**. The data type is BOOLEAN.

TimeColumnIndex property

TimeColumnIndex

References a configured time column. Using this attribute you can assign the values of other attributes to a specific time column.

Values between 0 and "TimeColumnCount" minus 1 are valid for "TimeColumnIndex". Attribute "TimeColumnCount" defines the number of time columns configured.

The "TimeColumnIndex" attribute can be assigned dynamic properties by means of attribute **TimeColumnRepos**. The data type is LONG.

TimeColumnLength property

Length in characters - TimeColumnLength

Specifies the width of a selected time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnLength**. The data type is LONG.

TimeColumnMeasurePoints property

Number of measurement points - TimeColumnMeasurePoints

Defines the number of measurement points to be displayed in the time column selected.

The attribute can be assigned dynamic properties by means of the name **TimeColumnMeasurePoints**. The data type is LONG.

TimeColumnName property

Object name - TimeColumnName

Specifies the name of a selected time column.

The "TimeColumnName" attribute can be assigned dynamic properties by means of attribute **TimeColumnRename**. The data type is STRING.

TimeColumnRangeType property

Time range setting - TimeColumnRangeType

Defines the time range setting for the time column selected.

Value	Description	Explanation
0	Time range	Defines the start time and time range of the time column.
1	Start to end time	Defines the start and end time for the time column.
2	Number of measurement points	Defines the start time and the number of measurement points for the time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnRangeType**. The data type is LONG.

TimeColumnRemove property

Remove - TimeColumnRemove

Removes the selected time column from the list.

The attribute can be assigned dynamic properties by means of the name **TimeColumnRemove**. The data type is STRING.

TimeColumnRename property

TimeColumnRename

Renames a time column which is referenced by means of "TimeColumnIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **TimeColumnRename**. "TimeColumnRename" also sets a dynamic attribute "TimeColumnName". The data type is STRING.

TimeColumnRepos property

Up/Down - TimeColumnRepos

Repositions the order of time columns and of corresponding value columns. "Up" and "Down" move the time column selected up or down in the list. This moves the time column and corresponding value columns in the table towards the front or towards the back.

The attribute can be assigned dynamic properties by means of the name **TimeColumnRepos**. The data type is LONG.

TimeColumnShowDate property

Show date - TimeColumnShowDate

Enables the display of the date and time in the time column selected.

Value	Explanation
TRUE	Date and time are displayed. The date format is defined in the "Date format" field or by using "TimeColumnDateFormat".
FALSE	The date is not displayed. Only the time is displayed.

The attribute can be assigned dynamic properties by means of the name **TimeColumnShowDate**. The data type is BOOLEAN.

TimeColumnShowIcon property

TimeColumnShowIcon

Enables the display of time column contents as icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **TimeColumnShowIcon**. The data type is BOOLEAN.

TimeColumnShowTitleIcon property

TimeColumnShowTitleIcon

Enables display of the time column header as icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **TimeColumnShowTitleIcon**. The data type is BOOLEAN.

TimeColumnSort property

TimeColumnSort

Defines the sorting order of the time column referenced in "TimeColumnIndex" .

The following settings are available:

Value	Description	Explanation
0	No	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **TimeColumnSort** . The data type is LONG.

TimeColumnSortIndex property

TimeColumnSortIndex

Defines the sorting order of the time column referenced in "TimeColumnIndex". The sorting criterion is removed from "TimeColumnSort" if you set a "0" value..

The attribute can be assigned dynamic properties by means of the name **TimeColumnSortIndex**. The data type is LONG.

TimeColumnTimeFormat property

Time format - TimeColumnTimeFormat

Defines the time format for visualizing a selected time column.

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The attribute can be assigned dynamic properties by means of the name **TimeColumnTimeFormat**. The data type is STRING.

TimeColumnTimeRangeBase property

Time range - TimeColumnTimeRangeBase

Defines the time unit for calculating the time range.

The following time units are available:

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

The attribute can be assigned dynamic properties by means of the name **TimeColumnTimeRangeBase**. The data type is LONG.

TimeColumnTimeRangeFactor property

Time range - TimeColumnTimeRangeFactor

Defines the factor for calculating the time range. Only integer factors are valid.

The attribute can be assigned dynamic properties by means of the name **TimeColumnTimeRangeFactor**. The data type is SHORT.

TimeColumnUseValueColumnColors property

Use value column colors - TimeColumnUseValueColumnColors

Defines whether the selected time column will be displayed in the value column colors.

Value	Explanation
TRUE	The colors of the value column are used to display a selected time column. The settings in the "Font color" and "Background color" fields are disabled.
FALSE	The colors defined in the "Font color" and "Background color" fields are used to display the selected time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnUseValueColumnColors**. The data type is BOOLEAN.

TimeColumnVisible property

Time columns - TimeColumnVisible

The list shows the time columns you created. Click a time column entry in the list to adapt the properties and to define the time range of the time column.

Select the time columns to be displayed in the table from the list.

Defines whether the selected time column is displayed.

The attribute can be assigned dynamic properties by means of the name **TimeColumnVisible**. The data type is BOOLEAN.

TimeFormat - Tolerance

TimeFormat Property

Description

Defines the format of the time specification.

- 0: The information is provided in hh:mm
- -1: The information is provided in hh:mm:ss
- -2: The information is provided in hh:mm:ss.ms
- -3: The information is provided in hh:mm (full hours)
- -4: The information is provided in hh:mm:ss (full minutes)
- -5: The information is provided in hh:mm:ss.ms (full seconds)

TimeJump Property

Description

WinCC Online Trend Control

The "Index" property references a trend. "TimeJump" defines whether the time jumps in the archive should be identified by the color defined in "TimeJumpColor".

WinCC Online Trend Control

The value of this attribute cannot be changed. Read only access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TimeJumpColor Property

Description

WinCC Online Trend Control

The "Index" property references a trend. "TimeJumpColor" defines the color identifying the time jumps in the archive. Whether the information is evaluated is dependent on the value of the "TimeJump" property. The color is defined as an RGB value. LONG write-read access.

WinCC Online Trend Control

The value of this property cannot be changed. Read only access.

ScreenItem Object (Page 141)

TimeRange Property

Description

The "Index" property references a column pair or a trend. "TimeRange" defines how the time range to be displayed should be defined.

- 0: The time range to be displayed is defined by a start time ("BeginTime") and end time ("EndTime").
- -1: The time range to be displayed is defined by a start time ("BeginTime") and a time range ("TimeRangeBase" and "TimeRangeFactor").

ScreenItem Object (Page 141)

TimeRangeBase Property

Description

The "Index" property references a column pair or a trend. The time range to be displayed for this column pair/trend results from multiplying the values "TimeRangeBase" and "TimeRangeFactor", whereby the value "TimeRangeBase" is interpreted in milliseconds.

The "TimeRangeBase" and "TimeRangeFactor" properties are only evaluated when the "TimeRange" property is set, i.e. has the value "-1".

TimeStamp Property

Description

Reads the time stamp of the last read access of a tag. The time stamp is returned in local time. DATE (read only)

The VBS standard function "FormatDateTime(Date[, NamedFormat])" enables the time stamp property to be output in plain text. The output is dependent on the current language setting. The language setting can be set using the VBS standard function SetLocale().

By implementing the second parameter of the FormatDate() function and further VBS standard functions such as Year, WeekDay, Day, Hour, Minute, Second enable the information, required by the user, to be split. Use the WeekdayName function to receive the name of the weekday for WeekDay.

Example:

```
'VBS87
Dim objTag
Dim lngCount
lngCount = 0
Set objTag = HMIRuntime.Tags("Tag11")
objTag.Read
SetLocale("en-gb")
MsgBox FormatDateTime(objTag.TimeStamp)    'Output: e.g. 06/08/2002 9:07:50
MsgBox Year(objTag.TimeStamp)    'Output: e.g. 2002
MsgBox Month(objTag.TimeStamp)    'Output: e.g. 8
MsgBox Weekday(objTag.TimeStamp)    'Output: e.g. 3
MsgBox WeekdayName(Weekday(objTag.TimeStamp))    'Output: e.g. Tuesday
MsgBox Day(objTag.TimeStamp)    'Output: e.g. 6
MsgBox Hour(objTag.TimeStamp)    'Output: e.g. 9
MsgBox Minute(objTag.TimeStamp)    'Output: e.g. 7
MsgBox Second(objTag.TimeStamp)    'Output: e.g. 50
For lngCount = 0 To 4
MsgBox FormatDateTime(objTag.TimeStamp, lngCount)
Next
'lngCount = 0: Output: e.g. 06/08/2002 9:07:50
'lngCount = 1: Output: e.g. 06 August 2002
'lngCount = 2: Output: e.g. 06/08/2002
'lngCount = 3: Output: e.g. 9:07:50
'lngCount = 4: Output: e.g. 9:07
```

Example:

The following example issues the time stamp of the tag "Tag1":

```
'VBS88
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.TimeStamp
```

See also

TimeStepBase property

Precision - TimeStepBase

Defines the precision of the time stamp displayed in a table.

Calculate the precision by multiplying the factor with the time unit. Enter factor "3" and time unit "1s" to display all values which were generated within 3 seconds in the same row, for example.

Value	Description	Explanation
0	Exact	Only values with precisely the same time stamp are displayed in a table row.
100	100 ms	All values generated within 100 milliseconds are grouped in a table row.
250	250 ms	All values generated within 250 milliseconds are grouped in a table row.
500	500 ms	All values generated within 500 milliseconds are grouped in a table row.
1000	1 s	All values generated within 1 second are grouped in a table row.

The attribute can be assigned dynamic properties by means of the name **TimeStepBase**. The data type is LONG.

TimeStepFactor property

Precision - TimeStepFactor

Defines the precision of the time stamp displayed in a table.

Calculate the precision by multiplying the factor with the time unit. Enter factor "3" and time unit "1s" to display all values which were generated within 3 seconds in the same row.

The factor entered is disabled if "Exact" is selected for the time unit or "0" is selected for "TimeStepBase".

The attribute can be assigned dynamic properties by means of the name **TimeStepFactor**. The data type is LONG.

TimeZone Property

Description

Defines the time zone used as a basis for displaying time values. Four settings are possible:

- Local time zone
- Server's time zone
- UTC (Universal Time Coordinated)
- Apply project settings (=> Use WinCC Explorer and access the computer's properties page to define the time mode specifically for the computer. The following are available for selection: WinCC V50 (Compatibility mode => Display as was standard in the individual display sections to V5), local time and UTC.

ScreenItem Object (Page 141)

TitleColor property

Table header background - TitleColor

Specifies the background color of the table headers. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TitleColor**. The data type is LONG.

TitleCut property

Shorten contents - TitleCut

Truncates the content of column headers if the column is insufficient.

Value	Explanation
TRUE	The column headers are truncated.
FALSE	The column headers are not truncated.

The attribute can be assigned dynamic properties by means of the name **TitleCut** . The data type is BOOLEAN.

TitleCut property (before WinCC V7)

Description

Defines whether the content of the fields of a title bar should be shortened if the column width is too small. Write/Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

TitleDarkShadowColor property

Dark shading color - TitleDarkShadowColor

Specifies the color of the dark side of shading. The button opens the "Color selection" dialog.

The setting is only active if the "Shading Color" option or "TitleStyle" is activated.

The attribute can be assigned dynamic properties by means of the name **TitleDarkShadowColor**. The data type is LONG.

TitleForeColor property

Table header font color - TitleForeColor

Specifies the color of the table header. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TitleForeColor**. The data type is LONG.

TitleGridLineColor property

Color of the divider / header - TitleGridLineColor

Defines the color of row/column dividers in the table header. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TitleGridLineColor**. The data type is LONG.

TitleLightShadowColor property

Bright shading color - TitleLightShadowColor

Specifies the color of the bright side of shading. The button opens the "Color selection" dialog.

The setting is only active if the "Shading Color" option or "TitleStyle" is activated.

The attribute can be assigned dynamic properties by means of the name **TitleLightShadowColor**. The data type is LONG.

Titleline Property

Description

TRUE, when the control has a title bar and it can be moved in Runtime. BOOLEAN write-read access.

ScreenItem Object (Page 141)

TitleSort property

Sort by column title- TitleSort

Defines how to trigger sorting by column title. You can only sort by column title if the "Auto-scrolling" option is deactivated.

Value	Description	Explanation
0	No	Sorting by column title is not possible.
1	With click	Sorting is triggered by clicking in the column header.
2	With double-click	Sorting is triggered by double-clicking in the column title.

The attribute can be assigned dynamic properties by means of the name **TitleSort**. The data type is LONG.

TitleStyle property

Shading color - TitleStyle

Specifies whether to set a shading color for the table header.

Value	Description	Explanation
0	Flat	Disables the use of shading colors. Flat header style.
1	Button	Enables the use of shading colors. 3D representation of the header.

The attribute can be assigned dynamic properties by means of the name **TitleStyle**. The data type is LONG.

Toggle Property

Description

TRUE, when the button or round button should lock after being operated in Runtime.
BOOLEAN write-read access.

See also

ToolbarAlignment Property

Alignment - ToolbarAlignment

Defines the orientation of the Control toolbar.

The following settings are available:

Value	Description	Explanation
0	Top	The toolbar is aligned to the top edge.
1	Bottom	The toolbar is aligned to the bottom edge.
2	Left	The toolbar is aligned to the left edge.
3	Right	The toolbar is aligned to the right edge.

The attribute can be assigned dynamic properties by means of the name **ToolbarAlignment**. The data type is LONG.

ToolbarBackColor property

Background color - ToolbarBackColor

Specifies the background color of the toolbar. Open the "Color selection" dialog by clicking the button.

The background color you configured is only displayed if the "Display" option is activated or "ToolbarUseBackColor" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **ToolbarBackColor**. The data type is LONG.

ToolbarButtonActive property

Active - ToolbarButtonActive

Activates a button function in Runtime. Clicking the button in Runtime triggers the corresponding function.

Value	Explanation
TRUE	The button function is enabled.
FALSE	The button function is disabled. You can assign custom functions to the button by means of scripting.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonActive**. The data type is BOOLEAN.

ToolbarButtonAdd property

New - ToolbarButtonAdd

Creates a new, user-defined button function. The name set by WinCC can be edited in the "Object name" field.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonAdd** . The data type is STRING.

ToolbarButtonBeginGroup property

Separator - ToolbarButtonBeginGroup

Inserts a leading separator (vertical line) for the selected button function on the toolbar. These separators can be used to group the icons of the button functions.

Value	Explanation
TRUE	A separator prefix is inserted for the button function selected.
FALSE	A separator prefix is not inserted for the button function selected.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonBeginGroup**. The data type is BOOLEAN.

ToolbarButtonClick AlarmControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	21	"Next message"
2	"Configuration dialog"	22	"Last message"
3	"Message list".	23	"Info text dialog"
4	"Short-term archive list".	24	"Comments dialog"
5	"Long-term archive list"	25	"Loop In Alarm"
6	"Lock List".	26	"Lock message"
7	"Hit List"	27	"Enable message"
8	"List of messages to be hidden"	28	"Hide messages"
9	"Ackn. Central Signaling Devices"	29	'Unhide messages"
10	"Single acknowledgment"	30	"Sort dialog"
11	"Group acknowledgement"	31	"Time base dialog"
18	"Emergency acknowledgement"	32	"Copy rows"
13	"Selection dialog"	33	"Connect backup"

14	"Display options dialog"	34	"Disconnect backup"
15	"Lock dialog"	36	"First page"
17	"Print"	37	"Previous page"
35	"Export data"	38	"Next page"
12	"Autoscroll"	39	"Last page"
19	"First message"	1001	"User-defined 1"
20	"Previous message"		

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick FunctionTrendControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	13	"Select time range"
2	"Configuration dialog"	14	"Previous trend"
4	"Zoom area"	15	"Next trend"
5	"Zoom +/-"	16	"Stop"
6	"Zoom X axis +/-"	16	"Start"
7	"Zoom Y axis +/-"	17	"Print"
8	"Shift trend range"	20	"Export data"
9	"Shift axes range"	3	"Ruler"
10	"Original view"	18	"Connect backup"
11	"Select data connection"	19	"Disconnect backup"
12	"Select trends"	1001	"User-defined 1"

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick OnlineTableControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	13	"Next column"
2	"Configuration dialog"	14	"Stop"
3	"First data record"	14	"Start"
4	"Previous data record"	15	"Print"

5	"Next data record"	20	"Export data"
6	"Last data record"	16	"Define statistics area"
7	"Edit"	17	"Calculate statistics"
8	"Copy rows"	18	"Connect backup"
9	"Select data connection"	19	"Disconnect backup"
10	"Select columns"	21	"Create archive value"
11	"Select time range"	1001	"User-defined 1"
12	"Previous column"		

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick OnlineTrendControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	17	"Select time range"
2	"Configuration dialog"	18	"Previous trend"
3	"First data record"	19	"Next trend"
4	"Previous data record"	20	"Stop"
5	"Next data record"	20	"Start"
6	"Last data record"	21	"Print"
8	"Zoom area"	26	"Export data"
9	"Zoom +/-"	7	"Ruler"
10	"Zoom time axis +/-"	22	"Define statistics area"
11	"Zoom value axis +/-"	23	"Calculate statistics"
12	"Shift trend range"	24	"Connect backup"
13	"Shift axes range"	25	"Disconnect backup"
14	"Original view"	27	"Relative axis"
15	"Select data connection"	1001	"User-defined 1"
16	"Select trends"		

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick RulerControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function
1	"Help"
2	"Configuration dialog"
3	"Ruler window"
4	"Statistics range"
5	"Statistics"
6	"Print"
7	"Export data"
1001	"User-defined 1"

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick UserArchiveControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	12	"Read tags"
2	"Configuration dialog"	13	"Write tags"
3	"Select data connection"	14	"Import archive"
4	"First row"	15	"Export archive"
5	"Previous row"	16	"Sort dialog"
6	"Next row"	17	"Selection dialog"
7	"Last row"	18	"Print"
8	"Delete rows"	20	"Export data"
9	"Cut rows"	19	"Time base dialog"
10	"Copy rows"	1001	"User-defined 1"
11	"Insert rows"		

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonCount property

ToolbarButtonCount

Defines the number of configurable button functions.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonCount**. The data type is LONG.

ToolbarButtonEnabled property

ToolbarButtonEnabled

Enables operation of custom toolbar buttons.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonEnabled**. The data type is BOOLEAN.

ToolbarButtonHotKey property

Hotkey - ToolbarButtonHotKey

Shows the hotkey for a button function selected.

You create or edit a hotkey by clicking in the "Hotkey" field and pressing the button or key shortcut required.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonHotKey**. The data type is LONG.

ToolbarButtonID property

Object ID - ToolbarButtonID

Unique ID number for the selected button function. WinCC assigns this read only ID number.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonID**. The data type is LONG.

ToolbarButtonIndex property

ToolbarButtonIndex

References a button function. Using this attribute you can assign the values of other attributes to a specific button function.

Values between 0 and "ToolbarButtonIndex" minus 1 are valid for "ToolbarButtonCount". Attribute "ToolbarButtonCount" defines the number of configurable button functions.

The "ToolbarButtonIndex" attribute can be assigned dynamic properties by means of attribute **ToolbarButtonRepos**. The data type is LONG.

ToolbarButtonLocked property

ToolbarButtonLocked

Enables/disables the display of the pressed state of a user-defined toolbar button.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonLocked**. The data type is BOOLEAN.

ToolbarButtonName property

Object name - ToolbarButtonName

Shows the name for the selected button function. You rename user-defined button functions.

The "ToolbarButtonName" attribute can be assigned dynamic properties by means of attribute **ToolbarButtonRename**. The data type is STRING.

ToolbarButtonPasswordLevel property

Operator authorization - ToolbarButtonPasswordLevel

Shows the authorization for a button function selected. You can edit the authorization using the selection button.

Authorizations are configured in the "User Administrator" editor.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonPasswordLevel**. The data type is LONG.

ToolbarButtonRemove property

Remove - ToolbarButtonRemove

Removes the selected button function from the list. Only user-defined button functions can be removed.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonRemove**. The data type is STRING.

ToolbarButtonRename property

ToolbarButtonRename

Renames a custom toolbar element which is referenced by means of "ToolbarButtonIndex" attribute.

The attribute for custom elements can be assigned dynamic properties by means of the name **ToolbarButtonRename**. "ToolbarButtonRename" also sets a dynamic attribute "ToolbarButtonName". The data type is STRING.

ToolbarButtonRepos property

Up/Down - ToolbarButtonRepos

Changes the sorting order of button functions. "Up" and "Down" move the button function selected up or down in the list. This moves the button function in the toolbar of a Control towards the front or towards the back.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonRepos**. The data type is LONG.

ToolbarButtonTooltipText property

ToolbarButtonTooltipText

Specifies the tooltip text for the button.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonTooltipText**. The data type is STRING.

ToolbarButtonUserDefined property

ToolbarButtonUserDefined

Indicates whether the project engineer has added a new user-defined toolbar button.

Value	Explanation
TRUE	The toolbar button is assigned a user-defined function.
FALSE	The toolbar button is defined by the system.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonUserDefined**. The data type is BOOLEAN.

ToolbarButtonVisible property

Button functions - ToolbarButtonVisible

Select the button functions to be displayed in the toolbar from the list.

Click a list entry to adapt the properties, or to change the position in the status bar of the Control by means of the "Up" and "Down" buttons.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonVisible** . The data type is BOOLEAN.

ToolbarButtons Property

Description

Defines or returns the buttons contained in the toolbar by setting or resetting the corresponding bits. Each button is assigned a bit. There are no limitations as to the bit combinations.

Bit - Value (hex) ; Value (dec) ; Button:

- 0 - 0x00000001; 1; Message List
- 1 - 0x00000002; 2; Short-term archive list
- 2 - 0x00000004; 4; Long-term archive list
- 3 - 0x00000008; 8; Acknowledgment of central signaling device
- 4 - 0x00000010; 16; Single Acknowledgment
- 5 - 0x00000020; 32; Group acknowledgment
- 6 - 0x00000040; 64; Autoscroll
- 7 - 0x00000080; 128; Selection Dialog
- 8 - 0x00000100; 256; Lock Dialog
- 9 - 0x00000200; 512; Print message log
- 11 - 0x00000800; 2048; Emergency acknowledgment
- 12 - 0x00001000; 4096; First message
- 13 - 0x00002000; 8192; Last message
- 14 - 0x00004000; 16384; Next message
- 15- 0x00008000; 32768; Previous message
- 16 - 0x00010000; 65536; Infotext Dialog
- 17 -0x00020000; 131072; Comment Dialog
- 18 - 0x00040000; 262144; Loop in Alarm
- 20 - 0x00100000; 1048576; Print current view
- 21 - 0x00200000; 2097152; Lock list
- 22 - 0x00400000; 4194304; Lock/release message

- 23 - 0x00800000; 8388608; Sorting Dialog
- 24 - 0x01000000; 16777216; Time basis dialog
- 25 - 0x02000000; 33554432; Hit list

In order to display more buttons, their values must be logically linked with OR. Write/Read access.

ToolbarShowTooltips property

Tooltips - ToolbarShowTooltips

Enables the display of tooltips for the button functions in Runtime.

Value	Explanation
TRUE	Enables the display of tooltips.
FALSE	Disables the display of tooltips.

The attribute can be assigned dynamic properties by means of the name **ToolbarShowTooltips**. The data type is BOOLEAN.

Attribute "ToolbarButtonTooltipText" defines the tooltip text.

ToolbarUseBackColor property

Show background color - ToolbarUseBackColor

Enables the display of the background color for a toolbar.

Value	Explanation
TRUE	Enables the display of the background color of a toolbar.
FALSE	Disables the display of the background color of a toolbar.

The attribute can be assigned dynamic properties by means of the name **ToolbarUseBackColor**. The data type is BOOLEAN.

ToolbarUseHotKeys property

Hotkeys - ToolbarUseHotKeys

Activates the hotkeys for button functions in Runtime. Insert the hotkeys for button functions in the "Hotkey" field.

Value	Explanation
TRUE	The hotkeys are activated.
FALSE	The hotkeys are deactivated.

The attribute can be assigned dynamic properties by means of the name **ToolbarUseHotKeys**. The data type is BOOLEAN.

ToolbarVisible property

Show toolbar - ToolbarVisible

Enables the display of the Control toolbar.

Value	Explanation
TRUE	Enables the display of the toolbar.
FALSE	Disables the display of the toolbar.

The attribute can be assigned dynamic properties by means of the name **ToolbarVisible** . The data type is BOOLEAN.

ToolTip - TrendLower

ToolTipText Property

Description

Defines or returns the text to be displayed as a tooltip when the mouse is positioned over the object.

STRING (write-read access)

Example:

The following example assigns a tool tip text to every object in the picture "NewPDL1": The picture "NewPDL1" comprises only objects containing the ToolTipText property:

```
'VBS89
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
'
'Assign tooltiptexts to the objects
objScrItem.ToolTipText = "Name of object is " & strName
Next
```

Top Property

Function

Defines or returns the Y-coordinate of an object (measured from the top left edge of the picture) in pixels. The Y-coordinate relates to the top left corner of the rectangle enclosing the object.

LONG (write-read access)

Example:

The following example shifts all objects in the picture "NewPDL1" 5 pixels upwards:

```
'VBS90
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
objScrItem.Top = objScrItem.Top - 5
```

```
Next
```

Left Property (Page 463)

ScreenItem Object (Page 141)

TopConnectedConnectionPointIndex Property

Description

Specifies or sets the index number of the top connecting point.

LONG write-read access.

See also

Connector (Page 182)

ScreenItem Object (Page 141)

TopConnectedObjectName Property

Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

See also

Connector (Page 182)

ScreenItem Object (Page 141)

Transparency property

Description

Defines and returns the percentage transparency of the object.

0 = no transparency; 100 = complete transparency (invisible)

The text and fields of the graphic objects are only transparent at "100."

In runtime, a completely transparent object (invisible) is also functional.

Transparent Property

Description

TRUE, when the button appears completely filled in the color specified in "BackColor". BOOLEAN write-read access.

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

Trend Property

Description

TRUE, when the tendency (rising or falling) of the measuring value being monitored should be displayed by a small arrow. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

TrendActualize property

Update -TrendActualize

Enables the update of a selected trend.

Value	Explanation
TRUE	Enables updates of the trend selected.
FALSE	Disables updates of the trend selected. This setting can be useful when comparing a logged trend with a current trend.

The attribute can be assigned dynamic properties by means of the name **TrendActualize**. The data type is BOOLEAN.

TrendAdd property

New - TrendAdd

Creates a new trend.

The attribute can be assigned dynamic properties by means of the name **TrendAdd**. The data type is STRING.

TrendAutoRangeBeginTagName property

TrendAutoRangeBeginTagName

This attribute sets the low limit tag for the range of values if the range of values is calculated automatically by means of online tags.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeBeginTagName**. The data type is STRING.

TrendAutoRangeBeginValue property

TrendAutoRangeBeginValue

This attribute sets the low limit tag for the range of values if the range of values is calculated based on the configuration of high and low limits.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeBeginValue**. The data type is DOUBLE.

TrendAutoRangeEndTagName property

TrendAutoRangeEndTagName

This attribute sets the high limit tag for the range of values if the range of values is calculated automatically by means of online tags.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeEndTagName**. The data type is STRING.

TrendAutoRangeEndValue property

TrendAutoRangeEndValue

This attribute sets the high limit tag for the range of values if the range of values is calculated based on the configuration of high and low limits.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeEndValue**. The data type is DOUBLE.

TrendAutoRangeSource property

TrendAutoRangeSource

Defines the mode for automatic calculation of the range of values of trend data.

Value	Description	Explanation
0	Display data	The range of values is calculated automatically based on the data displayed.
1	Value range	The range of values is defined based on its configured low and high limit. The low and high limits are emulated in the "TrendAutoRangeBeginValue" and "TrendAutoRangeEndValue" attributes.
2	Online tags	The low and high limits of the range of values are derived from the values of connected online tags. The low and high limits are emulated in the "TrendAutoRangeBeginTagName" and "TrendAutoRangeEndTagName" attributes.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeSource**. The data type is LONG.

TrendBeginTime property

Start time - TrendBeginTime

Defines the start time of the time range for data transfer to the selected trend.

The attribute can be assigned dynamic properties by means of the name **TrendBeginTime**. The data type is Date.

TrendColor property

Trend color - TrendColor

Specifies the trend color. Open the "Color selection" dialog by clicking the button.

The attribute can be assigned dynamic properties by means of the name **TrendColor**. The data type is LONG.

LTrendColor property (before WinCC V7)

Description

Determines the color of the trend display or returns it.
The trend display indicates the tendency (rising or falling) of the measuring value being monitored by a small arrow. In order to activate the trend display, the Trend property must be set to "True". LONG write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

TrendCount property

TrendCount

Defines the number of configured trends.

The attribute can be assigned dynamic properties by means of the name **TrendCount**. The data type is LONG.

TrendEndTime property

End time - TrendEndTime

Defines the end of the time range for data connections of a selected trend.

The attribute can be assigned dynamic properties by means of the name **TrendEndTime**. The data type is Date.

TrendExtendedColorSet property

Extended - TrendExtendedColorSet

Enables configuration of the point and fill colors and the display of colors in Runtime.

Value	Explanation
TRUE	The "Point color" and "Fill color" field settings can be configured and are active in Runtime.
FALSE	The "Point color" and "Fill color" field settings cannot be configured and are inactive in Runtime.

The attribute can be assigned dynamic properties by means of the name **TrendExtendedColorSet**. The data type is BOOLEAN.

TrendFill property

Filled - TrendFill

Specifies if the area beneath the trend is to be filled.

Value	Explanation
TRUE	The area beneath the trend is shown filled. You can define the trend color as fill color if the "Advanced" option is deactivated. The text background is displayed in the trend color for the trend type "Values". The background color of the control is used as text color.
FALSE	The trend is not visualized with fill color.

The attribute can be assigned dynamic properties by means of the name **TrendFill**. The data type is BOOLEAN.

TrendFillColor property

Fill color - TrendFillColor

Specifies the fill color of the trend. The text fill color is specified for the trend type "Values".

The fill color is used if the "Filled" option is activated or "TrendFill" is "TRUE". Open the "Color selection" dialog by clicking the button.

The configuration is only possible if the "Advanced" option is activated or "TrendExtendedColorSet" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendFillColor**. The data type is LONG.

TrendIndex property

TrendIndex

References a configured trend. Using this attribute you can assign the values of other attributes to a specific trend. The index must always be set before you change the properties of a trend in runtime.

Values between 0 and "TrendIndex" minus 1 are valid for "TrendCount". Attribute "TrendCount" defines the number of trends configured.

The "TrendIndex" attribute can be assigned dynamic properties by means of attribute **TrendRepos**. The data type is LONG.

TrendLabel property

Label - TrendLabel

Defines the label of the trend selected. The label is displayed in Runtime if the value at attribute "UseTrendNameAsLabel" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **TrendLabel**. The data type is STRING.

TrendLineStyle property

Line style - TrendLineStyle

Defines the line style for trend visualization.

The following settings are available:

Value	Description	Explanation
0	Solid	The trend is visualized as solid line.
1	Dashed	The trend is visualized as dashed line.
2	Dotted	The trend is visualized as dotted line.
3	Dash dot	The trend is visualized as dot-dash line.
4	Dash Dot Dot	The trend is visualized as dash-dot-dot line.

The attribute can be assigned dynamic properties by means of the name **TrendLineStyle**. The data type is LONG.

TrendLineType property

Trend type - TrendLineType

Defines how to visualize a trend.

The following settings are available:

Value	Description	Explanation
0	None	Only the dots are displayed.
1	Connect dots linearly	Visualizes a trend with linear interconnection of points.
2	Stepped	Visualizes a stepped trend and its interconnected points.
3	Values	Can only be configured with OnlineTrendControl. A value is displayed at each time stamp or at the main grid line of the time axis instead of trend points.

The attribute can be assigned dynamic properties by means of the name **TrendLineType**. The data type is LONG.

TrendLineWidth property

Line weight - TrendLineWidth

Defines the line weight of the line displayed.

The attribute can be assigned dynamic properties by means of the name **TrendLineWidth**. The data type is LONG.

TrendLowerLimit property

TrendLowerLimit

Specifies the low limit of a tag. The values are identified based on the color set in "TrendLowerLimitColor" if the tag value is less than "TrendLowerLimit". This setting is only active if the value at attribute "TrendLowerLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendLowerLimit**. The data type is DOUBLE.

TrendLowerLimitColor property

TrendLowerLimitColor

Specifies the color of tag values which are less than the value at "TrendLowerLimit". This setting is only active if the value at attribute "TrendLowerLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendLowerLimitColor**. The data type is LONG.

TrendLowerLimitColoring property

TrendLowerLimitColoring

Enables the "TrendLowerLimitColor" attribute for identifying tag values which are less than the value at "TrendLowerLimitValue".

Value	Explanation
TRUE	Attribute "TrendLowerLimitColor" is active.
FALSE	Attribute "TrendLowerLimitColor" is inactive.

The attribute can be assigned dynamic properties by means of the name **TrendLowerLimitColoring**. The data type is BOOLEAN.

TrendMeasure - TrendVisible

TrendMeasurePoints property

Number of measurement points - TrendMeasurePoints

Defines the number of measurement points for visualization of selected trends.

Defines the number of value pairs provided to the trend from a user archive.

The attribute can be assigned dynamic properties by means of the name **TrendMeasurePoints**. The data type is LONG.

TrendName property

Object name - TrendName

Displays the name of the selected trend. The name is defined on the "Trends" tab.

The "TrendName" attribute can be assigned dynamic properties by means of attribute **TrendRename**. The data type is STRING.

TrendPointColor property

Point color - TrendPointColor

Defines the color of trend points. Open the "Color selection" dialog by clicking the button.

The configuration is only possible if the "Advanced" option is activated or "TrendExtendedColorSet" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendPointColor**. The data type is LONG.

TrendPointStyle property

Dot type - TrendPointStyle

Defines the dot style for trend visualization.

The following settings are available:

Value	Description	Explanation
0	None	The points are not displayed.
1	Dots	The trend points are visualized with a size of one pixel. The setting in the "Dot width" field is deactivated.

Value	Description	Explanation
2	Squares	The dots are displayed as square. The setting in the "Dot width" field is active.
3	Circles	The dots are displayed as circles. The setting in the "Dot width" field is active.

The attribute can be assigned dynamic properties by means of the name **TrendPointStyle**. The data type is LONG.

TrendPointWidth property

Dot width - TrendPointWidth

Sets the dot width in pixels. You can only define the dot width for the "square" and "circular" type.

The attribute can be assigned dynamic properties by means of the name **TrendPointWidth**. The data type is LONG.

TrendProvider property

Data source - TrendProvider

Specifies the data source for a selected trend.

The following settings are available:

Value	Description	Explanation
0	None	No data source configured for implementation in Runtime by means of script.
1	Archive tags	Data source with archive tags of a process value archive.
2	Online tags	Data source with online tags derived from tag management.
3	User archive	Data source with columns of a user archive.

The attribute can be assigned dynamic properties by means of the name **TrendProvider**. The data type is LONG.

TrendProviderCLSID_FunctionTrend property

TrendProviderCLSID_FunctionTrend

Indicates the data source of the trend selected.

Value	Explanation
	No data source configured for implementation in Runtime by means of script.
{416A09D2-8B5A-11D2-8B81-006097A45D48}	Data source with archive tags of a process value archive.

Value	Explanation
{A3F69593-8AB0-11D2-A440-00A0C9DBB64E}	Data source with online tags derived from tag management.
{2DC9B1C8-4FC1-41B1-B354-3E469A13FBFD}	Data source with columns of a user archive.

The attribute can be assigned dynamic properties by means of the name **TrendProviderCLSID**. The data type is STRING.

TrendProviderCLSID_OnlineTrend property

TrendProviderCLSID_OnlineTrend

Indicates the data source of the trend selected.

Value	Explanation
	No data source configured for implementation in Runtime by means of script.
{416A09D2-8B5A-11D2-8B81-006097A45D48}	Data source with archive tags of a process value archive.
{A3F69593-8AB0-11D2-A440-00A0C9DBB64E}	Data source with online tags derived from tag management.

The attribute can be assigned dynamic properties by means of the name **TrendProviderCLSID**. The data type is STRING.

TrendRangeType property

Time range setting - TrendRangeType

Defines the time range for providing data to the selected trend.

You can only define the number of measuring points if you select user archives as the data source.

The following configuration options are available:

Value	Description	Explanation
0	Time range	Defines the start time and the time range for the data connection.
1	Start to end time	Defines the start and end time for the data connection.
2	Number of measurement points	Defines the start time and the number of measurement points for the data connection.

The attribute can be assigned dynamic properties by means of the name **TrendRangeType**. The data type is LONG.

TrendRemove property

Remove - TrendRemove

Removes selected trends from the list.

The attribute can be assigned dynamic properties by means of the name **TrendRemove**. The data type is STRING.

TrendRename property

TrendRename

Renames a trend which is referenced by means of "TrendIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **TrendRename**. "TrendRename" also sets a dynamic attribute "TrendName". The data type is STRING.

TrendRepos property

Up/Down - TrendRepos

Repositions the trend in the trend window. "Up" and "Down" move the selected trend up or down in the list. This moves the trend towards the foreground or background for visualization in Runtime.

The attribute can be assigned dynamic properties by means of the name **TrendRepos**. The data type is LONG.

TrendSelectTagName property

TrendSelectTagName

Opens a dialog for selecting the tag name for the source of Y axis data in WinCC OnlineTrendControl. Programmers can set this attribute to allow users to select a tag name by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **TrendSelectTagName**. The data type is BOOLEAN.

TrendSelectTagNameX property

TrendSelectTagNameX

Opens a dialog for selecting the tag name for the source of X axis data in WinCC FunctionTrendControl. Programmers can set this attribute to allow users to select a tag name by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **TrendSelectTagNameX**. The data type is BOOLEAN.

TrendSelectTagNameY property

TrendSelectTagNameY

Opens a dialog for selecting the tag name for the source of Y axis data in WinCC FunctionTrendControl. Programmers can set this attribute to allow users to select a tag name by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **TrendSelectTagNameY**. The data type is BOOLEAN.

TrendState property

TrendState

Shows the status of the data link of the selected curve in Runtime.

The attribute can be made dynamic with the name **TrendState**. The data type is LONG.

TrendTagName property

Tag name - TrendTagName

Displays the name of connected tags. Use the Open button to open a dialog for selecting an online or archive tag.

The attribute can be assigned dynamic properties by means of the name **TrendTagName**. The data type is STRING.

TrendTagNameX property

Tag Name X / Column X - TrendTagNameX

Shows the name of interconnected tags or of the column for the X axis. Using the selection button, select a tag or a column for the data source you configured.

The attribute can be assigned dynamic properties by means of the name **TrendTagNameX**. The data type is STRING.

TrendTagNameY property

Tag Name Y / Column Y - TrendTagNameY

Shows the name of interconnected tags or of the column for the Y axis. Using the selection button, select a tag or a column for the data source you configured.

The attribute can be assigned dynamic properties by means of the name **TrendTagNameY**. The data type is STRING.

TrendTimeAxis property

Time axis - TrendTimeAxis

Defines the time axis to be used for the trend selected. Define the available time axes in the "Time axes" tab.

The attribute can be assigned dynamic properties by means of the name **TrendTimeAxis**. The data type is STRING.

TrendTimeRangeBase property

Time Range - TrendTimeRangeBase

Defines the time unit for calculating the time range.

The following time units are available:

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

The attribute can be assigned dynamic properties by means of the name **TrendTimeRangeBase**. The data type is LONG.

TrendTimeRangeFactor property

Time range - TrendTimeRangeFactor

Defines the factor for calculating the time range. Only integer factors are valid.

The attribute can be assigned dynamic properties by means of the name **TrendTimeRangeFactor**. The data type is SHORT.

TrendTrendWindow property

Trend window - TrendTrendWindow

Defines the trend window for visualizing the trend selected. Define the available trend windows in the "Trend window" tab.

The attribute can be assigned dynamic properties by means of the name **TrendTrendWindow**. The data type is STRING.

TrendUncertainColor property

TrendUncertainColor

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. Set attribute "TrendUncertainColor" to define the color identifier of these values. The "TrendUncertainColoring" attribute determines whether or not this setting is evaluated.

The attribute can be assigned dynamic properties by means of the name **TrendUncertainColor**. The data type is LONG.

TrendUncertainColoring property

TrendUncertainColoring

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. The "TrendUncertainColoring" attribute is used to enable identification of such values based on the color set in "TrendUncertainColor".

Value	Explanation
TRUE	The settings of the "TrendUncertainColor" attribute are active.
FALSE	The settings of the "TrendUncertainColor" attribute are inactive.

The attribute can be assigned dynamic properties by means of the name **TrendUncertainColoring**. The data type is BOOLEAN.

TrendUpperLimit property

TrendUpperLimit

Specifies the high limit of a tag. The values are identified based on the color set in "TrendUpperLimitColor" if the tag value exceeds the "TrendUpperLimit". This setting is only active if the value at attribute "TrendUpperLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendUpperLimit**. The data type is DOUBLE.

TrendUpperLimitColor property

TrendUpperLimitColor

Specifies the color of tag values which are less than the value at "TrendLowerLimit". This setting is only active if the value at attribute "TrendUpperLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendUpperLimitColor**. The data type is LONG.

TrendUpperLimitColoring property

TrendUpperLimitColoring

Enables the "TrendUpperLimitColor" attribute for identifying tag values which are less than the value at "TrendUpperLimit".

Value	Explanation
TRUE	The setting of the "TrendUpperLimitColor" attribute is active.
FALSE	The setting of the "TrendUpperLimitColor" attribute is inactive.

The attribute can be assigned dynamic properties by means of the name **TrendUpperLimitColoring**. The data type is BOOLEAN.

TrendValueAlignment property

Alignment - TrendValueAlignment

Specifies the alignment of the displayed values for the trend type "Values".

The following settings are available depending on the writing direction of the trend:

- The writing direction of the trend is "from right" or "from left"

Value	Description	Explanation
0	Bottom	The values are displayed at the bottom in the trend window.
1	Centered	The values are displayed centered in the trend window.
2	Top	The values are displayed at the top in the trend window.

- The writing direction of the trend is "from top" or "from bottom"

Value	Description	Explanation
0	Left	The values are displayed on the left in the trend window.
1	Centered	The values are displayed centered in the trend window.
2	Right	The values are displayed on the right in the trend window.

The attribute can be assigned dynamic properties by means of the name **TrendValueAlignment**. The data type is LONG.

TrendValueAxis property

Value axis - TrendValueAxis

Defines the value axis to be used for the trend selected. Define the available value axes in the "Value axes" tab.

The attribute can be assigned dynamic properties by means of the name **TrendValueAxis**. The data type is STRING.

TrendValueUnit property

Unit - TrendValueUnit

Specifies a unit for the trend type "Values" that is appended to the displayed value, e.g., "%" or "°C".

The attribute can be assigned dynamic properties by means of the name **TrendValueUnit**. The data type is STRING.

TrendVisible property

Trends - TrendVisible

The list shows all trends you created.

Select the trends to be displayed in the trend window from the list.

Click a trend entry in the list to adapt the properties and to assign axes and trend windows to the trend.

The attribute can be assigned dynamic properties by means of the name **TrendVisible**. The data type is BOOLEAN.

TrendWindow - TrendYAxis

TrendWindowAdd property

New - TrendWindowAdd

Creates a new trend window.

The attribute can be assigned dynamic properties by means of the name **TrendWindowAdd**. The data type is STRING.

TrendWindowCoarseGrid property

Main grid lines - TrendWindowCoarseGrid

Enables the display of grid lines for the main scale.

Value	Explanation
TRUE	Enables the display of grid lines for the main scale.
FALSE	Disables the display of grid lines for the main scale.

The attribute can be assigned dynamic properties by means of the name **TrendWindowCoarseGrid**. The data type is BOOLEAN.

TrendWindowCoarseGridColor property

Color of main scale - TrendWindowCoarseGridColor

Specifies the grid color of the main scale. Open the "Color selection" dialog by clicking the button.

The attribute can be assigned dynamic properties by means of the name **TrendWindowCoarseGridColor**. The data type is LONG.

TrendWindowCount property

TrendWindowCount

Defines the number of configured trend views.

The attribute can be assigned dynamic properties by means of the name **TrendWindowCount**. The data type is LONG.

TrendWindowFineGrid property

Secondary grid lines - TrendWindowFineGrid

Enables the display of grid lines for the secondary scale.

Value	Explanation
TRUE	Enables the display of grid lines for the secondary scale.
FALSE	Disables the display of grid lines for the secondary scale.

The attribute can be assigned dynamic properties by means of the name **TrendWindowFineGrid**. The data type is BOOLEAN.

TrendWindowFineGridColor property

Color of secondary scale - TrendWindowFineGridColor

Specifies the grid color of the main scale. Open the "Color selection" dialog by clicking the button.

The attribute can be assigned dynamic properties by means of the name **TrendWindowFineGridColor**. The data type is LONG.

TrendWindowForegroundTrendGrid property

Only for foreground trend - TrendWindowForegroundTrendGrid

Enables the display of grid lines only for the foreground trend in the trend window.

Value	Explanation
TRUE	Enables the display of grid lines for the foreground trend in the trend window.
FALSE	Enables the display of grid lines for all trends in the trend window.

The attribute can be assigned dynamic properties by means of the name **TrendWindowForegroundTrendGrid**. The data type is BOOLEAN.

TrendWindowGridInTrendColor property

Use trend color - TrendWindowGridInTrendColor

Sets the trend color for the visualization of the grid lines for the main scale.

Value	Explanation
TRUE	The grid is displayed in the trend color.
FALSE	The grid is displayed with the color set in the "Color" field.

The attribute can be assigned dynamic properties by means of the name **TrendWindowGridInTrendColor**. The data type is BOOLEAN.

TrendWindowHorizontalGrid property

For X axis - TrendWindowVerticalGrid

Enables the display of horizontal grid lines.

Value	Explanation
TRUE	The display of horizontal grid lines is enabled.
FALSE	The display of horizontal grid lines is disabled.

The attribute can be assigned dynamic properties by means of the name **TrendWindowHorizontalGrid**. The data type is BOOLEAN.

TrendWindowIndex property

TrendWindowIndex

References a configured trend view. Using this attribute you can assign the values of other attributes to a specific trend view.

Values between 0 and "TrendWindowIndex" minus 1 are valid for "TrendWindowCount". Attribute "TrendWindowCount" defines the number of trend views configured.

The "TrendWindowIndex" attribute can be assigned dynamic properties by means of attribute **TrendWindowRepos**. The data type is LONG.

TrendWindowName property

Object name - TrendWindowName

Defines the name of the trend window selected.

The "TrendWindowName" attribute can be assigned dynamic properties by means of attribute **TrendWindowRename**. The data type is STRING.

TrendWindowRemove property

Remove - TrendWindowRemove

Removes the selected trend window from the list.

The attribute can be assigned dynamic properties by means of the name **TrendWindowRemove**. The data type is STRING.

TrendWindowRename property

TrendWindowRename

Renames a trend view which is referenced by means of "TrendWindowIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **TrendWIndowRename**. "TrendWindowRename" also sets a dynamic attribute "TrendWindowName". The data type is STRING.

TrendWindowRepos property

Up/Down - TrendWindowRepos

Changes the sorting order of the trend windows. "Up" and "Down" move the selected trend up or down in the list.

The sorting order in the list defines the position in the Control. The first trend window is displayed at the last position, while the last is displayed at the top position.

The attribute can be assigned dynamic properties by means of the name **TrendWindowRepos**. The data type is LONG.

TrendWindowRulerColor property

Ruler color - TrendWindowRulerColor

Specifies the ruler color. Open the "Color selection" dialog by clicking the button.

The color can be configured and displayed if "1 - graphic" is set for display of the ruler or "TrendWindowRulerStyle".

The attribute can be assigned dynamic properties by means of the name **TrendWindowRulerColor**. The data type is LONG.

TrendWindowRulerLayer property

Ruler layer - TrendWindowRulerLayer

Defines the representation layer of a ruler in the trend window.

The following settings are available:

Value	Description	Explanation
0	Under grid	The ruler is visualized on a layer under the grid.
1	Between grid and trend	The ruler is positioned on top of the trend and under the grid.
2	On top of trend	The ruler is positioned on top of the trend.

The attribute can be assigned dynamic properties by means of the name **TrendWindowRulerLayer**. The data type is LONG.

TrendWindowRulerStyle property

Ruler - TrendWindowRulerStyle

Defines the appearance of the ruler.

The following settings are available:

Value	Description	Explanation
0	Simple	The ruler is displayed as basic black line.
1	Graphic	The ruler is displayed based on the "color" and "weight" configured.

The attribute can be assigned dynamic properties by means of the name **TrendWindowRulerStyle**. The data type is LONG.

TrendWindowRulerWidth property

Ruler width - TrendWindowRulerWidth

Defines the width of the ruler in pixels.

The width can be configured and displayed if "1 - graphic" is set for display of the ruler or "TrendWindowRulerStyle".

The attribute can be assigned dynamic properties by means of the name **TrendWindowRulerWidth**. The data type is LONG.

TrendWindowSpacePortion property

Proportional area - TrendWindowSpacePortion

Specifies the proportion of the trend widow to be used for the selected curve.

The attribute can be assigned dynamic properties by means of the name **TrendWindowSpacePortion**. The data type is LONG.

TrendWindowStatisticRulerColor property

Color of ruler for statistics area - TrendWindowStatisticRulerColor

Specifies the color of the ruler for the statistics area. The button opens the "Color selection" dialog to select the color.

The color can be configured and displayed if "1 - graphic" is set for display of the ruler for the statistics area or "TrendWindowStatisticRulerStyle".

The attribute can be assigned dynamic properties by means of the name **TrendWindowStatisticRulerColor**. The data type is LONG.

TrendWindowStatisticRulerStyle property

Ruler for statistics area - TrendWindowStatisticRulerStyle

Enables the display of a ruler for defining the statistics area.

The following settings are available:

Value	Description	Explanation
0	Simple	The ruler is displayed as basic black line.
1	Graphic	The ruler is displayed based on the "color" and "weight" configured.

The attribute can be assigned dynamic properties by means of the name **TrendWindowStatisticRulerStyle**. The data type is LONG.

TrendWindowStatisticRulerWidth property

Width of ruler for statistics area - TrendWindowStatisticRulerWidth

Defines the width of the ruler for the statistics area in pixels.

The width of the ruler can be configured and displayed if "1 - graphic" is set for display of the ruler for the statistics area or "TrendWindowStatisticRulerStyle".

The attribute can be assigned dynamic properties by means of the name **TrendWindowStatisticRulerWidth**. The data type is LONG.

TrendWindowVerticalGrid property

for Y axis - TrendWindowVerticalGrid

Enables the display of vertical grid lines.

Value	Explanation
TRUE	The display of vertical grid lines is enabled.
FALSE	The display of vertical grid lines is disabled.

The attribute can be assigned dynamic properties by means of the name **TrendWindowVerticalGrid**. The data type is BOOLEAN.

TrendWindowVisible property

Trend window - TimeAxisTrendWindow

The list shows all trend windows you created.

Select the trend windows to be displayed in the control from the list.

Click a list entry to adapt the ruler and grid line properties.

The attribute can be assigned dynamic properties by means of the name **TrendWindowVisible**. The data type is BOOLEAN.

TrendXAxis property

X axis - TrendXAxis

Defines the X axis to be used for the trend selected. Define the available X axes inn the "X Axes" tab.

The attribute can be assigned dynamic properties by means of the name **TrendXAxis**. The data type is STRING.

TrendYAxis property

Y axis - TrendYAxis

Defines the Y axis to be used for the trend selected. Define the available Y axes inn the "Y Axes" tab.

The attribute can be assigned dynamic properties by means of the name **TrendYAxis**. The data type is STRING.

Type

Type Property

Description

Reads out the object type, e.g. "Rectangle", "Circle" or "Line".

The object type is returned as a string. Read only

A special ID is returned as the type for all the graphic elements provided by WinCC. It can be found under the topic "Type Identification in VBS“ in the individual descriptions of the WinCC Object Types.

Special feature

In the case of non-WinCC controls and OLE objects, the version-independent ProgID is returned as the type.

It is possible to determine the version-dependent ProgID or "User friendly Name" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every Control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS91
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Determine the User Friendly Name as follows:

```
'VBS92
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Example:

The following example displays the type for all objects in the picture "NewPDL1":

```
'VBS93
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim lngAnswer
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
```

```
lngAnswer = MsgBox(objScrItem.Type, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

1.14.4.20 U

Un - Up

UnitColor Property

Description

Defines the text color for the names of the unit of measurement. LONG write-read access.

See also

WinCC Gauge Control (Page 264)
ScreenItem Object (Page 141)

UnitFont Property

Description

Controls the display of the labeling for the unit of measurement. Read only access.
The following properties can be set:
- Font
- Font Style
- Font Size
- "Strikethrough" effect
- "Underline" effect

See also

WinCC Gauge Control (Page 264)
ScreenItem Object (Page 141)

UnitOffset Property

Description

This attribute defines the distance of the text for the unit of measurement in relation to the top edge of the object. The text can only be positioned along the vertical diameter of the graduated scale disk. The value of the property is related to the height of the object and is measured from the top edge of the object to the base of the text.

The value range is 0 is 1.

0: The base of the text is at the top limit of the object. The text is no longer visible because it is outside the object.

1: The base of the text is at the bottom limit of the object.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

UnitText Property

Description

Defines the text for the unit of measurement. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

UnselBGColor Property

Description

Defines or returns the background color of entries in the text list object which are not selected. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

UnselTextColor Property

Description

Defines or returns the color of the text for entries in the text list object which are not selected. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

UpdateCycle Property

Description

Returns the type and frequency of updating the picture window in Runtime. Read only access.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

UpperLimit Property

Description

TRUE, when the "UpperLimitColor" specification is to be used in order to identify the tag values (from a trend referenced via "Index") which lie above the value defined in "UpperLimitValue". BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

UpperLimitColor Property

Description

Defines the color to be used in order to identify the tag values (from a trend referenced via "Index") which lie above the value defined in "UpperLimitValue". Whether the information is evaluated is dependent on the value of the "UpperLimit" property. The color is defined as an RGB value. LONG write-read access.

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

UpperLimitTagName Property

Description

This defines the upper limit of the trend range, which is automatically taken from the variable properties configured in PCS 7. Write/Read access.

UpperLimitValue Property

Description

Tag values (from a trend referenced via "Index") which lie above the value defined by "UpperLimitValue" are identified by the color specified in "UpperLimitColor". Whether the information is evaluated is dependent on the value of the "UpperLimit" property.

Us

UseColumnBackColor property

Use column color / background - UseColumnBackColor

Specifies the settings to be activated for the background colors of columns.

Value	Explanation
TRUE	The background color settings are active in the "Time columns" or "TimeColumnBackColor" tabs and in the "Value columns" or "ValueColumnBackColor" tabs.
FALSE	The background color settings are active in the "Display" tab.

The attribute can be assigned dynamic properties by means of the name **UseColumnBackColors**. The data type is BOOLEAN.

UseColumnForeColor property

Use column color / font - UseColumnForeColor

Defines the active font color settings for the columns.

Value	Explanation
TRUE	The font color color settings are active in the "Time columns" or "TimeColumnForeColor" tabs and in the "Value columns" or "ValueColumnForeColor" tabs.
FALSE	The font color settings are active in the "Display" tab.

The attribute can be assigned dynamic properties by means of the name **UseColumnForeColors**. The data type is BOOLEAN.

UseMessageColor property

Show message colors - UseMessageColor

Sets the outputs of messages with colors as agreed by handshake.

Value	Explanation
TRUE	The message colors are displayed.
FALSE	The message colors are not displayed. Instead, the color settings defined for the table content are activated on the "Display" tab.

The attribute can be assigned dynamic properties by means of the name **UseMessageColor**. The data type is BOOLEAN.

UseOnlineTags Property

Description

This defines whether or not the variable properties configured in PCS 7 are applied as trend parameters. Write/Read access.

UseRangeSubstitutes Property

Description

TRUE, if a separate scaling of the value axis is displayed for the trends in Trend Control. BOOLEAN write-read access.

UserData-Property

Description

Contains the value that is to be transferred to the VB script while running a customized menu item or icon. STRING (write-read access)

Example:

Use the "User data" field in the "Menus and Toolbars" editor to apply a parameter to the procedure

The following example shows the "ActivateScreen" procedure that executes the picture change. Enter the picture name in the "User Data" field:

```
Sub ActivateScreen (ByVal Item)
Dim objScreen
Dim strScreenName
' "UserData" contains the screen name specified
' in editor menus and toolbars.
strScreenName = Item.Userdata
HMIRuntime.BaseScreenName = strScreenName
End Sub
```

UserName property

Description

Returns the name of the user who triggered the alarm object.

See also

Alarms object (list) (Page 126)

UserValue1 Property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

See also

ScreenItem Object (Page 141)

Group Display (Page 208)

UserValue2-Eigenschaft

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

UserValue3 Property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

UserValue4 Property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

UseSelectedTitleColor property

Selection color - UseSelectedTitleColor

Specifies whether to use a selection color for the headers of selected table cells.

Value	Explanation
TRUE	A selection color is used. The "Background" or "SelectedTitleColor" and "Font" or "SelectedTitleForeColor" settings are active in Runtime.
FALSE	Selection color is not used. The "Background" and "Font" settings are disabled in Runtime.

The attribute can be assigned dynamic properties by means of the name **UseSelectedTitleColor**. The data type is BOOLEAN.

UseSourceBackColors property

Apply background colors - UseSourceBackColors

Sets the background color derived from the control defined in the "Source" field.

Value	Explanation
TRUE	The background color from the interconnected control is used.
FALSE	The background color from the interconnected control is not used. The settings on the "Layout" tab are used.

The attribute can be assigned dynamic properties by means of the name **UseSourceBackColors**. The data type is BOOLEAN.

UseSourceForeColors property

Apply font colors - UseSourceForeColors

Sets the font colors derived from the control defined in the "Source" field.

Value	Explanation
TRUE	The font color of the interconnected control is activated.
FALSE	The font color from the connected control is not used. The settings on the "Layout" tab are used.

The attribute can be assigned dynamic properties by means of the name **UseSourceForeColors**. The data type is BOOLEAN.

UseTableColor2 property

Row Color 2 - UseTableColor2

Specifies whether to use a second row color for the representation of the table.

Value	Explanation
TRUE	"Row color 2" and "Row color 1" are used alternately.
FALSE	The "Row color 1" settings are used for all rows.

The attribute can be assigned dynamic properties by means of the name **UseTableColor2**. The data type is BOOLEAN.

UseTrendNameAsLabel property

UseTrendNameAsLabel

Sets the "TrendName" or "TrendLabel" attribute for labeling the trend in Runtime.

Value	Explanation
TRUE	Sets the "TrendName" attribute for labeling the trend in Runtime.
FALSE	Sets the "TrendLabel" attribute for labeling the trend in Runtime.

The attribute can be assigned dynamic properties by means of the name **UseTrendNameAsLabel**. The data type is BOOLEAN.

1.14.4.21 V

Val - ValueAxis

Value Property

Description of Tag Object

Displays the value of the tags at the last read access or the value written or to be written. Value represents the value of a tag. After calling in the "Read" method, the tag value read is returned. Before writing, the new tag value required can be assigned to the property. After calling in the "Write" method, the property contains the value last written.

VARIANT (write-read access)

Example:

The following example writes a new value in the "Tag1" tag:

```
'VBS94
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Value = 50
objTag.Write
```

Description of WinCC Gauge Control

Defines the value to which the pointer points. Value Range: "ValueMin" to "ValueMax".

Description of DataItem Object

Returns a value copy or object reference. Furthermore, an already added value can be changed via the value property.

Example:

The example shows how to add a value to the list, and how to output it as a trace. After that, the value is changed, output again and then removed. It make sense to perform this in several different actions.

```
'VBS198
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet("motor1").Value = 55
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
```

```
HMIRuntime.DataSet.Remove("motor1")
```

Note

For object references it must be ascertained that objects are multiread-enabled.

ValueAxisAdd property

New - ValueAxisAdd

Creates a new value axis.

The attribute can be assigned dynamic properties by means of the name **ValueAxisAdd**. The data type is STRING.

ValueAxisAlign property

Alignment - ValueAxisAlign

Specifies the mode of alignment of a selected value axis.

The following settings are available:

Value	Description	Explanation
0	left	The value axis selected is displayed on left side of the trend.
1	right	The value axis selected is displayed on right side of the trend.

The attribute can be assigned dynamic properties by means of the name **ValueAxisAlign**. The data type is LONG.

ValueAxisAutoPrecisions property

Decimal places automatic - ValueAxisAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The decimal precision is defined automatically. The value in the "Decimal places" or "ValueAxisPrecisions" field is disabled.
FALSE	The value in the "Decimal places" or "ValueAxisPrecisions" field is active.

The attribute can be assigned dynamic properties by means of the name **ValueAxisAutoPrecisions**. The data type is BOOLEAN.

ValueAxisAutoRange property

Value range automatic - ValueAxisAutoRange

Enables automatic calculation of the range of values.

Value	Explanation
TRUE	The range of values is calculated automatically.
FALSE	The range of values is calculated based on the values configured in the "from" and "to" or "ValueAxisBeginValue" and "ValueAxisEndValue" fields.

The attribute can be assigned dynamic properties by means of the name **ValueAxisAutoRange**. The data type is BOOLEAN.

ValueAxisBeginValue property

Value range from - ValueAxisBeginValue

Specifies the start value of the value axis selected. You can configure the value if the "Automatic" option is disabled or "ValueAxisAutoRange" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueAxisBeginValue**. The data type is DOUBLE.

ValueAxisColor property

Value axis color - ValueAxisColor

Specifies the color of the time axis. The button opens the "Color selection" dialog to select the color.

The setting is only active if the "Use trend color" option is disabled or if "ValueAxisInTrendColor" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueAxisColor**. The data type is LONG.

ValueAxisCount property

ValueAxisCount

Defines the number of value axes configured.

The attribute can be assigned dynamic properties by means of the name **ValueAxisCount**. The data type is LONG.

ValueAxisEndValue property

Value range to - ValueAxisEndValue

Specifies the end value of the value axis selected. You can configure the value if the "Automatic" option is disabled or "ValueAxisAutoRange" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueAxisEndValue**. The data type is DOUBLE.

ValueAxisExponentialFormat property

Exponential notation - ValueAxisExponentialFormat

Sets exponential notation for the display of values of a value axis selected.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The attribute can be assigned dynamic properties by means of the name **ValueAxisExponentialFormat**. The data type is BOOLEAN.

ValueAxisIndex property

ValueAxisIndex

References a value axis. Using this attribute you can assign the values of other attributes to a specific value axis.

Values between 0 and "ValueAxisCount" minus 1 are valid for "ValueAxisIndex". Attribute "ValueAxisCount" defines the number of value axes configured.

The "ValueAxisIndex" attribute can be assigned dynamic properties by means of attribute **ValueAxisRepos**. The data type is LONG.

ValueAxisInTrendColor property

Use trend color - ValueAxisInTrendColor

Sets the trend color for displaying the value axis selected. The color of the first trend is activated if several trends are displayed in the trend window. Define the order of trends on the "Trends" tab.

Value	Explanation
TRUE	The selected value axis is displayed in the trend color. The setting in the "Color" or "ValueAxisColor" field is disabled.
FALSE	The value axis selected is displayed in the color set in the "Color" or "ValueAxisColor" field.

The attribute can be assigned dynamic properties by means of the name **ValueAxisInTrendColor**. The data type is BOOLEAN.

ValueAxisInTrendColor property

Use trend color - ValueAxisInTrendColor

Sets the trend color for displaying the value axis selected. The color of the first trend is activated if several trends are displayed in the trend window. Define the order of trends on the "Trends" tab.

Value	Explanation
TRUE	The selected value axis is displayed in the trend color. The setting in the "Color" or "ValueAxisColor" field is disabled.
FALSE	The value axis selected is displayed in the color set in the "Color" or "ValueAxisColor" field.

The attribute can be assigned dynamic properties by means of the name **ValueAxisInTrendColor**. The data type is BOOLEAN.

ValueAxisLabel property

Label - ValueAxisLabel

Specifies the label of a value axis selected.

The attribute can be assigned dynamic properties by means of the name **ValueAxisLabel**. The data type is STRING.

ValueAxisName property

Object name - ValueAxisName

Specifies the name of a value axis selected.

The "ValueAxisName" attribute can be assigned dynamic properties by means of attribute **ValueAxisRename**. The data type is STRING.

ValueAxisPrecisions property

Decimal places - ValueAxisPrecisions

Specifies the decimal precision for displaying the value axis selected. The value can be configured and is active in Runtime, if the "Automatic" option is disabled or "ValueAxisAutoPrecisions" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueAxisPrecisions**. The data type is SHORT.

ValueAxisRemove property

Remove - ValueAxisRemove

Removes the selected value axis from the list.

The attribute can be assigned dynamic properties by means of the name **ValueAxisRemove**. The data type is STRING.

ValueAxisRename property

ValueAxisRename

Renames a value axis which is referenced by means of "ValueAxisIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **ValueAxisRename**. "ValueAxisRename" also sets a dynamic attribute "ValueAxisName". The data type is STRING.

ValueAxisRepos property

Up/Down - ValueAxisRepos

Changes the order of value axes. "Up" and "Down" move the value axis selected up or down in the list.

The list order determines the value axis position in the trend window. The axis output position is moved away from the trend if the value axis is moved further up in the list and the orientation is the same.

The attribute can be assigned dynamic properties by means of the name **ValueAxisRepos** . The data type is LONG.

ValueAxisScalingType property

Scaling - ValueAxisScalingType

Specifies the scaling mode for a selected value axis.

The following settings are available:

Value	Description	Explanation
0	Linear	Enables linear scaling of a value axis selected.
1	Logarithmic	Enables logarithmic scaling of a value axis selected.
2	Logarithmically negated	Enables scaling of a selected value value axis with logarithmic negation.

The attribute can be assigned dynamic properties by means of the name **ValueAxisScalingType**. The data type is LONG.

ValueAxisTrendWindow property

Trend window - ValueAxisTrendWindow

Specifies the trend window for displaying the value axis selected. Define the available trend windows in the "Trend window" tab.

The attribute can be assigned dynamic properties by means of the name **ValueAxisTrendWindow**. The data type is STRING.

ValueAxisVisible property

Value axes - ValueAxisVisible

The list shows all value axes you created. Click a value axis entry in the list to adapt the properties and to assign the value axis to a trend window.

Activate the value axes to be displayed in the trend windows in the list.

The attribute can be assigned dynamic properties by means of the name **ValueAxisVisible** . The data type is BOOLEAN.

ValueColumn - Vi

ValueColumnAdd property

New - ValueColumnAdd

Creates a new value column.

The attribute can be assigned dynamic properties by means of the name **ValueColumnAdd**. The data type is STRING.

ValueColumnAlign property

Alignment - ValueColumnAlign

Defines the mode of alignment of a selected value column.

The following settings are available:

Value	Description	Explanation
0	left	The selected value column is displayed on the left.
1	Centered	The selected value column is aligned to center.
2	right	The selected value column is displayed on the right.

The attribute can be assigned dynamic properties by means of the name **ValueColumnAlign**. The data type is LONG.

ValueColumnAlignment Property

Description

The "Index" property references a pair of columns. "ValueColumnAlignment" defines the alignment of the tag value for this column pair.

- 0: Tag values are entered aligned left.
- 1: Tag values are entered centered.
- 2: Tag values are entered aligned right.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

ValueColumnAutoPrecisions property

Automatic - ValueColumnAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The decimal precision is defined automatically. The value in the "Decimal places" or "ValueColumnPrecisions" field is disabled.
FALSE	The value in the "Decimal places" or "ValueColumnPrecisions" field is active.

The attribute can be assigned dynamic properties by means of the name **ValueColumnAutoPrecisions**. The data type is BOOLEAN.

ValueColumnBackColor property

Background color - ValueColumnBackColor

Specifies the background color of the value column selected. Use the button to open the "Color selection" dialog.

The setting is only active if the "Background color" option is set or "UseColumnBackColor" is "TRUE" in the "Use column color" field of the "General" tab.

The attribute can be assigned dynamic properties by means of the name **ValueColumnBackColor**. The data type is LONG.

ValueColumnCaption property

Description - ValueColumnCaption

Defines the label of the value column selected.

The attribute can be assigned dynamic properties by means of the name **ValueColumnCaption**. The data type is STRING.

ValueColumnCount property

ValueColumnCount

Defines the number of value columns configured.

The attribute can be assigned dynamic properties by means of the name **ValueColumnCount**. The data type is LONG.

ValueColumnExponentialFormat property

Exponential notation - ValueColumnExponentialFormat

Sets exponential notation for the display of values of a value column selected.

Value	Explanation
TRUE	Display with exponential notation.
FALSE	Display with decimal notation.

The attribute can be assigned dynamic properties by means of the name **ValueColumnExponentialFormat**. The data type is BOOLEAN.

ValueColumnForeColor property

Font color - ValueColumnForeColor

Specifies the font color of the value column selected. Use the button to open the "Color selection" dialog.

The setting is only active if the "Font color" option is set or "UseColumnForeColor" is "TRUE" in the "Use column color" field of the "General" tab.

The attribute can be assigned dynamic properties by means of the name **ValueColumnForeColor**. The data type is LONG.

ValueColumnHideText property

ValueColumnHideText

Sets text format for displaying the content of a value column.

Value	Explanation
TRUE	The content is not displayed in text format.
FALSE	The content is displayed in text format.

The attribute can be assigned dynamic properties by means of the name **ValueColumnHideText**. The data type is BOOLEAN.

ValueColumnHideTitleText property

ValueColumnHideTitleText

Sets text format for displaying the value column header.

Value	Explanation
TRUE	The header is not displayed in text format.
FALSE	The header is displayed in text format.

The attribute can be assigned dynamic properties by means of the name **ValueColumnHideTitleText**. The data type is BOOLEAN.

ValueColumnIndex property

ValueColumnIndex

References a configured value column. Using this attribute you can assign the values of other attributes to a specific value column.

Values between 0 and "ValueColumnCount" minus 1 are valid for "ValueColumnIndex". Attribute "ValueColumnCount" defines the number of value columns configured.

The "ValueColumnIndex" attribute can be assigned dynamic properties by means of attribute **ValueColumnRepos**. The data type is LONG.

ValueColumnLength property

Length in characters - ValueColumnLength

Specifies the width of a selected value column.

The attribute can be assigned dynamic properties by means of the name **ValueColumnLength**. The data type is LONG.

ValueColumnName property

Object name - ValueColumnName

Specifies the name of a selected value column.

The "ValueColumnName" attribute can be assigned dynamic properties by means of attribute **ValueColumnRename**. The data type is STRING.

ValueColumnPrecisions property

Decimal places - ValueColumnPrecisions

Specifies the decimal precision for displaying the data of a value column selected. The value can be entered if the "Automatic" option is disabled or "ValueColumnAutoPrecisions" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueColumnPrecisions**. The data type is SHORT.

ValueColumnProvider property

Data source - ValueColumnProvider

Specifies the data source for a selected value column.

The following settings are available:

Value	Description	Explanation
1	Archive tags	Data source with archive tags of a process value archive.
2	Online tags	Data source with online tags derived from tag management.

The attribute can be assigned dynamic properties by means of the name **ValueColumnProvider**. The data type is LONG.

ValueColumnProviderCLSID property

ValueColumnProviderCLSID

Indicates the data source of the value column selected.

Value	Explanation
{416A09D2-8B5A-11D2-8B81-006097A45D48}	Data source with archive tags of a process value archive.
{A3F69593-8AB0-11D2-A440-00A0C9DBB64E}	Data source with online tags derived from tag management.

The attribute can be assigned dynamic properties by means of the name **ValueColumnProviderCLSID**. The data type is STRING.

ValueColumnRemove property

Remove - ValueColumnRemove

Removes the selected value column from the list.

The attribute can be assigned dynamic properties by means of the name **ValueColumnRemove**. The data type is STRING.

ValueColumnRename property

ValueColumnRename

Renames a value column which is referenced by means of "ValueColumnIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **ValueColumnRename**. "ValueColumnRename" also sets a dynamic attribute "ValueColumnName". The data type is STRING.

ValueColumnRepos property

Up/Down - ValueColumnRepos

Changes the sorting order of the value columns. "Up" and "Down" move the value column selected up or down in the list.

The sorting order in the list determines the order of value columns after the time column if several value columns are assigned to the same time column. Higher positions of the value column in the list moves it to closer proximity towards the time column.

You change the order of time columns and their assigned value columns in the "Time columns" tab.

The attribute can be assigned dynamic properties by means of the name **ValueColumnRepos**. The data type is LONG.

ValueColumnSelectTagName property

ValueColumnSelectTagName

Opens a dialog for selecting the tag name for the data source of the value column in WinCC OnlineTableControl. Programmers can set this attribute to allow users to select a tag name by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **ValueColumnSelectTagName**. The data type is BOOLEAN.

ValueColumnShowIcon property

ValueColumnShowIcon

Enables the display of value column contents as icon.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **ValueColumnShowIcon**. The data type is BOOLEAN.

ValueColumnShowTitleIcon property

ValueColumnShowTitleIcon

Enables display of the value column header as icon.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **ValueColumnShowTitleIcon**. The data type is BOOLEAN.

ValueColumnSort property

ValueColumnSort

Defines the sorting order of the value column referenced in "ValueColumnIndex" .

The following settings are available:

Value	Description	Explanation
0	No	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **ValueColumnSort** . The data type is LONG.

ValueColumnSortIndex property

ValueColumnSortIndex

Defines the sorting order of the value column referenced in "ValueColumnIndex". The sorting criterion is removed from "ValueColumnSort" if you set a "0" value..

The attribute can be assigned dynamic properties by means of the name **ValueColumnSortIndex**. The data type is LONG.

ValueColumnState property

ValueColumnState

Displays the data connection status of a selected value column in Runtime.

The attribute can be assigned dynamic properties by means of the name **ValueColumnState**. The data type is LONG.

ValueColumnTagName property

Tag name - ValueColumnTagName

Displays the name of connected tags. You can change the tag connection using the selection button.

The attribute can be assigned dynamic properties by means of the name **ValueColumnTagName**. The data type is STRING.

ValueColumnTimeColumn property

Time column - ValueColumnTimeColumn

Specifies the time column for displaying the value column selected. Define the available time columns in the "Time columns" tab.

The attribute can be assigned dynamic properties by means of the name **ValueColumnTimeColumn**. The data type is STRING.

ValueColumnVisible property

Value columns - ValueColumnVisible

The list shows all value columns you created. Click a value column entry in the list to adapt the properties, to assign the value column, and to define the data connection.

Select the value columns to be displayed in the table from the list. Value columns are displayed if interconnected with a time column.

The attribute can be assigned dynamic properties by means of the name **ValueColumnVisible** . The data type is BOOLEAN.

ValueMax Property

Description

Defines the value at the end of the scale. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ValueMin Property

Description

Defines the value at the start of the scale. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

Variable Property

Description

The "Index" property references a pair of columns. "Tag" defines the name of the tag which should be connected to this column pair.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

VerticalGridLines property

Vertical - VerticalGridLines

Enables the display of vertical dividers.

Value	Explanation
TRUE	Enables the displays of vertical dividers.
FALSE	Disables the display of vertical dividers.

The attribute can be assigned dynamic properties by means of the name **VerticalGridLines**. The data type is BOOLEAN.

Visible Property

Description

witches an object visible or invisible or issues a corresponding value:

- TRUE : Object is visible
- FALSE : Object is invisible

VARIANT_BOOL (write-read access)

Example:

The following example sets all the objects in the picture "NewPDL1" to invisible:

```
'VBS95
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
```

```
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
objScrItem.Visible = False
Next
```

ScreenItem Object (Page 141)

Layer Object (Page 136)

HMIRuntime Object (Page 134)

1.14.4.22 W

Warning Property

Description

Defines the start of the "Warning zone" as a scale value. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

WarningColor Property

Description

Defines the color of the "Warning zone" o the scale. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

WarningHigh Property

Description

Defines or returns the upper limit value for "Warning High".
In order that the limit value is monitored, the "CheckWarningHigh" property must be set to TRUE.
The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningHigh" and "TypeWarningHigh" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

WarningLow Property

Description

Defines or returns the lower limit value for "Warning Low".
In order that the limit value is monitored, the "CheckWarningLow" property must be set to TRUE.
The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningLow" and "TypeWarningLow" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

Width Property

Description

Sets or outputs the width of an object in pixels.

LONG

Example:

The following example doubles the width of all objects in the pictures "NewPDL1" whose name begins with "Button":

```
'VBS96
Dim objScreen
```

```
Dim cmdButton
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'Get all "Buttons"
strName = objScreen.ScreenItems(lngIndex).ObjectName
If "Button" = Left(strName, 6) Then
Set cmdButton = objScreen.ScreenItems(strName)
cmdButton.Width = cmdButton.Width * 2
End If
Next
```

See also

Height Property (Page 430)

ScreenItem Object (Page 141)

WinCCStyle property

Description

Defines the style in which the object is displayed.

User Defined	Shows the object according to the respective settings.
Global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

WindowBorder Property

Description

TRUE, when the window is displayed with borders in Runtime. Read only access.

See also

Picture Window (Page 194)

Application Window (Page 188)

ScreenItem Object (Page 141)

WindowPositionMode property

Description

Defines the position and scaling of the picture window on the screen. It is only effective if the "Independent window" attribute is set to TRUE.

Standard	The picture window is positioned in its original size in the configured position on the screen.
Center	The picture window is positioned in its original size, centered on the screen.
Maximize	The picture window is scaled to the size of the screen.

WindowsStyle property

Description

Defines whether the object is displayed in the Windows style of WinCC version 6.2. It can only be selected if "WinCC Classic" is chosen as the current design.

TRUE if the object is displayed in the Windows style of WinCC version 6.2.

FALSE if the object is not displayed in the Windows style of WinCC version 6.2.

WindowsStyle Property

Description

TRUE, when the object complies with the general Windows style (e.g. gray buttons without borders). BOOLEAN write-read access. Note:

- When this property is set to "True", the properties which do not comply with the Windows style are ignored (e.g. "BorderWidth").
- On the other hand, the definition of a "BorderWidth" or a background color other than gray causes "WindowsStyle" to receive the value"False".
- Exceptions here are the flash attributes: The definition of flash attributes does not automatically lead to the deactivation of the "WindowsStyle" attribute.

See also

Slider (Page 226)

Button (Page 215)

ScreenItem Object (Page 141)

WindowType Property

Description

Defines the use of the message window.

- 0 - Message list: shows the currently pending messages.
- 1 - Short-term archive list: shows the archived messages.
- 2 - Long-term archive list: shows the archived messages.
- 3 - Lock list: shows the currently locked messages.
- 4 - Hit list: To display the statistical information of messages.

1.14.4.23 X - Z

XAxisColor property (before WinCC V7)

Description

Use this attribute to define the color for the common X-axis. The color is defined as an RGB value. LONG write-read access.

X/YAxisAdd property

New - X/YAxisAdd

Creates a new X or Y axis.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAdd** .

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAdd** .

The data type is STRING.

X/YAxisAlign property

Alignment - X/YAxisAlign

Defines the alignment mode for a selected axis.

The following settings are available for the X axis:

Value	Description	Explanation
0	Bottom	The X axis selected is displayed below the trend.
1	Top	The X axis selected is displayed above the trend.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAlign**. The data type is LONG.

The following settings are available for the Y axis:

Value	Description	Explanation
0	left	The X axis selected is displayed on left side of the trend.
1	right	The X axis selected is displayed on right side of the trend.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAlign**. The data type is LONG.

X/YAxisAutoPrecisions property

Decimal places automatic - X/YAxisAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The number of decimal places is set automatically. The value in the "Decimal places" or "X/YAxisPrecisions" field is disabled.
FALSE	The value in the "Decimal places" or "X/YAxisPrecisions" field is active.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAutoPrecisions**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAutoPrecisions**.

The data type is BOOLEAN.

X/YAxisAutoRange property

Value range automatic - X/YAxisAutoRange

Enables automatic calculation of the value range of the axis selected.

Value	Explanation
TRUE	The range of values is calculated automatically.
FALSE	The range of values is calculated based on the values configured in the "from" and "to" or "X/YAxisBeginValue" and "X/YAxisEndValue" fields.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAutoRange**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAutoRange**.

The data type is BOOLEAN.

X/YAxisBeginValue property

Value range from - X/YAxisBeginValue

Specifies the lower range of values of the axis selected. You can configure the value if the "Automatic" option is disabled or "X/YAxisAutoRange" is "FALSE".

The X axis attribute can be assigned dynamic properties by means of the name **XAxisBeginValue**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisBeginValue**.

The data type is DOUBLE.

X/YAxisColor property

Color XY axis - X/YAxisColor

Specifies the color of the axis selected. The button opens the "Color selection" dialog to select the color.

The setting is only active if the "Use trend color" field is disabled or "X/YAxisInTrendColor" is "FALSE".

The X axis attribute can be assigned dynamic properties by means of the name **XAxisColor**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisColor**.

The data type is LONG.

X/YAxisEndValue property

Value range to - X/YAxisEndValue

Specifies the upper range of values of the axis selected. You can configure the value if the "Automatic" option is disabled or "X/YAxisAutoRange" is "FALSE".

The X axis attribute can be assigned dynamic properties by means of the name **XAxisEndValue**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisEndValue**.

The data type is DOUBLE.

X/YAxisExponentialFormat property

Exponential notation - X/YAxisExponentialFormat

Enables the exponential notation for visualization of a selected axis.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisExponentialFormat**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisExponentialFormat**.

The data type is BOOLEAN.

X/YAxisInTrendColor property

Use trend color - X/YAxisInTrendColor

Enables the display of an axis selected in the trend color. The color of the first trend is activated if several trends are displayed in the trend window. Define the order of trends on the "Trends" tab.

Value	Explanation
TRUE	The axis selected is displayed in the trend color. The setting in the "Color" or "X/YAxisColor" field is disabled.
FALSE	The axis selected is displayed in the color set in the "Color" or "X/YAxisColor" field.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisInTrendColor**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisInTrendColor**.

The data type is BOOLEAN.

X/YAxisLabel property

Label - X/YAxisLabel

Defines the label text for a selected axis.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisLabel**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisLabel**.

The data type is STRING.

X/YAxisName property

Object name - X/YAxisName

Specifies the name of a selected axis.

Attribute "XAxisName" can be assigned dynamic properties for the X axis by means of **XAxisRename** attribute.

Attribute "YAxisName" can be assigned dynamic properties for the Y axis by means of **YAxisRename** attribute.

The data type is STRING.

X/YAxisPrecisions property

Decimal places - X/YAxisPrecisions

Specifies the decimal precision for displaying the axis selected. The value can be configured and is active in Runtime, if the "Automatic" option is disabled or "X/YAxisAutoPrecisions" is "FALSE".

The X axis attribute can be assigned dynamic properties by means of the name **XAxisPrecisions**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisPrecisions**.

The data type is SHORT.

X/YAxisRemove property

Remove - X/YAxisRemove

Removes the selected axis from the list.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisRemove** .

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisRemove** .

The data type is STRING.

X/YAxisRepos property

Up/Down - X/YAxisRepos

Changes the sorting order of the axes. "Up" and "Down" move the axis selected up or down in the list.

The list order determines the axis position in the trend window. The axis output position is moved away from the trend if the axis is moved further up in the list and the orientation is the same.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisRepos** .

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisRepos** .

The data type is LONG.

X/YAxisScalingType property

Scaling - X/YAxisScalingType

Defines the scaling mode for a selected axis.

The following settings are available:

Value	Description
0	Linear
1	Logarithmic
2	Logarithmically negated

The X axis attribute can be assigned dynamic properties by means of the name **XAxisScalingType**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisScalingType**.

The data type is LONG.

X/YAxisTrendWindow property

Trend window - X/YAxisTrendWindow

Specifies the trend window for a selected axis. Define the available trend windows in the "Trend window" tab.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisTrendWindow**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisTrendWindow**.

The data type is STRING.

X/YAxisVisible property

X/Y axes - X/YAxisVisible

The list shows all axes you created. Click an axis entry in the list to adapt the properties and to assign the axis to a trend window.

Activate the axes to be displayed in the trend windows in the list.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisVisible** .

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisVisible** .

The data type is BOOLEAN.

XAxisCount property

XAxisCount

Defines the number of X axes configured.

The attribute can be assigned dynamic properties by means of the name **XAxisCount**. The data type is LONG.

XAxisIndex property

XAxisIndex

References a configured X axis. Using this attribute you can assign the values of other attributes to a specific X axis.

Values between 0 and "XAxisCount" minus 1 are valid for "Index"; the attribute "XAxisCount" defines the number of configured X axes.

The "XAxisIndex" attribute can be assigned dynamic properties by means of attribute **XAxisRepos**. The data type is LONG.

XAxisRename property

XAxisRename

Renames the X axis which is referenced by means of "XAxisIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **XAxisRename**. "XAxisRename" also sets a dynamic attribute "XAxisName". The data type is STRING.

YAxisCount property

YAxisCount

Defines the number of Y axes configured.

The attribute can be assigned dynamic properties by means of the name **YAxisCount**. The data type is LONG.

YAxisIndex property

YAxisIndex

References a configured Y axis. Using this attribute you can assign the values of other attributes to a specific Y axis.

Values between 0 and "YAxisCount" minus 1 are valid for "Index". Attribute "YAxisCount" defines the number of configured Y axes.

The "YAxisIndex" attribute can be assigned dynamic properties by means of attribute **YAxisRepos**. The data type is LONG.

YAxisRename property

YAxisRename

Renames the Y axis which is referenced by means of "YAxisIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **YAxisRename**. "YAxisRename" also sets a dynamic attribute "YAxisName". The data type is STRING.

ZeroPoint Property

Description

Defines or returns the position of the zero point of the bar graph.
Specify the value as a %age of the total bar height. The zero point can also be outside of the range represented.
The "ScalingType" property must be set to "2" and "Scaling" to TRUE.

See also

ScreenItem Object (Page 141)

Bar (Page 189)

ZeroPointValue Property

Description

Defines the value of the zero point of the scale indicator.

Defines or returns the absolute value for the zero point.

See also

Bar (Page 189)

3D Bar (Page 184)

ScreenItem Object (Page 141)

Zoom Property

Description

Sets the zoom factor within a picture or picture window or reads it out.

If the indicated zoom factor is smaller than the minimum value, the zoom factor is automatically set to the minimum value. If the indicated zoom factor is larger than the minimum value, the zoom factor is automatically set to the maximum value.

The minimum value of the zoom factor is at 2%, the maximum value at 800%.

With the Screen Object the zoom factor is indicated as a numeric value and with a picture window object, it is indicated in percent.

Example:

The following example doubles the zoom factor of the current picture:

```
'VBS97
HMIRuntime.ActiveScreen.Zoom = HMIRuntime.ActiveScreen.Zoom * 2
```

Screen Object (Page 146)

1.14.5 Methods

1.14.5.1 Methods

Overview

Methods, which are applied to individual objects, can be used to read out tag values for further processing or displaying diagnostics messages in Runtime.

Available Methods in VBS

Activate	GetStatusbarElement	MoveToNext	ShowInfoText
ActivateDynamic	GetStatusbarElementCollection	MoveToNextLine	ShowLockDialog
Add	GetTimeAxis	MoveToNextPage	ShowLockList
AttachDB	GetTimeAxisCollection	MoveToPrevious	ShowLongTermArchiveList
CalculateStatistic	GetTimeColumn	MoveToPreviousLine	ShowMessageList
CopyRows	GetTimeColumnCollection	MoveToPreviousPage	ShowPercentageAxis
CreateTagSet	GetToolbarButton	NextColumn	ShowPropertyDialog
CutRows	GetToolbarButtonCollection	NextTrend	ShowSelectArchive

DeactivateDynamic	GetTrend	OneToOneView	ShowSelection
DeleteRows	GetTrendCollection	PasteRows	ShowSelectionDialog
DetachDB	GetTrendWindow	PreviousColumn	ShowSelectTimeBase
Edit	GetTrendWindowCollection	PreviousTrend	ShowShortTermArchiveList
Export	GetValueAxis	Print	ShowSort
GetColumn	GetValueAxisCollection	QuitHorn	ShowSortDialog
GetColumnCollection	GetValueColumn	QuitSelected	ShowTagSelection
GetHitlistColumn	GetValueColumnCollection	QuitVisible	ShowTimebaseDialog
GetHitlistColumnCollection	GetXAxis	Read	ShowTimeSelection
GetMessageBlock	GetXAxisCollection	ReadTags	ShowTrendSelection
GetMessageBlockCollection	GetYAxis	Refresh	StartStopUpdate
GetMessageColumn	GetYAxisCollection	Remove	Stop
GetMessageColumnCollection	HideAlarm	RemoveAll	Trace
GetOperatorMessage	Item Method	Restore	UnhideAlarm
GetOperatorMessageCollection	LockAlarm	SelectedStatisticArea	UnlockAlarm
GetRulerBlock	LoopInAlarm	ServerExport	Write
GetRulerBlockCollection	MoveAxis	ServerImport	WriteTags
GetRulerColumn	MoveRuler (Page 757)	ShowColumnSelection	ZoomArea
GetRulerColumnCollection	MoveToFirst	ShowComment	ZoomInOut
GetRulerData	MoveToFirstLine	ShowDisplayOptionsDialog	ZoomInOutTime
GetStatisticAreaColumn	MoveToFirstPage	ShowEmergencyQuitDialog	ZoomInOutValues
GetStatisticAreaColumnCollection	MoveToLast	ShowHelp	ZoomInOutX
GetStatisticResultColumn	MoveToLastLine	ShowHideList	ZoomInOutY
GetStatisticResultColumnCollection	MoveToLastPage	ShowHitList	ZoomMove

1.14.5.2 Methods A to E

Activate Method

Function

Activates the specified picture and picture element, respectively.

Note

Focus assignments should not be configured during a ButtonDown event. Since the focus is specifically requested during the ButtonDown event, invalid states may occur.

Syntax

```
Expression.Activate
```

Expression

Necessary. An expression which returns an object of type "Screen" or "ScreenItem".

Parameters

--

Examples

The following example shows the use for type "Screen":

```
'VBS98
Dim objScreen
MsgBox HMIRuntime.ActiveScreen.ObjectName    'Output of active screen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.Activate    'Activate "ScreenWindow1"
MsgBox HMIRuntime.ActiveScreen.ObjectName    'New output of active screen
```

The following example shows the use for type "ScreenItem":

```
'VBS158
MsgBox HMIRuntime.ActiveScreen.ActiveScreenItem.ObjectName  'Output of active screen item
HMIRuntime.ActiveScreen.ScreenItems("IOField1").Activate
MsgBox HMIRuntime.ActiveScreen.ActiveScreenItem.ObjectName  'New output of active screen
item
```

See also

ScreenItem Object (Page 141)

Screen Object (Page 146)

ActivateDynamic method

Function

Dynamically activates a trigger for the defined property and with the defined cycle during runtime. Every time the trigger is activated a different activation cycle can be used.

Examples of this method are available in chapter "VBS for creating procedures and action > Creating and editing actions > Trigger > Animation trigger".

Syntax

```
Expression.ActivateDynamic (ByVAl bstrPropertyName As String, ByVal
bstrCycleName As String)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Parameters	Description
bstrPropertyName	Name of property to which trigger relates.
bstrCycleName	Name of activation cycle, e.g. "CycleTime1s".

See also

Animation trigger (Page 82)

Add Method

Description of TagSet Object

Adds a tag to the list. A tag may be added to the tag object by using name or reference.

syntax

```
Expression.Add [Tag]
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be added to the list.

Example:

In the following example, a TagSet object is generated and a tag is added.

```
'VBS170
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
```

Tag objects may also be added as follows.

```
'VBS171
Dim Tag
Set Tag = HMIRuntime.Tags("Motor2")
Dim group2
Set group2 = HMIRuntime.Tags.CreateTagSet
group2.Add Tag
```

Description of DataSet Object

Adds a value or object reference to the list.

Note

The Data Set Object does not support classes.
Objects of type Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet cannot be included in the DataSet list.
For object references it must be ascertained that objects are multiread-enabled.

syntax

```
Expression.Add [vtName], [vtUserData]
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

VARIANT

Parameters	Description
vtName	Name by which value or tag are to be added to list.
vtUserData	Value to be added to list.

Example:

In this example, a value is included in the DataSet list.

```
'VBS172
HMIRuntime.DataSet.Add "Motor1",23
```

See also

TagSet Object (List) (Page 156)

DataSet Object (List) (Page 132)

AttachDB method

Function

Executes the "Connect backup" key function of the control.

Syntax

```
Ausdruck.AttachDB()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

CalculateStatistic method

Function

Executes the "Calculate statistics" key function of the OnlineTrendControl and OnlineTableControl.

Syntax

```
Ausdruck.CalculateStatistic()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

CopyRows method

Function

Executes the "Copy lines" key function of the control.

Syntax

```
Ausdruck.CopyRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Create method

Function

Creates a new Alarm object.

Syntax

```
Expression.Create (VARIANT vtApplication)
```

Expression

Necessary. An expression which returns an object of type "Alarm".

Parameters

```
VARIANT
```

Parameters	Description
vtApplication	Name of alarm object (optional)

See also

Alarms object (list) (Page 126)

CreateTagSet Method

Function

Creates a new TagSet object. This object may be used for optimized multi-tag access.

syntax

```
Expression.CreateTagSet()
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Example:

The following example shows how to create a TagSet object.

```
'VBS168
'Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
```

See also

TagSet Object (List) (Page 156)
Tags Object (List) (Page 155)

CutRows method

Function

Executes the "Cut lines" key function of the UserArchiveControl.

Syntax

```
Ausdruck.CutRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

DeactivateDynamic method

Function

Deactivates the trigger used with the "ActivateDynamic" method for the defined property during runtime.

Syntax

```
Ausdruck.DeactivateDynamic(ByVal bstrPropertyName As String)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

String

Parameters	Description
bstrPropertyName	Name of property to which trigger relates.

DeleteRows method

Function

Executes the "Delete Rows" key function of the UserArchiveControl.

Syntax

```
Ausdruck.DeleteRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

DetachDB method

Function

Executes the "Disconnect backup" key function of the control.

Syntax

```
Ausdruck.DetachDB()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Edit method

Function

Executes the "Edit" key function of the OnlineTableControl.

Syntax

```
Ausdruck.Edit()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Export Method

Function

Executes the "Export archive" or "Export data" key function of the control.

Syntax

```
Ausdruck.Export()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

1.14.5.3 Get methods

GetColumn method

Function

Returns the name or index designated column object of the WinCC UserArchiveControl as type "ICCAxUAColumn".

Syntax

```
Ausdruck.GetColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of UserArchiveControl.

Example

```
'VBS312
```

```
Dim ctrl
Dim objColumn
Set ctrl = ScreenItems("UAControl")
Set objColumn = ctrl.GetColumn("Field1")
objColumn.Length = 30
Set objColumn = ctrl.GetColumn(3)
objColumn.Align = 2
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Column" listing, for example, you write "objColumn.Align" instead of "objColumn.ColumnAlign".

See also

Column object (list) (Page 235)

GetColumnCollection method

Function

Returns the list of all column objects of the WinCC UserArchiveControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS313
Dim ctrl
Dim coll
Dim field
Set ctrl = ScreenItems("UAControl")
Set coll = ctrl.GetColumnCollection
HMIRuntime.Trace "Number of fields:" & coll.Count & vbCrLf
For Each field In coll
 HMIRuntime.Trace field.Name & vbCrLf
 HMIRuntime.Trace field.Type & vbCrLf
 HMIRuntime.Trace field.Length & vbCrLf
 HMIRuntime.Trace field.Caption & vbCrLf
Next
```

See also

Column object (list) (Page 235)

GetHitlistColumn method

Function

Returns the name or index designated column object of the hitlist of the WinCC AlarmControl as type "ICCAxMessageColumn".

Syntax

```
Expression.GetHitlistColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of hitlist column

Example

```
'VBS314
Dim ctrl
Dim objHitlistColumn
Set ctrl = ScreenItems("AlarmControl")
Set objHitlistColumn = ctrl.GetHitlistColumn("Date")
objHitlistColumn.Sort = 2
Set objHitlistColumn = ctrl.GetHitlistColumn("AverageComeGo")
objHitlistColumn.Visible = FALSE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "HitlistColumn" listing, for example, you write "objHitlistColumn.Visible" instead of "objHitlistColumn.HitlistColumnVisible".

See also

HitlistColumn object (list) (Page 236)

GetHistlistColumnCollection method

Function

Returns the list of all column objects of the WinCC AlarmControl hitlist as type "ICCAxCollection".

Syntax

```
Expression.GetHitlisteColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS315
Dim ctrl
Dim coll
Dim hitlistcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetHitlistColumnCollection
HMIRuntime.Trace "Number of hitlist columns:" & coll.Count & vbCrLf
For Each hitlistcol In coll
 HMIRuntime.Trace hitlistcol.Index & vbCrLf
 HMIRuntime.Trace hitlistcol.Name & vbCrLf
 HMIRuntime.Trace hitlistcol.Sort & vbCrLf
 HMIRuntime.Trace hitlistcol.SortIndex & vbCrLf
Next
```

See also

HitlistColumn object (list) (Page 236)

GetMessageBlock method

Function

Returns the name or index designated message block object of the WinCC AlarmControl as type "ICCAxMessageBlock".

Syntax

```
Expression.GetMessageBlock(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of message block.

Example

```
'VBS316
Dim ctrl
Dim objMsgBlock
Set ctrl = ScreenItems("AlarmControl")
Set objMsgBlock = ctrl.GetMessageBlock("Date")
objMsgBlock.Align = 2
Set objMsgBlock = ctrl.GetMessageBlock("Number")
objMsgBlock.LeadingZeros = 4
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "MessageBlock" listing, for example, you write "objMsgBlock.Align" instead of "objMsgBlock.MessageBlockAlign".

See also

MessageBlock object (list) (Page 237)

GetMessageBlockCollection method

Function

Returns the list of all message block objects of the WinCC AlarmControl as type "ICCAxCollection".

Syntax

```
Expression.GetMessageBlockCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS317
Dim ctrl
Dim coll
Dim msgblock
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageBlockCollection
For Each msgblock In coll
 msgblock.Align = 1
 msgblock.Length = 12
 msgblock.Selected = TRUE
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "MessageBlock" listing, for example, you write "msgblock.Align" instead of "msgblock.MessageBlockAlign".

See also

MessageBlock object (list) (Page 237)

GetMessageColumn method

Function

Returns the name or index designated column object of the WinCC AlarmControl as type "ICCAxMessageColumn".

Syntax

```
Expression.GetMessageColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column in message list.

Example

```
'VBS318
Dim ctrl
Dim objMessColumn
Set ctrl = ScreenItems("AlarmControl")
Set objMessColumn = ctrl.GetMessageColumn("Date")
objMessColumn.Visible = FALSE
Set objMessColumn = ctrl.GetMessageColumn("Number")
objMessColumn.Sort = 1
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "MessageColumn" listing, for example, you write "objMessColumn.Visible" instead of "objMessColumn.MessageColumnVisible".

MessageColumn object (list) (Page 238)

GetMessageColumnCollection method

Function

Returns the list of all column objects of the WinCC AlarmControl as type "ICCAxCollection".

Syntax

```
Expression.GetMessageColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS319
Dim ctrl
Dim coll
Dim msgcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageColumnCollection
HMIRuntime.Trace "Number of message columns:" & coll.Count & vbCrLf
For Each msgcol In coll
 HMIRuntime.Trace msgcol.Index & vbCrLf
 HMIRuntime.Trace msgcol.Name & vbCrLf
 HMIRuntime.Trace msgcol.Sort & vbCrLf
 HMIRuntime.Trace msgcol.SortIndex & vbCrLf
Next
```

MessageColumn object (list) (Page 238)

GetOperatorMessage method

Function

Returns the name or index designated operator message object of the WinCC AlarmControl as type "ICCAxOperatorMessage".

Syntax

```
Expression.GetOperatorMessage(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of operator message

Example

```
'VBS320
Dim ctrl
Dim objOpMess
Set ctrl = ScreenItems("AlarmControl")
Set objOpMess = ctrl.GetOperatorMessage(0)
objOpMess.Source1 = "Number"
objOpMess.SourceType1 = 1
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "OperatorMessage" listing, for example, you write "objOpMess.Source1" instead of "objOpMess.OperatorMessageSource1".

See also

OperatorMessage object (list) (Page 239)

GetOperatorMessageCollection method

Function

Returns the list of all operator message objects of the WinCC AlarmControl as type "ICCAxCollection".

Syntax

```
Expression.GetOperatorMessageCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS321
Dim ctrl
Dim coll
Dim opmsg
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetOperatorMessageCollection
For Each opmsg In coll
 HMIRuntime.Trace opmsg.Index & vbCrLf
 HMIRuntime.Trace opmsg.Name & vbCrLf
 HMIRuntime.Trace opmsg.Number & vbCrLf
 HMIRuntime.Trace opmsg.Selected & vbCrLf
Next
```

See also

OperatorMessage object (list) (Page 239)

GetRow method

Function

Returns the row number designated row object of the table-based controls as type "ICCAxDataRow".

Syntax

```
Expression.GetRow(ByVal IRow As Long)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Long

Parameters	Description
IRow	Number of the desired line of the control.

Example

```
'VBS356
Dim ctrl
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("UAControl")
Set coll = ctrl.GetRowCollection
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
 HMIRuntime.trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & "  "
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
  HMIRuntime.Trace ctrl.GetRow(0).CellText(lCellIndex) & " "
  HMIRuntime.trace ctrl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.trace vbNewLine
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

See also

Row object (list) (Page 240)

GetRowCollection method

Function

Returns the list of all row objects of the table-based controls type "ICCAxDataRowCollection".

Syntax

```
Expression.GetRowCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Properties of the ICCAxDataRowCollection

The ICCAxDataRowCollection refers to runtime data. The data is read-only. It is not possible to add and edit the data.

The following properties are available for the ICCAxDataRowCollection:

- Count - Determines the number of rows in the collection.
- Item - Access to an individual row within the collection via the row number. Numbering runs from 1 to Count. A Row object is returned.

Example

```
'VBS357
Dim ctrl
Dim coll
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetRowCollection
HMIRuntime.Trace "Number of message rows:" & coll.Count & vbCrLf
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
 HMIRuntime.Trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & "  "
```

```
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
  HMIRuntime.Trace ctrl.GetMessageColumn(lCellIndex -1).Name & " "
  HMIRuntime.Trace ctrl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.Trace vbNewLine
Next
```

Row object (list) (Page 240)

GetRulerBlock method

Function

Returns the Block object designated as name or index of the WinCC RulerControl as type "ICCAxRulerBlock".

Syntax

```
Expression.GetRulerBlock(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of block in RulerControl

Example

```
'VBS322
Dim ctrl
Dim objRulerBlock
Set ctrl = ScreenItems("RulerControl")
Set objRulerBlock = ctrl.GetRulerBlock(0)
objRulerBlock.Caption = "RulerBlock1"
Set objRulerBlock = ctrl.GetRulerBlock("Name")
objRulerBlock.Length = 10
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "RulerBlock" listing, for example, you write "objRulerBlock.Caption" instead of "objRulerBlock.BlockCaption".

See also

RulerBlock object (list) (Page 241)

GetRulerBlockCollection method

Function

Returns the list of all Block objects of the WinCC RulerControl as type "ICCAxCollection".

Syntax

```
Expression.GetRulerBlockCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS323
Dim ctrl
Dim coll
Dim rulerblock
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerBlockCollection
For Each rulerblock In coll
 rulerblock.Align = 1
 rulerblock.Length = 12
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "RulerBlock" listing, for example, you write "rulerblock.Align" instead of "rulerblock.RulerBlockAlign".

See also

RulerBlock object (list) (Page 241)

GetRulerColumn method

Function

Returns the Column object designated as name or index of the WinCC RulerControl as type "ICCAxRulerColumn".

Syntax

```
Expression.GetRulerColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of RulerControl.

Example

```
'VBS324
Dim ctrl
Dim objRulercol
Set ctrl = ScreenItems("RulerControl")
Set objRulercol = ctrl.GetRulerColumn("Name")
objRulercol.Sort = 0
Set objRulercol = ctrl.GetRulerColumn("ValueY")
objRulercol.Visible = FALSE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "RulerColumn" listing, for example, you write "objRulercol.Visible" instead of "objRulercol.ColumnVisible".

See also

RulerColumn object (list) (Page 241)

GetRulerColumnCollection method

Function

Returns the list of all Column objects of the WinCC RulerControl as type "ICCAxCollection".

Syntax

```
Expression.GetRulerColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS325
Dim ctrl
Dim coll
Dim rulercol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerColumnCollection
HMIRuntime.Trace "Number of ruler columns:" & coll.Count & vbCrLf
For Each rulercol In coll
 HMIRuntime.Trace rulercol.Index & vbCrLf
 HMIRuntime.Trace rulercol.Name & vbCrLf
 HMIRuntime.Trace rulercol.Sort & vbCrLf
 HMIRuntime.Trace rulercol.SortIndex & vbCrLf
Next
```

RulerColumn object (list) (Page 241)

GetRulerData method

Function

Returns the value of the called trend at the ruler position.

Syntax

```
Expression.GetRulerData(ByVal RulerIndex As Long, pvValue As
Variant, Optional pvTimeStamp As Variant, Optional pvFlags As
Varian) Long
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Parameters

Parameters	Description
RulerIndex	0 =Ruler
pvValue	Value of X axis
pvTimeStamp	Time or value of the Y axis
pvFlags	Qualitycode

Example

```
'VBS326
Dim ctrl
Dim objTrend
Dim objIOField1
Dim objIOField2
    Dim value
Dim time
Set ctrl = ScreenItems( "Control1" )
Set objTrend = ctrl.GetTrend( "Trend 1" )
Set objIOField1 = ScreenItems( "I/O Field1" )
Set objIOField2 = ScreenItems( "I/O Field2" )
objTrend.GetRulerData 0, value, time
objIOField1.OutputValue = value
objIOField2.OutputValue = time
```

GetSelectedRow method

Function

Returns the selected row object of the table-based controls as type "ICCAxDataRow".

Syntax

```
Expression.GetSelectedRow()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Example

```
'VBS358
Dim ctrl
 Dim lCellIndex
 Dim lCellCount
 Dim headingRow
 Dim selectedRow
 Set ctrl = ScreenItems("TableControl")
 Set headingRow = ctrl.GetRow(0)
 Set selectedRow = ctrl.GetSelectedRow
 lCellCount = headingRow.CellCount
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To lCellCount
  HMIRuntime.trace headingRow.CellText(lCellIndex) & ":  "
  HMIRuntime.trace selectedRow.CellText(lCellIndex)
    HMIRuntime.trace vbNewLine
 Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

See also

Row object (list) (Page 240)

GetSelectedRows method

Function

Returns the selected row objects of the table-based controls as type "ICCAxDataRow"for multiple selection.

Syntax

```
Expression.GetSelectedRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Example

```
'VBS359
Dim ctrl
 Dim lCellIndex
 Dim lCellCount
 Dim lRowIndex
 Dim lRowCount
 Dim headingRow
 Dim selectedRow
 Dim selectedRows
 Set ctrl = ScreenItems("TableControl")
 Set headingRow = ctrl.GetRow(0)
 Set selectedRows = ctrl.GetSelectedRows
 lCellCount = headingRow.CellCount
 lRowCount = selectedRows.Count
 'enumerate selected rows
 For lRowIndex = 1 To lRowCount
  Set selectedRow = selectedRows(lRowIndex)
  HMIRuntime.Trace "Row number: " & CStr(lRowIndex) & vbNewLine
  'enumerate and trace out column titles and cell texts
  For lCellIndex = 1 To lCellCount
   HMIRuntime.trace headingRow.CellText(lCellIndex) & ":  "
   HMIRuntime.trace selectedRow.CellText(lCellIndex)
     HMIRuntime.trace vbNewLine
  Next
 Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

See also

Row object (list) (Page 240)

GetStatisticAreaColumn method

Function

Returns the name or index designated Column object of the WinCC RulerControl statistics area window as type "ICCAxRulerColumn".

Syntax

```
Ausdruck.GetStatisticAreaColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics area window.

Example

```
'VBS327
Dim ctrl
Dim objStatAreaCol
Set ctrl = ScreenItems("RulerControl")
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("DatasourceY")
objStatAreaCol.Visible = FALSE
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("ValueY(LL)")
objStatAreaCol.Sort = 1
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "StatisticAreaColumn" listing, for example, you write "objStatAreaCol.Visible" instead of "objStatAreaCol.ColumnVisible".

See also

StatisticAreaColumn object (list) (Page 242)

GetStatisticAreaColumnCollection method

Function

Returns the list of all column objects of the WinCC RulerControl statistics area window as type "ICCAxCollection".

Syntax

```
Ausdruck.GetStatisticAreaColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS328
Dim ctrl
Dim coll
Dim statcol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetStatisticAreaColumnCollection
HMIRuntime.Trace "Number of statistic Area columns:" & coll.Count & vbCrLf
For Each statcol In coll
 HMIRuntime.Trace statcol.Index & vbCrLf
 HMIRuntime.Trace statcol.Name & vbCrLf
 HMIRuntime.Trace statcol.Sort & vbCrLf
 HMIRuntime.Trace statcol.SortIndex & vbCrLf
Next
```

GetStatisticResultColumn method

Function

Returns the name or index designated Column object of the WinCC RulerControl statistics window as type "ICCAxRulerColumn".

Syntax

```
Ausdruck.GetStatisticResultColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics window.

Example

```
'VBS329
Dim ctrl
Dim objStatResCol
Set ctrl = ScreenItems("RulerControl")
Set objStatResCol = ctrl.GetStatisticResultColumn("MaxValue")
objStatResCol.Visible = FALSE
Set objStatResCol = ctrl.GetStatisticResultColumn("Average")
objStatResCol.Sort = 2
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "StatisticResultColumn" listing, for example, you write "objStatResCol.Visible" instead of "objStatResCol.ColumnVisible".

StatisticResultColumn object (list) (Page 243)

GetStatisticResultColumnCollection method

Function

Returns the list of all Column objects of the WinCC RulerControl statistics window as type "ICCAxCollection".

Syntax

```
Ausdruck.GetStatisticResultColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS330
Dim ctrl
Dim coll
Dim statcol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetStatisticResultColumnCollection
HMIRuntime.Trace "Number of statistic result columns:" & coll.Count & vbCrLf
For Each statcol In coll
 HMIRuntime.Trace statcol.Index & vbCrLf
 HMIRuntime.Trace statcol.Name & vbCrLf
 HMIRuntime.Trace statcol.Sort & vbCrLf
 HMIRuntime.Trace statcol.SortIndex & vbCrLf
```

```
Next
```

GetStatusbarElement method

Function

Returns the element of the control status bar designated as name or index as type "ICCAxStatusbarElement".

Syntax

```
Ausdruck.GetStatusbarElement(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of status bar element.

Example

```
'VBS331
Dim ctrl
Dim objStatusBar
Set ctrl = ScreenItems( "Control1" )
Set objStatusBar = ctrl.GetStatusbarElement(1)
objStatusBar.Visible = FALSE
Set objStatusBar = ctrl.GetStatusbarElement(3)
objStatusBar.Width = 10
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "StatusbarElement" listing, for example, you write "objStatusBar.Visible" instead of "objStatusBar.StatusbarElementVisible".

See also

StatusbarElement object (list) (Page 244)

GetStatusbarElementCollection method

Function

Returns the list of all status bar elements of the control as type "ICCAxCollection".

Syntax

```
Ausdruck.GetStatusbarElementCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS332
Dim ctrl
Dim coll
Dim statelement
Set ctrl = ScreenItems.Item("Control1")
Set coll = ctrl.GetStatusbarElementCollection
HMIRuntime.Trace "Number of statusbar elements:" & coll.Count & vbCrLf
For Each statelement In coll
 HMIRuntime.Trace statelement.Name & vbCrLf
 HMIRuntime.Trace statelement.Width & vbCrLf
 HMIRuntime.Trace statelement.Text & vbCrLf
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "StatusbarElement" listing, for example, you write "statelement.Name" instead of "statelement.StatusbarElementName".

See also

StatusbarElement object (list) (Page 244)

GetTimeAxis method

Function

Returns the time axis object designated as name or index of the WinCC OnlineTrendControl as type "ICCAxTimeAxis".

Syntax

```
Ausdruck.GetTimeAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time axis.

Example

```
'VBS333
Dim ctrl
Dim objTimeAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTimeAxis = ctrl.GetTimeAxis(1)
objTimeAxis.Visible = FALSE
Set objTimeAxis = ctrl.GetTimeAxis("axis 2")
objTimeAxis.Label = "Time axis 2"
objTimeAxis.DateFormat = "dd.MM.yy"
objTimeAxis.TimeFormat = "HH:mm:ss.ms"
objTimeAxis.RangeType = 2
objTimeAxis.BeginTime = "06.04.2010 9:33:18"
objTimeAxis.MeasurePoints = 100
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "TimeAxis" listing, for example, you write "objTimeAx.Visible" instead of "objTimeAx.TimeAxisVisible".

See also

TimeAxis object (list) (Page 244)

GetTimeAxisCollection method

Function

Returns the list of all time axis objects of the WinCC OnlineTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetTimeAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS334
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis1
Dim objTimeAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis1 = ctrl.GetTimeAxisCollection.AddItem("TimeAxis2010")
Set objTimeAxis2 = ctrl.GetTimeAxisCollection.AddItem("TimeAxis2011")
objTimeAxis1.TrendWindow = objTrendWnd.Name
objTimeAxis1.Label = "2010"
objTimeAxis1.RangeType = 1
objTimeAxis1.BeginTime = "01.01.2010 0:00:00"
objTimeAxis1.EndTime = "31.12.2010 11:59:59"
objTimeAxis2.TrendWindow = objTrendWnd.Name
objTimeAxis2.Label = "2011"
objTimeAxis2.RangeType = 1
objTimeAxis2.BeginTime = "01.01.2011 0:00:00"
objTimeAxis2.EndTime = "31.12.2011 11:59:59"
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis2.Name
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "TimeAxis" listing, for example, you write "objTimeAxis1.Label" instead of "objTimeAxis1.TimeAxisLabel".

See also

TimeAxis object (list) (Page 244)

GetTimeColumn method

Function

Returns the time column object designated as name or index of the WinCC OnlineTableControl as type "ICCAxTimeColumn".

Syntax

```
Ausdruck.GetTimeColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time column.

Example

```
'VBS335
Dim ctrl
Dim objTimeCol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol = ctrl.GetTimeColumn("Timecolumn1")
objTimeCol.ShowDate = FALSE
Set objTimeCol = ctrl.GetTimeColumn("Timecolumn2")
objTimeCol.Visible = FALSE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "TimeColumn" listing, for example, you write "objTimeColumn.ShowDate" instead of "objTimeColumn.TimeColumnShowDate".

See also

TimeColumn object (list) (Page 245)

GetTimeColumnCollection method

Function

Returns the list of all time column objects of the WinCC OnlineTableControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetTimeColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS336
```

```
Dim ctrl
Dim objTimeCol1
Dim objTimeCol2
Dim coll
Dim timecol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol1 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2010")
Set objTimeCol2 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2011")
objTimeCol1.Caption = "2010"
objTimeCol1.RangeType = 1
objTimeCol1.BeginTime = "01.01.2010 0:00:00"
objTimeCol1.EndTime = "31.12.2010 11:59:59"
objTimeCol2.Caption = "2011"
objTimeCol2.RangeType = 0
objTimeCol2.BeginTime = "01.01.2011 0:00:00"
objTimeCol2.TimeRangeFactor = 1
objTimeCol2.TimeRangeBase = 3600000
Set coll = ctrl.GetTimeColumnCollection
For Each timecol In coll
 timecol.Align = 1
 timecol.Length = 12
 timecol.BackColor = RGB(240,240,0)
 timecol.ForeColor = RGB(130,160,255)
Next
```

See also

TimeColumn object (list) (Page 245)

GetToolbarButton method

Function

Returns the name or index designated toolbar button function of the control as type "ICCAxToolbarButton".

Syntax

```
Ausdruck.GetToolbarButton(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of toolbar button function.

Example

```
'VBS337
Dim ctrl
Set ctrl = ScreenItems( "Control1" )
Dim toolbu
Set toolbu = ctrl.GetToolbarButton ("ShowHelp")
HMIRuntime.Trace "Name: " & toolbu.Name & vbCrLf
HMIRuntime.Trace "Index: " & toolbu.Index & vbCrLf
HMIRuntime.Trace "Hotkey: " & toolbu.HotKey & vbCrLf
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "ToolbarButton" listing, for example, you write "toolbu.Index" instead of "toolbu.ToolbarButtonIndex".

See also

ToolbarButton object (list) (Page 246)

GetToolbarButtonCollection method

Function

Returns the list of all toolbar button functions of the control as type "ICCAxCollection".

Syntax

```
Ausdruck.GetToolbarButtonCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following methods are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS338
Dim ctrl
Dim coll
Dim toolbu
Set ctrl = ScreenItems( "Control1" )
Set coll = ctrl.GetToolbarButtonCollection
HMIRuntime.Trace "Number of toolbar buttons:" & coll.Count & vbCrLf
For Each toolbu In coll
 HMIRuntime.Trace toolbu.Name & vbCrLf
 HMIRuntime.Trace "Hotkey: " & toolbu.HotKey & vbCrLf
 HMIRuntime.Trace "Authorization: " & toolbu.PasswordLevel & vbCrLf
Next
```

ToolbarButton object (list) (Page 246)

GetTrend method

Function

Returns the trend object designated as name or index of the WinCC OnlineTrendControl or WinCC FunctionTrendControl as type "ICCAxTrend" or "ICCAxFunctionTrend".

Syntax

```
Ausdruck.GetTrend(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve.

Example

```
'VBS339
Dim ctrl
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrend = ctrl.GetTrend( "Trend 1" )
objTrend.PointStyle = 1
objTrend.LineWidth = 4
Set objTrend = ctrl.GetTrend(2)
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag2"
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Trend" listing, for example, you write "objTrend.PointStyle" instead of "objTrend.TrendPointStyle".

See also

Trend object (list) (Page 247)

GetTrendCollection method

Function

Returns the list of all trend objects of the WinCC OnlineTrendControl or WinCC FunctionTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetTrendCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS340
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValAxis = ctrl.GetValueAxisCollection.AddItem("myValueAxis")
objTimeAxis.TrendWindow = objTrendWnd.Name
objValAxis.TrendWindow = objTrendWnd.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag1"
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValAxis.Name
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Trend" listing, for example, you write "objTrend.TagName" instead of "objTrend.TrendTagName".

See also

Trend object (list) (Page 247)

GetTrendWindow method

Function

Returns the trend window object designated as name or index of the WinCC OnlineTrendControl or WinCC FunctionTrendControl as type "ICCAxTrendWindow".

Syntax

```
Ausdruck.GetTrendWindow(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve window.

Example

```
'VBS341
Dim ctrl
Dim objTrendWnd
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindow(1)
objTrendWnd.Visible = FALSE
Set objTrendWnd = ctrl.GetTrendWindow("trend window 2")
objTrendWnd.VerticalGrid = TRUE
objTrendWnd.FineGrid = TRUE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "TrendWindow" listing, for example, you write "objTrendWnd.Visible" instead of "objTrendWnd.TrendWindowVisible".

See also

TrendWindow object (list) (Page 249)

GetTrendWindowCollection method

Function

Returns the list of all trend window objects of the WinCC OnlineTrendControl or WinCC FunctionTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetTrendWindowCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS342
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValAxis = ctrl.GetValueAxisCollection.AddItem("myValueAxis")
objTimeAxis.TrendWindow = objTrendWnd.Name
objValAxis.TrendWindow = objTrendWnd.Name
```

See also

TrendWindow object (list) (Page 249)

GetValueAxis method

Function

Returns the value axis object designated as name or index of the WinCC OnlineTrendControl as type "ICCAxValueAxis".

Syntax

```
Ausdruck.GetValueAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of value axis.

Example

```
'VBS343
Dim ctrl
Dim objValAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objValAxis = ctrl.GetValueAxis(1)
objValAxis.Visible = FALSE
Set objValAxis = ctrl.GetValueAxis("axis 2")
objValAxis.Label = "Value axis 2"
objValAxis.ScalingType = 0
objValAxis.Precisions = 2
objValAxis.AutoRange = TRUE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "ValueAxis" listing, for example, you write "objValueAx.Visible" instead of "objValueAx.ValueAxisVisible".

See also

ValueAxis object (list) (Page 250)

GetValueAxisCollection method

Function

Returns the list of all value axis objects of the WinCC OnlineTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetValueAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS344
Dim ctrl
Dim objTrendWnd
Dim objValAxis1
Dim objValAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objValAxis1 = ctrl.GetValueAxisCollection.AddItem("myValueAxis1")
Set objValAxis2 = ctrl.GetValueAxisCollection.AddItem("myValueAxis2")
objValAxis1.TrendWindow = objTrendWnd.Name
objValAxis1.Label = "Value1"
```

```
objValAxis2.TrendWindow = objTrendWnd.Name
objValAxis2.inTrendColor = TRUE
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis2.Name
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "ValueAxis" listing, for example, you write "objValueAxis1.Label" instead of "objValueAxis1.ValueAxisLabel".

See also

ValueAxis object (list) (Page 250)

GetValueColumn method

Function

Returns the column object designated as name or index of the WinCC OnlineTableControl as type "ICCAxValueColumn".

Syntax

```
Ausdruck.GetValueColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of value column of OnlineTableControl.

Example

```
'VBS345
Dim ctrl
Dim objValueColumn
Set ctrl = ScreenItems("TableControl")
Set objValueColumn = ctrl.GetValueColumn("Valuecolumn1")
objValueColumn.Precisions = 4
Set objValueColumn = ctrl.GetValueColumn(2)
objValueColumn.ExponentialFormat = TRUE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "ValueColumn" listing, for example, you write "objValueColumn.Precisions" instead of "objValueColumn.ValueColumnPrecisions".

See also

ValueColumn object (list) (Page 250)

GetValueColumnCollection method

Function

Returns the list of all value column objects of the WinCC OnlineTableControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetValueColulmnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS346
Dim ctrl
Dim objValCol1
Dim objValCol2
Dim coll
Dim valcol
Set ctrl = ScreenItems("TableControl")
Set objValCol1 = ctrl.GetValueColumnCollection.AddItem("ValueColumn1")
Set objValCol2 = ctrl.GetValueColumnCollection.AddItem("ValueColumn2")
objValCol1.Caption = "Value Archive"
objValCol1.Provider = 1
objValCol1.TagName = "ProcessValueArchive\arch1"
objValCol1.TimeColumn = "TimeColumn1"
objValCol2.Caption = "Value Tag"
objValCol2.Provider = 2
objValCol2.TagName = "tagxx"
objValCol2.TimeColumn = "TimeColumn2"
Set coll = ctrl.GetValueColumnCollection
For Each valcol In coll
 valcol.Align = 2
 valcol.Length = 10
 valcol.AutoPrecisions = TRUE
Next
```

See also

ValueColumn object (list) (Page 250)

GetXAxis method

Function

Returns the X axis object designated as name or index of the WinCC FunctionTrendControl as type "ICCAxValueAxis".

Syntax

```
Ausdruck.GetXAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of X axis.

Example

```
'VBS347
Dim ctrl
Dim objXAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAx = ctrl.GetXAxis(1)
objXAx.Visible = FALSE
Set objXAx = ctrl.GetXAxis("axis 2")
objXAx.Label = "X axis 2"
objXAx.ScalingType = 0
objXAx.Precisions = 2
objXAx.Color = RGB(109,109,109)
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "XAxis" listing, for example, you write "objXAx.Visible" instead of "objXAx.XAxisVisible".

See also

XAxis object (list) (Page 251)

GetXAxisCollection method

Function

Returns the list of all X axis objects of the WinCC FunctionTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetXAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS348
Dim ctrl
Dim objXAxis1
Dim objXAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAxis1 = ctrl.GetXAxisCollection.AddItem("myXAxis1")
objXAxis1.Label = "temperature"
Set objXAxis2 = ctrl.GetXAxisCollection.AddItem("myXAxis2")
objXAxis2.Label = "pressure"
Set coll = ctrl.GetXAxisCollection
HMIRuntime.Trace "Number of XAxis:" & coll.Count & vbCrLf
For Each axes In coll
 HMIRuntime.Trace axes.Name & vbCrLf
 HMIRuntime.Trace axes.Label & vbCrLf
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "XAxis" listing, for example, you write "objXAxis1.Label" instead of "objXAxis1.XAxisLabel".

XAxis object (list) (Page 251)

GetYAxis method

Function

Returns the Y axis object designated as name or index of the WinCC FunctionTrendControl as type "ICCAxValueAxis".

Syntax

```
Ausdruck.GetYAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of Y axis.

Example

```
'VBS349
Dim ctrl
Dim objYAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAx = ctrl.GetYAxis(1)
objYAx.Visible = FALSE
Set objYAx = ctrl.GetYAxis("axis 2")
objYAx.Label = "Y axis 2"
```

```
objYAx.Align = 0
objYAx.Precisions = 3
objYAx.EndValue = 90.000
objYAx.BeginValue = 10.000
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "YAxis" listing, for example, you write "objYAx.Visible" instead of "objYAx.YAxisVisible".

See also

YAxis object (list) (Page 252)

GetYAxisCollection method

Function

Returns the list of all Y axis objects of the WinCC FunctionTrendControl of type "ICCAxCollection".

Syntax

```
Ausdruck.GetYAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS350
Dim ctrl
Dim objYAxis1
Dim objYAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAxis1 = ctrl.GetXAxisCollection.AddItem("myYAxis1")
objYAxis1.Label = "temperature"
Set objYAxis2 = ctrl.GetXAxisCollection.AddItem("myYAxis2")
objYAxis2.Label = "pressure"
Set coll = ctrl.GetYAxisCollection
HMIRuntime.Trace "Number of YAxis:" & coll.Count & vbCrLf
For Each axes In coll
 HMIRuntime.Trace axes.Name & vbCrLf
 HMIRuntime.Trace axes.Label & vbCrLf
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "YAxis" listing, for example, you write "objYAxis1.Label" instead of "objYAxis1.YAxisLabel".

YAxis object (list) (Page 252)

1.14.5.4 Methods H to M

HideAlarm method

Function

Executes the "Hide messages" key function of the AlarmControl.

Syntax

```
Expression.HideAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

InsertData method

Function

Adds data to the called trend.

Syntax

```
Expression.InsertData(dblAxisX As Variant, dblAxisY As Variant)
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Parameters

Parameters	Description
dblAxisX	Value of X axis
dblAxisY	Value of Y axis

Example

```
'VBS300
Dim lngFactor
Dim dblAxisX
Dim dblAxisY
Dim objTrendControl
Dim objTrend
Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")
For lngFactor = -100 To 100
dblAxisX = CDbl(lngFactor * 0.02)
dblAxisY = CDbl(dblAxisX * dblAxisX + 2 * dblAxisX + 1)
objTrend.InsertData dblAxisX, dblAxisY
Next
```

Item Method

Function

Retrieves an object from a collection and enables access to it via Index.

Description of DataItem Object

Access uses the name under which the value was added to the list. Single access using an index is not recommended since the index changes during adding or deleting of values.

syntax

```
Expression.Item()
```

Expression

Necessary. An expression which returns an object of the type "Screens", "Layers" (or "Tags").

Note

In the case of "Tags", restricted functional scope! The standard methods get_Count and get_NewEnum are missing so that access via Index nor the counting of all tags is possible.

Parameters

VARIANT

Example:

The following example issues the names of all objects contained in the picture "NewPDL1":

```
'VBS99
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim lngAnswer
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'The objects will be indicate by Item()
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
lngAnswer = MsgBox(objScrItem.ObjectName, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

See also

ScreenItem Object (Page 141)

Tags Object (List) (Page 155)

Alarms object (list) (Page 126)

ProcessValues Object (List) (Page 140)

LockAlarm method

Function

Executes the "Lock Alarm" key function of the AlarmControl.

Syntax

```
Expression.LockAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

LoopInAlarm method

Function

Executes the "Loop in Alarm" key function of the AlarmControl.

Syntax

```
Expression.LoopInAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

MoveAxis method

Function

Executes the "Move axis" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Expression.MoveAxis()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

MoveRuler

Function

Moves the ruler from a specified reference point by a specified distance.

Syntax

```
Expression.MoveRuler( RulerIndex As Long, RulerMoveRef As Long,
MoveDistance As Long, Optional vTrendWindow As Variant )
```

Expression

Required. An expression that returns an object of the "ScreenItem" type.

Parameter

Parameter	Description
RulerIndex	Specifies the ruler to move: 0 = Ruler 1 = Ruler at the start of the statistics area 2 = Ruler at the end of the statistics area
RulerMoveRef	Specifies the reference point as orientation for the third parameter "MoveDistance": 0 = Time axis start position 1 = Current ruler position 2 = Time axis end position
MoveDistance	Number of pixels by which the ruler is moved away from reference point "RulerMoveRef".
vTrendWindow	Optional parameter for handling several, independent trend windows. Specifies the trend window in which the ruler is moved. The ruler moves in all trend windows if this parameter is not specified.

Return value

Function that returns the new ruler position.

Example

Table 1-1 Move ruler left by 10 pixels

```
'VBS367
Sub OnClick(ByVal Item)
Dim ctrl
Set ctrl = ScreenItems.Item("Control1")
call ctrl.MoveRuler (0, 1, -10)
End Sub
```

In the example, the ruler is moved by -10 pixels, starting at reference point 1 (current ruler position). The ruler is now positioned 10 pixels away from the left of its original position.

Example

Table 1-2 Move ruler right by 10 pixels

```
'VBS368
Sub OnClick(ByVal Item)
Dim ctrl
Set ctrl = ScreenItems.Item("Control1")
ctrl.MoveRuler 0, 1, 10
End Sub
```

In the example, the ruler is moved by 10 pixels, starting at reference point 1 (current ruler position). The ruler is now positioned 10 pixels away from the right of its original position.

Example

Table 1-3 Move ruler to end on opening of the window

```
'VBS369
Sub OnOpen()
Dim ctrl
Set ctrl = ScreenItems.Item("Control1")
ctrl.MoveRuler 0, 2, 0
End Sub
```

In the example, the ruler is moved by 0 pixels, starting at reference point 2 (time axis end position). The ruler is now positioned at the time axis end position.

Example

Table 1-4 Calculate current ruler position

```
'VBS370
```

```
Sub OnClick(ByVal Item)
Dim ctrl
Set ctrl = ScreenItems.Item("Control1")
Dim pos
pos = ctrl.MoveRuler (0, 1, 0)
HmiRuntime.Trace "RulerPosition=" & pos & vbCrLf
End Sub
```

In the example, the ruler is moved by 0 pixels, starting at reference point 1 (current ruler position). The ruler remains in its original position. The ruler position is returned as value.

MoveToFirst method

Function

Executes the "First line" key function of the control.

Syntax

```
Expression.MoveToFirst()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

MoveToFirstLine method

Function

Executes the "First message" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToFirstLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

MoveToFirstPage method

Function

Executes the "First page" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToFirstPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

MoveToLast method

Function

Executes the "Last data record" key function of the control.

Syntax

```
Ausdruck.MoveToLast()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

MoveToLastLine method

Function

Executes the "Last message" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToLastLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

MoveToLastPage method

Function

Executes the "Last page" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToLastPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

MoveToNext method

Function

Executes the "Next data record" key function of the control.

Syntax

```
Ausdruck.MoveToNext()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

MoveToNextLine method

Function

Executes the "Next message" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToNextLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

MoveToNextPage method

Function

Executes the "Next page" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToNextPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

MoveToPrevious method

Function

Executes the "Previous data record" key function of the control.

Syntax

```
Ausdruck.MoveToPrevious()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

MoveToPreviousLine method

Function

Executes the "Previous message" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToPreviousLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

MoveToPreviousPage method

Function

Executes the "Previous page" key function of the AlarmControl.

syntax

```
Ausdruck.MoveToPreviousPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

1.14.5.5 Methods N to R

NextColumn method

Function

Executes the "Next column" key function of the OnlineTableControl.

Syntax

```
Ausdruck.NextColumn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

NextTrend method

Function

Executes the "Next curve" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.NextTrend()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

OneToOneView method

Function

Executes the "Original view" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.OneToOneView()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

PasteRows method

Function

Executes the "Paste Rows" key function of the UserArchiveControl.

Syntax

```
Expression.PasteRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

PreviousColumn method

Function

Executes the "Previous column" key function of the OnlineTableControl.

Syntax

```
Ausdruck.PreviousColumn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

PreviousTrend method

Function

Executes the "Previous curve" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.PreviousTrend()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Print method

Function

Executes the "Print" key function of the control.

Syntax

```
Ausdruck.Print()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

QuitHorn method

Function

Executes the "Acknowledge central signaling devices" key function of the AlarmControl.

Syntax

```
Ausdruck.QuitHorn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

QuitSelected method

Function

Executes the "Single acknowledgment" key function of the AlarmControl.

Syntax

```
Ausdruck.QuitSelected()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

QuitVisible method

Function

Executes the "Group acknowledgment" key function of the AlarmControl.

Syntax

```
Ausdruck.QuitVisible()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Read Method

Description of Tag Object

Reads out the status of a tag (tag object) shortly after the moment it was called. At the same time, the tag object is provided with the values read. Upon reading a tag, its value, quality code and time stamp are determined. The "LastError" property can be used to determine whether the call was successful.

The "Name", "ServerPrefix" and "TagPrefix" properties are not changed as a result.

If the value of the tag is read successfully, the properties of the tag object are assigned the following values:

Property	Assignment
Value	Tag values
Name	Tag name (unchanged)
QualityCode	Quality level
Timestamp	Current tag time stamp
LastError	0
ErrorDescription	" "

If the value of the tag is not read successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	VT_Empty
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Read operation error codes
ErrorDescription	Error description on LastError

Note

A summary of possible Quality Codes may be found in WinCC Information System under key word "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

syntax

```
Expression.Read([Readmode])
```

Expression

Necessary. An expression which returns a tag object. The return value of the Read method is the value of the tag read out.

Parameters

The optional "Readmode" parameter enables the distinction between two types of reading:

Parameters	Description
0	The tag value is read from the process image (cache). 0 is the default value.
1	The value of a tag is read directly from AS or channel (direct).

If the "Readmode" parameter is omitted, the value is read from the process image by default. The return value of the Read method is the tag value read out as VARIANT.

Reading From the Process Image

When reading from the process image, the tag is logged on and, from that moment, polled cyclically from the PLC. The login cycle is dependent on the configured trigger. The value is read from the tag image by WinCC. For Close Picture, the tag actions are ended again. The call is characterized by the following:

- The value is read by WinCC from the tag image.
- The call is faster in comparison to direct reading (except with the first call: The first call basically takes longer because the value from the PLC must be read out and logged on.)
- The duration of the call is not dependent on the bus load or AS.

Behavior in actions with a tag trigger

All of the tags contained in the tag trigger are already known with Open Picture and are registered with the defined monitoring time. Since all tags are requested at once, the best possible optimization can be targeted from the channel. If a tag, contained in the trigger, is requested with Read during an action, the value already exists and is transferred directly to the call. If a tag is requested which is not contained in the trigger, the behavior is the same as with a standard trigger.

Behavior in actions with a cyclic trigger

tags are registered with half of the cycle time with the first call. For every other call, the value is present.

Behavior in event-driven actions

The tag is registered in the "upon change" mode with the first call. Process tags that are registered in the "upon change" mode correspond with a cyclic read job with a cycle time of 1s.

If an event (e.g. mouse click) requests a value asynchronously, the tag is transferred to the tag image. The tag is requested cyclically from the AS as of this point in time and therefore increases the basic load. To bypass this increase in the basic load, the value can also be read synchronously. The synchronous call causes a one-off increase in the communication load but the tag is not transferred to the tag image.

Direct reading

In the case of direct reading, the current value is returned. The tag is not registered cyclically, the value is requested from the AS one time only. Direct reading has the following properties:

- The value is read explicitly from the AS.
- The call takes longer compared to reading from the process image.
- The duration of the call is dependent on the bus load and AS, amongst other things.

Example:

Reading a tag directly from AS or channel

```
'VBS100
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read(1)    'Read direct
MsgBox vntValue
```

Reading a tag from the process image

```
'VBS101
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read    'Read from cache
MsgBox vntValue
```

Description of TagSet Object

The TagSet object offers the option of reading several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

Expression

Necessary. An expression which returns an object of type "TagSet".

Reading From the Process Image

The TagSet object offers the advantage of requesting several tags in one read command. The tags are registered in the process image as a group, improving performance in the process.

Direct reading

Since one call may process several read commands, performance is enhanced in comparison to single calls.

Example:

The following example shows how tags are included in the TagSet list, how tag values are imported and subsequently read.

```
'VBS174
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Read
HMIRuntime.Trace "Motor1: " & group("Motor1").Value & vbNewLine
HMIRuntime.Trace "Motor2: " & group("Motor2").Value & vbNewLine
```

If the optional parameter "Readmode" is set to 1, the process tags are not registered but read directly from AS or channel.

```
group.Read 1
```

Example: Writing tag values (Page 811)

LastError Property (Page 445)

ErrorDescription Property (Page 398)

TagSet Object (List) (Page 156)

Tag Object (Page 152)

Read Tags method

Function

Executes the "Read tags" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ReadTags()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Refresh Method

Function

Drawing all visible pictures again.

syntax

```
Expression.Refresh
```

Expression

Necessary. An expression which returns a "Screens" or "Screen" type object.

Parameters

--

Examples

The first example forces all visible pictures to be drawn again:

```
'VBS149
HMIRuntime.Screens.Refresh
```

The second example forces the basic picture to be immediately redrawn:

```
'VBS150
HMIRuntime.Screens(1).Refresh
```

Screen Object (Page 146)

Screens Object (List) (Page 149)

HMIRuntime Object (Page 134)

Remove Method

Description of TagSet Object

Removes a tag from the TagSet list. The tag may be removed by name or reference to a tag object.

syntax

```
Expression.Remove [Tag]
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be removed from the list.

Example:

The following example shows how several tags are included in the TagSet list, and how to remove a tag again.

```
'VBS175
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Remove "Motor1"
```

Description of DataSet Object

Deletes the element specified in parameter "Name" from a list.

syntax

```
Expression.Remove [Name]
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

VARIANT

Parameters	Description
Name	Name of the object to be removed from the list.

Example:

The example shows how to remove the object "motor1" from the list.

```
'VBS166
HMIRuntime.DataSet.Remove("motor1")
```

Description of objects Logging, AlarmLogs, DataLogs

The method deletes a previously swapped archive segment from the Runtime project.

Archive segments deleted with the "Remove" method are removed from the common archiving directory of the project.

The call may require a somewhat longer time period, depending on archive data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be avoided if you start the call in a Global Scripting action, such as starting the action through a triggering tag.

The archive separation and deletion creates a CPU load. This will affect performance.

Note

Calling up the "Remove" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

For redundancy, the following applies: Re-swapped archives are deleted with the "Remove" method only on the computer from which the method was initiated.

syntax

Objects Logging, AlarmLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [ServerPrefix]
```

Expression

Necessary. An expression which returns an object of type "Logging" or "AlarmLogs".

Object DataLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [Type] [ServerPrefix]
```

Expression

Necessary. An expression which returns an object of type "DataLogs".

Parameters

TimeFrom

Point in time, from which the archives are to be deleted.
When indicating the time format, a short form is also possible. This is described in the "Time Format" section.

TimeTo

Time up to which archive segments are to be deleted.
When indicating the time format, a short form is also possible. This is described in the "Time Format" section.

Timeout

Timeout in milliseconds.
If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

Type:

Type of archive.
The parameter can (optionally) be used only to delete archive segments of the tag logging.
The following values can be entered:

Assigned Value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

ServerPrefix

Reserved for future versions.

Return value

If an error occurred during deletion of the archive segments, the method will return an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Time format

Time format is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the statement may be in the form of "YYYY-MM" or "YYYY-MM-DD hh". Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all archive segments between September 2004 up to and including October 4th are to be swapped.

Example:

In the following example, archive segments re-swapped after the fact for a specified time period may be removed and the return value may be output as Trace.

```
'VBS182
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("2004-08-22","2004-09-22",-1) &
vbNewLine
```

In the following example, all archive segments re-swapped after the fact may be removed and the return value may be output as Trace.

```
'VBS183
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("","",-1) & vbNewLine
```

AlarmLogs Object (Page 128)

TagSet Object (List) (Page 156)

RemoveAll Method

Description of TagSet Object

Deletes all tags from a TagSet list.

syntax

```
Expression.RemoveAll
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

--

Example:

The following example shows how several tags are included in the TagSet list, and how to remove all tags again.

```
'VBS176
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.RemoveAll
```

Description of DataSet Object

Deletes all values or object references from a DataSet list.

syntax

```
Expression.RemoveAll
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

--

Example:

The example shows how all objects are removed from the list.

```
'VBS167
HMIRuntime.DataSet.RemoveAll
```

See also

DataSet Object (List) (Page 132)

TagSet Object (List) (Page 156)

Tag Object (Page 152)

RemoveData method

Function

Deletes the data of the called trend.

Syntax

```
Expression.RemoveData
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Example

```
'VBS310
Dim objTrendControl
Dim objTrend
Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")
objTrend.RemoveData
```

Restore Method

Description of objects Logging, AlarmLogs, DataLogs

The method adds swapped archive segments to the Runtime project.

Upon swapping, the archive segments are copied to the common archiving directory of the project. Therefore, the appropriate storage capacity must be available.

The call may require a somewhat longer time period, depending on archive data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be avoided if you start the call in a Global Scripting action, such as starting the action through a triggering tag.

Linking / copying of the archives generates a CPU load because the SQL server experiences additional load because of turned-on signature checking in particular. Copying of archive segments will slow down hard disk access.

Upon turned-on signature checking, an error message is returned if an unsigned or modified archive is to be swapped. There is always only one error message returned, even if several

errors occurred during the swap process. Additionally, a WinCC system message is generated for each archive segment. An entry is added to the Windows event log in the "Application" section. This provides the opportunity to check which archive segments are creating the error.

- With an unsigned archive, the return value "0x8004720F" is returned. The archive is stored. The following text is entered in the event display:
  "Validation of database <db_name> failed! No signature found!"
- With an changed archive, the return value "0x80047207" is returned. The even screen, the entry is "Validation of database <db_name> failed !".
  The archive is not stored.

Note

Calling up the "Restore" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

For redundancy, the following applies: Upon re-swapping of archives with the "Restore" method, only archive segments are added to the Runtime project on the computer from which the method was called.

Syntax

Objects Logging, AlarmLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut]
[ServerPrefix]
```

Expression

Required. An expression which returns an object of type "Logging" or "AlarmLogs".

Object DataLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut] [Type]
[ServerPrefix]
```

Expression

Required. An expression which returns an object of type "DataLogs".

Parameter

SourcePath

Path to archive data.

TimeFrom

Point in time, from which the archives are to be stored.
When indicating the time format, a short form is also possible. This is described in the "Time Format" section.

TimeTo

Time up to which archive segments are to be swapped.
When indicating the time format, a short form is also possible. This is described in the "Time Format" section.

Timeout

Timeout in milliseconds.
If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

Type

Type of archive.
The parameter can (optionally) be used only to store archive segments of the tag logging.
The following values can be entered:

Assigned Value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

ServerPrefix

Reserved for future versions.

Return value

If an error occurred during swapping of archive segments, the method will return an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Time format

Time format is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the statement may be in the form of "YYYY-MM" or "YYYY-MM-DD hh". Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all archive segments between September 2004 up to and including October 4th are to be swapped.

Example

In the following example, all archive segments since the specified time period are re-swapped, and the return value is output as Trace.

```
'VBS184
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:\Folder","2004-09-14","",-1) &
vbNewLine
```

In the following example, all Tag Logging Slow archive segments since the specified time period are re-swapped, and the return value is output as Trace.

```
'VBS185
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:\Folder","2004-09-14
12:30:05","2004-09-20 18:30",-1,2) & vbNewLine
```

In the following example, all Alarm Logging archive segments up to the specified time period are re-swapped, and the return value is output as Trace.

```
'VBS186
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Restore("","2004-09-20",-1) &
vbNewLine
```

1.14.5.6 Methods S to T

SelectAll

Function

Selects all rows in the table-based control.

Syntax

```
Expression.SelectAll()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

Row object (list) (Page 240)

SelectRow

Function

Selects a particular row in the table-based control.

Syntax

```
Expression.SelectRow(ByVal IRow As Long, Optional bExtendSelection
As Boolean)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Parameters	Description
IRow	Number of the row to be selected.
bExtendSelection	Indicates as an option whether the current selection will be extended. Is only relevant if multiple selections are possible.

Example

- Row 1 is currently selected. If SelectRow(2, True) is called, then row 1 and row 2 will be selected.
- Row 1 is currently selected. If SelectRow(2, False) or SelectRow(2) is called without an optional parameter, then only row 2 will be selected.

See also

Row object (list) (Page 240)

SelectedStatisticArea method

Function

Executes the "Set statistic area" key function of the OnlineTableControl.

Syntax

```
Ausdruck.SelectedStatisticArea()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ServerExport method

Function

Executes the "Export archive" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ServerExport()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ServerImport method

Function

Executes the "Import archive" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ServerImport()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ShowColumnSelection method

Function

Executes the "Select columns" key function of the OnlineTableControl.

Syntax

```
Ausdruck.ShowColumnSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ShowComment method

Function

Executes the "Comments dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowComment()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ShowDisplayOptionsDialog method

Function

Executes the "Display options dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowDisplayOptionsDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowEmergencyQuitDialog method

Function

Executes the "Emergency acknowledgment" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowEmergencyQuitDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowHelp method

Function

Executes the "Help" key function of the control.

Syntax

```
Ausdruck.ShowHelp()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

ShowHideList method

Function

Executes the "List of messages to be hidden" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowHideList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowHitList method

Function

Executes the "Hitlist" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowHitList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowInfoText method

Function

Executes the "Info text dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowInfoText()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowInsertValue method

Function

Executes the "Create archive value" key function of the OnlineTableControl.

Syntax

```
Expression.ShowInsertValue()
```

Expression

Required. An expression that returns an object of the "ScreenItem" type.

ShowLockDialog method

Function

Executes the "Lock dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowLockDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowLockList method

Function

Executes the "Lock list" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowLockList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowLongTermArchiveList method

Function

Executes the "Long-term archive list" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowLongTermArchiveList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowMessageList method

Function

Executes the "Message list" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowMessageList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowPercentageAxis method

Function

Executes the "Relative axis" key function of the OnlineTrendControl.

Syntax

```
Ausdruck.ShowPercentageAxis()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowPropertyDialog method

Function

Executes the "Configuration dialog" key function of the control.

Syntax

```
Ausdruck.ShowPropertyDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

ShowSelectArchive method

Function

Executes the "Select data connection" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ShowSelectArchive()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ShowSelection method

Function

Executes the "Selection dialog" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ShowSelection ()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ShowSelectTimeBase method

Function

Executes the "Time base dialog" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ShowSelectTimeBase()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowSelectionDialog method

Function

Executes the "Selection dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowSelectionDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowShortTermArchiveList method

Function

Executes the "Short-term archive list" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowShortTermArchiveList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowSort method

Function

Executes the "Sort dialog" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ShowSort()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ShowSortDialog method

Function

Executes the "Sort dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowSortDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ShowTagSelection method

Function

Executes the "Select data connection" key function of the control.

Syntax

```
Ausdruck.ShowTagSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowTimebaseDialog method

Function

Executes the "Time base dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowTimebaseDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowTimeSelection method

Function

Executes the "Select time range" key function of the control.

Syntax

```
Ausdruck.ShowTimeSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ShowTrendSelection method

Function

Executes the "Select trends" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.ShowTrendSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

-- -

StartStopUpdate method

Function

Executes the "Start" or "Stop" key function of the control.

Syntax

```
Ausdruck.StartStopUpdate()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Stop Method

Function

Terminates WinCC Runtime.

syntax

```
HMIRuntime.Stop
```

Parameters

Example:

The following example terminates WinCC Runtime:

```
'VBS124
HMIRuntime.Stop
```

See also

HMIRuntime Object (Page 134)

Trace Method

Description

Displays messages in the diagnostics window.

syntax

```
HMIRuntime.Trace
```

Parameters

STRING

Example:

The following example writes a text in the diagnostics window:

```
'VBS103
HMIRuntime.Trace "Customized error message"
```

See also

HMIRuntime Object (Page 134)

1.14.5.7 Methods U to Z

UnhideAlarm method

Function

Executes the "Unhide alarm" key function of the AlarmControl.

Syntax

```
Ausdruck.UnhideAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

UnlockAlarm method

Function

Executes the "Unlock alarm" key function of the AlarmControl.

Syntax

```
Ausdruck.UnlockAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

UnselectAll

Function

Deselects all rows in the table-based control.

Syntax

```
Expression.UnselectAll()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

Row object (list) (Page 240)

UnselectRow

Function

Deselects a particular row in the table-based control.

Syntax

```
Expression.UnselectRow(ByVal IRow As Long)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Long

Parameters	Description
IRow	Number of the row to be selected.

See also

Row object (list) (Page 240)

Write Method

Description of Tag Object

Writes a value synchronously or asynchronously in a tag. The "LastError" property can be used to determine whether the call was successful.

If the value of the tag is set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	0
ErrorDescription	" "

If the value of the tag is not set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Write operation error codes
ErrorDescription	Error description on LastError

syntax

```
Expression.Write [Value],[Writemode]
```

Expression

Necessary. An expression which returns a tag object.

Parameters

The value to be written can be transferred directly to the method as a parameter. If the parameter is not specified, the value in the "Value" property is used. The "Writemode" option parameter can be used to select whether the tag value should be written synchronously or asynchronously. If the "Writemode" parameter is not used, writing is performed asynchronously as its default value.

During the writing process, no information is supplied on the status of the tags.

The "Value" property contains the value which was set before or during the writing operation, therefore is may not correspond to the real current value of the tag. If the data on the tag should be updated, use the Read method.

Parameters	Description
Value (optional)	The tag value is specified. The specified value overwrites the value in the "Value" property in the tag object. The tag value is not specified. The tag receives the current value from the "Value" property of the tag object.
Writemode (optional)	0 or empty: The tag value is written asynchronously. 0 is the default value. 1: The tag value is written synchronously.

On asynchronous writing, it is written immediately into the tag image. The user does not receive any feedback if the value has been written in the programmable controller, too.

In the case of synchronous writing (direct to the PLC), the writing operation actually occurs when the PLC is ready to operate. The use receives a check-back message if the writing operation was not successful.

Example:

Asynchronous writing

```
'VBS104
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write
MsgBox objTag.Value
```

or

```
'VBS105
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5
MsgBox objTag.Value
```

Synchronous writing

```
'VBS106
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write ,1
MsgBox objTag.Value
```

or

```
'VBS107
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5, 1
MsgBox objTag.Value
```

Description of TagSet Object

The TagSet object offers the option of writing several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

In order to write different values, the "Value" property of individual tag objects must be set, and write must be called thereafter without the "Value" parameter. Since the write commands are grouped into one call, it results in improved performance compared to single calls.

In a TagSet object, it is not possible to pass on a value using the "Write" method. Individual values must be set using the "Value" property of the individual tag objects.

Example:

The following example shows how tags are included in the TagSet list, how tag values are set and subsequently written.

```
'VBS173
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Wert1"
group.Add "Wert2"
group("Wert1").Value = 3
group("Wert2").Value = 9
group.Write
```

If you set the optional parameter "Writemode" equal to 1, the process tags are written synchronously (directly to AS).

```
group.Write 1
```

See also

LastError Property (Page 445)

ErrorDescription Property (Page 398)

TagSet Object (List) (Page 156)

Tag Object (Page 152)

WriteTags method

Function

Executes the "Write tags" key function of the UserArchiveControl.

Syntax

```
Expression.WriteTags()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ZoomArea - Method

Function

Executes the "Zoom area" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.ZoomArea()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

ZoomInOut - Method

Function

Executes the "Zoom +/-" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.ZoomInOut()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ZoomInOutTime method

Function

Executes the "Zoom time axis +/-" key function of the OnlineTrendControl.

Syntax

```
Ausdruck.ZoomInOutTime()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ZoomInOutValues - Method

Function

Executes the "Zoom value axis +/-" key function of the OnlineTrendControl.

Syntax

```
Ausdruck.ZoomInOutValues()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ZoomInOutX method

Function

Executes the "Zoom X axis +/-" key function of the FunctionTrendControl.

Syntax

```
Ausdruck.ZoomInOutX()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ZoomInOutY - Method

Function

Executes the "Zoom Y axis +/-" key function of the FunctionTrendControl.

Syntax

```
Ausdruck.ZoomInOutY()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

ZoomMove method

Function

Executes the "Move trend area" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.ZoomMove()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

1.14.6 Appendix

1.14.6.1 Error Messages from Database Area

Introduction

Upon access to databases, a value is returned upon execution. Values in the range "0x8..." represent an error message. Values not equal to "0x8..." represent a status message.

Status Messages

The following status messages are defined:

0x0	OK
0x1	Function did not find any errors in parameter supply and did not find any internal errors. The following causes may result in this value. When connecting databases: - No archive could be found in the given time window. - Archives were found in the given time window, but they were already connected. When separating databases: - No connected archives could be found in the given time window. No checks are performed on whether or not archives are attached at all.

Error Messages

The following error messages are defined (n in English only):

Error code	Error Message
0x80047200	WinCC is not activated
0x80047201	Invalid archive type
0x80047202	Invalid lower boundary
0x80047203	Invalid upper boundary
0x80047204	Path 'CommonArchiving' could not be created in the project path
0x80047205	Timeout, please retry
0x80047206	WinCC was deactivated
0x80047207	Wrong signification At least one database had a invalid signature and has not been attached.
0x80047208	Database could not be attached
0x80047209	Copy to 'CommonArchiving' is not possible.
0x8004720A	Invalid syntax for database filename.
0x8004720B	No list of databases.
0x8004720C	Database already detached.
0x8004720D	Database could not be detached.
0x8004720F	Unsigned database attached. At least one database without signature has been attached.
0x80047210	Path error : - Path invalid, - no *.MDF files found in specified path or - no permission to specified path.

1.15 Examples of VBScript

1.15.1 Examples of VBScript

Introduction

The following section contains application examples of VBS in WinCC. The "Examples in WinCC" section contains examples of codes with which the WinCC Runtime environment can be made dynamic. These examples have been conceived so that they can be assumed 1:1 in the configuration.

The "General Examples" section contains examples with which to influence the Microsoft environment. There is no guarantee nor support for the running capability of these examples.

See also

Examples in WinCC (Page 806)

1.15.2 Examples in WinCC

1.15.2.1 Examples in WinCC

Introduction

This section contains examples of using VBScript in WinCC with regard to the following topics:

- Access to objects in the Graphics Designer (e.g. color or text change)
- Set color of objects above RGB colors
- Configuring language change
- Deactivate Runtime
- Start external program
- Globally configure picture change (from Global Script)
- Configuring Change Picture Via Property
- Use trace for diagnostics output
- Set value of a tag
- Read value of a tag
- Check the success of a read/write action into a tag
- Asynchronously set value of a tag

Example: Defining the color of objects (Page 808)
Example: Accessing objects in Graphics Designer (Page 807)

1.15.2.2 Example: Accessing objects in Graphics Designer

Introduction

Access can be made to all Graphic Designer objects using VBS WinCC in order to make the graphic Runtime environment dynamic. Graphic objects can be made dynamic on operation (e.g. clicking the mouse on a button), depending on a tag or cyclically (e.g. flashing).

The following examples illustrate how to change a graphic object following a mouse click.

Procedure

In the following example, the radius of a circle is set to 20 in Runtime per mouse click:

```
'VBS121
Dim objCircle
Set objCircle= ScreenItems("Circle1")
objCircle.Radius = 20
```

Note

The expression used in the example only applies to Graphics Designer. In the case of analog actions in Global Script, address the objects using the HMIRuntime object.

See also

Examples in WinCC (Page 805)

1.15.2.3 Example: Defining the color of objects

Introduction

The colors of graphic objects are defined via RGB values (Red/Green/Blue). The color values for graphic objects can be set or read out.

Procedure

The following example defines the fill color for "ScreenWindow1" to blue:

```
'VBS122
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.FillStyle = 131075
objScreen.FillColor = RGB(0, 0, 255)
```

See also

Examples in WinCC (Page 805)

1.15.2.4 Example: How to Configure Language Changes

Introduction

The Runtime language of WinCC can be changed using VBS. The most typical use is buttons with the corresponding language codes which are placed on the start page of a project.

You specify the Runtime language in VBS by using a country code, e.g., 1031 for German - Default, 1033 for English - USA etc. A summary of all country codes may be found in the Basics of VBScript under the subject header "Regional Scheme ID (LCID) Diagram".

Procedure

Use the "Mouse click" event on a button to create a VBS action and enter the following action code to switch the Runtime language to German:

```
'VBS123
HMIRuntime.Language = 1031
```

See also

Examples in WinCC (Page 805)

1.15.2.5 Example: Deactivating Runtime

Introduction

It is possible to terminate WinCC Runtime with VBS, e.g. via a mouse click or in dependence on tag values or other events, such as multiple faulty input of a password when starting Runtime.

What to do

The following example terminates WinCC Runtime:

```
'VBS124
HMIRuntime.Stop
```

See also

Examples in WinCC (Page 805)

1.15.2.6 Example: Configuring change picture globally

Introduction

VBS can be used to initiate a global picture change and thus, for example, display a picture from a server on a client in a distributed system. To do this, server's server prefix must precede the target picture.

What to do

Configure the following code for a picture change to a button, for example:

```
'VBS125
HMIRuntime.BaseScreenName = "Serverprefix::New screen"
```

See also

Examples in WinCC (Page 805)

1.15.2.7 Example: Configuring Change Picture Via Property

Introduction

If partitioned pictures are used in the configuration, e.g. in a basic picture title and operating bar for the user interface and an embedded picture window for the actual picture display, configure a picture change using the properties of the picture window.

The property of the "ScreenName" picture window must be changed in order for the other picture to appear. The action and picture window must be configured in the same picture.

What to do

In the following example, the "test.pdl" picture is displayed in the "ScreenWindow" picture window when executing the action:

```
'VBS126
Dim objScrWindow
Set objScrWindow = ScreenItems("ScreenWindow")
objScrWindow.ScreenName = "test"
```

See also

Examples in WinCC (Page 805)

1.15.2.8 Example: Configuring diagnostics output via Trace

Introduction

If a GSC diagnostics window has been inserted in the picture, diagnostics output can be displayed in the diagnostics window in Runtime using the Trace command.

GSC Diagnostics issues the Trace methods contained in the actions in the chronological sequence they are called. This also applies to Trace instructions in procedures which are called in actions. The targeted implementation of Trace instructions, e.g. for the output of tag values, enables the progress of actions and the procedures called in them to be traced. The Trace instructions are entered in the form "HMIRuntime.Trace(<Ausgabe>)".

The GSC Diagnostics displays trace output from C and VBS.

What to do

The following example writes a text in the diagnostics window:

```
'VBS127
HMIRuntime.Trace "Customized error message"
```

See also

Examples in WinCC (Page 805)

1.15.2.9 Example: Writing tag values

Introduction

Using VBS, it is possible to write a tag value to the PLC, e.g. by clicking the mouse on a button to specify setpoint values, or to set internal tag values to trigger other actions.

Various write variations are mentioned and explained below.

Simple writing

In the following example, a value is written to the "Tag1" tag:

```
'VBS128
HMIRuntime.Tags("Tag1").Write 6
```

This is the simplest form of writing since no object reference is generated.

Writing with object reference

In the following example, a local copy of the tag object is created and a value written to "Tag1":

```
'VBS129
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Write 7
```

Referencing offers the advantage of being able to work with the tag object before writing. The tag value can be read, calculations executed and written again:

```
'VBS130
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
objTag.Value = objTag.Value + 1
objTag.Write
```

Synchronous writing

Normally, the value to be written is transferred to the tag management and processing of the action resumed. In some cases, however, it must be ensured that the value has actually been written before processing of the action can be resumed.

This type of writing is realized by specifying the value 1 for the additional, optional parameters:

```
'VBS131
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Write 8.1
```

or

```
'VBS132
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Value = 8
objTag.Write ,1
```

Note

Please note that the call takes longer in comparison to the standard call. The duration is also dependent on the channel and AS, amongst other things.

The type of writing complies to the SetTagXXXWait() call in C scripting.

Writing with status handling

In order to ensure that a value has been written successfully, it is necessary to execute an error check or determine the status of the tag, after the writing process.

This is done by checking the value of the "LastError" property after writing. When the test proves successful, i.e. the job has been placed successfully, the tag status is checked.

In the case of a write job, the current status from the process is not determined. To establish this, it is necessary to read the tag. The value specified in the Quality Code property after the read process provides an indication of the tag status and, if necessary, makes reference to a failed AS connection.

In the following example, the "Tag1" tag is written. If an error occurs during writing, the error value and error description appear in the Global Script diagnostics window. Finally, the Quality Code is checked. If the Quality Code is no OK (0x80), it is displayed in the diagnostics window.

```
'VBS133
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Write 9
If 0 <> objTag.LastError Then
HMIRuntime.Trace "Error: " & objTag.LastError & vbCrLf & "ErrorDescription: " &
objTag.ErrorDescription & vbCrLf
Else
objTag.Read
```

```
If &H80 <> objTag.QualityCode Then
HMIRuntime.Trace "QualityCode: 0x" & Hex(objTag.QualityCode) & vbCrLf
End If
End If
```

Note

After writing a tag, the QualityCode property of the local tag object is set to "BAD Out of Service" because it is not known which Quality Code manages the tag in the process.

The Quality Code cannot be written from VBS.

See also

Write Method (Page 796)

Examples in WinCC (Page 805)

1.15.2.10 Example: How to Read Tag Values

Introduction

VBS can be used to read and further process a tag value. This makes it possible, for example, to click the mouse on a button to obtain information on the system status or to execute a calculation.

Various read variations are mentioned and explained below.

Simple reading

In the following example, the value of "Tag1" is read and displayed in the Global Script diagnostics window:

```
'VBS134
HMIRuntime.Trace "Value: " & HMIRuntime.Tags("Tag1").Read & vbCrLf
```

This is the simplest form of reading since no object reference is generated.

Reading with object reference

In the following example, a local copy of the tag object is created, the tag value read and displayed in the Global Script diagnostics window:

```
'VBS135
```

```
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
HMIRuntime.Trace "Value: " & objTag.Read & vbCrLf
```

Referencing offers the advantage of being able to work with the tag object. The tag value can be read, calculations executed and written again:

```
'VBS136
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
objTag.Value = objTag.Value + 1
objTag.Write
```

Using the Read method, process tags which have been read are added to the image, from this moment on they cyclically requested from the AS. If the tag is already in the image, the value contained in it is returned.

For Close Picture, the tag actions are ended again.

Note

If a tag is requested in a Global Script action, it remains registered throughout the enter Runtime of WinCC.

Direct reading

Normally, the tag values are read from the tag image. In certain situations, however, it may be necessary to read the value direct from the AS, e.g. to synchronize fast processes.

If the optional parameter is set to 1 for the read process, the tag is not logged in cyclically but the value is requested once from the AS.

```
'VBS137
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
HMIRuntime.Trace "Value: " & objTag.Read(1) & vbCrLf
```

Note

Please note that the call takes longer in comparison to the standard call. The duration is also dependent on the channel and AS, amongst other things.

This type of call must be avoided in the case of cyclic C actions because this is the main reason for performance problems.

This type of read process corresponds to GetTagXXXWait() call from C scripting.

Reading with status handling

In order to ensure that a value is valid, a check should be made following reading. This occurs by the fact that the Quality Code is controlled.

In the following example, the "myWord" tag is read and the QualityCode then checked. When the Quality Code does not correspond to OK (0x80) the LastError, ErrorDescription and QualityCode properties are displayed in the Global Script diagnostics window.

```
'VBS138
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
If &H80 <> objTag.QualityCode Then
HMIRuntime.Trace "Error: " & objTag.LastError & vbCrLf & "ErrorDescription: " &
objTag.ErrorDescription & vbCrLf & "QualityCode: 0x" & Hex(objTag.QualityCode) & vbCrLf
Else
HMIRuntime.Trace "Value: " & objTag.Value & vbCrLf
End If
```

Note

If an error occurs during reading, QualityCode is set to BAD NON-SPECIFIC. Therefore, it is sufficient to check the QualityCode following reading.

See also

Read Method (Page 767)

Examples in WinCC (Page 805)

1.15.2.11 Example: Writing Object Properties

Introduction

VBS enables access to the properties of all Graphics Designer picture objects. Properties can be read out to be modified or changed during Runtime.

The following examples illustrate various forms of access.

Simple setting of a property

In the following example, the background color of the "Rectangle1" object contained in the picture is set to red:

```
'VBS139
ScreenItems("Rectangle1").BackColor = RGB(255,0,0)
This is the simplest form of writing since no object reference is generated.
```

Note

If the work is completed without an object reference, only the standard properties are provided in Intellisense.

The form of expression used in the example only applies to Graphics Designer. In the case of analog actions in Global Script, address the objects using the HMIRuntime object.

Setting a property with object reference

In the following example, a reference is created to the "Rectangle1" object contained in the picture and the background is set to red using the VBS standard function RGB():

```
'VBS140
Dim objRectangle
Set objRectangle = ScreenItems("Rectangle1")
objRectangle.BackColor = RGB(255,0,0)
```

Referencing is useful when several object properties must be changed. When using Intellisense, this process then lists all the object properties.

Note

The form of expression used in the example only applies to Graphics Designer. In the case of analog actions in Global Script, address the objects using the HMIRuntime object.

Setting properties via the picture window

VBS in Graphics Designer offers two possibilities for picture transcending addressing:

- via the Screen object of a picture window with "ScreenItems"
- from the basic picture with "HMIRuntime.Screens"

Referencing via the picture window

In the following example, the color of a rectangle is changed in an subordinate picture window. The script is executed in the picture "BaseScreen", in which the picture window "ScreenWindow1" is located. The picture window displays a picture, which contains an object of the type "Rectangle" with the name "Rectangle1".

```
'VBS199
Sub OnLButtonUp(ByVal Item, ByVal Flags, ByVal x, ByVal y)
Dim objRectangle
Set objRectangle = ScreenItems("ScreenWindow1").Screen.ScreenItems("Rectangle1")
objRectangle.BackColor = RGB(255,0,0)
End Sub
```

Referencing from the basic picture

You can reference the picture with the object to be modified via HMIRuntime.Screens. The specification of the picture is defined relative to the basic picture via the following access code:

[<Grundbildname>.]<Bildfenstername>[:<Bildname>]... .<Bildfenstername>[:<Bildname>]

In the following example, a reference is created to the "Screen2" object contained in the "Rectangle1" picture and the background color is set to red.

The picture "Screen2", in this case, is in "Screen1". "Screen1" is displayed in the basic picture "BaseScreen".

```
'VBS141
Dim objRectangle
Set objRectangle =
HMIRuntime.Screens("BaseScreen.ScreenWindow1:Screen1.ScreenWindow1:Screen2").ScreenItems("
Rectangle1")
objRectangle.BackColor = RGB(255,0,0)
```

It is not necessary to specify the picture name. It is possible to address a picture uniquely using the picture window name. Therefore, it is sufficient to specify the name of the picture window, as in the following example:

```
'VBS142
Dim objRectangle
Set objRectangle =
HMIRuntime.Screens("ScreenWindow1.ScreenWindow2").ScreenItems("Rectangle1")
```

```
objRectangle.BackColor = RGB(255,0,0)
```

This type of addressing enables objects in picture windows to be addressed in different pictures. This is a particularly interesting aspect in respect of the picture module technique.

Make the property dynamic using the return value

Actions on properties can not only be triggered by events or cyclically but properties can also be made dynamic directly via an action.

In the following example, the background color of an object is made dynamic via a return value. The value transferred can come from the evaluation of events in the PLC, for example and used for the graphic display of an operating status:

```
'VBS146
Function BackColor_Trigger(ByVal Item)
BackColor_Trigger = RGB(125,0,0)
End Function
```

Note

If you make an object property dynamic with a VBS action via the return value of a script, the value of the object property is written only if it has changed in relation to the last script run. It is not considered if the value had been changed from another location.

Therefore it is illegal to change properties which have been made dynamic by VBS action via the return value from another location (e.g., other C scripts or VBS scripts).

if you do not observe this, wrong values can be the results.

Examples in WinCC (Page 805)

1.15.2.12 Example: How to Start an Action on the Server (Logging Object)

Introduction

In multi-user projects, the Logging object presently functions on the server only. The following example shows how to start an action on the server from the client, and how to swap and delete archive segments on client accordingly.

The example shows a global action started with a control tag. The contents of the control tag determine whether the "Restore" method or the "Remove" method is called. At the end of the action, the control tag is set to "0".

A query prevents the action from being started on client computers.

Path and time period are passed on by internal tags.

The path information may also contain a network release. Archive segments to be swapped must therefore not be stored locally at the server. It must be warranted, though, that the server may directly access the path.

Note

The example shows a delete suggestion and may be adjusted as needed.

What to do

1. Create the following internal tags with project-wide updating in the WinCC Explorer:
   - StartLogging (unsigned 8 bit value)
   - SourcePath (Text tag 8 bit character set)
   - TimeFrom (Text tag 8 bit character set)
   - TimeTo (Text tag 8 bit character set)
   - RetVal (signed 32 bit value)
2. Create a global VBS action and enter the tag 'StartLogging' as tag trigger with cycle "Upon Change".
3. Copy the following script into the action

```
'VBS180
Dim StartLogging
Dim SourcePath
Dim TimeFrom
Dim TimeTo
Dim RetVal
'Exit when running on client
If (Left(HMIRuntime.ActiveProject.Path, 1) = "\") Then
Exit Function
End If
'read parameters
StartLogging = HMIRuntime.Tags("StartLogging").Read
SourcePath = HMIRuntime.Tags("SourcePath").Read(1)
TimeFrom = HMIRuntime.Tags("TimeFrom").Read(1)
TimeTo = HMIRuntime.Tags("TimeTo").Read(1)
'restore or remove depends on the parameter
If (StartLogging = 1) Then
RetVal = HMIRuntime.Logging.Restore(SourcePath, TimeFrom, TimeTo, -1)
HMIRuntime.Tags("RetVal").Write RetVal, 1
HMIRuntime.Tags("StartLogging").Write 0,1
Elseif (StartLogging = 2) Then
RetVal = HMIRuntime.Logging.Remove(TimeFrom, TimeTo, -1)
HMIRuntime.Tags("RetVal").Write RetVal, 1
```

```
HMIRuntime.Tags("StartLogging").Write 0,1
End If
```

The action may be started on a client with the following action, for example. Please note that parameters must be written prior to setting the control tag.

```
'VBS181
'set parameters
HMIRuntime.Tags("SourcePath").Write "\\client_pc\temp",1
HMIRuntime.Tags("TimeFrom").Write "2004",1
HMIRuntime.Tags("TimeTo").Write "2004",1
'start action
HMIRuntime.Tags("StartLogging").Write 1.1
```

Note

Tags are predominantly written and read in "direct" mode. This will synchronize the sequences. Since this deals with internal tags, this mode may be used without any further concerns.

1.15.2.13 Dynamization of Controls

Example: Calling Methods of an ActiveX Control

Introduction

The following examples illustrate how to call methods and properties of an ActiveX control which is embedded in a WinCC picture.

Example 1: WinCC FunctionTrendControl

This example fills "Trend 1" of the FuntionTrendControl "Control1" with values which describe a parabola.

To dynamize a trend with VBS, in the configuration dialog of the control on the "Data connection" tab under "Data supply" set "0 - None".

```
'VBS300
Dim lngFactor
Dim dblAxisX
Dim dblAxisY
```

```
Dim objTrendControl
Dim objTrend

Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")

For lngFactor = -100 To 100
dblAxisX = CDbl(lngFactor * 0.02)
dblAxisY = CDbl(dblAxisX * dblAxisX + 2 * dblAxisX + 1)
objTrend.InsertData dblAxisX, dblAxisY
Next
```

Example 2: WinCC FunctionTrendControl with value supply via array

In this example, "Trend 1" of the FunctionTrendControl "Control1" is supplied with values stored in arrays.

To dynamize a trend with VBS, in the configuration dialog of the control on the "Data connection" tab under "Data supply" set "0 - None".

```
'VBS301
Dim lngIndex
Dim dblAxisX(100)
Dim dblAxisY(100)
Dim objTrendControl
Dim objTrend
Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")
For lngIndex = 0 To 100
dblAxisX(lngIndex) = CDbl(lngIndex * 0.8)
dblAxisY(lngIndex) = CDbl(lngIndex)
Next
objTrend.InsertData dblAxisX, dblAxisY
```

Example 3: WinCC FunctionTrendControl (before WinCC V7)

This example fills the FunctionTrendControl named "Control1" with values that describe a parabola.

```
'VBS111
Dim lngFactor
Dim dblAxisX
Dim dblAxisY
Dim objTrendControl
Set objTrendControl = ScreenItems("Control1")
For lngFactor = -100 To 100
dblAxisX = CDbl(lngFactor * 0.02)
dblAxisY = CDbl(dblAxisX * dblAxisX + 2 * dblAxisX + 1)
objTrendControl.DataX = dblAxisX
objTrendControl.DataY = dblAxisY
```

```
objTrendControl.InsertData = True
Next
```

Example 4: WinCC FunctionTrendControl with value supply via array (before WinCC V7)

In this example, a FunctionTrendControl called "Control1" is supplied with 100 value pairs. In order that the value pair can be transferred correctly, the transfer e.g. in "dblAxisXY" must not occur directly but via an intermediate tag, e.g. "varTemp".

```
'VBS152
Dim lngIndex
Dim dblXY(1)
Dim dblAxisXY(100)
Dim varTemp
Dim objTrendControl
Set objTrendControl = ScreenItems("Control1")
For lngIndex = 0 To 100
 dblXY(0) = CDbl(lngIndex * 0.8)
 dblXY(1) = CDbl(lngIndex)
 dblAxisXY(lngIndex) = dblXY
Next
varTemp = (dblAxisXY)
objTrendControl.DataXY = varTemp
objTrendControl.InsertData = True
```

Example 5: Microsoft Web Browser

This example controls MS Web Browser.

```
'VBS112
Dim objWebBrowser
Set objWebBrowser = ScreenItems("WebControl")
objWebBrowser.Navigate "http://www.siemens.de"
...
objWebBrowser.GoBack
...
objWebBrowser.GoForward
...
objWebBrowser.Refresh
...
objWebBrowser.GoHome
...
objWebBrowser.GoSearch
...
objWebBrowser.Stop
...
```

Note

Insert the instructions, separated by stops, in self-defined procedures. Declaration and assignments must always precede them.

General examples for VBScript (Page 833)

Example: How to configure a user-defined toolbar button with a self-created selection dialog

Introduction

In the following example you create a user-defined toolbar button of an OnlineTrendControl. On this toolbar button you configure a self-created selection dialog with which you can optionally set one of two different time ranges of the OnlineTrendControl.

Requirement

- The Graphics Designer is open.
- An archive is created in the Tag Logging Editor.

Inserting and configuring WinCC OnlineTrendControl

1. Create a new process picture in the Graphics Designer.
2. Save the process picture under "OnlineTrend.pdl".
3. Insert a WinCC OnlineTrendControl into the process picture.
4. Select "Configuration dialog..." from the shortcut menu of the control.
   The "Properties of WinCC OnlineTrendControl" dialog opens.
5. On the "Trend" tab under "Data connection" connect the trend to an archive tag.
6. On the "Toolbar" tab under "Button functions" create a new user-defined toolbar button with object ID "1001" for the OnlineTrendControl.
7. Click on "Accept" to save the changes.
8. Click "OK" to close the dialog box.
9. Select "Properties" from the shortcut menu of the control.
   The "Object properties" dialog box opens.
10. Enter "Control1" as the object name for the control.
11. In the Object Properties of "Control1" select the "Event" tab.

12. On the "OnToolbarButtonClicked" object event, configure the VB script "Create VBS action on "OnToolbarButtonClicked" event of user-defined toolbar button (VBS302)".
13. Close the "Object properties" dialog box.

Creating a process picture for the selection dialog

1. Create a new process picture in the Graphics Designer.
2. Save the process picture under "Selectiondialog.pdl".
3. Click the "Properties" button on the shortcut menu of the process picture.
   The "Object properties" dialog box opens.
4. Under "Geometry", set value "200" for the "Picture width" and "Picture height" attributes.
5. Close the "Object properties" dialog box.
6. Insert two "Button" objects into the process picture.
7. Enter "Morning" or "Afternoon" as text for the button.

Dynamizing selection dialog button

1. In the Object Properties of the "Morning" button select the "Event" tab.
2. On the "Mouse-click" event, configure the VB script "Create VBS action on "Mouse-click" event of "Morning" button (VBS303)".
3. Close the "Object properties" dialog box.
4. In the Object Properties of the "Afternoon" button select the "Event" tab.
5. On the "Mouse-click" event configure the VB script "Create VBS action on "Mouse-click" event of "Afternoon" button (VBS304)".
6. Close the "Object properties" dialog box.

Inserting and configuring a picture window

1. Insert a "Picture window" object into the "OnlineTrend.pdl" process picture.
2. Select "Properties" from the shortcut menu of the picture window.
   The "Object properties" dialog box opens.
3. Enter "PictureWindow1" as the object name for the picture window.
4. Under "Miscellaneous" set the "Display" attribute to "no".
5. Under "Miscellaneous", select the "Selectiondialog.pdl" process picture for the "Picture name" attribute.
6. Close the "Object properties" dialog box.

Create VBS action on "OnToolbarButtonClicked" event of user-defined toolbar button (VBS302)

```
'VBS302
```

```
'Open selection window if Toolbarbutton with ID 1001 is pressed
If lId = 1001 Then
ScreenItems("PictureWindow1").Visible = True
End If
```

Create VBS action on "Mouse-click" event of "Morning" button (VBS303)

```
'VBS303
Dim obj
Set obj = Parent.Parent.ScreenItems("Control1")

'choose time axis, stop update, set begin time and time range
obj.TimeAxisName = "Time axis 1"
obj.TimeAxisActualize = False
obj.TimeAxisBeginTime = CStr(Date & " 4:00:00")
obj.TimeAxisTimeRangeBase = 3600000
obj.TimeAxisTimeRangeFactor = 8

'close the selection window
Parent.Visible = False
```

Create VBS action on "Mouse-click" event of "Afternoon" button (VBS304)

```
'VBS304
Dim obj
Set obj = Parent.Parent.ScreenItems("Control1")

'choose time axis, stop update, set begin time and time range
obj.TimeAxisName = "Time axis 1"
obj.TimeAxisActualize = False
obj.TimeAxisBeginTime = CStr(Date & " 12:00:00")
obj.TimeAxisTimeRangeBase = 3600000
obj.TimeAxisTimeRangeFactor = 8

'close the selection window
Parent.Visible = False
```

Example: How to add elements to an empty WinCC OnlineTrendControl

Introduction

In the following example you insert the Trend Window, Value Axis, Time Axis and Trends elements into an empty WinCC OnlineTrendControl.

Requirement

- The Graphics Designer is open.
- An archive is created in the Tag Logging Editor with three archive tags.

Inserting and configuring WinCC OnlineTrendControl

1. Create a new process picture in the Graphics Designer.
2. Insert a WinCC OnlineTrendControl into the process picture.
3. Select "Configuration dialog..." from the shortcut menu of the control.
   The "Properties of WinCC OnlineTrendControl" dialog opens.
4. In the "Trends" area of the "Trends" tab delete the default trend window "Trend 1".
5. Click on "Accept" to save the changes.
6. Click "OK" to close the dialog box.
7. Select "Properties" from the shortcut menu of the control.
   The "Object properties" dialog box opens.
8. Enter "Control1" as the object name for the control.
9. Close the "Object properties" dialog box.

Inserting and configuring a button

1. Insert a "Button" object into the process picture.
2. Enter "Paste elements" as text for the button.
3. Select "Properties" from the shortcut menu of the button.
   The "Object properties" dialog box opens.
4. In the Object Properties of the button select the "Event" tab.
5. On the "Mouse-click" event configure the VB script "Create VBS action on "Mouse-click" event of button (VBS305)".
6. Close the "Object properties" dialog box.

Create VBS action on "Mouse-click" event of button (VBS305)

```
'VBS305
Dim objTrendControl
Dim objTrendWindow
Dim objTimeAxis
Dim objValueAxis
Dim objTrend

'create reference to TrendControl
Set objTrendControl = ScreenItems("Control1")

'create reference to new window, time and value axis
```

```
Set objTrendWindow =
objTrendControl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis =
objTrendControl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValueAxis =
objTrendControl.GetValueAxisCollection.AddItem("myValueAxis")

'assign time and value axis to the window
objTimeAxis.TrendWindow = objTrendWindow.Name
objValueAxis.TrendWindow = objTrendWindow.Name

'add new trend and assign properties
Set objTrend = objTrendControl.GetTrendCollection.AddItem("myTrend1")
objTrend.Provider = 1
objTrend.TagName = "TestArchive\ArchivTag1"
objTrend.Color = RGB(255,0,0)
objTrend.TrendWindow = objTrendWindow.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValueAxis.Name

'add new trend and assign properties
Set objTrend = objTrendControl.GetTrendCollection.AddItem("myTrend2")
objTrend.Provider = 1
objTrend.TagName = "TestArchive\ArchivTag2"
objTrend.Color = RGB(0,255,0)
objTrend.TrendWindow = objTrendWindow.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValueAxis.Name

'add new trend and assign properties
Set objTrend = objTrendControl.GetTrendCollection.AddItem("myTrend3")
objTrend.Provider = 1
objTrend.TagName = "TestArchive\ArchivTag3"
objTrend.Color = RGB(0,0,255)
objTrend.TrendWindow = objTrendWindow.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValueAxis.Name
```

Note

In the VB script, replace the archive used and the archive tags "Archive\ArchiveTagX" with the names of the archive and archive tags that have been created.

Example: How to add a trend and a setpoint trend to an empty OnlineTrendControl.

Introduction

In the following example, you add a trend and a setpoint trend to an empty WinCC OnlineTrendControl. The time axis and value axis are added for the trends in a trend window.

Requirement

- A "WinCC OnlineTrendControl" with the name "Control2" is inserted in the process picture in the Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click", for example, for the button, with a VBS action and the following script.

Example

```
'VBS352
Dim objTrendControl
Dim objTrendWindow
Dim objTimeAxis
Dim objValueAxis
Dim objTrend
'tags used to generate trend data
Dim dtCurrent
Dim dblCurrent
Dim lIndex
Dim vValues(360)
Dim vTimeStamps(360)

'create reference to TrendControl
Set objTrendControl = ScreenItems("Control2")

'---- reference trend ----
'create reference to new window, time and value axis
Set objTrendWindow = objTrendControl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = objTrendControl.GetTimeAxisCollection.AddItem("myRefTimeAxis")
Set objValueAxis = objTrendControl.GetValueAxisCollection.AddItem("myRefValueAxis")

'assign time and value axis to the window
objTimeAxis.TrendWindow = objTrendWindow.Name
objTimeAxis.ShowDate = False
objValueAxis.TrendWindow = objTrendWindow.Name

'add trend and assign propertys
Set objTrend = objTrendControl.GetTrendCollection.AddItem("myRefTrend")
objTrend.Provider = 0
objTrend.Color = RGB(0,0,0)
objTrend.TrendWindow = objTrendWindow.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValueAxis.Name

'generate values for reference trend
dtCurrent = CDate("23.11.2006 00:00:00")
For lIndex = 0 To 360
 vValues(lIndex) = ( Sin(dblCurrent) * 60 ) + 60
 vTimeStamps(lIndex) = dtCurrent
 dblCurrent = dblCurrent + 0.105
 dtCurrent = dtCurrent + CDate ("00:00:01")
Next
```

```
'insert data to the reference trend
objTrend.RemoveData
objTrend.InsertData vValues, vTimeStamps

'---- data trend ----
'add time and value axis to the existing window
Set objTimeAxis = objTrendControl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValueAxis = objTrendControl.GetValueAxisCollection.AddItem("myValueAxis")

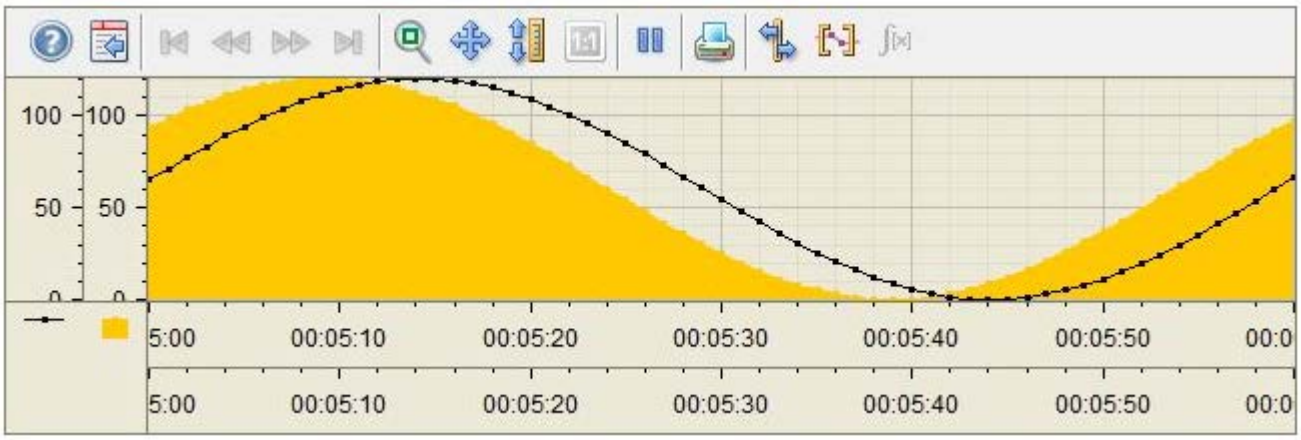
'assign time and value axis to the window
objTimeAxis.TrendWindow = objTrendWindow.Name
objTimeAxis.ShowDate = False
objValueAxis.TrendWindow = objTrendWindow.Name

'add new trend and assign properties
Set objTrend = objTrendControl.GetTrendCollection.AddItem("myTrend")
objTrend.Provider = 0
objTrend.Color = RGB(255,200,0)
objTrend.Fill = True
objTrend.TrendWindow = objTrendWindow.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValueAxis.Name

'generate values for data trend
dtCurrent = CDate("23.11.2006 00:00:00")
For lIndex = 0 To 360
 vValues(lIndex) = ( Sin(dblCurrent) * 60 ) + 60
 vTimeStamps(lIndex) = dtCurrent
 dblCurrent = dblCurrent + 0.106
 dtCurrent = dtCurrent + CDate ("00:00:01")
Next

'insert values to the data trend
objTrend.RemoveData
objTrend.InsertData vValues, vTimeStamps
```

Result



Example: How to add elements to a WinCC OnlineTrendControl

Introduction

In the following example, insert value columns with properties in an empty WinCC OnlineTableControl and link the columns to archive tags.

Requirement

- An archive is created in the "Tag Logging Editor" with three archive tags.
- A "WinCC OnlineTableControl" with the name "Control2" is inserted in the process picture in the Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click", for example, for the button, with a VBS action and the following script.

Example

```
'VBS351
Dim objTableControl
Dim objTimeColumn
Dim objValueColumn
Dim objTrend

'create reference to TableControl and enable BackColor
Set objTableControl = ScreenItems("Control2")
objTableControl.UseColumnBackColor = True

'create reference to new TimeColumn and assign column length
Set objTimeColumn = objTableControl.GetTimeColumnCollection.AddItem("myRefTimeAxis")
objTimeColumn.Length = 20

'add new ValueColumn and assign propertys
Set objValueColumn = objTableControl.GetValueColumnCollection.AddItem("myValueTable1")
objValueColumn.Provider = 1
objValueColumn.TagName = "Process value archive\PDL_ZT_1"
objValueColumn.BackColor = RGB(255,255,255)
objValueColumn.TimeColumn = objTimeColumn.Name

'add new ValueColumn and assign propertys
Set objValueColumn = objTableControl.GetValueColumnCollection.AddItem("myValueTable2")
objValueColumn.Provider = 1
objValueColumn.TagName = "Process value archive\PDL_ZT_2"
objValueColumn.BackColor = RGB(0,255,255)
objValueColumn.TimeColumn = objTimeColumn.Name

'add new ValueColumn and assign propertys
Set objValueColumn = objTableControl.GetValueColumnCollection.AddItem("myValueTable3")
objValueColumn.Provider = 1
objValueColumn.TagName = "Process value archive\PDL_ZT_3"
objValueColumn.BackColor = RGB(255,255,0)
```

```
objValueColumn.TimeColumn = objTimeColumn.Name
```

Result

	myRefTimeAxis	myValueTable1	myValueTable2	myValueTable3
112	08.02.2010 14:15:03	1	1	84
113	08.02.2010 14:15:03	22	1	84
114	08.02.2010 14:15:04	2	1	84
115	08.02.2010 14:15:04	1	1	84
116	08.02.2010 14:15:05	1	1	84
117	08.02.2010 14:15:05	3	1	84
118	08.02.2010 14:15:06	1	1	84
119	08.02.2010 14:15:06	1	1	84
120	08.02.2010 14:15:07	18	1	84

Example: Scripts for WinCC AlarmControl

Introduction

The following examples demonstrate the use of scripts for WinCC AlarmControl.

Requirement

- You have already configured messages in the "Alarm Logging" editor.

Example 1: Setting filters

A filter with message number "2" is set, or reset if the filter has already been set. The status is also output in the dialog window.

```
'VBS353
Dim objAlarmControl
'create reference to AlarmControl
Set objAlarmControl = ScreenItems("Control1")
'set / reset the filter and create a trace
If (objAlarmControl.MsgFilterSQL = "") Then
 objAlarmControl.MsgFilterSQL = "MSGNR = 2"
 HMIRuntime.Trace "MsgFilterSQL set to MSGNR = 2" & vbNewLine
Else
 objAlarmControl.MsgFilterSQL = ""
 HMIRuntime.Trace "no filter" & vbNewLine
End If
```

Example 2: Adding a column to WinCC AlarmContol

The column "Message text" is added or removed if the column already exists. The status is also output in the dialog window. The message block of the "Message text" column has the object name "Text1".

```
'VBS354
'add this function to the declaration section
Function IsExistingMsgColumn( objAlarmControl, strName )
'this function checks if the MessageColumn exists
on error resume next
objAlarmControl.GetMessageColumn( strName )
If err.number = 0 Then
 IsExistingMsgColumn = True
else
 err.Clear
 IsExistingMsgColumn = False
end if
End Function

'example code
Dim objAlarmControl
Dim colMsgColumn
'create reference to the alarm control
Set objAlarmControl = ScreenItems("Control1")
Set colMsgColumn = objAlarmControl.GetMessageColumnCollection
'add or remove the MsgColumn
If ( IsExistingMsgColumn(objAlarmControl, "Text1") ) Then
 HMIRuntime.Trace "Remove MsgColumn" & vbNewLine
 colMsgColumn.RemoveItem("Text1")
Else
 HMIRuntime.Trace "Add MsgColumn" & vbNewLine
 colMsgColumn.AddItem("Text1")
End If
```

Example 3: Output content of message window in dialog window

```
'VBS355
Dim objAlarmControl
Dim lIndex
Dim lCellIndex
'create reference to the alarm control
Set objAlarmControl = ScreenItems("Control1")
'enumerate and trace out row numbers
For lIndex = 1 To objAlarmControl.GetRowCollection.Count
 HMIRuntime.trace "Row: " & (objAlarmControl.GetRow(lIndex).RowNumber) & "  "
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To objAlarmControl.GetRow(lIndex).CellCount
  HMIRuntime.trace objAlarmControl.GetMessageColumn(lCellIndex -1).Name & " "
  HMIRuntime.trace objAlarmControl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.trace vbNewLine
```

```
Next
```

1.15.3 General Examples

1.15.3.1 General examples for VBScript

Introduction

This section contains examples of the general use of VBScript with regard to the following topics:

- Program data connection with VBS
- To retrieve methods
- Using the MS Automation Interface
- Starting External Applications

Note

All objects supplied with the Windows Script Host (WSH) from Microsoft can be integrated in their environment using the standard VBS method "CreateObject". However, there is no direct access to the WSH object itself using VBS from WinCC.

Example 1: "FileSystemObject" object for working with the file system

```
Dim fso, MyFile
Set fso = CreateObject("Scripting.FileSystemObject")
Set MyFile = fso.CreateTextFile("c:\testfile.txt", True)
MyFile.WriteLine("This is a test.")
MyFile.Close
```

Example 2: "WScript.Shell"-Object for working with the Windows environment

See also

Example: Configuring a Database Connection with VBS (Page 834)
Example: Starting an external application (Page 837)
Example: Using the MS Automation interface (Page 836)
Example: Calling Methods of an ActiveX Control (Page 819)

1.15.3.2 Example: Configuring a Database Connection with VBS

Introduction

The following examples describe the configuration of an Access database link via an ODBC driver.

- Example 1 writes a tag value from WinCC in an Access database.
- Example 2 reads a value from the database and writes it in a WinCC tag.

The examples do not contain any handling faults.

Procedure, Example 1

1. Create the Access database with the WINCC_DATA table and columns (ID, TagValue) with the ID as the Auto Value.
2. Set up the ODBC data source with the name "SampleDSN", reference to the above Access database.
3. Programming.

Example 1

```
'VBS108
Dim objConnection
Dim strConnectionString
Dim lngValue
Dim strSQL
Dim objCommand
strConnectionString = "Provider=MSDASQL;DSN=SampleDSN;UID=;PWD=;"
lngValue = HMIRuntime.Tags("Tag1").Read
strSQL = "INSERT INTO WINCC_DATA (TagValue) VALUES (" & lngValue & ");"
Set objConnection = CreateObject("ADODB.Connection")
objConnection.ConnectionString = strConnectionString
objConnection.Open
Set objCommand = CreateObject("ADODB.Command")
With objCommand
    .ActiveConnection = objConnection
    .CommandText = strSQL
End With
objCommand.Execute
Set objCommand = Nothing
objConnection.Close
Set objConnection = Nothing
```

Procedure, Example 2

1. Create the WinCC tag with the name dbValue.
2. Create Access database with WINCC_DATA table and ID, TagValue columns: ID, create TagValue (ID as auto value).
3. Set up the ODBC data source with the name "SampleDSN", reference to the above Access database.
4. Programming.

Example 2

```
'VBS108a
Dim objConnection
Dim objCommand
Dim objRecordset
Dim strConnectionString
Dim strSQL
Dim lngValue
Dim lngCount
strConnectionString = "Provider=MSDASQL;DSN=SampleDSN;UID=;PWD=;"
strSQL = "select TagValue from WINCC_DATA where ID = 1"
Set objConnection = CreateObject("ADODB.Connection")
objConnection.ConnectionString = strConnectionString
objConnection.Open
Set objRecordset = CreateObject("ADODB.Recordset")
Set objCommand = CreateObject("ADODB.Command")
objCommand.ActiveConnection = objConnection
objCommand.CommandText = strSQL
Set objRecordset = objCommand.Execute
lngCount = objRecordset.Fields.Count
If (lngCount>0) Then
objRecordset.movefirst
lngValue = objRecordset.Fields(0).Value
HMIRuntime.Tags("dbValue").Write lngValue
Else
HMIRuntime.Trace "Selection returned no fields" & vbNewLine
End If
Set objCommand = Nothing
objConnection.Close
Set objRecordset = Nothing
Set objConnection = Nothing
```

There are several ways in which to define the ConnectionString for the connection depending on the provider used:

Microsoft OLE DB provider for ODBC

Enables connections to any ODBC data source. The corresponding syntax is:

```
"[Provider=MSDASQL;]{DSN=name|FileDSN=filename};
[DATABASE=database;]UID=user; PWD=password"
```

Other Microsoft OLE DB Providers (e.g. MS Jet, MS SQL Server)

It is possible to work without DSN. The corresponding syntax is:

```
"[Provider=provider;]DRIVER=driver; SERVER=server;
DATABASE=database; UID=user; PWD=password"
```

1.15.3.3 Example: Using the MS Automation interface

Introduction

The following three examples illustrate how to use the MS Automation interface.

Example 1: MS Excel

In this example, an output value from an input field is written in an Excel table.

```
'VBS113
Dim objExcelApp
Set objExcelApp = CreateObject("Excel.Application")
objExcelApp.Visible = True
'
'ExcelExample.xls is to create before executing this procedure.
'Replace <path> with the real path of the file ExcelExample.xls.
objExcelApp.Workbooks.Open "<path>\ExcelExample.xls"
objExcelApp.Cells(4, 3).Value = ScreenItems("IOField1").OutputValue
objExcelApp.ActiveWorkbook.Save
objExcelApp.Workbooks.Close
objExcelApp.Quit
Set objExcelApp = Nothing
```

Example 2: MS Access

This example opens a report from MS Access.

```
'VBS114
Dim objAccessApp
Set objAccessApp = CreateObject("Access.Application")
objAccessApp.Visible = True
'
'DbSample.mdb and RPT_WINCC_DATA have to create before executing
'this procedure.
'Replace <path> with the real path of the database DbSample.mdb.
objAccessApp.OpenCurrentDatabase "<path>\DbSample.mdb", False
objAccessApp.DoCmd.OpenReport "RPT_WINCC_DATA", 2
objAccessApp.CloseCurrentDatabase
Set objAccessApp = Nothing
```

Example 3: MS Internet Explorer

This example opens the MS IE.

```
'VBS115
Dim objIE
Set objIE = CreateObject("InternetExplorer.Application")
objIE.Navigate "http://www.siemens.de"
Do
Loop While objIE.Busy
objIE.Resizable = True
objIE.Width = 500
objIE.Height = 500
objIE.Left = 0
objIE.Top = 0
objIE.Visible = True
```

General examples for VBScript (Page 832)

1.15.3.4 Example: Starting an external application

Introduction

The following two examples illustrate how to start an external application.

Example:

```
'VBS117
Dim objWshShell
Set objWshShell = CreateObject("Wscript.Shell")
objWshShell.Run "Notepad Example.txt", 1
```

1.16 Basic Principles of VBScript

1.16.1 Basic Principles of VBScript

Introduction

The most important topics of the Microsoft VBScript Reference are provided below:

- VBScript Language Directory
- VBScript Tutorial with the most important basic principles
- Scripting runtime reference

If a full version of the VBScript Reference is required, it is available under

http://msdn2.microsoft.com/en-us/library/t0aew7h6 (http://msdn2.microsoft.com/en-us/library/t0aew7h6)

See also

Microsoft VBScript Reference (http://msdn2.microsoft.com/en-us/library/t0aew7h6)

1.16.2 VBScript Basics

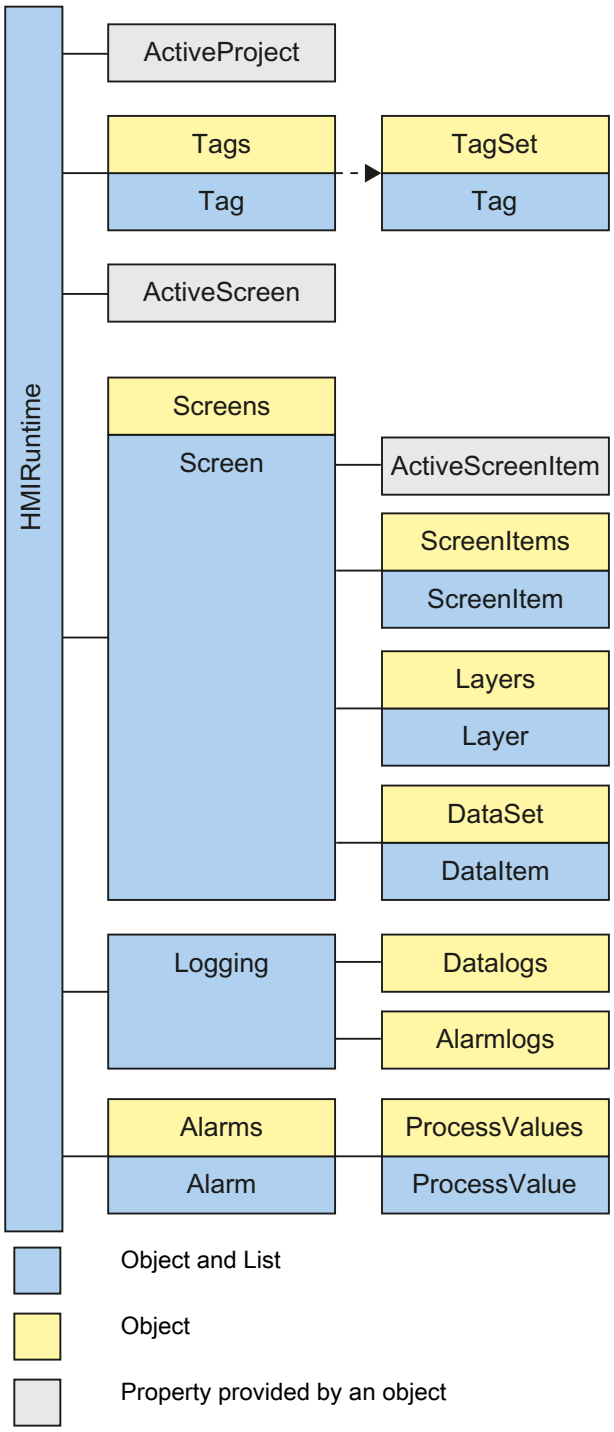
VBS Reference 2

2.1 VBS Reference

VBS object model in WinCC

The WinCC object model of the graphic Runtime system enables access to graphic objects and tags in Runtime.

When you click on an object name, you are shown a detailed description.



The VBS object model in a faceplate type

The VBS object model is not valid for WinCC in a Faceplate type. It is replaced by a completely new model.

The VBS object model of the Faceplate type provides you with access to the graphic objects and Faceplate tags of the Faceplate type in Runtime.

Objects

Objects and lists are provided for access to all the objects in the graphic Runtime systems: Graphic objects, pictures, layers and tags.

Properties

The properties of the individual objects can be used to modify specific graphic objects and tags in Runtime , e.g. activating an operating element per mouse click or triggering a color change by modifying a tag value.

Methods

Methods, which are applied to individual objects, can be used to read tag values for further processing or display diagnostics messages in Runtime.

ProcessValues Object (List) (Page 140)

2.2 Objects and Lists

2.2.1 Objects and Lists

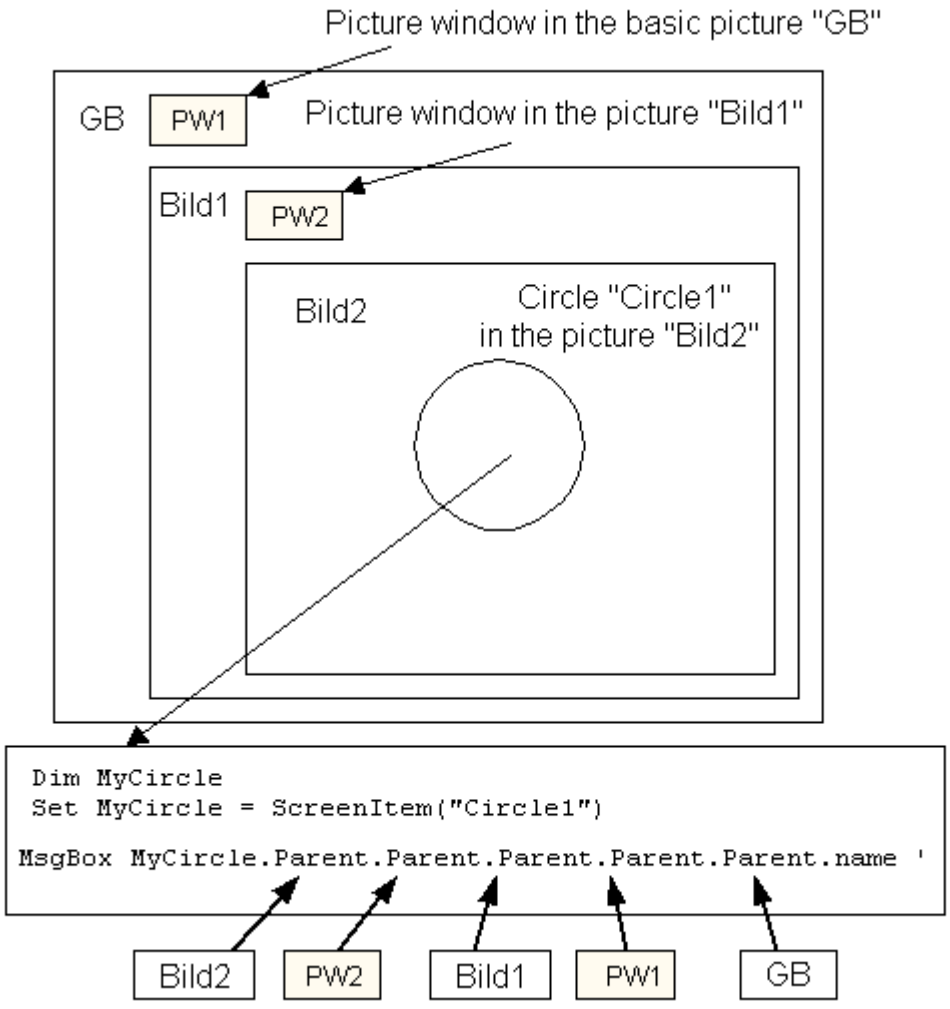
Overview

The objects and lists provided in WinCC object models enables access to graphic objects and tags in Runtime.

Navigation in Object Models

Access is made to objects in the VBS object model in hierarchical sequence. If, for example, a picture element is accessed within a picture, access is made to the picture element in the picture via its parent object (the surrounding picture).

Example:



Only the basic picture name is issued in this example.

Access to Graphic Objects

In WinCC, access is made to pictures, layers and graphic objects in Runtime using the superordinate "HMIRuntime" object. Access to objects and layers is always made via the picture (screen) in which they are contained.

Access to Tags

In WinCC, tags are accessed directly in Runtime using the superordinate "HMIRuntime" object. Tag values can be read out or set anew.

Lists

Lists of WinCC object models behave in the same way as standard collections of VBS. Exception: The "Tags" list has no Enum function.

Available Objects

- Alarm
- Alarms
- AlarmLogs
- DataItem
- DataLogs
- DataSet
- HMIRuntime
- Item
- Layer
- Layers
- Logging
- ProcessValues
- ProcessValue
- Project
- ScreenItem
- ScreenItems
- Screen
- Screens
- Tag

- Tags
- TagSet

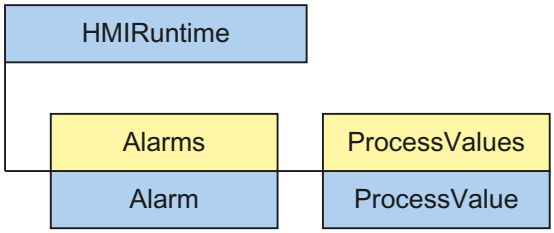
Item Object (Page 135)
HMIRuntime Object (Page 134)

2.2.2 Alarm object

Description



The alarm object is used to access the Alarms object list.

Note

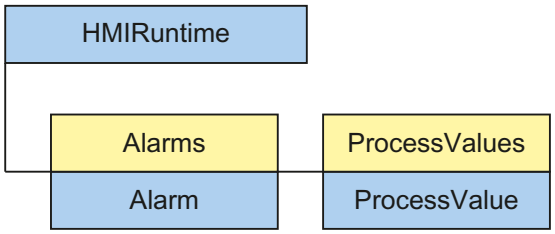
The properties of the alarm object are not automatically updated when the values of the properties change.

See also

Alarms object (list) (Page 126)

2.2.3 Alarms object (list)

Description



Use the alarm object to trigger existing messages.

Usage

Using the "Alarms" list you can:

- Access a message in the list (Item method)
- Create a new alarm object (Create method)
- Read the alarm ID of the message (AlarmID attribute)
- Read the status of a message (State property)
- Read the time stamp of the message (Timestamp property)
- Generate an instance of the alarm object (Instance property)
- Read the name of the computer on which the message came (ComputerName property)
- Read or set the name of the user who triggered the message (UserName property)
- Read or set the name of the process value blocks (ProcessValues property)
- Read or set the message commentary (Comment property)
- Read or set the message server prefix (Context property)

Example

In the following example, the message with the alarm number "1" configured in the Alarm Logging Editor will be triggered:

```
'VBS360
Dim MyAlarm
Set MyAlarm = HMIRuntime.Alarms(1)
MyAlarm.State = 5 'hmiAlarmStateCome + hmiAlarmStateComment
MyAlarm.Comment = "MyComment"
MyAlarm.UserName = "Hans-Peter"
MyAlarm.ProcessValues(1) = "Process Value 1"
MyAlarm.ProcessValues(4) = "Process Value 4"
MyAlarm.Create "MyApplication"
```

Alarm object (Page 126)

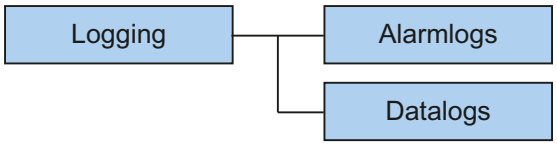
ProcessValues Object (List) (Page 140)

Create method (Page 700)

Item Method (Page 753)

2.2.4 AlarmLogs Object

Description



Using the object, swapped archive segments of Alarm Logging may be reconnected to Runtime, or previously swapped archive segments of Alarm Logging may be deleted again. Therein

- Archive segments to be swapped are copied to the common archiving directory of the WinCC project, or
- previously swapped archive segments are deleted in the common archiving directory.

Using parameters you may control from where archive segments are to be swapped. You may also specify the time period over which archive segments are to be swapped or deleted. Archive segments are copied to the common archiving directory of the project.

If an error occurred during the operation with archiving segments, the method used returns an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Usage

Previously swapped archive segments of Alarm Logging may be connected with Runtime ("Restore" method).

Previously swapped archive segments of Alarm Logging may be deleted from the Runtime project ("Remove" method).

Example:

In the following example, archive segments from Alarm Logging are swapped and the return value is output as Trace.

```
'VBS187
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

See also

Restore Method (Page 777)

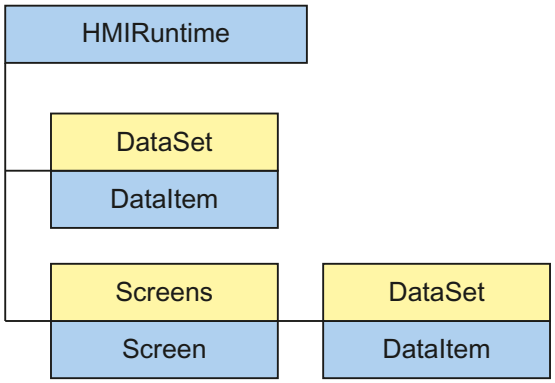
Remove Method (Page 772)

DataLogs Object (Page 130)

Logging Object (Page 138)

2.2.5 DataItem Object

Description



The DataItem object is used to access the contents of the DataSet list. Values or object references are stored in the list as DataItem.

Access uses the name under which the value was added to the list. Single access using an index is not recommended since the index changes during adding or deleting of values. The index may be used to output the complete contents of the list. The output is in alphabetical order.

Note

For object references it must be ascertained that objects are multiread-enabled.

Example:

The example shows how the value of 'Motor1' is output as Trace.

```
'VBS163
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
```

The following example enumerates all DataItem objects of the DataSet list. Name and value are output as Trace.

```
'VBS164
Dim data
For Each data In HMIRuntime.DataSet
HMIRuntime.Trace data.Name & ": " & data.Value & vbNewLine
Next
```

Note

For objects, value may possibly not be output directly

See also

Screen Object (Page 146)

HMIRuntime Object (Page 134)

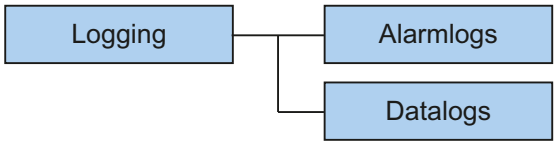
DataSet Object (List) (Page 132)

Value Property (Page 665)

Name Property (Page 495)

2.2.6 DataLogs Object

Description



Using the object, swapped archive segments of Tag Logging may be reconnected to Runtime, or previously swapped archive segments of Tag Logging may be deleted again. Therein

- Archive segments to be swapped are copied to the common archiving directory of the WinCC project, or
- previously swapped archive segments are deleted in the common archiving directory.

Using parameters you may control from where archive segments are to be swapped. You may also specify the time period over which archive segments are to be swapped or deleted. In addition, you may set the archive type ("Tag Logging Fast", "Tag Logging Slow", "Tag Logging Fast and Tag Logging Slow"). Archive segments are copied to the common archiving directory of the project.

If an error occurred during the operation with archiving segments, the method used returns an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Usage

Previously swapped archive segments of Tag Logging may be connected with Runtime ("Restore" method).

Previously swapped archive segments of Tag Logging may be deleted from the Runtime project ("Remove" method).

Example:

In the following example, fast archive segments from Tag Logging are swapped and the return value is output as Trace.

```
'VBS188
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1,1) & vbNewLine
```

See also

Error Messages from Database Area (Page 803)

Restore Method (Page 777)

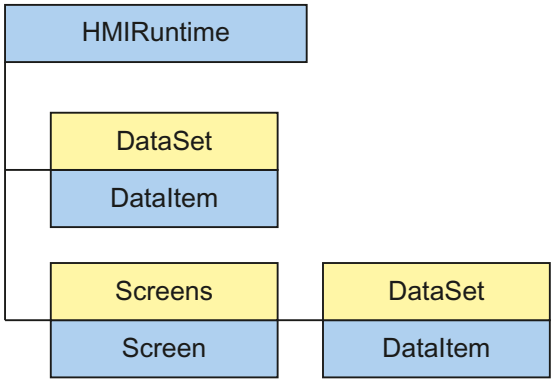
Remove Method (Page 772)

AlarmLogs Object (Page 128)

Logging Object (Page 138)

2.2.7 DataSet Object (List)

Description



Using the DataSet object, data may be exchanged across several actions.

A DataSet object is global and defined by the Screen object. Any VBS action may access the data.

The DataSet object at the Screen object must be addressed according to picture hierarchy and shall persist as long as the picture is displayed. The global object persists over the entire Runtime time period.

Access uses the DataItem object.

Note

Objects of type Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet cannot be included in the DataSet list.
The DataSet object does not support any classes.

Usage

Using the "DataSet" list, you may:

- Output or process (enumerate) all objects in the list.
- Output the number of elements contained ("Count" property).
- To process a specific object in the list ("Item" method).
- Add an object to the list ("Add" method).

- Remove a specific object from the list ("Remove" method).
- Remove all objects from the list ("RemoveAll" method).

Access to list elements uses:

```
HMIRuntime.DataSet("Itemname")
```

For a picture-specific list, access uses:

```
HMIRuntime.Screens("Screenname").DataSet("Itemname")
```

In a picture, you may access the DataSet object of the picture by using:

```
DataSet("Itemname")
```

If upon access the stated name does not exist in the list, VT_Empty is returned and an Exception is triggered.

Example:

The example shows how to add a value to the list, how to read it and remove it. It make sense to perform this in several different actions.

```
'VBS162
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet.Remove("motor1")
```

Remove Method (Page 772)

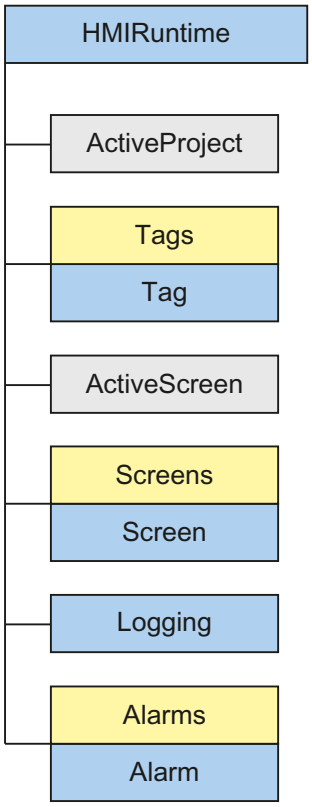
Item Method (Page 753)

Count Property (Page 380)

Add Method (Page 697)

2.2.8 HMIRuntime Object

Description



The HMIRuntime object represents the graphic Runtime environment.

Usage

The "HMIRuntime" object can be used for the following, for example:

- Read or set the current Runtime language ("Language" property).
- Read or set the name of the current base picture ("BaseScreenName" property).
- Read the path of the active Runtime project ("ActiveProject" property).
- Access tags ("Tags" property).
- Access tags of a list ("DataSet" property).
- Exit Runtime ("Stop" method).
- Display messages in a diagnostics window ("Trace" method).

Example:

The following command terminates WinCC Runtime:

```
'VBS3
HMIRuntime.Stop
```

BaseScreenName Property (Page 330)
ActiveProject Property (Page 305)
ActiveScreen Property (Page 305)
MenuToolBarConfig Property (Page 481)
Alarms object (list) (Page 126)

2.2.9 Item Object

Description

The "Item" object provides a reference to the current object.

Usage

The "Item" object is used, for example, to address the properties of the object currently selected in Graphics Designer.

Example:

In the following example, a rectangle has been created. When the object has been selected, all the properties of the current object can be set a background color red:

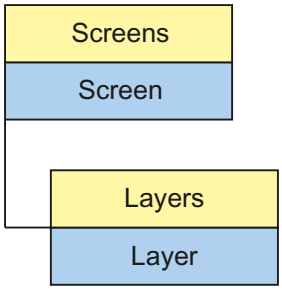
```
'VBS195
Item.BackColor = RGB(255,0,0)
```

See also

Objects and Lists (Page 123)

2.2.10 Layer Object

Description



The layer object returns the result of access to the layers list.

Parent Object

Picture, in which the picture layer is.

Usage

Depending on certain events, the Layer object can be used to obtain access to the properties of a complete layer in order, for example, to hide or unhide a layer with operating elements according to the operator authorization.

The "Layer" object can be used to:

- To activate or deactivate the visualization of a layer ("Visible" property).
- To read out the name of a layer ("Name" property).

Note

The layer property specifies the layer in which the object is located. The layer "0" is output as "Layer0".

When accessed, the layers are counted up from 1 in VBS. Therefore, the layer "1" must be addressed with "layers(2)".

Example:

In the following example, Layer 1 is set invisible:

```
'VBS4
Layers(2).Visible = vbFalse
```

See also

Layer Object (Page 136)

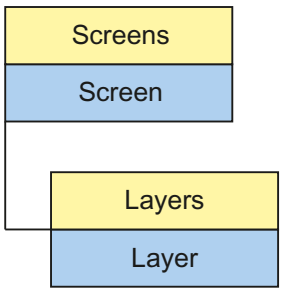
Visible Property (Page 680)

Parent Property (Page 514)

Name Property (Page 495)

2.2.11 Layers Object (Listing)

Description



The Layers list enables access to all 32 layers of the graphical Runtime system.

Parent Object

Picture, in which the picture layer is.

Usage

The "Layers" list can be used to:

- Process all layers in the list ("_NewEnum" property).
- Count all layers contained in the list ("Count" property).
- Process a layer from the list ("Item" method).

The properties represent default properties and methods of a list and are not described in detail in the WinCC documentation.

See also

Parent Property (Page 514)

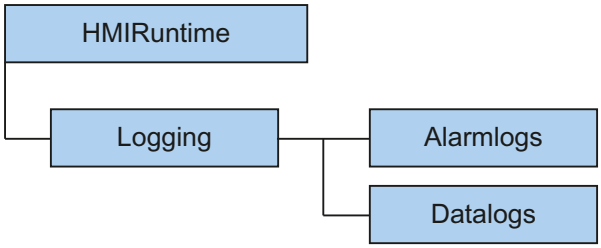
Item Method (Page 753)

Count Property (Page 380)

Layer Object (Page 136)

2.2.12 Logging Object

Description



Using the object, swapped archive segments may be reconnected to Runtime, or previously swapped archive segments may be deleted again. Therein

- Archive segments to be swapped are copied to the common archiving directory of the WinCC project, or
- previously swapped archive segments are deleted in the common archiving directory.

Using parameters you may control from where archive segments are to be swapped. You may also specify the time period over which archive segments are to be swapped or deleted. Archive segments are copied to the common archiving directory of the project.

If an error occurred during the operation with archiving segments, the method used returns an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Usage

Previously swapped archive segments of Alarm Logging and Tag Logging may be connected with Runtime ("Restore" method).

Previously swapped archive segments of Alarm Logging and Tag Logging may be deleted from the Runtime project ("Remove" method).

Example:

In the following example, archive segments from Alarm Logging and Tag Logging are swapped and the return value is output as Trace.

```
'VBS189
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

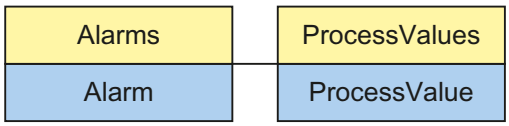
2.2.13 ProcessValue Object

Description



The ProcessValue object is used to access the ProcessValues object list.

Note

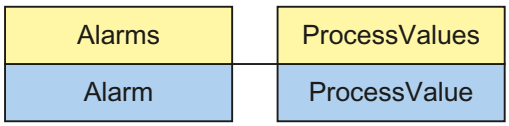
Only the 10 predefined ProcessValues are supported.

See also

ProcessValues Object (List) (Page 140)

2.2.14 ProcessValues Object (List)

Description



Usage

Using the "ProcessValues" list, you can:

- Edit a ProcessValue from the list ("Item" method)
- Display or edit all the objects in the list (_NewEnum attribute)
- Count all ProcessValues contained in the list (Count property)
- Read or set the values of the ProcessValue object (Value property)

The properties represent default properties and methods of a list and are not described in detail in the WinCC documentation.

See also

Alarms object (list) (Page 126)

ProcessValue Object (Page 139)

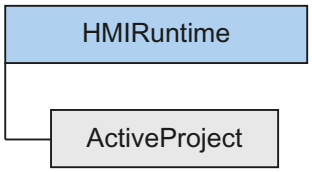
Count Property (Page 380)

Value Property (Page 665)

Item Method (Page 753)

2.2.15 Project Object

Description



Using the object, information may be requested from the current Runtime project.

The project object is returned as the result of ActiveProject.

Usage

Using the "Project" object, you may:

- Read the path of the current Runtime project ("Path" property).
- Read the name of the current Runtime project, without path or file extension ("Name" property).

Example:

The following example returns name and path of the current Runtime project as Trace:

```
'VBS159
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

See also

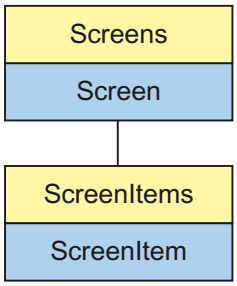
ActiveProject Property (Page 305)

Name Property (Page 495)

Path Property (Page 516)

2.2.16 ScreenItem Object

Description



The ScreenItem object returns the result of access to the ScreenItem list.

Parent Object

Picture containing the picture element.

Usage

The ScreenItem object can be used to access the properties of graphic objects within a picture according to certain events.

The "ScreenItem" object can be used for the following, for example:

- To activate or deactivate the visualization of an object ("Visible" property).
- To release or block the operation of an object ("Enabled" property).
- Change the width and height of an object ("Height" and "Width" properties).
- Change the position of an object ("Top" and "Left" properties).
- Read and define a layer in which a graphic object is located ("Layer" property).
- Read or define the name of a graphic object ("ObjectName" property).
- Define a reference to the superordinate picture ("Parent" property).

Using the "Activate" method, the focus is set on the respective ScreenItem object. If the focus cannot be set because the object is non-operable, for example, an error is generated. Using error processing (On Error Resume Next), the error may be evaluated.

Possible features of ScreenItem

The "ScreenItem" object can contain the following object types:

Standard objects	Smart objects	Windows objects	Tube objects	Controls	Others
Ellipse	3D bar	Button	Double T-piece	Siemens HMI Symbol Library	Customized Object
Ellipse arc	Application window	Check box	Polygon tube	WinCC AlarmControl	Group
Ellipse segment	Bar	Radio box	Tube bend	WinCC digital/ analog clock control	
Circle	Picture window	Round button	T-piece	WinCC FunctionTrendControl	
Circular arc	Control	Slider		WinCC gauge control	
Pie segment	I/O field			WinCC OnlineTrendControl	
Line	Faceplate Instance			WinCC OnlineTableControl	
Polygon	Graphic object			WinCC push button control	
Polyline	Combo box			WinCC RulerControl	
Rectangle	List box			WinCC slider control	
Rounded rectangle	Multiple row text			WinCC UserArchiveControl	
Connector	OLE object				
	Group display				
	Text list				
	Status display				

Detailed descriptions of the individual object types is provided under "ScreenItem Object Types". The ScreenItem object's "Type" property can be used to address the object types via the VBS Type ID.

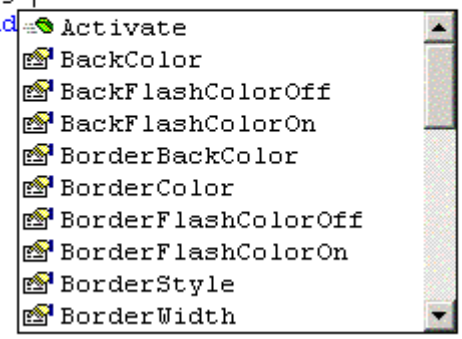
Object properties

The "ScreenItem" object has different properties according to the features. The following section describes the properties which all ScreenItem object types have:

```
Sub OnClick(ByVal Item)
Dim obj
Set obj = ScreenItems("Circle1").
End Sub
```

When a specific object type is addressed, certain further properties are added to the standard properties:

```
Sub OnClick(ByVal Item)
Dim obj
Set obj = ScreenItems("Circle1")
obj.
End
```



The additional properties are indicated in the descriptions of the individual object types.

Example

In the following example, the radius of a circle is set to 2 in Runtime per mouse click:

```
Sub OnClick(ByVal Item)
'VBS5
Dim objCircle
Set objCircle= ScreenItems("Circle1")
objCircle.Radius = 2
End Sub
```

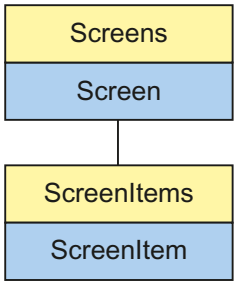
Object types of the ScreenItem object (Page 158)

2.2.17 ScreenItems Object (List)

Description



The "ScreenItems" list can be used to reference an object in the picture.

Parent Object

Picture containing the picture element.

Usage

The "ScreenItems" list can be used to:

- To display or edit all objects in the list (i.e. all objects within a picture) ("_NewEnum" property).
- To count the objects in a picture ("Count" property).
- To process a specific object in the list ("Item" method).

The properties are standard properties and methods of a collection and are not described in detail in the WinCC documentation.

Special features of the ScreenItem object

If an external control (ActiveX control or OLE object) is embedded in WinCC, it is possible that the properties of the embedded controls have the same name with the general properties of the ScreenItem object. In such cases, the ScreenItem properties have priority.

The properties of the embedded controls can also be addressed via the "object" property:

The "object" property is only provided by ActiveX controls and OLE objects.

Example:

```
'Control1 is an embedded ActiveX-Control with property "type"
'VBS196
Dim Control
Set Control=ScreenItems("Control1")
Control.object.type

'Control1 is a WinCC-Control
'VBS197
Dim Control
Set Control=ScreenItems("Control1")
Control.type
```

Example

In the following example, the name of the objects in the current picture are displayed in a message box:

```
Sub OnClick(ByVal Item)
'VBS6
  Dim lngAnswer
  Dim lngIndex
  lngIndex = 1
  For lngIndex = 1 To ScreenItems.Count
    lngAnswer = MsgBox(ScreenItems(lngIndex).Objectname, vbOKCancel)
    If vbCancel = lngAnswer Then Exit For
  Next
  End Sub
```

Example: Writing tag values (Page 810)

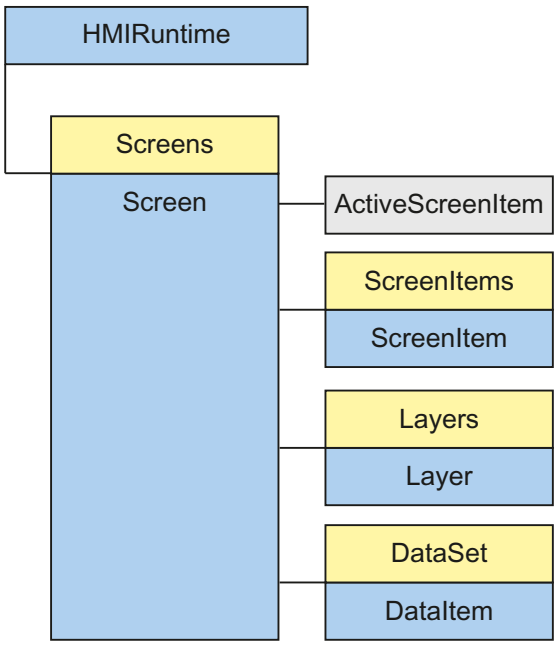
ScreenItem Object (Page 141)

Parent Property (Page 514)

Item Method (Page 753)

2.2.18 Screen Object

Description



The Screen object returns the result of access to the Screen list. All the properties and methods of this object can also be edited directly in Runtime. The "Screen" object represents a WinCC picture in Runtime and contains all the properties of the picture document and picture view.

The "Screen" object also contains the following:

- A list of all the graphic objects contained in the addressed picture which can be addressed by the "ScreenItems" object.
- A list of all the layers contained in the addressed picture which can be addressed by the "Layers" object.

Parent Object

A picture window in which the Screen object is embedded.

When the Screen object is the basic picture, the Parent object is not defined and set to zero.

Usage

The "Screen" object can be used for the following, for example:

- To release or block the operation of a screen ("Enabled" property).
- Change the width and height of a screen ("Height" and "Width" properties).
- Zoom a picture ("Zoom" property).
- Modify the fill pattern, background color and fill pattern color ("Fillstyle", "Backcolor" and "Fillcolor" properties).

Note

If a Change Picture is executed, all the open references are invalid for pictures no longer open. It is then no longer possible to work with these references.

Example:

In the following example, the width of the first picture in Runtime is increased by 20 pixels:

```
'VBS7
Dim objScreen
Set objScreen = HMIRuntime.Screens(1)
MsgBox "Screen width before changing: " & objScreen.Width
objScreen.Width = objScreen.Width + 20
MsgBox "Screen width after changing: " & objScreen.Width
```

Notes on Cross References

All the pictures which are addressed with the standard formulation

```
HMIRuntime.BaseScreenName = "Screenname"
```

are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

If pictures are addressed with different formulations in the code, this can be notified by the following section of the CrossReference:

```
' ' WINCC:SCREENNAME_SECTION_START
Const ScreenNameInAction = "ScreenName"
' WINCC:SCREENNAME_SECTION_END
The section can be inserted in VBS actions as often as required.
```

Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

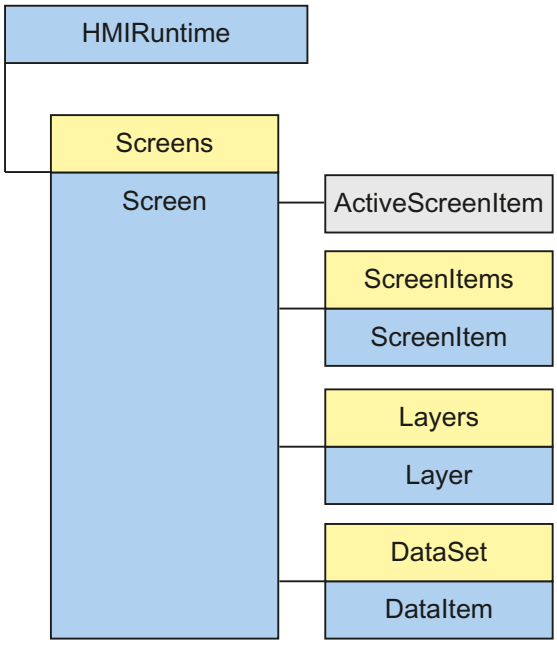
2.2.19 Screens Object (List)

Description



By using the picture window technique, several windows can be opened simultaneously in WinCC Runtime but only one basic picture exists. The "Screens" list enables access to all open pictures in Runtime using the picture names. The Screens list contains all invisible pictures.

Usage

When configuring a multi-user project, it is essential to specify the server prefix to access a picture which is not on the local computer.

The "Screens" list can be used to:

- Display or edit all the pictures within the list ("_NewEnum" property).
- To count the pictures in a project ("Count" property).
- To process a specific picture in the list ("Item" method).
- Initiate new drawing of all visible pictures ("Refresh" method).

The properties are standard properties and methods of a collection and are not described in detail in the WinCC documentation.

The access code, required in the VBS environment in the HMIRuntime.Screens(<Zugriffsschlüssel>) instruction, must fulfill the syntax requirements:

```
[<Grundbildname>.]<Bildfenstername>[:<Bildname>] ...
.<Bildfenstername>[:<Bildname>]
```

This means:

- The access code expresses the picture hierarchy.
- The picture names in the code can be omitted at any point.
- The "AccessPath" property of the "Screen" object corresponds to the full access code.
- Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.
- The basic picture can be addressed by the access code ".

In addition, it has been defined that the basic picture can be addressed with Index 1.

Examples

The pictures are addressed by the hierarchy information in the list. There are two options here, with or without use of the picture name. In the following examples, a basic picture "BaseScreenName" is configured with a picture window "ScreenWindow". The picture window contains the picture "ScreenName".

Addressing with the picture name

```
'VBS8
Set objScreen = HMIRuntime.Screens("BaseScreenName.ScreenWindow:ScreenName")
```

Addressing without the picture name

```
'VBS9
Set objScreen = HMIRuntime.Screens("ScreenWindow")
```

Referencing the basic picture in various ways

```
'VBS10
Set objScreen = HMIRuntime.Screens(1)

'VBS11
Set objScreen = HMIRuntime.Screens("")

'VBS12
Set objScreen = HMIRuntime.Screens("BaseScreenName")
```

Count Property (Page 380)

2.2.20 SmartTags Object

Description

The "HMIRuntime" component was deactivated in the faceplate type. The new "SmartTags" component was added for the faceplate type. With the SmartTags object you can dynamize the faceplate type. You can only access the faceplate variables and the properties of the faceplate type. You cannot access the normal WinCC tag management system. The normal WinCC tag management system is not available in the faceplate type.

Usage

Using the "SmartTags" object, you can:

- Access the faceplate tags in a faceplate type.
  Syntax: SmartTags("<tagname>")
- Access the properties of a faceplate type.
  Syntax: SmartTags("Properties\<propertyname>")

Example 1

Insert a rectangle and a button in a faceplate type. Define a faceplate variable var1. Connect the "Width" property of the rectangle to faceplate variable var1. Dynamize the "OnClick" event of the button as follows with VBS.

```
'VBS306
Dim w
w = SmartTags("var1")
w = w + 10
SmartTags("var1") = w
```

When you activate Runtime, the faceplate variable is incremented by 10 every time you click the button. This increases the rectangle width by 10.

Direct reading and writing with object reference

In the following example, the SmartTags object is used to create an object reference "w" to "var1".

Referencing offers the advantage of being able to access the "var1" tag.

```
'VBS307
Dim w
Set w = SmartTags("var1")
```

```
w.value = w.value + 10
```

Example 2:

Insert a rectangle and a button in a faceplate type. Define the instance-specific property "wide". Link the "Width" property of the rectangle to the instance-specific property "wide". Dynamize the "OnClick" event of the button as follows with VBS:

```
'VBS308
Dim w
w = SmartTags("Properties\wide")
SmartTags("Properties\wide") = w + 50
```

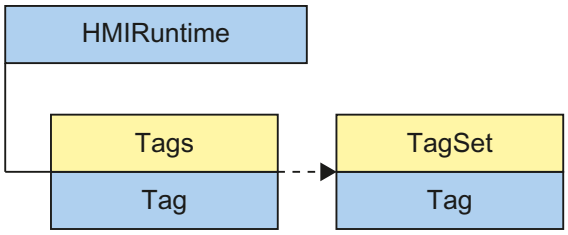
When you activate Runtime, the instance-specific property "wide" is increased by 50 every time you click the button. This increases the rectangle width by 50.

See also

SmartTag property (Page 567)

2.2.21 Tag Object

Description



A tag object is returned via the "Tags" list. A tag object can be used to address all the properties and methods of a tag.

When creating a tag object, all the properties are installed with the following values:

- Value = VT_EMPTY
- Name = Tag name
- QualityCode = BAD NON-SPECIFIC
- TimeStamp = 0

- LastError = 0
- ErrorDescription = " "

Note

A summary of possible Quality Codes may be found in WinCC Information System under key word "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

Usage

The "Tag" object can be used to:

- Read out information on the tag ("Name", "QualityCode", "TimeStamp", "LastError" and "ErrorDescription" properties)
- Set a value for a tag ("Write" method, "Value" property)
- Read a value for a tag ("Read" method, "Value" property)

Read the value of a "Tag1" tag:

```
'VBS13
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read()
MsgBox objTag.Value
```

Declaration of tags in WinCC

Always define internal tags in VB script using the "Dim" instruction in order to prevent writing tags wrongly.

When creating a new action, the "Option explicit" instruction is automatically entered in the declaration area and cannot be deleted.

Do not use the "Option explicit" instruction in the code because it may cause Runtime errors.

Example: Declaration of a VBScript "lngVar" tag:

```
'VBS14
Dim lngVar
lngVar = 5
MsgBox lngVar
```

Note

Tag names must not contain any special characters.

Please note that when creating a tag, it must not contain a value (Value = VT_EMPTY). Initialize the tags after declaration with the corresponding value.

Notes on Cross References

All the pictures which are addressed with the standard formulation

```
HMIRuntime.Tags("Tagname")
```

are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

If tags are addressed with different formulations in the code, this can be notified by the following section of the CrossReference:

```
' ' WINCC:TAGNAME_SECTION_START
Const TagNameInAction = "TagName"
' WINCC:TAGNAME_SECTION_END
```

The section can be inserted in VBS actions as often as required.

Note

It is not possible to guarantee the compilation of combined tag names from the CrossReference.

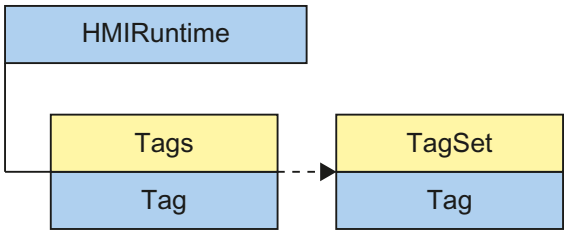
2.2.22 Tags Object (List)

Description



The "Tags" list enables access to tags in WinCC Runtime. The result of access to the "Tags" list is returned by an object of the type "Tag". The Tag object can be used to access all the tag properties and methods.

Note

"Tags" is a list with a restricted functional scope. The tags in the list cannot be accessed via the index but only by using the tag names. The standard methods get_Count and get_NewEnum cannot be used in the Tags list.

Usage

Tags in the list are accessed via:

```
HMIRuntime.Tags("Tagname")
```

The Tags list is used to declare tags (tag objects) for read and write access. To ensure that read and write access is carried out without errors, the corresponding tags must be available in WinCC tag management.

In VBS you can address tags directly via the name and set and read values. If you want to access additional tag properties, request the quality code, for example, you will always have to address tags via the tag listing. The tag object returned enables access to all tag properties and methods. You have to form an instance for the object, to write a binary tag with HMIRuntime.Tags("Variable").Value=TRUE, for example.

The "CreateTagSet" method can be used to generate a "TagSet" object that enables simultaneous access to several tags.

Example:

There are two options when creating tags:

- With specification of the server prefix: For tags in multi-user systems which are not stored locally.
- Direct use of the tag name: For tags stored locally on the computer.

Specification of the server prefix

```
'VBS15
Dim objTag
Set objTag = HMIRuntime.Tags("Serverprefix::Tagname")
If the server prefix is entered directly, the "ServerPrefix" property is assigned the
corresponding value.
```

Specification of the tag name

```
'VBS16
Dim objTag
Set objTag = HMIRuntime.Tags("Tagname")
If just the tag name is used, the "ServerPrefix" and "TagPrefix" properties are assigned
the values from the current context (current picture window).
```

Example: How to Read Tag Values (Page 812)
Example: Writing tag values (Page 810)
Item Method (Page 753)
CreateTagSet Method (Page 701)
Tag Object (Page 152)

2.2.23 TagSet Object (List)

Description

The object "TagSet" enables simultaneous access to several tags in one call. This features better performance and lower communication load that single access to various tags.

Usage

Using the TagSet object, you may:

- Add tags to the list ("Add" method)
- Access tag objects contained in the list, and their properties ("Item" method)
- Write all tags of the list ("Write" method)
- Read all tags of the list ("Read" method)
- Remove single tags from the list ("Remove" method)
- Remove all tags from the list ("RemoveAll" method)

Tags in the list are accessed via:

```
'VBS169
Dim myTags
myTags = HMIRuntime.Tags.CreateTagSet
myTags("Tagname")
```

In order to have error-free read/write access to tags (tag objects) of the list, the respective tags must exist in WinCC tag management.

If an error occurred during read/write access, the method used will return an error message using the "LastError" and "ErrorDescription" properties.

Synchronous writing and reading of the tags is possible. The optional "Writemode" parameter can be used to write process tags directly to the AS with "1", for example, "group.Write 1". Use the optional "Readmode" parameter to read process tags with "1" directly from the AS or channel, for example, "group.Read 1".

Example:

The following example shows how to generate a TagSet object, how to add tags, and how to write values.

```
'VBS168
Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
'Add Tags to the Collection
group.Add "Motor1"
group.Add "Motor2"
'Set the Values of the Tags
group("Motor1").Value = 3
group("Motor2").Value = 9
'Write the Values to the DataManager
group.Write
```

2.3 Object types of the ScreenItem object

2.3.1 Object types of the ScreenItem object

Introduction

The following section lists all the available types of the "ScreenItem" object.

The features of the "ScreenItem" object represent all the graphic objects available in WinCC Graphics Designer.

The object types are divided into the following groups according to their arrangement in Graphics Designer:

- Standard objects
- Smart objects
- Windows objects
- Tube objects
- Controls

There are also the object types

- Customized Object
- Group

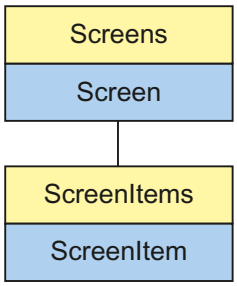
2.3.2.1 Ellipse

Description



Object Type of ScreenItem Object. Represents the graphic object "Ellipse"

Type Identifier in VBS

HMIEllipse

Usage

In the following example, the object with the name "Ellipse1" is moved 10 pixels to the right:

```
'VBS17
Dim objEllipse
Set objEllipse = ScreenItems("Ellipse1")
objEllipse.Left = objEllipse.Left + 10
```

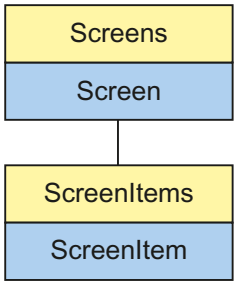
2.3.2.2 Ellipse arc

Description



Object Type of ScreenItem Object. Represents the graphic object "Ellipse Arc"

Type Identifier in VBS

HMIEllipticalArc

Usage

In the following example, the object with the name "EllipseArc1" is moved 10 pixels to the right:

```
'VBS18
Dim objEllipseArc
Set objEllipseArc = ScreenItems("EllipseArc1")
objEllipseArc.Left = objEllipseArc.Left + 10
```

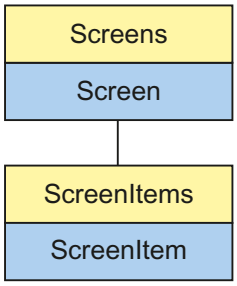
2.3.2.4 Circle

Description



Object Type of ScreenItem Object. Represents the graphic object "Circle".

Type Identifier in VBS

HMICircle

Usage

In the following example, the object with the name "Circle1" is moved 10 pixels to the right:

```
'VBS20
Dim objCircle
Set objCircle= ScreenItems("Circle1")
objCircle.Left = objCircle.Left + 10
```

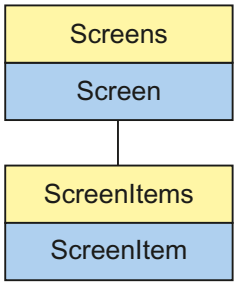
2.3.2.7 Line

Description



Object Type of ScreenItem Object. Represents the graphic object "Line"

Type Identifier in VBS

HMILine

Usage

In the following example, the object with the name "Line1" is moved 10 pixels to the right:

```
'VBS23
Dim objLine
Set objLine = ScreenItems("Line1")
objLine.Left = objLine.Left + 10
```

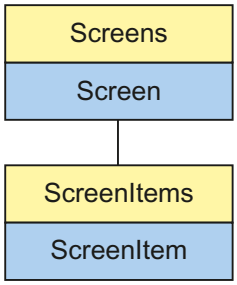
2.3.2.8 Polygon

Description



Object Type of ScreenItem Object. Represents the graphic object "Polygon"

Type Identifier in VBS

HMIPolygon

Usage

In the following example, the object with the name "Polygon1" is moved 10 pixels to the right:

```
'VBS24
Dim objPolygon
Set objPolygon = ScreenItems("Polygon1")
objPolygon.Left = objPolygon.Left + 10
```

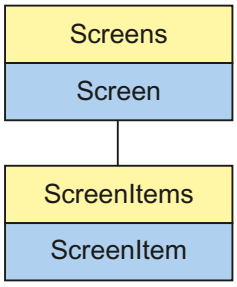
2.3.2.10 Rectangle

Description



Object Type of ScreenItem Object. Represents the graphic object "Rectangle"

Type Identifier in VBS

HMIRectangle

Usage

In the following example, the object with the name "Rectangle1" is moved 10 pixels to the right:

```
'VBS26
Dim objRectangle
Set objRectangle = ScreenItems("Rectangle1")
objRectangle.Left = objRectangle.Left + 10
```

Notes on Error Handling

The rectangle and rounded rectangle are mapped to an "HMIRectangle" type in the object model. Since the two objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(ByVal Item)
'VBS27
Dim objScreenItem
'
'Activation of errorhandling:
On Error Resume Next
For Each objScreenItem In ScreenItems
If "HMIRectangle" = objScreenItem.Type Then
'
'=== Property "RoundCornerHeight" only available for RoundRectangle
objScreenItem.RoundCornerHeight = objScreenItem.RoundCornerHeight * 2
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.Name & ": no RoundedRectangle" & vbCrLf
'
'Delete error message
Err.Clear
End If
End If
Next
On Error Goto 0  'Deactivation of errorhandling
End Sub
```

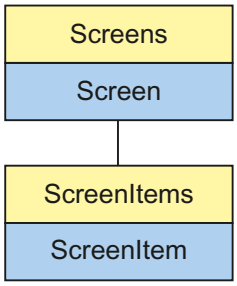
2.3.2.11 Rounded rectangle

Description



Object Type of ScreenItem Object. Represents the graphic object "Rounded Rectangle".

Type Identifier in VBS

HMIRoundRectangle

Usage

In the following example, the object with the name "RoundedRectangle1" is moved 10 pixels to the right:

```
'VBS28
Dim objRoundedRectangle
Set objRoundedRectangle = ScreenItems("RoundedRectangle1")
objRoundedRectangle.Left = objRoundedRectangle.Left + 10
```

Notes on Error Handling

The rectangle and rounded rectangle are mapped to an "HMIRectangle" type in the object model. Since the two objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(ByVal Item)
```

```
'VBS29
Dim objScreenItem
On Error Resume Next    'Activation of errorhandling
For Each objScreenItem In ScreenItems
If "HMIRectangle" = objScreenItem.Type Then
'
'=== Property "RoundCornerHeight" available only for RoundRectangle
objScreenItem.RoundCornerHeight = objScreenItem.RoundCornerHeight * 2
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.ObjectName & ": no RoundedRectangle" & vbCrLf
Err.Clear    'Delete errormessage
End If
End If
Next
On Error Goto 0    'Deactivation of errorhandling
End Sub
```

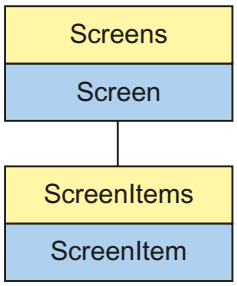
2.3.3 Smart objects

2.3.3.1 3D Bar

Description



Object Type of ScreenItem Object. Represents the graphic object "3D Bar"

Type Identifier in VBS

HMIBar

Usage

In the following example, the object with the name "3DBar1" is moved 10 pixels to the right:

```
'VBS32
Dim objBar
Set objBar = ScreenItems("3DBar1")
objBar.Left = objBar.Left + 10
```

Notes on Error Handling

Bars and 3D bars are imaged in the object model on a "HMIBar" type. Since the two objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
'VBS148
Sub OnClick(ByVal Item)
Dim objScreenItem
'
'Activation of errorhandling:
On Error Resume Next
For Each objScreenItem In ScreenItems
If "HMIBar" = objScreenItem.Type Then
'
'=== Property "Layer00Value" only available for 3D bar
objScreenItem.Layer00Value = objScreenItem.Layer00Value * 2
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.Name & ": no 3D bar" & vbCrLf
'
'Delete error message
Err.Clear
End If
End If
Next
On Error Goto 0 'Deactivation of errorhandling
End Sub
```

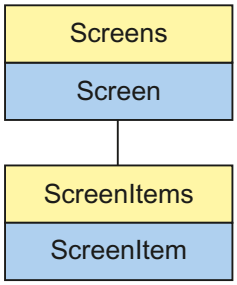
2.3.3.4 Picture Window

Description



Object Type of ScreenItem Object. Represents the graphic object "Picture Window"

Type Identifier in VBS

HMIScreenWindow

Usage

In the following example, the object with the name "ScreenWindow1" is moved 10 pixels to the right:

```
'VBS35
Dim objScrWindow
Set objScrWindow = ScreenItems("ScreenWindow1")
objScrWindow.Left = objScrWindow.Left + 10
```

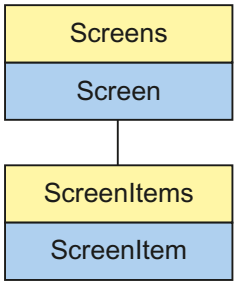
2.3.3.5 Control

Description



Object Type of ScreenItem Object. Represents the graphic object "Control"

The Control object type always assumes the properties of the Control type selected. In the case of controls provided by WinCC, the properties are indicated under the description of the corresponding Control.

In the case of controls from external suppliers, the control properties are supplied and thus not a part of this description. However, the control properties can be queried using the "Item" property.

Type Identifier in VBS

Special WinCC type descriptions or version-independent ProgID

Usage

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS36
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 10
```

Special feature

The controls provided by WinCC return a special ID as the type. It can be found under the topic "Type Identification in VBS" in the individual descriptions of the WinCC Controls.

Use of Controls from External Suppliers

In the case of non-WinCC controls, the version-independent ProgID is returned as the type.

It is possible to determine the version-dependent ProgID or "User friendly Name" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every Control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS37
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Determine the UserFriendlyName as follows:

```
'VBS38
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property. Address the properties of an external control supplier as follows:

```
Control.object.type
```

The properties of the ScreenItem object are used in the case of identical names, if you use the following form:

```
Control.type
```

WinCC controls available

- WinCC Alarm Control
- WinCC Digital/Analog Clock
- WinCC FunctionTrendControl
- WinCC Gauge Control
- WinCC Media Control
- WinCC OnlineTableControl
- WinCC OnlineTrendControl
- WinCC Push Button Control
- WinCC Slider Control
- WinCC UserArchiveControl
- HMI Symbol Library

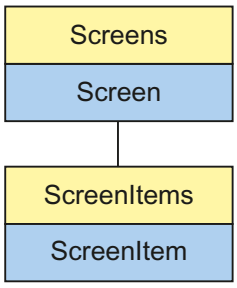
2.3.3.7 Faceplate Instance

Description



Object Type of ScreenItem Object. Represents the "faceplate instance" graphic object.

Type identifier in VBS

HMIFaceplateObject

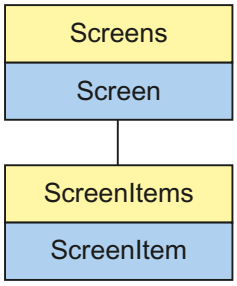
Usage

In the following example, the object with the name "FaceplateInstance1" is moved 10 pixels to the right:

```
'VBS309
Dim objFaceplateObject
Set objFaceplateObject = ScreenItems("FaceplateInstance1")
objFaceplateObject.Left = objFaceplateObject.Left + 10
```

2.3.3.8 Graphic Object

Description



Object Type of ScreenItem Object. Represents the graphic object "Graphic Object"

Type Identifier in VBS

HMIGraphicView

Usage

In the following example, the object with the name "GraphicObject1" is moved 10 pixels to the right:

```
'VBS40
Dim objGraphicView
Set objGraphicView= ScreenItems("GraphicObject1")
objGraphicView.Left = objGraphicView.Left + 10
```

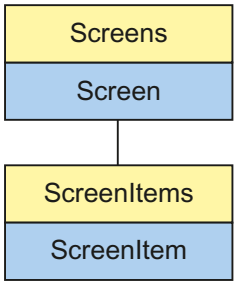
2.3.3.9 Combobox

Description



Object Type of ScreenItem Object. Represents the "Combobox" graphic object.

Type Identifier in VBS

HMIComboBox

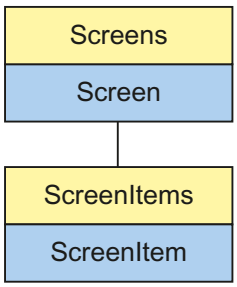
Usage

In the following example, the object with the name "ComboBox1" is moved 10 pixels to the right:

```
'VBS21
Dim objComboBox
Set objComboBox = ScreenItems("ComboBox1")
objComboBox.Left = objComboBox.Left + 10
```

2.3.3.10 List Box

Description



Object Type of ScreenItem Object. Represents the "List Box" graphic object.

Type Identifier in VBS

HMIListBox

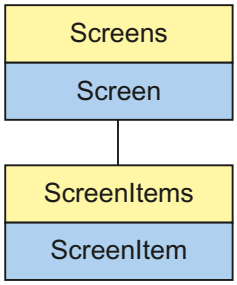
Usage

In the following example, the object with the name "ListBox1" is moved 10 pixels to the right:

```
'VBS21
Dim objListBox
Set objListBox = ScreenItems("ListBox1")
objListBox.Left = objListBox.Left + 10
```

2.3.3.11 Multiple row text

Description



Object Type of ScreenItem Object. Represents the "Multiline Text" graphic object.

Type Identifier in VBS

HMIMultiLineEdit

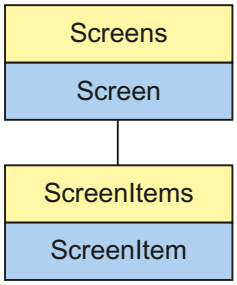
Usage

In the following example, the object with the name "MultiLineEdit1" is moved 10 pixels to the right:

```
'VBS21
Dim objMultiLineEdit
Set objMultiLineEdit = ScreenItems("MultiLineEdit1")
objMultiLineEdit.Left = objMultiLineEdit.Left + 10
```

2.3.3.12 OLE object

Description



Object Type of ScreenItem Object. Represents the graphic object "OLE Element". The return value is a STRING type.

Type Identifier in VBS

Version-independent ProgID

Usage

In the following example, the object with the name "OLEElement1" is moved 10 pixels to the right:

```
'VBS41
Dim objOLEElement
Set objOLEElement = ScreenItems("OLEElement1")
objOLEElement.Left = objOLEElement.Left + 10
```

Special feature

In the case of OLE Elements, the version-independent ProgID is returned as the type.

It is possible to determine the version-dependent ProgID or "User friendly Name" from the ProgID: In the following example, "OLEObject1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every Control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS42
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("OLEElement1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that the example above works, a Word document should be embedded in the picture as an OLE Element.

Determine the User Friendly Name as follows:

```
'VBS43
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("OLEElement1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that the example above works, a Word document should be embedded in the picture as an OLE Element.

Using OLE Elements

If an OLE Element is used, it is possible that the properties provided by the OLE Element have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an OLE Element can be accessed using the additional "Object" property. Address the properties of an OLE Element as follows:

```
OLEObjekt.object.type
```

Only use the form

```
OLEObjekt.type
```

In the case of identical names, the properties of the ScreenItem object are used.

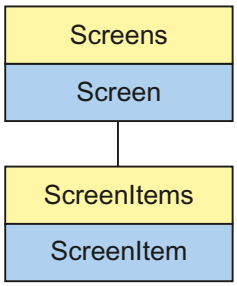
2.3.4 Windows objects

2.3.4.1 Button

Description



Object Type of ScreenItem Object. Represents the graphic object "Button"

Type Identifier in VBS

HMIButton

Usage

In the following example, the object with the name "Button1" is moved 10 pixels to the right:

```
'VBS47
Dim cmdButton
Set cmdButton = ScreenItems("Button1")
cmdButton.Left = cmdButton.Left + 10
```

Notes on Error Handling

Buttons and pushbuttons are mapped in the object model to an "HMIButton" type. Since the objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(ByVal Item)
'VBS48
Dim objScreenItem
On Error Resume Next    'Activation of errorhandling
For Each objScreenItem In ScreenItems
If objScreenItem.Type = "HMIButton" Then
'
'=== Property "Text" available only for Standard-Button
objScreenItem.Text = "Windows"
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.ObjectName & ": no Windows-Button" & vbCrLf
Err.Clear    'Delete error message
End If
```

```
End If
Next
On Error Goto 0    'Deactivation of errorhandling
End Sub
```

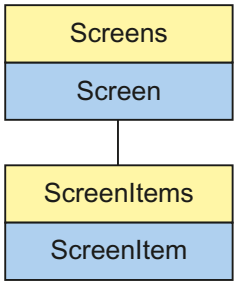
2.3.4.2 Check box

Description



Object Type of ScreenItem Object. Represents the graphic object "Check Box"

Type Identifier in VBS

HMICheckBox

Usage

In the following example, the object with the name "CheckBox1" is moved 10 pixels to the right:

```
'VBS49
Dim chkCheckBox
Set chkCheckBox = ScreenItems("CheckBox1")
chkCheckBox.Left = chkCheckBox.Left + 10
```

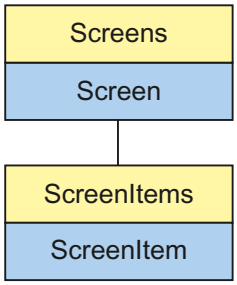
2.3.4.3 Radio box

Description



Object Type of ScreenItem Object. Represents the graphic object "Radio Box"

Type Identifier in VBS

HMIOptionGroup

Usage

In the following example, the object with the name "RadioBox1" is moved 10 pixels to the right:

```
'VBS50
Dim objOptionGroup
Set objOptionGroup = ScreenItems("RadioBox1")
objOptionGroup.Left = objOptionGroup.Left + 10
```

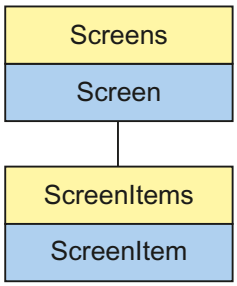
2.3.4.4 Round Button

Description



Object Type of ScreenItem Object. Represents the graphic object "Round Button"

Type Identifier in VBS

HMISwitch

Usage

In the following example, the object with the name "RoundButton1" is moved 10 pixels to the right:

```
'VBS51
Dim objSwitch
Set objSwitch= ScreenItems("RoundButton1")
```

```
objSwitch.Left = objSwitch.Left + 10

Sub OnClick(ByVal Item)
'VBS52
Dim objScreenItem
On Error Resume Next    'Activation of errorhandling
For Each objScreenItem In ScreenItems
    If objScreenItem.Type = "HMIButton" Then
 '
         '=== Property "Text" available only for Standard-Button
         objScreenItem.Text = "Windows"
         If 0 <> Err.Number Then
         HMIRuntime.Trace objScreenItem.ObjectName & ": no Windows-Button" & vbCrLf
         Err.Clear   'Delete error message
         End If
'
         '=== Property "Radius" available only for RoundButton
         objScreenItem.Radius = 10
         If 0 <> Err.Number Then
         HMIRuntime.Trace ScreenItem.ObjectName & ": no RoundButton" & vbCrLf
         Err.Clear
         End If
    End If
Next
On Error Goto 0    'Deactivation of errorhandling
End Sub
```

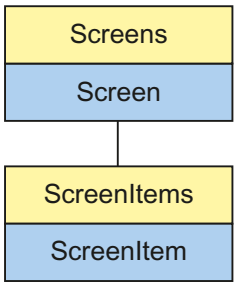
2.3.4.5 Slider

Description



Object Type of ScreenItem Object. Represents the graphic object "Slider"

Type Identifier in VBS

HMISlider

Usage

In the following example, the object with the name "Slider1" is moved 10 pixels to the right:

```
'VBS53
Dim sldSlider
Set sldSlider = ScreenItems("Slider1")
sldSlider.Left = sldSlider.Left + 10
```

Notes on Error Handling

Sliders and WinCC slider controls are mapped in the object model to an "HMISlider" type. Since the objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(Byval Item)
'VBS194
Dim ScreenItem
' activating error handling:
On Error Resume Next
For Each ScreenItem In ScreenItems
If ScreenItem.Type = "HMISlider" Then
'=== Property "BevelColorUp" only exists for a WinCC Slider Control
ScreenItem.BevelColorUp = 1
If (Err.Number <> 0) Then
HMIRuntime.Trace(ScreenItem.ObjectName + ": no Windows-Slider" + vbCrlf)
' delete error message
Err.Clear
End If
'=== Property "BorderStyle" only exists for a Windows-Slider
ScreenItem.BorderStyle = 1
If (Err.Number <> 0) Then
HMIRuntime.Trace(ScreenItem.ObjectName + ": no WinCC Slider Control" + vbCrlf)
Err.Clear
End If
End If
Next
On Error GoTo 0  ' deactivating error handling
End Sub
```

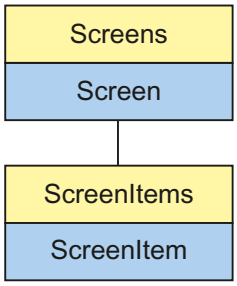
2.3.5 Tube objects

2.3.5.1 Polygon Tube

Description



Object Type of ScreenItem Object. Represents the "Polygon Tube" graphic object.

Type Identifier in VBS

HMITubePolyline

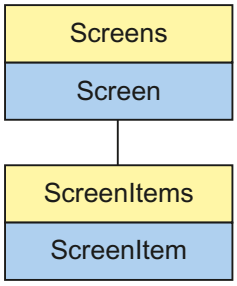
Usage

In the following example, the object with the name "TubePolyline1" is moved 10 pixels to the right:

```
'VBS24
Dim objTubePolyline
Set objTubePolyline = ScreenItems("TubePolyline1")
objTubePolyline.Left = objTubePolyline.Left + 10
```

2.3.5.2 T-piece

Description



Object Type of ScreenItem Object. Represents the "T-piece" graphic object.

Type Identifier in VBS

HMITubeTeeObject

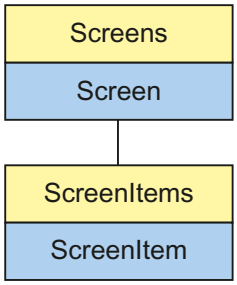
Usage

In the following example, the object with the name "TubeTeeObject1" is moved 10 pixels to the right:

```
'VBS21
Dim objTubeTeeObject
Set objTubeTeeObject = ScreenItems("TubeTeeObject1")
objTubeTeeObject.Left = objTubeTeeObject.Left + 10
```

2.3.5.3 Double T-piece

Description



Object Type of ScreenItem Object. Represents the "Double T-piece" graphic object.

Type Identifier in VBS

HMITubeDoubleTeeObject

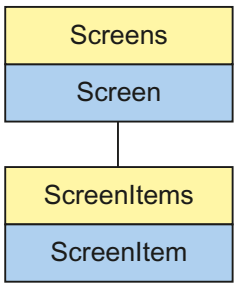
Usage

In the following example, the object with the name "TubeDoubleTeeObject1" is moved 10 pixels to the right:

```
'VBS21
Dim objTubeDoubleTeeObject
Set objTubeDoubleTeeObject = ScreenItems("TubeDoubleTeeObject1")
objTubeDoubleTeeObject.Left = objTubeDoubleTeeObject.Left + 10
```

2.3.5.4 Tube Bend

Description



Object Type of ScreenItem Object. Represents the "Tube Arc" graphic object.

Type Identifier in VBS

HMITubeArcObject

Usage

In the following example, the object with the name "TubeArcObject1" is moved 10 pixels to the right:

```
'VBS24
Dim objTubeArcObject
Set objTubeArcObject = ScreenItems("TubeArcObject1")
objTubeArcObject.Left = objTubeArcObject.Left + 10
```

2.3.6 Controls

2.3.6.1 Controls

Special features with controls

In the case of non-WinCC controls, the version-independent ProgID is returned as the type.

It is possible to determine the version-dependent ProgID or "User friendly Name" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every Control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS153
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Determine the User Friendly Name as follows:

```
'VBS154
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Restrictions of VBS for Dynamization by Controls

If Controls are to be dynamized with, the following conditions must be fulfilled:

Methods

The "ByRef" declaration may only be implemented as a "Variant" (ByRef xxx as Variant)

The "ByVal" declaration may only be implemented with tag types (ByVal xxx as Long)

Properties

The "ByRef" declaration may only be implemented as a "Variant" (ByRef xxx as Variant)

The "ByVal" declaration may only be implemented with tag types (ByVal xxx as Long)

Events

The "ByRef" declaration is not permitted.

The "ByVal" declaration may only be implemented as a "Variant" (ByVal xxx as Variant)

Arrays

If arrays are used, they must be declared with (ByRef xxx As Variant).

In order that arrays can be transferred in variants, variant tag must also be inserted as an intermediate tag according to the following scheme:

```
'VBS151
Dim arrayPoints(200)
Dim vArrayCoercion      'Variant for array Coercion
```

```
' Make the VBS Array compatibile with the OLE Automation
vArrayCoercion = (arrayPoints)
objTrendControl.DataXY = vArrayCoercion   ' this array will occur in the control
```

Use of Controls from External Suppliers

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property. Address the properties of an external control supplier as follows:

```
Control.object.type
```

If you use the following form, the properties of the ScreenItem object are used in the case of identical names:

```
Control.type
```

Double parameter

When using a Control which is not an internal WinCC control, it is possible that the event prototypes contain a parameter with the name "Item". In this case, the name of the parameter is renamed according to "ObjectItem" in the VBS prototype submitted. If this name already exists, the name is differentiated by numbers being appended.

WinCC controls available

- HMI Symbol Library
- WinCC AlarmControl
- WinCC Alarm Control (before WinCC V7)
- WinCC Digital/Analog Clock
- WinCC FunctionTrendControl
- WinCC Function Trend Control (before WinCC V7)
- WinCC Gauge Control
- WinCC Media Control
- WinCC OnlineTableControl
- WinCC Online Table Control (before WinCC V7)
- WinCC OnlineTrendControl

- WinCC Online Trend Control (before WinCC V7)
- WinCC Push Button Control
- WinCC RulerControl
- WinCC Slider Control
- WinCC UserArchiveControl

2.3.6.2 List of controls

Column object (list)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "Column" listing object to configure the properties of the columns in the WinCC UserArchiveControl.

Use in the controls

- WinCC UserArchiveControl (Page 284)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "colobj.ColumnName", the listing name "Column" is dropped: "colobj.Name".

HitlistColumn object (list)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "HitlistColumn" listing object to configure the message blocks used in the hitlist of WinCC AlarmControl.

Use in the controls

- WinCC AlarmControl (Page 255)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "hitlistobj.HitlistColumnName", the listing name "HitlistColumn" is dropped: "hitlistobj.Name".

Note that properties are available for WinCC controls that can have the effect of methods. These properties are characterized by the respective names, e.g. "Add", "Remove" or "Rename".

HitlistColumnAdd (Page 432)	HitlistColumnRepos (Page 433)	HitListMaxSourceItems (Page 434)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "Row" listing object to access the rows of the table-based controls. The Row object refers to the runtime data in the tables.

Use in the controls

WinCC AlarmControl (Page 255)	WinCC OnlineTableControl (Page 267)
WinCC RulerControl (Page 278)	WinCC UserArchiveControl (Page 284)

Available methods of the object

SelectAll (Page 780)	SelectRow (Page 781)
UnselectAll (Page 795)	UnselectRow (Page 796)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "rowobj.RowCellCount", the listing name "Row" is dropped: "rowobj.CellCount".

RowCellCount (Page 539)	RowCellText (Page 539)
RowCount (Page 539)	RowNumber (Page 540)

RulerBlock object (list)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "Block" listing object to configure the blocks of WinCC RulerControl.

Use in the controls

- WinCC RulerControl (Page 278)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "rulerblockobj.BlockName", the listing name "Block" is dropped: "rulerblockobj.Name".

BlockAlign (Page 336)	BlockHideText (Page 337)	BlockPrecisions (Page 339)
BlockAutoPrecisions (Page 336)	BlockHideTitleText (Page 338)	BlockShowDate (Page 340)

RulerColumn object (list)

Description

The listing of controls is a data container that can save a number of objects of the same type (users can change the number).

Use the "Column" listing object to configure the columns of the ruler window in WinCC RulerControl.

Use in the controls

- WinCC RulerControl (Page 278)

Available properties of the object

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "rulercolobj.ColumnName", the listing name "Column" is dropped: "rulercolobj.Name".

Note that properties are available for WinCC controls that can have the effect of methods. These properties are characterized by the respective names, e.g. "Add", "Remove" or "Rename".

ColumnAdd (Page 367)	ColumnName (Page 371)	ColumnSort (Page 374)
ColumnCount (Page 368)	ColumnRemove (Page 372)	ColumnSortIndex (Page 374)
ColumnIndex (Page 370)	ColumnRepos (Page 372)	ColumnVisible (Page 376)

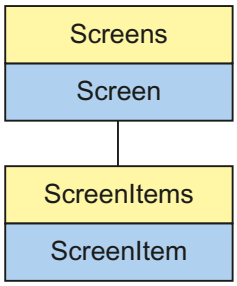
2.3.6.3 HMI Symbol Library

Description



Object Type of ScreenItem Object. Represents the graphic object "HMI Symbol Library"

Type Identifier in VBS

HMISymbolLibrary

Usage

In the following example, the object with the name "Control1" is moved 20 pixels to the right:

```
'VBS64
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left +20
```

Properties

This object type has the following properties:

Example

A selection of messages is defined in an existing WinCC AlarmControl. The column properties are configured in the script.

Requirements

- A "WinCC AlarmControl" with the name "Control1" has already been inserted in a process picture in Graphics Designer. The picture "C_015_Native_Alarms_Sel.pdl" from the demo project was used for this example.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.

- You have already configured messages in your project. Or you are using the demo project from which we have taken the messages used for the example.
- Messages have already been triggered in Runtime. The buttons "incoming" and "outgoing" were clicked in the demo project.

```
'VBS366
Sub OnClick(ByVal Item)
Dim objControl
Dim objMessColumn
Dim objMessBlock

Set objControl = ScreenItems("Control1")
objControl.ApplyProjectSettings = False
Set objMessBlock = objControl.GetMessageBlock("Date")
objMessBlock.DateFormat = "dd.MM.yy"
Set objMessColumn = objControl.GetMessageColumn("Time")
objMessColumn.Visible = False
objControl.MsgFilterSQL = "MSGNR >= 5 AND Priority = 0"
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

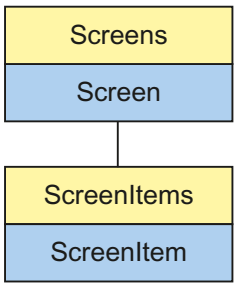
2.3.6.5 WinCC Digital/Analog Clock

Description



Object Type of ScreenItem Object. Represents the graphic object "WinCC Digital/Analog Clock"

Type Identifier in VBS

HMIClock

Usage

In the following example, the object with the name "Control1" is moved 11 pixels to the right:

```
'VBS55
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left +11
```

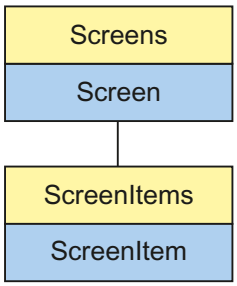
2.3.6.6 WinCC FunctionTrendControl

Description



Object Type of ScreenItem Object. Represents the graphic object "WinCC FunctionTrendControl" as of WinCC V7.0.

Type Identifier in VBS

HMIFunctionTrendControl

Available list objects

StatusbarElement (Page 244)	Trend (Page 247)	XAxis (Page 251)
ToolbarButton (Page 246)	TrendWindow (Page 249)	YAxis (Page 252)

Methods available in VBS

Activate	GetToolbarButtonCollection	MoveAxis	ShowTrendSelection
ActivateDynamic	GetTrend	NextTrend	StartStopUpdate
AttachDB	GetTrendCollection	OneToOneView	ZoomArea
DeactivateDynamic	GetTrendWindow	PreviousTrend	ZoomInOut
DetachDB	GetTrendWindowCollection	Print	ZoomInOutX
Export	GetXAxis	ShowHelp	ZoomInOutY
GetStatusbarElement	GetXAxisCollection	ShowPropertyDialog	ZoomMove
GetStatusbarElementCollection	GetYAxis	ShowTagSelection	
GetToolbarButton	GetYAxisCollection	ShowTimeSelection	

Properties available in VBS

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "xaxisobj.XAxisName", the listing name "XAxis" is dropped: "xaxisobj.Name".

Note that properties are available for WinCC controls that can have the effect of methods. These properties are characterized by the respective names, e.g. "Add", "Remove" or "Rename".

Examples

A trend is displayed in a WinCC FunctionTrendControl that is linked with a user archive. Different properties are configured for the trend in the script. The "StartID" of the user archive and the number of measurement points is changed regarding data connection.

Requirements

- A "WinCC FunctionTrendControl" with the name "Control1" is inserted in a process picture in Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have already configured a user archive in your project. Or you are using the demo project from which we have taken the user archive for the example.

```
'VBS363
Sub OnClick(ByVal Item)
Dim objFXControl
Dim objTrendWindow
Dim objTrend
Dim objXAxis
Dim objYAxis
Dim startID
Dim FXServerDataX(3)
Dim FXServerDataY(3)
' create reference to FXControl
Set objFXControl = ScreenItems("Control1")
' create reference to new window, x and y axis
Set objTrendWindow = objFXControl.GetTrendWindowCollection.AddItem("myWindow")
Set objXAxis = objFXControl.GetXAxisCollection.AddItem("myXAxis")
Set objYAxis = objFXControl.GetYAxisCollection.AddItem("myYAxis")
' assign x and y axis to the window
objXAxis.TrendWindow = objTrendWindow.Name
objYAxis.TrendWindow = objTrendWindow.Name
' add new trend
Set objTrend = objFXControl.GetTrendCollection.AddItem("myTrend1")
' configure trend data connection (UserArchive)
objTrend.Provider = 3
startID = CLng(4)
FXServerDataX(0) = "Setpoint"
FXServerDataX(1) = "ParabelX"
FXServerDataX(3) = startID
FXServerDataY(0) = "Setpoint"
FXServerDataY(1) = "ParabelY"
FXServerDataY(3) = startID
objTrend.MeasurePoints = 50
objTrend.SetTagName "Setpoint\ParabelX", "Setpoint\ParabelY", FXServerDataX, FXServerDataY
' assign trend properties
objTrend.Color = RGB(255,0,0)
objTrend.PointStyle = 1
objTrend.TrendWindow = objTrendWindow.Name
objTrend.XAxis = objXAxis.Name
objTrend.YAxis = objYAxis.Name
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

Example

An additional column is added in an existing WinCC OnlineTableControl that is linked with an archive tag. Different properties are configured for the control and the column in the script.

Requirement

- A "WinCC OnlineTableControl" with the name "Control1" has already been inserted in a process picture in Graphics Designer. The control consists of a time column and three value columns. The picture "B_025_V7_Arch_TableControl.PDL" from the demo project was used for this example.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have already configured archives and archive tags in your project. Or you are using the demo project from which we have taken the archive for the example.

```
'VBS362
Sub OnClick(ByVal Item)
Dim objControl
Dim objTimeColumn
Dim objValueColumn
Set objControl = ScreenItems("Control1")
' Control wide specification
objControl.ColumnResize = False
objControl.TimeBase = 1
objControl.TimeColumnTimeFormat = "HH:mm:ss tt"
objControl.TimeColumnLength = 20
' properties for Time column
Set objTimeColumn = objControl.GetTimeColumn("Time column 1")
objTimeColumn.DateFormat = "dd/MM/yy"
' properties for a new 4th value column with connection to archive tag "Trend_4"
Set objValueColumn = objControl.GetValueColumnCollection.AddItem("Trend 4")
objValueColumn.Caption = "Trend 4"
objValueColumn.Length = 10
objValueColumn.Align = 1
objValueColumn.Provider = 1
objValueColumn.TagName = "G_Archive\Trend_4"
objValueColumn.TimeColumn = "Time column 1"
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

Example

Three trends are displayed in a WinCC OnlineTrendControl that are linked with archive tags. Different properties are configured for the trends in the script.

Requirements

- A "WinCC OnlineTrendControl" with the name "Control1" is inserted in a process picture in Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have already configured archives and archive tags in your project. Or you are using the demo project from which we have taken the archives for the example.

```
'VBS361
Sub OnClick(ByVal Item)
```

```
Dim objTrendControl
Dim objTrendWindow
Dim objTimeAxis
Dim objValueAxis
Dim objTrend
'create reference to TrendControl
Set objTrendControl = ScreenItems("Control1")
'create reference to new window, time and value axis
Set objTrendWindow = objTrendControl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = objTrendControl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValueAxis = objTrendControl.GetValueAxisCollection.AddItem("myValueAxis")
'assign time and value axis to the window
objTimeAxis.TrendWindow = objTrendWindow.Name
objValueAxis.TrendWindow = objTrendWindow.Name
' assign properties to trendwindow
objTrendWindow.HorizontalGrid = False
' add new trend and assign properties
Set objTrend = objTrendControl.GetTrendCollection.AddItem("myTrend1")
objTrend.Provider = 1
objTrend.TagName = "G_Archive\Trend_1"
objTrend.TrendWindow = objTrendWindow.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValueAxis.Name
objTrend.Color = RGB(255,0,0)
objTrend.PointStyle = 0
'add new trend and assign properties
Set objTrend = objTrendControl.GetTrendCollection.AddItem("myTrend2")
objTrend.Provider = 1
objTrend.TagName = "G_Archive\Trend_2"
objTrend.TrendWindow = objTrendWindow.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValueAxis.Name
objTrend.Color = RGB(0,255,0)
objTrend.LineWidth = 3
'add new trend and assign properties
Set objTrend = objTrendControl.GetTrendCollection.AddItem("myTrend3")
objTrend.Provider = 1
objTrend.TagName = "G_Archive\Trend_3"
objTrend.TrendWindow = objTrendWindow.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValueAxis.Name
objTrend.Color = RGB(0,0,255)
objTrend.LineType = 2
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

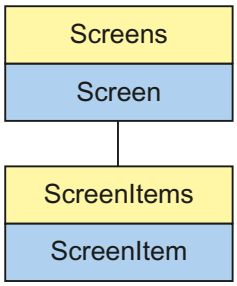
Controls (Page 232)

2.3.6.11 WinCC Push Button Control

Description



Object Type of ScreenItem Object. Represents the graphic object "WinCC Push Button Control"

Type Identifier in VBS

HMIButton

Usage

In the following example, the object with the name "Control1" is moved 17 pixels to the right:

```
'VBS61
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left +17
```

Note

The events KeyDown, KeyUp and KeyPress cannot be addressed by VBS. If it is required to make controls dynamic with the help of VBS, no parameter must be declared with ByRef.

Notes on Error Handling

Buttons and pushbuttons are mapped in the object model to an "HMIButton" type. Since the objects have different properties, the availability of the property (dynamic type compilation in

Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
'VBS62
Dim objScreenItem
On Error Resume Next    'Activation of errorhandling
For Each objScreenItem In ScreenItems
If objScreenItem.Type = "HMIButton" Then
'
'=== Property "Text" available only for Standard-Button
objScreenItem.Text = "Windows"
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.ObjectName & ": no Windows-Button" & vbCrLf
Err.Clear    'Delete error message
End If
'
'=== Property "Caption" available only for PushButton
objScreenItem.Caption = "Push"
If 0 <> Err.Number Then
HMIRuntime.Trace objScreenItem.ObjectName & ": no Control" & vbCrLf
```

```
Err.Clear
End If
End If
Next
On Error Goto 0    'Deactivation of errorhandling
```

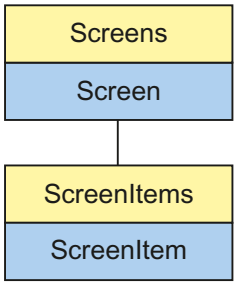
2.3.6.12 WinCC RulerControl

Description



Object Type of ScreenItem Object. Represents the graphic object "WinCC RulerControl" as of WinCC V7.0.

Type Identifier in VBS

HMIRulerControl

Available list objects

Row (Page 240)	StatisticResultColumn (Page 243)
RulerBlock (Page 241)	StatusbarElement (Page 244)
RulerColumn (Page 241)	ToolbarButton (Page 246)
StatisticAreaColumn (Page 242)	

Available Methods in VBS

Activate	GetRulerBlock	GetStatisticAreaColumn	GetToolbarButton
ActivateDynamic	GetRulerBlockCollection	GetStatisticAreaColumnCollection	GetToolbarButtonCollection
DeactivateDynamic	GetRulerColumn	GetStatisticResultColumn	ShowHelp
Export	GetRulerColumnCollection	GetStatisticResultColumnCollection	ShowPropertyDialog

GetRow (Page 715)	GetSelectedRow (Page 722)	GetStatusbarElement	
GetRowCollection (Page 716)	GetSelectedRows (Page 723)	GetStatusbarElementCollection	

Available Properties in VBS

If you access the properties with the listing object, you do not have to enter the name of the listing. For example, when using "rulercolobj.ColumnName", the listing name "Column" is dropped: "rulercolobj.Name".

Note that properties are available for WinCC controls that can have the effect of methods. These properties are characterized by the respective names, e.g. "Add", "Remove" or "Rename".

Example

A WinCC Ruler Control is inserted in a picture with an existing WinCC OnlineTableControl. The RulerControl contains a statistics window that displays the "Minimum", "Maximum" and "Average" columns. The static values are then displayed for the selected rows of the OnlineTableControl.

Requirements

- A "WinCC OnlineTableControl" with the name "Control1" has already been inserted in a process picture in Graphics Designer. The control is linked with archive tags or process tags. The picture "B_025_V7_Arch_TableControl.PDL" from the demo project was used for this example.
- You have added an additional "WinCC RulerControl" with the name "Control2" in the picture.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have selected some rows in OnlineTableControl.

```
'VBS364
Sub OnClick(ByVal Item)
Dim objRulerControl
Dim objTableControl
Dim objstatColumn
Dim rows

Set objRulerControl = ScreenItems("Control2")
' Use Statistic-window
objRulerControl.RulerType = 2
objRulerControl.SourceControl = "Control1"
' In Statistic-window only columns "Name", "MinValue", MaxValue" and "Average" are shown
Set objstatColumn = objRulerControl.GetStatisticResultColumnCollection
objstatColumn.RemoveItem(4)
objstatColumn.RemoveItem(5)
objstatColumn.RemoveItem(6)
```

```
' Get the selected rows of tablecontrol and calculate statistic
Set objTrendControl = ScreenItems("Control1")
Set rows = objTableControl.SelectAll
objTableControl.CalculateStatistic
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

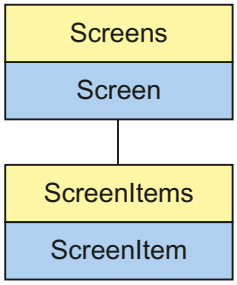
Controls (Page 232)

2.3.6.13 WinCC Slider Control

Description



Object Type of ScreenItem Object. Represents the graphic object "WinCC Slider Control"

Type Identifier in VBS

HMISlider

Usage

In the following example, the object with the name "Control1" is moved 19 pixels to the right:

```
'VBS63
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left +19
```

Notes on Error Handling

Sliders and WinCC slider controls are mapped in the object model to an "HMISlider" type. Since the objects have different properties, the availability of the property (dynamic type compilation in Runtime) should be queried via an exception measure. The exception measure is activated for the corresponding procedure by the following instruction:

```
On Error Resume Next
```

The instruction causes the VBScript engine to initiate the follow-on command in the case of a Runtime error.

The error code can subsequently be checked using the Err object. In order to deactivate the handling of Runtime errors in scripts, use the following command:

```
On Error Goto 0
```

Handling errors always relates to the procedure layer. If a script in a procedure causes an error, VBScript checks whether an error handling measure is implemented in this layer. If not, control is transferred one layer up (to the calling procedure). If there is no error handling measure here either, the control is transferred yet another layer up. This continues until either the top module level is reached or the code for Runtime error handling is located. If the activation of the Runtime error handling fails, the control is transferred to the top level on the internal VBScript Runtime error handing. This opens an error dialog and stops the script.

The "On Error Resume Next" command can be installed on all layers (i.e. also in procedures). When the error handling measure is use, it can basically be determined whether the user is actually using the required implementation type.

In addition, it can be ensured that there is no termination of execution due to a faulty access to the object.

Examples of error handling

```
Sub OnClick(Byval Item)
'VBS193
Dim ScreenItem
' activating error handling:
On Error Resume Next
For Each ScreenItem In ScreenItems
If ScreenItem.Type = "HMISlider" Then
'=== Property "BevelColorUp" only exists for a WinCC Slider Control
ScreenItem.BevelColorUp = 1
If (Err.Number <> 0) Then
HMIRuntime.Trace(ScreenItem.ObjectName + ": no Windows-Slider" + vbCrlf)
' delete error message
Err.Clear
```

```
End If
'=== Property "BorderStyle" only exists for a Windows-Slider
ScreenItem.BorderStyle = 1
If (Err.Number <> 0) Then
HMIRuntime.Trace(ScreenItem.ObjectName + ": no WinCC Slider Control" + vbCrlf)
Err.Clear
End If
End If
Next
On Error GoTo 0  ' deactivating error handling
End Sub
```

Example

A user archive is displayed in a WinCC UserArchiveControl.

The following actions are initiated via script:

- Selecting data
- Exporting data
- Printing a table

Requirements

- A "WinCC UserArchiveControl" with the name "Control1" is inserted in a process picture in Graphics Designer.
- A button is inserted in the Graphics Designer. You have configured the event "mouse click" with a VBS action and the following script for the button.
- You have already configured a user archive in your project. Or you are using the demo project from which you can use a user archive.

```
VBS365
Sub OnClick(ByVal Item)
Dim objUAControl
Dim objColumn
Dim coll
Dim field
' create reference to UserArchivControl
Set objUAControl = ScreenItems("Control1")
' Select user archive and general column properties
objUAControl.SelectArchiveName = True
objUAControl.ColumnResize = False
objUAControl.ColumnTitleAlign = 1
' properties for ID column
Set objColumn = objUAControl.GetColumn("ID")
objColumn.Length = 2
objColumn.Align = 0
' Select data
objUAControl.FilterSQL = "ID >=3"
'export the content as a CSV-file in the "ua" directory of the project folder
objUAControl.ServerExport
' print the control
objUAControl.PrintJobName = "UserArchiveControl - Table"
objUAControl.Print
End Sub
```

Note

More examples for use of properties and methods are available in the descriptions of the Get methods of the controls and under "Examples for VBScript/Examples in WinCC/Dynamizing controls".

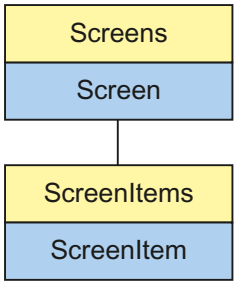
WinCC Online Table Control (before WinCC V7)

Description



Object Type of ScreenItem Object. Represents the graphic object "WinCC Online Table Control"

Type Identifier in VBS

HMITableView

Usage

In the following example, the object with the name "Control1" is moved 15 pixels to the right:

```
'VBS59
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left +15
```

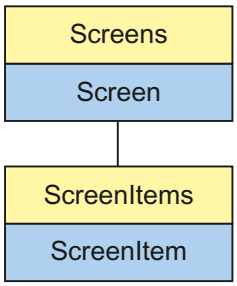
2.3.7 Customized Object

Description



Object Type of ScreenItem Object. Represents the graphic object "Customized Object".

Type Identifier in VBS

HMIScreenModule

Usage

You access customized properties in a customized object via the attribute name in VBS. Intellisense is only applicable to the customized object as a whole.

You will locate the attribute name under Properties of the properties placed outside (right-click Property) and can be modified there.

In the following example, the object with the name "CustomizedObject1" is moved 10 pixels to the right:

```
'VBS65
Dim objCustomObject
Set objCustomObject = ScreenItems("CustomizedObject1")
objCustomObject.Left = objCustomObject.Left + 10
```

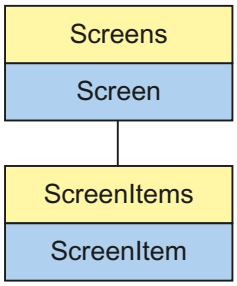
2.3.8 Group

Description



Object Type of ScreenItem Object. Represents the graphic object "Group"

Type Identifier in VBS

HMIGroup

Usage

In the following example, the object with the name "Group1" is moved 10 pixels to the right:

```
'VBS66
Dim objGroup
Set objGroup = ScreenItems("Group1")
objGroup.Left = objGroup.Left + 10
```

2.4 Properties

2.4.1 Properties

Overview

The properties of the individual objects can be used to modify specific graphic objects and tags in Runtime , e.g. activating an operating element per mouse click or triggering a color change by modifying a tag value.

Properties on graphic objects can be addressed via the following syntax:

```
'VBS191
Dim obj
Set obj = ScreenItems("object1")
obj.property = Value
```

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS192
Dim obj
Set obj = ScreenItems("control1")
obj.Left = obj.Left + 10
```

2.4.2 A

2.4.2.1 Aa - Ad

AccessPath Property

Description

Displays the storage path (with hierarchy information) of a screen object (picture). The property corresponds to the full access code on the Screens Collections.

STRING (read only)

Example:

In the following example, the path of the picture "ScreenWindow1" is issued:

```
'VBS67
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
MsgBox objScreen.AccessPath
```

See also

ScreenItem Object (Page 141)

Screens Object (List) (Page 149)

Activate property (before WinCC V7)

Description

The data to be displayed is only requested from the archive server when this attribute is set. In order to reduce the picture opening times, this attribute should not be set and the value only dynamically changed when necessary.

Write/Read access

To differentiate between the "Activate" property form the "Activate" method, the property is accessed via "Object".

Example:

```
Dim ctrl
Set ctrl = ScreenItems("Control")
ctrl.Object.activate = true
```

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

Activate property

Activate

The data to be displayed in the message window are only requested from the message server if you set this attribute. Instead of setting this attribute, it is advisable to change the value dynamically in order to reduce picture activation times.

The attribute can be assigned dynamic properties by means of the name **Activate** . The data type is BOOLEAN.

ActiveProject Property

Description

Returns an object of type "Project".

See also

Path Property (Page 516)

Name Property (Page 495)

Ellipse segment (Page 162)

HMIRuntime Object (Page 134)

ActiveScreen Property

Description

Supplies a reference to the picture which contains the object with the current focus.

Usage

"ActiveScreen" is used in Runtime to address the properties of the picture which contains the currently focussed object.

Example:

The following example assigns the name of the current picture to the tag "strScrName" and outputs it in a message:

```
'VBS68
Dim strScrName
strScrName = HMIRuntime.ActiveScreen.Objectname
MsgBox strScrName
```

See also

Screen Object (Page 146)

HMIRuntime Object (Page 134)

ActiveScreenItem Property

Description

Supplies a reference to the object currently in focus.

Usage

"ActiveScreenItem" is used in Runtime in order to address the properties of the object currently in focus.

Example:

The following example displays the name of the object in the "ScreenWindow1" picture which has the focus:

```
'VBS69
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
MsgBox objScreen.ActiveScreenItem.ObjectName
```

See also

ScreenItem Object (Page 141)

HMIRuntime Object (Page 134)

Actualize Property

Description

The "Index" property references a column pair or a trend. "Actualize" defines whether a static or dynamic representation should be used for this column pair/trend.

- 0: Static display
- -1: Dynamic display

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

ActualPointLeft Property

Description

Defines or returns the x-coordinate of the current corner point in relation to the original picture (top left). Each corner point is identified by an index which is derived from the number ("PointCount") of corner point available.

A change of the value can affect the properties "Width" (object width) and "Left" (x-coordinate of the object position).

See also

Polyline (Page 173)

Polygon (Page 171)

ScreenItem Object (Page 141)

ActualPointTop Property

Description

Defines or returns the y-coordinate of the current corner point in relation to the original picture (top left). Each corner point is identified by an index which is derived from the number ("PointCount") of corner point available.

A change of the value can affect the properties "Height" (object height) and "Top" (y-coordinate of the position).

See also

Polyline (Page 173)

Polygon (Page 171)

Radio box (Page 221)

Check box (Page 219)

I/O Field (Page 199)

ScreenItem Object (Page 141)

AdaptPicture Property

Description

Defines whether the picture displayed in a picture window should be adapted to the size of the picture window in Runtime or not. Read only access.

TRUE, when the picture adapts to the picture window size.

FALSE, when the picture does not adapt to the picture window size.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

AdaptSize Property

Description

Defines whether the picture window should adapt to the size of the picture displayed in it during Runtime or not. Read only access.

TRUE, when the picture window adapts to the picture size.

FALSE, when the picture window does not adapt to the picture size.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

AdjustRuler Property

Description

Specifies if the ruler window should be adjusted to the trend window upon each appearance.

TRUE, if you move the ruler window and make it appear and disappear again, it will be displayed in its original position and its original size.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

2.4.2.2 Al - Ap

AlarmID property

Description

Returns the AlarmID of the Alarm object. The AlarmID is unique, and is assigned by the system.

AlarmID (readonly)

See also

Alarms object (list) (Page 126)

AlarmHigh Property

Description

Defines the top limit value at which an alarm should be triggered or returned.
The type of the evaluation (in percent or absolute) is defined in the "TypeAlarmHigh" property.
The "CheckAlarmHigh" property determines whether the monitoring for this limit value is activated.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

AlarmLogs Property

Description

Returns an object of type "AlarmLogs".

AlarmLogs (read-only)

See also

HMIRuntime Object (Page 134)

AlarmLow Property

Description

Defines the bottom limit value at which an alarm should be triggered or returned.
The type of the evaluation (in percent or absolute) is defined in the "TypeAlarmLow" property.
The "CheckAlarmLow" property determines whether the monitoring for this limit value is activated.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

Alignment Property

Description

Defines or returns the representation of the scale (left/right or top/bottom) according to the position of the bar graph object. The "Scaling" property must be set to TRUE for the scale to be displayed.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

AlignmentLeft Property

Description

Defines or returns the horizontal alignment of the text. Value range from 0 to 2.

0 = left

1 = centered

2 = right

See also

Group Display (Page 208)

Static text (Page 180)

AllowPersistence Property

Description

TRUE, when settings regarding persistence are possible. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

AllowXAxisColor - Property

Description

TRUE if the defined color of the common X-axis is displayed in runtime. BOOLEAN write-read access.

AllServer property (before WinCC V7)

Description

Defines that the data to be displayed in the message window is required by all servers participating in a distributed system on which Alarm Logging is activated. Write/Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

AllServer property

All servers - AllServer

Selects all servers whose packages were loaded and on which "Alarm Logging Runtime" is activated in the startup list.

Value	Explanation
TRUE	All servers are activated.
FALSE	Activates only the servers entered in "Server selection".

The attribute can be assigned dynamic properties by means of the name **AllServer**. The data type is BOOLEAN.

Analog Property

Description

TRUE, when the clock is to be displayed as an analog clock. BOOLEAN write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

AnchorRuler Property

Description

TRUE if the ruler window is firmly linked to the curve window. BOOLEAN write-read access.

AngleAlpha Property

Description

Defines or returns depth angle a for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

AngleBeta Property

Description

Defines or returns depth angle b for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

AngleMax Property

Description

Defines or returns the angle on the scale at which the scale graduation ends. LONG write-read access.

The start and end of the scale graduation are described by the attributes "AngleMin" and "AngleMax" in angular degrees. AngleMin < AngleMax applies.

Angle 0 degrees is at the right side of the horizontal diameter of the graduated scale disk. Positive angle values are counted in a counterclockwise direction.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

AngleMin Property

Description

Defines or returns the angle on the scale at which the scale graduation begins. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

Application Property

Description

Returns the Graphics Designer application when the application property is used without an object identifier. If the application property is used with object identifier, it returns an application object which displays the application with which the defined object was created. Read only access.

See also

Application Window (Page 188)

ScreenItem Object (Page 141)

ApplyProjectSettings property

Apply project settings - ApplyProjectSettings

Activates the project settings derived from "Alarm Logging".

Value	Explanation
TRUE	The "Apply project settings" check box is selected. The message blocks configured in "Alarm Logging" and their properties are activated in AlarmControl. The message blocks are displayed with these properties in the message window.
FALSE	The "Apply project settings" check box is deactivated. You can add or remove message blocks, or edit their properties.

The attribute can be assigned dynamic properties by means of the name **ApplyProjectSettings**. The data type is BOOLEAN.

2.4.2.3 Ar - Ax

Archive Property

Description

The "Index" property references a pair of columns. "Archive" defines process archive values linked to the column pair. The name of the process value archive is specified in the following form: Server name::Archive name

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

ArchiveName property

Name - ArchiveName

Specifies the user archive or view to be displayed. Open the "Package Browser" dialog for configuring an archive or a view by clicking the button.

The attribute can be assigned dynamic properties by means of the name **ArchiveName**. The data type is STRING.

ArchiveType property

Type - ArchiveType

Specifies whether the selected user archive is an archive or a view. The field cannot be edited.

The attribute can be assigned dynamic properties by means of the name **ArchiveType**. The data type is LONG.

AspectRatio property

AspectRatio

Specifies if the aspect ratio is kept in movies.

The attribute can be assigned dynamic properties by means of the name **AspectRatio**. The data type is BOOLEAN.

Assignments Property

Description

A list which contains the assignments between the output values and the actual output texts to be output.
The assignments depend on the set list type. The list type is defined with the ListType property.

Read only access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

AssumeOnExit Property

Description

TRUE, if the entered text is assumed upon exiting the entry field (e.g., with the key or mouse click). BOOLEAN write-read access.

See also

I/O Field (Page 199)

Text list (Page 211)

ScreenItem Object (Page 141)

AssumeOnFull Property

Description

TRUE, when the content of the input field is full (specified number of characters have been entered) and should be exited automatically and the input accepted. BOOLEAN write-read access.

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

AutoCompleteColumns property

Show empty columns - AutoCompleteColumns

Adds empty columns if the Control width is greater than the width of columns configured.

Value	Explanation
TRUE	Enables the display of empty columns.
FALSE	Disables the display of empty columns.

The attribute can be assigned dynamic properties by means of the name **AutoCompleteColumns**. The data type is BOOLEAN.

AutoCompleteRows property

Show empty rows - AutoCompleteRows

Enables the insertion of empty rows if the Control length is greater than the number of rows configured.

Value	Explanation
TRUE	Enables the display of empty rows.
FALSE	Disables the display of empty rows.

The attribute can be assigned dynamic properties by means of the name **AutoCompleteRows**. The data type is BOOLEAN.

AutoPosition property

Automatic positioning - AutoPosition

Defines whether to position the RulerControl exactly below the source control.

The following settings are available:

Value	Explanation
TRUE	The RulerControl is positioned exactly below the source control.
FALSE	The RulerControl is displayed in accordance with your configuration of the control position.

The attribute can be assigned dynamic properties by means of the name **AutoPosition**. The data type is BOOLEAN.

Autorange Property

Description

TRUE, when the value range of the Y-axis is determined automatically or defined by using the "BeginValue" and "EndValue"attributes. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

AutorangeX Property

Description

TRUE, when the value range of the X-axis is determined automatically. FALSE, when it is determined by means of the "BeginX" and "EndX" attributes. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

AutorangeY Property

Description

TRUE, when the value range of the Y-axis is determined automatically. FALSE, when it is determined by means of the "BeginY" and "EndY" attributes. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

AutoScroll property (before WinCC V7)

Description

Defines the behavior of the message window when a new message is received. BOOLEAN write-read access.

TRUE : A newly received message is appended to the list displayed in the message window and is automatically selected. The visible range of the message window is moved, if necessary.

FALSE : A newly received message is not selected. The visible range of the message window is not changed.

The targeted selection of messages is only possible when "AutoScroll" is not active.

The "AutoScroll" property is deactivated when the attribute "MsgCtrlFlag" = "-1" is set. This means that the most recent message is displayed at the top of the list in the message window.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

AutoScroll Property

Auto scrolling - AutoScroll

Defines the behavior of the message window after a new message events.

You can only select message lines if "Auto scrolling" is disabled.

Value	Explanation
TRUE	If "AutoScroll" is activated, a new activated message is appended to the list displayed in the message window and selected automatically. The visible area of the message window is shifted as required.
FALSE	New message events are not selected if "Autoscroll" is disabled. The visible area of the message window is not changed.

The attribute can be assigned dynamic properties by means of the name **AutoScroll**. The data type is BOOLEAN.

AutoSelectionColors property

Automatic selection coloring - AutoSelectionColor

Enables the display of default system colors as selection color for cells and rows.

Value	Explanation
TRUE	The system colors are in use.
FALSE	The custom colors are used.

The attribute can be assigned dynamic properties by means of the name **AutoSelectionColors**. The data type is BOOLEAN.

AutoSelectionRectColor property

Automatic color assignment - AutoSelectionRectColor

Defines a system color for the selection border.

Value	Explanation
TRUE	The system color is in use.
FALSE	The custom color is used.

The attribute can be assigned dynamic properties by means of the name **AutoSelectionRectColors**. The data type is BOOLEAN.

AutoShow property

Show/hide automatically - AutoShow

Enables/disables automatic activation of the RulerControl on the display if you selected the button functions for the ruler, statistics range and for statistics in the source control.

The RulerControl is hidden again if you are no longer using the ruler, statistics range and statistics functions.

Value	Explanation
TRUE	The RulerControl is displayed automatically.
FALSE	The RulerControl is not displayed automatically.

The attribute can be assigned dynamic properties by means of the name **AutoShow**. The data type is BOOLEAN.

AutoSize Property

Description

Defines or returns the size adaptation of the object. The following values can be set:

- 0: No size adaptation.
- 1: The picture ("PictureSelected", "PictureUnselected" properties) is adapted to the button.
- 2: The button is adapted to the picture ("PictureSelected", "PictureUnselected" properties).

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

Autostart property

Autostart

Specifies if movies are started automatically.

The attribute can be assigned dynamic properties by means of the name **Autostart**. The data type is BOOLEAN.

Average Property

Average

TRUE, if the mean value is calculated based on the last 10 values. A value change is conditional for calculation of a new mean value. The mean value is reset when you change a picture. If only one value is available when you change the picture, the following mean value is calculated: (5+0+0+0+0+0+0+0+0+0)/10=0,5.

BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

Axe Property

Description

Defines or returns the position of the 3D bar in the coordinate system. Value range from 0 to 2.

0: The 3D-bar is displayed on the X-axis.

1: The 3D-bar is displayed on the Y-axis.

2: The 3D-bar is displayed on the Z-axis.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

AxisSection Property

Description

Defines or returns the distance between two long axis sections. The information on the distance is given in scale units and is dependent on the minimum and maximum values configured.

ScreenItem Object (Page 141)

Button (Page 215)

Round Button (Page 223)

Slider (Page 226)

Group Display (Page 208)

BackColor property

Background - BackColor

Specifies the background color of the control. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **BackColor**. The data type is LONG.

BackColor property

Background Color (BackColor)

Specifies the icon background color in the "Color selection" dialog. The background color is displayed in "opaque" style.

The attribute can be assigned dynamic properties by means of the name **BackColor**. The data type is LONG.

BackColor Property

Function

Defines or returns the background color for the object.

For objects with a fill pattern, the background color is not displayed if "transparent" is defined as the fill style.

Special features of the WinCC slider control

The background color only takes effect when the object is at least partially filled.

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Enter the appropriate decimal value for each of the three RGB values.

Example:

RGB(200, 150, 100)

Example:

The following example defines the background of the "ScreenWindow1" picture to red:

```
'VBS70
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.BackColor = RGB(255, 0, 0)
```

BackFlashColorOff Property

Description

Defines or returns the color of the object background for the flash status "Off". LONG write-read access.

See also

ScreenItem Object (Page 141)

BackFlashColorOn Property

Description

Defines or returns the color of the object background for the flash status "On". LONG write-read access.

See also

ScreenItem Object (Page 141)

Background Property

Description

TRUE, when the background of the 3D-bar graph object should be visible. BOOLEAN write-read access.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

BackgroundPicture Property

Description

Returns the picture name of the background picture for the graduated scale disk. Read only access

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

BackPictureAlignment property

Description

Defines or returns the mode of representation of the background image in the process picture.

LONG write-read access.

BackPictureName property

Description

Defines the path and file name of the background image in the process picture or returns it.
LONG write-read access.

BackStyle Property

Description

WinCC Digital/Analog Clock

Defines the type of background of the analog clock:

- 0: The rectangular background of the clock is filled by the specified background color.
- 1: The round numbered face of the clock is filled by the specified background color. This enables a round analog clock to be displayed.
- 2: Numbered face and rectangular background are transparent.

WinCC Gauge Control

Defines the type of background of the gauge:

- 0: The rectangular or square background of the gauge has a border color is filled with the specified color. The circular graduated scale disk is filled by the specified background color.
- 1: The rectangular or square background of the gauge is transparent. The circular graduated scale disk is filled by the specified background color. This enables a circular gauge to be displayed.
- 2: The rectangular or square background and graduated scale disk are transparent.

WinCC Slider Control

Defines whether the object background should be transparent.

- 0: The object background is not transparent
- 1: The object background is transparent

HMI Symbol Library

Defines the icon background transparency. Write/Read access.

- 0: The background is transparent and, thus, invisible.
- 1: The background is visible, the color of the background is defined by the "Background Color" attribute.

BarFillColor Property

Description

Defines the fill color in the area of the slider. The area stretches from "RangeMin" to the position of the slider.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

BarHeight Property

Description

Defines or returns the height of the bar in pixels.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

BarWidth Property

Description

Defines or returns the width of the bar in pixels.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

BasePicReferenced Property

Description

TRUE, when the picture assigned in the object status display should be saved. Otherwise, only the associated object reference is saved. Read only access.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

BasePicTransColor Property

Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "BasePicUseTransColor" property is "True".

See also

Status display (Page 213)

ScreenItem Object (Page 141)

BasePicture Property

Description

Returns the basic picture for the object status display. Read-only access.
The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.
In this context, the "BasePicReferenced" property defines whether the basic picture should be saved together with the object status display or referenced.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

BasePicUseTransColor Property

Description

TRUE, when the configured color ("BasePicTransColor" property) of the bitmap objects should be set to "transparent". BOOLEAN write-read access.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

BaseScreenName Property

Function

Defines or returns the current basic picture.

STRING (write-read access)

A picture change is executed using the

```
HMIRuntime.BaseScreenName = (<Serverpräfix>::)<Neues Grundbild>
```

command.

When reading out the "BaseScreenName" property, only the picture name without server prefix is returned.

Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

Example:

The following example executes a picture change to "bild1.pdl":

```
HMIRuntime.BaseScreenName = "bild1"
```

2.4.3.2 Be - Bl

BeginTime Property

Description

WinCC Online Trend Control

The "Index" property references a pair of columns. "BeginTime" defines the start time for displaying this column pair. Write/Read access.

WinCC Online Trend Control

The "Index" property references a trend. "BeginTime" defines the start time for displaying this trend. Whether the information is evaluated is dependent on the TimeRange" and "CommonX" properties.

Use the "yyyy-mm-dd hh:mm:ss" format when creating a dynamic time range.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

BeginValue Property

Description

The "Index" property references a trend. "BeginValue" defines the lower limit of the value range to be displayed for the trend. Whether the information is evaluated is dependent on the "Autorange" and "CommonY" properties.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

BeginX Property

Description

Defines or returns the lower limit of the X-axis of a trend referenced with the "Index" property. Whether the information is evaluated is dependent on the "AutorangeX" and "CommonX" properties.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

BeginY Property

Description

Defines or returns the lower limit of the Y-axis of a trend referenced with the "Index" property. Whether the information is evaluated is dependent on the "AutorangeY" and "CommonY" properties.

See also

ScreenItem Object (Page 141)

WinCC Function Trend Control (before WinCC V7) (Page 290)

BevelColorDown Property

Description

Defines the color of the following border sections in the case of 3D representation of the borders:

- with depressed bevel ("BevelStyle" = 1): top and left bevel section
- with raised bevel ("BevelStyle" = 2): bottom and right bevel section

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

BevelColorUp Property

Description

Defines the color of the following border sections in the case of 3D representation of the borders:

- with depressed bevel ("BevelStyle" = 1): bottom and right bevel section
- with raised bevel ("BevelStyle" = 2): top and left bevel section

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

BevelInner Property

Description

Defines or returns the appearance of the inner part of the object bevel. Write/Read access.

- 0: inner part not available
- 1: "depressed" appearance
- 2: "raised" appearance
- 3: uniform gray border
- 4 or higher: uniformly colored order, border color = background color

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

BevelOuter Property

Description

Defines or returns the appearance of the outer part of the object bevel. Write/Read access.

- 0: inner part not available
- 1: "depressed" appearance
- 2: "raised" appearance
- 3: uniform gray border
- 4 or higher: uniformly colored order, border color = background color

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

BevelWidth Property

Description

Defines or returns the border width for the inner part of the border (inner bevel) and for the outer border part (outer bevel) in pixels. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

BitNumber Property

Description

Defines or returns the bit whose status must change in order to trigger a change of value. The tag used must be of the type BYTE, WORD or DWORD.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

BlinkColor Property

Description

Defines the color of the icon in the flash picture. LONG write-read access.

See also

HMI Symbol Library (Page 253)

ScreenItem Object (Page 141)

BlinkMode property

Flash mode (BlinkMode)

Specifies the flash mode of the icon in runtime.

The following settings are available:

Value	Description	Comments
0	No flashing	The icon does not flash.
1	Hidden	The icon flashes in the background color.
2	Shadow	The icon flashes with shading in the foreground color.
3	Solid	The icon flashes in the foreground color.

The attribute can be assigned dynamic properties by means of the name **BlinkMode**. The data type is LONG.

BlinkSpeed property

Flash rate (BlinkSpeed)

Specifies the length of the icon flash interval in Runtime.

The following settings are available:

Value	Description	Comments
250	Fast	Flash interval of 250 ms.
500	Medium	Flash interval of 500 ms.
1000	Slow	Flash interval of 1000 ms.

The attribute can be assigned dynamic properties by means of the name **BlinkSpeed**. You can also use other values. The data type is LONG.

BlockAlign property

Block alignment - BlockAlign

Defines the mode of aligning the caption of blocks in column headers.

The following settings are available:

Value	Description	Explanation
0	left	The block caption is left justified.
1	centered	The block caption is aligned to center.
2	right	The block caption is right justified.

The attribute can be assigned dynamic properties by means of the name **BlockAlign**. The data type is LONG.

BlockAutoPrecisions property

Decimal places automatic - BlockAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The decimal precision is defined automatically. The value in the "Decimal places" field is disabled.
FALSE	The value in the "Decimal places" field is enabled.

The attribute can be assigned dynamic properties by means of the name **BlockAutoPrecisions**. The data type is BOOLEAN.

BlockCaption property

Caption - BlockCaption

Defines the caption of the column header in the control for the selected message block.

The caption is active in all Runtime languages.

The attribute can be assigned dynamic properties by means of the name **BlockCaption**. The data type is STRING.

BlockCount property

BlockCount

Specifies the number of blocks to be made available as columns for the control.

The attribute can be assigned dynamic properties by means of the name **BlockCount**. The data type is LONG.

BlockDateFormat property

Date format - BlockDateFormat

Defines the date format for visualization.

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **BlockDateFormat**. The data type is STRING.

BlockExponentialFormat property

Exponential notation - BlockExponentialFormat

Specifies exponential notation for the display of values of a selected block.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The attribute can be assigned dynamic properties by means of the name **BlockExponentialFormat**. The data type is BOOLEAN.

BlockHideText property

Content as text - BlockHideText

Enables the textual display of the content of a selected block.

Value	Explanation
TRUE	The content is not displayed in text format. The option is disabled.
FALSE	The content is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **BlockHideText**. The data type is BOOLEAN.

BlockHideTitleText property

Title as text - BlockHideTitleText

Enables the display of the header of a selected block in text format.

Value	Explanation
TRUE	The header is not displayed in text format. The option is disabled.
FALSE	The header is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **BlockHideTitleText**. The data type is BOOLEAN.

BlockId property

BlockId

Default assignment of the ID number and of the block in WinCC RulerControl:

Value	Description
0	No block
1	Name
2	Index
3	Designation
4	Display
5	Tag name Y
6	Tag name X
7	Y value
8	X value/time stamp
9	Y value (LL)
10	Time stamp (LL)
11	Y value (UL)
12	Time stamp (UL)
13	Minimum
14	Minimum - Time stamp
15	Maximum
16	Maximum - Time stamp
17	Average
18	Standard deviation
19	Integral
20	Weighted mean value
21	Duration
22	Number of values

The attribute can be assigned dynamic properties by means of the name **BlockID**. The data type is LONG.

BlockIndex property

BlockIndex

References a block. Using this attribute you can assign the values of other attributes to a specific block.

Values between 0 and "BlockCount" minus 1 are valid for "BlockIndex". Attribute "BlockCount" defines the number of available blocks.

The attribute can be assigned dynamic properties by means of the name **BlockIndex**. The data type is LONG.

BlockLength property

Length in characters - BlockLength

Specifies the column width for a selected block.

The attribute can be assigned dynamic properties by means of the name **BlockLength**. The data type is LONG.

BlockName property

Object name - BlockName

Displays the name of the block selected. You cannot edit this name.

The attribute can be assigned dynamic properties by means of the name **BlockName**. The data type is STRING.

BlockPrecisions property

Decimal places - BlockPrecisions

Specifies the number of decimal places of the values in the selected column. You can only enter the value if the "Automatic" option is disabled.

The attribute can be assigned dynamic properties by means of the name **BlockPrecisions**. The data type is SHORT.

BlockShowDate property

Display date - BlockShowDate

Specifies if the "Time" block is displayed with time and date in a field.

Value	Explanation
TRUE	The date and time are displayed. The date format is defined in the "Date format" field.
FALSE	The time is displayed.

The attribute can be assigned dynamic properties by means of the name **BlockShowDate**. The data type is BOOLEAN.

BlockShowIcon property

Content as icon - BlockShowIcon

Enables the display of the content of a selected block as icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **BlockShowIcon**. The data type is BOOLEAN.

BlockShowTitleIcon property

Title as icon - BlockShowTitleIcon

Enables the display of the header of a selected block as icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **BlockShowTitleIcon**. The data type is BOOLEAN.

BlockTimeFormat property

Time format - BlockTimeFormat

Defines the time format to be used for visualization.

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The attribute can be assigned dynamic properties by means of the name **BlockTimeFormat**. The data type is STRING.

BlockUseSourceFormat property

Use source format - BlockUseSourceFormat

Specifies that the format is inherited from the interconnected control. Here the size of the control, the zoom factor and the value range are taken into consideration to display the optimal number of decimal places.

Value	Explanation
TRUE	The formats are derived from the interconnected control.
FALSE	The formats configured in Ruler Control are used, for example, the display of a precisely specified number of decimal places.

The attribute can be assigned dynamic properties by means of the name **BlockUseSouceFormat**. The data type is BOOLEAN.

2.4.3.3 Bo - Bu

BorderBackColor Property

Description

Defines or returns the background color of the line for the object. LONG write-read access. The background color is only visible with the property setting "BorderWidth" > 0.

See also

ScreenItem Object (Page 141)

BorderColor Property

Description

Defines or returns the line color for the object. LONG write-read access.

See also

ScreenItem Object (Page 141)

BorderColor property

Border color - BorderColor

Specifies the border color. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **BorderColor**. The data type is LONG.

BorderColorBottom Property

Description

Defines or returns the border color for the bottom/right part of the object. LONG write-read access.

See also

ScreenItem Object (Page 141)

Button (Page 215)

Round Button (Page 223)

Description

Defines or returns the border color for the top/left part of the object. LONG write-read access.

See also

Button (Page 215)

Round Button (Page 223)

ScreenItem Object (Page 141)

BorderEndStyle Property

Description

Defines or returns the line end style of the object. LONG write-read access.

See also

Polyline (Page 173)

Line (Page 169)

ScreenItem Object (Page 141)

BorderFlashColorOff Property

Description

Defines or returns the color of the object lines for the flashing status "Off". LONG write-read access.

See also

ScreenItem Object (Page 141)

BorderFlashColorOn Property

Description

Defines or returns the color of the object lines for the flashing status "On". LONG write-read access.

See also

ScreenItem Object (Page 141)

BorderStyle Property

Description

Defines or returns the line style for the object. Value range from 0 to 4.

0 = solid line

1 = dashed line

2 = dotted line

3 = dash-dotted line

4 = dash-dot-dot line

See also

ScreenItem Object (Page 141)

BorderWidth Property

Description

Defines or returns the line weight (in pixels) for the object.

WinCC Gauge Control:

Defines or returns the width of the middle border part in pixels.

The object border is composed of three parts. The middle part of the object border is described by the "BorderWidth" property.

The color of the middle border part is in the background color.

See also

ScreenItem Object (Page 141)

BorderWidth property

Border width - BorderWidth

Specifies the line weight of the border in pixels.

The attribute can be assigned dynamic properties by means of the name **BorderWidth**. The data type is LONG.

BottomConnectedConnectionPointIndex Property

Description

Specifies or sets the index number of the bottom connecting point.

LONG write-read access.

See also

Connector (Page 182)

ScreenItem Object (Page 141)

BottomConnectedObjectName Property

Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

See also

Connector (Page 182)

ScreenItem Object (Page 141)

BoxAlignment Property

Description

TRUE, when the fields are arranged aligned to the right. BOOLEAN write-read access.

See also

Radio box (Page 221)

Check box (Page 219)

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

Button1MessageClasses property

Message Types for Button 1 (Button1MessageClasses)

Define one or more message events for displaying the first button in the group display. This is done by entering the numbers of the bits in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

One event can be displayed simultaneously in more than one button.

The "Message Types for Button 1" attribute can be assigned dynamic properties with the name "Button1MessageClasses".

Button2MessageClasses property

Message Types for Button 2 (Button2MessageClasses)

For displaying both buttons, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 2" attribute can be assigned dynamic properties with the name "Button2MessageClasses".

Button3MessageClasses property

Message Types for Button 3 (Button3MessageClasses)

For displaying the third button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 3" attribute can be assigned dynamic properties with the name "Button3MessageClasses".

Button4MessageClasses property

Message Types for Button 4 (Button4MessageClasses)

For displaying the fourth button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 4" attribute can be assigned dynamic properties with the name "Button4MessageClasses".

Button5MessageClasses property

Message Types for Button 5 (Button5MessageClasses)

For displaying the fifth button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, separate the numbers with a comma. The sequence of the assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 5" attribute can be assigned dynamic properties with the name "Button5MessageClasses".

Button6MessageClasses property

Message Types for Button 6 (Button6MessageClasses)

For displaying the sixth button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, delimit the numbers with a comma. The order of assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 6" attribute can be assigned dynamic properties with the name "Button6MessageClasses".

Button7MessageClasses property

Message Types for Button 7 (Button7MessageClasses)

For displaying the seventh button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, delimit the numbers with a comma. The order of assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 7" attribute can be assigned dynamic properties with the name "Button7MessageClasses".

Button8MessageClasses property

Message Types for Button 8 (Button8MessageClasses)

For displaying the eighth button, define one or more message events in the group display. This is done by entering the number of the bit in the collect value. The display of the message events is configured in the "Message Types" property group.

If you want to assign several message events, delimit the numbers with a comma. The order of assignment defines the priority. If there are more than one selected event for one button, the event that has been entered first is displayed.

The same event can be visualized simultaneously in several buttons.

The "Message Types for Button 8" attribute can be assigned dynamic properties with the name "Button8MessageClasses".

Button1Width Property

Description

Defines or returns the width of the Button 1 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

Button2Width Property

Description

Defines or returns the width of the Button 2 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

Button3Width Property

Description

Defines or returns the width of the Button 3 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

See also

ScreenItem Object (Page 141)

Group Display (Page 208)

Button4Width Property

Description

Defines or returns the width of the Button 4 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

2.4.4 C

2.4.4.1 Ca - Cl

Caption Property

Description

Application and picture windows

TRUE, when the application or picture window has a title bar in Runtime. Read only access.

The Caption property must be set to TRUE when the application or picture window should have Maximize and Close buttons.

Controls before WinCC V7

Defines or returns the text to be displayed on the label on the button or in the title bar (Online Trend Control and Online Table Control). Write/Read access.

See also

Controls (Page 232)

Picture Window (Page 194)

Application Window (Page 188)

ScreenItem Object (Page 141)

Caption property

Text - Caption

Defines the text of the window caption.

The attribute can be assigned dynamic properties by means of the name **Caption**. The data type is STRING.

CaptionColor Property

Description

Defines or returns the color of the element labeling. LONG write-read access.

See also

ScreenItem Object (Page 141)

WinCC Gauge Control (Page 264)

CaptionFont Property

Description

Returns the values for font, font style and font size as well as the "Underline" and "Strikethrough" effects for the element labeling. Read only access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

CaptionOffset Property

Description

Defines or returns the distance of the element labeling in relation to the top edge of the object. The element labeling can only be positioned along the vertical diameter of the graduated scale disk. The value of the attribute is related to the height of the object and is measured from the top edge of the object to the base of the text. Write/Read access.

The value range is 0 to 1:

0: The base of the text is at the top limit of the object. The text is no longer visible because it is outside the object.

1: The base of the text is at the bottom limit of the object.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

CaptionText Property

Description

Defines or returns the window title which is displayed in Runtime.
The Caption property must be set to TRUE.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

CellCut property (before WinCC V7)

Description

TRUE, when the content of the cells in a message line should be cut if the column width is too small. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

CellCut property

Shorten contents - CellCut

Shortens cell contents if the cell width is insufficient.

Value	Explanation
TRUE	Enables shortening of cell contents.
FALSE	Disables shortening of cell contents.

The attribute can be assigned dynamic properties by means of the name **CellCut**. The data type is BOOLEAN.

CellSpaceBottom property

CellSpaceBottom

Defines the bottom margin of the table cells.

The attribute can be assigned dynamic properties by means of the name **CellSpaceBottom**. The data type is LONG.

CellSpaceLeft property

CellSpaceLeft

Defines the left indent of the table cells.

The attribute can be assigned dynamic properties by means of the name **CellSpaceLeft** . The data type is LONG.

CellSpaceRight property

CellSpaceRight

Defines the right indent of the table cells.

The attribute can be assigned dynamic properties by means of the name **CellSpaceRight** . The data type is LONG.

CellSpaceTop property

CellSpaceTop

Defines the top margin of the table cells.

The attribute can be assigned dynamic properties by means of the name **CellSpaceTop** . The data type is LONG.

CenterColor Property

Description

Defines or returns the color of the circular center of the scale (cover of the pointer axis). LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

CenterScale Property

Description

Defines or returns the diameter of the circular center of the scale (cover of the pointer axis) in relation to the smaller value of the geometric width and height attributes. Write/Read access.

The value range is 0.03 to 1:

1: The diameter corresponds to the smaller value of the "Width" or "Height" geometric values.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

CheckAlarmHigh Property

Description

TRUE, when the "AlarmHigh" limit value is to be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmHigh", "ColorAlarmHigh" and "TypeAlarmHigh" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckAlarmLow Property

Description

TRUE, when the "AlarmLow" limit value is to be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmLow", "ColorAlarmLow" and "TypeAlarmLow" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckLimitHigh4 Property

Description

TRUE, when the "Reserve 4" upper limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh4", "ColorLimitHigh4" and "TypeLimitHigh4" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckLimitHigh5 Property

Description

TRUE, when the "Reserve 5" upper limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh5", "ColorLimitHigh5" and "TypeLimitHigh5" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckLimitLow4 Property

Description

TRUE, when the "Reserve 4" lower limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow4", "ColorLimitLow4" and "TypeLimitLow4" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckLimitLow5 Property

Description

TRUE, when the "Reserve 5" lower limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow5", "ColorLimitLow5" and "TypeLimitLow5" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckToleranceHigh Property

Description

TRUE, when the "ToleranceHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceHigh", "ColorToleranceHigh" and "TypeToleranceHigh" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckToleranceLow Property

Description

TRUE, when the "ToleranceLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceLow", "ColorToleranceLow" and "TypeToleranceLow" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckWarningHigh Property

Description

TRUE, when the "WarningHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningHigh", "ColorWarningHigh" and "TypeWarningHigh" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

CheckWarningLow Property

Description

TRUE, when the "WarningLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningLow", "ColorWarningLow" and "TypeWarningLow" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ClearOnError Property

Description

TRUE, when the field entry is automatically deleted in the case of invalid input. BOOLEAN write-read access.

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

ClearOnNew Property

Description

TRUE, when the field entry is deleted as soon as the I/O field has the focus. BOOLEAN write-read access.

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

Closeable property (before WinCC V7)

Description

TRUE, when the window can be closed in Runtime. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

Closeable property

Closeable

Defines whether the control can be closed in Runtime.

Value	Explanation
TRUE	The control can be closed in Runtime.
FALSE	The control cannot be closed in Runtime.

The attribute can be assigned dynamic properties by means of the name **Closeable**. The data type is BOOLEAN.

CloseButton Property

Description

TRUE, when the window is provided with a "Close" button. Read only access.

See also

Picture Window (Page 194)

Application Window (Page 188)

ScreenItem Object (Page 141)

2.4.4.2 Co

CoarseGrid Property

Description

TRUE when the value axis is scaled by long tick marks. The distance between two long tick marks can be changed using the "CoarseGridValue" property. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

CoarseGridX Property

Description

TRUE, when the X-axis graduation is scaled by long tick marks. The distance between two long tick marks can be changed using the "CoarseGridValueX" property. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

CoarseGridY Property

Description

TRUE, when the Y-axis graduation is scaled by long tick marks. The distance between two long tick marks can be changed using the "CoarseGridValueY" property. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

CoarseGridValue Property

Description

Defines the distance between two long tick marks in the scale. Whether the information is evaluated is dependent on the value of the "CoarseGrid" property.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

CoarseGridValueX Property

Description

Defines or returns the distance between two long tick marks on the graduation scale of the X-axis. Whether the information is evaluated is dependent on the value of the "CoarseGridX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

CoarseGridValueY Property

Description

Defines or returns the distance between two long tick marks on the graduation scale of the Y-axis. Whether the information is evaluated is dependent on the value of the "CoarseGridY" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

CollectValue Property

Description

Contains the respective status of the active message class in Runtime as the start value. LONG write/read access.
The value can be determined from the group display of hierarchically subordinate pictures by making it dynamic using a tag.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

ColMove Property

Description

TRUE, when the arrangement of columns can be changed. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

Color Property

Description

The "Index" property references a column pair or a trend. "Color" defines the color of the font in the column or the trend. LONG write-read access. The color is defined as an RGB value.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ColorAlarmHigh Property

Description

Defines or returns the bar color for the "AlarmHigh" limit value. LONG write/read access. The "CheckAlarmHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorAlarmLow Property

Description

Defines or returns the bar color for the "AlarmLow" limit value. LONG write/read access. The "CheckAlarmLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorBottom Property

Description

Defines or returns the color for the bottom/right stop of the slider object. LONG write-read access.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

ColorChangeType Property

Description

TRUE, if the change of color should occur segment by segment in the case of a color change (e.g. on reaching a limit value). If set to FALSE, it defines the change of color for the entire bar. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorLimitHigh4 Property

Description

Defines or returns the color for the "Reserve 4" upper limit value. LONG write/read access. The "CheckLimitHigh4" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorLimitHigh5 Property

Description

Defines or returns the color for the "Reserve 5" upper limit value. LONG write/read access. The "CheckLimitHigh5" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorLimitLow4 Property

Description

Defines or returns the color for the "Reserve 4" lower limit value. LONG write/read access. The "CheckLimitLow4" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorLimitLow5 Property

Description

Defines or returns the color for the "Reserve 5" lower limit value. LONG write/read access. The "CheckLimitLow5" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorToleranceHigh Property

Description

Defines or returns the color for the "ToleranceHigh" upper limit value. LONG write/read access. The "CheckToleranceHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorToleranceLow Property

Description

Defines or returns the color for the "ToleranceLow" lower limit value. LONG write/read access. The "CheckToleranceLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorTop Property

Description

Defines or returns the color for the top/left stop of the slider object. LONG write-read access.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

ColorWarningHigh Property

Description

Defines or returns the color for the "WarningHigh" upper limit value. LONG write/read access. The "CheckWarningHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColorWarningLow Property

Description

Defines or returns the color for the "WarningLow" lower limit value. LONG write/read access. The "CheckWarningLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ColTitle Property

Description

TRUE, when the columns in the message window should have a title bar. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

ColumnAdd property

Apply - ColumnAdd

Copies the selected column from the list of existing columns to the list of selected columns.

The attribute can be assigned dynamic properties by means of the name **ColumnAdd**. The data type is STRING.

ColumnAlias property

ColumnAlias

Defines the alias specified in the user archive for the column name.

The attribute can be assigned dynamic properties by means of the name **ColumnAlias**. The data type is STRING.

ColumnAlign property

Alignment - ColumnAlign

Specifies the mode of alignment of a selected column.

The following settings are available:

Value	Description	Explanation
0	left	The selected column is aligned left.
1	centered	The selected column is aligned to center.
2	right	The selected column is aligned right.

The attribute can be assigned dynamic properties by means of the name **ColumnAlign**. The data type is LONG.

ColumnAutoPrecisions property

Decimal places automatic - ColumnAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The decimal precision is defined automatically. The value in the "Decimal places" field is disabled.
FALSE	The value in the "Decimal places" field is enabled.

The attribute can be assigned dynamic properties by means of the name **ColumnAutoPrecisions**. The data type is BOOLEAN.

ColumnCaption property

Caption - ColumnCaption

Sets the caption for a selected column.

The attribute can be assigned dynamic properties by means of the name **ColumnCaption**. The data type is STRING.

ColumnCount property

ColumnCount

Defines the number of columns configured.

The attribute can be assigned dynamic properties by means of the name **ColumnCount**. The data type is LONG.

ColumnDateFormat property

Date format - ColumnDateFormat

Defines the date format for visualization.

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **ColumnDateFormat**. The data type is STRING.

ColumnDMVarName property

ColumnDMVarName

Defines the name of the tag you assigned to the column in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnDMVarName**. The data type is STRING.

ColumnExponentialFormat property

Exponential notation - ColumnExponentialFormat

Sets exponential notation for the display of values of a selected column.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The attribute can be assigned dynamic properties by means of the name **ColumnExponentialFormat**. The data type is BOOLEAN.

ColumnFlagNotNull property

ColumnFlagNotNull

Specifies whether the user archive field assigned to the column must have a value.

Value	Explanation
Yes	The column must have a value.
No	The column can have a value.

The attribute cannot be dynamized.

ColumnFlagUnique property

ColumnFlagUnique

Specifies whether the user archive field assigned to the column must have a unique value. Values in this column must not be redundant.

Value	Explanation
TRUE	The column must have a unique value.
FALSE	The column must not have a unique value.

The attribute cannot be dynamized.

ColumnHideText property

Content as text - ColumnHideText

Defines textual display of the contents of a selected column.

Value	Explanation
TRUE	The content is not displayed in text format. The option is disabled.
FALSE	The content is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **ColumnHideText**. The data type is BOOLEAN.

ColumnHideTitleText property

Text header - ColumnHideTitleText

Sets textual display of the header of a selected column.

Value	Explanation
TRUE	The header is not displayed in text format. The option is disabled.
FALSE	The header is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **ColumnHideTitleText**. The data type is BOOLEAN.

ColumnIndex property

ColumnIndex

References a control column. Using this attribute you can assign the values of other properties to a specific column.

Values between 0 and "ColumnCount" minus 1 are valid for "ColumnIndex"; the attribute "ColumnCount" defines the number of available columns.

The "ColumnIndex" attribute can be assigned dynamic properties by means of attribute **ColumnIndex**. The data type is LONG.

ColumnLeadingZeros property

With leading zeros - ColumnLeadingZeros

Enables the display of values with leading zeros for the column selected. Use "Number of digits" or "ColumnLeadingZeros" to specify the number of leading zeros. The maximum number is "11". No leading zeros are displayed with the value "0". The "With leading zeros" option is deactivated.

The attribute can be assigned dynamic properties by means of the name **ColumnLeadingZeros**. The data type is LONG.

ColumnLength property

Length in Characters - ColumnLength

Specifies the width of a selected column.

The attribute can be assigned dynamic properties by means of the name **ColumnLength**. The data type is LONG.

ColumnMaxValue property

ColumnMaxValue

Defines the maximum column value specified in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnMaxValue**. The data type is STRING.

ColumnMinValue property

ColumnMinValue

Defines the minimum column value specified in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnMinValue**. The data type is STRING.

ColumnName property

ColumnName

Defines the name of the column which is referenced by means of "ColumnIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **ColumnName**. The data type is STRING.

ColumnPosition property

ColumnPosition

Displays the field position defined in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnPosition**. The data type is LONG.

ColumnPrecisions property

Decimal places - ColumnPrecisions

Specifies the number of decimal places of the values in the selected column. You can only enter the value if the "Automatic" option is disabled.

The attribute can be assigned dynamic properties by means of the name **ColumnPrecisions**. The data type is SHORT.

ColumnReadAccess property

ColumnReadAccess

Defines authorizations for read access to the column as specified in the user archive. The number corresponds with the number assigned to the authorization in the "User Administrator" editor.

The attribute cannot be dynamized.

ColumnReadonly property

Write protected - ColumnReadonly

Sets the write protection of a selected column.

Value	Explanation
TRUE	This column is write protected.
FALSE	This column is not write protected. You can edit the column values in Runtime by activating the "Change" option in the General" tab.

The attribute can be assigned dynamic properties by means of the name **ColumnReadonly**. The data type is BOOLEAN.

ColumnRemove property

Remove - ColumnRemove

Cuts selected columns from the list of selected columns and pastes these to the list of available columns.

The attribute can be assigned dynamic properties by means of the name **ColumnRemove**. The data type is STRING.

ColumnRepos property

Up/Down - ColumnRepos

Changes the order of columns. "Up" and "Down" move the column selected up or down in the list. This moves the column towards the front or towards the back.

The attribute can be assigned dynamic properties by means of the name **ColumnRepos**. The data type is LONG.

ColumnResize property

Width can be resized - ColumnResize

Enables changes to the width of columns.

Value	Explanation
TRUE	You can change the width of the columns.
FALSE	You cannot change the width of the columns.

The attribute can be assigned dynamic properties by means of the name **ColumnResize**. The data type is BOOLEAN.

ColumnSrollbar properties

Column scroll bars - ColumnScrollbar

Enables the display of column scroll bars.

The following settings are available:

Value	Description	Explanation
0	no	Column scroll bars are not displayed.
1	as required	Column scroll bars are displayed if vertical space requirements of the control are greater than the actually available display area.
2	always	Column scroll bars are always displayed.

The attribute can be assigned dynamic properties by means of the name **ColumnScrollbar**. The data type is LONG.

ColumnShowDate property

Display date - ColumnShowDate

Specifies if the "Time" block is displayed with time and date in a field.

Value	Explanation
TRUE	The date and time are displayed. The date format is defined in the "Date format" field.
FALSE	The time is displayed.

The attribute can be assigned dynamic properties by means of the name **ColumnShowDate**. The data type is BOOLEAN.

ColumnShowIcon property

Content as icon - ColumnShowIcon

Enables the display the contents of a selected column by means of icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **ColumnShowIcon**. The data type is BOOLEAN.

ColumnShowTitleIcon property

Header as icon - ColumnShowTitleIcon

Specifies the display of the header of a selected column by means of icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **ColumnShowTitleIcon**. The data type is BOOLEAN.

ColumnSort property

ColumnSort

Defines the sorting order of the user archive column referenced in the "ColumnIndex" attribute.

The following settings are available:

Value	Description	Explanation
0	No	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **ColumnSort** . The data type is LONG.

ColumnSortIndex property

ColumnSortIndex

Defines the sorting order of the column referenced in "ColumnIndex". The sorting criterion is removed from "ColumnSort" if you set a "0" value..

The attribute can be assigned dynamic properties by means of the name **ColumnSortIndex**. The data type is LONG.

ColumnStartValue property

ColumnStartValue

Defines the column start value specified in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnStartValue**. The data type is STRING.

ColumnStringLength property

ColumnStringLength

Displays the string length of the column as defined in the user archive.

The attribute can be assigned dynamic properties by means of the name **ColumnStringLength**. The data type is LONG.

ColumnTimeFormat property

Time format - ColumnTimeFormat

Defines the time format to be used for visualization.

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The attribute can be assigned dynamic properties by means of the name **ColumnTimeFormat**. The data type is STRING.

ColumnTitleAlign property

Column title alignment - ColumnTitleAlign

Specifies the type of column title alignment.

The following settings are available:

Value	Description	Explanation
0	left	The column titles are left justified.
1	centered	The column titles are centered.
2	right	The column titles are right justified.
3	Same as table content	The column titles are justified to fit the corresponding column content.

The attribute can be assigned dynamic properties by means of the name **ColumnTitleAlign**. The data type is LONG.

ColumnTitles property

Show column title - ColumnTitles

Enables the display of the column header.

Value	Explanation
TRUE	The column header is displayed.
FALSE	The column header is not displayed.

The attribute can be assigned dynamic properties by means of the name **ColumnTitles**. The data type is BOOLEAN.

ColumnType property

Type - ColumnType

Displays the data type set in the user archive for a selected column.

The attribute can be assigned dynamic properties by means of the name **ColumnType**. The data type is LONG.

ColumnVisible property

ColumnVisible

Enables the display of a column referenced by means of "ColumnIndex" attribute.

Value	Explanation
TRUE	The column is displayed.
FALSE	The column is not displayed.

The attribute can be assigned dynamic properties by means of the name **ColumnVisible** . The data type is BOOLEAN.

ColumnWriteAccess property

ColumnWriteAccess

Defines authorizations for write access to the column as specified in the user archive. The number corresponds with the number assigned to the authorization in the "User Administrator" editor.

The attribute cannot be dynamized.

ColWidth Property

Description

TRUE, when it should be possible to change the widths of the columns in the message window. The width of the columns can only be changed, however, when the "AutoScroll" property is not active. BOOLEAN write-read access.

ScreenItem Object (Page 141)

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ComputerName property

Description

Returns the name of the computer on which the alarm object was triggered.

ComputerName (readonly)

See also

Alarms object (list) (Page 126)

Context property

Description

Reads or sets the alarm object server prefix.

See also

Alarms object (list) (Page 126)

ConnectTrendWindows property

Connect trend windows - ConnectTrendWindows

Enables the connection of trend windows configured. You must have configured several trend windows.

The connected trend windows have the following properties:

- They can have a common X axis.
- They have a scroll bar.
- They have a ruler.
- The zoom functions for a trend window affect the connected trend windows.

Value	Description
TRUE	All trend windows configured are connected.
FALSE	The trend windows are displayed separately.

The attribute can be assigned dynamic properties by means of the name **ConnectTrendWindows**. The data type is BOOLEAN.

ContinousChange Property

Description

Defines the type of transfer of the value defined by the slider ("Position" property) in Runtime:

- FALSE : The value of the "Position" property is transferred when the mouse button is released.
- TRUE : The value of the "Position" property is transferred immediately following a change of the slider position.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

Count Property

Description

Supplies the number of elements in a list.

INTEGER (read-only access).

Example:

The example shows how the number of objects in a DataSet list is output.

```
'VBS165
HMIRuntime.Trace "Count: " & HMIRuntime.DataSet.Count & vbNewLine
```

The following example adds two tags to the TagSet list and outputs the count properties as Trace.

```
'VBS177
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "Count: " & group.Count & vbNewLine
```

2.4.4.3 Cu

CurrentContext Property

Description

In the case of a picture window, the server from which the picture comes and contains the script is read out.

The "CurrentContext" property can return different results: If, for example, a picture window displaying a server picture is set in a local basic picture, distinction is made between two cases:

- The "CurrentContext" property is used in an action of the picture window picture: The result is the return of the symbolic computer name of the server (Package property) extended by two colons, e.g."WinCCProject_MyComputer::“ .
- The "CurrentContext" property is used in an action of the basic picture: The result is returned in the form of an empty character string.

See also

HMIRuntime Object (Page 134)

Cursor Property

Description

Controls the appearance of the cursor in Runtime when positioned over an icon.

- 0: The cursor appears as an arrow and does not change when positioned over the icon.
- 1: The cursor appears as a 3D arrow accompanied by a green lightening symbol. In Runtime, this indicates that the object concerned can be operated.

See also

ScreenItem Object (Page 141)

HMI Symbol Library (Page 253)

Cursor property

Mouse pointer (Cursor)

Specifies whether or not to display the mouse pointer on the icon at runtime.

Value	Explanation
TRUE	The mouse pointer is shown at runtime if positioned on the icon.
FALSE	The mouse pointer is hidden at runtime if positioned on the icon.

The attribute can be assigned dynamic properties by means of the name **Cursor**. The data type is BOOLEAN.

CursorControl Property

Description

TRUE, when Alpha Cursor mode is activated, the cursor skips to the next field in the TAB sequence after exiting the field. BOOLEAN write-read access.

To do this, the "CursorMode" property must be set to TRUE.

See also

Text list (Page 211)

I/O Field (Page 199)

ScreenItem Object (Page 141)

CurveForm Property

Description

WinCC Function Trend Control

Defines how the measuring points of a trend referenced by the "Index" property should be connected. Write/Read access.

WinCC Online Trend Control

The "Index" property references a trend. "CurveForm" defines how the measuring points should be connected.

- 0x00000012 Representation of the measuring points.
- 0x00000014 Measuring points are connected linearly.
- 0x00000011 Measuring points are connected via a step curve.
- 0x00000021 The area under the linearly connected trend is filled.
- 0x00000022: The area under the step curve is filled.

ScreenItem Object (Page 141)

CursorMode Property

Description

When the "CursorMode" is set to "yes", you can show all messages from the short-term archive page by page in the long-term archive list. Use the "CursorModePrefetch" property to determine the number of messages shown per page.

The "Autoscroll" option must be unchecked in order to be able to switch between pages. Write/Read access.

CursorModePrefetch Property

Description

Sets the number of message that you want to display page by page in the long-term archive list out of all messages in the short-term archive.

The "CursorMode" object property must be set to "yes".

Write/Read access.

2.4.5 D

2.4.5.1 Da

DangerColor Property

Description

Defines or returns the color of the danger zone on the scale. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

Danger Property

Description

Defines or returns the beginning of the "danger zone". The zone stretches from the "danger" value to the end of the scale. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

DataFormat Property

Description

Returns the data type of the I/O field object. Read only access.

Value range from 0 to 3.

0: Binary

1: Decimal

2: String

3: Hexadecimal

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

DataIndex Property

Description

Returns the current index of the data of the current trend.

Note

The property is only supported for the controls prior to WinCC V7.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DataLogs Property

Description

Returns an object of type "DataLogs".

DataLogs (read-only)

See also

DataLogs Object (Page 130)

HMIRuntime Object (Page 134)

DataSet Property

Description

Returns an object of type "DataSet".

DataSet (read-only)

See also

DataSet Object (List) (Page 132)

HMIRuntime Object (Page 134)

DataX Property

Description

Inserts a single data record and must be set before calling "InsertData".

Note

The property is only supported for the controls prior to WinCC V7.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DataXY Property

Description

Inserts several data records as an array with pairs of values and must be set before calling "InsertData".

The data in the array is assumed when "DataX" is of the VT_EMPTY type. Otherwise, the "InsertData" attribute used the single value pair resulting from “DataX” and “DataY”.

Note

The property is only supported for the controls prior to WinCC V7.

See also

Example: Calling Methods of an ActiveX Control (Page 819)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DataY Property

Description

Inserts a single data record and must be set before calling "InsertData".

Note

The property is only supported for the controls prior to WinCC V7.

See also

ScreenItem Object (Page 141)

2.4.5.2 De - Do

DefaultMsgFilterSQL property

DefaultMsgFilterSQL

Defines an SQL statement for a fixed selection of messages.

The SQL statements of "DefaultMsgFilterSQL" and "MsgFilterSQL" are linked logically by "AND" operation if you define additional custom selections by means of "MsgFilterSQL" attribute.

The attribute can be assigned dynamic properties by means of the name **DefaultMsgFilterSQL**. The data type is STRING.

DefaultPrecision Property

Description

This attribute defines the number of default decimal places, with which the scale value is specified. Write/Read access.

DefaultRulerPrecision Property

Description

This attribute defines the number of decimal places as standard value with which a measured value should be displayed when it is determined using the "Display value at this position" function. Write/Read access.

DefaultSort property

Default sorting order - DefaultSort

Defines the default sorting order in table columns.

The following settings are available:

Value	Description	Explanation
0	Ascending	The list is updated starting with the bottom line.
1	Descending	The list is updated starting with the top line.

The attribute can be assigned dynamic properties by means of the name **DefaultSort**. The data type is LONG.

DefaultSort2 property

DefaultSort2

Use this function to define the sorting method in table columns if not using the default "Date/time/number" sorting order. Instead, you defined a message block in the "DefaultSort2Column" object property to sort the columns based on the "message block/date/time/number" order.

The following settings are available:

Value	Description	Explanation
0	Ascending	The list is updated starting with the bottom line.
1	Descending	The list is updated starting with the top line.

The attribute can be assigned dynamic properties by means of the name **DefaultSort2**. The data type is LONG.

DefaultSort2Column property

DefaultSort2Column

Use this function to define the sorting method in table columns if not using the default "Date/time/number" sorting order.

Define a message block by its object name.

The table columns are now sorted based on the "message block/date/time/number" order.

The attribute can be assigned dynamic properties by means of the name **DefaultSort2Column**. The data type is STRING.

DeleteData Property

Description

Deletes data in the data buffer of the current trend.

TRUE : All trend data is deleted.

FALSE : The value pair at the "DataIndex" position are deleted.

Note

The property is only supported for the controls prior to WinCC V7.

See also

ScreenItem Object (Page 141)

Delta Property

Description

Defines or returns the value difference between two main scale graduation marks. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

DesiredCurveColor Property

Description

Defines the color of a setpoint trend which belongs to a trend referenced by the "Index" property. The color is defined as an RGB value. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DesiredCurveCurveForm Property

Description

Defines the form of representation of a setpoint trend which belongs to a trend referenced by the "Index" property. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

0x00000011 Measuring points are connected by a solid line via a step curve

0x00000012 Representation of the measuring points

0x00000014 Measuring points are connected linearly with a solid line

0x00000021 The area under the linearly connected trend is filled.

0x00000022: The area under the stepped curve is filled.

0x00000031: Measuring points are connected by a dashed line via a step curve

0x00000032: Measuring points are connected linearly with a dashed line

DesiredCurveSourceNumberOfUAValues Property

Description

Defines the number of value pairs of a setpoint trend which belongs to a trend referenced by the "Index" property. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DesiredCurveSourceUAArchive Property

Description

Defines the name of the user archive from which the value of a setpoint trend, which belongs to a trend referenced by "Index", is read. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DesiredCurveSourceUAArchiveStartID Property

Description

Defines the starting point for the value of a setpoint trend, which belongs to a trend referenced by "Index", from which the values should be read from the archive. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DesiredCurveSourceUAColumnX Property

Description

Defines the column in the user archive from which the X-values of a setpoint trend, which belongs to a trend referenced by "Index", should be read. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DesiredCurveSourceUAColumnY Property

Description

Defines the column in the user archive from which the Y-values of a setpoint trend, which belongs to a trend referenced by "Index", should be read. Whether the information is evaluated is dependent on the value of the "DesiredCurveVisible" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

DesiredCurveVisible Property

Description

TRUE, a setpoint trend which belongs to a trend referenced by "Index" should be displayed. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

Direction Property

Description

Defines or returns the bar direction or the position of the slider object. BOOLEAN write-read access. Value range from 0 to 3.

0 = top

1 = bottom

2 = left

3 = right

See also

Slider (Page 226)

Bar (Page 189)

3D Bar (Page 184)

ScreenItem Object (Page 141)

DisplayName property

Display name (DisplayName)

Specifies the user-defined name of the process picture. The attribute is of type "Multilingual String". You can specify names for all languages installed in WinCC.

The "Display name" attribute can be dynamized with the "DisplayName" name.

DisplayOptions property

Show messages - DisplayOptions

Select the messages to be displayed.

The following selection options are available:

Value	Designation
0	All messages
1	Only displayed messages
2	Only hidden messages

The attribute can be assigned dynamic properties by means of the name **DisplayOptions**. The data type is LONG.

DisplayOptions property (before WinCC V7)

Description

Specifies if a button is assigned to a graphic, text, or both.

0 Picture or text: If a picture exists, the button is assigned with the picture, otherwise it is assigned with text.
1 Graphic and text
2 Text only
3 Graphic only

DoubleClickAction property

Action on double-click - DoubleClickAction

Sepcifies the action to be executed in Runtime by double-clicking on a message line.

The following settings are available:

Value	Description	Explanation
0	none	No action.
1	Loop-in-alarm	Calls the "Loop-in-alarm" function.
2	Open comments dialog	Calls the "Comments dialog" button function.
3	Open Infotext dialog	Calls the "Infotext dialog" button function.
4	Column-dependent	The action is determined by the column in which you double-clicked.

The attribute can be assigned dynamic properties by means of the name **DoubleClickAction**. The data type is LONG.

2.4.6 E

2.4.6.1 Edit Property

Description

Activates Editing mode for a cell as long as the "Editable" property has been set to TRUE for the corresponding column.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

2.4.6.2 Editable Property

Description

The "Index" property references a pair of columns. "Editable" defines whether the column pair should be editable. BOOLEAN write-read access.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

2.4.6.3 EditAtOnce Property

Description

TRUE, if accessing the field with the <TAB> key permits input immediately and without further action. BOOLEAN write-read access.

See also

Text list (Page 211)

I/O Field (Page 199)

ScreenItem Object (Page 141)

2.4.6.4 Enabled Property

Function

Enables or disables possible operation of an object or issues the corresponding value. TRUE : Enable operation, FALSE: Operation is disabled.

BOOLEAN write-read access.

Example:

The following example disables all objects in the picture "NewPDL1":

```
'VBS71
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName    'Read names of objects
Set objScrItem = objScreen.ScreenItems(strName)
objScrItem.Enabled=False    'Lock object
Next
```

See also

Screen Object (Page 146)

ScreenItem Object (Page 141)

2.4.6.5 EnableDelete property

Delete - EnableDelete

Enables deletion of data from the user archive in Runtime.

Value	Explanation
TRUE	You can delete data from the user archive in Runtime.
FALSE	You cannot delete data from the user archive in Runtime.

The attribute can be assigned dynamic properties by means of the name **EnableDelete**. The data type is BOOLEAN.

2.4.6.6 EnableEdit property

Modify - EnableEdit

Enables editing of the data displayed during runtime.

Value	Explanation
TRUE	Enables editing of data during runtime.
FALSE	Disables editing of data during runtime.

The attribute can be assigned dynamic properties by means of the name **EnableEdit**. The data type is BOOLEAN.

2.4.6.7 EnableInsert property

Add - EnableInsert

Enables insertion of data in the user archive in Runtime.

Value	Explanation
TRUE	You can add data to the user archive in Runtime.
FALSE	You cannot add data to the user archive in Runtime.

The attribute can be assigned dynamic properties by means of the name **EnableInsert**. The data type is BOOLEAN.

2.4.6.8 EnablePopupMenu property

EnablePopupMenu

Specifies if the pop-up menu is enabled in the control.

The attribute can be assigned dynamic properties by means of the name **EnablePopupMenu**. The data type is BOOLEAN.

2.4.6.9 EndAngle Property

Description

Defines or returns the end of the object. The information is in counterclockwise direction in degrees, beginning at the 12:00 clock position.

See also

Pie segment (Page 167)

2.4.6.10 EndTime Property

Description

Online Table Control

The "Index" attribute references a pair of columns. "EndTime" defines the end time for displaying this column pair. Whether the information is evaluated is dependent on the TimeRange" and "CommonTime" properties. Write/Read access.

Online Trend Control

The "Index" attribute references a trend. "EndTime" defines the end time for displaying this trend. Whether the information is evaluated is dependent on the "Autorange", "TimeRange" and "CommonX" properties.

Use the "yyyy-mm-dd hh:mm:ss" format when creating a dynamic time range.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

2.4.6.11 EndValue Property

Description

The "Index" property references a trend. "EndValue" defines the upper limit of the value range to be displayed for the trend. Whether the information is evaluated is dependent on the "Autorange" and "CommonY" properties.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

2.4.6.12 EndX Property

Description

Defines the upper limit of the X-axis of a trend referenced with "Index". Whether the information is evaluated is dependent on the "AutorangeX" and "CommonX" properties.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

2.4.6.13 EndY Property

Description

Defines the upper limit of the Y-axis of a trend referenced with "Index". Whether the information is evaluated is dependent on the "AutorangeY" and "CommonY" properties.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

2.4.6.14 ErrorDescription Property

Function

Error description of the "LastError" property. The error description is provided in English only.

STRING (read only)

The following error messages are defined:

Output	Description
" "	OK
"Operation Failed"	Execution error
"Variable not found"	Tag error
"Server down"	Server not available.
"An error occured for one or several tags"	Multi Tag Error (Error in one or several tags)

In order that ErrorDescription returns a value, a read process must be executed beforehand.

If an error occurs during read or write of several tags using the TagSet object, the error is set to "Multi Tag Error". In order to determine at which tag the error occurred and what type of error it was, the ErrorDescription property of each tag must be analyzed.

Example:

The following example displays the error description for "Tag1":

```
'VBS72
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objtag.Read
MsgBox objTag.ErrorDescription
```

The following example adds two tags to the TagSet list and outputs the ErrorDescription property as Trace.

```
'VBS179
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "ErrorDescription: " & group.ErrorDescription & vbNewLine
```

The ErrorDescription property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "ErrorDescription: " & group("Motor1").ErrorDescription & vbNewLine
```

Tag Object (Page 152)

2.4.6.15 Exponent Property

Description

TRUE, when the display of numbers should be with exponents (e.g."1.00e+000"). BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

2.4.6.16 ExportDirectoryChangeable property

Directory can be changed - ExportDirectoryChangeable

Enables changing of the directory for data export in Runtime.

Value	Explanation
TRUE	The data export directory can be changed in Runtime.
FALSE	The data export directory cannot be changed in Runtime.

The attribute can be assigned dynamic properties by means of the name **ExportDirectoryChangeable**. The data type is BOOLEAN.

2.4.6.17 ExportDirectoryname property

Directory - ExportDirectoryname

Defines the directory to which the exported Runtime data is written.

You can select or create the directory using the selection button.

The attribute can be assigned dynamic properties by means of the name **ExportDirectoryname**. The data type is STRING.

2.4.6.18 ExportFileExtension property

ExportFileExtension

Defines the extension of the export file.

Only the file name extension "csv" is currently supported.

The attribute can be assigned dynamic properties by means of the name **ExportFileExtension**. The data type is STRING.

2.4.6.19 ExportFilename property

File name - ExportFilename

Defines the name of the file which is to receive the exported Runtime data.

The attribute can be assigned dynamic properties by means of the name **ExportFilename**. The data type is STRING.

2.4.6.20 ExportFilenameChangeable property

File can be renamed - ExportFilenameChangeable

Enables renaming of the export file in Runtime.

Value	Explanation
TRUE	The export file can be renamed in Runtime.
FALSE	The export file cannot be renamed in Runtime.

The attribute can be assigned dynamic properties by means of the name **ExportFilenameChangeable**. The data type is BOOLEAN.

2.4.6.21 ExportFormatGuid property

ExportFormatGuid

Default assignment of the ID number and export provider.

The attribute can be assigned dynamic properties by means of the name **ExportFormatGuid**. The data type is STRING.

2.4.6.22 ExportFormatName property

Format - ExportFormatName

Defines the export file format.

Only the "csv" file format is currently available for the export.

The attribute can be assigned dynamic properties by means of the name **ExportFormatName**. The data type is STRING.

See also

How to export Runtime data

2.4.6.23 ExportParameters property

ExportParameters

Specifies the parameters of the selected format by means of the properties dialog.

The attribute can be assigned dynamic properties by means of the name **ExportParameters**. The data type is VARIANT.

2.4.6.24 ExportSelection property

Scope of data export - ExportSelection

Specifies the control's Runtime data to be exported.

The following settings are available:

Value	Description	Explanation
0	all	All Runtime data of the control is exported.
1	Selection	Selected Runtime data of the control is exported.

The attribute can be assigned dynamic properties by means of the name **ExportSelection**. The data type is LONG.

2.4.6.25 ExportShowDialog property

Show dialog - ExportShowDialog

Enables the display of the export dialog during runtime.

Value	Explanation
TRUE	The dialog is displayed during runtime.
FALSE	The dialog is not displayed during runtime.

The attribute can be assigned dynamic properties by means of the name **ExportShowDialog**. The data type is BOOLEAN.

2.4.6.26 ExportXML property

ExportXML

Only used internally.

The attribute can be assigned dynamic properties by means of the name **ExportXML**.

2.4.6.27 ExtendedOperation Property

Description

TRUE, when the slider regulator is set at the respective end value (minimum/maximum value). This is done by clicking the mouse in an area outside the current regulator setting. BOOLEAN write-read access.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

2.4.6.28 ExtendedZoomingEnable Property

Description

Activates/deactivates the ExtendedZooming properties of a picture.

Using ExtendedZooming, the view of a process picture in Runtime may be enlarged or reduced by using the mouse wheel.

BOOLEAN write-read access.

Example:

Activates ExtendedZooming for picture NewPDL1.

```
'VBS155
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
objScreen.ExtendedZoomingEnable = 1
```

See also

Screen Object (Page 146)

2.4.7 F

2.4.7.1 Fe - Fl

FeatureFullscreen property

FeatureFullscreen

Specifies if the "Full screen" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureFullscreen**. The data type is BOOLEAN.

FeaturePause property

FeaturePause

Specifies if the "Pause" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeaturePause**. The data type is BOOLEAN.

FeaturePlay property

FeaturePlay

Specifies if the "Play" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeaturePlay**. The data type is BOOLEAN.

FeatureStepBackward property

FeatureStepBackward

Specifies if the "Step backward" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureStepBackward**. The data type is BOOLEAN.

FeatureStepForward property

FeatureStepForward

Specifies if the "Step forward" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureStepForward**. The data type is BOOLEAN.

FeatureStop property

FeatureStop

Specifies if the "Stop" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureStop**. The data type is BOOLEAN.

FeatureVolume property

FeatureVolume

Specifies if the "Volume" function is available in the control.

The attribute can be assigned dynamic properties by means of the name **FeatureVolume**. The data type is BOOLEAN.

FileName property

FileName

Specifies the file whose content you want to display or play.

The attribute can be assigned dynamic properties by means of the name **FileName**. The data type is STRING.

FillColor Property

Description

Defines or returns the fill pattern color for the object.

LONG (write-read access)

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Enter the appropriate decimal value for each of the three RGB values.

Example:

RGB(200, 150, 100)

Example:

The following example defines the fill color for "ScreenWindow1" to blue:

```
'VBS73
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.FillStyle = 131075
objScreen.FillColor = RGB(0, 0, 255)
```

See also

FillStyle Property (Page 407)

BackColor Property (Page 323)

ScreenItem Object (Page 141)

Filling Property

Description

TRUE, when the object can be filled by closed border lines (e.g. representing the fill level of a tank). BOOLEAN write-read access.
The fill level of the object is set by means of the "FillingIndex" property.

See also

ScreenItem Object (Page 141)

FillingDirection properties

Filling direction (FillingDirection)

The "Filling direction" attribute specifies the filling direction for an object enclosed in a frame line.

Bottom to top	The object is filled from bottom to top.
Top to bottom	The object is filled from top to bottom.
Left to right	The object is filled from left to right.
Right to left	The object is filled from right to left.

The attribute can be assigned dynamic properties by means of the name FillingDirection. The data type is LONG.

FillingIndex Property

Description

Defines the %age value (related to the height of the object) to which the object with closed border line is to be filled.
The fill level is represented by the current background color. The unfilled background is transparent.

See also

ScreenItem Object (Page 141)

FillStyle Property

Description

Defines or returns the fill pattern for the object.

LONG (write-read access)

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
< Transparent >	65536				
< Massiv >	0				
	1048576		196611		196627
	1048577		196612		196628
	1048578		196613		196629
	1048579		196614		196630
	1048832		196615		196631
	1048833		196616		196632
	1048834		196617		196633
	1048835		196618		196634
	131072		196619		196635

Fill pattern	Value	Fill pattern	Value	Fill pattern	Value
	131073		196620		196636
	131074		196621		196637
	131075		196622		196638
	131076		196623		196639
	196608		196624		196640
	196609		196625		196641
	196610		196626		196642

Example

The following example sets the fill pattern for "ScreenWindow1" to transparent:

```
'VBS190
Dim obj
Set obj = ScreenItems("Rectangle1")
obj.FillStyle = 65536
```

See also

FillColor Property (Page 405)

BackColor Property (Page 323)

Screen Object (Page 146)

FillStyle2 Property

Description

Defines or returns the fill style of the bar.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

FillStyleAlignment property

Description

Defines the alignment of the fill pattern for the process picture.

Normal	The fill pattern refers to the process picture. In runtime, no scaling is performed when opening the picture.
Stretched (window)	The fill pattern refers to the window in the Graphics Designer. In runtime, scaling is performed when opening the picture.

FilterSQL property

FilterSQL

Defines an SQL statement for a selection of data in the user archive.

The attribute can be assigned dynamic properties by means of the name **FilterSQL**. The data type is STRING.

FineGrid Property

Description

TRUE, when the value axis is scaled by short tick marks. The distance between two short tick marks can be changed using the "FineGridValue" property. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

FineGridValue Property

Description

Defines the distance between two short tick marks in the scale. Whether the information is evaluated is dependent on the value of the "FineGrid" property.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

FineGridValueX Property

Description

Defines the distance between two short tick marks on the X-axes scaling. Whether the information is evaluated is dependent on the value of the "FineGridX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

FineGridValueY Property

Description

Defines the distance between two short tick marks on the Y-axes scaling. Whether the information is evaluated is dependent on the value of the "FineGridX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

FineGridX Property

Description

TRUE, when the X-axis graduation is scaled by short tick marks. The distance between two short tick marks can be changed using the "FineGridValueX" property.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

FineGridY Property

Description

TRUE, when the Y-axis graduation is scaled by short tick marks. The distance between two short tick marks can be changed using the "FineGridValueY" property.

See also

Text list (Page 211)

Radio box (Page 221)

Check box (Page 219)

Button (Page 215)

ScreenItem Object (Page 141)

FlashPicReferenced Property

Description

TRUE, when the assigned flash picture should be saved. Otherwise, only the associated object reference is saved. Read only access.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

FlashPicTransColor Property

Description

Defines which color of the bitmap object (.bmp, .dib) assigned to the flash picture should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "FlashPicUseTransColor" property is "True".

See also

ScreenItem Object (Page 141)

Status display (Page 213)

FlashPicture Property

Description

Returns the flash picture. Read-only access.
The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

In this context, the "FlashPicReferenced" property defines whether the flash picture should be saved together with the object status display or referenced.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

FlashPicUseTransColor Property

Description

TRUE, when the configured color ("FlashPicTransColor" property) of the bitmap objects assigned to the flash picture should be set to "transparent". BOOLEAN write-read access.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

FlashRate Property

Description

Defines or returns the flashing frequency for the object. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

FlashRateBackColor Property

Description

Defines or returns the flash frequency for the object background. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

See also

ScreenItem Object (Page 141)

FlashRateBorderColor Property

Description

Defines or returns the flash frequency for the lines of the object. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

See also

ScreenItem Object (Page 141)

FlashRateFlashPic Property

Description

Defines or returns the flash frequency for the status display. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.25 Hz)	0
Medium (approx. 0.5 Hz)	1
Fast (approx. 1 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

FlashRateForeColor Property

Description

Defines or returns the flash frequency for the object label. Value range from 0 to 2.

Flash frequency	Assigned Value
Slow (approx. 0.5 Hz)	0
Medium (approx. 2 Hz)	1
Fast (approx. 8 Hz)	2

Note

Because the flashing is performed by means of software engineering, the flash frequency is both system-dependent and hardware-bound (number of objects, processor speed, RAM size, update time, etc.).

The information in the table is therefore only for orientation purposes.

Flip property

Flip (Flip)

Specifies flipping of the icon at runtime.

The following settings are available:

Value	Description	Comments
0	None	The icon is not flipped.
1	Horizontal	The object is flipped along the horizontal center axis.
2	Vertical	The object is flipped along the vertical center axis.
3	Both	The object is flipped along the horizontal and vertical center axes.

The attribute can be assigned dynamic properties by means of the name **Flip**. The data type is LONG.

Flip Property

Description

Mirrors the icon on the vertical and/or horizontal middle axis of the icon.

- Zero - 0: The icon is mot mirrored.
- Horizontal - 1: The icon is mirrored on the vertical center axis.
- Vertical - 2: The icon is mirrored on the horizontal, center axis.
- Both - 3: The icon is mirrored both on the horizontal and vertical center axes.

FocusColor Property

Description

If the focus is positioned on the control in Runtime, the labeling and position text are identified by a border. FocusColor defines the color of the border.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

FocusRect Property

Description

TRUE, when the button should be provided with a selection border, in Runtime, as soon as it receives the focus. BOOLEAN write-read access.

See also

WinCC Push Button Control (Page 275)

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

FocusWidth Property

Description

If the focus is positioned on the control in Runtime, the labeling and position text are identified by a border. FocusWidth defines the width of the border, value range of 1-10 pixels. LONG write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

Font Property

Name - Font

Sets the font.

The attribute cannot be dynamized.

Font property (before WinCC V7)

Description

Defines or returns the font. Write/Read access.

The font object has the following sub-properties

- Size (Font Size)
- Bold (yes/no)
- Name (font name)
- Italic (yes/no)
- Underline (underline yes/no)
- StrikeThrough (yes/no)

If two font properties are directly assigned, only the default property "Name" is assumed.

Example:

```
'VBS74
Dim objControl1
Dim objControl2
Set objControl1 = ScreenItems("Control1")
Set objControl2 = ScreenItems("Control2")
objControl2.Font = objControl1.Font ' take over only the type of font
```

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

FrameColorUp Property

Description

Defines or returns the color for the left, top part of the 3D frame of the button (button not pressed). LONG write-read access.

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

FramePicture Property

Description

Returns the picture name of the background picture for the graduated scale disk. Read only access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

FrameScale Property

Description

Defines or returns the diameter of the graduated scale disk in relation to smallest value of the width and height geometric attributes. Write/Read access.

The value range is (scale distance - scale width) to 1.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

FrameWidth Property

Description

Defines or returns the border width of the button in pixels. Write/Read access.

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

FreezeProviderConnections Property

Description

Enables modification of the data connection properties ("ProviderType", "Source"...), without the change being effective immediately. On changing "SourceTagNameX", for example, impermissible combinations can created with "SourceTagNameY".

Therefore, FreezeProviderConnections" must be set to TRUE before modifying a data connection attribute. After modifying all the data connection, "FreezeProviderConnection" is set to FALSE and the changes take effect.

2.4.8.1 GlobalColorScheme property

Description

Defines whether the colors defined for the current design in the global color scheme will be used for this object.

TRUE if the object is displayed with the colors from the global color scheme defined for this object type.

FALSE if the object is displayed with the colors as per the settings in the object.

BOOLEAN write-read access.

2.4.8.2 GlobalShadow property

Description

Defines whether the object will be displayed with the shadowing defined in the active design.

TRUE if the object is displayed with the global shadow defined for this object type.

FALSE if no shadow is displayed.

BOOLEAN write-read access.

2.4.8.3 GraphDirection property (before WinCC V7)

Description

Defines which edge of the trend window should display the current values. Write/Read access.

0: Positive values run to the right and upwards.

-1: Positive values run to the left and upwards.

-2: Positive values run to the right and upwards.

-3: Positive values run to the right and downwards.

ScreenItem Object (Page 141)

2.4.8.4 GraphDirection Property

Write direction - GraphDirection

Defines the direction of the update of axis values.

Value	Description	Explanation
0	From the right	The updated values are displayed starting at the right side of the trend.
1	From the left	The updated values are displayed starting at the left side of the trend.
2	From the top	The updated values are displayed starting at the top of the trend.
3	From the bottom	The updated values are displayed starting at the bottom of the trend.

True type fonts must be used within the trend window if "From the top" or "From the bottom" is selected for write direction. Only this setting ensures legibility of the labeling of the vertical axis.

The attribute can be assigned dynamic properties by means of the name **GraphDirection**. The data type is LONG.

2.4.8.5 GridLineColor property

Color of the row divider / content - GridLineColor

Defines the color of row/column dividers in table contents. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **GridLineColor**. The data type is LONG.

2.4.8.6 GridLineHorz Property

Description

TRUE, when the message window columns are separated by horizontal dividing lines. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

2.4.8.7 GridLines Property

Description

TRUE, when the trend window is displayed with grid lines parallel to the X-axis. The distance between two grid lines can be changed using the "GridLineValue" property. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

2.4.8.14 GridLineWidth property

Width of dividers - GridLineWidth

Defines the line weight of the row/column dividers in pixels.

The attribute can be assigned dynamic properties by means of the name **GridLineWidth**. The data type is LONG.

2.4.9 H

2.4.9.1 Ha - Hi

HandFillColor Property

Description

Defines or returns the fill color of all the hands in the analog clock. In order that the hands are displayed with the fill color defined, the "Handtype" property must be set to "0" (covering). LONG write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

Handtype Property

Description

Defines the representation of the hands:

- 0: The hands are filled in the hand color defined and the edges in the foreground color.
- 1: The hands fill color is transparent and the edges displayed in the foreground color.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

HeaderSort Property

Description

Specifies if sorting of messages by message block column header is possible.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

Height Property

Description

Defines or returns the height of the object in pixels.

LONG (write-read access)

Example:

The following example halves the height of all objects in the "NewPDL1" picture whose names begin with "Circle":

```
'VBS75
Dim objScreen
Dim objCircle
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'Searching all circles
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
If "Circle" = Left(strName, 6) Then
'
'to halve the height of the circles
Set objCircle = objScreen.ScreenItems(strName)
objCircle.Height = objCircle.Height / 2
End If
Next
```

Width Property (Page 682)

Object types of the ScreenItem object (Page 158)

ScreenItem Object (Page 141)

HiddenInput Property

Description

TRUE, when the input value should not be displayed when being entered. Each character entered is substituted by a *. BOOLEAN write-read access.

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

HideTagNames Property

Description

TRUE if the archive and tag name in the trend should be hidden via the right mouse button, in the status line and in the table to display the coordinates. BOOLEAN write-read access.

HitlistColumnAdd property

HitlistColumnAdd

Transfers the selected message block from the list of available message blocks to the list of selected message blocks.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnAdd** . The data type is STRING.

HitlistColumnCount property

HitlistColumnCount

Specifies the number of message blocks displayed in the hitlist in Runtime.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnCount** . The data type is LONG.

HitlistColumnIndex property

HitlistColumnIndex

References a message block selected for the hitlist. Using this attribute you can assign the values of other attributes to a specific message block of the hitlist.

Values between 0 and "HitlistColumnCount" minus 1 are valid for "HitlistColumnIndex". Attribute "HitlistColumnCount" defines the number of message blocks selected for the hitlist.

The "HitlistColumnIndex" attribute can be assigned dynamic properties by means of attribute **HitlistColumnRepos**. The data type is LONG.

HitlistColumnName property

HitlistColumnName

Displays the name of the message block of the hitlist which is referenced with attribute "HitlistColumnIndex". You cannot edit this name.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnName** . The data type is STRING.

HitlistColumnRemove property

HitlistColumnRemove

Cuts the marked message block from the list of selected message blocks and pastes it to the list of available message blocks.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnRemove**. The data type is STRING.

HitlistColumnRepos

Up/Down - MessageColumnRepos/HitlistColumnRepos

Resorts the message blocks. The "Up" and "Down" commands move the selected message block accordingly in the list. This moves the message block in Runtime Control towards the front or towards the back.

The attribute for the hitlist can be assigned dynamic properties by means of the name **HitlistColumnRepos** .

The attribute for the message list can be assigned dynamic properties by means of the name **MessageColumnRepos**.

The data type is LONG.

HitlistColumnSort property

HitlistColumnSort

Defines the sorting order of the message block referenced in "HitlistColumnIndex" for the hitlist.

The following settings are available:

Value	Description	Explanation
0	none	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **HitlistColumnSort** . The data type is LONG.

HitlistColumnSortIndex property

HitlistColumnSortIndex

Defines the sorting order of the message block referenced in "HitlistColumnIndex" in the hitlist. The sorting criterion is removed from "HitlistColumnSort" if you set a "0" value..

The attribute can be assigned dynamic properties by means of the name **HitlistColumnSortIndex**. The data type is LONG.

HitlistColumnVisible

Selected message blocks - MessageColumnVisible/HitlistColumnVisible

Selected message blocks of message list or hitlist that are displayed in Runtime. Defines whether the message block referenced in "MessageColumnIndex" or "HitlistColumnIndex" is displayed.

The attribute for the message list can be assigned dynamic properties by means of the name **MessageColumnVisible**.

The attribute for the hitlist can be assigned dynamic properties by means of the name **HitlistColumnVisible**.

The data type is BOOLEAN.

HitlistDefaultSort property

HitlistDefaultSort

Defines the default sorting order in the table columns of the hitlist.

The following settings are available:

Value	Description	Explanation
0	Ascending	The list is sorted in ascending order based on frequency.
1	Descending	The list is sorted in descending order based on frequency.

The attribute can be assigned dynamic properties by means of the name **HitlistDefaultSort**. The data type is LONG.

HitListMaxSourceItems property

Maximum number of data records - HitListMaxSourceItems

Defines the maximum number of data records for statistics.

The attribute can be assigned dynamic properties by means of the name **HitListMaxSourceItems** . The data type is LONG.

HitListMaxSourceItemsWarn property

Warning when maximum is reached - HitListMaxSourceItemsWarn

Enables the output of a warning notice after the valid number of data records was reached.

Value	Explanation
TRUE	A warning is output after the valid maximum number of data records was reached.
FALSE	A warning is not output after the valid maximum number of data records was reached.

The attribute can be assigned dynamic properties by means of the name **HitListMaxSourceItemsWarn**. The data type is BOOLEAN.

HitListRelTime property

Time range for statistics - HitListRelTime

Sets a time range for the statistics.

Value	Explanation
TRUE	The time range set for statistics is used if this range was not defined in the selection.
FALSE	The time range is not used.

The attribute can be assigned dynamic properties by means of the name **HitListRelTime**. The data type is BOOLEAN.

HitListRelTimeFactor property

Time range - HitListRelTimeFactor

Defines the factor for calculating the time range. Only integer factors are valid.

The attribute can be assigned dynamic properties by means of the name **HitListRelTimeFactor**. The data type is LONG.

HitListRelTimeFactorType property

Time range - HitListRelTimeFactorType

Defines the time unit for calculating the time range.

The following time units are available:

Value	Description
0	Minute
1	Hour
2	Day
3	Week
4	Month

The attribute can be assigned dynamic properties by means of the name **HitListMaxRelTimeFactorType**. The data type is LONG.

2.4.9.2 Ho - Hy

HorizontalGridLines property

Horizontal - HorizontalGridLines

Defines whether horizontal separating lines will be displayed.

Value	Explanation
TRUE	Enables the display of horizontal dividers.
FALSE	Disables the display of horizontal dividers.

The attribute can be assigned dynamic properties by means of the name **HorizontalGridLines**. The data type is BOOLEAN.

Hotkey Property

Description

Returns the function key related to the mouse operation in respect of a button object.

Read only access.

See also

Button (Page 215)

ScreenItem Object (Page 141)

HourNeedleHeight Property

Description

Defines or returns the length of the hour hand for the analog clock. The specification of the length is entered as a percentage value in relation to half the length of the short side of the rectangular background. Write/Read access.

Example:
The shorter side of the rectangular background is 100 pixels long.
The hour hand length is 50.
This results in a length of the hour hand of (100 pixels / 2) * 0.5 = 25 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

HourNeedleWidth Property

Description

Defines or returns the width of the hour hand for the analog clock. The width is specified as a percentage value related to double the length of the hour hand. Write/Read access.

Example:
The length of the hour hand is 25 pixels.
The hour hand width is 10.
This results in a width of the hour hand of 25 pixels * 2 * 0.1 = 5 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

Hysteresis Property

Description

TRUE, when the display should appear with hysteresis. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

HysteresisRange Property

Description

Defines the hysteresis in % of the displayed value or returns it.
The Hysteresis property must be set to TRUE for the hysteresis to be calculated.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

2.4.10 I

2.4.10.1 IconSpace property

IconSpace

Defines the spacing between the icons and text in the table cells. The value is active if and icon and text are displayed.

The attribute can be assigned dynamic properties by means of the name **IconSpace**. The data type is LONG.

2.4.10.2 IndependentWindow property

Description

Defines whether the display of the picture window in Runtime depends on the process picture in which the picture window was configured.

TRUE if the size and position of the picture window are independent of the process picture and only defined by the "Window mode" attribute.

FALSE if the size and position of the picture window change with the shift or scaling of the process picture.

2.4.10.3 Index Property

Description

Check box, radio box

Defines or returns the number (0 to 31) of the field whose text is to be defined.

Combo box, list box

Defines or returns the number (0 to 31) of the line whose text is to be defined.

Polygon, polyline, tube polygon

Defines or returns the number of the corner point whose position coordinates are to be modified or displayed.

WinCC online trend control, WinCC online table control, WinCC function trend control

The "Index" property is evaluated by other properties in order to be able to assign the settings to a specific trend or column pair. The valid values for the index move within the range from 0 to (NumItems - 1). The "NumItems" properties contains the number of the trends/column pairs to be displayed. The index must always be set before you change the properties of a trend / column in runtime.

Status display

Defines the status (0 to 255) or returns it. A basic picture and flash picture can be defined for each status value.

See also

Status display (Page 213)

ScreenItem Object (Page 141)

2.4.10.4 InnerBevelOffset Property

Description

Defines the distance between the inner and outer bevels.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

2.4.10.5 InnerBevelStyle Property

Description

Defines the 3D effect for the inner bevel of the object.

- 0: No border.
- 1: The border is displayed depressed.
- 2: The border is displayed raised.
- 3: The border is displayed in one color without a 3D effect. The border color is defined by the "BevelColorDown" property.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

2.4.10.6 InnerBevelWidth Property

Description

Defines the width of the inner bevel in pixels.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

2.4.10.7 InputValue property

Description

Defines the value to be entered by the user in the I/O field. The value is not displayed in the I/O field when the property is set.

If you want the value to be displayed in the I/O field after confirmation with the <Return> key, configure a direct connection between the properties "input value" and "output value". The direct connection is only practical when no tag is connected to the output value, but the user can nevertheless query the specified value, for example, through a script.

LONG write-read access.

See also

Example: Calling Methods of an ActiveX Control (Page 819)

2.4.10.8 InsertData Property

Description

Inserts data for the current trend.

TRUE : "DataIndex" is ignored and the data is appended to that in the data buffer.

FALSE : The data is inserted at the "DataIndex" position in the data buffer.

The trend window is redrawn following each operation involving "Insert Data".

Note

The property is only supported for the controls prior to WinCC V7.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

2.4.10.9 Instance property

Description

Returns an instance of the alarm object.

See also

Alarms object (list) (Page 126)

2.4.10.10 ItemBorderBackColor Property

Description

Defines or returns the background color for dividing lines in the selection list of the text list object. LONG write-read access. The background color is only visible with the property setting ItemBorderStyle > 0.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

2.4.10.11 ItemBorderColor Property

Description

Defines or returns the color for deviding lines in the selection list of the text list object. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

2.4.10.12 ItemBorderStyle Property

Description

Defines or returns the color for the dividing line style in the selection list of the text list object. Value range from 0 to 4.

0 = solid line

1 = dashed line

2 = dotted line

3 = dash-dotted line

4 = dash-dot-dot line

See also

Text list (Page 211)

ScreenItem Object (Page 141)

2.4.10.13 ItemBorderWidth Property

Description

Defines or returns the dividing line weight in pixels in the selection list of the text list object.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

2.4.10.14 ItemProviderCIsid Property

Description

"ItemProviderCIsid" shows, if the trend referenced using Index in Trend Control is connected with an archive tag or an online tag.

Notice: If you assign a value to the "ProviderCIsid" property , you will overwrite the trend-specific property "ItemProviderCIsid".

- {416A09D2-8B5A-11D2-8B81-006097A45D48}: The trend is connected to an archive tag.
- {A3F69593-8AB0-11D2-A440-00A0C9DBB64E}: The trend is connected to an online tag.

If the trends are being supplied with archive and online tags, the property "ProviderCIsid" returns the value "{00000000-0000-0000-0000-000000000000}".

2.4.10.15 ItemVisible Property

Description

TRUE, when a trend or a column pair reference by the "Index" property is visible. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

2.4.11 L

2.4.11.1 Lab - Las

Label Property

Description

The "Index" property references a trend. Label is used to define the name of the time axis or value axis in accordance with the value of the "TimeAxis" property.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

LabelColor Property

Description

Defines the color of the scale label.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

LabelX Property

Description

Defines or returns the label on the X-axis for a trend referenced by "Index" according to the value of "TimeAxisX". Write/Read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

LabelY Property

Description

Defines or returns the label on the Y-axis for a trend referenced by "Index" according to the value of "TimeAxisY". Write/Read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

LanguageSwitch Property

Description

Returns the value which defines where the language dependent assigned texts are stored. Read only access.

TRUE, when the texts in the Text Library are managed. Translation to other language occurs in the Text Library.

FALSE, when the texts are managed directly in the object. Translation to other language can be carried out using Text Distributor.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

Language Property

Description

Defines the current Runtime language or reads it.

You specify the Runtime language in VBS by using a country code, e.g., 1031 for German - Default, 1033 for English - USA etc. A summary of all country codes may be found in the Basics of VBScript under the subject header "Regional Scheme ID (LCID) Diagram".

INTEGER (write-read access)

Example:

The following example sets the data language to German:

```
'VBS76
HMIRuntime.Language = 1031
```

See also

HMIRuntime Object (Page 134)

LastError Property

Description

Returns an error code regarding the success of the last operation, e.g. information on a tag write or read process. The "QualityCode" property can provide information on the quality of

the returned value. A description of the error can be called in using the "ErrorDescription" property.

LONG (read only)

The following error codes are defined:

Code in hexadecimal notation	Description
0x00000000	OK
0x80040001	Execution error
0x80040002	Tag error
0x80040003	Server not available.
0x80040004	Multi Tag Error (Error in one or several tags)

In order that LastError returns a value, a read must be executed beforehand.

If an error occurs during read or write of several tags using the TagSet object, the error is set to "Multi Tag Error". In order to determine at which tag the error occurred and what type of error it was, the LastError property of each tag must be analyzed.

Example:

The following example displays the error code for "Tag1":

```
'VBS77
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.LastError
```

The following example adds two tags to the TagSet list and outputs the LastError property as Trace.

```
'VBS178
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "LastError: " & group.LastError & vbNewLine
```

The LastError property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "LastError: " & group("Motor1").LastError & vbNewLine
```

See also

TagSet Object (List) (Page 156)

QualityCode Property (Page 532)

ErrorDescription Property (Page 398)

Tag Object (Page 152)

2.4.11.2 Layer

Layer Property

Description

Returns the layer of the picture in which the object is located. There is a total of 32 layers available, whereby Layer "0" is the bottom layer and Layer "31" the top layer.

The configured objects are initially in the background of a layer.

LONG (read only)

Note

The layer property specifies the layer in which the object is located. The layer "0" is output as "Layer0".

When accessed, the layers are counted up from 1 in VBS. Therefore, the layer "1" must be addressed with "layers(2)".

Example:

The following example displays the name and layer of all the objects in the picture "NewPDL1":

```
'VBS78
Dim objScreen
Dim objScrItem
Dim lngAnswer
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
lngAnswer = MsgBox(strName & " is in layer  " & objScrItem.Layer,vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

Layer00FillColor property

Bar fill color 0 (Layer00FillColor)

The "Layer00FillColor" attribute defines the color with which the bar is filled in relation to "Limit 0".

The "Layer00FillColor" attribute can be made dynamic with the name "Layer00FillColor".

Layer01FillColor property

Layer01FillColor

The "Layer01FillColor" attribute defines the color with which the bar is filled in relation to "Limit 1".

The "Layer01FillColor" attribute can be made dynamic with the name "Layer01FillColor".

Layer02FillColor property

Layer02FillColor

The "Layer02FillColor" attribute defines the color with which the bar is filled in relation to "Limit 2".

The "Layer02FillColor" attribute can be made dynamic with the name "Layer02FillColor".

Layer03FillColor property

Layer03FillColor

The "Layer03FillColor" attribute defines the color with which the bar is filled in relation to "Limit 3".

The "Layer03FillColor" attribute can be made dynamic with the name "Layer03FillColor".

Layer04FillColor property

Layer04FillColor

The "Layer04FillColor" attribute defines the color with which the bar is filled in relation to "Limit 4".

The "Layer04FillColor" attribute can be made dynamic with the name "Layer04FillColor".

Layer05FillColor property

Layer05FillColor

The "Layer05FillColor" attribute defines the color with which the bar is filled in relation to "Limit 5".

The "Layer05FillColor" attribute can be made dynamic with the name "Layer05FillColor".

Layer06FillColor property

Layer06FillColor

The "Layer06FillColor" attribute defines the color with which the bar is filled in relation to "Limit 6".

The "Layer06FillColor" attribute can be made dynamic with the name "Layer06FillColor".

Layer07FillColor property

Layer07FillColor

The "Layer07FillColor" attribute defines the color with which the bar is filled in relation to "Limit 7".

The "Layer07FillColor" attribute can be made dynamic with the name "Layer07FillColor".

Layer08FillColor property

Layer08FillColor

The "Layer08FillColor" attribute defines the color with which the bar is filled in relation to "Limit 8".

The "Layer08FillColor" attribute can be made dynamic with the name "Layer08FillColor".

Layer09FillColor property

Layer09FillColor

The "Layer09FillColor" attribute defines the color with which the bar is filled in relation to "Limit 9".

The "Layer09FillColor" attribute can be made dynamic with the name "Layer09FillColor".

Layer10FillColor property

Layer10FillColor

The "Layer10FillColor" attribute defines the color with which the bar is filled in relation to "Limit 10".

The "Layer10FillColor" attribute can be made dynamic with the name "Layer10FillColor".

Layer00FillStyle property

Layer00FillStyle

The "Layer00FillStyle" attribute defines the style of the bar in relation to "Limit 0". For the fill pattern to become visible, "bar fill color 0" must differ from "bar color 0".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer00FillStyle" attribute can be made dynamic with the name "Layer00FillStyle".

Layer01FillStyle property

Layer01FillStyle

The "Layer01FillStyle" attribute defines the style of the bar in relation to "Limit 1". For the fill pattern to become visible, "bar fill color 1" must differ from "bar color 1".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer01FillStyle" attribute can be made dynamic with the name "Layer01FillStyle".

Layer02FillStyle property

Layer02FillStyle

The "Layer02FillStyle" attribute defines the style of the bar in relation to "Limit 2". For the fill pattern to become visible, "bar fill color 2" must differ from "bar color 2".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer02FillStyle" attribute can be made dynamic with the name "Layer02FillStyle".

Layer03FillStyle property

Layer03FillStyle

The "Layer03FillStyle" attribute defines the style of the bar in relation to "Limit 3". For the fill pattern to become visible, "bar fill color 3" must differ from "bar color 3".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer03FillStyle" attribute can be made dynamic with the name "Layer03FillStyle".

Layer04FillStyle property

Layer04FillStyle

The "Layer04FillStyle" attribute defines the style of the bar in relation to "Limit 4". For the fill pattern to become visible, "bar fill color 4" must differ from "bar color 4".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer04FillStyle" attribute can be made dynamic with the name "Layer04FillStyle".

Layer05FillStyle property

Layer05FillStyle

The "Layer05FillStyle" attribute defines the style of the bar in relation to "Limit 5". For the fill pattern to become visible, "bar fill color 5" must differ from "bar color 5".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer05FillStyle" attribute can be made dynamic with the name "Layer05FillStyle".

Layer06FillStyle property

Layer06FillStyle

The "Layer06FillStyle" attribute defines the style of the bar in relation to "Limit 6". For the fill pattern to become visible, "bar fill color 6" must differ from "bar color 6".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer06FillStyle" attribute can be made dynamic with the name "Layer06FillStyle".

Layer07FillStyle property

Layer07FillStyle

The "Layer07FillStyle" attribute defines the style of the bar in relation to "Limit 7". For the fill pattern to become visible, "bar fill color 7" must differ from "bar color 7".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer07FillStyle" attribute can be made dynamic with the name "Layer07FillStyle".

Layer08FillStyle property

Layer08FillStyle

The "Layer08FillStyle" attribute defines the style of the bar in relation to "Limit 8". For the fill pattern to become visible, "bar fill color 8" must differ from "bar color 8".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer08FillStyle" attribute can be made dynamic with the name "Layer08FillStyle".

Layer09FillStyle property

Layer09FillStyle

The "Layer09FillStyle" attribute defines the style of the bar in relation to "Limit 9". For the fill pattern to become visible, "bar fill color 9" must differ from "bar color 9".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer09FillStyle" attribute can be made dynamic with the name "Layer09FillStyle".

Layer10FillStyle property

Layer10FillStyle

The "Layer10FillStyle" attribute defines the style of the bar in relation to "Limit 10". For the fill pattern to become visible, "bar fill color 10" must differ from "bar color 10".

There is a choice of 50 fill styles. The 0 "Solid" fill style fills the object with the set background color. The 1 "Transparent" fill style means neither a background nor a fill pattern is displayed.

The "Layer10FillStyle" attribute can be made dynamic with the name "Layer10FillStyle".

Layer00Value Property

Description

Determines the value for "Limit 0" or returns it.
Monitoring only takes effect when the Layer00Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer01Value Property

Description

Determines the value for "Limit 1" or returns it.
Monitoring only takes effect when the Layer01Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer02Value Property

Description

Determines the value for "Limit 2" or returns it.
Monitoring only takes effect when the Layer02Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer03Value Property

Description

Determines the value for "Limit 3" or returns it.
Monitoring only takes effect when the Layer03Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer04Value Property

Description

Determines the value for "Limit 4" or returns it.
Monitoring only takes effect when the Layer04Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer05Value Property

Description

Determines the value for "Limit 5" or returns it.
Monitoring only takes effect when the Layer05Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer06Value Property

Description

Determines the value for "Limit 6" or returns it.
Monitoring only takes effect when the Layer06Checked property value is set to TRUE.

See also

ScreenItem Object (Page 141)

Layer07Value Property

Description

Determines the value for "Limit 7" or returns it.
Monitoring only takes effect when the Layer07Checked property value is set to TRUE.

See also

ScreenItem Object (Page 141)

3D Bar (Page 184)

Layer08Value Property

Description

Determines the value for "Limit 8" or returns it.
Monitoring only takes effect when the Layer08Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer09Value Property

Description

Determines the value for "Limit 9" or returns it.
Monitoring only takes effect when the Layer09Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

Layer10Value Property

Description

Determines the value for "Limit 10" or returns it.
Monitoring only takes effect when the Layer10Checked property value is set to TRUE.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

LayerDeclutteringEnable Property

Description

Returns the LayerDecluttering properties of a picture.

LayerDecluttering enables fading in and out of layers depending on the set minimum and maximum zoom.

BOOLEAN Read-only access.

Example:

The example outputs the LayerDecluttering Property NewPDL1 as a trace.

```
'VBS156
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen Object (Page 146)

Layers Property

Description

Returns an object of type "Layers".

Layers (read-only)

See also

Layers Object (Listing) (Page 137)

HMIRuntime Object (Page 134)

2.4.11.3 Le - Li

Left Property

Description

Defines or returns the X-coordinate of an object (measured from the top left edge of the picture) in pixels. The X-coordinate relates to the top left corner of the rectangle enclosing the object.

LONG (write-read access)

Example:

The following example shifts all objects in the picture "NewPDL1" 5 pixels to the left:

```
'VBS79
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
objScrItem.Left = objScrItem.Left - 5
Next
```

Top Property (Page 627)

ScreenItem Object (Page 141)

LeftComma Property

Description

Defines or returns the number of digits to the left of the decimal point (0 to 20).

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LightEffect Property

Description

TRUE, when the light effect should be activated. BOOLEAN write-read access.

See also

3D Bar (Page 184)

ScreenItem Object (Page 141)

LimitHigh4 Property

Description

Determines the upper limit value for "Reserve 4" or returns it.
The CheckLimitHigh4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh4 property.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LimitHigh5 Property

Description

Determines the upper limit value for "Reserve 5" or returns it.
The CheckLimitHigh5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh5 property.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LimitLow4 Property

Description

Determines the lower limit value for "Reserve 4" or returns it.
The CheckLimitLow4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow4 property.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LimitLow5 Property

Description

Determines the lower limit value for "Reserve 5" or returns it.
The CheckLimitLow5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow5 property.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LimitMax Property

Description

Determines the upper limit value as an absolute value depending on the data format or returns it.
If the displayed value exceeds the upper limit value, it is displayed by a sequence of *** (not displayable).

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

LimitMin Property

Description

Determines the lower limit value as an absolute value depending on the data format or returns it.
If the displayed value exceeds the upper limit value, it is displayed by a sequence of *** (not displayable).

See also

I/O Field (Page 199)

ScreenItem Object (Page 141)

LineColor property

Color of window dividers - LineColor

Specifies the color of the window dividers. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **LineColor**. The data type is LONG.

LineFont Property

Description

TRUE, when the font size should be automatically adapted to the line height. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

LineHeight Property

Description

TRUE, when the line height can be modified. BOOLEAN write-read access.

The "LineHeight" property is only deactivated if both properties "LineHeight" and "LineFont" are set to "FALSE".

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

LineJoinStyle property

Description

Defines the way that corners are displayed in a tube polygon.

Angle	The tubes are joined at corner points without rounding
Round	The tubes are rounded at the outside corner points.

LineTitle Property

Description

TRUE, when the message window a column with consecutive number contains queued messages. BOOLEAN write-read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

LineWidth property (before WinCC V7)

Description

Specifies the line width of the trend referenced by "Index". Value range from 0 to 10.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

LineWidth property

Line weight of window dividers - LineWidth

Defines the line weight of the window dividers in pixels.

The attribute can be assigned dynamic properties by means of the name **LineWidth**. The data type is LONG.

ListType Property

Description

Returns the data type displayed in the case of a text list object. Read only access.

Value range from 0 to 2.

0 = decimal

1 = binary

2 = bit

See also

Text list (Page 211)

ScreenItem Object (Page 141)

2.4.11.4 Lo

LoadDataImmediately property

Load archive data - LoadDataImmediately

Defines whether the tag values for the time range to be displayed are loaded from the archives when the picture is called.

Value	Explanation
TRUE	Loads archived values on picture calls.
FALSE	Loads only current values on picture calls.

The attribute can be assigned dynamic properties by means of the name **LoadDataImmediately**. The data type is BOOLEAN.

LoadDataImmediately property (before WinCC V7)

Description

TRUE, when the tag values for the time range to be displayed are loaded from the archives on opening a picture. BOOLEAN write-read access.

See also

ScreenItem Object (Page 141)

LocaleSpecificSettings Property

Description

TRUE if a font can be assigned and formatted for each Runtime language. BOOLEAN write-read access.

LockBackColor Property

Description

Defines or returns the background color of the button for a locked measuring point. LONG write/read access.
The LockStatus property must be set to TRUE for the background color to be displayed.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

LockStatus Property

Description

TRUE, when a locked measuring point should be displayed. BOOLEAN write-read access.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

LockText Property

Description

Defines the label of a button for a locked measuring point.
The LockStatus property must be set to TRUE for the label to be displayed.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

LockTextColor Property

Description

Defines or returns the color of the button label for a locked measuring point. LONG write/read access.
The LockStatus property must be set to TRUE for the background color to be displayed.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

Logging Property

Description

Returns an object of type "Logging".

Logging (read-only)

See also

HMIRuntime Object (Page 134)

Logging Object (Page 138)

LongStrokesBold Property

Description

TRUE, when the long sections of a scale should be displayed in bold face. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LongStrokesOnly Property

Description

TRUE, when only the long sections of a scale should be displayed . BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LongStrokesSize Property

Description

Defines or returns the length of the axis section in pixels.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LongStrokesTextEach Property

Description

Returns the value which defines which sections of the scale displayed should be labeled (1 = every section, 2 = every second section, etc.). Read only access

See also

Bar (Page 189)

ScreenItem Object (Page 141)

LongTimeArchiveConsistency Property

LongTimeArchiveConsistency

If "LongTimeArchiveConsistency" is set to "No", 1000 messages are displayed in the long-term archive list on the single-user system, server or client for each server, or for each redundant server pair.

If the "LongTimeArchiveConsistency" is set to "yes", the most recent 1000 messages are displayed on the client of all servers or redundant server pair in the long-term archive list.

The attribute can be assigned dynamic properties by means of the name **LongTimeArchiveConsistency** . The data type is BOOLEAN.

LongTimeArchiveConsistency property (before WinCC V7)

Description

If "LongTimeArchiveConsistency" is set to "No", 1000 messages are displayed in the long-term archive list in the single-user system, server or client for each server or for each redundant server pair.

If the "LongTimeArchiveConsistency" is set to "yes", the most recent 1000 messages are displayed on the client of all servers or redundant server pair in the long-term archive list.

Write/Read access.

LowerLimit Property

Description

WinCC Online Trend Control/WinCC Function Trend Control

TRUE, when the "LowerLimitColor" specification is to be used in order to identify the tag values (from a trend referenced via "Index") which lie below the value defined in "LowerLimitValue". BOOLEAN write-read access.

WinCC Online Trend Control

The value of this attribute cannot be changed. Read only access.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

LowerLimitColor Property

Description

WinCC Online Trend Control/WinCC Function Trend Control

Defines the color to be used in order to identify the tag values (from trend referenced via "Index") which lie below the value defined in "LowerLimitValue". Whether the information is evaluated is dependent on the value of the "LowerLimit" property. The color is defined as an RGB value. LONG write-read access.

Online Table Control

The value of this attribute cannot be changed. Read only access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

LowerLimitTagName Property

Description

This defines the lower limit of the trend range, which is automatically taken from the variable properties configured in PCS 7. Write/Read access.

LowerLimitValue Property

Description

WinCC Online Trend Control/WinCC Function Trend Control

Tag values (from a trend referenced via "Index") which lie below the value defined by "LowerLimitValue" are identified by the color specified in "LowerLimitColor". Whether the information is evaluated is dependent on the value of the "LowerLimit" attribute.

Online Table Control

The value of this attribute cannot be changed. Read only access.

See also

2.4.12.2 Me

MeasurePoints Property

Description

The "Index" property references a trend. "MeasurePoints" defines the number of measuring points to be displayed. The information is only evaluated when the "TimeAxis" property is set to the value "-1".

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

MenuToolBarConfig Property

Description

Loads the given configuration file with configured menu and toolbars or returns the name of the configuration file. STRING (write-read access)

See also

Picture Window (Page 194)

HMIRuntime Object (Page 134)

MessageBlockAlign property

Alignment - MessageBlockAlign

Aligns the contents of a selected message block in the table.

To change the alignment, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The following settings are available:

Value	Description	Explanation
0	Left	Aligns the contents of a selected message block to the left.
1	Centered	Aligns the contents of a selected message block to the center.
2	Right	Aligns the contents of a selected message block to the right.

The attribute can be assigned dynamic properties by means of the name **MessageBlockAlign**. The data type is LONG.

MessageBlockAutoPrecisions property

Automatic decimal places - MessageBlockAutoPrecisions

Enables automatic setting of the number of decimal places.

Value	Explanation
TRUE	The number of decimal places is set automatically. The value in the "Decimal places" field is disabled.
FALSE	The value in the "Decimal places" field is enabled.

The attribute can be assigned dynamic properties by means of the name **MessageBlockAutoPrecisions**. The data type is BOOLEAN.

MessageBlockCaption property

Label - MessageBlockCaption

Defines the label of the column title in the message window for the selected message block. The label specified is active in all Runtime languages.

To change the label, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockCaption**. The data type is STRING.

MessageBlockCount property

MessageBlockCount

Defines the number of message blocks which are available for the message list and the hitlist.

The attribute can be assigned dynamic properties by means of the name **MessageBlockCount** . The data type is LONG.

MessageBlockDateFormat property

Date format - MessageBlockDateFormat

Defines the date format for displaying messages.

To change the date format, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **MessageBlockDateFormat**. The data type is STRING.

MessageBlockExponentialFormat property

Exponential notation - MessageBlockExponentialFormat

Specifies the exponential notation for visualization of the values of a selected message block.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The attribute can be assigned dynamic properties by means of the name **MessageBlockExponentialFormat**. The data type is BOOLEAN.

MessageBlockFlashMode property

Flash mode - MessageBlockFlashMode

Specifies how the content of the selected message block flashes in Runtime when a message appears. The "Flashing on" option must be selected.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

Value	Description	Explanation
0	Standard	The text color switches between the standard color and the flash color when flashing
1	Switch background color/text color	The color of the background and the text color switch during flashing. You configure the message colors for the type of message in the alarm logging editor.
2	Switch message color/table color	The message colors and the configured table colors switch during flashing. You configure the message colors for the type of message in the alarm logging editor. Set the table colors in the "Layout" tab in the AlarmControl.

The attribute can be assigned dynamic properties by means of the name **MessageBlockFlashMode**. The data type is LONG.

MessageBlockFlashOn property

Flashing on - MessageBlockFlashOn

Enables flashing of the selected message block in Runtime after a message was activated.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

Value	Explanation
TRUE	Flashing message block content.
FALSE	No flashing message block content.

The attribute can be assigned dynamic properties by means of the name **MessageBlockFlashOn**. The data type is BOOLEAN.

MessageBlockHideText property

Content as text - MessageBlockHideText

Enables the textual display of the content of a selected message block.

Value	Explanation
TRUE	The content is not displayed in text format. The option is disabled.
FALSE	The content is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **MessageBlockHideText**. The data type is BOOLEAN.

MessageBlockHideTitleText property

Title as text - MessageBlockHideTitleText

Enables the display of the header of a selected message block in text format.

Value	Explanation
TRUE	The header is not displayed in text format. The option is disabled.
FALSE	The header is displayed in text format. The option is enabled.

The attribute can be assigned dynamic properties by means of the name **MessageBlockHideTitleText**. The data type is BOOLEAN.

MessageBlockId property

MessageBlockId

Default assignment of the ID number and message block in WinCC AlarmControl.

The attribute can be assigned dynamic properties by means of the name **MessageBlockID**. The data type is LONG.

MessageBlockInvertUseMessageColor property

MessageBlockInvertUseMessageColor

Specifies for the message block whether or not the message colors are displayed, contrary to the central setting for the AlarmControl . For example, the "UseMessageColor" property is set to "FALSE" for the AlarmControl. You have set the "MessageBlockInvertUseMessageColor"

property to "TRUE" for a message block. This causes the message colors to be displayed for this message block in Runtime.

Value	Explanation
TRUE	Contrary to the central setting in "UseMessageColor", the message colors are displayed or not displayed for the message block.
FALSE	Just like the central setting in "UseMessageColor", the message colors are displayed or not displayed for the message block.

The attribute can be assigned dynamic properties by means of the name **MessageBlockInvertUseMessageColor**. The data type is BOOLEAN.

MessageBlockIndex property

MessageBlockIndex

References an existing message block. Using this attribute, you can assign a specific message block values for other attributes.

Values between 0 and "MessageBlockCount" minus 1 are valid for "MessageBlockIndex". Attribute "MessageBlockCount" defines the number of available message blocks.

The attribute can be assigned dynamic properties by means of the name **MessageBlockIndex**. The data type is LONG.

MessageBlockLeadingZeros property

Number of digits - MessageBlockLeadingZeros

Defines the number of leading zeros for the message block content. The maximum number is "11". A "0" value deactivates the "With leading zeros" option.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockLeadingZeros**. The data type is LONG.

MessageBlockLength property

Length in characters - MessageBlockLength

Defines the length of the message block selected based on the number of characters.

To change the length, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockLength**. The data type is LONG.

MessageBlockName property

Object name - MessageBlockName

Displays the object name of the message block selected. You cannot edit this name.

The data type is STRING.

MessageBlockPrecisions property

Decimal places - MessageBlockPrecisions

Specifies the decimal precision of the values of a selected message block. You can only enter the value if the "Automatic" option is disabled.

The attribute can be assigned dynamic properties by means of the name **MessageBlockPrecisions**. The data type is SHORT.

MessageBlockSelected property

Available message blocks - MessageBlockSelected

The available message blocks are blocks that can be used in Runtime for the message list or hitlist.

Select the "Message blocks" tab to activate existing message blocks as required in the Control. Select the "Hitlist" and "Message list" tabs to configure the hitlist and message list based on the available blocks.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockSelected**. The data type is BOOLEAN.

MessageBlockShowDate property

Show date - MessageBlockShowDate

Enables the display of a date in the "Time" message block in addition to the time.

Value	Explanation
TRUE	Date and time are displayed.
FALSE	The time is displayed.

The attribute can be assigned dynamic properties by means of the name **MessageBlockShowDate**. The data type is BOOLEAN.

MessageBlockShowIcon property

Content as icon - MessageBlockShowIcon

Enables the display of the content of a selected message block as icon.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **MessageBlockShowIcon**. The data type is BOOLEAN.

MessageBlockShowTitleIcon property

Title as icon - MessageBlockShowTitleIcon

Enables the display of the title of a selected message block as icon.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **MessageBlockShowTitleIcon**. The data type is BOOLEAN.

MessageBlockTextId property

Text ID - MessageBlockTextId

Specifies the caption of the selected message block using a Text ID which was derived from the text library. The caption is adapted automatically if a user changes the Runtime language.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The attribute can be assigned dynamic properties by means of the name **MessageBlockTextId**. The data type is LONG.

MessageBlockTimeFormat property

MessageBlockTimeFormat

Defines which time format or duration format is used for displaying the messages.

To change the setting, the option "Apply project settings" must be deactivated or "ApplyProjectSettings" must be set to "FALSE".

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss	Hours:Minutes:Seconds, e.g. 15:35:44
HH:mm:ss.ms	Hours:Minutes:Seconds.Milliseconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The following time duration formats are available:

Value	Explanation
Automatic	The time duration format is determined automatically.
d H:mm:ss	Day Hours:Minutes:Seconds, e.g. 1 2:03:55.
H:mm:ss.	Hours:Minutes:Seconds, e.g. 26:03:55.
m:ss	Minutes:Seconds, Example: 1563:55.
s	Seconds, e.g. 93835.

The attribute can be made dynamic by means of the name **MessageBlockTimeFormat**. The data type is STRING.

MessageBlockType property

MessageBlockType

Displays the association of the message block.

The following settings are available:

Value	Description	Explanation
0	System block	The message block belongs to the system block category.
1	Text block	The message block belongs to the user text block category.
2	Process value block	The message block belongs to the process value block category.
3	Hitlist block	The message block belongs to the message blocks of the hitlist.

The attribute can be assigned dynamic properties by means of the name **MessageBlockType** . The data type is LONG.

MessageClass Property

Description

Defines the respective message type (Alarm High, Alarm Low, Warning High, Warning Low, ...) for which the "Display Text", "Arrived-", "Arrived Acknowledged -" and "Departed Unacknowledged -" settings have been configured.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

MessageColumnAdd property

MessageColumnAdd

Adds the selected message block from the list of existing message blocks to the list of selected message blocks.

The attribute can be assigned dynamic properties by means of the name **MessageColumnAdd** . The data type is STRING.

MessageColumnCount property

MessageColumnCount

Specifies the number of message blocks to be displayed in the message list in Runtime.

The attribute can be assigned dynamic properties by means of the name **MessageColumnCount** . The data type is LONG.

MessageColumnIndex property

MessageColumnIndex

References a message block selected for the message list. Using this attribute you can assign the values of other attributes to a specific message block of the message list.

Values between 0 and "MessageColumnCount" minus 1 are valid for "MessageColumnIndex". Attribute "MessageColumnCount" defines the number of message blocks selected for the message list.

The "MessageColumnIndex" attribute can be assigned dynamic properties by means of attribute **MessageColumnRepos**. The data type is LONG.

MessageColumnName property

MessageColumnName

Displays the name of the message block of the message list which is referenced with attribute "MessageColumnIndex". You cannot edit this name.

The attribute can be assigned dynamic properties with the name **MessageColumnName**. The data type is STRING.

MessageColumnRemove property

MessageColumnRemove

Cuts the marked message block from the list of selected message blocks and pastes it to the list of available message blocks.

The attribute can be assigned dynamic properties by means of the name **MessageColumnRemove** . The data type is STRING.

MessageColumnRepos property

Up/Down - MessageColumnRepos/HitlistColumnRepos

Resorts the message blocks. The "Up" and "Down" commands move the selected message block accordingly in the list. This moves the message block in Runtime Control towards the front or towards the back.

The attribute for the hitlist can be assigned dynamic properties by means of the name **HitlistColumnRepos** .

The attribute for the message list can be assigned dynamic properties by means of the name **MessageColumnRepos**.

The data type is LONG.

MessageColumnSort property

MessageColumnSort

Defines the sorting order of the message block referenced in "MessageColumnIndex" .

The following settings are available:

Value	Description	Explanation
0	no	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **MessageColumnSort** . The data type is LONG.

MessageColumnSortIndex property

MessageColumnSortIndex

Defines the sorting order of the message block referenced in "MessageColumnIndex". The sorting criterion is removed from "MessageColumnSort" if you set a "0" value.

The attribute can be assigned dynamic properties by means of the name **MessageColumnSortIndex**. The data type is LONG.

MessageColumnVisible property

Selected message blocks - MessageColumnVisible/HitlistColumnVisible

Selected message blocks of message list or hitlist that are displayed in Runtime. Defines whether the message block referenced in "MessageColumnIndex" or "HitlistColumnIndex" is displayed.

The attribute for the message list can be assigned dynamic properties by means of the name **MessageColumnVisible**.

The attribute for the hitlist can be assigned dynamic properties by means of the name **HitlistColumnVisible**.

The data type is BOOLEAN.

MessageListType property

Active list on picture call - MessageListType

Selection field for defining the active list for picture calls.

Value	Description	Explanation
0	Message list	The currently active messages are displayed after a picture was called.
1	Short-term archive list	A short-term archive list displays the logged messages after the picture was called. The display is updated immediately on activation of new messages.
2	Long-term archive list	A long-term archive list displays the logged messages after a picture was called.
3	Lock list	Only the currently locked messages are displayed after a picture was called.
4	Hitlist	The configured statistics data is displayed after a picture was called.
5	List of messages to be hidden	The messages to be hidden are displayed at the call of a picture.

The attribute can be assigned dynamic properties by means of the name **MessageListType**. The data type is LONG.

2.4.12.3 Mi - Ms

Min Property

Description

Defines or returns the absolute value in the case of the smallest value display. This value is displayed if the scale display is active.

See also

Slider (Page 226)

Bar (Page 189)

3D Bar (Page 184)

ScreenItem Object (Page 141)

MinuteNeedleHeight Property

Description

Defines or returns the length of the minute hand for the analog clock. The specification of the length is entered as a percentage value in relation to half the length of the short side of the rectangular background. Write/Read access.

Example:
The shorter side of the rectangular background is 100 pixels long.
The minute hand length is 80.
This results in a length of the minute hand of (100 pixels / 2) * 0.8 = 40 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

MinuteNeedleWidth Property

Description

Defines or returns the width of the minute hand for the analog clock. The width is specified as a percentage value related to double the length of the minute hand.

Example:
The length of the minute hand is 40 pixels.
The minute hand width is 8.
This results in a width of the minute hand of 40 pixels * 2 * 0.08 = 6 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

Moveable Property

Description

TRUE, when the object can be moved in Runtime. Read only access.

See also

Picture Window (Page 194)

Application Window (Page 188)

ScreenItem Object (Page 141)

Moveable Property

Movable

Defines whether the control can be moved in Runtime.

Value	Explanation
TRUE	The control can be moved in Runtime.
FALSE	The control cannot be moved in Runtime.

The attribute can be assigned dynamic properties by means of the name **Moveable**. The data type is BOOLEAN.

MsgCtrlFlags Property

Description

Defines the sorting sequence in Alarm Control. Write/Read access.

- 0: The entries are sorted by the value in the time column and in ascending order, i.e. the oldest messages are displayed at the top of the message window.
- 1: The entries are sorted by the value in the time column in descending order, i.e. the oldest messages are displayed at the bottom of the message window. In the case of this value, the "AutoScroll" property is automatically deactivated, otherwise the current message could be moved out of the display area of the message window.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

MsgFilterSQL property (before WinCC V7)

Description

Defines an SQL Statement to the selected messages displayed in the message window. Write/ Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

MsgFilterSQL property

MsgFilterSQL

Defines one or several SQL statements for the custom selection of messages. Multiple user-defined selections are logically linked by "OR" operation. The SQL statements of "DefaultMsgFilterSQL" and "MsgFilterSQL" are linked logically by "AND" operation if you define a default selection by means of "DefaultMsgFilterSQL".

The attribute can be assigned dynamic properties by means of the name **MsgFilterSQL**. The data type is STRING.

2.4.13 N

2.4.13.1 Name Property

Description of layer and tag object

Returns the object name. STRING (read only)

- In the case of tags, the name of the tag without server and tag prefix
- In the case of layers, the layer name

Tags

The tag "Name" property is used to address the tag via the tag list. The name of a tag can contain a server prefix. In WinCC, tag names are structured according to the following scheme:

<Serverprefix>::<Variablenprefix><Name der Variable>

If the tag name alone is specified, the server prefix and tag prefix are removed from the context of the picture.

If the tag is specified with a server prefix in the tag name, the tags and server prefix of the context are ignored and the server prefix included is used.

WinCC Function Trend Control Description

The "Index" property references a trend. "Name" defines the name of the trend.

Description Project Object

Returns the name of the current Runtime project. STRING (read only)

Example:

The following example returns the name of the current Runtime project as Trace:

```
'VBS160
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
```

Description of DataItem Object

Returns the name of the DataItem object.

See also

DataItem Object (Page 129)

2.4.13.2 NeedleColor Property

Description

Defines or returns the color of the pointer. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

2.4.13.3 NormalColor Property

Description

Defines the color of the normal area of the scale. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

2.4.13.4 NumberLines Property

Description

Text list

Defines or return the number of lines the text list object should contain. If the amount of configured text is larger than this value, the selection list receives a vertical scroll bar.

Combobox and list box

Defines or returns for the Combobox and List Box objects the number of entries the object should contain. You can define a maximum of 100,000 lines.

At the same time, the value of the "Number of rows" attribute specifies the upper limit value for the "Index" attribute in the "Font" property group. Changing the value can have the following effects:

- Increasing the number: New lines are added at the bottom. The standard labeling of the new filed can be changed using the "Text" attribute in the "Font" property group.
- Reducing the number: All lines are removed for which the value of the "Index" attribute is higher than the new number.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

2.4.13.5 NumItems Property

Description

Returns the number of trends or column pairs (visible and invisible) in the window which have been configured. Write/Read access.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

2.4.14 O

2.4.14.1 Ob - On

Object Property

Description

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property.

Example:

Address the properties of an external control supplier as follows:

Control.object.type

If the following form alone is used

Control.type

the properties of the ScreenItem object are used in the case of identical names.

See also

Controls (Page 232)

ScreenItem Object (Page 141)

ObjectName Property

Description

Returns the object name.

- In the case of graphic objects, the object name
- In the case of pictures, the picture name

STRING (read only)

Example:

The following example issues the names of all the objects contained in the picture "NewPDL1":

```
'VBS80
Dim objScreen
Dim lngIndex
Dim lngAnswer
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
lngAnswer = MsgBox("Name of object " & lngIndex & ": " & strName, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

Pictures

Establish the picture name directly from the "ObjectName" property:

```
'VBS81
MsgBox "Screenname: " & HMIRuntime.ActiveScreen.ObjectName
```

See also

Screen Object (Page 146)

ScreenItem Object (Page 141)

ObjectSizeDeclutteringEnable Property

Description

Returns the ObjectSizeDecluttering properties of a picture.

Upon activated ObjectSizeDecluttering, only objects within a set size range are displayed.

You specify the upper and lower limits for the display range in Graphics Designer under "Tools> Settings > Show/Hide".

BOOLEAN Read-only access.

Example:

The example outputs the Decluttering Properties of the picture NewPDL1 as a trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen Object (Page 146)

ObjectSizeDeclutteringMax Property

Description

Using the ObjectSizeDeclutteringMax property, the upper size range of a picture may be read.

Objects which are larger than the stated pixel size are no longer displayed when ObjectSizeDecluttering is activated.

LONG read-only access.

Example:

The example outputs the Decluttering Properties of the picture NewPDL1 as a trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen Object (Page 146)

ObjectSizeDeclutteringMin Property

Description

Using the ObjectSizeDeclutteringMin property, the lower size range of a picture may be read.

Objects which are smaller than the stated pixel size are no longer displayed when ObjectSizeDecluttering is activated.

LONG read-only access.

Example:

The example outputs the Decluttering Properties of the picture NewPDL1 as a trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

Screen Object (Page 146)

OffsetLeft Property

Description

Defines or returns the distance of the picture from the left edge of the picture window.

The picture is displayed as a cutout of the picture window. The picture scroll bars are located at the left and upper edge of the picture. If you wish to display the picture in the picture window by using the horizontal and vertical positioning of the picture scroll bars, use the properties "ScrollPositionX" and "ScrollPositionY" for such positioning.

ScreenItem Object (Page 141)

OneY Property

Description

TRUE if only the Y-axis of the trend is displayed in the foreground instead of all Y-axes of the displayed trends. BOOLEAN write-read access.

Online property (before WinCC V7)

Description

Serves to start or stop updating.

- 0: The updated display is stopped. The values are buffered and updated when the button is clicked again.
- -1: The updated display is resumed.

Online property

Starting refresh - Online

Enables a refresh of displayed values when calling a picture in Runtime.

Value	Description
TRUE	Enables the refresh of values on picture calls.
FALSE	Disables the refresh of values on picture calls.

The attribute can be assigned dynamic properties by means of the name **Online**. The data type is BOOLEAN.

OnTop Property

Description

TRUE, when the object should remain in the foreground in Runtime. Read only access.

Application Window (Page 188)

ScreenItem Object (Page 141)

2.4.14.2 Op

OperationMessage Property

Description

TRUE, if a message should be output upon successful operation. BOOLEAN Schreib-Lese-Zugriff.
The operation is sent to the message system, and is archived. Using the message system, a message may be output in a message line, for example.

Special features of I/O field, text list and slider

The reason for the operation may only be entered if the "OperationReport" property has been set to TRUE.

Check box (Page 219)

I/O Field (Page 199)

ScreenItem Object (Page 141)

OperatorMessageID property

OperatorMessageID

Default assignment of the ID number and trigger event in WinCC OnlineTableControl:

Value	Description	Explanation
5	EditValue	Trigger event "Change archive value"
6	InsertValue	Trigger event "Generate archive value"

The attribute can be assigned dynamic properties by means of the name **OperatorMessageID**. The data type is LONG.

OperatorMessageIndex property

OperatorMessageIndex

References the event of an archive value change for an operator message. Using this attribute you can assign the values of other attributes to a specific operator message.

The following values are available:

Value	Explanation
0	Trigger event "Change archive value"
1	Trigger event "Generate archive value"

The attribute can be assigned dynamic properties by means of the name **OperatorMessageIndex**. The data type is LONG.

OperatorMessageName property

Object name - OperatorMessageName

Displays the name that is referenced with the attribute "OperatorMessageIndex" for message events for operator messages. You cannot edit this name.

The following names are available for message events:

Value	Explanation
Lock	Message event "Lock"
Unlock	Message event "Enable"
Hide	Message event "Hide"
Unhide	Message event "Unhide"
Quit	Message event "Ackn."

The attribute can be assigned dynamic properties by means of the name **OperatorMessageName** . The data type is STRING.

See also

How to configure operator messages

OperatorMessageNumber property

Message number - OperatorMessageNumber

Define a message number for the selected operator message event if you do not want to use the operator message of WinCC.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageNumber**. The data type is LONG.

OperatorMessageSelected property

Operator messages for - OperatorMessageSelected

Activate the message events which trigger operator messages in the list.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSelected**. The data type is BOOLEAN.

OperatorMessageSource1 property

Source - OperatorMessageSource1

Define the message block of an operated message to be added to "Process value block 1" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 1" of the operator message. Select "1" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource1**. The data type is STRING.

OperatorMessageSource2 property

Source - OperatorMessageSource2

Define the message block of an operated message to be added to "Process value block 2" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 2" of the operator message. Select "2" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource2**. The data type is STRING.

OperatorMessageSource3 property

Source - OperatorMessageSource3

Define the message block of an operated message to be added to "Process value block 3" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 3" of the operator message. Select "3" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource3**. The data type is STRING.

OperatorMessageSource4 property

Source - OperatorMessageSource4

Define the message block of an operated message to be added to "Process value block 4" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 4" of the operator message. Select "4" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource4**. The data type is STRING.

OperatorMessageSource5 property

Source - OperatorMessageSource5

Define the message block of an operated message to be added to "Process value block 5" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 5" of the operator message. Select "5" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource5**. The data type is STRING.

OperatorMessageSource6 property

Source - OperatorMessageSource6

Define the message block of an operated message to be added to "Process value block 6" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 6" of the operator message. Select "6" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource6**. The data type is STRING.

OperatorMessageSource7 property

Source - OperatorMessageSource7

Define the message block of an operated message to be added to "Process value block 7" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 7" of the operator message. Select "7" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource7**. The data type is STRING.

OperatorMessageSource8 property

Source - OperatorMessageSource8

Define the message block of an operated message to be added to "Process value block 8" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 8" of the operator message. Select "8" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource8**. The data type is STRING.

OperatorMessageSource9 property

Source - OperatorMessageSource9

Define the message block of an operated message to be added to "Process value block 9" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 9" of the operator message. Select "9" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource9**. The data type is STRING.

OperatorMessageSource10 property

Source - OperatorMessageSource10

Define the message block of an operated message to be added to "Process value block 10" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The contents of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 10" of the operator message. Select "10" at process value as the message lock of the operated message "User text block 1".

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSource10**. The data type is STRING.

OperatorMessageSourceType1 property

Transfer as - OperatorMessageSourceType1

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType1**. The data type is LONG.

OperatorMessageSourceType2 property

Transfer as - OperatorMessageSourceType2

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType2**. The data type is LONG.

OperatorMessageSourceType3 property

Transfer as - OperatorMessageSourceType3

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType3**. The data type is LONG.

OperatorMessageSourceType4 property

Transfer as - OperatorMessageSourceType4

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType4**. The data type is LONG.

OperatorMessageSourceType5 property

Transfer as - OperatorMessageSourceType5

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType5**. The data type is LONG.

OperatorMessageSourceType6 property

Transfer as - OperatorMessageSourceType6

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType6**. The data type is LONG.

OperatorMessageSourceType7 property

Transfer as - OperatorMessageSourceType7

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType7**. The data type is LONG.

OperatorMessageSourceType8 property

Transfer as - OperatorMessageSourceType8

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType8**. The data type is LONG.

OperatorMessageSourceType9 property

Transfer as - OperatorMessageSourceType9

Defines the format for transferring the source.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source as text.
1	Value	Transfer the source as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType9**. The data type is LONG.

OperatorMessageSourceType10 property

Transfer as - OperatorMessageSourceType10

Specifies the format of the source content for the transfer.

The following formats are available:

Value	Description	Explanation
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

The attribute can be assigned dynamic properties by means of the name **OperatorMessageSourceType10**. The data type is LONG.

OperationReport Property

Description

TRUE, if the reason for an operation should be recorded. BOOLEAN write/read access. When the object is used or operated in Runtime, a dialog opens in which the operator can input the reason for the operation in the form of text. The operation is sent to the message system, and is archived.

I/O Field (Page 199)

ScreenItem Object (Page 141)

OuterBevelStyle Property

Description

Defines the 3D effect for the outer bevel of the object.

- 0: No border.
- 1: The border is displayed depressed.
- 2: The border is displayed raised.
- 3: The border is displayed in one color without a 3D effect. The border color is defined by the "BevelColorUp" property.

See also

2.4.15 P

2.4.15.1 Pa - Pe

PageMode property

Enable paging - PageMode

Enables paging is in the long-term archive list. Allows you to display all messages of the short-term archive in the long-term archive list. Use the "Messages per page" or "PageModeMessageNumber" property to determine the number of messages displayed per page.

The page up/down buttons of the toolbar can be used if paging is enabled.

Value	Explanation
TRUE	Paging is enabled for the long-term archive list.
FALSE	Paging is disabled for the long-term archive list.

The attribute can be assigned dynamic properties by means of the name **PageMode**. The data type is BOOLEAN.

PageModeMessageNumber property

Messages per page - PageModeMessageNumber

Defines the number of messages shown per page when paging the long-term archive list.

The attribute can be assigned dynamic properties by means of the name **PageModeMessageNumber**. The data type is LONG.

Parent Property

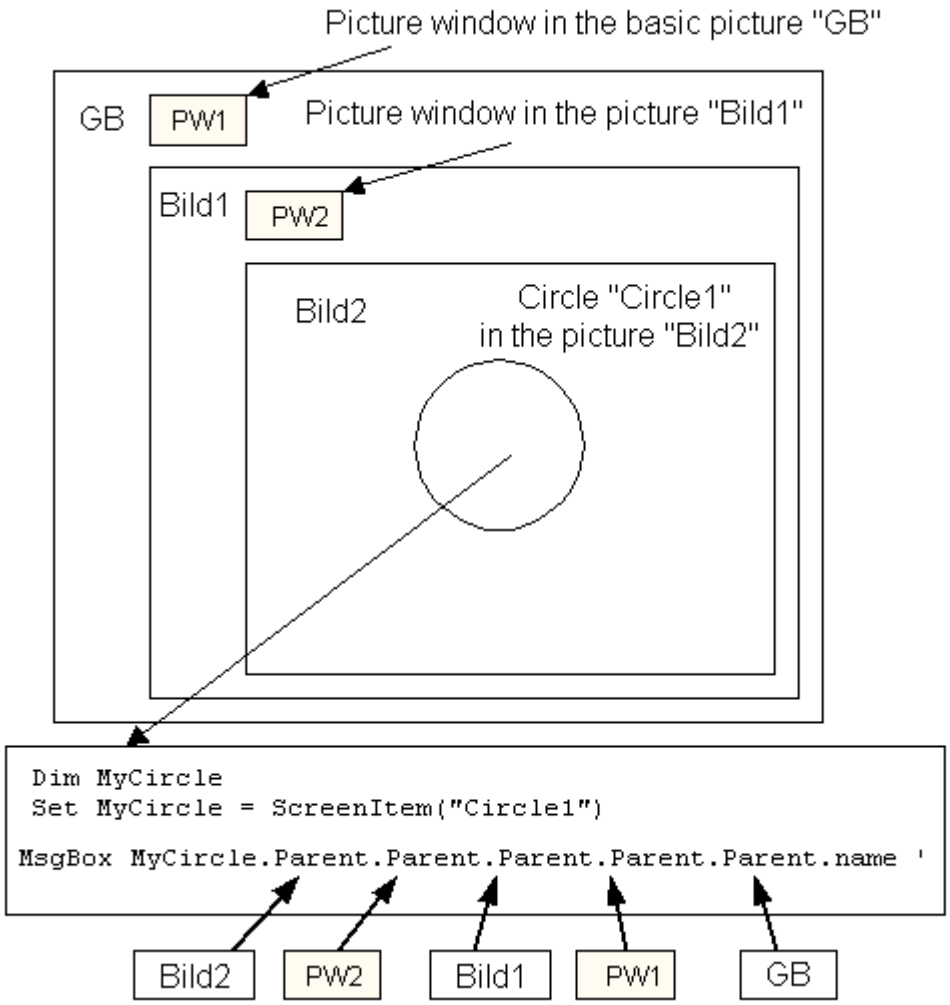
Description

Returns a reference to the superordinate object.

Objects within the VBS object model are accessed by hierarchy. You may descend in the picture hierarchy using Screen and Screenitems. You may ascend in the picture hierarchy by using the Parent property.

Usage

The Parent property can be used as often as required within an object hierarchy. The following section provides a systematic description of how to access all the elements in a hierarchy:



The Command

```
MsgBox MyCircle.Parent.Objectname
```

returns the name of "Picture2" located one layer higher in the object hierarchy than the original ScreenItem object "Circle1".

For example, if you wish to use "Parent" three times, ascend in the object hierarchy by three layers:

```
MsgBox MyCircle.Parent.Parent.Parent.Objectname
```

returns the name of Picture1.

Reasoning:

- Original reference is to ScreenItem "Circle1"
- "Circle1" is within "Picture2" (Layer 1)

- "Picture2" is within Picture Window2 "BF2" (Layer 2)
- "BF2" is within "Picture 1"(Layer 3)

Example

In the following examples, the object name of the parent object is displayed:

```
'VBS120
Dim objCircle
Set objCircle = HMIRuntime.Screens("ScreenWindow1").ScreenItems("Circle1")
MsgBox objCircle.Parent.ObjectName
```

```
'VBS82
Dim objScrItem
Set objScrItem = HMIRuntime.Screens(1).ScreenItems(1)
MsgBox "Name of BaseScreen: " & objScrItem.Parent.ObjectName
```

See also

Picture Window (Page 194)

Screen Object (Page 146)

Objects and Lists (Page 123)

PasswordLevel Property

Description

Defines the authorization for operation (e.g. no input or no triggering actions) of the object.

See also

ScreenItem Object (Page 141)

Path Property

Description

Returns the path of the current project (without file name). For a WinCC client without its own path, the path is returned in UNC format, otherwise the local path is returned.

STRING (read access only)

Example:

The following example returns the project path as Trace:

```
'VBS161
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

Project Object (Page 140)

PercentageAxis property

PercentageAxis

Enables the additional display of an axis with percentage scaling in a trend window for value axes.

Value	Explanation
TRUE	The display of an axis with percentage scaling is enabled.
FALSE	The display of an axis with percentage scaling is disabled.

The attribute can be assigned dynamic properties by means of the name **PercentageAxis**. The data type is BOOLEAN.

PercentageAxisAlign property

PercentageAxisAlign

Enables axis alignment with percentage scaling in the trend window.

The following settings are available:

Value	Description	Explanation
0	left	The axis with percentage scaling is aligned left.
1	right	The axis with percentage scaling is aligned right.

The attribute can be assigned dynamic properties by means of the name **PercentageAxisAlign**. The data type is LONG.

PercentageAxisColor property

PercentageAxisColor

Specifies the color of an axis with percentage scaling. The button opens the "Color selection" dialog to select the color.

The attribute can be assigned dynamic properties by means of the name **PercentageAxisColor**. The data type is LONG.

PersistentRT Property

Description

TRUE, when modified window settings should be retained following a change of picture. Whether the information is evaluated is dependent on the value of the "AllowPersistance" property.

PictureDeactivated Property

Description

Defines the picture to be displayed in the "Disable" status or returns the picture name.
The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

See also

Round Button (Page 223)

ScreenItem Object (Page 141)

PictureDirectory property

Directory for pictures (PictureDirectory)

Specifies the name of the subdirectory that is created in the "GraCS" directory of the WinCC project. If pictures are stored in the subdirectory, they are available for the extended status display. If no subdirectory is specified or the subdirectory does not contain any pictures, the pictures in the "GraCS" directory are taken into consideration.

The "Directory for pictures" attribute can be dynamized with the name "PictureDirectory".

PictureDown Property

Description

Defines the picture to be displayed in the "On" status or returns the picture name.
The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

See also

Button (Page 215)

PictureName Property

Description

Defines the picture to be displayed in the graphic object in Runtime or returns the picture name.

The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

See also

Graphic Object (Page 202)

ScreenItem Object (Page 141)

PictureSelected Property

Description

Returns the picture name of the picture displayed in the "On" status. "AutoSize" controls the adaptation of the size of picture and buttons. Read only access.

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

PictureSizeMode property

PictureSizeMode

Specifies the size adjustment between picture and control.

Value	Designation	Explanation
0	Fit size to content	The control is adapted to the picture size.
1	Fit content to size	The picture is adapted or scaled to the control.

The attribute can be assigned dynamic properties by means of the name **PictureSizeMode**. The data type is LONG.

PictureThumb Property

Description

Returns the picture name of the background picture for the slider. Read only access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

PictureUnselected Property

Description

Returns the picture name of the picture displayed in the "Off" status. "AutoSize" controls the adaptation of the size of picture and buttons. Read only access.

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

PictureUp Property

Description

Defines the picture to be displayed in the "Off" status or returns the picture name.
The picture (*.BMP or *.DIB) must be located in the "GraCS" directory of the current project so that it can be integrated.

PredefinedAngles Property

Description

Defines or returns the depth of the display of the 3DBarGraph object. Value range from 0 to 3.

0 = cavalier

1 = isometric

2 = axionometric

3 = freely defined

See also

ScreenItem Object (Page 141)

3D Bar (Page 184)

PreferredTarget property

Preferred picture target (PreferredTarget)

The "Preferred picture target" attribute specifies where the picture change is carried out by the Favorites browser.

Yes	The picture change is carried out in this picture screen. In the case of nested picture screens the picture change is carried out at the innermost picture screen with the "Yes" setting.
No	The picture change is carried out in the main screen.

The "Preferred picture target" attribute can be made dynamic with the name "PreferredTarget".

Pressed Property

Description

TRUE, when the Button or RoundButton object is pressed. BOOLEAN write-read access.

See also

Round Button (Page 223)

ScreenItem Object (Page 141)

PrintBackgroundColor Property

Description

TRUE, if the defined background color is also printed while printing the controls. BOOLEAN write-read access.

PrintJob Property

Description

Defines or reads out which print layout should be used for the printed output.

See also

2.4.16 Q

2.4.16.1 QualityCode Property

Description

Defines a standard for the quality of a tag value after being read. The quality code is provided as a 16-bit value for automatic evaluation. After a tag has been written, the value is invalid.

SHORT (read only)

Note

A summary of possible Quality Codes is provided in the WinCC Information System under the heading "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

Example:

The following example indicates the quality of the read value when no errors have occurred during the reading process:

```
'VBS83
Dim objTag
Dim lngLastErr
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
```

```
lngLastErr = objTag.LastError
If 0 = lngLastErr Then
MsgBox objTag.QualityCode

Defines or returns the horizontal radius in pixels (0 to 5000).

See also

Ellipse segment (Page 162)

Ellipse arc (Page 161)

Ellipse (Page 159)

ScreenItem Object (Page 141)

RangeMax Property

Description

Defines the maximum absolute value for the value display.

If the "WithLabels" property has the value -1 (yes), this value is displayed on the scale.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

RangeMin Property

Description

Defines the minimum absolute value for the value display.

If the "WithLabels" property has the value -1 (yes), this value is displayed on the scale.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

Rectangular Property

Description

Defines or returns the side ratio of the rectangular background of the gauge. BOOLEAN write-read access.

FALSE : The size of the gauge can be adjusted to any side ratio by dragging the marking points with the mouse.

TRUE : The size of the gauge can only be adjusted by dragging the marking points with the mouse. The side ratio of the background always remains 1:1.

See also

ScreenItem Object (Page 141)

WinCC Gauge Control (Page 264)

ReferenceRotationLeft Property

Description

Defines or returns the X-coordinate of the reference point about which the object should be rotated in Runtime.
The value of the x coordinate is relative to the object width. Enter the value in percent starting from the left edge of the rectangle enclosing the object.

See also

Line (Page 169)

Polyline (Page 173)

Polygon (Page 171)

ScreenItem Object (Page 141)

2.4.17.2 Ro - Ru

Rotation property

Rotation (Rotation)

Specifies anticlockwise rotation around the icon center.

The following settings are available:

Value	Comments
0	The icon is not rotated.
90	The icon is rotated by 90 degrees.
180	The icon is rotated by 180 degrees.
270	The icon is rotated by 270 degrees.

The attribute can be assigned dynamic properties by means of the name **Rotation**. The data type is LONG.

RotationAngle Property

Description

Standard objects

Defines or returns the rotation angle in degrees.

In Runtime, the object (starting from the configured starting position) is displayed rotated clockwise around the reference point by the specified value. The changed orientation of the object is only visible in Runtime.

The coordinates of the reference point are defined with the "Rotation Reference X" and "Rotation Reference Y" attributes.

T-piece

Defines or returns the orientation of a T-piece in degrees.

The attribute can assume one of four values. If you enter another value, it is automatically converted to modulus 360 and rounded up or down to the closest permissible value.

The orientation is produced by rotating the T-piece clockwise around the center point by the specified number of degrees.

0 The standard position of the T-piece is the shape of the letter "T"
90 The "leg" of the "T" points towards the left
180 The "leg" of the "T" points upwards
270 The "leg" of the "T" points to the right

ScreenItem Object (Page 141)

RowCellCount property

RowCellCount

Specifies the number of cells of the Row object of a Table Control. The number of cells corresponds to the number of columns.

RowCellText property

RowCellText

Returns the contents of a cell as a string. The cell is determined from the column number of the Row object. Numbering runs from "1" to "CellCount".

RowCount property

RowCount

Specifies the number of rows of the Row object of a Table Control.

RowNumber property

RowNumber

Specifies the row number of the Row object of a Table Control.

RowScrollbar property

Row scroll bars - RowScrollbar

Enables the display of row scroll bars.

The following settings are available:

Value	Description	Explanation
0	No	No row scroll bars.
1	as required	Row scroll bars are displayed if horizontal space requirements of the control are greater than the actually available display area.
2	always	Row scroll bars are always displayed.

The attribute can be assigned dynamic properties by means of the name **RowScrollbar**. The data type is LONG.

RowTitleAlign property

Row label alignment - RowTitleAlign

Specifies the type of row label alignment.

The following settings are available:

Value	Description	Explanation
0	left	The row headers are aligned left.
1	centered	The row headers are aligned to center.
2	right	The row headers are aligned right.

The attribute can be assigned dynamic properties by means of the name **RowTitleAlign**. The data type is LONG.

RowTitles property

Show row labels - RowTitles

Enables the display of row labels.

Value	Explanation
TRUE	The row labels are displayed.
FALSE	The row labels are not displayed.

The attribute can be assigned dynamic properties by means of the name **RowTitles**. The data type is BOOLEAN.

RTPersistence property

Online configuration at the next picture change - RTPersistence

Enables retention of the online configurations of the control after a picture change.

The following settings are available:

Value	Description	Explanation
0	Discard	The current online configurations are discarded at the next picture change.
1	Retain	The current online configurations are retained at the next picture change.
2	Reset	All online configurations made are lost. The picture is set to the contents found in the configuration system.

The attribute can be assigned dynamic properties by means of the name **RTPersistence**. The data type is LONG.

RTPersistencePasswordLevel property

Operator authorization for online configuration - RTPersistencePasswordLevel

Displays the authorization for online configuration. You can edit the authorization using the selection button. Authorizations are configured in the "User Administrator" editor.

The attribute can be assigned dynamic properties by means of the name **RTPersistencePasswordLevel** . The data type is LONG.

RTPersistenceType property

Online configuration - RTPersistenceType

Defines how to retain online configurations of WinCC.

The following settings are available:

Value	Description	Explanation
0	Do not retain	Online configurations are not retained. These are lost at the next picture change.
1	Retain during runtime	Online configurations are retained during runtime. These are lost on exiting.
2	Retain permanently	Online configurations are retained permanently. These are also available after restart.

The attribute cannot be dynamized.

RulerFont Property

Description

This attribute defines the font of the table of the tag values, which is displayed by the key function "Display value at this position" / "Ruler". Write/Read access.

RulerPrecisions Property

Description

Defines the number of decimal places to which a measured value should be displayed when it is determined using the "Display value at this position" function.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

RulerPrecisionX Property

Description

Defines the number of decimal places used by the "Display value at this position" to display the X-coordinate of a measured value. Whether the information is evaluated is dependent on the value of the "TimeAxisX" attribute.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

RulerPrecisionY Property

Description

Defines the number of decimal places used by the "Display value at this position" to display the Y-coordinate of a measured value.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

RulerType property

Window - RulerType

Specifies window to be displayed during runtime. Depending on the window type, only certain blocks can be used as columns of the WinCC RulerControl.

The following window types can be selected:

Value	Description	Explanation
0	"Ruler" window	The ruler window shows the coordinate values of the trends on a ruler or values of a selected row in the table.
1	"Statistics area" window	The statistics area window shows the values of the low and high limit of trends between two rulers, or displays the selected range in the table.
2	"Statistics" window	The statistics window shows the statistic evaluation of trends between two rulers, or it displays the selected values in the table.

The attribute can be assigned dynamic properties by means of the name **RulerType**. The data type is LONG.

2.4.18 S

2.4.18.1 Sa - Sc

SameSize Property

Description

TRUE, when all four buttons of a Group Display object have the same size. BOOLEAN write-read access.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

SavedTrend Property

Description

Displays the name of the last saved trend that was exported in WinCC Online Trend Control using the Save Report button. Read only access.

ScaleColor Property

Description

Defines or returns the color of the scale. LONG write-read access.
The "Scaling" property must be set to TRUE for the color to be displayed.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ScaleTicks Property

Description

Defines the number of segments into which the bar will be subdivided by large tick marks of the scale:
0-100: Object can be divided into a maximum of 100 segments
= 0: The optimum number of segments is set automatically.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

Scaling Property

Description

TRUE, when a scale should also be used to represent a value. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

ScalingType Property

Description of Bar Scaling

Defines or returns the type of bar scaling. Value range from 0 to 6.

0 = linear

1 = logarithmic

2 = negative logarithmic

3 = automatic (linear)

4 = tangent

5 = square

6 = cubic

The "Scaling" property must be set to TRUE for the color to be displayed.

Description of Online Trend Control

Specifies or returns the type of scaling for a trend referenced by "Index". Value range from 0 to 2.

0 = linear

1 = logarithmic

2 = negative logarithmic

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

Bar (Page 189)

ScreenItem Object (Page 141)

ScalingTypeX Property

Description

Defines the type of scaling of the X-axis of a trend referenced with "Index". Whether the information is evaluated is dependent on the value of the "TimeAxisX" attribute.

0: Linear

-1: Logarithmically. This setting prevents the display of negative values.

-2: Logarithmically negated. This setting prevents the display of positive values.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ScalingTypeY Property

Description

Defines the type of scaling of the Y-axis of a trend referenced with "Index".

0: Linear

-1: Logarithmically. This setting prevents the display of negative values.

-2: Logarithmically negated. This setting prevents the display of positive values.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ScreenName Property

Description

Defines the picture to be displayed in the picture window in Runtime or returns the picture name.

Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

Screens Property

Description

Returns an object of type "Screens".

Screens (read only)

Example:

The following example accesses the picture "NewPDL1":

```
'VBS84
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
```

See also

Screens Object (List) (Page 149)

Screen Object (Page 146)

HMIRuntime Object (Page 134)

ScreenItems Property

Description

Returns an object of type "ScreenItems".

ScreenItems (read only)

Example:

The following example issues the number of all the objects contained in the picture "NewPDL1":

```
'VBS85
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
Msgbox objScreen.ScreenItems.Count
```

See also

ScreenItems Object (List) (Page 144)

HMIRuntime Object (Page 134)

ScrollBars Property

Description

TRUE, when the object is equipped with a scroll bar in Runtime. Read only access.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

ScrollPositionX Property

Description

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

See also

ScreenItem Object (Page 141)

OffsetTop Property (Page 501)

OffsetLeft Property (Page 500)

Picture Window (Page 194)

ScrollPositionY Property

Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

OffsetTop Property (Page 501)

OffsetLeft Property (Page 500)

Picture Window (Page 194)

ScreenItem Object (Page 141)

2.4.18.2 Se

SecondNeedleHeight Property

Description

Defines or returns the length of the second hand for the analog clock. The specification of the length is entered as a percentage value in relation to half the length of the short side of the rectangular background. Write/Read access.

Example:
The shorter side of the rectangular background is 100 pixels long.
The second hand length is 80.
This results in a length of the second hand of (100 pixels / 2) * 0.8 = 40 pixels.

See also

ScreenItem Object (Page 141)

WinCC Digital/Analog Clock (Page 258)

SecondNeedleWidth Property

Description

Defines or returns the width of the second hand for the analog clock. The width is specified as a percentage value related to double the length of the second hand. Write/Read access.

Example:
The length of the second hand is 40 pixels.
The second hand width is 2.
This results in a width of the second hand of 40 pixels * 2 * 0.02 = 2 pixels.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

SelBGColor Property

Description

Defines or returns the background color of the selected entry in a text list object. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

SelectArchiveName property

SelectArchiveName

Opens the dialog for selecting the user archive.

Programmers can set this attribute to allow users to select a user archive by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **SelectArchiveName**. The data type is BOOLEAN.

SelectedCellColor property

Background color of selected cell - SelectedCellColor

Specifies the background color of a selected cell. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectedCellColor**. The data type is LONG.

SelectedCellForeColor property

Font color of the selected cell - SelectedCellForeColor

Specifies the font color of the selected cell. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectedCellForeColor**. The data type is LONG.

SelectedRowColor property

Background color of the selected row - SelectedRowColor

Specifies the background color of the selected line. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectedRowColor**. The data type is LONG.

SelectedRowForeColor property

Font color of the selected row - SelectedRowForeColor

Specifies the font color of the selected row. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectedRowForeColor**. The data type is LONG.

SelectedTitleColor property

Background selection color - SelectedTitleColor

Specifies the background color of a selected table header. The button opens the "Color selection" dialog.

The setting is only active in Runtime if the "Selection color" or "UseSelectedTitleColor" option is activated.

The attribute can be assigned dynamic properties by means of the name **SelectedTitleColor**. The data type is LONG.

SelectedTitleForeColor property

Font selection color - SelectedTitleForeColor

Specifies the font color of the table header selected. The button opens the "Color selection" dialog.

The setting is only active in Runtime if the "Selection color" or "UseSelectedTitleColor" option is activated.

The attribute can be assigned dynamic properties by means of the name **SelectedTitleForeColor**. The data type is LONG.

SelectedTrend Property

Description

This property brings a trend to the foreground via its name. Write/Read access.

SelectionColoring property

Selection colors for - SelectionColoring

Enables the use of selection colors for cells or rows.

The following settings are available:

Value	Description	Explanation
0	None	No selection colors for cells and rows.
1	Cell	Selection color for cell.
2	Row	Selection color for row.
3	Cell and row	Selection colors for cell and row.

The attribute can be assigned dynamic properties by means of the name **SelectionColoring**. The data type is LONG.

SelectionMode Property

Description

Defines whether and how a message line can be selected.

- 0 - NoSelection: Prevents the selection of a message. Acknowledgement affects the oldest pending message.
- 1 - Cell: Enables the selection of fields in the message line. Acknowledgement affects the selected message.
- 2 - Line: Enables the selection of a message line. Acknowledgement affects the selected message.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

SelectionRect property

Selection border- SelectionRect

Enables the use of a selection border for selected cells or rows.

The following settings are available:

Value	Description	Explanation
0	None	No selection border is drawn for selected cells or rows.
1	Cell	A selection border is drawn for the selected cell.
2	Row	A selection border is drawn for the selected row.

The attribute can be assigned dynamic properties by means of the name **SelectionRect**. The data type is LONG.

SelectionRectColor property (before WinCC V7)

Description

Specifies the color of the rectangle in the message window if SelectionType equals "1".

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

SelectionRectColor property

Color of the selection border - SelectionRectColor

Specifies the color of the selection border. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **SelectionRectColor**. The data type is LONG.

SelectionRectWidth property (before WinCC V7)

Description

Specifies the line weight of the rectangle in the message window if SelectionType equals "1".

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

SelectionRectWidth property

Line weight of the selection border - SelectionRectWidth

Defines the line weight of the selection border in pixels.

The attribute can be assigned dynamic properties by means of the name **SelectionRectWidth**. The data type is LONG.

SelectionType property (before WinCC V7)

Description

Specifies if the selected message in the message window should be optically emphasized by color change or rectangle.

- 0 - Color Change: selected message is optically emphasized by color change
- 1 - Rectangle: selected message is optically emphasized by a rectangle

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

SelectionType property

Selectable rows - SelectionType

Defines the number of lines you can select. The following settings are available:

Value	Description	Explanation
0	None	No row selection.
1	Single selection	One row can be selected.
2	Multiple selection	Multiple rows can be selected.

The attribute can be assigned dynamic properties by means of the name **SelectionType**. The data type is LONG.

SelIndex property

Description

Defines and returns the index of which the associated text is highlighted in the combobox or list box.

The maximum value is the number of lines (NumberLines) of the object.

SelText property

Description

Shows the text defined with the "Selected field" (SelIndex) attribute which is highlighted in the combobox or list box.

SelTextColor Property

Description

Defines or returns the color of the text of the selected entry in the text list object. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

ServerData Property

Description

The attribute can only be modified using the "Properties of WinCC Online Trend Control" dialog. Read only access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

ServerDataX

ServerDataX

Accesses the configured data connection for the X axis with WinCC FunctionTrendControl.

The attribute can be assigned dynamic properties by means of the name **ServerDataX**. The data type is LONG.

Example: Editing the start ID

You may use the **ServerDataX** attribute to edit the start ID of the X axis.

Prerequisite is that you have an existing trend and trend view, configured X and Y axes, as well as a data connection to the user archive.

In the following example you employ the GetTrend method to set a reference to the object in step one, and then to the trend used in step two. Determine the data connection settings in the third step. Set the start ID to 4 in step 4. The number (3) represents the listing type "user archive" for data transfer. Change the modified data connection settings in step five:

```
Sub OnCklick(ByVal Item)
```

1. Step:
```
   Dim fx_ctrl
   Set fx_ctrl  ScreenItems.Item("Control1")
```
2. Step:
```
   Dim fx_trend
   Set fx_trend = fx_ctrl.Getrend("myTrend1")
```
3. Step:
```
   Dim vServerDataX, vServerDataY
   vServerDataX = fx_trend.ServerDataX
   vServerDataY = fx_trend.ServerDataY
```
4. Step:
```
   Dim startId
   startId = CLng(4)
   vServerDataX(3) = startId
   vServerDataY(3) = startId
```
5. Step:
```
   fx_trend.ServerDataX = ServerDataX
   fx_trend.ServerDataY = ServerDataY
```

```
End Sub
```

ServerDataY

ServerDataY

Accesses the configured data connection for the Y axis with WinCC FunctionTrendControl.

The attribute can be assigned dynamic properties by means of the name **ServerDataY**. The data type is LONG.

Example: Editing the start ID

You may use the **ServerDataY** attribute to edit the start ID of the Y axis.

Prerequisite is that you have an existing trend and trend view, configured X and Y axes, as well as a data connection to the user archive.

In the following example you employ the GetTrend method to set a reference to the object and then to the trend used. Determine the data connection settings in the third step. Set the start ID to 4 in step 4. The number (3) represents the listing type "user archive" for data transfer. Change the modified data connection settings in step five:

```
Sub OnCklick(ByVal Item)
```

1. Step:
   ```
   Dim fx_ctrlSet fx_ctrl  ScreenItems.Item("Control1")
   ```
2. Step:
   ```
   Dim fx_trendSet fx_trend = fx_ctrl.Getrend("myTrend1")
   ```
3. Step:
   ```
   Dim vServerDataX, vServerDataYvServerDataX =
   fx_trend.ServerDataXvServerDataY = fx_trend.ServerDataY
   ```
4. Step:
   ```
   Dim startIdstartId = CLng(4)vServerDataX(3) =
   startIdvServerDataY(3) = startId
   ```
5. Step:
   ```
   fx_trend.ServerDataX = ServerDataXfx_trend.ServerDataY =
   ServerDataY
   ```

```
End Sub
```

ServerNames property

Server selection - ServerNames

Defines from which servers within a distributed system the message window obtains the display data.

The attribute can be assigned dynamic properties by means of the name **ServerNames**. The data type is STRING.

ServerNames property (before WinCC V7)

Description

Defines the server in a distributed system to which the data in the message window should relate. Servers are specified as follows: NameServer1;NameServer2;NameServer3. Write/ Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

ServerPrefix Property

Description

Defines the server containing the picture to be displayed in the picture window in Runtime or returns the server name.
Enter the server name followed by two colons: "<Servername>::". No check is made as to whether the server actually exists.

ShareSpaceWithSourceControl property

ShareSpaceWithSourceControl

Defines whether the size of the source control in the picture window is adapted so that the WinCC RulerControl is also displayed in a small picture window.

Value	Explanation
TRUE	The source control in the picture window is adapted.
FALSE	The source control in the picture window is not adapted.

The attribute can be assigned dynamic properties by means of the name **ShareSpaceWithSourceControl**. The data type is BOOLEAN.

ShowBar Property

Description

TRUE, when the bar should be displayed. BOOLEAN write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

ShowDanger Property

Description

Controls the display of the "danger zone" on the instrument scale. BOOLEAN write-read access.

TRUE : The area is identified by the color defined in "DangerColor".

FALSE : The color identification of the area is switched off.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ShowDecimalPoint Property

Description

TRUE, when the labeling of the scale section should be with decimal numbers (decimal point and one decimal place).

FALSE, when the labeling of the scale section should be with whole numbers.

BOOLEAN write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ShowNormal Property

Description

Controls the display of the "normal zone" on the instrument scale. BOOLEAN write-read access.

TRUE : The area is identified by the color defined for normal color.

FALSE : The color identification of the area is switched off.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ShowRuler property

Show ruler - ShowRuler

Enables the display of a ruler for scanning the coordinate points on picture calls.

Value	Explanation
TRUE	Enables the display of a ruler for scanning the coordinate points.
FALSE	Disables the display of a ruler for scanning the coordinate points.

The attribute can be assigned dynamic properties by means of the name **ShowRuler**. The data type is BOOLEAN.

ShowRulerImmediately Property

Description

TRUE, when the ruler for determining the coordinate values should be displayed when opening a picture. BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

ShowRulerInAxis property

ShowRulerInAxis

Enables the display of rulers in the time axis.

Value	Explanation
TRUE	Enables the display of rulers in the time axes.
FALSE	Disables the display of rulers in the time axes.

The attribute can be assigned dynamic properties by means of the name **ShowRulerInAxis**. The data type is BOOLEAN.

ShowScrollbars property

Scroll bars - ShowScrollbars

Enables the display of scroll bars.

The following settings are available:

Value	Description	Explanation
0	No	The display of scroll bars is disabled.
1	as required	Scroll bars are displayed if space requirements of the control are greater than the actual display area.
2	always	The scroll bars are always displayed.

The attribute can be assigned dynamic properties by means of the name **ShowScrollbars**. The data type is LONG.

ShowSlider property

ShowSlider

Specifies if a time slider is displayed in the control.

The attribute can be assigned dynamic properties by means of the name **ShowSlider**. The data type is BOOLEAN.

ShowSortButton property

Use sorting button - ShowSortButton

Enables the display of a sorting button above the vertical scroll bar. Click this sorting button to sort the selected column based on the configured sorting criteria. The sorting button is not displayed if the table does not contain a vertical scroll bar.

Value	Explanation
TRUE	Enables sorting of a selected column by means of sorting button.
FALSE	The sorting button is not displayed.

The attribute can be assigned dynamic properties by means of the name **ShowSortButton** . The data type is BOOLEAN.

ShowSortIcon property

Show sorting icon - ShowSortIcon

Enables the display of the sorting icon.

Value	Explanation
TRUE	Enables the display of the sorting icon.
FALSE	Disables the display of the sorting icon.

The attribute can be assigned dynamic properties by means of the name **ShowSortIcon**. The data type is BOOLEAN.

ShowSortIndex property

Show sorting index - ShowSortIndex

Enables the display of a sorting icon.

Value	Explanation
TRUE	Enables the display of a sorting index.
FALSE	Disables the display of a sorting index.

The attribute can be assigned dynamic properties by means of the name **ShowSortIndex**. The data type is BOOLEAN.

ShowSpanNames Property

Description

TRUE, if a section name is also to be displayed in the Value column of Trend Control apart from the measured value and the status display "i" and "u". BOOLEAN write-read access.

ShowStatisticRuler property

ShowStatisticRuler

Enables the display of rulers in the statistics field on picture calls.

Value	Explanation
TRUE	Enables the display of rulers in the statistics field.
FALSE	Disables the display of rulers in the statistics field.

The attribute can be assigned dynamic properties by means of the name **ShowStatisticRuler**. The data type is BOOLEAN.

ShowThumb Property

Description

TRUE, when the slider is to be displayed. BOOLEAN write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

ShowTitle property

Window title - ShowTitle

Defines representation the Control window header.

Value	Designation	Explanation
0	No	No window title.
1	Normal	The window title consists of a WinCC icon and text. The text is entered in the "Text" field.
2	Narrow	The window title consists only of text. The text is entered in the "Text" field.

The attribute can be assigned dynamic properties by means of the name **ShowTitle**. The data type is LONG.

ShowToolbar property

ShowToolbar

Specifies if a toolbar is displayed in the control.

The attribute can be assigned dynamic properties by means of the name **ShowToolbar**. The data type is BOOLEAN.

ShowTrendIcon property

ShowTrendIcon

Enables the display of an icon below the value axes. The icon indicates the trend currently displayed in the foreground.

The attribute can be assigned dynamic properties by means of the name **ShowTrendIcon**. The data type is BOOLEAN.

ShowValuesExponentialX Property

Description

TRUE, when the X-coordinate of a measured value determined via the "Display value at this position" function is displayed in exponential notation by a trend referenced via "Index". Whether the information is evaluated is dependent on the value of the "TimeAxisX" property. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ShowWarning Property

Description

Controls the display of the "warning zone" on the instrument scale. BOOLEAN write-read access.

TRUE : The area is identified by the color defined by the warning color attribute.

FALSE : The color identification of the area is switched off.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

SignificantMask Property

Description

Is required in Runtime to display the active message class with the highest priority.
The value of the SignificantMask property represents an internal system output value does not require any specific configuration by the user. Updating is initiated in Runtime by clicking on the object.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

Sizeable property

Sizeable

Enables resizing of the control during runtime.

Value	Explanation
TRUE	The control can be resized during runtime.
FALSE	The control cannot be resized during runtime.

The attribute can be assigned dynamic properties by means of the name **Sizeable**. The data type is BOOLEAN.

SkinName property

Style - SkinName

The control style can be defined in this selection field.

The following settings are available:

Value	Designation	Explanation
	Project setting	The style corresponds to the project settings in WinCC Explorer.
0	Simple	"Classic" WinCC style
1	Standard	New WinCC V7 style
	Basic Process Control	The style is reserved for internal use with Basic Process Control.

The attribute can be assigned dynamic properties by means of the name **SkinName**. The data type is STRING.

2.4.18.4 Sm - Sq

SmallChange Property

Description

Defines how many steps the controller can be moved with one mouse click or returns the value.

See also

Slider (Page 226)

ScreenItem Object (Page 141)

SmartTag property

Description

Returns an object of type "SmartTag".

See also

SmartTags Object (Page 151)

SortOrder Property

Description

Defines the sort sequence of the message blocks in the message window.

SortSequence property

Sorting order by mouse click - SortSequence

Specifies how to change the sorting order by mouse click.

The following sorting orders are available:

Value	Description	Explanation
0	Up/down/none	You can toggle between ascending, descending and no sorting by means of mouse click.
1	Up/down	You can toggle between ascending and descending sorting order by means of mouse click.

The attribute can be assigned dynamic properties by means of the name **SortSequence**. The data type is LONG.

SourceBeginTime Property

Description

In the case of online tags and archive tags ("ProviderType" = -1), it defines the starting time of the time range of a trend referenced via "Index" and to be displayed in the trend window. In the case of modification of "SourceBeginTime", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceBeginTime", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceControl property

Source - SourceControl

Defines the control to be interconnected with WinCC RulerControl.

The attribute can be assigned dynamic properties by means of the name **SourceControl**. The data type is STRING.

SouceControlType property

Type - SourceControlType

Defines the type of control that is interconnected with the WinCC RulerControl in the "Source" field.

Value	Designation	Explanation
0	None	The RulerControl is not connected to any source.
1	OnlineTrend Control	The RulerControl is connected with an OnlineTrendControl.
2	OnlineTable Control	The RulerControl is connected with an OnlineTableControl.
3	FunctionTrend Control	The RulerControl is connected with a FunctionTrendControl.

The attribute can be assigned dynamic properties by means of the name **SourceControlType**. The data type is LONG.

SourceEndTime Property

Description

In the case of online tags and archive tags ("ProviderType" = -1), it defines the stopping time of the time range of a trend referenced via "Index" and to be displayed in the trend window. In the case of modification of "SourceEndTime", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceEndTime", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceNumberOfUAValues Property

Description

For values from the user archives ("ProviderType" = -2) it defines the number of values which should be loaded from the user archive for a trend referenced via "Index". In the case of modification of "SourceNumberOfUAValues", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceNumberOfUAValues", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceNumberOfValues Property

Description

The "Index" property references a trend. In the case of online tags and archive tags ("ProviderType" = -1), "SourceNumberOfValues" defines the number of values which should be displayed in the trend window. Whether the information is evaluated is dependent on the value of the "SourceTimeRange" property.

In the case of modification of "SourceNumberOfValues", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceNumberOfValues", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTagNameX Property

Description

The "Index" property references a trend. In the case of online tags and archive tags ("ProviderType" = -1) "SourceTagNameX" defines the tag which should be displayed along the X-axis. In the case of modification of "SourceTagNameX", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceTagNameX", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTagNameY Property

Description

The "Index" property references a trend. In the case of online tags and archive tags ("ProviderType" = -1) "SourceTagNameY" defines the tag which should be displayed along the X-axis. In the case of modification of "SourceTagNameY", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceTagNameY", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

SourceTagProviderDataX Property

Description

The attribute can only be modified using the "Properties of WinCC Function Trend Control" dialog.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTagProviderDataY Property

Description

The attribute can only be modified using the "Properties of WinCC Function Trend Control" dialog.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

SourceTimeRange Property

Description

The "Index" property references a trend. In the case of online tags and archive tags ("ProviderType" = -1) "SourceTimeRange" defines how the time range to be displayed in the trend window is defined. In the case of modification of "SourceTimeRange", impermissible combinations with other attributes for data connection could be created. Therefore, before modifying "SourceTimeRange", the immediate acceptance of the changes must be prevented using "FreezeProviderConnections".

0: The time range to be displayed is defined by the starting time (SourceBeginTime) and the number of value pairs (SourceNumberOfValues).

-1: The time range to be displayed is defined by the starting time (SourceBeginTime) and stopping time (SourceEndTime).

See also

ScreenItem Object (Page 141)

StatusbarBackColor property

Background color - StatusbarBackColor

Defines the background color of the status bar. The button opens the "Color selection" dialog to select the color.

For the setting to become active, the "Display" or "StatusbarUseBackColor" option must be activated.

The attribute can be assigned dynamic properties by means of the name **StatusbarBackColor**. The data type is LONG.

StatusbarElementAdd property

New - StatusbarElementAdd

Defines a new, user-defined status bar element. The name set by WinCC can be edited in the "Object name" field.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementAdd** . The data type is STRING.

StatusbarElementAutoSize property

Automatic - StatusbarElementAutoSize

Enables autosizing of the width of a status bar element selected.

Value	Explanation
TRUE	The width of the selected element is set automatically.
FALSE	The width of the selected element is not set automatically.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementAutoSize**. The data type is BOOLEAN.

StatusbarElementCount property

StatusbarElementCount

Defines the number of configurable status bar elements.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementCount**. The data type is LONG.

StatusbarElementIconId property

StatusbarElementIconId

Default assignment of the ID number and icon of a status bar element.

The attribute for custom status bar elements can be made assigned dynamic properties by measn of the name **StatusbarElementIconId**. The data type is LONG.

StatusbarElementID property

Object ID - StatusbarElementID

Unique ID of the status bar element selected. WinCC assigns this read only ID number.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementID**. The data type is LONG.

StatusbarElementIndex property

StatusbarElementIndex

References a status bar element. Using this attribute you can assign the values of other attributes to a specific status bar element.

Values between 0 and "StatusbarElementCount" minus 1 are valid for "StatusbarElementIndex". Attribute "StatusbarElementCount" defines the number of configurable status bar elements.

The "StatusbarElementIndex" attribute can be assigned dynamic properties by means of attribute **StatusbarElementIndex**. The data type is LONG.

StatusbarElementName property

Object name - StatusbarElementName

Displays the object name of the status bar element selected. You can rename the objects of custom status bar elements.

The "StatusbarElementName" attribute can be assigned dynamic properties by means of attribute **StatusbarElementRename**. The data type is STRING.

StatusbarElementRemove property

Remove - StatusbarElementRemove

Removes the selected status bar element. You can only remove user-defined status bar element from the list.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementRemove**. The data type is STRING.

StatusbarElementRename property

StatusbarElementRename

Renames a custom status bar element which is referenced by means of "StatusbarElementIndex" attribute.

The attribute for custom elements can be assigned dynamic properties by means of the name **StatusbarElementRename**. "StatusbarElementRename" also sets a dynamic attribute "StatusbarElementName". The data type is STRING.

StatusbarElementRepos property

Up/Down - StatusbarElementRepos

Changes the sorting order of button functions. "Up" and "Down" moves the selected status bar element up or down in the list. This moves the status bar element of the Control towards the front or towards the back in Runtime.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementRepos** . The data type is LONG.

StatusbarElementText property

StatusbarElementText

Defines the text to be displayed for the status bar element. You can edit the "StatusbarElementText" attribute for custom elements.

The attribute for custom elements can be assigned dynamic properties by means of the name **StatusbarElementText**. The data type is STRING.

StatusbarElementTooltipText property

StatusbarElementTooltipText

Defines the tooltip text for the custom status bar element.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementTooltipText**. The data type is STRING.

StatusbarElementVisible property

Status bar elements - StatusbarElementVisible

Activate the elements in the list of status bar elements for their display in Runtime.

Click a list entry to adapt the properties, or to change its position in the status bar of the Control by means of the "Up" and "Down" buttons.

Value	Explanation
TRUE	The status bar element is displayed.
FALSE	The status bar element is not displayed.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementVisible**. The data type is BOOLEAN.

StatusbarElementUserDefined property

StatusbarElementUserDefined

Indicates whether the project engineer has added the status bar element as a new custom element.

Value	Explanation
TRUE	The status bar element is user-defined.
FALSE	The status bar element is defined by the system.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementUserDefined**. The data type is BOOLEAN.

StatusbarElementWidth property

Width in pixels - StatusbarElementWidth

Shows the width of the status bar element selected in pixels. You can define the width if the "Automatic" option is not activated.

The attribute can be assigned dynamic properties by means of the name **StatusbarElementWidth**. The data type is LONG.

StatusbarFontColor property

Font color - StatusbarFontColor

Defines the color of the text in the status bar.

The attribute can be assigned dynamic properties by means of the name **StatusbarFontColor**. The data type is LONG.

StatusbarPanes Property

Description

Defines the elements to be displayed in the status bar. Write/Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

StatusbarShowTooltips property

Tooltips - StatusbarShowTooltips

Enables the display of tooltips for the status bar elements in Runtime.

Value	Explanation
TRUE	Enables the display of tooltips.
FALSE	Disables the display of tooltips.

The attribute can be assigned dynamic properties by means of the name **StatusbarShowTooltips**. The data type is BOOLEAN.

Attribute "StatusbarElementTooltipText" defines the tooltip text.

StatusbarText property

StatusbarText

Default text in the status bar.

The attribute can be assigned dynamic properties by means of the name **StatusbarText**. The data type is STRING.

StatusbarUseBackColor property

Display background color - StatusbarUseBackColor

Sets a background color for the status bar.

Value	Explanation
TRUE	Enables the display of the background color of the status bar.
FALSE	Disables the display of a background color for the status bar.

The attribute can be assigned dynamic properties by means of the name **StatusbarUseBackColor**. The data type is BOOLEAN.

StatusbarVisible property

Show status bar - StatusbarVisible

Enables the display of the status bar of a control.

Value	Explanation
TRUE	Enables the display of a status bar.
FALSE	Disables the display of a status bar.

The attribute can be assigned dynamic properties by means of the name **StatusbarVisible** . The data type is BOOLEAN.

StepSeconds property

StepSeconds

Specifies the interval for step forward or step backward in movies.

The attribute can be assigned dynamic properties by means of the name **StepSeconds**. The data type is LONG.

Stretch Property

Description

Defines whether the side ratio is retained or adjustable on changing the icon size. BOOLEAN write-read access.

- FALSE : The side ratio is retained on changing the icon size.
- TRUE : The side ratio of the icon can be adjusted parallel to changing the icon size.

HMI Symbol Library (Page 253)

ScreenItem Object (Page 141)

SymbolAppearance property

Foreground mode (SymbolAppearance)

Specifies the appearance of the icon.

The following settings are available:

Value	Description	Comments
0	Original	The appearance of the icon corresponds to the multi-color representation in the selection of the "Icons" tab.
1	Shadow	"Black" lines are maintained as contour lines. Elements of the symbols in other colors are displayed as brightness grades of the current foreground color.
2	Solid	"Black" lines are maintained as contour lines. All icon elements of other colors are assigned the color value of the current foreground color.
3	Outline	Lines of the color "Black" are maintained as contour lines. All the elements of the symbol in other colors are assigned the color value of the current background color.

The attribute can be assigned dynamic properties by means of the name **SymbolAppearance**. The data type is LONG.

2.4.19 T

2.4.19.1 Ta -Tic

TableColor property

Row background color 1 - TableColor

Defines the background color of the rows. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TableColor**. The data type is LONG.

TableColor2 property

Row background color 2 - TableColor2

Specifies the background color of "Row color 2". The button opens the "Color selection" dialog.

The setting is only active in Runtime if the "Row color 2" or "UseTableColor2" option is activated. The background colors of "Row color 2" and "Row color 1" are used alternately in this case.

The attribute can be assigned dynamic properties by means of the name **TableColor2**. The data type is LONG.

TableFocusOnButtonCommand Property

Description

Defines whether the focus is set to the table of the control when a button in a script is clicked.

TableForeColor property

Row font color 1 - TableForeColor

Specifies the font color of the rows. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TableForeColor**. The data type is LONG.

TableForeColor2 property

Row font color 2 - TableForeColor2

Specifies the font color of "Row color 2". The button opens the "Color selection" dialog.

The setting is only active in Runtime if the "Row color 2" or "UseTableColor2" option is activated. The font colors of "Row color 2" and "Row color 1" are used alternately in this case.

The attribute can be assigned dynamic properties by means of the name **TableForeColor2**. The data type is LONG.

TagName Property

Description

The "Index" property references a trend. "TagName" defines the tag linked to this trend. It is specified in the form "Archivname\Variablenname" to display tags in a process value archive or "TasgName" to display an internal or external tag which is not stored in an archive.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TagPrefix Property

Description

Defines or returns the tag prefix which is prefixed to all tags contained in the picture window object. In this way, a picture that is embedded in a picture window retains access to its own tags while another accesses other tags.

Modification of the TagPrefix takes effect when a picture is reloaded. When a picture is changed, this occurs automatically, otherwise the picture name must be reassigned.

The tag prefix can be freely defined, but must match the name of the structure tags.

Note

The TagPrefix property is not available for the controls.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

Tags Property

Description

Returns an object of type "Tags".

Tags (read only)

Example:

The following example accesses the tag "Tag1":

```
'VBS86
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
```

See also

Tags Object (List) (Page 155)

HMIRuntime Object (Page 134)

TagProviderClsid Property

Description

The "Index" property references a trend. "TagProviderClsid" defines whether this trend should display an online tag or archived value. The data is only evaluated for online tags and archive tags ("ProviderType" = -1).

{A3F69593-8AB0-11D2-A440-00A0C9DBB64E}: Online tag.

{416A09D2-8B5A-11D2-8B81-006097A45D48}: Values are read from a process value archive or a user archive.

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

Template Property

Description

Returns the template for displaying the window content of the "Application Window" object. Read only access.

The following templates are possible depending on the property value:

Window Contents = Global Script

"GSC diagnostics"
The application window is supplied by applications of the Global Script. The results of the diagnosis system are displayed.

"GSC Runtime"
The application window is supplied by applications of the Global Script. The analysis results regarding characteristics in Runtime are displayed.

Window Contents = Print Jobs

"All Jobs":
The application window is supplied by the logging system. The available reports are displayed as a list.

"All Jobs - Context Menu":
The application window is supplied by the logging system. The available reports are displayed as a list. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

"Job Detail View":
The application window is supplied by the logging system. The available reports are displayed in a selection menu. Detailed information is displayed for the selected report.

"Selected Jobs - Context Menu":
The application window is supplied by the logging system. The available reports are displayed as a list. This list only contains reports which you have activated the option "Mark for print job list" in the "Print Job Properties" dialog. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

TicOffset Property

Description

Defines the diameter of the imaginary circle on which the scale graduation is set. The value is related to the smaller value of the geometric properties Width and Height.

The ends of the main tick marks of the scale graduation point outwards onto this circle.

Value range from 0 to 1.

0: The scale division is in the middle of the graduated scale disk.

1: The diameter of the imaginary circle for the scale tick marks is the smaller value of the geometric properties Width and Height.

ScreenItem Object (Page 141)

TicTextColor Property

Description

Defines the color of the labeling of the scale tick marks.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

TicTextOffset Property

Description

Defines the diameter of the imaginary circle on which the labeling of the scale tick marks is set. The value is related to the smaller value of the geometric properties Width and Height.

Value range from 0 to 1.

0: The label is in the middle of the graduated scale disk.

1: The diameter of the imaginary circle for the label is the smaller value of the geometric properties Width and Height. As a result, part of the label can lie outside the object limits and is, thus, invisible.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

TicWidth Property

Description

Defines the length of the long tick marks for the scaling. The value is related to the half the smaller value of the geometric properties Width and Height.

The length of the tick marks for fine scaling is 0.5*scale width.

Value range from 0 to end of scale.

0: No scale graduation is available. The division of the scale into ranges is not visible.

Scaling distance: The scaling division ranges from the middle point of the graduated scale disk to the value defined by the scaling distance.

Ticks Property

Description

TRUE, when the numbered face is displayed. BOOLEAN write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

TicksColor Property

Description

Defines or returns the color of the hour markings on the face of the analog clock. LONG write-read access.

See also

WinCC Digital/Analog Clock (Page 258)

ScreenItem Object (Page 141)

TickStyle Property

Description

This attribute defines the appearance of the scale. Value Range: 0 to 3.

As a result of the automatic scaling, it is possible that, occasionally, two scale tick marks lie directly beside each other (apparently wide tick mark). This effect can be corrected by minimally lengthening or shortening the slider object.

It is also possible to completely suppress display of the scaling ("WithAxes").

2.4.19.2 TimeAxis - TimeBase

TimeAxis Property

Description

Defines whether a common time axis should be used for all trends in the trend window.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TimeAxisActualize property

Refresh - TimeAxisActualize

Enables refreshing of the time axis selected.

Value	Explanation
TRUE	Enables updates of the trend window which is assigned to the time axis.
FALSE	Disables updates of the trend window which is assigned to the time axis. This setting can be useful when comparing a logged trend with a current trend.

The attribute can be assigned dynamic properties by means of the name **TimeAxisActualize**. The data type is BOOLEAN.

TimeAxisAdd property

New - TimeAxisAdd

Creates a new time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisAdd**. The data type is STRING.

TimeAxisAlign property

Alignment - TimeAxisAlign

Specifies the mode of alignment of a selected time axis.

The following settings are available:

Value	Description	Explanation
0	Bottom	The time axis selected is displayed below the trend.
1	Top	The time axis selected is displayed above the trend.

The attribute can be assigned dynamic properties by means of the name **TimeAxisAlign**. The data type is LONG.

TimeAxisBeginTime property

Start time - TimeAxisBeginTime

Defines the start of the time range for a selected time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisBeginTime**. The data type is Date.

Use the "yyyy-mm-dd hh:mm:ss" format when setting a dynamic time range.

TimeAxisColor property

Time axis color - TimeAxisColor

Specifies the color of the time axis. The button opens the "Color selection" dialog to select the color.

The setting is only active if the "Use trend color" option is not activated or if "TimeAxisInTrendColor" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **TimeAxisColor**. The data type is LONG.

TimeAxisCount property

TimeAxisCount

Defines the number of time axes configured.

The attribute can be assigned dynamic properties by means of the name **TimeAxisCount**. The data type is LONG.

TimeAxisDateFormat property

Date format - TimeAxisDateFormat

Defines the date format for visualizing a selected time axis.

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **TimeAxisDateFormat**. The data type is STRING.

TimeAxisEndTime property

End time - TimeAxisEndTime

Defines the end of the time range of a selected time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisEndTime**. The data type is Date.

Use the "yyyy-mm-dd hh:mm:ss" format when setting a dynamic time range.

TimeAxisFormat Property

Description

Defines the format of the information along the time axis.

- 0: The information is provided in hh:mm
- -1: The information is provided in hh:mm:ss
- -2: The information is provided in hh:mm:ss.ms
- -3: The information is provided in hh:mm (full hours)
- -4: The information is provided in hh:mm:ss (full minutes)
- -5: The information is provided in hh:mm:ss.ms (full seconds)

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TimeAxisIndex property

TimeAxisIndex

References a configured time axis. Using this attribute you can assign the values of other attributes to a specific time axis.

Values between 0 and "TimeAxisCount" minus 1 are valid for "TimeAxisIndex". Attribute "TimeAxisCount" defines the number of trends configured.

The "TimeAxisIndex" attribute can be assigned dynamic properties by means of attribute **TimeAxisRepos**. The data type is LONG.

TimeAxisInTrendColor property

Use trend color - TrendAxisInTrendColor

Sets a trend color for displaying the time axis selected. The color of the first trend is activated if several trends are displayed in the trend window. Define the order of trends on the "Trends" tab.

Value	Explanation
TRUE	The trend color is used to display the time axis selected. The setting in the "Color" or "TimeAxisColor" field is disabled.
FALSE	The time axis selected is displayed in the color set in the "Color" or "TimeAxisColor" field.

The attribute can be assigned dynamic properties by means of the name **TimeAxisInTrendColor**. The data type is BOOLEAN.

TimeAxisLabel property

Label - TimeAxisLabel

Defines the label text for a time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisLabel**. The data type is STRING.

TimeAxisMeasurePoints property

Number of measurement points - TimeAxisMeasurePoints

Defines the number of measurement points to be displayed at the time axis selected.

The attribute can be assigned dynamic properties by means of the name **TimeAxisMeasurePoints**. The data type is LONG.

TimeAxisName property

Object name - TimeAxisName

Specifies the name of a selected time axis.

The "TimeAxisName" attribute can be assigned dynamic properties by means of attribute **TimeAxisRename**. The data type is STRING.

TimeAxisRangeType property

Time range setting - TimeAxisRangeType

Specifies the time range for the time axis selected.

Value	Description	Explanation
0	Time range	Defines the start time and the time range for the time axis.
1	Start to end time	Defines the start and end time for the time axis.
2	Number of measurement points	Defines the start time and the number of measurement points for the time axis.

The attribute can be assigned dynamic properties by means of the name **TimeAxisRangeType**. The data type is LONG.

TimeAxisRemove property

Remove - TimeAxisRemove

Removes the selected time axis from the list.

The attribute can be assigned dynamic properties by means of the name **TimeAxisRemove**. The data type is STRING.

TimeAxisRename property

TimeAxisRename

Renames a time axis which is referenced by means of "TimeAxisIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **TimeAxisRename**. "TimeAxisRename" also sets a dynamic attribute "TimeAxisName". The data type is STRING.

TimeAxisRepos property

Up/Down - TimeAxisRepos

Changes the order of the time axes. "Up" and "Down" move the selected time axis up or down in the list.

The list order determines the time axis position in the trend window. The time axis is moved away from the trend if the listing is the same and the time axis is further up in the list.

The attribute can be assigned dynamic properties by means of the name **TimeAxisRepos**. The data type is LONG.

TimeAxisShowDate property

Show date - TimeAxisShowDate

Enables the display of the date and time at the time axis selected.

Value	Explanation
TRUE	Date and time are displayed. The date format is defined in the "Date format" field.
FALSE	The date is not displayed. Only the time is displayed.

The attribute can be assigned dynamic properties by means of the name **TimeAxisShowDate**. The data type is BOOLEAN.

TimeAxisTimeFormat property

Time format - TimeAxisTimeFormat

Defines the time format for visualizing a selected time axis.

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
hh:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The attribute can be assigned dynamic properties by means of the name **TimeAxisTimeFormat**. The data type is STRING.

TimeAxisTimeRangeBase property

Time range - TimeAxisTimeRangeBase

Defines the time unit for calculating the time range.

The following time units are available:

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

The attribute can be assigned dynamic properties by means of the name **TimeAxisTimeRangeBase**. The data type is LONG.

TimeAxisTimeRangeFactor property

Time range - TimeAxisTimeRangeFactor

Defines the factor for calculating the time range. Only integer factors are valid.

The attribute can be assigned dynamic properties by means of the name **TimeAxisTimeRangeFactor**. The data type is SHORT.

TimeAxisTrendWindow property

Trend window - TimeAxisTrendWindow

Specifies the trend window for displaying the time axis selected. Define the available trend windows in the "Trend window" or "TrendWindowAdd" tab.

The attribute can be assigned dynamic properties by means of the name **TimeAxisTrendWindow**. The data type is STRING.

TImeAxisVisible property

Time axis - TimeAxisVisible

The list shows all time axes you created. Click a time axis entry in the list to adapt the properties and to assign the time axis to a trend window.

Activate the time axes to be displayed in the trend window in the list.

Defines whether the selected time axis is displayed.

Value	Explanation
TRUE	The time axis is displayed.
FALSE	The time axis is not displayed.

The attribute can be assigned dynamic properties by means of the name **TimeAxisVisible**. The data type is BOOLEAN.

TimeAxisX Property

Description

TRUE, when a common axis should be used for all trends in the trend window. BOOLEAN write-read access.

See also

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

TimeBase property

Time base - TimeBase

This selection field is used to define the time base for the time stamp in the control.

Value	Designation
0	Local time zone
1	Coordinated Universal Time (UTC)
2	Project setting

The attribute can be assigned dynamic properties by means of the name **TimeBase**. The data type is LONG.

2.4.19.3 TimeColumn

TimeColumnActualize property

TimeColumnActualize

Enables the update of values in the selected column.

Value	Explanation
TRUE	The time column is updated.
FALSE	The time column is not updated. This setting can be useful when comparing tables.

The attribute can be assigned dynamic properties by means of the name **TimeColumnActualize**. The data type is BOOLEAN.

TimeColumnAdd property

New - TimeColumnAdd

Creates a new time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnAdd**. The data type is STRING.

TimeColumnAlign property

Alignment - TimeColumnAlign

Defines the mode of alignment of the time column selected.

The following settings are available:

Value	Description	Explanation
0	left	The time column selected is displayed on the left.
1	Centered	The time column selected is aligned to center.
2	right	The time column selected is displayed on the right.

The attribute can be assigned dynamic properties by means of the name **TimeColumnAlign**. The data type is LONG.

TimeColumnAlignment Property

Description

The "Index" property references a pair of columns. "TimeColumnAlignment" defines the alignment of the time column for this column pair.

- 0: Time values are entered aligned left.
- 1: Time values are entered centered.
- 2: Time values are entered aligned right.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

TimeColumnBackColor property

Background color - TimeColumnBackColor

Specifies the background color of the time column selected. Use the button to open the "Color selection" dialog.

The setting is useful if:

- The "Use value column colors" option is not activated or "TimeColumnUseValueColumnColors" is "FALSE".
- The "Background color" option is activated or "UseColumnBackColor" is "TRUE in the "Use column color" field of the "General" tab".

The attribute can be assigned dynamic properties by means of the name **TimeColumnBackColor**. The data type is LONG.

TimeColumnBeginTime property

Start time - TimeColumnBeginTime

Defines the start of the time range for a selected time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnBeginTime**. The data type is Date.

Use the "yyyy-mm-dd hh:mm:ss" format when setting a dynamic time range.

TimeColumnCaption property

Caption - TimeColumnCaption

Defines the caption of the time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnCaption**. The data type is STRING.

TimeColumnCount property

TimeColumnCount

Defines the number of time columns configured.

The attribute can be assigned dynamic properties by means of the name **TimeColumnCount**. The data type is LONG.

TimeColumnDateFormat property

Date format - TimeColumnDateFormat

Defines the date format for visualizing a selected time column.

The following date formats are available:

Value	Explanation
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.07.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2007.
dd/MM/yy	Day/Month/Year, e.g. 24/12/07.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2007.

The attribute can be assigned dynamic properties by means of the name **TimeColumnDateFormat**. The data type is STRING.

TimeColumnEndTime property

End time - TimeColumnEndTime

Defines the end of the time range of a selected time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnEndTime**. The data type is Date.

Use the "yyyy-mm-dd hh:mm:ss" format when setting a dynamic time range.

TimeColumnForeColor property

Font color - TimeColumnForeColor

Specifies the font color of the time column selected. Use the button to open the "Color selection" dialog.

The setting is useful if:

- The "Use value column colors" option is not activated or "TimeColumnUseValueColumnColors" is "FALSE".
- The "Font color" option is activated or "UseColumnForeColor" is "TRUE" in the "Use column color" field of the "General" tab.

The attribute can be assigned dynamic properties by means of the name **TimeColumnForeColor**. The data type is LONG.

TimeColumnHideText property

TimeColumnHideText

Sets text format for displaying the content of a time column.

Value	Explanation
TRUE	The content is not displayed in text format.
FALSE	The content is displayed in text format.

The attribute can be assigned dynamic properties by means of the name **TimeColumnHideText**. The data type is BOOLEAN.

TimeColumnHideTitleText property

TimeColumnHideTitleText

Sets text format for displaying the time column header.

Value	Explanation
TRUE	The header is not displayed in text format.
FALSE	The header is displayed in text format.

The attribute can be assigned dynamic properties by means of the name **TimeColumnHideTitleText**. The data type is BOOLEAN.

TimeColumnIndex property

TimeColumnIndex

References a configured time column. Using this attribute you can assign the values of other attributes to a specific time column.

Values between 0 and "TimeColumnCount" minus 1 are valid for "TimeColumnIndex". Attribute "TimeColumnCount" defines the number of time columns configured.

The "TimeColumnIndex" attribute can be assigned dynamic properties by means of attribute **TimeColumnRepos**. The data type is LONG.

TimeColumnLength property

Length in characters - TimeColumnLength

Specifies the width of a selected time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnLength**. The data type is LONG.

TimeColumnMeasurePoints property

Number of measurement points - TimeColumnMeasurePoints

Defines the number of measurement points to be displayed in the time column selected.

The attribute can be assigned dynamic properties by means of the name **TimeColumnMeasurePoints**. The data type is LONG.

TimeColumnName property

Object name - TimeColumnName

Specifies the name of a selected time column.

The "TimeColumnName" attribute can be assigned dynamic properties by means of attribute **TimeColumnRename**. The data type is STRING.

TimeColumnRangeType property

Time range setting - TimeColumnRangeType

Defines the time range setting for the time column selected.

Value	Description	Explanation
0	Time range	Defines the start time and time range of the time column.
1	Start to end time	Defines the start and end time for the time column.
2	Number of measurement points	Defines the start time and the number of measurement points for the time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnRangeType**. The data type is LONG.

TimeColumnRemove property

Remove - TimeColumnRemove

Removes the selected time column from the list.

The attribute can be assigned dynamic properties by means of the name **TimeColumnRemove**. The data type is STRING.

TimeColumnRename property

TimeColumnRename

Renames a time column which is referenced by means of "TimeColumnIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **TimeColumnRename**. "TimeColumnRename" also sets a dynamic attribute "TimeColumnName". The data type is STRING.

TimeColumnRepos property

Up/Down - TimeColumnRepos

Repositions the order of time columns and of corresponding value columns. "Up" and "Down" move the time column selected up or down in the list. This moves the time column and corresponding value columns in the table towards the front or towards the back.

The attribute can be assigned dynamic properties by means of the name **TimeColumnRepos**. The data type is LONG.

TimeColumnShowDate property

Show date - TimeColumnShowDate

Enables the display of the date and time in the time column selected.

Value	Explanation
TRUE	Date and time are displayed. The date format is defined in the "Date format" field or by using "TimeColumnDateFormat".
FALSE	The date is not displayed. Only the time is displayed.

The attribute can be assigned dynamic properties by means of the name **TimeColumnShowDate**. The data type is BOOLEAN.

TimeColumnShowIcon property

TimeColumnShowIcon

Enables the display of time column contents as icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **TimeColumnShowIcon**. The data type is BOOLEAN.

TimeColumnShowTitleIcon property

TimeColumnShowTitleIcon

Enables display of the time column header as icon. This function is only available in WinCC Alarm Control.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **TimeColumnShowTitleIcon**. The data type is BOOLEAN.

TimeColumnSort property

TimeColumnSort

Defines the sorting order of the time column referenced in "TimeColumnIndex" .

The following settings are available:

Value	Description	Explanation
0	No	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **TimeColumnSort** . The data type is LONG.

TimeColumnSortIndex property

TimeColumnSortIndex

Defines the sorting order of the time column referenced in "TimeColumnIndex". The sorting criterion is removed from "TimeColumnSort" if you set a "0" value..

The attribute can be assigned dynamic properties by means of the name **TimeColumnSortIndex**. The data type is LONG.

TimeColumnTimeFormat property

Time format - TimeColumnTimeFormat

Defines the time format for visualizing a selected time column.

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The attribute can be assigned dynamic properties by means of the name **TimeColumnTimeFormat**. The data type is STRING.

TimeColumnTimeRangeBase property

Time range - TimeColumnTimeRangeBase

Defines the time unit for calculating the time range.

The following time units are available:

Value	Description
500	500 ms
1000	1 second

Value	Description
60000	1 minute
3600000	1 hour
86400000	1 day

The attribute can be assigned dynamic properties by means of the name **TimeColumnTimeRangeBase**. The data type is LONG.

TimeColumnTimeRangeFactor property

Time range - TimeColumnTimeRangeFactor

Defines the factor for calculating the time range. Only integer factors are valid.

The attribute can be assigned dynamic properties by means of the name **TimeColumnTimeRangeFactor**. The data type is SHORT.

TimeColumnUseValueColumnColors property

Use value column colors - TimeColumnUseValueColumnColors

Defines whether the selected time column will be displayed in the value column colors.

Value	Explanation
TRUE	The colors of the value column are used to display a selected time column. The settings in the "Font color" and "Background color" fields are disabled.
FALSE	The colors defined in the "Font color" and "Background color" fields are used to display the selected time column.

The attribute can be assigned dynamic properties by means of the name **TimeColumnUseValueColumnColors**. The data type is BOOLEAN.

TimeColumnVisible property

Time columns - TimeColumnVisible

The list shows the time columns you created. Click a time column entry in the list to adapt the properties and to define the time range of the time column.

Select the time columns to be displayed in the table from the list.

Defines whether the selected time column is displayed.

The attribute can be assigned dynamic properties by means of the name **TimeColumnVisible**. The data type is BOOLEAN.

2.4.19.4 TimeFormat - Tolerance

TimeFormat Property

Description

Defines the format of the time specification.

- 0: The information is provided in hh:mm
- -1: The information is provided in hh:mm:ss
- -2: The information is provided in hh:mm:ss.ms
- -3: The information is provided in hh:mm (full hours)
- -4: The information is provided in hh:mm:ss (full minutes)
- -5: The information is provided in hh:mm:ss.ms (full seconds)

TimeOverlapColor Property

Description

WinCC Online Trend Control

The "Index" property references a trend. "TimeOverlapColor" defines the color identifying the time overlaps in the archive. Whether the information is evaluated depends on the value of the "TimeOverlap" attribute. The color is defined as an RGB value.

WinCC Online Trend Control

The value of this property cannot be changed. Read only access.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TimeRange Property

Description

The "Index" property references a column pair or a trend. "TimeRange" defines how the time range to be displayed should be defined.

- 0: The time range to be displayed is defined by a start time ("BeginTime") and end time ("EndTime").
- -1: The time range to be displayed is defined by a start time ("BeginTime") and a time range ("TimeRangeBase" and "TimeRangeFactor").

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

TimeRangeBase Property

Description

The "Index" property references a column pair or a trend. The time range to be displayed for this column pair/trend results from multiplying the values "TimeRangeBase" and "TimeRangeFactor", whereby the value "TimeRangeBase" is interpreted in milliseconds.

The "TimeRangeBase" and "TimeRangeFactor" properties are only evaluated when the "TimeRange" property is set, i.e. has the value "-1".

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

ScreenItem Object (Page 141)

TimeStamp Property

Description

Reads the time stamp of the last read access of a tag. The time stamp is returned in local time. DATE (read only)

The VBS standard function "FormatDateTime(Date[, NamedFormat])" enables the time stamp property to be output in plain text. The output is dependent on the current language setting. The language setting can be set using the VBS standard function SetLocale().

By implementing the second parameter of the FormatDate() function and further VBS standard functions such as Year, WeekDay, Day, Hour, Minute, Second enable the information, required by the user, to be split. Use the WeekdayName function to receive the name of the weekday for WeekDay.

Example:

```
'VBS87
Dim objTag
Dim lngCount
lngCount = 0
Set objTag = HMIRuntime.Tags("Tag11")
objTag.Read
SetLocale("en-gb")
MsgBox FormatDateTime(objTag.TimeStamp)    'Output: e.g. 06/08/2002 9:07:50
MsgBox Year(objTag.TimeStamp)    'Output: e.g. 2002
MsgBox Month(objTag.TimeStamp)    'Output: e.g. 8
MsgBox Weekday(objTag.TimeStamp)    'Output: e.g. 3
MsgBox WeekdayName(Weekday(objTag.TimeStamp))    'Output: e.g. Tuesday
MsgBox Day(objTag.TimeStamp)    'Output: e.g. 6
MsgBox Hour(objTag.TimeStamp)    'Output: e.g. 9
MsgBox Minute(objTag.TimeStamp)    'Output: e.g. 7
```

```
MsgBox Second(objTag.TimeStamp)    'Output: e.g. 50
For lngCount = 0 To 4
MsgBox FormatDateTime(objTag.TimeStamp, lngCount)
Next
'lngCount = 0: Output: e.g. 06/08/2002 9:07:50
'lngCount = 1: Output: e.g. 06 August 2002
'lngCount = 2: Output: e.g. 06/08/2002
'lngCount = 3: Output: e.g. 9:07:50
'lngCount = 4: Output: e.g. 9:07
```

Example:

The following example issues the time stamp of the tag "Tag1":

```
'VBS88
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.TimeStamp
```

Alarms object (list) (Page 126)

TimeStepBase property

Precision - TimeStepBase

Defines the precision of the time stamp displayed in a table.

Calculate the precision by multiplying the factor with the time unit. Enter factor "3" and time unit "1s" to display all values which were generated within 3 seconds in the same row, for example.

Value	Description	Explanation
0	Exact	Only values with precisely the same time stamp are displayed in a table row.
100	100 ms	All values generated within 100 milliseconds are grouped in a table row.
250	250 ms	All values generated within 250 milliseconds are grouped in a table row.
500	500 ms	All values generated within 500 milliseconds are grouped in a table row.
1000	1 s	All values generated within 1 second are grouped in a table row.

The attribute can be assigned dynamic properties by means of the name **TimeStepBase**. The data type is LONG.

TimeStepFactor property

Precision - TimeStepFactor

Defines the precision of the time stamp displayed in a table.

Calculate the precision by multiplying the factor with the time unit. Enter factor "3" and time unit "1s" to display all values which were generated within 3 seconds in the same row.

The factor entered is disabled if "Exact" is selected for the time unit or "0" is selected for "TimeStepBase".

The attribute can be assigned dynamic properties by means of the name **TimeStepFactor**. The data type is LONG.

TimeZone Property

Description

Defines the time zone used as a basis for displaying time values. Four settings are possible:

- Local time zone
- Server's time zone
- UTC (Universal Time Coordinated)
- Apply project settings (=> Use WinCC Explorer and access the computer's properties page to define the time mode specifically for the computer. The following are available for selection: WinCC V50 (Compatibility mode => Display as was standard in the individual display sections to V5), local time and UTC.

ScreenItem Object (Page 141)

TitleColor property

Table header background - TitleColor

Specifies the background color of the table headers. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TitleColor**. The data type is LONG.

TitleCut property

Shorten contents - TitleCut

Truncates the content of column headers if the column is insufficient.

Value	Explanation
TRUE	The column headers are truncated.
FALSE	The column headers are not truncated.

The attribute can be assigned dynamic properties by means of the name **TitleCut** . The data type is BOOLEAN.

TitleCut property (before WinCC V7)

Description

Defines whether the content of the fields of a title bar should be shortened if the column width is too small. Write/Read access.

See also

WinCC Alarm Control (before WinCC V7) (Page 288)

ScreenItem Object (Page 141)

TitleDarkShadowColor property

Dark shading color - TitleDarkShadowColor

Specifies the color of the dark side of shading. The button opens the "Color selection" dialog.

The setting is only active if the "Shading Color" option or "TitleStyle" is activated.

The attribute can be assigned dynamic properties by means of the name **TitleDarkShadowColor**. The data type is LONG.

TitleForeColor property

Table header font color - TitleForeColor

Specifies the color of the table header. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TitleForeColor**. The data type is LONG.

TitleGridLineColor property

Color of the divider / header - TitleGridLineColor

Defines the color of row/column dividers in the table header. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **TitleGridLineColor**. The data type is LONG.

TitleLightShadowColor property

Bright shading color - TitleLightShadowColor

Specifies the color of the bright side of shading. The button opens the "Color selection" dialog.

The setting is only active if the "Shading Color" option or "TitleStyle" is activated.

The attribute can be assigned dynamic properties by means of the name **TitleLightShadowColor**. The data type is LONG.

Titleline Property

Description

TRUE, when the control has a title bar and it can be moved in Runtime. BOOLEAN write-read access.

ScreenItem Object (Page 141)

TitleSort property

Sort by column title- TitleSort

Defines how to trigger sorting by column title. You can only sort by column title if the "Auto-scrolling" option is deactivated.

Value	Description	Explanation
0	No	Sorting by column title is not possible.
1	With click	Sorting is triggered by clicking in the column header.
2	With double-click	Sorting is triggered by double-clicking in the column title.

The attribute can be assigned dynamic properties by means of the name **TitleSort**. The data type is LONG.

TitleStyle property

Shading color - TitleStyle

Specifies whether to set a shading color for the table header.

Value	Description	Explanation
0	Flat	Disables the use of shading colors. Flat header style.
1	Button	Enables the use of shading colors. 3D representation of the header.

The attribute can be assigned dynamic properties by means of the name **TitleStyle**. The data type is LONG.

Toggle Property

Description

TRUE, when the button or round button should lock after being operated in Runtime. BOOLEAN write-read access.

ToolbarAlignment Property

Alignment - ToolbarAlignment

Defines the orientation of the Control toolbar.

The following settings are available:

Value	Description	Explanation
0	Top	The toolbar is aligned to the top edge.
1	Bottom	The toolbar is aligned to the bottom edge.
2	Left	The toolbar is aligned to the left edge.
3	Right	The toolbar is aligned to the right edge.

The attribute can be assigned dynamic properties by means of the name **ToolbarAlignment**. The data type is LONG.

ToolbarBackColor property

Background color - ToolbarBackColor

Specifies the background color of the toolbar. Open the "Color selection" dialog by clicking the button.

The background color you configured is only displayed if the "Display" option is activated or "ToolbarUseBackColor" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **ToolbarBackColor**. The data type is LONG.

ToolbarButtonActive property

Active - ToolbarButtonActive

Activates a button function in Runtime. Clicking the button in Runtime triggers the corresponding function.

Value	Explanation
TRUE	The button function is enabled.
FALSE	The button function is disabled. You can assign custom functions to the button by means of scripting.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonActive**. The data type is BOOLEAN.

ToolbarButtonAdd property

New - ToolbarButtonAdd

Creates a new, user-defined button function. The name set by WinCC can be edited in the "Object name" field.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonAdd** . The data type is STRING.

ToolbarButtonBeginGroup property

Separator - ToolbarButtonBeginGroup

Inserts a leading separator (vertical line) for the selected button function on the toolbar. These separators can be used to group the icons of the button functions.

Value	Explanation
TRUE	A separator prefix is inserted for the button function selected.
FALSE	A separator prefix is not inserted for the button function selected.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonBeginGroup**. The data type is BOOLEAN.

ToolbarButtonClick AlarmControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	21	"Next message"
2	"Configuration dialog"	22	"Last message"
3	"Message list".	23	"Info text dialog"
4	"Short-term archive list".	24	"Comments dialog"
5	"Long-term archive list"	25	"Loop In Alarm"
6	"Lock List".	26	"Lock message"
7	"Hit List"	27	"Enable message"
8	"List of messages to be hidden"	28	"Hide messages"
9	"Ackn. Central Signaling Devices"	29	'Unhide messages"
10	"Single acknowledgment"	30	"Sort dialog"
11	"Group acknowledgement"	31	"Time base dialog"
18	"Emergency acknowledgement"	32	"Copy rows"
13	"Selection dialog"	33	"Connect backup"
14	"Display options dialog"	34	"Disconnect backup"
15	"Lock dialog"	36	"First page"
17	"Print"	37	"Previous page"
35	"Export data"	38	"Next page"
12	"Autoscroll"	39	"Last page"
19	"First message"	1001	"User-defined 1"
20	"Previous message"		

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick FunctionTrendControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	13	"Select time range"
2	"Configuration dialog"	14	"Previous trend"
4	"Zoom area"	15	"Next trend"
5	"Zoom +/-"	16	"Stop"
6	"Zoom X axis +/-"	16	"Start"
7	"Zoom Y axis +/-"	17	"Print"
8	"Shift trend range"	20	"Export data"
9	"Shift axes range"	3	"Ruler"
10	"Original view"	18	"Connect backup"
11	"Select data connection"	19	"Disconnect backup"
12	"Select trends"	1001	"User-defined 1"

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick OnlineTableControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	13	"Next column"
2	"Configuration dialog"	14	"Stop"
3	"First data record"	14	"Start"
4	"Previous data record"	15	"Print"
5	"Next data record"	20	"Export data"
6	"Last data record"	16	"Define statistics area"
7	"Edit"	17	"Calculate statistics"
8	"Copy rows"	18	"Connect backup"
9	"Select data connection"	19	"Disconnect backup"
10	"Select columns"	21	"Create archive value"
11	"Select time range"	1001	"User-defined 1"
12	"Previous column"		

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick OnlineTrendControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	17	"Select time range"
2	"Configuration dialog"	18	"Previous trend"
3	"First data record"	19	"Next trend"
4	"Previous data record"	20	"Stop"
5	"Next data record"	20	"Start"
6	"Last data record"	21	"Print"
8	"Zoom area"	26	"Export data"
9	"Zoom +/-"	7	"Ruler"
10	"Zoom time axis +/-"	22	"Define statistics area"

11	"Zoom value axis +/-"	23	"Calculate statistics"
12	"Shift trend range"	24	"Connect backup"
13	"Shift axes range"	25	"Disconnect backup"
14	"Original view"	27	"Relative axis"
15	"Select data connection"	1001	"User-defined 1"
16	"Select trends"		

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick RulerControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function
1	"Help"
2	"Configuration dialog"
3	"Ruler window"
4	"Statistics range"
5	"Statistics"
6	"Print"
7	"Export data"
1001	"User-defined 1"

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonClick UserArchiveControl property

ToolbarButtonClick

Triggers the function linked to the toolbar button. Programmers can use the "ID" to call the corresponding button function.

ID	Button function	ID	Button function
1	"Help"	12	"Read tags"
2	"Configuration dialog"	13	"Write tags"
3	"Select data connection"	14	"Import archive"
4	"First row"	15	"Export archive"
5	"Previous row"	16	"Sort dialog"
6	"Next row"	17	"Selection dialog"
7	"Last row"	18	"Print"

8	"Delete rows"	20	"Export data"
9	"Cut rows"	19	"Time base dialog"
10	"Copy rows"	1001	"User-defined 1"
11	"Insert rows"		

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonClick**. The data type is LONG.

ToolbarButtonCount property

ToolbarButtonCount

Defines the number of configurable button functions.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonCount**. The data type is LONG.

ToolbarButtonEnabled property

ToolbarButtonEnabled

Enables operation of custom toolbar buttons.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonEnabled**. The data type is BOOLEAN.

ToolbarButtonHotKey property

Hotkey - ToolbarButtonHotKey

Shows the hotkey for a button function selected.

You create or edit a hotkey by clicking in the "Hotkey" field and pressing the button or key shortcut required.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonHotKey**. The data type is LONG.

ToolbarButtonID property

Object ID - ToolbarButtonID

Unique ID number for the selected button function. WinCC assigns this read only ID number.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonID**. The data type is LONG.

ToolbarButtonIndex property

ToolbarButtonIndex

References a button function. Using this attribute you can assign the values of other attributes to a specific button function.

Values between 0 and "ToolbarButtonIndex" minus 1 are valid for "ToolbarButtonCount". Attribute "ToolbarButtonCount" defines the number of configurable button functions.

The "ToolbarButtonIndex" attribute can be assigned dynamic properties by means of attribute **ToolbarButtonRepos**. The data type is LONG.

ToolbarButtonLocked property

ToolbarButtonLocked

Enables/disables the display of the pressed state of a user-defined toolbar button.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonLocked**. The data type is BOOLEAN.

ToolbarButtonName property

Object name - ToolbarButtonName

Shows the name for the selected button function. You rename user-defined button functions.

The "ToolbarButtonName" attribute can be assigned dynamic properties by means of attribute **ToolbarButtonRename**. The data type is STRING.

ToolbarButtonPasswordLevel property

Operator authorization - ToolbarButtonPasswordLevel

Shows the authorization for a button function selected. You can edit the authorization using the selection button.

Authorizations are configured in the "User Administrator" editor.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonPasswordLevel**. The data type is LONG.

ToolbarButtonRemove property

Remove - ToolbarButtonRemove

Removes the selected button function from the list. Only user-defined button functions can be removed.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonRemove**. The data type is STRING.

ToolbarButtonRename property

ToolbarButtonRename

Renames a custom toolbar element which is referenced by means of "ToolbarButtonIndex" attribute.

The attribute for custom elements can be assigned dynamic properties by means of the name **ToolbarButtonRename**. "ToolbarButtonRename" also sets a dynamic attribute "ToolbarButtonName". The data type is STRING.

ToolbarButtonRepos property

Up/Down - ToolbarButtonRepos

Changes the sorting order of button functions. "Up" and "Down" move the button function selected up or down in the list. This moves the button function in the toolbar of a Control towards the front or towards the back.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonRepos**. The data type is LONG.

ToolbarButtonTooltipText property

ToolbarButtonTooltipText

Specifies the tooltip text for the button.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonTooltipText**. The data type is STRING.

ToolbarButtonUserDefined property

ToolbarButtonUserDefined

Indicates whether the project engineer has added a new user-defined toolbar button.

Value	Explanation
TRUE	The toolbar button is assigned a user-defined function.
FALSE	The toolbar button is defined by the system.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonUserDefined**. The data type is BOOLEAN.

ToolbarButtonVisible property

Button functions - ToolbarButtonVisible

Select the button functions to be displayed in the toolbar from the list.

Click a list entry to adapt the properties, or to change the position in the status bar of the Control by means of the "Up" and "Down" buttons.

The attribute can be assigned dynamic properties by means of the name **ToolbarButtonVisible** . The data type is BOOLEAN.

ToolbarButtons Property

Description

Defines or returns the buttons contained in the toolbar by setting or resetting the corresponding bits. Each button is assigned a bit. There are no limitations as to the bit combinations.

Bit - Value (hex) ; Value (dec) ; Button:

- 0 - 0x00000001; 1; Message List
- 1 - 0x00000002; 2; Short-term archive list
- 2 - 0x00000004; 4; Long-term archive list
- 3 - 0x00000008; 8; Acknowledgment of central signaling device
- 4 - 0x00000010; 16; Single Acknowledgment
- 5 - 0x00000020; 32; Group acknowledgment
- 6 - 0x00000040; 64; Autoscroll
- 7 - 0x00000080; 128; Selection Dialog
- 8 - 0x00000100; 256; Lock Dialog
- 9 - 0x00000200; 512; Print message log
- 11 - 0x00000800; 2048; Emergency acknowledgment
- 12 - 0x00001000; 4096; First message
- 13 - 0x00002000; 8192; Last message
- 14 - 0x00004000; 16384; Next message
- 15- 0x00008000; 32768; Previous message
- 16 - 0x00010000; 65536; Infotext Dialog
- 17 -0x00020000; 131072; Comment Dialog
- 18 - 0x00040000; 262144; Loop in Alarm
- 20 - 0x00100000; 1048576; Print current view
- 21 - 0x00200000; 2097152; Lock list
- 22 - 0x00400000; 4194304; Lock/release message

- 23 - 0x00800000; 8388608; Sorting Dialog
- 24 - 0x01000000; 16777216; Time basis dialog
- 25 - 0x02000000; 33554432; Hit list

In order to display more buttons, their values must be logically linked with OR. Write/Read access.

ToolbarShowTooltips property

Tooltips - ToolbarShowTooltips

Enables the display of tooltips for the button functions in Runtime.

Value	Explanation
TRUE	Enables the display of tooltips.
FALSE	Disables the display of tooltips.

The attribute can be assigned dynamic properties by means of the name **ToolbarShowTooltips**. The data type is BOOLEAN.

Attribute "ToolbarButtonTooltipText" defines the tooltip text.

ToolbarUseBackColor property

Show background color - ToolbarUseBackColor

Enables the display of the background color for a toolbar.

Value	Explanation
TRUE	Enables the display of the background color of a toolbar.
FALSE	Disables the display of the background color of a toolbar.

The attribute can be assigned dynamic properties by means of the name **ToolbarUseBackColor**. The data type is BOOLEAN.

ToolbarUseHotKeys property

Hotkeys - ToolbarUseHotKeys

Activates the hotkeys for button functions in Runtime. Insert the hotkeys for button functions in the "Hotkey" field.

Value	Explanation
TRUE	The hotkeys are activated.
FALSE	The hotkeys are deactivated.

The attribute can be assigned dynamic properties by means of the name **ToolbarUseHotKeys**. The data type is BOOLEAN.

ToolbarVisible property

Show toolbar - ToolbarVisible

Enables the display of the Control toolbar.

Value	Explanation
TRUE	Enables the display of the toolbar.
FALSE	Disables the display of the toolbar.

The attribute can be assigned dynamic properties by means of the name **ToolbarVisible** . The data type is BOOLEAN.

2.4.19.6 ToolTip - TrendLower

ToolTipText Property

Description

Defines or returns the text to be displayed as a tooltip when the mouse is positioned over the object.

STRING (write-read access)

Example:

The following example assigns a tool tip text to every object in the picture "NewPDL1": The picture "NewPDL1" comprises only objects containing the ToolTipText property:

```
'VBS89
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
'
'Assign tooltiptexts to the objects
objScrItem.ToolTipText = "Name of object is " & strName
Next
```

Top Property

Function

Defines or returns the Y-coordinate of an object (measured from the top left edge of the picture) in pixels. The Y-coordinate relates to the top left corner of the rectangle enclosing the object.

LONG (write-read access)

Example:

The following example shifts all objects in the picture "NewPDL1" 5 pixels upwards:

```
'VBS90
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
objScrItem.Top = objScrItem.Top - 5
```

```
Next
```

Description

Specifies or sets the index number of the top connecting point.

LONG write-read access.

See also

Connector (Page 182)

ScreenItem Object (Page 141)

TopConnectedObjectName Property

Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

See also

Connector (Page 182)

ScreenItem Object (Page 141)

Transparency property

Description

Defines and returns the percentage transparency of the object.

0 = no transparency; 100 = complete transparency (invisible)

The text and fields of the graphic objects are only transparent at "100."

In runtime, a completely transparent object (invisible) is also functional.

Transparent Property

Description

TRUE, when the button appears completely filled in the color specified in "BackColor". BOOLEAN write-read access.

See also

WinCC Push Button Control (Page 275)

ScreenItem Object (Page 141)

Trend Property

Description

TRUE, when the tendency (rising or falling) of the measuring value being monitored should be displayed by a small arrow. BOOLEAN write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

TrendActualize property

Update -TrendActualize

Enables the update of a selected trend.

Value	Explanation
TRUE	Enables updates of the trend selected.
FALSE	Disables updates of the trend selected. This setting can be useful when comparing a logged trend with a current trend.

The attribute can be assigned dynamic properties by means of the name **TrendActualize**. The data type is BOOLEAN.

TrendAdd property

New - TrendAdd

Creates a new trend.

The attribute can be assigned dynamic properties by means of the name **TrendAdd**. The data type is STRING.

TrendAutoRangeBeginTagName property

TrendAutoRangeBeginTagName

This attribute sets the low limit tag for the range of values if the range of values is calculated automatically by means of online tags.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeBeginTagName**. The data type is STRING.

TrendAutoRangeBeginValue property

TrendAutoRangeBeginValue

This attribute sets the low limit tag for the range of values if the range of values is calculated based on the configuration of high and low limits.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeBeginValue**. The data type is DOUBLE.

TrendAutoRangeEndTagName property

TrendAutoRangeEndTagName

This attribute sets the high limit tag for the range of values if the range of values is calculated automatically by means of online tags.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeEndTagName**. The data type is STRING.

TrendAutoRangeEndValue property

TrendAutoRangeEndValue

This attribute sets the high limit tag for the range of values if the range of values is calculated based on the configuration of high and low limits.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeEndValue**. The data type is DOUBLE.

TrendAutoRangeSource property

TrendAutoRangeSource

Defines the mode for automatic calculation of the range of values of trend data.

Value	Description	Explanation
0	Display data	The range of values is calculated automatically based on the data displayed.
1	Value range	The range of values is defined based on its configured low and high limit. The low and high limits are emulated in the "TrendAutoRangeBeginValue" and "TrendAutoRangeEndValue" attributes.
2	Online tags	The low and high limits of the range of values are derived from the values of connected online tags. The low and high limits are emulated in the "TrendAutoRangeBeginTagName" and "TrendAutoRangeEndTagName" attributes.

The attribute can be assigned dynamic properties by means of the name **TrendAutoRangeSource**. The data type is LONG.

TrendBeginTime property

Start time - TrendBeginTime

Defines the start time of the time range for data transfer to the selected trend.

The attribute can be assigned dynamic properties by means of the name **TrendBeginTime**. The data type is Date.

TrendColor property

Trend color - TrendColor

Specifies the trend color. Open the "Color selection" dialog by clicking the button.

The attribute can be assigned dynamic properties by means of the name **TrendColor**. The data type is LONG.

LTrendColor property (before WinCC V7)

Description

Determines the color of the trend display or returns it.
The trend display indicates the tendency (rising or falling) of the measuring value being monitored by a small arrow. In order to activate the trend display, the Trend property must be set to "True". LONG write-read access.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

TrendCount property

TrendCount

Defines the number of configured trends.

The attribute can be assigned dynamic properties by means of the name **TrendCount**. The data type is LONG.

TrendEndTime property

End time - TrendEndTime

Defines the end of the time range for data connections of a selected trend.

The attribute can be assigned dynamic properties by means of the name **TrendEndTime**. The data type is Date.

TrendExtendedColorSet property

Extended - TrendExtendedColorSet

Enables configuration of the point and fill colors and the display of colors in Runtime.

Value	Explanation
TRUE	The "Point color" and "Fill color" field settings can be configured and are active in Runtime.
FALSE	The "Point color" and "Fill color" field settings cannot be configured and are inactive in Runtime.

The attribute can be assigned dynamic properties by means of the name **TrendExtendedColorSet**. The data type is BOOLEAN.

TrendFill property

Filled - TrendFill

Specifies if the area beneath the trend is to be filled.

Value	Explanation
TRUE	The area beneath the trend is shown filled. You can define the trend color as fill color if the "Advanced" option is deactivated. The text background is displayed in the trend color for the trend type "Values". The background color of the control is used as text color.
FALSE	The trend is not visualized with fill color.

The attribute can be assigned dynamic properties by means of the name **TrendFill**. The data type is BOOLEAN.

TrendFillColor property

Fill color - TrendFillColor

Specifies the fill color of the trend. The text fill color is specified for the trend type "Values".

The fill color is used if the "Filled" option is activated or "TrendFill" is "TRUE". Open the "Color selection" dialog by clicking the button.

The configuration is only possible if the "Advanced" option is activated or "TrendExtendedColorSet" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendFillColor**. The data type is LONG.

TrendIndex property

TrendIndex

References a configured trend. Using this attribute you can assign the values of other attributes to a specific trend. The index must always be set before you change the properties of a trend in runtime.

Values between 0 and "TrendIndex" minus 1 are valid for "TrendCount". Attribute "TrendCount" defines the number of trends configured.

The "TrendIndex" attribute can be assigned dynamic properties by means of attribute **TrendRepos**. The data type is LONG.

TrendLabel property

Label - TrendLabel

Defines the label of the trend selected. The label is displayed in Runtime if the value at attribute "UseTrendNameAsLabel" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **TrendLabel**. The data type is STRING.

TrendLineStyle property

Line style - TrendLineStyle

Defines the line style for trend visualization.

The following settings are available:

Value	Description	Explanation
0	Solid	The trend is visualized as solid line.
1	Dashed	The trend is visualized as dashed line.
2	Dotted	The trend is visualized as dotted line.
3	Dash dot	The trend is visualized as dot-dash line.
4	Dash Dot Dot	The trend is visualized as dash-dot-dot line.

The attribute can be assigned dynamic properties by means of the name **TrendLineStyle**. The data type is LONG.

TrendLineType property

Trend type - TrendLineType

Defines how to visualize a trend.

The following settings are available:

Value	Description	Explanation
0	None	Only the dots are displayed.
1	Connect dots linearly	Visualizes a trend with linear interconnection of points.
2	Stepped	Visualizes a stepped trend and its interconnected points.
3	Values	Can only be configured with OnlineTrendControl. A value is displayed at each time stamp or at the main grid line of the time axis instead of trend points.

The attribute can be assigned dynamic properties by means of the name **TrendLineType**. The data type is LONG.

TrendLineWidth property

Line weight - TrendLineWidth

Defines the line weight of the line displayed.

The attribute can be assigned dynamic properties by means of the name **TrendLineWidth**. The data type is LONG.

TrendLowerLimit property

TrendLowerLimit

Specifies the low limit of a tag. The values are identified based on the color set in "TrendLowerLimitColor" if the tag value is less than "TrendLowerLimit". This setting is only active if the value at attribute "TrendLowerLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendLowerLimit**. The data type is DOUBLE.

TrendLowerLimitColor property

TrendLowerLimitColor

Specifies the color of tag values which are less than the value at "TrendLowerLimit". This setting is only active if the value at attribute "TrendLowerLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendLowerLimitColor**. The data type is LONG.

TrendLowerLimitColoring property

TrendLowerLimitColoring

Enables the "TrendLowerLimitColor" attribute for identifying tag values which are less than the value at "TrendLowerLimitValue".

Value	Explanation
TRUE	Attribute "TrendLowerLimitColor" is active.
FALSE	Attribute "TrendLowerLimitColor" is inactive.

The attribute can be assigned dynamic properties by means of the name **TrendLowerLimitColoring**. The data type is BOOLEAN.

2.4.19.7 TrendMeasure - TrendVisible

TrendMeasurePoints property

Number of measurement points - TrendMeasurePoints

Defines the number of measurement points for visualization of selected trends.

Defines the number of value pairs provided to the trend from a user archive.

The attribute can be assigned dynamic properties by means of the name **TrendMeasurePoints**. The data type is LONG.

TrendName property

Object name - TrendName

Displays the name of the selected trend. The name is defined on the "Trends" tab.

The "TrendName" attribute can be assigned dynamic properties by means of attribute **TrendRename**. The data type is STRING.

TrendPointColor property

Point color - TrendPointColor

Defines the color of trend points. Open the "Color selection" dialog by clicking the button.

The configuration is only possible if the "Advanced" option is activated or "TrendExtendedColorSet" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendPointColor**. The data type is LONG.

TrendPointStyle property

Dot type - TrendPointStyle

Defines the dot style for trend visualization.

The following settings are available:

Value	Description	Explanation
0	None	The points are not displayed.
1	Dots	The trend points are visualized with a size of one pixel. The setting in the "Dot width" field is deactivated.

Value	Description	Explanation
2	Squares	The dots are displayed as square. The setting in the "Dot width" field is active.
3	Circles	The dots are displayed as circles. The setting in the "Dot width" field is active.

The attribute can be assigned dynamic properties by means of the name **TrendPointStyle**. The data type is LONG.

TrendPointWidth property

Dot width - TrendPointWidth

Sets the dot width in pixels. You can only define the dot width for the "square" and "circular" type.

The attribute can be assigned dynamic properties by means of the name **TrendPointWidth**. The data type is LONG.

TrendProvider property

Data source - TrendProvider

Specifies the data source for a selected trend.

The following settings are available:

Value	Description	Explanation
0	None	No data source configured for implementation in Runtime by means of script.
1	Archive tags	Data source with archive tags of a process value archive.
2	Online tags	Data source with online tags derived from tag management.
3	User archive	Data source with columns of a user archive.

The attribute can be assigned dynamic properties by means of the name **TrendProvider**. The data type is LONG.

TrendProviderCLSID_FunctionTrend property

TrendProviderCLSID_FunctionTrend

Indicates the data source of the trend selected.

Value	Explanation
	No data source configured for implementation in Runtime by means of script.
{416A09D2-8B5A-11D2-8B81-006097A45D48}	Data source with archive tags of a process value archive.

Value	Explanation
{A3F69593-8AB0-11D2-A440-00A0C9DBB64E}	Data source with online tags derived from tag management.
{2DC9B1C8-4FC1-41B1-B354-3E469A13FBFD}	Data source with columns of a user archive.

The attribute can be assigned dynamic properties by means of the name **TrendProviderCLSID**. The data type is STRING.

TrendProviderCLSID_OnlineTrend property

TrendProviderCLSID_OnlineTrend

Indicates the data source of the trend selected.

Value	Explanation
	No data source configured for implementation in Runtime by means of script.
{416A09D2-8B5A-11D2-8B81-006097A45D48}	Data source with archive tags of a process value archive.
{A3F69593-8AB0-11D2-A440-00A0C9DBB64E}	Data source with online tags derived from tag management.

The attribute can be assigned dynamic properties by means of the name **TrendProviderCLSID**. The data type is STRING.

TrendRangeType property

Time range setting - TrendRangeType

Defines the time range for providing data to the selected trend.

You can only define the number of measuring points if you select user archives as the data source.

The following configuration options are available:

Value	Description	Explanation
0	Time range	Defines the start time and the time range for the data connection.
1	Start to end time	Defines the start and end time for the data connection.
2	Number of measurement points	Defines the start time and the number of measurement points for the data connection.

The attribute can be assigned dynamic properties by means of the name **TrendRangeType**. The data type is LONG.

TrendRemove property

Remove - TrendRemove

Removes selected trends from the list.

The attribute can be assigned dynamic properties by means of the name **TrendRemove**. The data type is STRING.

TrendRename property

TrendRename

Renames a trend which is referenced by means of "TrendIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **TrendRename**. "TrendRename" also sets a dynamic attribute "TrendName". The data type is STRING.

TrendRepos property

Up/Down - TrendRepos

Repositions the trend in the trend window. "Up" and "Down" move the selected trend up or down in the list. This moves the trend towards the foreground or background for visualization in Runtime.

The attribute can be assigned dynamic properties by means of the name **TrendRepos**. The data type is LONG.

TrendSelectTagName property

TrendSelectTagName

Opens a dialog for selecting the tag name for the source of Y axis data in WinCC OnlineTrendControl. Programmers can set this attribute to allow users to select a tag name by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **TrendSelectTagName**. The data type is BOOLEAN.

TrendSelectTagNameX property

TrendSelectTagNameX

Opens a dialog for selecting the tag name for the source of X axis data in WinCC FunctionTrendControl. Programmers can set this attribute to allow users to select a tag name by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **TrendSelectTagNameX**. The data type is BOOLEAN.

TrendSelectTagNameY property

TrendSelectTagNameY

Opens a dialog for selecting the tag name for the source of Y axis data in WinCC FunctionTrendControl. Programmers can set this attribute to allow users to select a tag name by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **TrendSelectTagNameY**. The data type is BOOLEAN.

TrendState property

TrendState

Shows the status of the data link of the selected curve in Runtime.

The attribute can be made dynamic with the name **TrendState**. The data type is LONG.

TrendTagName property

Tag name - TrendTagName

Displays the name of connected tags. Use the Open button to open a dialog for selecting an online or archive tag.

The attribute can be assigned dynamic properties by means of the name **TrendTagName**. The data type is STRING.

TrendTagNameX property

Tag Name X / Column X - TrendTagNameX

Shows the name of interconnected tags or of the column for the X axis. Using the selection button, select a tag or a column for the data source you configured.

The attribute can be assigned dynamic properties by means of the name **TrendTagNameX**. The data type is STRING.

TrendTagNameY property

Tag Name Y / Column Y - TrendTagNameY

Shows the name of interconnected tags or of the column for the Y axis. Using the selection button, select a tag or a column for the data source you configured.

The attribute can be assigned dynamic properties by means of the name **TrendTagNameY**. The data type is STRING.

TrendTimeAxis property

Time axis - TrendTimeAxis

Defines the time axis to be used for the trend selected. Define the available time axes in the "Time axes" tab.

The attribute can be assigned dynamic properties by means of the name **TrendTimeAxis**. The data type is STRING.

TrendTimeRangeBase property

Time Range - TrendTimeRangeBase

Defines the time unit for calculating the time range.

The following time units are available:

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

The attribute can be assigned dynamic properties by means of the name **TrendTimeRangeBase**. The data type is LONG.

TrendTimeRangeFactor property

Time range - TrendTimeRangeFactor

Defines the factor for calculating the time range. Only integer factors are valid.

The attribute can be assigned dynamic properties by means of the name **TrendTimeRangeFactor**. The data type is SHORT.

TrendTrendWindow property

Trend window - TrendTrendWindow

Defines the trend window for visualizing the trend selected. Define the available trend windows in the "Trend window" tab.

The attribute can be assigned dynamic properties by means of the name **TrendTrendWindow**. The data type is STRING.

TrendUncertainColor property

TrendUncertainColor

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. Set attribute "TrendUncertainColor" to define the color identifier of these values. The "TrendUncertainColoring" attribute determines whether or not this setting is evaluated.

The attribute can be assigned dynamic properties by means of the name **TrendUncertainColor**. The data type is LONG.

TrendUncertainColoring property

TrendUncertainColoring

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. The "TrendUncertainColoring" attribute is used to enable identification of such values based on the color set in "TrendUncertainColor".

Value	Explanation
TRUE	The settings of the "TrendUncertainColor" attribute are active.
FALSE	The settings of the "TrendUncertainColor" attribute are inactive.

The attribute can be assigned dynamic properties by means of the name **TrendUncertainColoring**. The data type is BOOLEAN.

TrendUpperLimit property

TrendUpperLimit

Specifies the high limit of a tag. The values are identified based on the color set in "TrendUpperLimitColor" if the tag value exceeds the "TrendUpperLimit". This setting is only active if the value at attribute "TrendUpperLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendUpperLimit**. The data type is DOUBLE.

TrendUpperLimitColor property

TrendUpperLimitColor

Specifies the color of tag values which are less than the value at "TrendLowerLimit". This setting is only active if the value at attribute "TrendUpperLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendUpperLimitColor**. The data type is LONG.

TrendUpperLimitColoring property

TrendUpperLimitColoring

Enables the "TrendUpperLimitColor" attribute for identifying tag values which are less than the value at "TrendUpperLimit".

Value	Explanation
TRUE	The setting of the "TrendUpperLimitColor" attribute is active.
FALSE	The setting of the "TrendUpperLimitColor" attribute is inactive.

The attribute can be assigned dynamic properties by means of the name **TrendUpperLimitColoring**. The data type is BOOLEAN.

TrendValueAlignment property

Alignment - TrendValueAlignment

Specifies the alignment of the displayed values for the trend type "Values".

The following settings are available depending on the writing direction of the trend:

- The writing direction of the trend is "from right" or "from left"

Value	Description	Explanation
0	Bottom	The values are displayed at the bottom in the trend window.
1	Centered	The values are displayed centered in the trend window.
2	Top	The values are displayed at the top in the trend window.

- The writing direction of the trend is "from top" or "from bottom"

Value	Description	Explanation
0	Left	The values are displayed on the left in the trend window.
1	Centered	The values are displayed centered in the trend window.
2	Right	The values are displayed on the right in the trend window.

The attribute can be assigned dynamic properties by means of the name **TrendValueAlignment**. The data type is LONG.

TrendValueAxis property

Value axis - TrendValueAxis

Defines the value axis to be used for the trend selected. Define the available value axes in the "Value axes" tab.

The attribute can be assigned dynamic properties by means of the name **TrendValueAxis**. The data type is STRING.

TrendValueUnit property

Unit - TrendValueUnit

Specifies a unit for the trend type "Values" that is appended to the displayed value, e.g., "%" or "°C".

The attribute can be assigned dynamic properties by means of the name **TrendValueUnit**. The data type is STRING.

TrendVisible property

Trends - TrendVisible

The list shows all trends you created.

Select the trends to be displayed in the trend window from the list.

Click a trend entry in the list to adapt the properties and to assign axes and trend windows to the trend.

The attribute can be assigned dynamic properties by means of the name **TrendVisible**. The data type is BOOLEAN.

2.4.19.8 TrendWindow - TrendYAxis

TrendWindowAdd property

New - TrendWindowAdd

Creates a new trend window.

The attribute can be assigned dynamic properties by means of the name **TrendWindowAdd**. The data type is STRING.

TrendWindowCoarseGrid property

Main grid lines - TrendWindowCoarseGrid

Enables the display of grid lines for the main scale.

Value	Explanation
TRUE	Enables the display of grid lines for the main scale.
FALSE	Disables the display of grid lines for the main scale.

The attribute can be assigned dynamic properties by means of the name **TrendWindowCoarseGrid**. The data type is BOOLEAN.

TrendWindowCoarseGridColor property

Color of main scale - TrendWindowCoarseGridColor

Specifies the grid color of the main scale. Open the "Color selection" dialog by clicking the button.

The attribute can be assigned dynamic properties by means of the name **TrendWindowCoarseGridColor**. The data type is LONG.

TrendWindowCount property

TrendWindowCount

Defines the number of configured trend views.

The attribute can be assigned dynamic properties by means of the name **TrendWindowCount**. The data type is LONG.

TrendWindowFineGrid property

Secondary grid lines - TrendWindowFineGrid

Enables the display of grid lines for the secondary scale.

Value	Explanation
TRUE	Enables the display of grid lines for the secondary scale.
FALSE	Disables the display of grid lines for the secondary scale.

The attribute can be assigned dynamic properties by means of the name **TrendWindowFineGrid**. The data type is BOOLEAN.

TrendWindowFineGridColor property

Color of secondary scale - TrendWindowFineGridColor

Specifies the grid color of the main scale. Open the "Color selection" dialog by clicking the button.

The attribute can be assigned dynamic properties by means of the name **TrendWindowFineGridColor**. The data type is LONG.

TrendWindowForegroundTrendGrid property

Only for foreground trend - TrendWindowForegroundTrendGrid

Enables the display of grid lines only for the foreground trend in the trend window.

Value	Explanation
TRUE	Enables the display of grid lines for the foreground trend in the trend window.
FALSE	Enables the display of grid lines for all trends in the trend window.

The attribute can be assigned dynamic properties by means of the name **TrendWindowForegroundTrendGrid**. The data type is BOOLEAN.

TrendWindowGridInTrendColor property

Use trend color - TrendWindowGridInTrendColor

Sets the trend color for the visualization of the grid lines for the main scale.

Value	Explanation
TRUE	The grid is displayed in the trend color.
FALSE	The grid is displayed with the color set in the "Color" field.

The attribute can be assigned dynamic properties by means of the name **TrendWindowGridInTrendColor**. The data type is BOOLEAN.

TrendWindowHorizontalGrid property

For X axis - TrendWindowVerticalGrid

Enables the display of horizontal grid lines.

Value	Explanation
TRUE	The display of horizontal grid lines is enabled.
FALSE	The display of horizontal grid lines is disabled.

The attribute can be assigned dynamic properties by means of the name **TrendWindowHorizontalGrid**. The data type is BOOLEAN.

TrendWindowIndex property

TrendWindowIndex

References a configured trend view. Using this attribute you can assign the values of other attributes to a specific trend view.

Values between 0 and "TrendWindowIndex" minus 1 are valid for "TrendWindowCount". Attribute "TrendWindowCount" defines the number of trend views configured.

The "TrendWindowIndex" attribute can be assigned dynamic properties by means of attribute **TrendWindowRepos**. The data type is LONG.

TrendWindowName property

Object name - TrendWindowName

Defines the name of the trend window selected.

The "TrendWindowName" attribute can be assigned dynamic properties by means of attribute **TrendWindowRename**. The data type is STRING.

TrendWindowRemove property

Remove - TrendWindowRemove

Removes the selected trend window from the list.

The attribute can be assigned dynamic properties by means of the name **TrendWindowRemove**. The data type is STRING.

TrendWindowRename property

TrendWindowRename

Renames a trend view which is referenced by means of "TrendWindowIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **TrendWIndowRename**. "TrendWindowRename" also sets a dynamic attribute "TrendWindowName". The data type is STRING.

TrendWindowRepos property

Up/Down - TrendWindowRepos

Changes the sorting order of the trend windows. "Up" and "Down" move the selected trend up or down in the list.

The sorting order in the list defines the position in the Control. The first trend window is displayed at the last position, while the last is displayed at the top position.

The attribute can be assigned dynamic properties by means of the name **TrendWindowRepos**. The data type is LONG.

TrendWindowRulerColor property

Ruler color - TrendWindowRulerColor

Specifies the ruler color. Open the "Color selection" dialog by clicking the button.

The color can be configured and displayed if "1 - graphic" is set for display of the ruler or "TrendWindowRulerStyle".

The attribute can be assigned dynamic properties by means of the name **TrendWindowRulerColor**. The data type is LONG.

TrendWindowRulerLayer property

Ruler layer - TrendWindowRulerLayer

Defines the representation layer of a ruler in the trend window.

The following settings are available:

Value	Description	Explanation
0	Under grid	The ruler is visualized on a layer under the grid.
1	Between grid and trend	The ruler is positioned on top of the trend and under the grid.
2	On top of trend	The ruler is positioned on top of the trend.

The attribute can be assigned dynamic properties by means of the name **TrendWindowRulerLayer**. The data type is LONG.

TrendWindowRulerStyle property

Ruler - TrendWindowRulerStyle

Defines the appearance of the ruler.

The following settings are available:

Value	Description	Explanation
0	Simple	The ruler is displayed as basic black line.
1	Graphic	The ruler is displayed based on the "color" and "weight" configured.

The attribute can be assigned dynamic properties by means of the name **TrendWindowRulerStyle**. The data type is LONG.

TrendWindowRulerWidth property

Ruler width - TrendWindowRulerWidth

Defines the width of the ruler in pixels.

The width can be configured and displayed if "1 - graphic" is set for display of the ruler or "TrendWindowRulerStyle".

The attribute can be assigned dynamic properties by means of the name **TrendWindowRulerWidth**. The data type is LONG.

TrendWindowSpacePortion property

Proportional area - TrendWindowSpacePortion

Specifies the proportion of the trend widow to be used for the selected curve.

The attribute can be assigned dynamic properties by means of the name **TrendWindowSpacePortion**. The data type is LONG.

TrendWindowStatisticRulerColor property

Color of ruler for statistics area - TrendWindowStatisticRulerColor

Specifies the color of the ruler for the statistics area. The button opens the "Color selection" dialog to select the color.

The color can be configured and displayed if "1 - graphic" is set for display of the ruler for the statistics area or "TrendWindowStatisticRulerStyle".

The attribute can be assigned dynamic properties by means of the name **TrendWindowStatisticRulerColor**. The data type is LONG.

TrendWindowStatisticRulerStyle property

Ruler for statistics area - TrendWindowStatisticRulerStyle

Enables the display of a ruler for defining the statistics area.

The following settings are available:

Value	Description	Explanation
0	Simple	The ruler is displayed as basic black line.
1	Graphic	The ruler is displayed based on the "color" and "weight" configured.

The attribute can be assigned dynamic properties by means of the name **TrendWindowStatisticRulerStyle**. The data type is LONG.

TrendWindowStatisticRulerWidth property

Width of ruler for statistics area - TrendWindowStatisticRulerWidth

Defines the width of the ruler for the statistics area in pixels.

The width of the ruler can be configured and displayed if "1 - graphic" is set for display of the ruler for the statistics area or "TrendWindowStatisticRulerStyle".

The attribute can be assigned dynamic properties by means of the name **TrendWindowStatisticRulerWidth**. The data type is LONG.

TrendWindowVerticalGrid property

for Y axis - TrendWindowVerticalGrid

Enables the display of vertical grid lines.

Value	Explanation
TRUE	The display of vertical grid lines is enabled.
FALSE	The display of vertical grid lines is disabled.

The attribute can be assigned dynamic properties by means of the name **TrendWindowVerticalGrid**. The data type is BOOLEAN.

TrendWindowVisible property

Trend window - TimeAxisTrendWindow

The list shows all trend windows you created.

Select the trend windows to be displayed in the control from the list.

Click a list entry to adapt the ruler and grid line properties.

The attribute can be assigned dynamic properties by means of the name **TrendWindowVisible**. The data type is BOOLEAN.

TrendXAxis property

X axis - TrendXAxis

Defines the X axis to be used for the trend selected. Define the available X axes inn the "X Axes" tab.

The attribute can be assigned dynamic properties by means of the name **TrendXAxis**. The data type is STRING.

TrendYAxis property

Y axis - TrendYAxis

Defines the Y axis to be used for the trend selected. Define the available Y axes inn the "Y Axes" tab.

The attribute can be assigned dynamic properties by means of the name **TrendYAxis**. The data type is STRING.

2.4.19.9 Type

Type Property

Description

Reads out the object type, e.g. "Rectangle", "Circle" or "Line".

The object type is returned as a string. Read only

A special ID is returned as the type for all the graphic elements provided by WinCC. It can be found under the topic "Type Identification in VBS“ in the individual descriptions of the WinCC Object Types.

Special feature

In the case of non-WinCC controls and OLE objects, the version-independent ProgID is returned as the type.

It is possible to determine the version-dependent ProgID or "User friendly Name" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every Control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS91
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Determine the User Friendly Name as follows:

```
'VBS92
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Example:

The following example displays the type for all objects in the picture "NewPDL1":

```
'VBS93
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim lngAnswer
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
```

```
lngAnswer = MsgBox(objScrItem.Type, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

TypeWarningLow Property

Description

TRUE, when the "Warning low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

See also

Bar (Page 189)

2.4.20 U

2.4.20.1 Un - Up

UnitColor Property

Description

Defines the text color for the names of the unit of measurement. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

UnitFont Property

Description

Controls the display of the labeling for the unit of measurement. Read only access.

The following properties can be set:

- Font
- Font Style
- Font Size
- "Strikethrough" effect
- "Underline" effect

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

UnitOffset Property

Description

This attribute defines the distance of the text for the unit of measurement in relation to the top edge of the object. The text can only be positioned along the vertical diameter of the graduated scale disk. The value of the property is related to the height of the object and is measured from the top edge of the object to the base of the text.

The value range is 0 is 1.

0: The base of the text is at the top limit of the object. The text is no longer visible because it is outside the object.

1: The base of the text is at the bottom limit of the object.

UnitText Property

Description

Defines the text for the unit of measurement. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

UnselBGColor Property

Description

Defines or returns the background color of entries in the text list object which are not selected. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

UnselTextColor Property

Description

Defines or returns the color of the text for entries in the text list object which are not selected. LONG write-read access.

See also

Text list (Page 211)

ScreenItem Object (Page 141)

UpdateCycle Property

Description

Returns the type and frequency of updating the picture window in Runtime. Read only access.

See also

Picture Window (Page 194)

ScreenItem Object (Page 141)

UpperLimit Property

Description

TRUE, when the "UpperLimitColor" specification is to be used in order to identify the tag values (from a trend referenced via "Index") which lie above the value defined in "UpperLimitValue". BOOLEAN write-read access.

See also

WinCC Online Trend Control (before WinCC V7) (Page 297)

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

UpperLimitColor Property

Description

Defines the color to be used in order to identify the tag values (from a trend referenced via "Index") which lie above the value defined in "UpperLimitValue". Whether the information is evaluated is dependent on the value of the "UpperLimit" property. The color is defined as an RGB value. LONG write-read access.

WinCC Function Trend Control (before WinCC V7) (Page 290)

ScreenItem Object (Page 141)

UpperLimitTagName Property

Description

This defines the upper limit of the trend range, which is automatically taken from the variable properties configured in PCS 7. Write/Read access.

UpperLimitValue Property

Description

Tag values (from a trend referenced via "Index") which lie above the value defined by "UpperLimitValue" are identified by the color specified in "UpperLimitColor". Whether the information is evaluated is dependent on the value of the "UpperLimit" property.

2.4.20.2 Us

UseColumnBackColor property

Use column color / background - UseColumnBackColor

Specifies the settings to be activated for the background colors of columns.

Value	Explanation
TRUE	The background color settings are active in the "Time columns" or "TimeColumnBackColor" tabs and in the "Value columns" or "ValueColumnBackColor" tabs.
FALSE	The background color settings are active in the "Display" tab.

The attribute can be assigned dynamic properties by means of the name **UseColumnBackColors**. The data type is BOOLEAN.

UseColumnForeColor property

Use column color / font - UseColumnForeColor

Defines the active font color settings for the columns.

Value	Explanation
TRUE	The font color color settings are active in the "Time columns" or "TimeColumnForeColor" tabs and in the "Value columns" or "ValueColumnForeColor" tabs.
FALSE	The font color settings are active in the "Display" tab.

The attribute can be assigned dynamic properties by means of the name **UseColumnForeColors**. The data type is BOOLEAN.

UseMessageColor property

Show message colors - UseMessageColor

Sets the outputs of messages with colors as agreed by handshake.

Value	Explanation
TRUE	The message colors are displayed.
FALSE	The message colors are not displayed. Instead, the color settings defined for the table content are activated on the "Display" tab.

The attribute can be assigned dynamic properties by means of the name **UseMessageColor**. The data type is BOOLEAN.

UseOnlineTags Property

Description

This defines whether or not the variable properties configured in PCS 7 are applied as trend parameters. Write/Read access.

UseRangeSubstitutes Property

Description

TRUE, if a separate scaling of the value axis is displayed for the trends in Trend Control. BOOLEAN write-read access.

UserData-Property

Description

Contains the value that is to be transferred to the VB script while running a customized menu item or icon. STRING (write-read access)

Example:

Use the "User data" field in the "Menus and Toolbars" editor to apply a parameter to the procedure

The following example shows the "ActivateScreen" procedure that executes the picture change. Enter the picture name in the "User Data" field:

```
Sub ActivateScreen (ByVal Item)
Dim objScreen
Dim strScreenName
' "UserData" contains the screen name specified
' in editor menus and toolbars.
strScreenName = Item.Userdata
HMIRuntime.BaseScreenName = strScreenName
End Sub
```

UserName property

Description

Returns the name of the user who triggered the alarm object.

See also

Alarms object (list) (Page 126)

UserValue1 Property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

See also

ScreenItem Object (Page 141)

Group Display (Page 208)

UserValue2-Eigenschaft

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

UserValue3 Property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

UserValue4 Property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

See also

Group Display (Page 208)

ScreenItem Object (Page 141)

UseSelectedTitleColor property

Selection color - UseSelectedTitleColor

Specifies whether to use a selection color for the headers of selected table cells.

Value	Explanation
TRUE	A selection color is used. The "Background" or "SelectedTitleColor" and "Font" or "SelectedTitleForeColor" settings are active in Runtime.
FALSE	Selection color is not used. The "Background" and "Font" settings are disabled in Runtime.

The attribute can be assigned dynamic properties by means of the name **UseSelectedTitleColor**. The data type is BOOLEAN.

UseSourceBackColors property

Apply background colors - UseSourceBackColors

Sets the background color derived from the control defined in the "Source" field.

Value	Explanation
TRUE	The background color from the interconnected control is used.
FALSE	The background color from the interconnected control is not used. The settings on the "Layout" tab are used.

The attribute can be assigned dynamic properties by means of the name **UseSourceBackColors**. The data type is BOOLEAN.

UseSourceForeColors property

Apply font colors - UseSourceForeColors

Sets the font colors derived from the control defined in the "Source" field.

Value	Explanation
TRUE	The font color of the interconnected control is activated.
FALSE	The font color from the connected control is not used. The settings on the "Layout" tab are used.

The attribute can be assigned dynamic properties by means of the name **UseSourceForeColors**. The data type is BOOLEAN.

UseTableColor2 property

Row Color 2 - UseTableColor2

Specifies whether to use a second row color for the representation of the table.

Value	Explanation
TRUE	"Row color 2" and "Row color 1" are used alternately.
FALSE	The "Row color 1" settings are used for all rows.

The attribute can be assigned dynamic properties by means of the name **UseTableColor2**. The data type is BOOLEAN.

UseTrendNameAsLabel property

UseTrendNameAsLabel

Sets the "TrendName" or "TrendLabel" attribute for labeling the trend in Runtime.

Value	Explanation
TRUE	Sets the "TrendName" attribute for labeling the trend in Runtime.
FALSE	Sets the "TrendLabel" attribute for labeling the trend in Runtime.

The attribute can be assigned dynamic properties by means of the name **UseTrendNameAsLabel**. The data type is BOOLEAN.

2.4.21 V

2.4.21.1 Val - ValueAxis

Value Property

Description of Tag Object

Displays the value of the tags at the last read access or the value written or to be written. Value represents the value of a tag. After calling in the "Read" method, the tag value read is returned. Before writing, the new tag value required can be assigned to the property. After calling in the "Write" method, the property contains the value last written.

VARIANT (write-read access)

Example:

The following example writes a new value in the "Tag1" tag:

```
'VBS94
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Value = 50
objTag.Write
```

Description of WinCC Gauge Control

Defines the value to which the pointer points. Value Range: "ValueMin" to "ValueMax".

Description of DataItem Object

Returns a value copy or object reference. Furthermore, an already added value can be changed via the value property.

Example:

The example shows how to add a value to the list, and how to output it as a trace. After that, the value is changed, output again and then removed. It make sense to perform this in several different actions.

```
'VBS198
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet("motor1").Value = 55
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
```

```
HMIRuntime.DataSet.Remove("motor1")
```

Note

For object references it must be ascertained that objects are multiread-enabled.

WinCC Gauge Control (Page 264)

Write Method (Page 796)

Read Method (Page 767)

Tag Object (Page 152)

DataItem Object (Page 129)

ProcessValues Object (List) (Page 140)

ValueAxisAdd property

New - ValueAxisAdd

Creates a new value axis.

The attribute can be assigned dynamic properties by means of the name **ValueAxisAdd**. The data type is STRING.

ValueAxisAlign property

Alignment - ValueAxisAlign

Specifies the mode of alignment of a selected value axis.

The following settings are available:

Value	Description	Explanation
0	left	The value axis selected is displayed on left side of the trend.
1	right	The value axis selected is displayed on right side of the trend.

The attribute can be assigned dynamic properties by means of the name **ValueAxisAlign**. The data type is LONG.

ValueAxisAutoPrecisions property

Decimal places automatic - ValueAxisAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The decimal precision is defined automatically. The value in the "Decimal places" or "ValueAxisPrecisions" field is disabled.
FALSE	The value in the "Decimal places" or "ValueAxisPrecisions" field is active.

The attribute can be assigned dynamic properties by means of the name **ValueAxisAutoPrecisions**. The data type is BOOLEAN.

ValueAxisAutoRange property

Value range automatic - ValueAxisAutoRange

Enables automatic calculation of the range of values.

Value	Explanation
TRUE	The range of values is calculated automatically.
FALSE	The range of values is calculated based on the values configured in the "from" and "to" or "ValueAxisBeginValue" and "ValueAxisEndValue" fields.

The attribute can be assigned dynamic properties by means of the name **ValueAxisAutoRange**. The data type is BOOLEAN.

ValueAxisBeginValue property

Value range from - ValueAxisBeginValue

Specifies the start value of the value axis selected. You can configure the value if the "Automatic" option is disabled or "ValueAxisAutoRange" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueAxisBeginValue**. The data type is DOUBLE.

ValueAxisColor property

Value axis color - ValueAxisColor

Specifies the color of the time axis. The button opens the "Color selection" dialog to select the color.

The setting is only active if the "Use trend color" option is disabled or if "ValueAxisInTrendColor" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueAxisColor**. The data type is LONG.

ValueAxisCount property

ValueAxisCount

Defines the number of value axes configured.

The attribute can be assigned dynamic properties by means of the name **ValueAxisCount**. The data type is LONG.

ValueAxisEndValue property

Value range to - ValueAxisEndValue

Specifies the end value of the value axis selected. You can configure the value if the "Automatic" option is disabled or "ValueAxisAutoRange" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueAxisEndValue**. The data type is DOUBLE.

ValueAxisExponentialFormat property

Exponential notation - ValueAxisExponentialFormat

Sets exponential notation for the display of values of a value axis selected.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The attribute can be assigned dynamic properties by means of the name **ValueAxisExponentialFormat**. The data type is BOOLEAN.

ValueAxisIndex property

ValueAxisIndex

References a value axis. Using this attribute you can assign the values of other attributes to a specific value axis.

Values between 0 and "ValueAxisCount" minus 1 are valid for "ValueAxisIndex". Attribute "ValueAxisCount" defines the number of value axes configured.

The "ValueAxisIndex" attribute can be assigned dynamic properties by means of attribute **ValueAxisRepos**. The data type is LONG.

ValueAxisInTrendColor property

Use trend color - ValueAxisInTrendColor

Sets the trend color for displaying the value axis selected. The color of the first trend is activated if several trends are displayed in the trend window. Define the order of trends on the "Trends" tab.

Value	Explanation
TRUE	The selected value axis is displayed in the trend color. The setting in the "Color" or "ValueAxisColor" field is disabled.
FALSE	The value axis selected is displayed in the color set in the "Color" or "ValueAxisColor" field.

The attribute can be assigned dynamic properties by means of the name **ValueAxisInTrendColor**. The data type is BOOLEAN.

ValueAxisInTrendColor property

Use trend color - ValueAxisInTrendColor

Sets the trend color for displaying the value axis selected. The color of the first trend is activated if several trends are displayed in the trend window. Define the order of trends on the "Trends" tab.

Value	Explanation
TRUE	The selected value axis is displayed in the trend color. The setting in the "Color" or "ValueAxisColor" field is disabled.
FALSE	The value axis selected is displayed in the color set in the "Color" or "ValueAxisColor" field.

The attribute can be assigned dynamic properties by means of the name **ValueAxisInTrendColor**. The data type is BOOLEAN.

ValueAxisLabel property

Label - ValueAxisLabel

Specifies the label of a value axis selected.

The attribute can be assigned dynamic properties by means of the name **ValueAxisLabel**. The data type is STRING.

ValueAxisName property

Object name - ValueAxisName

Specifies the name of a value axis selected.

The "ValueAxisName" attribute can be assigned dynamic properties by means of attribute **ValueAxisRename**. The data type is STRING.

ValueAxisPrecisions property

Decimal places - ValueAxisPrecisions

Specifies the decimal precision for displaying the value axis selected. The value can be configured and is active in Runtime, if the "Automatic" option is disabled or "ValueAxisAutoPrecisions" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueAxisPrecisions**. The data type is SHORT.

ValueAxisRemove property

Remove - ValueAxisRemove

Removes the selected value axis from the list.

The attribute can be assigned dynamic properties by means of the name **ValueAxisRemove**. The data type is STRING.

ValueAxisRename property

ValueAxisRename

Renames a value axis which is referenced by means of "ValueAxisIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **ValueAxisRename**. "ValueAxisRename" also sets a dynamic attribute "ValueAxisName". The data type is STRING.

ValueAxisRepos property

Up/Down - ValueAxisRepos

Changes the order of value axes. "Up" and "Down" move the value axis selected up or down in the list.

The list order determines the value axis position in the trend window. The axis output position is moved away from the trend if the value axis is moved further up in the list and the orientation is the same.

The attribute can be assigned dynamic properties by means of the name **ValueAxisRepos** . The data type is LONG.

ValueAxisScalingType property

Scaling - ValueAxisScalingType

Specifies the scaling mode for a selected value axis.

The following settings are available:

Value	Description	Explanation
0	Linear	Enables linear scaling of a value axis selected.
1	Logarithmic	Enables logarithmic scaling of a value axis selected.
2	Logarithmically negated	Enables scaling of a selected value value axis with logarithmic negation.

The attribute can be assigned dynamic properties by means of the name **ValueAxisScalingType**. The data type is LONG.

ValueAxisTrendWindow property

Trend window - ValueAxisTrendWindow

Specifies the trend window for displaying the value axis selected. Define the available trend windows in the "Trend window" tab.

The attribute can be assigned dynamic properties by means of the name **ValueAxisTrendWindow**. The data type is STRING.

ValueAxisVisible property

Value axes - ValueAxisVisible

The list shows all value axes you created. Click a value axis entry in the list to adapt the properties and to assign the value axis to a trend window.

Activate the value axes to be displayed in the trend windows in the list.

The attribute can be assigned dynamic properties by means of the name **ValueAxisVisible** . The data type is BOOLEAN.

2.4.21.2 ValueColumn - Vi

ValueColumnAdd property

New - ValueColumnAdd

Creates a new value column.

The attribute can be assigned dynamic properties by means of the name **ValueColumnAdd**. The data type is STRING.

ValueColumnAlign property

Alignment - ValueColumnAlign

Defines the mode of alignment of a selected value column.

The following settings are available:

Value	Description	Explanation
0	left	The selected value column is displayed on the left.
1	Centered	The selected value column is aligned to center.
2	right	The selected value column is displayed on the right.

The attribute can be assigned dynamic properties by means of the name **ValueColumnAlign**. The data type is LONG.

ValueColumnAlignment Property

Description

The "Index" property references a pair of columns. "ValueColumnAlignment" defines the alignment of the tag value for this column pair.

- 0: Tag values are entered aligned left.
- 1: Tag values are entered centered.
- 2: Tag values are entered aligned right.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

ValueColumnAutoPrecisions property

Automatic - ValueColumnAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The decimal precision is defined automatically. The value in the "Decimal places" or "ValueColumnPrecisions" field is disabled.
FALSE	The value in the "Decimal places" or "ValueColumnPrecisions" field is active.

The attribute can be assigned dynamic properties by means of the name **ValueColumnAutoPrecisions**. The data type is BOOLEAN.

ValueColumnBackColor property

Background color - ValueColumnBackColor

Specifies the background color of the value column selected. Use the button to open the "Color selection" dialog.

The setting is only active if the "Background color" option is set or "UseColumnBackColor" is "TRUE" in the "Use column color" field of the "General" tab.

The attribute can be assigned dynamic properties by means of the name **ValueColumnBackColor**. The data type is LONG.

ValueColumnCaption property

Description - ValueColumnCaption

Defines the label of the value column selected.

The attribute can be assigned dynamic properties by means of the name **ValueColumnCaption**. The data type is STRING.

ValueColumnCount property

ValueColumnCount

Defines the number of value columns configured.

The attribute can be assigned dynamic properties by means of the name **ValueColumnCount**. The data type is LONG.

ValueColumnExponentialFormat property

Exponential notation - ValueColumnExponentialFormat

Sets exponential notation for the display of values of a value column selected.

Value	Explanation
TRUE	Display with exponential notation.
FALSE	Display with decimal notation.

The attribute can be assigned dynamic properties by means of the name **ValueColumnExponentialFormat**. The data type is BOOLEAN.

ValueColumnForeColor property

Font color - ValueColumnForeColor

Specifies the font color of the value column selected. Use the button to open the "Color selection" dialog.

The setting is only active if the "Font color" option is set or "UseColumnForeColor" is "TRUE" in the "Use column color" field of the "General" tab.

The attribute can be assigned dynamic properties by means of the name **ValueColumnForeColor**. The data type is LONG.

ValueColumnHideText property

ValueColumnHideText

Sets text format for displaying the content of a value column.

Value	Explanation
TRUE	The content is not displayed in text format.
FALSE	The content is displayed in text format.

The attribute can be assigned dynamic properties by means of the name **ValueColumnHideText**. The data type is BOOLEAN.

ValueColumnHideTitleText property

ValueColumnHideTitleText

Sets text format for displaying the value column header.

Value	Explanation
TRUE	The header is not displayed in text format.
FALSE	The header is displayed in text format.

The attribute can be assigned dynamic properties by means of the name **ValueColumnHideTitleText**. The data type is BOOLEAN.

ValueColumnIndex property

ValueColumnIndex

References a configured value column. Using this attribute you can assign the values of other attributes to a specific value column.

Values between 0 and "ValueColumnCount" minus 1 are valid for "ValueColumnIndex". Attribute "ValueColumnCount" defines the number of value columns configured.

The "ValueColumnIndex" attribute can be assigned dynamic properties by means of attribute **ValueColumnRepos**. The data type is LONG.

ValueColumnLength property

Length in characters - ValueColumnLength

Specifies the width of a selected value column.

The attribute can be assigned dynamic properties by means of the name **ValueColumnLength**. The data type is LONG.

ValueColumnName property

Object name - ValueColumnName

Specifies the name of a selected value column.

The "ValueColumnName" attribute can be assigned dynamic properties by means of attribute **ValueColumnRename**. The data type is STRING.

ValueColumnPrecisions property

Decimal places - ValueColumnPrecisions

Specifies the decimal precision for displaying the data of a value column selected. The value can be entered if the "Automatic" option is disabled or "ValueColumnAutoPrecisions" is "FALSE".

The attribute can be assigned dynamic properties by means of the name **ValueColumnPrecisions**. The data type is SHORT.

ValueColumnProvider property

Data source - ValueColumnProvider

Specifies the data source for a selected value column.

The following settings are available:

Value	Description	Explanation
1	Archive tags	Data source with archive tags of a process value archive.
2	Online tags	Data source with online tags derived from tag management.

The attribute can be assigned dynamic properties by means of the name **ValueColumnProvider**. The data type is LONG.

ValueColumnProviderCLSID property

ValueColumnProviderCLSID

Indicates the data source of the value column selected.

Value	Explanation
{416A09D2-8B5A-11D2-8B81-006097A45D48}	Data source with archive tags of a process value archive.
{A3F69593-8AB0-11D2-A440-00A0C9DBB64E}	Data source with online tags derived from tag management.

The attribute can be assigned dynamic properties by means of the name **ValueColumnProviderCLSID**. The data type is STRING.

ValueColumnRemove property

Remove - ValueColumnRemove

Removes the selected value column from the list.

The attribute can be assigned dynamic properties by means of the name **ValueColumnRemove**. The data type is STRING.

ValueColumnRename property

ValueColumnRename

Renames a value column which is referenced by means of "ValueColumnIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **ValueColumnRename**. "ValueColumnRename" also sets a dynamic attribute "ValueColumnName". The data type is STRING.

ValueColumnRepos property

Up/Down - ValueColumnRepos

Changes the sorting order of the value columns. "Up" and "Down" move the value column selected up or down in the list.

The sorting order in the list determines the order of value columns after the time column if several value columns are assigned to the same time column. Higher positions of the value column in the list moves it to closer proximity towards the time column.

You change the order of time columns and their assigned value columns in the "Time columns" tab.

The attribute can be assigned dynamic properties by means of the name **ValueColumnRepos**. The data type is LONG.

ValueColumnSelectTagName property

ValueColumnSelectTagName

Opens a dialog for selecting the tag name for the data source of the value column in WinCC OnlineTableControl. Programmers can set this attribute to allow users to select a tag name by means of a button, for example.

The attribute can be assigned dynamic properties by means of the name **ValueColumnSelectTagName**. The data type is BOOLEAN.

ValueColumnShowIcon property

ValueColumnShowIcon

Enables the display of value column contents as icon.

Value	Explanation
TRUE	The content is visualized as icon.
FALSE	The content is not visualized as icon.

The attribute can be assigned dynamic properties by means of the name **ValueColumnShowIcon**. The data type is BOOLEAN.

ValueColumnShowTitleIcon property

ValueColumnShowTitleIcon

Enables display of the value column header as icon.

Value	Explanation
TRUE	The header is displayed as icon.
FALSE	The header is not displayed as icon.

The attribute can be assigned dynamic properties by means of the name **ValueColumnShowTitleIcon**. The data type is BOOLEAN.

ValueColumnSort property

ValueColumnSort

Defines the sorting order of the value column referenced in "ValueColumnIndex" .

The following settings are available:

Value	Description	Explanation
0	No	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

The attribute can be assigned dynamic properties by means of the name **ValueColumnSort** . The data type is LONG.

ValueColumnSortIndex property

ValueColumnSortIndex

Defines the sorting order of the value column referenced in "ValueColumnIndex". The sorting criterion is removed from "ValueColumnSort" if you set a "0" value..

The attribute can be assigned dynamic properties by means of the name **ValueColumnSortIndex**. The data type is LONG.

ValueColumnState property

ValueColumnState

Displays the data connection status of a selected value column in Runtime.

The attribute can be assigned dynamic properties by means of the name **ValueColumnState**. The data type is LONG.

ValueColumnTagName property

Tag name - ValueColumnTagName

Displays the name of connected tags. You can change the tag connection using the selection button.

The attribute can be assigned dynamic properties by means of the name **ValueColumnTagName**. The data type is STRING.

ValueColumnTimeColumn property

Time column - ValueColumnTimeColumn

Specifies the time column for displaying the value column selected. Define the available time columns in the "Time columns" tab.

The attribute can be assigned dynamic properties by means of the name **ValueColumnTimeColumn**. The data type is STRING.

ValueColumnVisible property

Value columns - ValueColumnVisible

The list shows all value columns you created. Click a value column entry in the list to adapt the properties, to assign the value column, and to define the data connection.

Select the value columns to be displayed in the table from the list. Value columns are displayed if interconnected with a time column.

The attribute can be assigned dynamic properties by means of the name **ValueColumnVisible** . The data type is BOOLEAN.

ValueMax Property

Description

Defines the value at the end of the scale. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

ValueMin Property

Description

Defines the value at the start of the scale. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

Variable Property

Description

The "Index" property references a pair of columns. "Tag" defines the name of the tag which should be connected to this column pair.

See also

WinCC Online Table Control (before WinCC V7) (Page 294)

ScreenItem Object (Page 141)

VerticalGridLines property

Vertical - VerticalGridLines

Enables the display of vertical dividers.

Value	Explanation
TRUE	Enables the displays of vertical dividers.
FALSE	Disables the display of vertical dividers.

The attribute can be assigned dynamic properties by means of the name **VerticalGridLines**. The data type is BOOLEAN.

Visible Property

Description

witches an object visible or invisible or issues a corresponding value:

- TRUE : Object is visible
- FALSE : Object is invisible

VARIANT_BOOL (write-read access)

Example:

The following example sets all the objects in the picture "NewPDL1" to invisible:

```
'VBS95
Dim objScreen
Dim objScrItem
Dim lngIndex
Dim strName
lngIndex = 1
```

```
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
objScrItem.Visible = False
Next
```

ScreenItem Object (Page 141)

Layer Object (Page 136)

HMIRuntime Object (Page 134)

2.4.22 W

2.4.22.1 Warning Property

Description

Defines the start of the "Warning zone" as a scale value. Write/Read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

2.4.22.2 WarningColor Property

Description

Defines the color of the "Warning zone" o the scale. LONG write-read access.

See also

WinCC Gauge Control (Page 264)

ScreenItem Object (Page 141)

2.4.22.3 WarningHigh Property

Description

Defines or returns the upper limit value for "Warning High".
In order that the limit value is monitored, the "CheckWarningHigh" property must be set to TRUE.
The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningHigh" and "TypeWarningHigh" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

2.4.22.4 WarningLow Property

Description

Defines or returns the lower limit value for "Warning Low".
In order that the limit value is monitored, the "CheckWarningLow" property must be set to TRUE.
The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningLow" and "TypeWarningLow" properties.

See also

Bar (Page 189)

ScreenItem Object (Page 141)

2.4.22.5 Width Property

Description

Sets or outputs the width of an object in pixels.

LONG

Example:

The following example doubles the width of all objects in the pictures "NewPDL1" whose name begins with "Button":

```
'VBS96
Dim objScreen
```

```
Dim cmdButton
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'Get all "Buttons"
strName = objScreen.ScreenItems(lngIndex).ObjectName
If "Button" = Left(strName, 6) Then
Set cmdButton = objScreen.ScreenItems(strName)
cmdButton.Width = cmdButton.Width * 2
End If
Next
```

See also

Height Property (Page 430)

ScreenItem Object (Page 141)

2.4.22.6 WinCCStyle property

Description

Defines the style in which the object is displayed.

User Defined	Shows the object according to the respective settings.
Global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

2.4.22.7 WindowBorder Property

Description

TRUE, when the window is displayed with borders in Runtime. Read only access.

See also

Picture Window (Page 194)

Application Window (Page 188)

ScreenItem Object (Page 141)

2.4.22.8 WindowPositionMode property

Description

Defines the position and scaling of the picture window on the screen. It is only effective if the "Independent window" attribute is set to TRUE.

Standard	The picture window is positioned in its original size in the configured position on the screen.
Center	The picture window is positioned in its original size, centered on the screen.
Maximize	The picture window is scaled to the size of the screen.

2.4.22.9 WindowsStyle property

Description

Defines whether the object is displayed in the Windows style of WinCC version 6.2. It can only be selected if "WinCC Classic" is chosen as the current design.

TRUE if the object is displayed in the Windows style of WinCC version 6.2.

FALSE if the object is not displayed in the Windows style of WinCC version 6.2.

2.4.22.10 WindowsStyle Property

Description

TRUE, when the object complies with the general Windows style (e.g. gray buttons without borders). BOOLEAN write-read access. Note:

- When this property is set to "True", the properties which do not comply with the Windows style are ignored (e.g. "BorderWidth").
- On the other hand, the definition of a "BorderWidth" or a background color other than gray causes "WindowsStyle" to receive the value"False".
- Exceptions here are the flash attributes: The definition of flash attributes does not automatically lead to the deactivation of the "WindowsStyle" attribute.

See also

Slider (Page 226)

Button (Page 215)

ScreenItem Object (Page 141)

2.4.22.11 WindowType Property

Description

Defines the use of the message window.

- 0 - Message list: shows the currently pending messages.
- 1 - Short-term archive list: shows the archived messages.
- 2 - Long-term archive list: shows the archived messages.
- 3 - Lock list: shows the currently locked messages.
- 4 - Hit list: To display the statistical information of messages.

2.4.22.12 WithAxes Property

Description

TRUE, when the scale should be displayed. BOOLEAN write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

2.4.22.13 WithLabels Property

Description

TRUE, when the scale labels should be displayed. BOOLEAN write-read access.

See also

WinCC Slider Control (Page 281)

ScreenItem Object (Page 141)

2.4.23 X - Z

2.4.23.1 XAxisColor property (before WinCC V7)

Description

Use this attribute to define the color for the common X-axis. The color is defined as an RGB value. LONG write-read access.

2.4.23.2 X/YAxisAdd property

New - X/YAxisAdd

Creates a new X or Y axis.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAdd** .

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAdd** .

The data type is STRING.

2.4.23.3 X/YAxisAlign property

Alignment - X/YAxisAlign

Defines the alignment mode for a selected axis.

The following settings are available for the X axis:

Value	Description	Explanation
0	Bottom	The X axis selected is displayed below the trend.
1	Top	The X axis selected is displayed above the trend.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAlign**. The data type is LONG.

The following settings are available for the Y axis:

Value	Description	Explanation
0	left	The X axis selected is displayed on left side of the trend.
1	right	The X axis selected is displayed on right side of the trend.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAlign**. The data type is LONG.

2.4.23.4 X/YAxisAutoPrecisions property

Decimal places automatic - X/YAxisAutoPrecisions

Enables automatic setting of the decimal precision.

Value	Explanation
TRUE	The number of decimal places is set automatically. The value in the "Decimal places" or "X/YAxisPrecisions" field is disabled.
FALSE	The value in the "Decimal places" or "X/YAxisPrecisions" field is active.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAutoPrecisions**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAutoPrecisions**.

The data type is BOOLEAN.

2.4.23.5 X/YAxisAutoRange property

Value range automatic - X/YAxisAutoRange

Enables automatic calculation of the value range of the axis selected.

Value	Explanation
TRUE	The range of values is calculated automatically.
FALSE	The range of values is calculated based on the values configured in the "from" and "to" or "X/YAxisBeginValue" and "X/YAxisEndValue" fields.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAutoRange**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAutoRange**.

The data type is BOOLEAN.

2.4.23.6 X/YAxisBeginValue property

Value range from - X/YAxisBeginValue

Specifies the lower range of values of the axis selected. You can configure the value if the "Automatic" option is disabled or "X/YAxisAutoRange" is "FALSE".

The X axis attribute can be assigned dynamic properties by means of the name **XAxisBeginValue**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisBeginValue**.

The data type is DOUBLE.

2.4.23.7 X/YAxisColor property

Color XY axis - X/YAxisColor

Specifies the color of the axis selected. The button opens the "Color selection" dialog to select the color.

The setting is only active if the "Use trend color" field is disabled or "X/YAxisInTrendColor" is "FALSE".

The X axis attribute can be assigned dynamic properties by means of the name **XAxisColor**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisColor**.

The data type is LONG.

2.4.23.8 X/YAxisEndValue property

Value range to - X/YAxisEndValue

Specifies the upper range of values of the axis selected. You can configure the value if the "Automatic" option is disabled or "X/YAxisAutoRange" is "FALSE".

The X axis attribute can be assigned dynamic properties by means of the name **XAxisEndValue**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisEndValue**.

The data type is DOUBLE.

2.4.23.9 X/YAxisExponentialFormat property

Exponential notation - X/YAxisExponentialFormat

Enables the exponential notation for visualization of a selected axis.

Value	Explanation
TRUE	The values are displayed with exponential notation.
FALSE	The values are displayed with decimal notation.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisExponentialFormat**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisExponentialFormat**.

The data type is BOOLEAN.

2.4.23.10 X/YAxisInTrendColor property

Use trend color - X/YAxisInTrendColor

Enables the display of an axis selected in the trend color. The color of the first trend is activated if several trends are displayed in the trend window. Define the order of trends on the "Trends" tab.

Value	Explanation
TRUE	The axis selected is displayed in the trend color. The setting in the "Color" or "X/YAxisColor" field is disabled.
FALSE	The axis selected is displayed in the color set in the "Color" or "X/YAxisColor" field.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisInTrendColor**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisInTrendColor**.

The data type is BOOLEAN.

2.4.23.11 X/YAxisLabel property

Label - X/YAxisLabel

Defines the label text for a selected axis.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisLabel**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisLabel**.

The data type is STRING.

2.4.23.12 X/YAxisName property

Object name - X/YAxisName

Specifies the name of a selected axis.

Attribute "XAxisName" can be assigned dynamic properties for the X axis by means of **XAxisRename** attribute.

Attribute "YAxisName" can be assigned dynamic properties for the Y axis by means of **YAxisRename** attribute.

The data type is STRING.

2.4.23.13 X/YAxisPrecisions property

Decimal places - X/YAxisPrecisions

Specifies the decimal precision for displaying the axis selected. The value can be configured and is active in Runtime, if the "Automatic" option is disabled or "X/YAxisAutoPrecisions" is "FALSE".

The X axis attribute can be assigned dynamic properties by means of the name **XAxisPrecisions**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisPrecisions**.

The data type is SHORT.

2.4.23.14 X/YAxisRemove property

Remove - X/YAxisRemove

Removes the selected axis from the list.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisRemove** .

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisRemove** .

The data type is STRING.

2.4.23.15 X/YAxisRepos property

Up/Down - X/YAxisRepos

Changes the sorting order of the axes. "Up" and "Down" move the axis selected up or down in the list.

The list order determines the axis position in the trend window. The axis output position is moved away from the trend if the axis is moved further up in the list and the orientation is the same.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisRepos** .

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisRepos** .

The data type is LONG.

2.4.23.16 X/YAxisScalingType property

Scaling - X/YAxisScalingType

Defines the scaling mode for a selected axis.

The following settings are available:

Value	Description
0	Linear
1	Logarithmic
2	Logarithmically negated

The X axis attribute can be assigned dynamic properties by means of the name **XAxisScalingType**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisScalingType**.

The data type is LONG.

2.4.23.17 X/YAxisTrendWindow property

Trend window - X/YAxisTrendWindow

Specifies the trend window for a selected axis. Define the available trend windows in the "Trend window" tab.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisTrendWindow**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisTrendWindow**.

The data type is STRING.

2.4.23.18 X/YAxisVisible property

X/Y axes - X/YAxisVisible

The list shows all axes you created. Click an axis entry in the list to adapt the properties and to assign the axis to a trend window.

Activate the axes to be displayed in the trend windows in the list.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisVisible** .

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisVisible** .

The data type is BOOLEAN.

2.4.23.19 XAxisCount property

XAxisCount

Defines the number of X axes configured.

The attribute can be assigned dynamic properties by means of the name **XAxisCount**. The data type is LONG.

2.4.23.20 XAxisIndex property

XAxisIndex

References a configured X axis. Using this attribute you can assign the values of other attributes to a specific X axis.

Values between 0 and "XAxisCount" minus 1 are valid for "Index"; the attribute "XAxisCount" defines the number of configured X axes.

The "XAxisIndex" attribute can be assigned dynamic properties by means of attribute **XAxisRepos**. The data type is LONG.

2.4.23.21 XAxisRename property

XAxisRename

Renames the X axis which is referenced by means of "XAxisIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **XAxisRename**. "XAxisRename" also sets a dynamic attribute "XAxisName". The data type is STRING.

2.4.23.22 YAxisCount property

YAxisCount

Defines the number of Y axes configured.

The attribute can be assigned dynamic properties by means of the name **YAxisCount**. The data type is LONG.

2.4.23.23 YAxisIndex property

YAxisIndex

References a configured Y axis. Using this attribute you can assign the values of other attributes to a specific Y axis.

Values between 0 and "YAxisCount" minus 1 are valid for "Index". Attribute "YAxisCount" defines the number of configured Y axes.

The "YAxisIndex" attribute can be assigned dynamic properties by means of attribute **YAxisRepos**. The data type is LONG.

2.4.23.24 YAxisRename property

YAxisRename

Renames the Y axis which is referenced by means of "YAxisIndex" attribute.

The attribute can be assigned dynamic properties by means of the name **YAxisRename**. "YAxisRename" also sets a dynamic attribute "YAxisName". The data type is STRING.

2.4.23.25 ZeroPoint Property

Description

Defines or returns the position of the zero point of the bar graph.
Specify the value as a %age of the total bar height. The zero point can also be outside of the range represented.
The "ScalingType" property must be set to "2" and "Scaling" to TRUE.

See also

ScreenItem Object (Page 141)

Bar (Page 189)

2.4.23.26 ZeroPointValue Property

Description

Defines the value of the zero point of the scale indicator.

Defines or returns the absolute value for the zero point.

See also

Bar (Page 189)

3D Bar (Page 184)

ScreenItem Object (Page 141)

2.4.23.27 Zoom Property

Description

Sets the zoom factor within a picture or picture window or reads it out.

If the indicated zoom factor is smaller than the minimum value, the zoom factor is automatically set to the minimum value. If the indicated zoom factor is larger than the minimum value, the zoom factor is automatically set to the maximum value.

The minimum value of the zoom factor is at 2%, the maximum value at 800%.

With the Screen Object the zoom factor is indicated as a numeric value and with a picture window object, it is indicated in percent.

Example:

The following example doubles the zoom factor of the current picture:

```
'VBS97
HMIRuntime.ActiveScreen.Zoom = HMIRuntime.ActiveScreen.Zoom * 2
```

Screen Object (Page 146)

2.5 Methods

2.5.1 Methods

Overview

Methods, which are applied to individual objects, can be used to read out tag values for further processing or displaying diagnostics messages in Runtime.

Available Methods in VBS

Activate	GetStatusbarElement	MoveToNext	ShowInfoText
ActivateDynamic	GetStatusbarElementCollection	MoveToNextLine	ShowLockDialog
Add	GetTimeAxis	MoveToNextPage	ShowLockList
AttachDB	GetTimeAxisCollection	MoveToPrevious	ShowLongTermArchiveList
CalculateStatistic	GetTimeColumn	MoveToPreviousLine	ShowMessageList
CopyRows	GetTimeColumnCollection	MoveToPreviousPage	ShowPercentageAxis
CreateTagSet	GetToolbarButton	NextColumn	ShowPropertyDialog
CutRows	GetToolbarButtonCollection	NextTrend	ShowSelectArchive
DeactivateDynamic	GetTrend	OneToOneView	ShowSelection
DeleteRows	GetTrendCollection	PasteRows	ShowSelectionDialog
DetachDB	GetTrendWindow	PreviousColumn	ShowSelectTimeBase
Edit	GetTrendWindowCollection	PreviousTrend	ShowShortTermArchiveList
Export	GetValueAxis	Print	ShowSort
GetColumn	GetValueAxisCollection	QuitHorn	ShowSortDialog
GetColumnCollection	GetValueColumn	QuitSelected	ShowTagSelection
GetHitlistColumn	GetValueColumnCollection	QuitVisible	ShowTimebaseDialog
GetHitlistColumnCollection	GetXAxis	Read	ShowTimeSelection
GetMessageBlock	GetXAxisCollection	ReadTags	ShowTrendSelection
GetMessageBlockCollection	GetYAxis	Refresh	StartStopUpdate
GetMessageColumn	GetYAxisCollection	Remove	Stop
GetMessageColumnCollection	HideAlarm	RemoveAll	Trace
GetOperatorMessage	Item Method	Restore	UnhideAlarm

GetOperatorMessageCollection	LockAlarm	SelectedStatisticArea	UnlockAlarm
GetRulerBlock	LoopInAlarm	ServerExport	Write
GetRulerBlockCollection	MoveAxis	ServerImport	WriteTags
GetRulerColumn	MoveRuler (Page 756)	ShowColumnSelection	ZoomArea
GetRulerColumnCollection	MoveToFirst	ShowComment	ZoomInOut
GetRulerData	MoveToFirstLine	ShowDisplayOptionsDialog	ZoomInOutTime
GetStatisticAreaColumn	MoveToFirstPage	ShowEmergencyQuitDialog	ZoomInOutValues
GetStatisticAreaColumnCollection	MoveToLast	ShowHelp	ZoomInOutX
GetStatisticResultColumn	MoveToLastLine	ShowHideList	ZoomInOutY
GetStatisticResultColumnCollection	MoveToLastPage	ShowHitList	ZoomMove

2.5.2 Methods A to E

2.5.2.1 Activate Method

Function

Activates the specified picture and picture element, respectively.

Note

Focus assignments should not be configured during a ButtonDown event. Since the focus is specifically requested during the ButtonDown event, invalid states may occur.

Syntax

```
Expression.Activate
```

Expression

Necessary. An expression which returns an object of type "Screen" or "ScreenItem".

Parameters

--

Examples

The following example shows the use for type "Screen":

```
'VBS98
Dim objScreen
MsgBox HMIRuntime.ActiveScreen.ObjectName    'Output of active screen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
objScreen.Activate    'Activate "ScreenWindow1"
MsgBox HMIRuntime.ActiveScreen.ObjectName    'New output of active screen
```

The following example shows the use for type "ScreenItem":

```
'VBS158
MsgBox HMIRuntime.ActiveScreen.ActiveScreenItem.ObjectName  'Output of active screen item
HMIRuntime.ActiveScreen.ScreenItems("IOField1").Activate
MsgBox HMIRuntime.ActiveScreen.ActiveScreenItem.ObjectName  'New output of active screen
item
```

See also

ScreenItem Object (Page 141)

Screen Object (Page 146)

2.5.2.2 ActivateDynamic method

Function

Dynamically activates a trigger for the defined property and with the defined cycle during runtime. Every time the trigger is activated a different activation cycle can be used.

Examples of this method are available in chapter "VBS for creating procedures and action > Creating and editing actions > Trigger > Animation trigger".

Syntax

```
Expression.ActivateDynamic (ByVAl bstrPropertyName As String, ByVal
bstrCycleName As String)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Parameters	Description
bstrPropertyName	Name of property to which trigger relates.
bstrCycleName	Name of activation cycle, e.g. "CycleTime1s".

See also

Animation trigger (Page 82)

2.5.2.3 Add Method

Description of TagSet Object

Adds a tag to the list. A tag may be added to the tag object by using name or reference.

syntax

```
Expression.Add [Tag]
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be added to the list.

Example:

In the following example, a TagSet object is generated and a tag is added.

```
'VBS170
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
```

Tag objects may also be added as follows.

```
'VBS171
Dim Tag
Set Tag = HMIRuntime.Tags("Motor2")
Dim group2
Set group2 = HMIRuntime.Tags.CreateTagSet
group2.Add Tag
```

Description of DataSet Object

Adds a value or object reference to the list.

Note

The Data Set Object does not support classes.
Objects of type Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet cannot be included in the DataSet list.
For object references it must be ascertained that objects are multiread-enabled.

syntax

```
Expression.Add [vtName], [vtUserData]
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

VARIANT

Parameters	Description
vtName	Name by which value or tag are to be added to list.
vtUserData	Value to be added to list.

Example:

In this example, a value is included in the DataSet list.

```
'VBS172
HMIRuntime.DataSet.Add "Motor1",23
```

See also

TagSet Object (List) (Page 156)

DataSet Object (List) (Page 132)

2.5.2.4 AttachDB method

Function

Executes the "Connect backup" key function of the control.

Syntax

```
Ausdruck.AttachDB()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.2.5 CalculateStatistic method

Function

Executes the "Calculate statistics" key function of the OnlineTrendControl and OnlineTableControl.

Syntax

```
Ausdruck.CalculateStatistic()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.2.6 CopyRows method

Function

Executes the "Copy lines" key function of the control.

Syntax

```
Ausdruck.CopyRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.2.7 Create method

Function

Creates a new Alarm object.

Syntax

```
Expression.Create (VARIANT vtApplication)
```

Expression

Necessary. An expression which returns an object of type "Alarm".

Parameters

```
VARIANT
```

Parameters	Description
vtApplication	Name of alarm object (optional)

See also

Alarms object (list) (Page 126)

2.5.2.8 CreateTagSet Method

Function

Creates a new TagSet object. This object may be used for optimized multi-tag access.

syntax

```
Expression.CreateTagSet()
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Example:

The following example shows how to create a TagSet object.

```
'VBS168
'Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
```

See also

TagSet Object (List) (Page 156)

Tags Object (List) (Page 155)

2.5.2.9 CutRows method

Function

Executes the "Cut lines" key function of the UserArchiveControl.

Syntax

```
Ausdruck.CutRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.2.10 DeactivateDynamic method

Function

Deactivates the trigger used with the "ActivateDynamic" method for the defined property during runtime.

Syntax

```
Ausdruck.DeactivateDynamic(ByVal bstrPropertyName As String)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

String

Parameters	Description
bstrPropertyName	Name of property to which trigger relates.

2.5.2.11 DeleteRows method

Function

Executes the "Delete Rows" key function of the UserArchiveControl.

Syntax

```
Ausdruck.DeleteRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.2.12 DetachDB method

Function

Executes the "Disconnect backup" key function of the control.

Syntax

```
Ausdruck.DetachDB()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.2.13 Edit method

Function

Executes the "Edit" key function of the OnlineTableControl.

Syntax

```
Ausdruck.Edit()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.2.14 Export Method

Function

Executes the "Export archive" or "Export data" key function of the control.

Syntax

```
Ausdruck.Export()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

2.5.3 Get methods

2.5.3.1 GetColumn method

Function

Returns the name or index designated column object of the WinCC UserArchiveControl as type "ICCAxUAColumn".

Syntax

```
Ausdruck.GetColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of UserArchiveControl.

Example

```
'VBS312
Dim ctrl
Dim objColumn
Set ctrl = ScreenItems("UAControl")
Set objColumn = ctrl.GetColumn("Field1")
objColumn.Length = 30
Set objColumn = ctrl.GetColumn(3)
objColumn.Align = 2
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Column" listing, for example, you write "objColumn.Align" instead of "objColumn.ColumnAlign".

See also

Column object (list) (Page 235)

2.5.3.2 GetColumnCollection method

Function

Returns the list of all column objects of the WinCC UserArchiveControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS313
Dim ctrl
Dim coll
Dim field
Set ctrl = ScreenItems("UAControl")
Set coll = ctrl.GetColumnCollection
HMIRuntime.Trace "Number of fields:" & coll.Count & vbCrLf
For Each field In coll
 HMIRuntime.Trace field.Name & vbCrLf
 HMIRuntime.Trace field.Type & vbCrLf
 HMIRuntime.Trace field.Length & vbCrLf
 HMIRuntime.Trace field.Caption & vbCrLf
```

```
Next
```

See also

Column object (list) (Page 235)

2.5.3.3 GetHitlistColumn method

Function

Returns the name or index designated column object of the hitlist of the WinCC AlarmControl as type "ICCAxMessageColumn".

Syntax

```
Expression.GetHitlistColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of hitlist column

Example

```
'VBS314
Dim ctrl
Dim objHitlistColumn
Set ctrl = ScreenItems("AlarmControl")
Set objHitlistColumn = ctrl.GetHitlistColumn("Date")
objHitlistColumn.Sort = 2
Set objHitlistColumn = ctrl.GetHitlistColumn("AverageComeGo")
objHitlistColumn.Visible = FALSE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "HitlistColumn" listing, for example, you write "objHitlistColumn.Visible" instead of "objHitlistColumn.HitlistColumnVisible".

See also

HitlistColumn object (list) (Page 236)

2.5.3.4 GetHistlistColumnCollection method

Function

Returns the list of all column objects of the WinCC AlarmControl hitlist as type "ICCAxCollection".

Syntax

```
Expression.GetHitlisteColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS315
Dim ctrl
Dim coll
Dim hitlistcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetHitlistColumnCollection
HMIRuntime.Trace "Number of hitlist columns:" & coll.Count & vbCrLf
For Each hitlistcol In coll
 HMIRuntime.Trace hitlistcol.Index & vbCrLf
 HMIRuntime.Trace hitlistcol.Name & vbCrLf
 HMIRuntime.Trace hitlistcol.Sort & vbCrLf
 HMIRuntime.Trace hitlistcol.SortIndex & vbCrLf
Next
```

HitlistColumn object (list) (Page 236)

2.5.3.5 GetMessageBlock method

Function

Returns the name or index designated message block object of the WinCC AlarmControl as type "ICCAxMessageBlock".

Syntax

```
Expression.GetMessageBlock(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of message block.

Example

```
'VBS316
```

```
Dim ctrl
Dim objMsgBlock
Set ctrl = ScreenItems("AlarmControl")
Set objMsgBlock = ctrl.GetMessageBlock("Date")
objMsgBlock.Align = 2
Set objMsgBlock = ctrl.GetMessageBlock("Number")
objMsgBlock.LeadingZeros = 4
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "MessageBlock" listing, for example, you write "objMsgBlock.Align" instead of "objMsgBlock.MessageBlockAlign".

See also

MessageBlock object (list) (Page 237)

2.5.3.6 GetMessageBlockCollection method

Function

Returns the list of all message block objects of the WinCC AlarmControl as type "ICCAxCollection".

Syntax

```
Expression.GetMessageBlockCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS317
Dim ctrl
Dim coll
Dim msgblock
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageBlockCollection
For Each msgblock In coll
 msgblock.Align = 1
 msgblock.Length = 12
 msgblock.Selected = TRUE
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "MessageBlock" listing, for example, you write "msgblock.Align" instead of "msgblock.MessageBlockAlign".

See also

MessageBlock object (list) (Page 237)

2.5.3.7 GetMessageColumn method

Function

Returns the name or index designated column object of the WinCC AlarmControl as type "ICCAxMessageColumn".

Syntax

```
Expression.GetMessageColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column in message list.

Example

```
'VBS318
Dim ctrl
Dim objMessColumn
Set ctrl = ScreenItems("AlarmControl")
Set objMessColumn = ctrl.GetMessageColumn("Date")
objMessColumn.Visible = FALSE
Set objMessColumn = ctrl.GetMessageColumn("Number")
objMessColumn.Sort = 1
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "MessageColumn" listing, for example, you write "objMessColumn.Visible" instead of "objMessColumn.MessageColumnVisible".

See also

MessageColumn object (list) (Page 238)

2.5.3.8 GetMessageColumnCollection method

Function

Returns the list of all column objects of the WinCC AlarmControl as type "ICCAxCollection".

Syntax

```
Expression.GetMessageColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS319
Dim ctrl
Dim coll
Dim msgcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageColumnCollection
HMIRuntime.Trace "Number of message columns:" & coll.Count & vbCrLf
For Each msgcol In coll
 HMIRuntime.Trace msgcol.Index & vbCrLf
 HMIRuntime.Trace msgcol.Name & vbCrLf
 HMIRuntime.Trace msgcol.Sort & vbCrLf
 HMIRuntime.Trace msgcol.SortIndex & vbCrLf
Next
```

See also

MessageColumn object (list) (Page 238)

2.5.3.9 GetOperatorMessage method

Function

Returns the name or index designated operator message object of the WinCC AlarmControl as type "ICCAxOperatorMessage".

Syntax

```
Expression.GetOperatorMessage(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of operator message

Example

```
'VBS320
Dim ctrl
Dim objOpMess
Set ctrl = ScreenItems("AlarmControl")
Set objOpMess = ctrl.GetOperatorMessage(0)
objOpMess.Source1 = "Number"
objOpMess.SourceType1 = 1
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "OperatorMessage" listing, for example, you write "objOpMess.Source1" instead of "objOpMess.OperatorMessageSource1".

See also

OperatorMessage object (list) (Page 239)

2.5.3.10 GetOperatorMessageCollection method

Function

Returns the list of all operator message objects of the WinCC AlarmControl as type "ICCAxCollection".

Syntax

```
Expression.GetOperatorMessageCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS321
Dim ctrl
Dim coll
Dim opmsg
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetOperatorMessageCollection
For Each opmsg In coll
 HMIRuntime.Trace opmsg.Index & vbCrLf
 HMIRuntime.Trace opmsg.Name & vbCrLf
 HMIRuntime.Trace opmsg.Number & vbCrLf
 HMIRuntime.Trace opmsg.Selected & vbCrLf
Next
```

See also

OperatorMessage object (list) (Page 239)

2.5.3.11 GetRow method

Function

Returns the row number designated row object of the table-based controls as type "ICCAxDataRow".

Syntax

```
Expression.GetRow(ByVal IRow As Long)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Long

Parameters	Description
IRow	Number of the desired line of the control.

Example

```
'VBS356
Dim ctrl
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("UAControl")
Set coll = ctrl.GetRowCollection
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
 HMIRuntime.trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & "  "
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
  HMIRuntime.Trace ctrl.GetRow(0).CellText(lCellIndex) & " "
  HMIRuntime.trace ctrl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.trace vbNewLine
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

See also

Row object (list) (Page 240)

2.5.3.12 GetRowCollection method

Function

Returns the list of all row objects of the table-based controls type "ICCAxDataRowCollection".

Syntax

```
Expression.GetRowCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Properties of the ICCAxDataRowCollection

The ICCAxDataRowCollection refers to runtime data. The data is read-only. It is not possible to add and edit the data.

The following properties are available for the ICCAxDataRowCollection:

- Count - Determines the number of rows in the collection.
- Item - Access to an individual row within the collection via the row number. Numbering runs from 1 to Count. A Row object is returned.

Example

```
'VBS357
Dim ctrl
Dim coll
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetRowCollection
HMIRuntime.Trace "Number of message rows:" & coll.Count & vbCrLf
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
 HMIRuntime.Trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & "  "
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
  HMIRuntime.Trace ctrl.GetMessageColumn(lCellIndex -1).Name & " "
  HMIRuntime.Trace ctrl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.Trace vbNewLine
Next
```

See also

Row object (list) (Page 240)

2.5.3.13 GetRulerBlock method

Function

Returns the Block object designated as name or index of the WinCC RulerControl as type "ICCAxRulerBlock".

Syntax

```
Expression.GetRulerBlock(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of block in RulerControl

Example

```
'VBS322
Dim ctrl
Dim objRulerBlock
Set ctrl = ScreenItems("RulerControl")
Set objRulerBlock = ctrl.GetRulerBlock(0)
objRulerBlock.Caption = "RulerBlock1"
Set objRulerBlock = ctrl.GetRulerBlock("Name")
objRulerBlock.Length = 10
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "RulerBlock" listing, for example, you write "objRulerBlock.Caption" instead of "objRulerBlock.BlockCaption".

See also

RulerBlock object (list) (Page 241)

2.5.3.14 GetRulerBlockCollection method

Function

Returns the list of all Block objects of the WinCC RulerControl as type "ICCAxCollection".

Syntax

```
Expression.GetRulerBlockCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS323
Dim ctrl
Dim coll
Dim rulerblock
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerBlockCollection
For Each rulerblock In coll
 rulerblock.Align = 1
 rulerblock.Length = 12
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "RulerBlock" listing, for example, you write "rulerblock.Align" instead of "rulerblock.RulerBlockAlign".

See also

RulerBlock object (list) (Page 241)

2.5.3.15 GetRulerColumn method

Function

Returns the Column object designated as name or index of the WinCC RulerControl as type "ICCAxRulerColumn".

Syntax

```
Expression.GetRulerColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of RulerControl.

Example

```
'VBS324
Dim ctrl
Dim objRulercol
Set ctrl = ScreenItems("RulerControl")
Set objRulercol = ctrl.GetRulerColumn("Name")
objRulercol.Sort = 0
Set objRulercol = ctrl.GetRulerColumn("ValueY")
objRulercol.Visible = FALSE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "RulerColumn" listing, for example, you write "objRulercol.Visible" instead of "objRulercol.ColumnVisible".

See also

RulerColumn object (list) (Page 241)

2.5.3.16 GetRulerColumnCollection method

Function

Returns the list of all Column objects of the WinCC RulerControl as type "ICCAxCollection".

Syntax

```
Expression.GetRulerColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS325
Dim ctrl
Dim coll
Dim rulercol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerColumnCollection
HMIRuntime.Trace "Number of ruler columns:" & coll.Count & vbCrLf
For Each rulercol In coll
 HMIRuntime.Trace rulercol.Index & vbCrLf
 HMIRuntime.Trace rulercol.Name & vbCrLf
 HMIRuntime.Trace rulercol.Sort & vbCrLf
 HMIRuntime.Trace rulercol.SortIndex & vbCrLf
Next
```

See also

RulerColumn object (list) (Page 241)

2.5.3.17 GetRulerData method

Function

Returns the value of the called trend at the ruler position.

Syntax

```
Expression.GetRulerData(ByVal RulerIndex As Long, pvValue As
Variant, Optional pvTimeStamp As Variant, Optional pvFlags As
Varian) Long
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Parameters

Parameters	Description
RulerIndex	0 =Ruler
pvValue	Value of X axis
pvTimeStamp	Time or value of the Y axis
pvFlags	Qualitycode

Example

```
'VBS326
Dim ctrl
Dim objTrend
Dim objIOField1
Dim objIOField2
    Dim value
Dim time
Set ctrl = ScreenItems( "Control1" )
Set objTrend = ctrl.GetTrend( "Trend 1" )
Set objIOField1 = ScreenItems( "I/O Field1" )
Set objIOField2 = ScreenItems( "I/O Field2" )
objTrend.GetRulerData 0, value, time
objIOField1.OutputValue = value
objIOField2.OutputValue = time
```

2.5.3.18 GetSelectedRow method

Function

Returns the selected row object of the table-based controls as type "ICCAxDataRow".

Syntax

```
Expression.GetSelectedRow()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Example

```
'VBS358
Dim ctrl
 Dim lCellIndex
 Dim lCellCount
 Dim headingRow
 Dim selectedRow
 Set ctrl = ScreenItems("TableControl")
 Set headingRow = ctrl.GetRow(0)
 Set selectedRow = ctrl.GetSelectedRow
 lCellCount = headingRow.CellCount
 'enumerate and trace out column titles and cell texts
```

```
For lCellIndex = 1 To lCellCount
 HMIRuntime.trace headingRow.CellText(lCellIndex) & ":  "
 HMIRuntime.trace selectedRow.CellText(lCellIndex)
   HMIRuntime.trace vbNewLine
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

See also

Row object (list) (Page 240)

2.5.3.19 GetSelectedRows method

Function

Returns the selected row objects of the table-based controls as type "ICCAxDataRow"for multiple selection.

Syntax

```
Expression.GetSelectedRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Example

```
'VBS359
Dim ctrl
 Dim lCellIndex
 Dim lCellCount
 Dim lRowIndex
 Dim lRowCount
```

```
Dim headingRow
Dim selectedRow
Dim selectedRows
Set ctrl = ScreenItems("TableControl")
Set headingRow = ctrl.GetRow(0)
Set selectedRows = ctrl.GetSelectedRows
lCellCount = headingRow.CellCount
lRowCount = selectedRows.Count
'enumerate selected rows
For lRowIndex = 1 To lRowCount
 Set selectedRow = selectedRows(lRowIndex)
 HMIRuntime.Trace "Row number: " & CStr(lRowIndex) & vbNewLine
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To lCellCount
  HMIRuntime.trace headingRow.CellText(lCellIndex) & ":  "
  HMIRuntime.trace selectedRow.CellText(lCellIndex)
    HMIRuntime.trace vbNewLine
 Next
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

See also

Row object (list) (Page 240)

2.5.3.20 GetStatisticAreaColumn method

Function

Returns the name or index designated Column object of the WinCC RulerControl statistics area window as type "ICCAxRulerColumn".

Syntax

```
Ausdruck.GetStatisticAreaColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics area window.

Example

```
'VBS327
Dim ctrl
Dim objStatAreaCol
Set ctrl = ScreenItems("RulerControl")
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("DatasourceY")
objStatAreaCol.Visible = FALSE
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("ValueY(LL)")
objStatAreaCol.Sort = 1
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "StatisticAreaColumn" listing, for example, you write "objStatAreaCol.Visible" instead of "objStatAreaCol.ColumnVisible".

See also

StatisticAreaColumn object (list) (Page 242)

2.5.3.21 GetStatisticAreaColumnCollection method

Function

Returns the list of all column objects of the WinCC RulerControl statistics area window as type "ICCAxCollection".

Syntax

```
Ausdruck.GetStatisticAreaColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS328
Dim ctrl
Dim coll
Dim statcol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetStatisticAreaColumnCollection
HMIRuntime.Trace "Number of statistic Area columns:" & coll.Count & vbCrLf
For Each statcol In coll
 HMIRuntime.Trace statcol.Index & vbCrLf
 HMIRuntime.Trace statcol.Name & vbCrLf
 HMIRuntime.Trace statcol.Sort & vbCrLf
 HMIRuntime.Trace statcol.SortIndex & vbCrLf
Next
```

StatisticAreaColumn object (list) (Page 242)

2.5.3.22 GetStatisticResultColumn method

Function

Returns the name or index designated Column object of the WinCC RulerControl statistics window as type "ICCAxRulerColumn".

Syntax

```
Ausdruck.GetStatisticResultColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics window.

Example

```
'VBS329
Dim ctrl
Dim objStatResCol
Set ctrl = ScreenItems("RulerControl")
Set objStatResCol = ctrl.GetStatisticResultColumn("MaxValue")
objStatResCol.Visible = FALSE
Set objStatResCol = ctrl.GetStatisticResultColumn("Average")
objStatResCol.Sort = 2
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "StatisticResultColumn" listing, for example, you write "objStatResCol.Visible" instead of "objStatResCol.ColumnVisible".

See also

StatisticResultColumn object (list) (Page 243)

2.5.3.23 GetStatisticResultColumnCollection method

Function

Returns the list of all Column objects of the WinCC RulerControl statistics window as type "ICCAxCollection".

Syntax

```
Ausdruck.GetStatisticResultColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS330
Dim ctrl
Dim coll
Dim statcol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetStatisticResultColumnCollection
HMIRuntime.Trace "Number of statistic result columns:" & coll.Count & vbCrLf
For Each statcol In coll
 HMIRuntime.Trace statcol.Index & vbCrLf
 HMIRuntime.Trace statcol.Name & vbCrLf
 HMIRuntime.Trace statcol.Sort & vbCrLf
 HMIRuntime.Trace statcol.SortIndex & vbCrLf
Next
```

StatisticResultColumn object (list) (Page 243)

2.5.3.24 GetStatusbarElement method

Function

Returns the element of the control status bar designated as name or index as type "ICCAxStatusbarElement".

Syntax

```
Ausdruck.GetStatusbarElement(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of status bar element.

Example

```
'VBS331
Dim ctrl
Dim objStatusBar
Set ctrl = ScreenItems( "Control1" )
Set objStatusBar = ctrl.GetStatusbarElement(1)
objStatusBar.Visible = FALSE
Set objStatusBar = ctrl.GetStatusbarElement(3)
objStatusBar.Width = 10
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "StatusbarElement" listing, for example, you write "objStatusBar.Visible" instead of "objStatusBar.StatusbarElementVisible".

See also

StatusbarElement object (list) (Page 244)

2.5.3.25 GetStatusbarElementCollection method

Function

Returns the list of all status bar elements of the control as type "ICCAxCollection".

Syntax

```
Ausdruck.GetStatusbarElementCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS332
Dim ctrl
Dim coll
Dim statelement
Set ctrl = ScreenItems.Item("Control1")
Set coll = ctrl.GetStatusbarElementCollection
HMIRuntime.Trace "Number of statusbar elements:" & coll.Count & vbCrLf
For Each statelement In coll
 HMIRuntime.Trace statelement.Name & vbCrLf
 HMIRuntime.Trace statelement.Width & vbCrLf
 HMIRuntime.Trace statelement.Text & vbCrLf
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "StatusbarElement" listing, for example, you write "statelement.Name" instead of "statelement.StatusbarElementName".

See also

StatusbarElement object (list) (Page 244)

2.5.3.26 GetTimeAxis method

Function

Returns the time axis object designated as name or index of the WinCC OnlineTrendControl as type "ICCAxTimeAxis".

Syntax

```
Ausdruck.GetTimeAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time axis.

Example

```
'VBS333
Dim ctrl
Dim objTimeAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTimeAxis = ctrl.GetTimeAxis(1)
objTimeAxis.Visible = FALSE
Set objTimeAxis = ctrl.GetTimeAxis("axis 2")
objTimeAxis.Label = "Time axis 2"
objTimeAxis.DateFormat = "dd.MM.yy"
objTimeAxis.TimeFormat = "HH:mm:ss.ms"
objTimeAxis.RangeType = 2
objTimeAxis.BeginTime = "06.04.2010 9:33:18"
objTimeAxis.MeasurePoints = 100
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "TimeAxis" listing, for example, you write "objTimeAx.Visible" instead of "objTimeAx.TimeAxisVisible".

See also

TimeAxis object (list) (Page 244)

2.5.3.27 GetTimeAxisCollection method

Function

Returns the list of all time axis objects of the WinCC OnlineTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetTimeAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS334
```

```
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis1
Dim objTimeAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis1 = ctrl.GetTimeAxisCollection.AddItem("TimeAxis2010")
Set objTimeAxis2 = ctrl.GetTimeAxisCollection.AddItem("TimeAxis2011")
objTimeAxis1.TrendWindow = objTrendWnd.Name
objTimeAxis1.Label = "2010"
objTimeAxis1.RangeType = 1
objTimeAxis1.BeginTime = "01.01.2010 0:00:00"
objTimeAxis1.EndTime = "31.12.2010 11:59:59"
objTimeAxis2.TrendWindow = objTrendWnd.Name
objTimeAxis2.Label = "2011"
objTimeAxis2.RangeType = 1
objTimeAxis2.BeginTime = "01.01.2011 0:00:00"
objTimeAxis2.EndTime = "31.12.2011 11:59:59"
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis2.Name
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "TimeAxis" listing, for example, you write "objTimeAxis1.Label" instead of "objTimeAxis1.TimeAxisLabel".

See also

2.5.3.28 GetTimeColumn method

Function

Returns the time column object designated as name or index of the WinCC OnlineTableControl as type "ICCAxTimeColumn".

Syntax

```
Ausdruck.GetTimeColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time column.

Example

```
'VBS335
Dim ctrl
Dim objTimeCol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol = ctrl.GetTimeColumn("Timecolumn1")
objTimeCol.ShowDate = FALSE
Set objTimeCol = ctrl.GetTimeColumn("Timecolumn2")
objTimeCol.Visible = FALSE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "TimeColumn" listing, for example, you write "objTimeColumn.ShowDate" instead of "objTimeColumn.TimeColumnShowDate".

See also

TimeColumn object (list) (Page 245)

2.5.3.29 GetTimeColumnCollection method

Function

Returns the list of all time column objects of the WinCC OnlineTableControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetTimeColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS336
Dim ctrl
Dim objTimeCol1
Dim objTimeCol2
Dim coll
Dim timecol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol1 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2010")
Set objTimeCol2 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2011")
objTimeCol1.Caption = "2010"
objTimeCol1.RangeType = 1
objTimeCol1.BeginTime = "01.01.2010 0:00:00"
objTimeCol1.EndTime = "31.12.2010 11:59:59"
objTimeCol2.Caption = "2011"
objTimeCol2.RangeType = 0
objTimeCol2.BeginTime = "01.01.2011 0:00:00"
objTimeCol2.TimeRangeFactor = 1
objTimeCol2.TimeRangeBase = 3600000
Set coll = ctrl.GetTimeColumnCollection
For Each timecol In coll
 timecol.Align = 1
 timecol.Length = 12
 timecol.BackColor = RGB(240,240,0)
 timecol.ForeColor = RGB(130,160,255)
Next
```

See also

TimeColumn object (list) (Page 245)

2.5.3.30 GetToolbarButton method

Function

Returns the name or index designated toolbar button function of the control as type "ICCAxToolbarButton".

Syntax

```
Ausdruck.GetToolbarButton(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of toolbar button function.

Example

```
'VBS337
Dim ctrl
Set ctrl = ScreenItems( "Control1" )
Dim toolbu
Set toolbu = ctrl.GetToolbarButton ("ShowHelp")
HMIRuntime.Trace "Name: " & toolbu.Name & vbCrLf
HMIRuntime.Trace "Index: " & toolbu.Index & vbCrLf
HMIRuntime.Trace "Hotkey: " & toolbu.HotKey & vbCrLf
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "ToolbarButton" listing, for example, you write "toolbu.Index" instead of "toolbu.ToolbarButtonIndex".

See also

ToolbarButton object (list) (Page 246)

2.5.3.31 GetToolbarButtonCollection method

Function

Returns the list of all toolbar button functions of the control as type "ICCAxCollection".

Syntax

```
Ausdruck.GetToolbarButtonCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following methods are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS338
Dim ctrl
Dim coll
Dim toolbu
Set ctrl = ScreenItems( "Control1" )
Set coll = ctrl.GetToolbarButtonCollection
HMIRuntime.Trace "Number of toolbar buttons:" & coll.Count & vbCrLf
For Each toolbu In coll
 HMIRuntime.Trace toolbu.Name & vbCrLf
 HMIRuntime.Trace "Hotkey: " & toolbu.HotKey & vbCrLf
 HMIRuntime.Trace "Authorization: " & toolbu.PasswordLevel & vbCrLf
Next
```

See also

ToolbarButton object (list) (Page 246)

2.5.3.32 GetTrend method

Function

Returns the trend object designated as name or index of the WinCC OnlineTrendControl or WinCC FunctionTrendControl as type "ICCAxTrend" or "ICCAxFunctionTrend".

Syntax

```
Ausdruck.GetTrend(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve.

Example

```
'VBS339
Dim ctrl
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrend = ctrl.GetTrend( "Trend 1" )
objTrend.PointStyle = 1
objTrend.LineWidth = 4
Set objTrend = ctrl.GetTrend(2)
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag2"
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Trend" listing, for example, you write "objTrend.PointStyle" instead of "objTrend.TrendPointStyle".

See also

Trend object (list) (Page 247)

2.5.3.33 GetTrendCollection method

Function

Returns the list of all trend objects of the WinCC OnlineTrendControl or WinCC FunctionTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetTrendCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS340
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValAxis = ctrl.GetValueAxisCollection.AddItem("myValueAxis")
objTimeAxis.TrendWindow = objTrendWnd.Name
objValAxis.TrendWindow = objTrendWnd.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag1"
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis.Name
```

```
objTrend.ValueAxis = objValAxis.Name
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "Trend" listing, for example, you write "objTrend.TagName" instead of "objTrend.TrendTagName".

See also

Trend object (list) (Page 247)

2.5.3.34 GetTrendWindow method

Function

Returns the trend window object designated as name or index of the WinCC OnlineTrendControl or WinCC FunctionTrendControl as type "ICCAxTrendWindow".

Syntax

```
Ausdruck.GetTrendWindow(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve window.

Example

```
'VBS341
Dim ctrl
Dim objTrendWnd
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindow(1)
```

```
objTrendWnd.Visible = FALSE
Set objTrendWnd = ctrl.GetTrendWindow("trend window 2")
objTrendWnd.VerticalGrid = TRUE
objTrendWnd.FineGrid = TRUE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "TrendWindow" listing, for example, you write "objTrendWnd.Visible" instead of "objTrendWnd.TrendWindowVisible".

See also

TrendWindow object (list) (Page 249)

2.5.3.35 GetTrendWindowCollection method

Function

Returns the list of all trend window objects of the WinCC OnlineTrendControl or WinCC FunctionTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetTrendWindowCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS342
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValAxis = ctrl.GetValueAxisCollection.AddItem("myValueAxis")
objTimeAxis.TrendWindow = objTrendWnd.Name
objValAxis.TrendWindow = objTrendWnd.Name
```

See also

TrendWindow object (list) (Page 249)

2.5.3.36 GetValueAxis method

Function

Returns the value axis object designated as name or index of the WinCC OnlineTrendControl as type "ICCAxValueAxis".

Syntax

```
Ausdruck.GetValueAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of value axis.

Example

```
'VBS343
Dim ctrl
Dim objValAxis
```

```
Set ctrl = ScreenItems("OnlineTrendControl")
Set objValAxis = ctrl.GetValueAxis(1)
objValAxis.Visible = FALSE
Set objValAxis = ctrl.GetValueAxis("axis 2")
objValAxis.Label = "Value axis 2"
objValAxis.ScalingType = 0
objValAxis.Precisions = 2
objValAxis.AutoRange = TRUE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "ValueAxis" listing, for example, you write "objValueAx.Visible" instead of "objValueAx.ValueAxisVisible".

See also

ValueAxis object (list) (Page 250)

2.5.3.37 GetValueAxisCollection method

Function

Returns the list of all value axis objects of the WinCC OnlineTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetValueAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS344
Dim ctrl
Dim objTrendWnd
Dim objValAxis1
Dim objValAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objValAxis1 = ctrl.GetValueAxisCollection.AddItem("myValueAxis1")
Set objValAxis2 = ctrl.GetValueAxisCollection.AddItem("myValueAxis2")
objValAxis1.TrendWindow = objTrendWnd.Name
objValAxis1.Label = "Value1"
objValAxis2.TrendWindow = objTrendWnd.Name
objValAxis2.inTrendColor = TRUE
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis2.Name
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "ValueAxis" listing, for example, you write "objValueAxis1.Label" instead of "objValueAxis1.ValueAxisLabel".

See also

ValueAxis object (list) (Page 250)

2.5.3.38 GetValueColumn method

Function

Returns the column object designated as name or index of the WinCC OnlineTableControl as type "ICCAxValueColumn".

Syntax

```
Ausdruck.GetValueColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of value column of OnlineTableControl.

Example

```
'VBS345
Dim ctrl
Dim objValueColumn
Set ctrl = ScreenItems("TableControl")
Set objValueColumn = ctrl.GetValueColumn("Valuecolumn1")
objValueColumn.Precisions = 4
Set objValueColumn = ctrl.GetValueColumn(2)
objValueColumn.ExponentialFormat = TRUE
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "ValueColumn" listing, for example, you write "objValueColumn.Precisions" instead of "objValueColumn.ValueColumnPrecisions".

See also

ValueColumn object (list) (Page 250)

2.5.3.39 GetValueColumnCollection method

Function

Returns the list of all value column objects of the WinCC OnlineTableControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetValueColulmnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS346
Dim ctrl
Dim objValCol1
Dim objValCol2
Dim coll
Dim valcol
Set ctrl = ScreenItems("TableControl")
Set objValCol1 = ctrl.GetValueColumnCollection.AddItem("ValueColumn1")
Set objValCol2 = ctrl.GetValueColumnCollection.AddItem("ValueColumn2")
objValCol1.Caption = "Value Archive"
objValCol1.Provider = 1
objValCol1.TagName = "ProcessValueArchive\arch1"
objValCol1.TimeColumn = "TimeColumn1"
objValCol2.Caption = "Value Tag"
objValCol2.Provider = 2
objValCol2.TagName = "tagxx"
objValCol2.TimeColumn = "TimeColumn2"
Set coll = ctrl.GetValueColumnCollection
For Each valcol In coll
 valcol.Align = 2
 valcol.Length = 10
 valcol.AutoPrecisions = TRUE
Next
```

See also

ValueColumn object (list) (Page 250)

2.5.3.40 GetXAxis method

Function

Returns the X axis object designated as name or index of the WinCC FunctionTrendControl as type "ICCAxValueAxis".

Syntax

```
Ausdruck.GetXAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of X axis.

Example

```
'VBS347
Dim ctrl
Dim objXAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAx = ctrl.GetXAxis(1)
objXAx.Visible = FALSE
Set objXAx = ctrl.GetXAxis("axis 2")
objXAx.Label = "X axis 2"
objXAx.ScalingType = 0
objXAx.Precisions = 2
objXAx.Color = RGB(109,109,109)
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "XAxis" listing, for example, you write "objXAx.Visible" instead of "objXAx.XAxisVisible".

See also

XAxis object (list) (Page 251)

2.5.3.41 GetXAxisCollection method

Function

Returns the list of all X axis objects of the WinCC FunctionTrendControl as type "ICCAxCollection".

Syntax

```
Ausdruck.GetXAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS348
Dim ctrl
Dim objXAxis1
Dim objXAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAxis1 = ctrl.GetXAxisCollection.AddItem("myXAxis1")
objXAxis1.Label = "temperature"
```

```
Set objXAxis2 = ctrl.GetXAxisCollection.AddItem("myXAxis2")
objXAxis2.Label = "pressure"
Set coll = ctrl.GetXAxisCollection
HMIRuntime.Trace "Number of XAxis:" & coll.Count & vbCrLf
For Each axes In coll
 HMIRuntime.Trace axes.Name & vbCrLf
 HMIRuntime.Trace axes.Label & vbCrLf
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "XAxis" listing, for example, you write "objXAxis1.Label" instead of "objXAxis1.XAxisLabel".

See also

XAxis object (list) (Page 251)

2.5.3.42 GetYAxis method

Function

Returns the Y axis object designated as name or index of the WinCC FunctionTrendControl as type "ICCAxValueAxis".

Syntax

```
Ausdruck.GetYAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of Y axis.

Example

```
'VBS349
Dim ctrl
Dim objYAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAx = ctrl.GetYAxis(1)
objYAx.Visible = FALSE
Set objYAx = ctrl.GetYAxis("axis 2")
objYAx.Label = "Y axis 2"
objYAx.Align = 0
objYAx.Precisions = 3
objYAx.EndValue = 90.000
objYAx.BeginValue = 10.000
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "YAxis" listing, for example, you write "objYAx.Visible" instead of "objYAx.YAxisVisible".

See also

YAxis object (list) (Page 252)

2.5.3.43 GetYAxisCollection method

Function

Returns the list of all Y axis objects of the WinCC FunctionTrendControl of type "ICCAxCollection".

Syntax

```
Ausdruck.GetYAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS350
Dim ctrl
Dim objYAxis1
Dim objYAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAxis1 = ctrl.GetXAxisCollection.AddItem("myYAxis1")
objYAxis1.Label = "temperature"
Set objYAxis2 = ctrl.GetXAxisCollection.AddItem("myYAxis2")
objYAxis2.Label = "pressure"
Set coll = ctrl.GetYAxisCollection
HMIRuntime.Trace "Number of YAxis:" & coll.Count & vbCrLf
For Each axes In coll
 HMIRuntime.Trace axes.Name & vbCrLf
 HMIRuntime.Trace axes.Label & vbCrLf
Next
```

Note

If you access the properties with the listing object, you do not have to enter the name of the listing.

For the "YAxis" listing, for example, you write "objYAxis1.Label" instead of "objYAxis1.YAxisLabel".

See also

YAxis object (list) (Page 252)

2.5.4 Methods H to M

2.5.4.1 HideAlarm method

Function

Executes the "Hide messages" key function of the AlarmControl.

Syntax

```
Expression.HideAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.2 InsertData method

Function

Adds data to the called trend.

Syntax

```
Expression.InsertData(dblAxisX As Variant, dblAxisY As Variant)
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Parameters

Parameters	Description
dblAxisX	Value of X axis
dblAxisY	Value of Y axis

Example

```
'VBS300
Dim lngFactor
```

```
Dim dblAxisX
Dim dblAxisY
Dim objTrendControl
Dim objTrend
Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")
For lngFactor = -100 To 100
dblAxisX = CDbl(lngFactor * 0.02)
dblAxisY = CDbl(dblAxisX * dblAxisX + 2 * dblAxisX + 1)
objTrend.InsertData dblAxisX, dblAxisY
Next
```

2.5.4.3 Item Method

Function

Retrieves an object from a collection and enables access to it via Index.

Description of DataItem Object

Access uses the name under which the value was added to the list. Single access using an index is not recommended since the index changes during adding or deleting of values.

syntax

```
Expression.Item()
```

Expression

Necessary. An expression which returns an object of the type "Screens", "Layers" (or "Tags").

Note

In the case of "Tags", restricted functional scope! The standard methods get_Count and get_NewEnum are missing so that access via Index nor the counting of all tags is possible.

Parameters

VARIANT

Example:

The following example issues the names of all objects contained in the picture "NewPDL1":

```
'VBS99
Dim objScreen
```

```
Dim objScrItem
Dim lngIndex
Dim lngAnswer
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'The objects will be indicate by Item()
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
lngAnswer = MsgBox(objScrItem.ObjectName, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

ScreenItems Object (List) (Page 144)

ScreenItem Object (Page 141)

Tags Object (List) (Page 155)

Alarms object (list) (Page 126)

ProcessValues Object (List) (Page 140)

2.5.4.4 LockAlarm method

Function

Executes the "Lock Alarm" key function of the AlarmControl.

Syntax

```
Expression.LockAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.4.5 LoopInAlarm method

Function

Executes the "Loop in Alarm" key function of the AlarmControl.

Syntax

```
Expression.LoopInAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.4.6 MoveAxis method

Function

Executes the "Move axis" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Expression.MoveAxis()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.4.7 MoveRuler

Function

Moves the ruler from a specified reference point by a specified distance.

Syntax

```
Expression.MoveRuler( RulerIndex As Long, RulerMoveRef As Long,
MoveDistance As Long, Optional vTrendWindow As Variant )
```

Expression

Required. An expression that returns an object of the "ScreenItem" type.

Parameter

Parameter	Description
RulerIndex	Specifies the ruler to move: 0 = Ruler 1 = Ruler at the start of the statistics area 2 = Ruler at the end of the statistics area
RulerMoveRef	Specifies the reference point as orientation for the third parameter "MoveDistance": 0 = Time axis start position 1 = Current ruler position 2 = Time axis end position
MoveDistance	Number of pixels by which the ruler is moved away from reference point "RulerMoveRef".
vTrendWindow	Optional parameter for handling several, independent trend windows. Specifies the trend window in which the ruler is moved. The ruler moves in all trend windows if this parameter is not specified.

Return value

Function that returns the new ruler position.

Example

Table 2-1 Move ruler left by 10 pixels

```
'VBS367
Sub OnClick(ByVal Item)
Dim ctrl
Set ctrl = ScreenItems.Item("Control1")
call ctrl.MoveRuler (0, 1, -10)
End Sub
```

In the example, the ruler is moved by -10 pixels, starting at reference point 1 (current ruler position). The ruler is now positioned 10 pixels away from the left of its original position.

Example

Table 2-2 Move ruler right by 10 pixels

```
'VBS368
Sub OnClick(ByVal Item)
Dim ctrl
Set ctrl = ScreenItems.Item("Control1")
ctrl.MoveRuler 0, 1, 10
End Sub
```

In the example, the ruler is moved by 10 pixels, starting at reference point 1 (current ruler position). The ruler is now positioned 10 pixels away from the right of its original position.

Example

Table 2-3 Move ruler to end on opening of the window

```
'VBS369
Sub OnOpen()
Dim ctrl
Set ctrl = ScreenItems.Item("Control1")
ctrl.MoveRuler 0, 2, 0
End Sub
```

In the example, the ruler is moved by 0 pixels, starting at reference point 2 (time axis end position). The ruler is now positioned at the time axis end position.

Example

Table 2-4 Calculate current ruler position

```
'VBS370
Sub OnClick(ByVal Item)
Dim ctrl
Set ctrl = ScreenItems.Item("Control1")
Dim pos
pos = ctrl.MoveRuler (0, 1, 0)
HmiRuntime.Trace "RulerPosition=" & pos & vbCrLf
End Sub
```

In the example, the ruler is moved by 0 pixels, starting at reference point 1 (current ruler position). The ruler remains in its original position. The ruler position is returned as value.

2.5.4.8 MoveToFirst method

Function

Executes the "First line" key function of the control.

Syntax

```
Expression.MoveToFirst()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.9 MoveToFirstLine method

Function

Executes the "First message" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToFirstLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.10 MoveToFirstPage method

Function

Executes the "First page" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToFirstPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.11 MoveToLast method

Function

Executes the "Last data record" key function of the control.

Syntax

```
Ausdruck.MoveToLast()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.12 MoveToLastLine method

Function

Executes the "Last message" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToLastLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.13 MoveToLastPage method

Function

Executes the "Last page" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToLastPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.14 MoveToNext method

Function

Executes the "Next data record" key function of the control.

Syntax

```
Ausdruck.MoveToNext()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.15 MoveToNextLine method

Function

Executes the "Next message" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToNextLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.16 MoveToNextPage method

Function

Executes the "Next page" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToNextPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.17 MoveToPrevious method

Function

Executes the "Previous data record" key function of the control.

Syntax

```
Ausdruck.MoveToPrevious()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.18 MoveToPreviousLine method

Function

Executes the "Previous message" key function of the AlarmControl.

Syntax

```
Ausdruck.MoveToPreviousLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.4.19 MoveToPreviousPage method

Function

Executes the "Previous page" key function of the AlarmControl.

syntax

```
Ausdruck.MoveToPreviousPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.5 Methods N to R

2.5.5.1 NextColumn method

Function

Executes the "Next column" key function of the OnlineTableControl.

Syntax

```
Ausdruck.NextColumn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.5.2 NextTrend method

Function

Executes the "Next curve" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.NextTrend()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.5.3 OneToOneView method

Function

Executes the "Original view" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.OneToOneView()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

2.5.5.4 PasteRows method

Function

Executes the "Paste Rows" key function of the UserArchiveControl.

Syntax

```
Expression.PasteRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.5.5 PreviousColumn method

Function

Executes the "Previous column" key function of the OnlineTableControl.

Syntax

```
Ausdruck.PreviousColumn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.5.6 PreviousTrend method

Function

Executes the "Previous curve" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.PreviousTrend()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.5.7 Print method

Function

Executes the "Print" key function of the control.

Syntax

```
Ausdruck.Print()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.5.8 QuitHorn method

Function

Executes the "Acknowledge central signaling devices" key function of the AlarmControl.

Syntax

```
Ausdruck.QuitHorn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.5.9 QuitSelected method

Function

Executes the "Single acknowledgment" key function of the AlarmControl.

Syntax

```
Ausdruck.QuitSelected()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.5.10 QuitVisible method

Function

Executes the "Group acknowledgment" key function of the AlarmControl.

Syntax

```
Ausdruck.QuitVisible()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.5.11 Read Method

Description of Tag Object

Reads out the status of a tag (tag object) shortly after the moment it was called. At the same time, the tag object is provided with the values read. Upon reading a tag, its value, quality code and time stamp are determined. The "LastError" property can be used to determine whether the call was successful.

The "Name", "ServerPrefix" and "TagPrefix" properties are not changed as a result.

If the value of the tag is read successfully, the properties of the tag object are assigned the following values:

Property	Assignment
Value	Tag values
Name	Tag name (unchanged)
QualityCode	Quality level
Timestamp	Current tag time stamp
LastError	0
ErrorDescription	" "

If the value of the tag is not read successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	VT_Empty
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0

Property	Allocation
LastError	Read operation error codes
ErrorDescription	Error description on LastError

Note

A summary of possible Quality Codes may be found in WinCC Information System under key word "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

syntax

```
Expression.Read([Readmode])
```

Expression

Necessary. An expression which returns a tag object. The return value of the Read method is the value of the tag read out.

Parameters

The optional "Readmode" parameter enables the distinction between two types of reading:

Parameters	Description
0	The tag value is read from the process image (cache). 0 is the default value.
1	The value of a tag is read directly from AS or channel (direct).

If the "Readmode" parameter is omitted, the value is read from the process image by default. The return value of the Read method is the tag value read out as VARIANT.

Reading From the Process Image

When reading from the process image, the tag is logged on and, from that moment, polled cyclically from the PLC. The login cycle is dependent on the configured trigger. The value is read from the tag image by WinCC. For Close Picture, the tag actions are ended again. The call is characterized by the following:

- The value is read by WinCC from the tag image.
- The call is faster in comparison to direct reading (except with the first call: The first call basically takes longer because the value from the PLC must be read out and logged on.)
- The duration of the call is not dependent on the bus load or AS.

Behavior in actions with a tag trigger

All of the tags contained in the tag trigger are already known with Open Picture and are registered with the defined monitoring time. Since all tags are requested at once, the best possible optimization can be targeted from the channel. If a tag, contained in the trigger, is

requested with Read during an action, the value already exists and is transferred directly to the call. If a tag is requested which is not contained in the trigger, the behavior is the same as with a standard trigger.

Behavior in actions with a cyclic trigger

tags are registered with half of the cycle time with the first call. For every other call, the value is present.

Behavior in event-driven actions

The tag is registered in the "upon change" mode with the first call. Process tags that are registered in the "upon change" mode correspond with a cyclic read job with a cycle time of 1s.

If an event (e.g. mouse click) requests a value asynchronously, the tag is transferred to the tag image. The tag is requested cyclically from the AS as of this point in time and therefore increases the basic load. To bypass this increase in the basic load, the value can also be read synchronously. The synchronous call causes a one-off increase in the communication load but the tag is not transferred to the tag image.

Direct reading

In the case of direct reading, the current value is returned. The tag is not registered cyclically, the value is requested from the AS one time only. Direct reading has the following properties:

- The value is read explicitly from the AS.
- The call takes longer compared to reading from the process image.
- The duration of the call is dependent on the bus load and AS, amongst other things.

Example:

Reading a tag directly from AS or channel

```
'VBS100
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read(1)    'Read direct
MsgBox vntValue
```

Reading a tag from the process image

```
'VBS101
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read    'Read from cache
```

```
MsgBox vntValue
```

Description of TagSet Object

The TagSet object offers the option of reading several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

Expression

Necessary. An expression which returns an object of type "TagSet".

Reading From the Process Image

The TagSet object offers the advantage of requesting several tags in one read command. The tags are registered in the process image as a group, improving performance in the process.

Direct reading

Since one call may process several read commands, performance is enhanced in comparison to single calls.

Example:

The following example shows how tags are included in the TagSet list, how tag values are imported and subsequently read.

```
'VBS174
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Read
HMIRuntime.Trace "Motor1: " & group("Motor1").Value & vbNewLine
HMIRuntime.Trace "Motor2: " & group("Motor2").Value & vbNewLine
```

If the optional parameter "Readmode" is set to 1, the process tags are not registered but read directly from AS or channel.

```
group.Read 1
```

Example: Writing tag values (Page 810)

LastError Property (Page 445)

ErrorDescription Property (Page 398)

TagSet Object (List) (Page 156)

Tag Object (Page 152)

2.5.5.12 Read Tags method

Function

Executes the "Read tags" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ReadTags()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.5.13 Refresh Method

Function

Drawing all visible pictures again.

syntax

```
Expression.Refresh
```

Expression

Necessary. An expression which returns a "Screens" or "Screen" type object.

Parameters

--

Examples

The first example forces all visible pictures to be drawn again:

```
'VBS149
HMIRuntime.Screens.Refresh
```

The second example forces the basic picture to be immediately redrawn:

```
'VBS150
HMIRuntime.Screens(1).Refresh
```

Screen Object (Page 146)

Screens Object (List) (Page 149)

HMIRuntime Object (Page 134)

2.5.5.14 Remove Method

Description of TagSet Object

Removes a tag from the TagSet list. The tag may be removed by name or reference to a tag object.

syntax

```
Expression.Remove [Tag]
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be removed from the list.

Example:

The following example shows how several tags are included in the TagSet list, and how to remove a tag again.

```
'VBS175
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Remove "Motor1"
```

Description of DataSet Object

Deletes the element specified in parameter "Name" from a list.

syntax

```
Expression.Remove [Name]
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

VARIANT

Parameters	Description
Name	Name of the object to be removed from the list.

Example:

The example shows how to remove the object "motor1" from the list.

```
'VBS166
HMIRuntime.DataSet.Remove("motor1")
```

Description of objects Logging, AlarmLogs, DataLogs

The method deletes a previously swapped archive segment from the Runtime project.

Archive segments deleted with the "Remove" method are removed from the common archiving directory of the project.

The call may require a somewhat longer time period, depending on archive data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be

avoided if you start the call in a Global Scripting action, such as starting the action through a triggering tag.

The archive separation and deletion creates a CPU load. This will affect performance.

Note

Calling up the "Remove" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

For redundancy, the following applies: Re-swapped archives are deleted with the "Remove" method only on the computer from which the method was initiated.

syntax

Objects Logging, AlarmLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [ServerPrefix]
```

Expression

Necessary. An expression which returns an object of type "Logging" or "AlarmLogs".

Object DataLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [Type] [ServerPrefix]
```

Expression

Necessary. An expression which returns an object of type "DataLogs".

Parameters

TimeFrom

Point in time, from which the archives are to be deleted.
When indicating the time format, a short form is also possible. This is described in the "Time Format" section.

TimeTo

Time up to which archive segments are to be deleted.
When indicating the time format, a short form is also possible. This is described in the "Time Format" section.

Timeout

Timeout in milliseconds.
If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

Type:

Type of archive.
The parameter can (optionally) be used only to delete archive segments of the tag logging.
The following values can be entered:

Assigned Value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

ServerPrefix

Reserved for future versions.

Return value

If an error occurred during deletion of the archive segments, the method will return an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Time format

Time format is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the statement may be in the form of "YYYY-MM" or "YYYY-MM-DD hh". Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all archive segments between September 2004 up to and including October 4th are to be swapped.

Example:

In the following example, archive segments re-swapped after the fact for a specified time period may be removed and the return value may be output as Trace.

```
'VBS182
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("2004-08-22","2004-09-22",-1) &
vbNewLine
```

In the following example, all archive segments re-swapped after the fact may be removed and the return value may be output as Trace.

```
'VBS183
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("","",-1) & vbNewLine
```

AlarmLogs Object (Page 128)

TagSet Object (List) (Page 156)

2.5.5.15 RemoveAll Method

Description of TagSet Object

Deletes all tags from a TagSet list.

syntax

```
Expression.RemoveAll
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

--

Example:

The following example shows how several tags are included in the TagSet list, and how to remove all tags again.

```
'VBS176
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.RemoveAll
```

Description of DataSet Object

Deletes all values or object references from a DataSet list.

syntax

```
Expression.RemoveAll
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

--

Example:

The example shows how all objects are removed from the list.

```
'VBS167
HMIRuntime.DataSet.RemoveAll
```

See also

DataSet Object (List) (Page 132)

TagSet Object (List) (Page 156)

Tag Object (Page 152)

2.5.5.16 RemoveData method

Function

Deletes the data of the called trend.

Syntax

```
Expression.RemoveData
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Example

```
'VBS310
Dim objTrendControl
Dim objTrend
Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")
objTrend.RemoveData
```

2.5.5.17 Restore Method

Description of objects Logging, AlarmLogs, DataLogs

The method adds swapped archive segments to the Runtime project.

Upon swapping, the archive segments are copied to the common archiving directory of the project. Therefore, the appropriate storage capacity must be available.

The call may require a somewhat longer time period, depending on archive data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be avoided if you start the call in a Global Scripting action, such as starting the action through a triggering tag.

Linking / copying of the archives generates a CPU load because the SQL server experiences additional load because of turned-on signature checking in particular. Copying of archive segments will slow down hard disk access.

Upon turned-on signature checking, an error message is returned if an unsigned or modified archive is to be swapped. There is always only one error message returned, even if several errors occurred during the swap process. Additionally, a WinCC system message is generated for each archive segment. An entry is added to the Windows event log in the "Application" section. This provides the opportunity to check which archive segments are creating the error.

- With an unsigned archive, the return value "0x8004720F" is returned. The archive is stored. The following text is entered in the event display:
  "Validation of database <db_name> failed! No signature found!"
- With an changed archive, the return value "0x80047207" is returned. The even screen, the entry is "Validation of database <db_name> failed !".
  The archive is not stored.

Note

Calling up the "Restore" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

For redundancy, the following applies: Upon re-swapping of archives with the "Restore" method, only archive segments are added to the Runtime project on the computer from which the method was called.

Syntax

Objects Logging, AlarmLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut]
[ServerPrefix]
```

Expression

Required. An expression which returns an object of type "Logging" or "AlarmLogs".

Object DataLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut] [Type]
[ServerPrefix]
```

Expression

Required. An expression which returns an object of type "DataLogs".

Parameter

SourcePath

Path to archive data.

TimeFrom

Point in time, from which the archives are to be stored.
When indicating the time format, a short form is also possible. This is described in the "Time Format" section.

TimeTo

Time up to which archive segments are to be swapped.
When indicating the time format, a short form is also possible. This is described in the "Time Format" section.

Timeout

Timeout in milliseconds.
If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

Type

Type of archive.
The parameter can (optionally) be used only to store archive segments of the tag logging.
The following values can be entered:

Assigned Value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

ServerPrefix

Reserved for future versions.

Return value

If an error occurred during swapping of archive segments, the method will return an error message. Additional information may be found under the subject heading "Error Messages from Database Area".

Time format

Time format is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the statement may be in the form of "YYYY-MM" or "YYYY-MM-DD hh". Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all archive segments between September 2004 up to and including October 4th are to be swapped.

Example

In the following example, all archive segments since the specified time period are re-swapped, and the return value is output as Trace.

```
'VBS184
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:\Folder","2004-09-14","",-1) &
vbNewLine
```

In the following example, all Tag Logging Slow archive segments since the specified time period are re-swapped, and the return value is output as Trace.

```
'VBS185
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:\Folder","2004-09-14
12:30:05","2004-09-20 18:30",-1,2) & vbNewLine
```

In the following example, all Alarm Logging archive segments up to the specified time period are re-swapped, and the return value is output as Trace.

```
'VBS186
```

```
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Restore("","2004-09-20",-1) &
vbNewLine
```

2.5.6 Methods S to T

2.5.6.1 SelectAll

Function

Selects all rows in the table-based control.

Syntax

```
Expression.SelectAll()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

Row object (list) (Page 240)

2.5.6.2 SelectRow

Function

Selects a particular row in the table-based control.

Syntax

```
Expression.SelectRow(ByVal IRow As Long, Optional bExtendSelection
As Boolean)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Parameters	Description
IRow	Number of the row to be selected.
bExtendSelection	Indicates as an option whether the current selection will be extended. Is only relevant if multiple selections are possible.

Example

- Row 1 is currently selected. If SelectRow(2, True) is called, then row 1 and row 2 will be selected.
- Row 1 is currently selected. If SelectRow(2, False) or SelectRow(2) is called without an optional parameter, then only row 2 will be selected.

See also

Row object (list) (Page 240)

2.5.6.3 SelectedStatisticArea method

Function

Executes the "Set statistic area" key function of the OnlineTableControl.

Syntax

```
Ausdruck.SelectedStatisticArea()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.4 ServerExport method

Function

Executes the "Export archive" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ServerExport()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.6.5 ServerImport method

Function

Executes the "Import archive" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ServerImport()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.6.6 ShowColumnSelection method

Function

Executes the "Select columns" key function of the OnlineTableControl.

Syntax

```
Ausdruck.ShowColumnSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.7 ShowComment method

Function

Executes the "Comments dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowComment()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.8 ShowDisplayOptionsDialog method

Function

Executes the "Display options dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowDisplayOptionsDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.9 ShowEmergencyQuitDialog method

Function

Executes the "Emergency acknowledgment" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowEmergencyQuitDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.10 ShowHelp method

Function

Executes the "Help" key function of the control.

Syntax

```
Ausdruck.ShowHelp()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

2.5.6.11 ShowHideList method

Function

Executes the "List of messages to be hidden" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowHideList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.12 ShowHitList method

Function

Executes the "Hitlist" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowHitList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.13 ShowInfoText method

Function

Executes the "Info text dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowInfoText()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.14 ShowInsertValue method

Function

Executes the "Create archive value" key function of the OnlineTableControl.

Syntax

```
Expression.ShowInsertValue()
```

Expression

Required. An expression that returns an object of the "ScreenItem" type.

2.5.6.15 ShowLockDialog method

Function

Executes the "Lock dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowLockDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.16 ShowLockList method

Function

Executes the "Lock list" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowLockList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.17 ShowLongTermArchiveList method

Function

Executes the "Long-term archive list" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowLongTermArchiveList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.18 ShowMessageList method

Function

Executes the "Message list" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowMessageList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.19 ShowPercentageAxis method

Function

Executes the "Relative axis" key function of the OnlineTrendControl.

Syntax

```
Ausdruck.ShowPercentageAxis()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.20 ShowPropertyDialog method

Function

Executes the "Configuration dialog" key function of the control.

Syntax

```
Ausdruck.ShowPropertyDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

2.5.6.21 ShowSelectArchive method

Function

Executes the "Select data connection" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ShowSelectArchive()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.22 ShowSelection method

Function

Executes the "Selection dialog" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ShowSelection ()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.6.23 ShowSelectTimeBase method

Function

Executes the "Time base dialog" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ShowSelectTimeBase()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.6.24 ShowSelectionDialog method

Function

Executes the "Selection dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowSelectionDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.25 ShowShortTermArchiveList method

Function

Executes the "Short-term archive list" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowShortTermArchiveList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.26 ShowSort method

Function

Executes the "Sort dialog" key function of the UserArchiveControl.

Syntax

```
Ausdruck.ShowSort()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.27 ShowSortDialog method

Function

Executes the "Sort dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowSortDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.6.28 ShowTagSelection method

Function

Executes the "Select data connection" key function of the control.

Syntax

```
Ausdruck.ShowTagSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.6.29 ShowTimebaseDialog method

Function

Executes the "Time base dialog" key function of the AlarmControl.

Syntax

```
Ausdruck.ShowTimebaseDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.30 ShowTimeSelection method

Function

Executes the "Select time range" key function of the control.

Syntax

```
Ausdruck.ShowTimeSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.6.31 ShowTrendSelection method

Function

Executes the "Select trends" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.ShowTrendSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

-- -

2.5.6.32 StartStopUpdate method

Function

Executes the "Start" or "Stop" key function of the control.

Syntax

```
Ausdruck.StartStopUpdate()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.6.33 Stop Method

Function

Terminates WinCC Runtime.

syntax

```
HMIRuntime.Stop
```

Parameters

Example:

The following example terminates WinCC Runtime:

```
'VBS124
HMIRuntime.Stop
```

See also

HMIRuntime Object (Page 134)

2.5.6.34 Trace Method

Description

Displays messages in the diagnostics window.

syntax

```
HMIRuntime.Trace
```

Parameters

STRING

Example:

The following example writes a text in the diagnostics window:

```
'VBS103
HMIRuntime.Trace "Customized error message"
```

See also

HMIRuntime Object (Page 134)

2.5.7 Methods U to Z

2.5.7.1 UnhideAlarm method

Function

Executes the "Unhide alarm" key function of the AlarmControl.

Syntax

```
Ausdruck.UnhideAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.7.2 UnlockAlarm method

Function

Executes the "Unlock alarm" key function of the AlarmControl.

Syntax

```
Ausdruck.UnlockAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

2.5.7.3 UnselectAll

Function

Deselects all rows in the table-based control.

Syntax

```
Expression.UnselectAll()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

Row object (list) (Page 240)

2.5.7.4 UnselectRow

Function

Deselects a particular row in the table-based control.

Syntax

```
Expression.UnselectRow(ByVal IRow As Long)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Long

Parameters	Description
IRow	Number of the row to be selected.

See also

Row object (list) (Page 240)

2.5.7.5 Write Method

Description of Tag Object

Writes a value synchronously or asynchronously in a tag. The "LastError" property can be used to determine whether the call was successful.

If the value of the tag is set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	0
ErrorDescription	" "

If the value of the tag is not set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Write operation error codes
ErrorDescription	Error description on LastError

syntax

```
Expression.Write [Value],[Writemode]
```

Expression

Necessary. An expression which returns a tag object.

Parameters

The value to be written can be transferred directly to the method as a parameter. If the parameter is not specified, the value in the "Value" property is used. The "Writemode" option parameter can be used to select whether the tag value should be written synchronously or asynchronously. If the "Writemode" parameter is not used, writing is performed asynchronously as its default value.

During the writing process, no information is supplied on the status of the tags.

The "Value" property contains the value which was set before or during the writing operation, therefore is may not correspond to the real current value of the tag. If the data on the tag should be updated, use the Read method.

Parameters	Description
Value (optional)	The tag value is specified. The specified value overwrites the value in the "Value" property in the tag object. The tag value is not specified. The tag receives the current value from the "Value" property of the tag object.
Writemode (optional)	0 or empty: The tag value is written asynchronously. 0 is the default value. 1: The tag value is written synchronously.

On asynchronous writing, it is written immediately into the tag image. The user does not receive any feedback if the value has been written in the programmable controller, too.

In the case of synchronous writing (direct to the PLC), the writing operation actually occurs when the PLC is ready to operate. The use receives a check-back message if the writing operation was not successful.

Example:

Asynchronous writing

```
'VBS104
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write
MsgBox objTag.Value
```

or

```
'VBS105
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5
MsgBox objTag.Value
```

Synchronous writing

```
'VBS106
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write ,1
MsgBox objTag.Value
```

or

```
'VBS107
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5, 1
MsgBox objTag.Value
```

Description of TagSet Object

The TagSet object offers the option of writing several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

In order to write different values, the "Value" property of individual tag objects must be set, and write must be called thereafter without the "Value" parameter. Since the write commands are grouped into one call, it results in improved performance compared to single calls.

In a TagSet object, it is not possible to pass on a value using the "Write" method. Individual values must be set using the "Value" property of the individual tag objects.

Example:

The following example shows how tags are included in the TagSet list, how tag values are set and subsequently written.

```
'VBS173
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Wert1"
group.Add "Wert2"
group("Wert1").Value = 3
group("Wert2").Value = 9
group.Write
```

If you set the optional parameter "Writemode" equal to 1, the process tags are written synchronously (directly to AS).

```
group.Write 1
```

LastError Property (Page 445)

ErrorDescription Property (Page 398)

TagSet Object (List) (Page 156)

Tag Object (Page 152)

2.5.7.6 WriteTags method

Function

Executes the "Write tags" key function of the UserArchiveControl.

Syntax

```
Expression.WriteTags()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.7.7 ZoomArea - Method

Function

Executes the "Zoom area" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.ZoomArea()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.7.8 ZoomInOut - Method

Function

Executes the "Zoom +/-" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.ZoomInOut()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.7.9 ZoomInOutTime method

Function

Executes the "Zoom time axis +/-" key function of the OnlineTrendControl.

Syntax

```
Ausdruck.ZoomInOutTime()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.7.10 ZoomInOutValues - Method

Function

Executes the "Zoom value axis +/-" key function of the OnlineTrendControl.

Syntax

```
Ausdruck.ZoomInOutValues()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.7.11 ZoomInOutX method

Function

Executes the "Zoom X axis +/-" key function of the FunctionTrendControl.

Syntax

```
Ausdruck.ZoomInOutX()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.7.12 ZoomInOutY - Method

Function

Executes the "Zoom Y axis +/-" key function of the FunctionTrendControl.

Syntax

```
Ausdruck.ZoomInOutY()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.5.7.13 ZoomMove method

Function

Executes the "Move trend area" key function of the OnlineTrendControl and FunctionTrendControl.

Syntax

```
Ausdruck.ZoomMove()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

2.6 Appendix

2.6.1 Error Messages from Database Area

Introduction

Upon access to databases, a value is returned upon execution. Values in the range "0x8..." represent an error message. Values not equal to "0x8..." represent a status message.

Status Messages

The following status messages are defined:

0x0	OK
0x1	Function did not find any errors in parameter supply and did not find any internal errors. The following causes may result in this value. When connecting databases: - No archive could be found in the given time window. - Archives were found in the given time window, but they were already connected. When separating databases: - No connected archives could be found in the given time window. No checks are performed on whether or not archives are attached at all.

Error Messages

The following error messages are defined (n in English only):

Error code	Error Message
0x80047200	WinCC is not activated
0x80047201	Invalid archive type
0x80047202	Invalid lower boundary
0x80047203	Invalid upper boundary
0x80047204	Path 'CommonArchiving' could not be created in the project path
0x80047205	Timeout, please retry
0x80047206	WinCC was deactivated
0x80047207	Wrong signification At least one database had a invalid signature and has not been attached.
0x80047208	Database could not be attached
0x80047209	Copy to 'CommonArchiving' is not possible.
0x8004720A	Invalid syntax for database filename.
0x8004720B	No list of databases.
0x8004720C	Database already detached.
0x8004720D	Database could not be detached.

Error code	Error Message
0x8004720F	Unsigned database attached. At least one database without signature has been attached.
0x80047210	Path error : - Path invalid, - no *.MDF files found in specified path or - no permission to specified path.

ANSI-C for Creating Functions and Actions 3

3.1 Creating Functions and Actions with ANSI-C

Contents

In Runtime, background tasks, such as printing daily reports, monitoring tags or performing picture-specific calculations, are performed as actions.

These actions are started by triggers.

Functions can be called from actions. WinCC has a multitude of functions, which can be modified by the user. Furthermore, the user can also develop his own functions.

The Global Script editor is used to create and edit functions and actions.

This chapter will show you

- How to use the Global Script editor
- How to create and edit functions
- How to create and edit actions
- How to use the diagnostic tools to analyze runtime problems

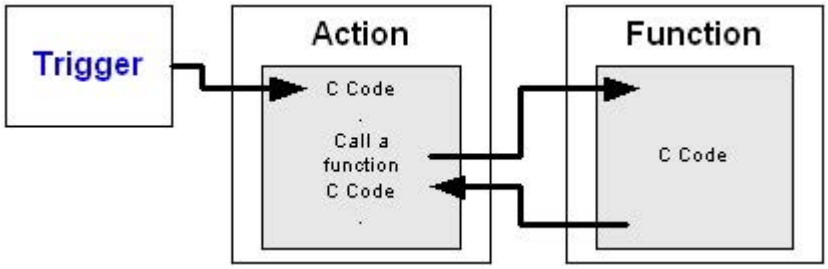
3.2 Creating Functions and Actions

Introduction

WinCC supports the use of functions and actions for dynamization of the processes in your WinCC project. These functions and actions are written in ANSI-C.

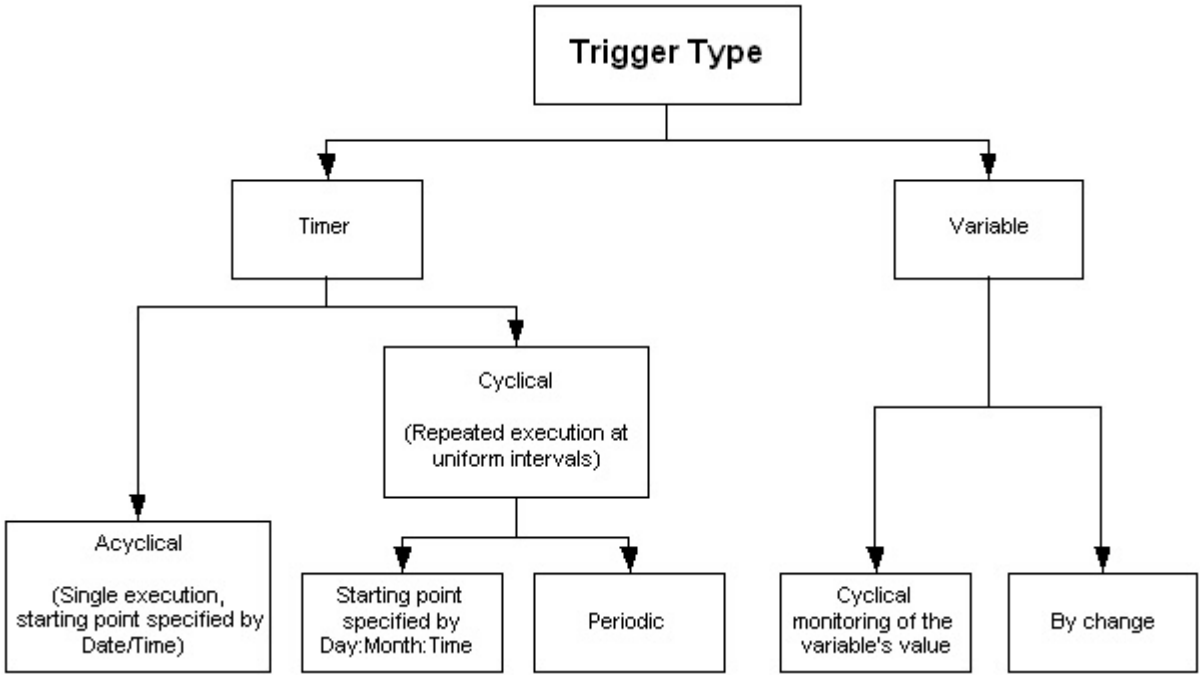
Difference between Functions and Actions

Actions are activated by a trigger, namely a triggering event. Functions do not have a trigger and are used as components of actions as well as in Dynamic Dialogs, in Tag Logging and in Alarm Logging.



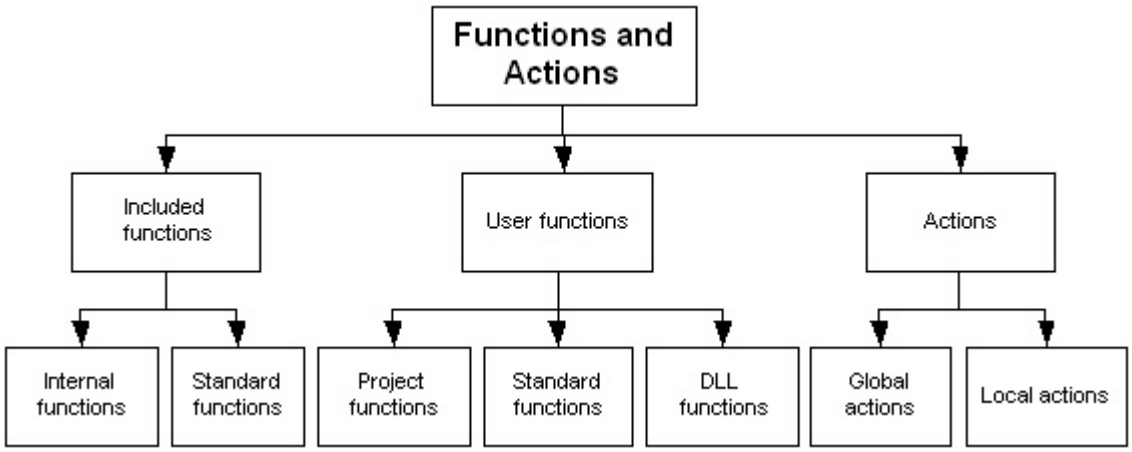
Trigger Types

The following trigger types are available:



Outline of the Functions and Actions

The diagram provides an overview of the range of functions and actions:



Actions are used for picture-independent background tasks, such as printing daily reports, monitoring tags or performing calculations.

Functions are pieces of code, which can be used in several locations, but are only defined in one place. WinCC includes a multitude of functions. Furthermore, you can also write your own functions and actions.

The included standard functions can be modified by the user. In the event that WinCC is reinstalled or upgraded, the standard functions that were modified are deleted or replaced by the unedited standard functions. Therefore, you should back up the modified functions prior to upgrading or reinstalling.

Design tool

WinCC provides the "Global Script" editor for designing, creating and editing functions and actions. Global Script is started from the navigation window of WinCC Explorer.

Unicode support

You can set the suitable code page in the toolbar of the "Global Script" editor. This means that the system language no longer has to be changed with the Microsoft setting "Start > Settings > Control Panel > Regional and Language Options".

You can select "Dynamic: Project setting" as the language setting for scripts. The C script is compiled in English. The code page of the centrally configured language is used for the strings in runtime.

You can specify the project setting in the "Project Properties" dialog in the WinCC Explorer. You can select the following from a list in the "Options" under "C scripts with "Dynamic" language setting in runtime":

- "Respective set WinCC Runtime language". The C script is executed in the WinCC Runtime language.
- Operating system language for non-Unicode programs.
- The C script is executed with the code page setting of the operating system. Select the language from the list.

Characteristics of Local Actions (Page 1539)
Characteristics of Internal Functions (Page 1538)
Characteristics of Standard Functions (Page 1536)
Characteristics of Project Functions (Page 1535)

3.3 Characteristics of Project Functions

Characteristics of Project Functions

Project functions ...

- can be created by yourself
- can be edited by you
- can be password-protected against modification and viewing by unauthorized persons
- have no trigger
- are only known within the project
- are assigned file name extension "*.fct"

Project functions are saved in the "\library"" subdirectory of the WinCC project.

Use of Project Functions

Project functions can be used...

- in other project functions
- in Global Script actions
- in C-Actions in the Graphics Designer and within the Dynamic Dialog
- in Alarm Logging within the Loop in Alarm functionality
- in Tag Logging when starting and releasing archives and when swapping-out cyclic archives

See also

How to Protect a Function Against Unauthorized Access (Page 1568)
Creating and Editing Functions (Page 1560)

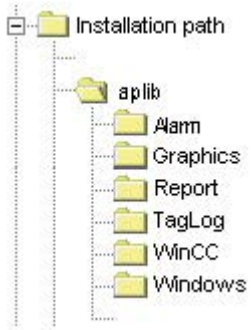
3.4 Characteristics of Standard Functions

Characteristics of Standard Functions

Standard functions ...

- are provided for use in WinCC
- cannot be created by yourself
- can be edited by you
- can be password-protected against modification and viewing by unauthorized persons
- have no trigger
- are known across projects
- are assigned file name extension "*.fct"

Standard functions are saved in the "\aplib" subdirectories in the WinCC installation directory.



Use of Standard Functions

Standard functions can be used...

- in project functions
- in other standard functions
- in Global Script actions
- in C-actions in the Graphics Designer and within the Dynamic Dialog
- in Alarm Logging within the Loop in Alarm functionality
- in Tag Logging when starting and releasing archives and when swapping-out cyclic archives

Note

The included standard functions can be edited by the user. In the event that WinCC is reinstalled or upgraded, the standard functions that were modified are deleted or replaced by the unedited standard functions. Therefore, you should back up the modified functions prior to upgrading or reinstalling.

See also

How to Use Standard and Project Functions (Page 1566)

Creating and Editing Functions (Page 1560)

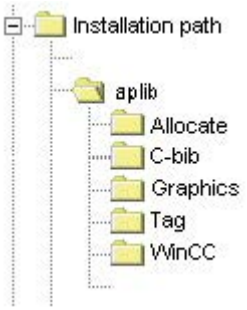
3.5 Characteristics of Internal Functions

Characteristics of Internal Functions

Internal functions ...

- are provided for use in WinCC
- **cannot** be created by you
- **cannot** be edited
- **cannot** be renamed
- have no trigger
- are know project-wide
- are assigned file name extension "*.icf"

Internal functions are saved in the "\aplib" subdirectories in the WinCC installation directory.



Use of Internal Functions

Internal functions can be used...

- in project functions
- in standard functions
- in actions
- in C-actions in the Graphics Designer and within the Dynamic Dialog

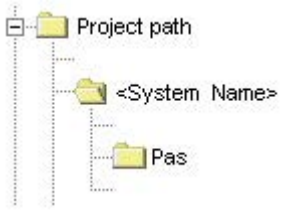
3.6 Characteristics of Local Actions

Characteristics of Local Actions

Local actions ...

- can be created by yourself
- can be edited by you
- can be password-protected against modification and viewing by unauthorized persons
- have at least one trigger
- are only executed on the assigned computer
- are assigned file name extension "*.pas"

Local actions are saved in the "\<computer_name\Pas" subdirectory in the project directory.



Use of Local Actions

Actions are used for picture-independent background tasks, such as printing daily reports, monitoring tags or performing calculations. An action is started by the trigger configured for it. In order for an action to be executed, Global Script Runtime must be included in the startup list.

In contrast to global actions, local actions can be assigned to a single computer. It is thus for example possible to ensure that a report is only printed on the server.

See also

How to Protect an Action Against Unauthorized Access (Page 1580)

Triggers (Page 1582)

How To Create and Edit Actions (Page 1573)

How to Add Global Script Runtime to a Project's Startup List (Page 1541)

3.7 Characteristics of Global Actions

Characteristics of Global Actions

Global actions ...

- can be created by yourself
- can be edited by you
- can be password-protected against modification and viewing by unauthorized persons
- have at least one trigger to start them
- are executed on all project computers in a client-server project
- are assigned file name extension "*.pas"

Global Actions are saved in the "\Pas" subdirectory of the WinCC project.

Use of Global Actions

Actions are used for background tasks, such as printing daily reports, monitoring tags or performing calculations. An action is started by the trigger configured for it. In order for an action to be executed, Global Script Runtime must be included in the startup list.

In contrast to local actions, global actions are executed on all project computers in a client-server project. In a single-user project there is no difference between global and local actions.

See also

How to Protect an Action Against Unauthorized Access (Page 1580)

Triggers (Page 1582)

How To Create and Edit Actions (Page 1573)

How to Add Global Script Runtime to a Project's Startup List (Page 1541)

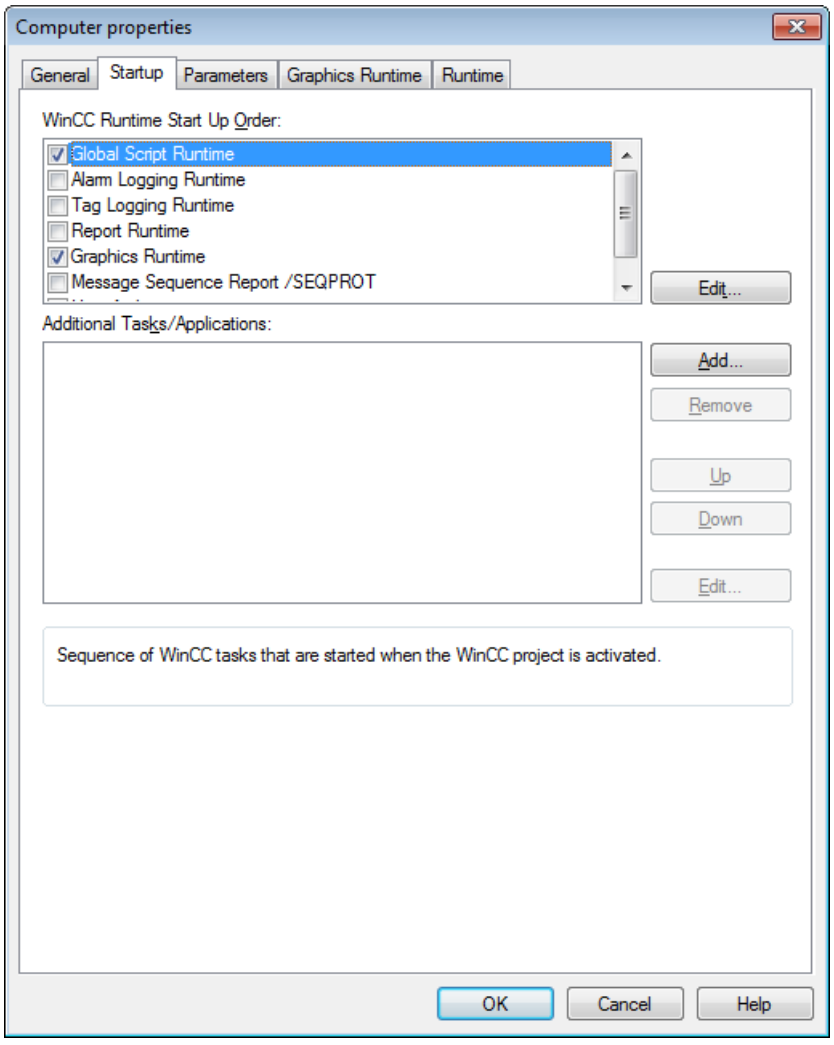
3.8 How to Add Global Script Runtime to a Project's Startup List

Introduction

In order to run Global Script Actions in Runtime, Global Script Runtime must be added to the project's startup list. This does not affect the executability of the functions.

Procedure

1. In the shortcut menu of computer in WinCC Explorer, select "Properties". The "Computer list properties" dialog opens.
2. Click "Properties". The "Computer Properties" dialog opens.
3. Select the "Startup" tab
4. Activate "Global Script Runtime".



5. Click "OK" to close the dialog.

3.9 Use of Global C-Tags

Definition of global C tags

A global C-tag is defined by adding the definition line in front of the function name of a function:

```
int a; //The tag a is defined as an integer
void dummy() //Function name
{
. //Function code
}
```

Validity range

A tag defined in this manner is known to every function and action in Runtime. It is created as soon as Runtime is started, even if the function itself was not called.

Note

When you operate the WinCC Service Mode, there is no common data area for C scripting. Thus, for example, no global C variables can be exchanged between "Global Script" and the "Graphics Designer".

Use of global C tags

Global C tags are used in functions or actions by declaring them as external within the function or action:

```
void dummy() //Function name
{
extern int a; //External declaration of the tag a
. //Function code
}
```

The compiler is thus informed that it need not create the tag, since it is created in another location in Runtime.

If the value of tag a changes, this change can be read by every function and action.

Each C-tag may only be defined in one location. For reasons of clarity and to avoid duplicate definitions, we recommend defining global C tags in only one location.

Note

A maximum of 64 Kbytes are available to a function and the global C-tag defined with it.

3.10 Use of DLLs in Functions and Actions

Adjusting DLLs

WinCC allows you to use your own DLLs (Dynamic Link Libraries).

Functions in existing DLLs can be enabled for functions and actions by making the necessary additions to the respective function or action.

Add the following code in front of the function or action:

```
#pragma code("<Name>.dll")
<Type of returned value> <Function_name 1>(...);
<Type of returned value> <Function_name2>(...);
  .
  .
  .
<Type of returned value> <Function_name n>(...);
#pragma code()
```

The functions <Function_name 1> ... <Function_name n> from <Name.dll> are declared and can now be called by the respective function or action.

Example:

```
#pragma code("kernel32.dll")
VOID GetLocalTime(LPSYSTEMTIME lpSystemTime);
#pragma code()

SYSTEMTIME st;

GetLocalTime(&st);
```

As an alternative to this procedure, you can also make the necessary additions in the "Apdefap.h" header file.

When using own DLLs in WinCC, you must use the release version. WinCC is delivered as a release version and thus uses the release version of the system DLLs. If you generate a custom DLL in the debug version, it is possible that both the release and the debug version of the DLL are loaded, increasing the memory requirements.

Structures of the DLL have to be set up using 1-byte alignment.

Note

The DLL must be saved in either the "\bin" directory or in a path defined in the "PATH" system tag. This tag is defined in the operating system properties.

3.11 The Global Script Editor

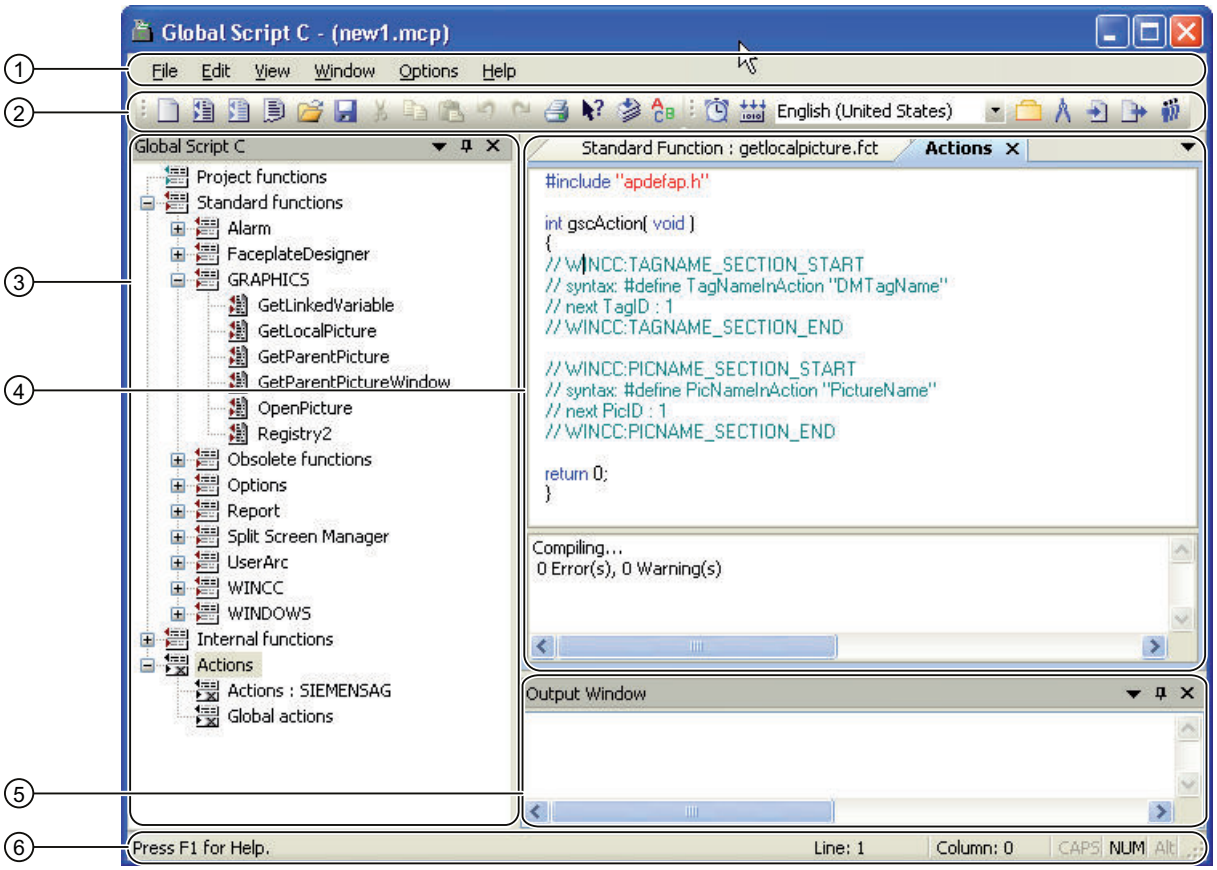
3.11.1 The Global Script Editor

Introduction

WinCC supports the creation and editing of functions and actions with the Global Script editor. Global Script is started from the project window of WinCC Explorer.

Structure of the Global Script Editor

The Global Script editor is designed in accordance with the Windows standards. It comes with toolbars, a menu bar and a status bar. It has several windows featuring drop-down menus.



Menu bar (1)
The menu bar content depends on the situation. It is always visible.

Toolbars (2)
Global Script contains two toolbars You may always unhide these toolbars and use the mouse

to move them to any screen position.
You may hide/unhide the toolbars using the "View" > "Toolbars" menu command and move these to any position in the editor.

Navigation window (3)
The navigation window serves to select functions and actions for editing, or to insert an editing window at the cursor position. The functions and actions are organized in groups with hierarchic order. Functions are always displayed by their function name, while actions are displayed by their file name.

Editing window (4)
The editing window is used to edit functions and actions. It is only visible when a function or action has been opened for editing. Each function or action is opened in a separate edit window. Several editing windows can be opened simultaneously.

Output window (5)
The output window displays results of the "Search in files" or "Compile all functions" functions. By default, it is visible, but can be hidden.

- Search in files:
  A hit list is returned for each search term found in a single line of the output window, which consists of the line number, path and file name, as well as the line text with the specified number of the line in which the search term was found. You can directly open the corresponding file by double-clicking an entry in the output window. The cursor is placed in the line in which the search term was found.
- Compile All Functions:
  Compiler warnings and error messages are output for all functions compiled. In the next line, the path and file name of the compiled function as well as the summary message from the compiler are displayed.

Status bar (6)
The status bar is located on the bottom edge of the Global Script window; you may hide/unhide the status bar. It contains information about the position of the cursor in the edit window and the keyboard settings. In addition, the status bar shows either a brief description for the currently selected Global Script functionality or a tip.

Window docking

Window docking is a useful tool for the flexible arrangement of windows. It lets you reposition windows to obtain separate windows, or to group windows in tab groups. For example, you can arrange your actions horizontally, vertically, or as tab group. You may hide windows automatically and show these again as required.
For more information ,refer to chapter "Creating process pictures".

Working with the Toolbars (Page 1550)
Working in the Edit Window (Page 1548)

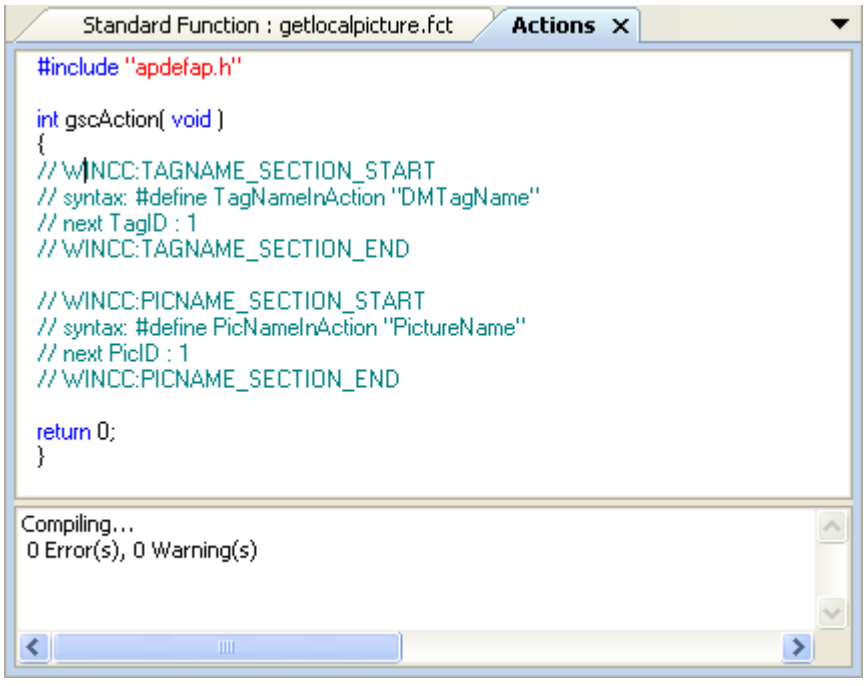
3.11.2 Working in the Edit Window

3.11.2.1 Working in the Edit Window

Introduction

The edit window includes an array of functions, which can be executed with either the keyboard or the mouse.

In the edit window, you can edit functions and actions.



Contents

The window can be split. The upper part of the edit window displays the code of the function or action. In the lower part, you can see the messages that the compiler output while compiling the function or action.

Properties

When the window is opened for the first time, the lower part of the window is minimized. When the compiler process is started, the lower part of the window is enlarged to allow for the display of the compiler messages. The division of the window can be adjusted with the mouse. Double-click an error message to jump to the corresponding line in the code.

Color code

The C code is color-coded as follows:

Color	Description	Example
Blue	Keywords	define, double, if
Green	Comments	// is a comment
Red	Strings	"Rectangle3"
Black	Other C-codes	level=100*newvalue/255;

Note

A function or action cannot have more than 32767 characters including spaces.

See also

Editing Functions with the Mouse (Page 1550)

Editing Functions with the Keyboard (Page 1549)

3.11.2.2 Editing Functions with the Keyboard

You can carry out the following editing functions using the keyboard:

Editing function	Keyboard operation
Switch between write modes Insert/Overwrite	<INSERT>
Add new line	<ENTER>
Delete one character to the right	<DELETE>
Delete one character to the left	<BACKSPACE>
Delete marked text	<DELETE> or <BACKSPACE>
Jump to beginning of line	<POS1>
Jump to end of line	<END>
Jump to beginning of text	<CTRL+POS1>
Jump to end of text	<CTRL+END>
Move cursor	<Cursor keys>
Move cursor by one window content to beginning of text	<PAGE UP>

Editing function	Keyboard operation
Move cursor by one window content to end of text	<PAGE DOWN>
Move cursor to first line in window	<CTRL+PAGE UP>
Move cursor to last line in window	<CTRL+PAGE DOWN>
Jump to next tab position	<TAB>
Cut marked text and paste to clipboard	<CTRL+X>
Copy marked text to clipboard	<CTRL+C>
Paste text from clipboard	<CTRL+V>

3.11.2.3 Editing Functions with the Mouse

You can carry out the following editing functions using the mouse:

Editing function	Mouse command (left mouse button)
Select text	Drag mouse over text
Select a word	Double-click the word
Select a line	Triple-click the line
Extended selection	<SHIFT> + mouse-click
Set cursor	Click
Move selected text	Drag and drop
Duplicate selected text	<CTRL>+drag and drop

Other editing functions:

- By double-clicking a compiler error message, the editor jumps to the corresponding line in the code.
- Right-clicking calls up a shortcut menu.

With the following actions, the selected text is replaced by the result of the action:

- Input of character(s) through the keyboard
- Pasting of text from the clipboard
- Insertion of a function call by means of parameter assignment

3.11.3 Working with the Toolbars

Purpose

The toolbars are located in their default position below the menu bar, at the top of the Global Script window. The toolbar buttons allow for fast and easy execution to a number of Global Script functions.

There are two toolbars available:

"Standard" toolbar

"Edit" toolbar

Contents

The standard toolbar contains buttons for the following functions:

Button	Function	Key combination
	Creates a new action.	<ALT+A> or <CTRL+N>
	Creates a new standard function.	<ALT+S> or <CTRL+N>
	Creates a new project function.	<ALT+P> or <CTRL+N>
	Creates a new header file.	<CTRL+H>
	Opens an existing action or function.	<CTRL+O>
	Saves the content of the active editing window. This function is only available if an editing window is open.	<CTRL+S>
	Cuts the selected text and copies it to the clipboard. This function is only available if text has been selected.	<CTRL+X>
	Copies the selected text to the clipboard. This function is only available if text has been selected.	<CTRL+C>
	Pastes the contents of the clipboard at the location of the cursor. This function is only available if the clipboard is not empty.	<CTRL+V>
	Undoes the last of a maximum of 30 editor actions. This function is only available if an editor action has been performed.	<CTRL+Z>
	Redoes the last editor action that was undone. This function is only available if an editor action has been undone.	<CTRL+A>
	Prints the contents of the active editing window as project documentation. This function is only available if an editing window is open.	<CTRL+P>
	Activates the direct help (What's this?).	<SHIFT+F1>
	Generates a new header.	<CTRL+G>
	Allows you to set the font.	<CTRL+F>

Note

The key combination <CTRL+N> is only available if at least one editing window is open. If the active editing window contains a function and <CTRL+N> is pressed, a new project function is created. If the active editing window contains an action, this key combination creates a new global action.

The editing toolbar contains buttons for the following functions:

Button	Function	Key combination
	Enables you to add information about functions and, in the case of an action, to setup a trigger. This function is only available if an editing window is open.	<CTRL+I>
	Compiles the code in the active editing window. This function is only available if an editing window is open.	<SHIFT+F8>
	Set the appropriate code page. Verify that the code page selection matches the source text. You cannot use more than one language in the source text.	-
	Opens the tag dialog. This function is only available if an editing window is open.	<CTRL+R>
	Opens a dialog for the selection of a picture. The name of the selected picture is inserted at the position of the cursor in the editing window. This function is only available if an editing window is open.	<CTRL+W>
	Imports an action. This function is only available if the active window contains an action.	<CTRL+M>
	Exports the action from the active editing window. This function is only available if the active window contains an action.	<CTRL+T>
	Sets the authorization for operating the action. This function is only available if the active window contains an action.	<CTRL+E>

Properties

Both toolbars can be shown or hidden.

They can be pinned below the menu bar.

When they are not pinned down, they can be dragged with the mouse to any position on the screen.

See also

How to Set Different Views (Page 1553)

3.11.4 How to Set Different Views

Introduction

In this context, views are considered to be different combinations of elements visible in the Global Script editor, such as the output window, status bar and toolbars. These elements can be individually displayed or hidden.

By default, all elements are visible.

Procedure

1. Opens the "View" menu in the Global Script menu bar.
2. Activate or deactivate the display of the desired elements e.g. the toolbars. If "show" is chosen, a check mark is displayed in front of the name.

Note

When Global Script restarted, the editor reverts to the default settings and all elements are again visible.

3.11.5 How to Set the Font Style

Introduction

The font style is composed of the settings "Font", "Style" and "Size".

The style selected is active in all edit windows.

Procedure

1. Click the button in the standard toolbar to open the dialog for setting the font style.
2. Make the desired settings.
3. Confirm your settings by clicking "OK".

Alternative procedure

You can also open the dialog for the font style settings in the following manner:

Select the "Options" menu in the Global Scripts menu bar and select "Font", or use the corresponding key combination.

Note

The settings are automatically saved and are not reset when WinCC is restarted.

3.11.6 How to Use "Save As..."

Introduction

If a function or action is created, Global Script saves the corresponding file in a predefined path with a default file name, e.g. "new_function_1.fct" for functions and "gsccs1.pas" for actions. Since these default file names are not particularly useful, use "Save As ..." to save the function or action under a different - more meaningful - file name. The file with the default file name is retained.

With "Save As ...", only the file name is changed, the function or action name remains unchanged.

Global Script expects that the function or action is saved in a project directory. If this is not the case, a message is displayed, but the file is saved nonetheless.

Requirement

"Save As..." is only available, if at least one edit window is open. It saves the content of the active edit window.

Procedure

1. In the Global Script menu bar, open the "File" menu.
2. Select "Save As...".
3. Enter the new file name.
4. Close the dialog by clicking the "Save" button.

See also

How to Delete Actions or Project and Standard Functions (Page 1555)

3.11.7 How to Delete Actions or Project and Standard Functions

Introduction

Actions or project and standard functions can be deleted during configuration or in Runtime. Global Script deletes the entry in the navigation window as well as the associated file.

If a deleted function is called by an action, the action is terminated upon calling the function.

If a Global Script diagnostic window is open at this time, a message is displayed. The termination of the action is logged in the "WinCC_Sys_xx.log" diagnostic file (xx = consecutive number). This diagnostic file is located in the "Diagnostics" subdirectory of the WinCC installation directory.

Procedure

1. In the Global Script navigation window, call up the shortcut menu for the function or action to be deleted.
2. Select "Delete".
3. Confirm the command by clicking "Yes".

Alternative operation

Instead of using the shortcut menu, you can also delete the selected function or action by using the <DELETE> key.

Note

If a function is deleted, the entry in the respective header file is deleted as well.

3.11.8 How to Generate a New Header

Introduction

The header must be generated again in the following cases:

- After you have copied project functions from a different project to the "library" directory in your project path.
- After you have copied standard functions from another PC to the "aplib" directory or subdirectories.

By regenerating the header, you enter the copied functions in the respective header files. You can then use the functions in your project.

Procedure

1. Click  in the "Standard" toolbar.

Alternative operation

Alternatively, you can start a generation process as follows:

Open the "Options" menu and select "Regenerate Header" or use the corresponding key combination.

Note

Once the regeneration is finished, the contents of the navigation window are updated.

If WinCC is in Runtime, the Runtime system is not influenced by the regeneration of the header.

3.11.9 How to Compile All Functions

Introduction

If you have changed the header files manually, you have to recompile all functions. All project functions, standard functions and internal functions are automatically compiled with the menu command "Compile all functions".

If functions are called in other functions, error messages are possible. The reason for this is that the called functions have not yet been compiled. These functions must then be compiled individually.

Requirement

This function is only available, if all edit windows are closed.

Procedure

1. Open the "Options" menu.
2. Select "Compile All Functions".

Alternative operation

You can compile all functions using the key combination <ALT+U>.

Result

The results of the individual compilation runs are displayed in the output window, e.g. warnings and error messages of the compiler. The path and the file name of the compiled function as well as the summary message of the compiler are also displayed.

Note

In a multi-user project, the "Compile All Functions" function is not available. Assigning functions is no longer possible with these projects.

The functions compiled in this way will not become active until the next time you start Runtime on a WinCC PC.

3.11.10 How to Search in Files

Introduction

All files of the group selected in the navigation window are searched for the specified search term.

The result of the search is displayed in the output window as follows:

For each found search term, a line is displayed in the output window. This line contains the line number of the line in the code in which the search term was found, plus the path and file name as well as the line of code itself.

Standard and project functions as well as actions can be opened by double-clicking the search results. The cursor is positioned at the start of the line in which the search term was found. In the case of internal functions, the function containing the search term is shown in the navigation window and selected.

Procedure

1. Open the shortcut menu for the group to be searched in the Global Script navigation window.
2. Select "Find in Files".
3. In the dialog, enter the search term to be found.
4. Click "Find" to start the search. The result of the search is displayed in the output window.

3.11.11 Printing Functions and Actions

3.11.11.1 Printing Functions and Actions

Introduction

Actions or project or standard functions can be printed using specified system layouts.

This is however only possible, if the function or action to be printed is displayed in the edit window. The content of the active edit window is printed.

The printout can be examined on the screen in page view.

The printing process can be controlled by a number of print parameters.

The following system layouts are used:

- @gsc_pfc.rpl for project functions
- @gsc_sfc.rpl for standard functions
- @gsc_act.rpl for actions

See also

How to Print the Project Documentation (Page 1559)

How to Open Page View (Page 1559)

How to Set the Print Parameters (Page 1558)

3.11.11.2 How to Set the Print Parameters

Introduction

You can modify the printout as follows:

- By specifying a layout that differs from the standard layout
- By selecting a page range
- By selecting a printer selection
- By printing to file

Requirement

At least one edit window must be open.

Procedure

1. In the Global Script menu bar, open the "File" menu.
2. Select "Project Documentation Setup..."

3. In the subsequent dialog, adjust the desired settings.
4. Apply the settings by clicking "OK".

Note

The settings are automatically saved and are not reset when WinCC is restarted.

3.11.11.3 How to Open Page View

Introduction

Before you begin printing a function or action, it is sometimes an advantage to first see a preview of the printout on the screen (in page view).

The content of the active edit window is displayed in page view.

Procedure

1. In the Global Script menu bar, open the "File" menu.
2. Select "Project Documentation Setup...".

3.11.11.4 How to Print the Project Documentation

Introduction

You can output the contents of the active edit window to a printer or to a file. The selected print parameter settings are applied.

Procedure

1. In the Global Script menu bar, open the "File" menu.
2. Select "Print Project Documentation".

3.12 Creating and Editing Functions

3.12.1 Creating and Editing Functions

Introduction

The system distinguishes between project, standard and internal functions. WinCC is delivered with a broad selection of standard and internal functions. Furthermore, you can create your own project and standard functions or modify standard functions. Please remember, however, that the standard functions included with WinCC are overwritten when WinCC is reinstalled so any modifications are lost.

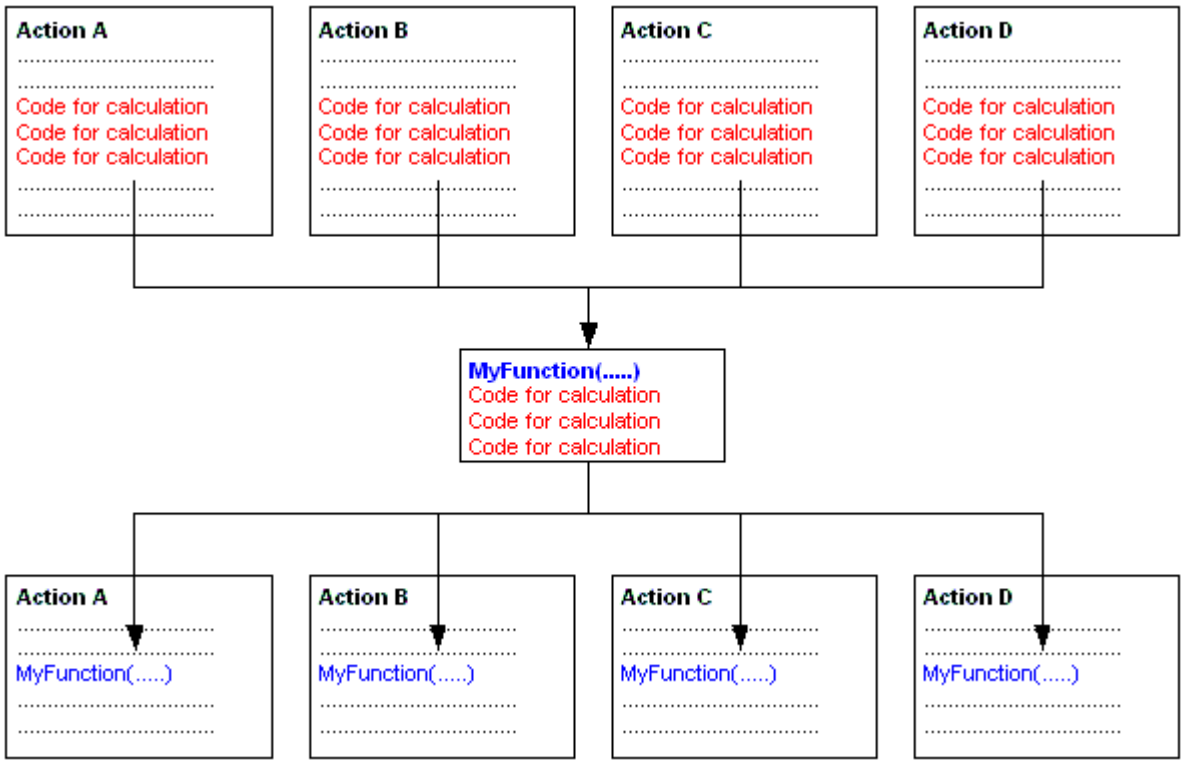
Internal functions cannot be created or edited.

Using Functions

If the same calculation must be performed - with different starting values - in several actions, it would be to your advantage to program a function to perform this calculation. Subsequently you can simply call this function with the current parameters in the actions.

This approach has a number of advantages:

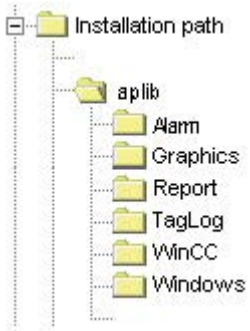
- The code is only programmed once.
- Modifications are only made at one point, namely in the procedure, not in each action.
- The action code is shorter and, thus clearer.



Finding Functions

To access existing functions or create new ones, you can either use the "File" menu in the Global Script navigation window or click the corresponding button in the toolbar.

Functions are stored in the file system as follows:



Editing and Compiling Functions

A function is edited and compiled in its own edit window. The edit window displays messages from the compiler after a compilation run. These might be warnings or error messages. In each case, a summary of the number of warnings and error messages is output.

What Happens When Functions Are Renamed?

In the navigation window, functions are always displayed with their function not their Windows file names. If you change the name of a function and then compile it, the name displayed in the navigation window longer match the function name. This is indicated in the navigation window with the prefix "*" (asterisk) in front of the name. As soon as you save the function, the current function name is displayed in the navigation window.

Note re. Saving Functions

If you save a function that has not been properly compiled, the  symbol is shown in the navigation window.

If you save a function that has not been compiled without errors, the  symbol is shown in the navigation window.

How to Write Function Code (Page 1564)

How to Create a New Function (Page 1563)

Characteristics of Standard Functions (Page 1534)

Characteristics of Project Functions (Page 1533)

3.12.2 How to Create a New Function

Introduction

The procedure is identical for both project and standard functions. In the navigation window, specify the type (project or standard function) and, for standard functions, the group, e.g. "graphics". This also specifies the place where the file is to be saved.

Global Script suggests a default name, e.g. "new_function_3", for the new function. This is also the file name of the function. To ensure that the function name is unique, the suggested name includes a sequential number.

As a rule, the default name should be replaced with a more informative function name. When the renamed function is first saved, the file name can also be changed.

Global Script adds the following information to the function: date created, date modified and version. This information can be viewed in the "Properties" dialog. In the same dialog, you can also assign a password to protect the function against unauthorized modification or viewing. To open the dialog, click the button.

Note

The characters supported by ANSI-C are also supported for the function name:

- Letters, apart from regional special characters
- Numbers
- Underscore

Procedure

1. In the navigation window, open the shortcut menu for the desired group.
2. Select "New"
   If a new function has been created, the first line of code in the associated edit window contains the type of return value and the default name of the new function. In the brackets following this, you can enter transfer parameters if you wish.
   The function code is entered between the curly brackets.

Alternative operation

Alternatively, you can also create a new function by clicking the associated button in the toolbar, via the "File" menu or by using the corresponding key combination.

See also

Inserting Additional Function-Related Information (Page 1567)

How to Use "Save As..." (Page 1552)

3.12.3 How to Write Function Code

Introduction

The function code is written in the edit window for the function. The programming language is ANSI-C.

The code of any project or standard function can call other functions. The called function can be a project, standard, internal or DLL function. To make certain that the called function is known to the calling function, the line #include "apdefap.h" is added as the first line of code in the calling function code.

In the navigation window under "Internal Functions", the C-function library is available as "c_bib".

The first line of code contains the type of the returned value and the default name of the new function. Parameters can be passed by entering them in the following brackets.

The function code is entered between the braces.

Procedure

1. Double-click the function in the navigation window to open it in an edit window.
2. Set the cursor where you wish to begin writing.
3. Enter the desired code.

Alternative operation

You can also open a function as follows:

In the navigation window, open the shortcut menu for the desired action and click "Open" or "File\Open...". You can also click the button in the standard toolbar or use the corresponding key combination.

Note

A maximum of 32 Kbytes of memory is available for local tags (tags defined within the braces of the function code).

How to Use Internal Functions (Page 1565)

Editing Functions with the Mouse (Page 1548)

Editing Functions with the Keyboard (Page 1547)
Working in the Edit Window (Page 1546)

3.12.4 How to Use Internal Functions

Introduction

You can use any of the internal functions as part of your function code. The internal functions are found in the navigation window in the "Internal Functions" group.

If you have used the "Assigning Parameters" dialog to add a function, the function's comments show the type of value returned.

Procedure

1. Place the cursor at the point at which the internal function is to be inserted.
2. In the navigation window, open the shortcut menu for the internal function to be added.
3. Select "Assigning Parameters". The "Assigning Parameters" dialog is opened.
   This dialog has one line for each parameter. In the "Value" column, enter the respective current parameter.
4. In the "Value" column, enter the current value for each of the required parameters.
   This can be accomplished by either a direct entry from the keyboard, or you can open the menu in the "Value" column (single-click and then click the displayed button). From the menu, you can open the selection dialog for tags, pictures or graphic objects.
5. Confirm your entries with "OK". The parameterized function is inserted in the edit window at the location of the cursor.

Alternative operation

Alternatively you can also open the "Assigning Parameters" dialog for an internal function by double-clicking the function to be added.

Note

If you close the "Assigning Parameters" dialog with "OK" without entering the current parameter value, the internal function is inserted with its formal parameters. You can then set the parameters in the edit window at a later stage.

Instead of using the "Assigning Parameters" dialog, you can also use the keyboard to enter the function.

3.12.5 How to Use Standard and Project Functions

Introduction

You can use any project or standard function as part of the function code, if you have first added the line #include "apdefap.h" in the header. The project functions are found in the navigation window in the "Project Functions" group. The standard functions are found in the navigation window in the "Standard Functions" group.

Project functions are entered in the "Ap_pbib.h" header file; standard functions are entered in the "Ap_glob.h" header file. These entries are made by the system. The " Ap_glob.h" header file is integrated into the "Ap_pbib.h" header file. The "Ap_pbib.h" header file itself is linked to the "Apdefap.h" header file. Therefore all project and standard functions are declared in the "Apdefap.h" file header.

To inform the compiler of the project and standard functions added, add the line #include "apdefap.h" as the first line in the function code.

If you have used the "Assigning Parameters" dialog to add a function, the function comments show the type of value returned.

Procedure

1. Place the cursor at the point at which the project or standard function is to be inserted.
2. In the navigation window, open the shortcut menu for the function to be added.
3. Select "Assigning Parameters". The "Assigning Parameters" dialog is opened.
   This dialog has one line for each parameter. In the "Value" column, enter the respective current parameter.
4. In the "Value" column, enter the current value for each of the required parameters.
   This can be accomplished by either a direct entry from the keyboard, or you can open the menu in the "Value" column (single-click and then click the displayed button). From the menu, you can open the selection dialog for tags, pictures or graphic objects.
5. Confirm the entries by clicking "OK".

Note

If the function does not require a parameter, it is added to the function code immediately without opening the "Assigning Parameters" dialog.

If you close the "Assigning Parameters" dialog with "OK" without entering the current parameter value, the internal function is inserted with its formal parameters. You can then set the parameters in the edit window at a later stage.

3.12.6 Inserting Additional Function-Related Information

Introduction

Additional information can be assigned to every function.

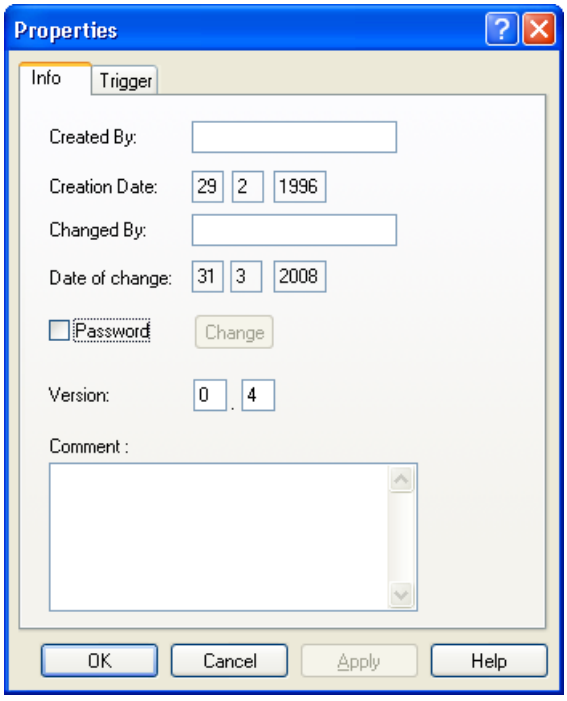
When a new action is created, the creation date is automatically entered in the function-related information and is unchangeable. In addition, the version number 1.0 is also assigned to the number. The version numbers can be individually assigned when editing a function. When a function is changed and saved, the current date of change is entered automatically and is unchangeable. This dialog can be used to assign a password to protect the function from unauthorized viewing and modification.

Requirements

The function to which the information relates must be open in an edit window.

Procedure

1. Click the button in the editing toolbar. The "Properties" dialog is opened.
2. Select the required entries.



3. Confirm the entries by clicking "OK".

Alternative operation

Alternatively, the "Properties" dialog can be opened as follows:

Click the "Edit" menu and select the "Info" option or use the corresponding key combination.

See also

How to Protect a Function Against Unauthorized Access (Page 1568)

How to Set Different Views (Page 1551)

Working with the Toolbars (Page 1548)

3.12.7 How to Protect a Function Against Unauthorized Access

Introduction

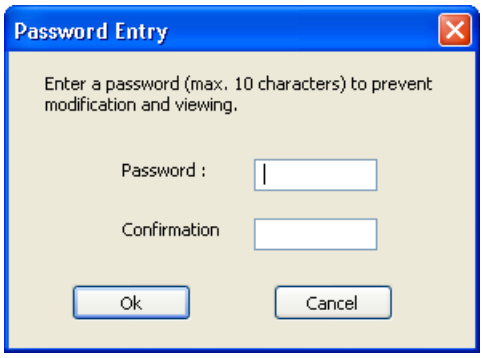
Functions can be protected with a password against unauthorized read and write access. The password is a part of the function-related information.

Requirements

The function to be compiled must be opened in the edit window.

Procedure

1. Click the button in the editing toolbar. The "Properties" dialog is opened.
2. Select the "Password" check box.
3. Click the "Change" button.



4. Enter the password in the "Password" field.
5. Enter the password again in the "Confirmation" field.
6. Confirm your entries with "OK".
7. Click "OK" to close the dialog.

Alternative operation

Alternatively, the "Properties" dialog can be opened as follows:

Click the "Edit" menu and select the "Info" option or use the corresponding key combination.

Note

A password-protected function can only be opened in the edit window if the correct password is entered.

To deactivate the password protection, clear the "Password" check box.

See also

How to Set Different Views (Page 1551)

Working with the Toolbars (Page 1548)

3.12.8 How to Compile and Save a Function

Introduction

In order to use a function, it must first be compiled. Only the function in the active edit window is compiled.

Errors reported by the compiler are displayed in the lower portion of the window. Each message is displayed on a separate line. The line includes the line number in the source code where the error occurred, a hexadecimal encoded error code and a description of the error.

Double-click such a line to select the source code line where the error occurred.

It is recommended that you examine the first message error listed, as subsequent ones could be errors resulting from the first one. If the first error is corrected, then the others might disappear after the next compilation.

To make the changes permanent, the function must be saved.

If you save a function that has been compiled with errors, or not at all, the  icon is assigned to this function in the navigation window.

If you save a function that has been compiled without errors, the  icon is assigned to this function in the navigation window.

Requirements

The function to be compiled must be opened in the edit window.

Procedure

1. Use the toolbar to set the language for compilation of the C function.
2. Click  on the "Edit" toolbar.
3. Examine the compiler messages in the lower portion of the edit window.

4. If the compiler reported an error, the function code must be corrected. After this has been done, start again with step 1 in this table.
5. If the compiler generated warnings, the function source code may require correction. After the code has been corrected, start again with step 1 in this table, otherwise proceed to step 6.
6. Click on the "Default" toolbar.

Alternative operation

Alternatively, the compilation process can be initiated in the following ways:

Select "Compile" from the "Edit" menu, select the "Compile" option from the shortcut menu of the edit window or use the corresponding key combination.

Saving may also be performed in the following ways:

Select "Save" from the "File" menu or use the corresponding key combination.

Note

The compiler does not output an error message if tag names are used several times in a C function. This is also the case if a tag name is used both as transfer parameter and as local tag definition.

For example, the following faulty script does not trigger an error message in the compiler:

```
void neue_Funktion(DWORD dwMyVar)
{
DWORD dwMyVar = 0;
}
```

Message in the output window of the compiler:

Compiling ...

0 Error(s), 0 Warning(s)

See also

Runtime Behavior of Actions (Page 1595)

3.12.9 How to Rename a Function

Introduction

It is recommended that you rename the function, when it is created.

The name of the function in the edit window is then changed accordingly. Since this also changes the code, the function must be recompiled. The old function name, displayed in the navigation window, is assigned prefix "*" (asterisk).

Afterwards, the modified function must be saved at which time you can change the path and file name. The old function should then be deleted to avoid accumulating a collection of obsolete functions.

Note

Please note that only certain characters may be used in function names: characters (with the exception of national special characters), numbers and the underscore.

Procedure

1. Change the function name in the edit window.
2. Click the button in the editing toolbar. The function is compiled.
3. Click the button in the standard toolbar to save the function.
4. If desired, enter a different path and/or file name.
5. Confirm your entry by clicking "Save".

Alternative operation

Alternatively, the compilation process can be initiated in the following ways:

Select "Compile" from the "Edit" menu, select the "Compile" option from the shortcut menu of the edit window or use the corresponding keyboard shortcut.

Saving may also be performed in the following ways:

Select "Save" from the "File" menu or use the corresponding key combination.

3.12.10 How to Use Functions from Other Sources

Introduction

Project functions from other WinCC projects and standard functions from other WinCC systems can also be made useable for the current project. To do so they must be brought into the current project.

Apart from the location in the file system in which they are saved, there is no difference in the procedure for project or standard functions.

Procedure

1. Copy the functions. Project functions are copied in the "\library" directory for the WinCC project. Standard functions are copied in the "\aplib\..." directory in the WinCC path. The content of the navigation window is updated automatically.
2. Click  in the "Standard" toolbar. When the header is regenerated, the copied functions are registered so that you can use them in your current project.

Alternative operation

Alternatively, you can start a generation process as follows:

Open the "Options" menu and select "Regenerate Header" or use the corresponding key combination.

Note

In the event that WinCC is reinstalled or upgraded, the standard functions that were modified are deleted or replaced by the unedited standard functions.

If WinCC is in Runtime, the Runtime system is not influenced by the regeneration of the header.

3.13 Creating and Editing Actions

3.13.1 How To Create and Edit Actions

Introduction

There system distinguishes between global and local actions. In a client-server project, global actions are carried out on all computers in the project, whereas local ones are carried out only on the computer to which they are assigned.

A global action can, for instance, be used to perform a calculation on all computers in the project.

An example of use for a local action might be to output a log file on a server.

The process of creating and editing both action types is identical.

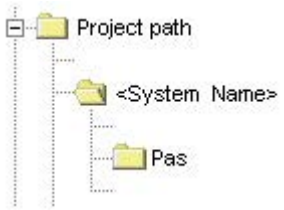
Differences between actions and functions

- Actions, in contrast to functions, can have a trigger. This means that a function, by itself, cannot be executed in Runtime.
- Actions can be exported and imported.
- Authorizations can be assigned to actions. This authoriation refers to the operational options for the Global Script Runtime troubleshooting window.
- An action has no parameters.

Finding actions

New actions can be created, and existing actions can be accessed through the Global Script navigation window.

Actions are stored in the file system as follows:



Editing and Compiling Actions

An action is edited and compiled in a separate edit window. The edit window displays messages from the compiler after a compilation run. These might be warnings or error messages. In each case, a summary of the number of warnings and error messages is output.

Display of Actions

If a syntactically incorrect action is stored, it is displayed in the Global Script navigation window with the icon shown to the left.

If a syntactically correct action is stored with no trigger, it is displayed in the Global Script navigation window with the icon shown to the left.

If a syntactically correct action is stored with a trigger, it is displayed in the Global Script navigation window with the icon shown to the left.

Please note the following when creating actions:

The CrossReference feature of WinCC allows for the creation of cross-references. When building the cross-reference list, in order that the tags and images be recognized when function calls are used as part of actions, the coding rules described further below are to be observed.

Renaming actions

Actions are always displayed with their file names in the navigation window. Renaming an action means renaming the file containing the action code.

System behavior if actions are changed, deleted and saved at Runtime

If a local action is stored at runtime, then all local and global actions of the computer are reset on the computer to which the local action belongs.

If a global action is stored in Runtime, then all local and global actions for the entire project – and thus on all computers – are reset.

Such a reset might reinitialize for examples tags and times that are used as triggers for actions, triggering the action at that stage.

Static tags used in the reset actions are reinitialized.

Possible causes for an action not being performed in Runtime

Failure of an action to be executed in Runtime might have the following causes:

- The action has no trigger
- The action was not compiled
- Global Script Runtime is not enabled in the project start list

Note

Before creating an action, check whether the relevant functionality can also be implemented on the automation device.

3.13.2 WinCC Coding Rule

Coding Rules for the Use of CrossReference

The CrossReference feature of WinCC allows for the creation of cross-references. To ensure that the software can recognize the tags and pictures used in function calls made within actions, the coding rules given here must be observed.

The action's code begins with two sections. In the first section, you must declare all tags used; in the second section all picture names used.

Do not enter any other instructions in the sections.

Both sections are already present in the form of comments when an action is created:

```
// WINCC:TAGNAME_SECTION_START
// syntax: #define TagNameInAction "DMTagName"
// next TagID : 1
// WINCC:TAGNAME_SECTION_END

// WINCC:PICNAME_SECTION_START
// syntax: #define PicNameInAction "PictureName"
// next PicID : 1
// WINCC:PICNAME_SECTION_END
```

The sections are expanded, for example as follows:

```
// WINCC:TAGNAME_SECTION_START
// syntax: #define TagNameInAction "DMTagName"
// next TagID : 1
#define ApcTagName1 "TagName1"
// WINCC:TAGNAME_SECTION_END

// WINCC:PICNAME_SECTION_START
// syntax: #define PicNameInAction "PictureName"
// next PicID : 1
#define ApcPicName1 "PicName1"
#define ApcPicName2 "PicName2"
#define ApcPicName3 "PicName3"
// WINCC:PICNAME_SECTION_END
```

Calls to functions to read and write tags and the utilization of picture names must then be handled using the defined names:

```
GetTagDWord(ApcTagName1);
OpenPicture(ApcPicName1);
SetPictureName(ApcPicName2,"PictureWindow1",ApcPicName3);
```

3.13.3 How to Create a New Action

Introduction

In a client-server project, global actions are carried out on all computers in the project, whereas local ones are carried out only on the computer to which they are assigned.

The procedure is identical for both global and local actions. By specifying, in the navigation window, the location in which the action is saved, you specify its type (global or local).

Global Script suggests a default name for the new action.

A newly created action already contains the instruction #include "apdefap.h". Therefore, all functions are registered within the action. The name of the action is found in the third line. The first three lines cannot be deleted nor modified. This means that every function can be called from each action without requiring any special measures. Furthermore every action has a returned value of type "int" and it is already set to a value of 0.

A returned value of an action can be used in conjunction with GSC Runtime for diagnostic purposes.

The action code begins with a code framework in the form of comments. If this coding framework is filled out in accordance with the coding rules, the tags and picture names are recognized by CrossReference.

Procedure

1. In the navigation window, open the shortcut menu for the desired action type.
2. Select "New".

Alternative operation

Alternatively, you can also create a new action by clicking the associated button in the toolbar, via the "File" menu or by using the corresponding key combination.

See also

GSC Runtime (Page 1596)

WinCC Coding Rule (Page 1574)

3.13.4 How to Edit Actions

Introduction

An action is edited in its own edit window exactly like a function. Only the first three lines cannot be edited.

The action must have a return value. The returned value is of the type "int" and is preset to 0. A returned value of an action can be modified and used in conjunction with GSC Runtime for diagnostic purposes. The returned value's type cannot be changed.

To execute an action in Runtime, the action must have a trigger.

Procedure

1. Double-click the action in the navigation window to open it in an edit window.
2. Edit the action code.

Alternative operation

You can also open an action as follows:

In the navigation window, open the shortcut menu for the desired action and click "Open" or "File\Open...". You can also click the button in the standard toolbar or use the corresponding key combination.

Note

A maximum of 32 Kbytes of memory is available for local tags (tags defined within the braces of the action code).

See also

GSC Runtime (Page 1596)

How to Write Function Code (Page 1562)

3.13.5 How to add action-related information

Introduction

Additional information can be assigned to every action.

When a new action is created, the creation date is entered in the action-related information automatically and is unchangeable. The action is also assigned version number 1.0. The version numbers can be individually assigned when editing an action. When an action is changed and saved, the current date of change is entered automatically and is unchangeable.

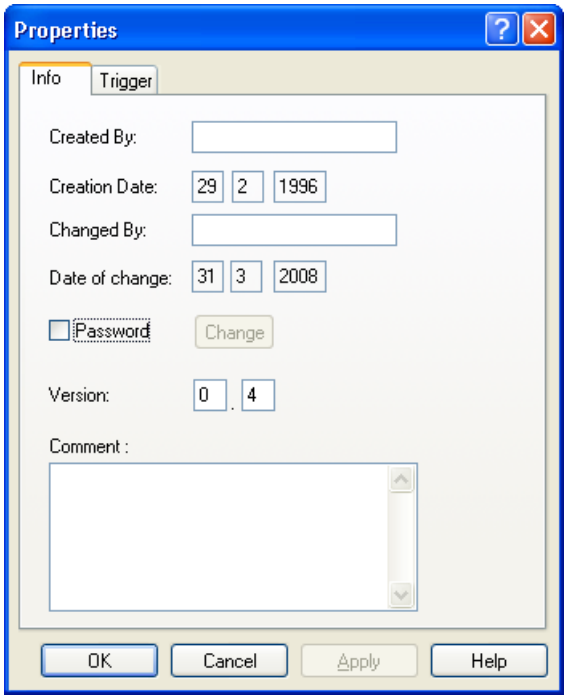
This dialog can be used to assign a password to protect the action against unauthorized read and write access.

Requirements

The action to which the information relates must be open in an edit window.

Procedure

1. Click the button in the editing toolbar. The "Properties" dialog is opened.
2. Select the required entries.



3. Confirm your entries with "OK".

Alternative operation

Alternatively, the "Properties" dialog can be opened as follows:

Click the "Edit" menu and select the "Info" option or use the corresponding key combination.

See also

How to Protect an Action Against Unauthorized Access (Page 1580)

How to Set Different Views (Page 1551)

Working with the Toolbars (Page 1548)

3.13.6 How to Protect an Action Against Unauthorized Access

Introduction

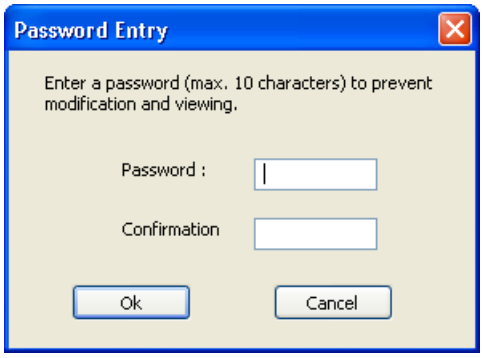
Actions can be protected with a password against unauthorized read and write access. The password is a part of the action-related information.

Requirements

The action to be compiled must be opened in the edit window.

Procedure

1. Click the button in the editing toolbar. The "Properties" dialog is opened.
2. Select the "Password" check box.
3. Click the "Change" button.



4. Enter the password in the "Password" field.
5. Enter the password again in the "Confirmation" field.
6. Confirm your entries with "OK".
7. Click "OK" to close the dialog.

Alternative operation

Alternatively, the "Properties" dialog can be opened as follows:

Click the "Edit" menu and select the "Info" option or use the corresponding key combination.

Note

A password-protected action can only be opened in the edit window if the correct password is entered.

To deactivate the password protection, clear the "Password" check box.

See also

How to Set Different Views (Page 1551)

Working with the Toolbars (Page 1548)

3.13.7 How to Compile and Save an Action

Introduction

In order to use an action, it must first be compiled. Only the action in the active edit window is compiled.

Errors reported by the compiler are displayed in the lower portion of the window. Each message is displayed on a separate line. The line includes the line number in the source code where the error occurred, a hexadecimal encoded error code and a description of the error.

Double-click such a line to view the source code line where the error occurred.

It is recommended that you examine the first message error listed, because subsequent ones could be errors resulting from the first one. If the first error is corrected, then the others might disappear after the next compilation.

Requirement

The action to be compiled must be opened in the edit window.

Procedure

1. Set the language for C compilation using the toolbar.
2. Click  on the "Edit" toolbar.
3. Examine the compiler messages in the lower portion of the edit window.
4. If the compiler reported an error, the action source code must be corrected. After this has been done, start again with step 1 in this table.
5. If the compiler generated warnings, the action source code may require correction. After the code has been corrected, start again with step 1 in this table, otherwise proceed to step 6.
6. Click  on the "Default" toolbar.

Alternative operation

Alternatively, the compilation process can be initiated in the following ways:

Select "Compile" from the "Edit" menu, select the "Compile" option from the shortcut menu of the edit window or use the corresponding keyboard shortcut.

Saving may also be performed in the following ways:

Select "Save" from the "File" menu or use the corresponding key combination.

Display of Actions

If a syntactically incorrect action is stored, it is displayed in the Global Script navigation window with the icon shown to the left.

If a syntactically correct action is stored with no trigger, it is displayed in the Global Script navigation window with the icon shown to the left.

If a syntactically correct action is stored with a trigger, it is displayed in the Global Script navigation window with the icon shown to the left.

See also

Runtime Behavior of Actions (Page 1595)

3.13.8 Triggers

3.13.8.1 Triggers

Defining and Using Triggers

Triggers are used to execute actions in Runtime. To do this, a trigger is linked to an action, forming the triggering event for calling the action. Actions without triggers are not executed.

Trigger Types

The following trigger types are available:

Acyclic Triggers

These consist of a specified date and time. The action specified by such a trigger is performed once at the date and time specified.

Cyclic Triggers

These consist of a specified time interval and starting point. The following types of cyclic triggers are available:

- Default cycle. The start of the first time interval coincides with the start of Runtime. The length of the interval is determined by the cycle.
- Hourly. The start of the interval is specified as minutes and seconds. The length of the interval is an hour.

- Daily. The start of the interval is specified by the time (hours, minutes and seconds). The length of the interval is a day.
- Weekly. The start of the interval is specified by the day of the week (Monday, Tuesday, etc.) and the time. The length of the interval is a week.
- Monthly. The start of the interval is specified by the day and time. The length of the interval is a month.
- Annually. The start of the interval is specified by the day, month and time. The length of the interval is a year.

Tag Triggers

These consist of the specification of one or more tags. The action associated with such a trigger is performed each time a change in the value of one of these tags is detected.
How the tag values are queried may be customized for each tag. Either cyclic polling with a specified period or a reaction as soon as the system detects a change in the tag value may be selected.
Depending on the choice of query method, it is possible that the tag changes but the system does not detect this. In this case the action is not performed.

Effect of Triggers on an Action

If the action is associated with only one trigger, then the action is performed as soon as the triggering event occurs.

However, an action may be associated with multiple triggers, such as a cyclic trigger and a tag trigger. In this case, the action is performed whenever one of the two triggering events occurs. If two events occur simultaneously, the action is executed twice in sequence. If two tag triggers fire at the same time, the action is performed only once.

The processing of an action should be completed before another call of the action occurs, as there might otherwise be an overflow of the queue.

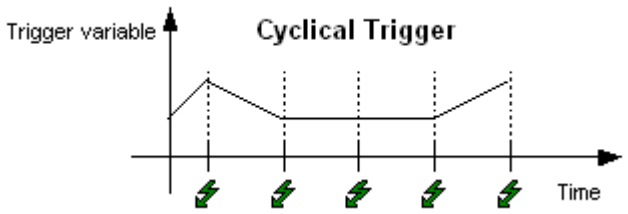
Tip: If the action is not to be carried out with each event occurrence, then a condition can be specified for the action that controls its further course dependent on the event. If the action is not to be executed any more, it can be terminated with a <value> return.

Rules for the Selection of Triggers

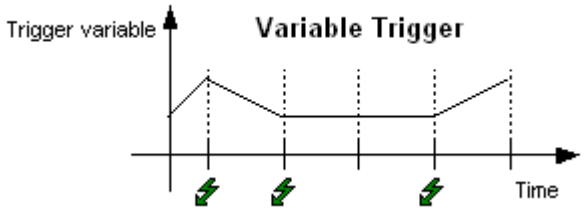
Depending on the system, it cannot be guaranteed that an action with a cyclic trigger is carried out at exactly the specified time. If this is a requirement, then the task (such as a check, etc.) must be implemented on the automation device.

For processing, tag triggers have priority over cyclic triggers.

- For a cyclic trigger, the action is always performed when the trigger event occurs, e.g. every 20 seconds. (= action is performed)



- The tag trigger only causes the action to be performed if the value of the trigger tag has changed. This is done to reduce the system load (= action is performed).



The values of tags contained in the trigger are already known when the action begins. The GetTag() call can be used to access the value directly. Processing is much faster than for trigger tags than for those not contained in the trigger whose values must be obtained via GetTag() requests.

Display of Actions

If a syntactically incorrect action is stored, it is displayed in the Global Script navigation window with the icon shown to the left.

If a syntactically correct action is stored with no trigger, it is displayed in the Global Script navigation window with the icon shown to the left.

If a syntactically correct action is stored with a trigger, it is displayed in the Global Script navigation window with the icon shown to the left.

How to Add a New Trigger of the "Timer" Type (Page 1585)

3.13.8.2 How to Add a New Trigger of the "Timer" Type

Introduction

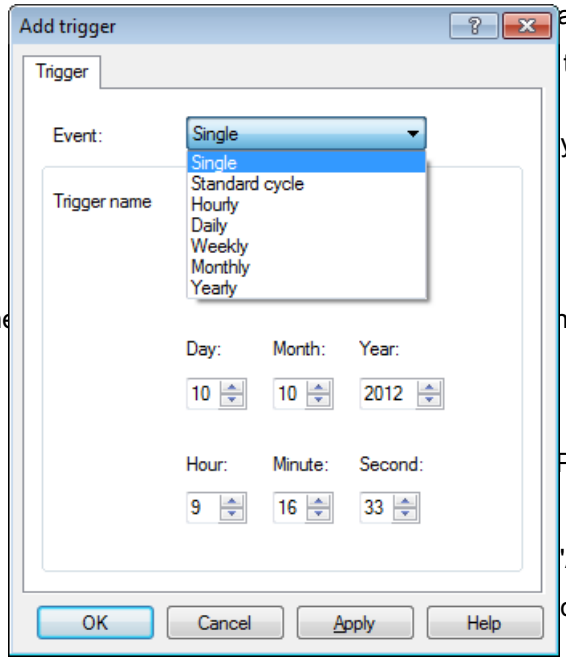
Triggers are used to execute actions in Runtime. To do t his, a trigger is linked to an action, forming the triggering event for calling the action. Actions without triggers are not executed.

"Timer" type triggers can be cyclic or acyclic triggers.

Acyclic triggers consist of a specified date and time. The action specified by such a trigger is performed once at the date and time specified.

Cyclic triggers consist of a specified time interval and starting point. The following types of cyclic triggers are available:

- Default cycle. The start of the first time interval coincides with the start of the Runtime system. The length of the interval is determined by the cycle.
- Hourly. The start of the interval is specified as minutes and seconds. The length of the interval is an hour.
- Daily. The start of the interval is specified by the time (hours, minutes and seconds). The length of the interval is a day.
- Weekly. The start of the interval is specified by the day of the week (Monday, Tuesday, a week.
- the day and time. The length of the interval
- y the day, month and time. The length of



Requirement

The h in the active edit window.

Procedure

1. Properties" dialog is opened.
2.
3. "Add" button.
4. ct a cycle to add a cyclical trigger.
5. Complete the required details in the dialog.
6. Confirm the entries by clicking "OK".
7. Close the "Properties" dialog by clicking "OK".

Alternative operation

Alternatively, the "Properties" dialog can be opened as follows:

In the "Edit" menu, select "Info", select "Info / Trigger" in the shortcut menu of the edit window, or use the corresponding key combination.

3.13.8.3 How to Add a New Trigger of the "Tag" Type

Introduction

Triggers are used to execute actions in Runtime. To do this, a trigger is linked to an action, forming the triggering event for calling the action. Actions without triggers are not executed.

Tag triggers consist of one or more specified tags. The action associated with such a trigger is performed each time a change in the value of one of these tags is detected.
How the tag values are queried may be customized for each tag. Either cyclic polling with a specified period or a reaction as soon as the system detects a change in the tag value may be selected.
Depending on the choice of query method, it is possible that the tag changes while the system fails to detect this. In this case the action is not performed.

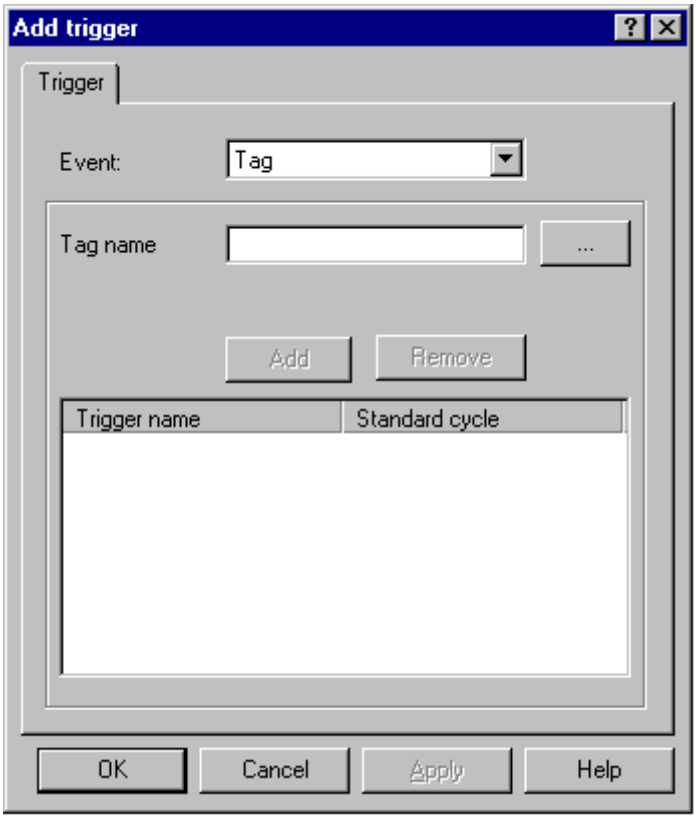
Requirements

The action to be linked with a trigger must be open in the active edit window.

Procedure

1. Click the button in the editing toolbar. The "Properties" dialog is opened.
2. Select the "Trigger" tab.

3. Select the trigger source "Tag" and click the "Add" button. The "Add Tags" dialog is opened.



4. Click the ... button to open the tag selection dialog, select a tag and confirm your selection by clicking "OK".
5. In the "Add Trigger" dialog, open the shortcut menu in the "Standard cycle" column and then select the desired monitoring cycle. Selecting "After Every Change" results continuous monitoring.
6. Repeat steps 4 and 5, if you want add more tags.
7. Confirm the entries by clicking "OK".
8. Close the "Properties" dialog by clicking "OK".

Alternative operation

Alternatively, the "Properties" dialog can be opened as follows:

In the "Edit" menu, select "Info", select "Info / Trigger" in the shortcut menu of the edit window, or use the corresponding key combination.

In the "Add Trigger" dialog, you can also enter a tag name directly and insert the tag in the "Trigger Name" column by clicking "Add". With this approach, the system does however not check whether the tag exists.

3.13.8.4 How to change a trigger

Introduction

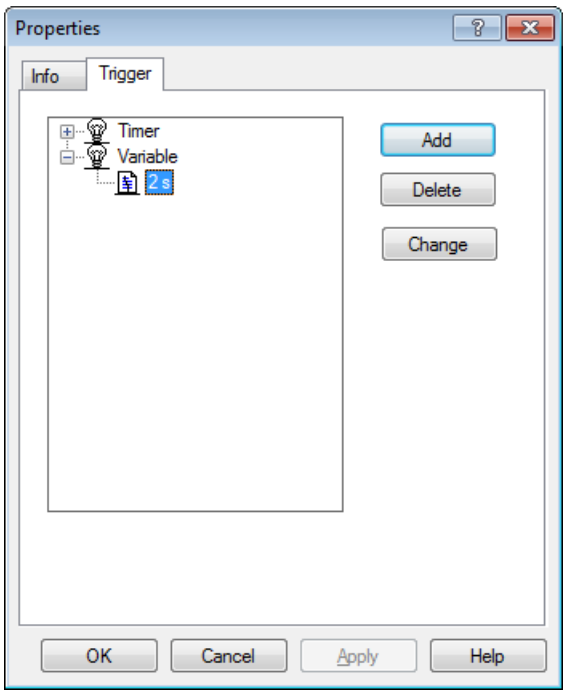
Triggers that have been defined can be changed at any time. They can also be changed in Runtime.

Requirements

The relevant action must be opened in the edit window.

Procedure

1. Click the button in the editing toolbar. The "Properties" dialog is opened.
2. Select the "Trigger" tab and select the trigger you wish to change.



3. Click the "Change" button to open the "Change Trigger" dialog.
4. Make the desired changes.
5. Confirm the entries by clicking "OK".
6. Close the "Properties" dialog by clicking "OK".

Alternative operation

Alternatively, the "Properties" dialog can be opened as follows:

In the "Edit" menu, select "Info", select "Info / Trigger" in the shortcut menu of the edit window, or use the corresponding key combination.

3.13.8.5 How to delete a trigger

Introduction

Triggers that have been defined can be deleted at any time. They can also be deleted in Runtime.

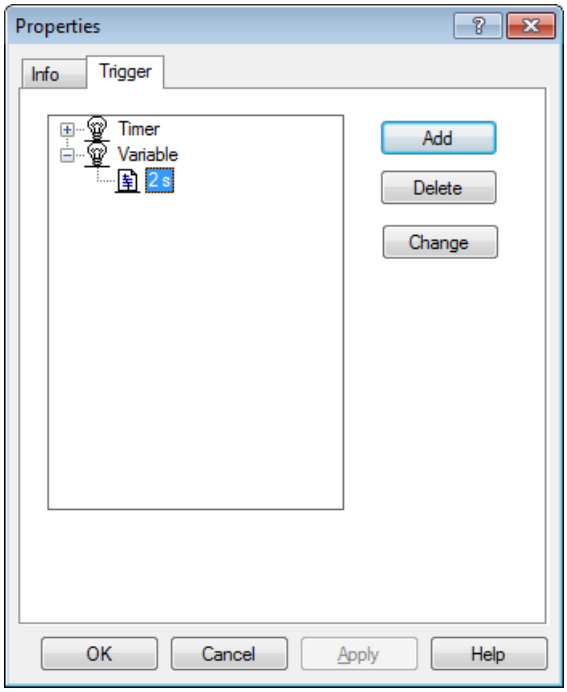
If a trigger is deleted in Runtime, it only takes effect after the action is saved.

Requirements

The relevant action must be opened in the edit window.

Procedure

1. Click the button in the editing toolbar. The "Properties" dialog is opened.
2. Select the "Trigger" tab and select the trigger you wish to delete.



3. Delete the selected trigger by clicking "Delete".
4. Close the "Properties" dialog by clicking "OK".

Alternative operation

Alternatively, the "Properties" dialog can be opened as follows:

In the "Edit" menu, select "Info", select "Info / Trigger" in the shortcut menu of the edit window, or use the corresponding key combination.

3.13.9 How to Assign Authorizations

Introduction

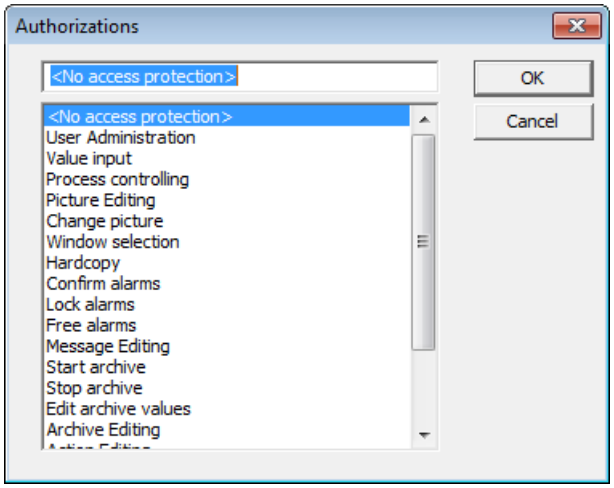
With the Global Script - Runtime diagnostic tool, you can influence the processing of actions in Runtime. Each action can be assigned an authorization. This authorization only effects the operation in the Global Script - Runtime window.

Requirement

The relevant action must be opened in the editing window.

Procedure

1. Click in the toolbar.
   The "Authorizations" dialog box is opened.
2. Select an authorization.



3. Confirm your selection with "OK".

See also

GSC Runtime (Page 1596)

3.13.10 How to Export an Action

Introduction

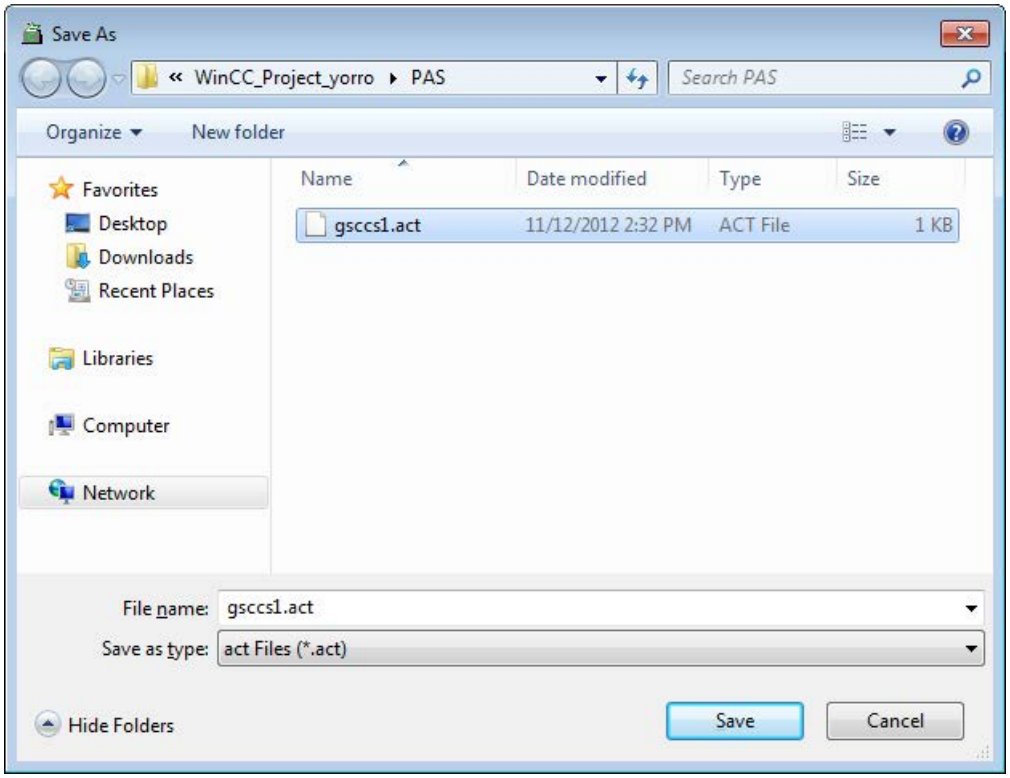
Use export and import to move actions between projects. The triggers linked to the actions are retained in the process.

Requirements

The action to be exported must be opened in the edit window.

Procedure

1. Click the button in the editing toolbar. The "Save As" dialog is opened.
2. Select the path and file name for the action that you wish to export.



3. Close the dialog by clicking the "Save" button.

Alternative operation

Alternatively, you can start the export as follows:

In the "Edit" menu, select "Export", select "Export" in the shortcut menu of the edit window, or use the corresponding key combination.

3.13.11 How to Import an Action

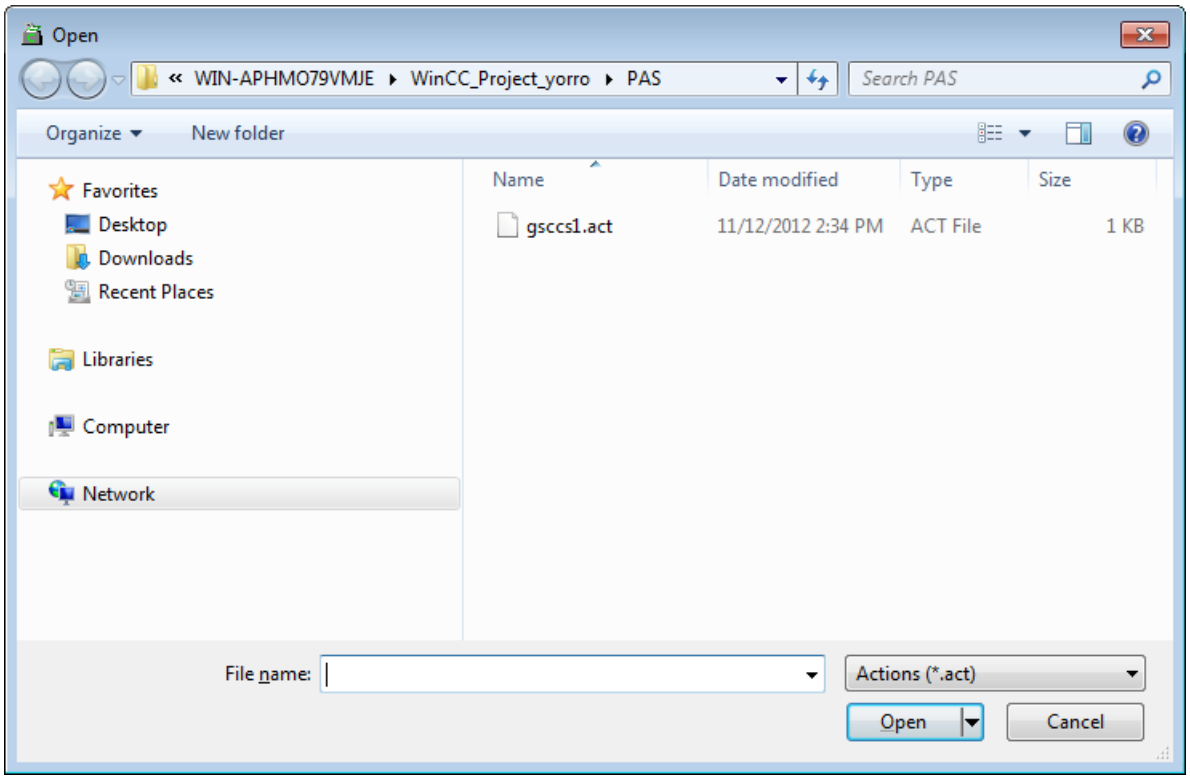
Introduction

Use export and import to move actions between projects. The triggers linked to the actions are retained in the process.

The action in the active edit window is replaced by the imported action.

Procedure

1. Click the button in the editing toolbar. The "Open" dialog is opened.
2. Select the path and file name of the action that you wish to import.



3. Close the dialog by clicking the "Open" button.

Alternative operation

Alternatively, you can start the import as follows:

In the "Edit" menu, select "Import", select "Import" in the shortcut menu of the edit window, or use the corresponding key combination.

3.13.12 How to Rename an Action

Introduction

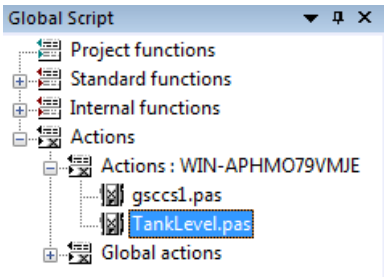
You may rename an action at any time. The action is thereby assigned a different file name.

Requirements

The action to be renamed may not be open in the edit window.

Procedure

1. Open the shortcut menu of the action to be renamed.
2. Select "Rename".
3. Enter a new name with the file extension ".pas".



4. Confirm the new name by pressing the <ENTER> key.

Alternative operation

Alternatively, click the action name twice to complete the renaming.

Note

If you do not enter the file extension ".pas", the action name remains unchanged.

3.13.13 How to Use Actions From Other Sources

Introduction

You have two options for using actions from other sources in your project:

- Importing exported actions
- Copy the file with the desired action into the corresponding path in your project. The path for local actions is "<Computer_name>\Pas" in the project path. The path for global actions is "\Pas" in the project path.

To show the copied actions in the navigation window, you must refresh the display. This can be accomplished by quitting and then restarting Global Script.

If Runtime is active, imported actions are only executed, after they have been opened in Global Script Editor and then saved.

Note

Actions can include calls to project and standard functions. These can in turn have calls to project and standard functions etc. Therefore, when importing actions from other sources, you must make sure that the current project has all necessary functions.

Particular attention is called for whenever the actions were imported from a different computer. Since standard functions can be customized by the user, it is possible that the standard functions called in the action have a different functionality on the source computer than the ones with the same names on the target computer.

See also

How to Import an Action (Page 1589)

How to Export an Action (Page 1588)

3.14 Runtime Behavior of Actions

3.14.1 Runtime Behavior of Actions

Analysis of Runtime Behavior

WinCC provides a range of tools with which the Runtime behavior of actions can be analyzed. These are the application windows GSC Runtime and GSC Diagnose plus the application apdiag.exe.

To use the application windows GSC Runtime and GSC Diagnose, they must be added to a process picture. This may be a process picture made especially for diagnostic purposes. This picture is then called in Runtime.

The application windows are used for the following strategies:

- GSC Runtime supplies information about the dynamic behavior of all (Global Script) actions, supports the individual start and the Start and End Action for each individual action and provides an entry point into Global Script Editor, while Runtime is active.
- GSC Diagnose outputs the printf instructions (contained in the actions) in the order in which they are called. This also applies to the printf instructions in functions that are called in actions. Through a well thought out use of printf instructions, for example to output the values of tags, it is possible to follow the action's flow and that of the called functions. Even error conditions, which result in a call to the OnErrorExecute function, are displayed in the GSC Diagnose window.

Note

When using dynamic C-scripts with access to picture objects, you should note that execution of the script is not terminated automatically by closing the picture.

This scenario may to the failure of access to an object that is addressed in the script, e.g. if properties of the type "Text" are read and the values returned are modified or processed in subsequent string operations.

See also

GSC Diagnose (Page 1601)

GSC Runtime (Page 1596)

3.14.2 GSC Runtime

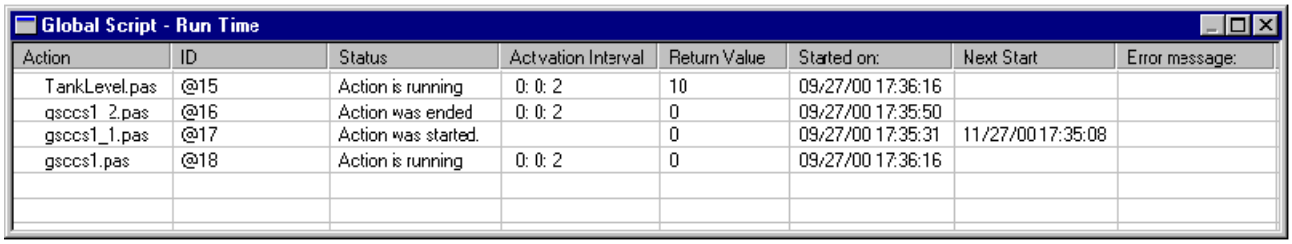
3.14.2.1 GSC Runtime

GSC Runtime Window

GSC Runtime is a window showing the dynamic behavior of all (Global Script) actions in Runtime. Additionally, GSC Runtime, enables you to influence the execution of each individual action and provides an entry point into Global Script Editor, while Runtime is active.

The following information is output:

- Action: Name of the action
- ID: Action ID. It is used internally to the system and for example is output by the function OnErrorExecute together with a description of the error in the event that an error occurs in the action. GSC Runtime supplies the name of the action with this ID. The connection between the ID and action name ceases to be valid when Runtime is terminated or an action is saved while Runtime is active.
- Status: Current status of the action. For possible statuses, refer to the table below.
- Activation Interval: The time in the form hours:minutes:seconds that has elapsed between two calls to the action.
- Return Value: Return value of the action.
- Started On: Date and time at which the current action was started.
- Next Start: Date and time at which the action is started again.
- Error Message: Contains the error text in the case of an error.



Action	ID	Status	Activation Interval	Return Value	Started on:	Next Start	Error message:
TankLevel.pas	@15	Action is running	0: 0: 2	10	09/27/00 17:36:16		
gsccs1_2.pas	@16	Action was ended	0: 0: 2	0	09/27/00 17:35:50		
gsccs1_1.pas	@17	Action was started.		0	09/27/00 17:35:31	11/27/00 17:35:08	
gsccs1.pas	@18	Action is running	0: 0: 2	0	09/27/00 17:36:16		

Statuses of actions

Possible statuses of actions:

- Action was started.
- Action was ended.
- Action was stopped.
- Action is running.

- Error during start of action!
- Error during execution of action!

Error messages

Possible error messages:

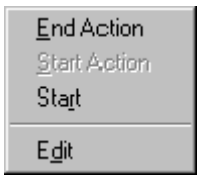
- No error occurred.
- The application is already connected to the script control. No additional connection setup is possible.
- There is no connection to the script control. Possibly no connection setup took place.
- An error occurred during interprocess communication. The cause of the error is unknown.
- Undefined error.
- The parameter assignment is wrong. Some necessary parameters may be missing.
- Script control is not started. Check has whether WinCC has been started.
- Time-out occurred. Check the connection or increase the monitoring time.
- Script control was terminated.
- The service channel could not be installed.
- An unknown job number was used for the EndAct job.
- The action could not be executed without error. The returned results are invalid.
- An error occurred in the server application.
- The maximum number of connections to the script control has been reached.
- The transaction is unknown. An attempt was made to terminate a transaction that was not logged on previously.
- A pre-compiled header file cannot be generated from a pre-compiled header file.
- There is no access to the action. The module is being used presently.
- The program is invalid.
- The action is invalid.
- The script control could not set up the file.
- The script interpreter does not have enough memory.
- The file format is invalid for the script control.
- The script control could not open the file.
- The program is presently locked by the script control. No further access is possible.
- The action has already been given to the script control for processing.
- In this action, a conflict has occurred with another action.
- The script control could not find the action.
- The script control could not find the function.
- The specified line information is invalid.

- The specified symbol is outside the valid range.
- The provided memory is too small for the script interpreter.
- The script interpreter does not recognize the specified type.
- The specified symbol was not found.
- Load project functions.
- A stack overflow has occurred in the script interpreter during execution. Further execution of the action is being canceled.
- Division by 0 occurred during execution of an action. The action is being canceled.
- Within the action, a reference was made during execution to a symbol that does not exist.
- Within the action, an attempt was made during execution to access an undefined memory area.
- The script interpreter ran into a breakpoint.
- The script interpreter was advanced in the debugger by one processing step.
- The action contains no interpreter code.
- The action has the wrong data format.
- The return value of the action cannot be represented as a variant.
- There is insufficient memory to execute this operation.
- An error has occurred within the transaction. For more information, see the AP_ACT_KEYs.
- An error occurred while executing the action. For more information, see the AP_ACT_KEYs.
- An error occurred while executing the action. For more information, see the AP_ACT_KEYs.
- There is no update capability for the existing data format. The action cannot be read.

Shortcut Menu for Actions

The following functions are available for every action in the shortcut menu:

- End Action: The corresponding action is not executed again after the current execution is completed.
- Start Action: The corresponding action is executed again when the next trigger occurs.
- Start: The relevant action is executed once.
- Edit: The relevant action is opened in the Global Script editor for editing. Runtime remains active. If the edited action is compiled (if necessary) and saved, the changes are immediately adopted by the Runtime system.



You can determine for each action individually, whether or not the popup menu can be opened without a password.

To use GSC Runtime, you must first add an application window of the GSC Runtime type in a process picture. Using the GSC Runtime attributes, you can determine the appearance of the GSC Runtime window.

Note

Updating the GSC Runtime window increases the load on the system resources. The system load depends on how many actions are visible in the window. The system load can be lowered by reducing the height of the window so that fewer lines are visible.

See also

How to Edit Actions (Page 1600)

Attributes of GSC Runtime (Page 1600)

How to Place GSC Runtime in a Process Picture (Page 1599)

How to Assign Authorizations (Page 1588)

3.14.2.2 How to Place GSC Runtime in a Process Picture

Introduction

To use GSC Runtime, you must add GSC Runtime to a process picture. This process picture can be an existing picture or a picture that just serves diagnostic purposes. GSC Runtime cannot be added to the process picture directly, rather it must be added as an application in an application window. The application window is itself part of the process picture. The measures described must be performed in Graphics Designer.

Requirement

Graphics Designer has been started and the process picture is open.

Procedure

1. In the Object palette, select "Smart Object\Application Window".
2. In the drawing area, open the application window.
3. In the "Window Contents" dialog select "Global Script".
4. Confirm the entries by clicking "OK".
5. In the "Template" dialog, select "GSC Runtime".
6. Click "OK" to confirm your selection.

See also

Attributes of GSC Runtime (Page 1600)

3.14.2.3 Attributes of GSC Runtime

GSC Runtime Window Layout

GSC Runtime has attributes with which you can determine the appearance of the GSC Runtime window in Runtime. These include the geometry attribute and in particular the following attributes:

- Display: With this attribute, you can specify whether the window should be visible or hidden. The attribute can be made dynamic with the name "Visible".
- Sizeable: Use this attribute to specify whether the window size can be changed in Runtime.
- Moveable: Use this attribute to specify whether the window can be moved in Runtime.
- Border: Use this attribute to specify whether the window has a border. If the window has a border, its height and width can be changed in Runtime.
- Title: Use this attribute to specify whether the window has a title bar.
- Can be Maximized: Use this attribute to specify whether the window's title bar has a button to maximize the window in Runtime.
- Can be Closed: Use this attribute to specify whether the window's title bar has a button to close the window in Runtime.
- Foreground: Use this attribute to specify whether the window is always in the foreground.

The attributes are displayed and can be set in Graphics Designer.

3.14.2.4 How to Edit Actions

Introduction

Each of the actions in your project will be displayed on its own line in the GSC Runtime window. You can open an action in the GSC Runtime window and then edit it using Global Script Editor. After the edited action is saved, it is used in Runtime.

Procedure

1. Open the shortcut menu for the desired action.
2. Select "Edit".

How To Create and Edit Actions (Page 1571)

3.14.3 GSC Diagnose

3.14.3.1 GSC Diagnose

Description of Functions

GSC Diagnose outputs the printf instructions (contained in the actions) in the order in which they are called in the Diagnose window. This also applies to the printf instructions in functions that are called in actions. Through a well thought out use of printf instructions, for example to output the values of tags, it is possible to follow the action's flow and that of the called functions. Even error conditions, which result in a call to the OnErrorExecute function, are displayed in the GSC Diagnose window.

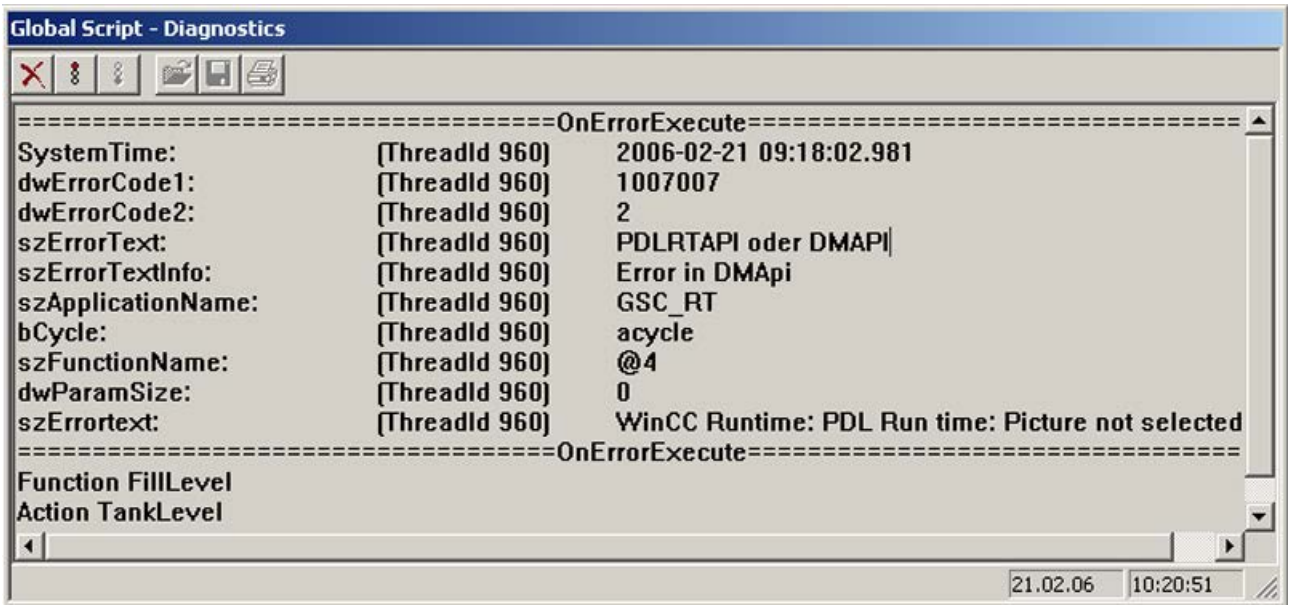

Figure 3-1 Diagnose window of GSC Diagnose

To use GSC Diagnose, you must first add an application window of the GSC Diagnose type in a process picture. Using the GSC Diagnose attributes, you can determine the appearance of the GSC Diagnose window.

When the picture is changed, the contents in the GSC Diagnose window is deleted.

Note

A printf() may contain maximum 360 characters.

The Toolbar of GSC Diagnose (Page 1603)

Attributes of GSC Runtime (Page 1598)

How to Place GSC Diagnose in a Process Picture? (Page 1602)

3.14.3.2 How to Place GSC Diagnose in a Process Picture?

Introduction

To use GSC Diagnose, you must add GSC Diagnose to a process picture. This process picture can be an existing picture or a picture that just serves diagnostic purposes. GSC Diagnose cannot be added as an application to the process picture directly, rather it must be added as an application in an application window. The application window is itself part of the process picture. The measures described must be performed in Graphics Designer.

Requirement

Graphics Designer has been started and the process picture is open.

Procedure

1. In the Object palette, select "Smart Object\Application Window".
2. In the drawing area, open the application window.
3. In the "Window Contents" dialog select "Global Script".
4. Confirm the entries by clicking "OK".
5. In the "Template" dialog, select "GSC Diagnose".
6. Click "OK" to confirm your selection.

See also

Attributes of GSC Runtime (Page 1598)

The Toolbar of GSC Diagnose (Page 1603)

3.14.3.3 Attributes of GSC Diagnose

GSC Diagnose Attributes

GSC Diagnose has attributes with which you can determine the appearance of the GSC Diagnose window in Runtime. These include the geometry attribute and in particular the following attributes:

- Display: With this attribute, you can specify whether the window should be visible or hidden. The attribute can be made dynamic with the name "Visible".
- Sizeable: Use this attribute to specify whether the window size can be changed in Runtime.
- Moveable: Use this attribute to specify whether the window can be moved in Runtime.
- Border: Use this attribute to specify whether the window has a border. If the window has a border, its height and width can be changed in Runtime.
- Title: Use this attribute to specify whether the window has a title bar.
- Can be Maximized: Use this attribute to specify whether the window's title bar has a button to maximize the window in Runtime.
- Can be Closed: Use this attribute to specify whether the window's title bar has a button to close the window in Runtime.
- Foreground: Use this attribute to specify whether the window is always in the foreground.

The attributes are displayed and can be set in Graphics Designer.

3.14.3.4 The Toolbar of GSC Diagnose

Toolbar Functions

The toolbar of GSC Diagnose includes buttons for the control the output in the Diagnose window as well as for saving, printing and opening the contents of the window.

The toolbar contains buttons with the following functions:

Button	Function
	Deletes the contents of the window.
	Stops the updating of the window.
	Resumes the updating of the window.
	Opens a text file in the window.
	Saves the contents of the window in a text file.
	DPrints the contents of the window.

3.15 ANSI-C function descriptions

3.15.1 lpszPictureName

Overview

"lpszPictureName" is the name of the picture.

If you configure an action on a property or a "Mouse-click" event in WinCC, the name of the picture is provided as "lpszPictureName" in the action. The picture name has the following structure:

<BASE PICTURE NAME>.<PICTURE WINDOW NAME>:<PICTURE NAME>. ... .<Picture window name>:<Picture name>.

The "BASE PICTURE NAME" and the "PICTURE NAME" are provided without the file extension ".PDL".

This enables you to identify the object's picture path. You can also address specific picture windows, if a process picture is opened more than once for example.

Note

Do not change the text in "lpszPictureName not even using the function "strcat".

3.15.2 Standard functions

3.15.2.1 Standard functions - short description

The system provides standard functions. You can modify these functions to adapt them to your personal needs. Furthermore, you can create your own standard functions.

The basic system provides you with standard functions. They are divided into the following function groups:

- Alarm
- Graphics
- Report
- TagLog
- WinCC
- Windows

The "Obsolete functions" directory contains standard functions that were used to control the control before WinCC V7.

If the corresponding options have been installed, the following additional function groups are available:

- Options
- Split Screen Manager
- userarc (user archives)

3.15.2.2 Alarm

AcknowledgeMessage

Function

Acknowledges the message with the number that has been sent as a parameter in the message system.

Syntax

void AcknowledgeMessage(DWORD MsgNr)

Parameters

MsgNo

Message to be acknowledged

Note

Make sure a configured message exists for the transferred message number.
To use the function on a client with its own project, a standard server for alarms has to be configured on the client.

See also

AcknowledgeMessage example

AXC_SetFilter

Function

External message window operation

This function sets a filter for WinCC Alarm Control to show a portion of the existing messages according to the filter criterion.

Syntax

BOOL AXC_SetFilter(char* lpszPictureName, char* lpszObjectName,
LPMSG_FILTER_STRUCT lpMsgFilter, LPCMN_ERROR, lpError)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the WinCC Alarm Control name

lpMsgFilter

Pointer to the structure containing the filter criterion

lpError

Pointer to the structure of the error description

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

CMN_ERROR structure definition

ResetFilter example

AXC_SetFilter example

Structure definition MSG_FILTER_STRUCT structure definition

GCreateMyOperationMsg

Function

The "GCreateMyOperationMsg" standard function makes it possible to trigger your own operator input message in the message system. The message with the "dwMsgNum" message number must have already been configured as the operator input message.

Syntax

int GCreateMyOperationMsg(DWORD dwFlags, DWORD dwMsgNum, char* lpszPictureName, char* lpszObjectName, DWORD dwMyTextID, double doValueOld, double doValueNew, char* pszComment)

Parameters

dwFlags

The message form can be selected using the "dwFlags" parameter.

Name	Value	Description
FLAG_COMMENT_PARAMETER	0x00000001	The text is entered as a comment directly into the message in Runtime, without its own comment dialog. The pointer to the comment must not equal "NULL."
FLAG_COMMENT_DIALOG	0x00000003	A comment dialog appears. The comment entered there is transferred to the message.
FLAG_TEXTID_PARAMETER	0x00000100	The text ID of a text from the TextLibrary is provided as the accompanying process value of the message.

dwMsgNum

WinCC message number of a self-created operator input message.

lpszPictureName

Pointer to the picture name of the picture from which the function is called.

lpszObjectName

Pointer to the WinCC tag name to which the old values and new values belong.

The name is forwarded as the instance name of the operator input message and entered in the accompanying process value "1".

dwMyTextID

Text ID of a text from the TextLibrary.

When the "FLAG_TEXTID_PARAMETER" is set, the text ID is provided as the numeric accompanying process value "8" of the message and is displayed as a number in process value block 8. So that the language-dependent text from the TextLibrary is displayed in the message, you must enter format statement "@8%s@" in the message text block.

doValueOld

Numeric old value of the WinCC tags with the name specified in "lpszObjectName". "doValueOld" is entered in the accompanying process value "2" of the message.
The function itself has no option of reading a tag value before the action. For this, use the provided "GetTag..." feature.

doValueNew

Numeric new value of the WinCC tags with the name specified in "lpszObjectName". "doValueNew" is entered in the accompanying proces value "3" of the message.
The function itself has no option of reading a tag value after the action. For this, use the provided "GetTag..." feature.

pszComment

Comment text or empty string.

When "FLAG_COMMENT_PARAMETER" is set, the text is entered directly into the message in Runtime as a comment. The message does not need a separate comment dialog.

Return value

Value	Description
0	The function has been completed without any errors.
-101	The message editing could not be started.
-201	An error occurred when calling the "MSRTGetComment()" feature.
-301	An error occurred when calling the "MSRTCreateMsgInstanceWithComment()" feature.

Note

Make sure that only operator input messages are used for the "GCreateMyOperationMsg" function. The use of messages of different message classes is not permitted.

Please note the role of the standard server when using the function with a Client. For more information see the chapter "Client configuration".

GMsgFunction

Function

This function provides the message data.

It is a global function for single messages. It is called for each message for which the "Triggers an action" parameter has been set.

Evaluation of the message data is best made in a project function called from GMsgFunction.

Syntax

BOOL GMsgFunction(char* pszMsgData)

Parameters

pszMsgData

Pointer to a string whose data are mapped with scanf to the MSG_RTDATA_STRUCT structure.

The "MSG_RTDATA_STRUCT" string contains the following data, which are separated from each other with "#":

1. Telegram time
2. Process values
3. Instance
4. User
5. Computer
6. Current time in format "yyyy.mm.dd, hh:mm:ss.mmm"

Note

The value "Instance" of string "MSG_RTDATA_STRUCT" is only supplied if an instance message was triggered.

The values "User" and "Computer" of the string "MSG_RTDATA_STRUCT" are only supplied if a comment was provided during the creation of the message with the same call.

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

Please note that modified standard functions are overwritten by a WinCC installation so that the changes will be lost.

See also

Structure definition MSG_RTDATA_STRUCT

3.15.2.3 Graphics

Graphics - short description

The Graphics group contains functions for programming the graphic system.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

GetLinkedVariable

Function

Provides the name of the variable linked to a certain object property.

Syntax

char* GetLinkedVariable(char* lpszPictureName, char* lpszObjectName, char* lpszPropertyName);

Parameters

lpszPictureName

Pointer to the picture

lpszObjectName

Pointer to the object

lpszPropertyName

Pointer to the object property

Return value

Pointer to the name of the tag linked to a certain object property.

See also

GetLinkedVariable example

GetLocalPicture

Function

Provides a pointer to the name of the picture. The picture name is the file name without the ".PDL" extension.

Syntax

char* GetLocalPicture(char* lpszPictureName);

Parameters

lpszPictureName

Pointer to the picture

Return value

Pointer on the name of the picture.

Note

The passed call parameter lpszPictureName must have the structure provided by the graphics system for the picture paths:

<Basic picture name>.<Picture window name>:<Picture name>. ... .<Picture window name>[:<Picture name>]

where <Basic picture name> and <Picture name> go without the ".PDL" file extension.

Example:

In a basic picture "AAA" there is a picture window "bbb" in which a picture "CCC" is called which itself contains a picture window "ddd" in which a picture "EEE" is called.

Then the function call

```
GetLocalPicture(lpszPictureName)
```

returns the pointer to the picture name:

"EEE" if the functions is called in the picture "EEE";

"CCC" if the functions is called in the picture "CCC";

"AAA" if the functions is called in the picture "AAA".

See also

GetLocalPicture example

GetParentPicture

Function

Provides a pointer to the name of the picture. The picture name is the file name without the ".PDL" extension.

Syntax

char* GetParentPicture(char* lpszPictureName);

Parameters

lpszPictureName

Pointer to the picture

Return value

Name of the current picture if the function is called in the basic picture

Name path of the higher-level picture if the function is called in a picture window

Note

The passed call parameter lpszPictureName must have the structure provided by the graphics system for the picture paths:

<Basic picture name>.<Picture window name>:<Picture name>. ... .<Picture window name>[:<Picture name>]

where <Basic picture name> and <Picture name> go without the ".PDL" file extension.

See also

GetParentPicture example

GetParentPictureWindow

Function

Provides a pointer to the name of the picture window.

Syntax

char* GetParentPictureWindow(char* lpszPictureName);

Parameters

lpszPictureName

Pointer to the picture

Return value

Pointer to the name of the picture window if the function is called in a picture displayed in a picture window of a higher-level picture

Call parameter lpszPictureName unchanged if the function is called in the basic picture

Note

The passed call parameter lpszPictureName must have the structure provided by the graphics system for the picture paths:

<Basic picture name>.<Picture window name>:<Picture name>. ... .<Picture window name>[:<Picture name>]

where <Basic picture name> and <Picture name> go without the ".PDL" file extension.

Example:

In a basic picture "Picture_1" there is a picture window "Picture_window_1" in which a picture "Picture_2" is called.

In the picture "Picture_2" there is a picture window "Picture_window_2" in which a picture "Picture_3" is called.

Then the function call

```
GetParentPictureWindow(lpszPictureName)
```

returns the pointer to the picture window name:

"Picture_2" if the function is called in the picture "Picture_3";

"Picture_window_1" if the function is called in the picture "Picture_2";

"Picture_1" if the function is called in the picture "Picture_1".

OpenPicture

Function

Changes the specified basic picture. On the client and in case of a picture name with server prefix a picture change is performed in the picture window.

If, for example, the picture window is located in a different picture window with a server prefix, a picture change is not performed in the picture window in which the function was called.

If multiple picture windows with server prefix are integrated in the picture and the "OpenPicture()" function calls the last picture, the picture change is carried out in the first picture window, e.g.
"screen1.window1(screen2.window2(screen3.window3(screen4.OpenPicture)))" executes a picture change in "window1".

Syntax

void OpenPicture(Picture PictureName)

Parameters

Picture name

Picture name

Registry2

Function

This function manages a list of string pairs (String0, String1).

It knows the following types of calls controlled by the mode parameter:

- Registry2("set", "String0", "String1");

Includes the passed string pair into the list.

- Registry2("get", "String0", NULL);

Returns the first string pair partner String1 which belongs to the passed String0 and then deletes the string pair from the list.

- Registry2("reset", NULL, NULL);

Deletes all string pairs from the list.

- Registry2("display", NULL, NULL);

Shows the string pairs currently stored in the list in a Global Script diagnostics window.

Syntax

char* Registry2(char* mode, char* String0, char* String1);

Parameters

mode

Defines the working principle of the function.

set	Incorporation of the string pair into the list
get	Determination of the first sting pair partner for String0 and deletion of the string pair from the list
reset	Deletion of all string pairs
display	Display of the string pairs in a Global Script diagnostics window

String0

The parameter supply depends on the working principle of the function.

String1

The parameter supply depends on the working principle of the function.

Return value

In the mode=get mode a pointer to the first string pair partner is returned.

Note

This function is used in conjunction with the picture module technology.

If you work with the "Create faceplate as type" and "Create instance(s) in the process picture" wizards in the "Faceplates" tab of the Dynamic Wizard, using the "Registry2" function is not permitted!

3.15.2.4 Obsolete functions

Alarm

AXC_OnBtnAlarmHidingList

Function

This function displays the list of hidden messages in a message window.

Syntax

BOOL AXC_OnBtnAlarmHidingList(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnArcLong

Function

This function displays the messages stored in a long-term archive list in a message window.

Syntax

BOOL AXC_OnBtnArcLong (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnArcShort

Function

This function displays the messages stored in a short-term archive list in a message window.

Syntax

BOOL AXC_OnBtnArcShort(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnComment

Function

External message window operation

This function displays the comment of the previously selected messages.

Syntax

BOOL AXC_OnBtnComment (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnEmergAckn

Function

External message window operation

This function opens the acknowledgement dialog (emergency acknowledgement/reset).

Syntax

BOOL AXC_OnBtnEmergAckn(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnHideDlg

Function

This function opens the display options dialog for defining the messages that are to be displayed in the message window. The options are "All messages", "Shown messages" or "Hidden messages".

Syntax

BOOL AXC_OnBtnHideDlg(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnHideUnhideMsg

Function

The function hides the selected message or displays again the hidden message.

Syntax

BOOL AXC_OnBtnHideUnhideMsg(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnHit

Function

This function displays the messages stored in the hit list in a message window.

Syntax

BOOL AXC_OnBtnHit (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnHornAckn

Function

External message window operation

This function acknowledges the horn signal.

Syntax

BOOL AXC_OnBtnHornAckn (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnInfo

Function

External message window operation

This function displays the information text.

Syntax

BOOL AXC_OnBtnInfo (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnLock

Function

External message window operation

This function opens the "Set the Lock List Parameters" dialog.

Syntax

BOOL AXC_OnBtnLock (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnLockUnlock

Function

This function locks the selected message in the message window. This message will then no longer be archived.

This function unlocks the selected message in the lock list.

Syntax

BOOL AXC_OnBtnLockUnlock (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnLockWin

Function

External message window operation.

This function calls the lock list.

Syntax

BOOL AXC_OnBtnLockWin (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnLoop

Function

External message window operation

This function triggers the "LoopInAlarm" function of the selected message.

Syntax

BOOL AXC_OnBtnLoop (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnMsgFirst

Function

External message window operation

This function switches to the beginning of the message list.

Syntax

BOOL AXC_OnBtnMsgFirst (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnMsgLast

Function

External message window operation

This function switches to the beginning of the message list.

Syntax

BOOL AXC_OnBtnMsgLast (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgLast example

AXC_OnBtnMsgNext

Function

External message window operation

This function switches to the next message in the message list.

Syntax

BOOL AXC_OnBtnMsgNext (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnMsgPrev

Function

External message window operation

This function switches to the previous message in the message list.

Syntax

BOOL AXC_OnBtnMsgPrev (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnMsgWin

Function

External message window operation

This function calls the message list.

Note

The message list contains the currently pending and unacknowledged messages.

Syntax

BOOL AXC_OnBtnMsgWin (char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnPrint

Function

External message window operation

All messages fulfilling the selection criterion set in the Alarm Control are output to the printer.

Syntax

BOOL AXC_OnBtnPrint(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnProtocol

Function

External message window operation

Printing of the current view of the Alarm Control is started. All messages fulfilling the selection criterion set in the Alarm Control are output to the printer.

Syntax

BOOL AXC_OnBtnProtocol(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnScroll

Function

External message window operation

This function activates or deactivates the horizontal and vertical scroll functions.

Syntax

BOOL AXC_OnBtnScroll(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnScroll example

AXC_OnBtnSelect

Function

External message window operation

This function opens the "Specify Selection" dialog for the displayed list.

Syntax

BOOL AXC_OnBtnSelect(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnMsgFirst example

AXC_OnBtnSinglAckn

Function

External message window operation

This function acknowledges the currently selected message.

Syntax

BOOL AXC_OnBtnSinglAckn(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

See also

AXC_OnBtnSinglAckn example

AXC_OnBtnSortDlg

Function

External operation of the message window

This function opens the dialog for setting a user-defined sorting of the displayed messages for the displayed list.

Syntax

BOOL AXC_OnBtnSortDlg(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnTimeBase

Function

External operation of the message window

This function opens the dialog for setting the time base for the times shown in the messages.

Syntax

BOOL AXC_OnBtnTimeBase(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnVisibleAckn

Function

External message window operation

All visible messages in the message window are acknowledged (group acknowledgement).

Syntax

BOOL AXC_OnBtnVisibleAckn(char* lpszPictureName, char* lpszObjectName)

Parameters

lpszPictureName

Pointer to the name of the picture in which the WinCC Alarm Control is located

lpszObjectName

Pointer to the object name of the WinCC Alarm Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC AlarmControl as of WinCC V7.0.

AXC_OnBtnMsgFirst example

Report

ReportJob

Function

Depending on the value of the lpMethod Name parameter a print job or the preview for a print job is started.

Syntax

void ReportJob(LPSTR lpJobName, LPSTR lpMethodName)

Parameters

lpJobName

Pointer to the name of the print job

lpMethodName

PRINTJOB	Print job is started
PREVIEW	Preview of the print job is started

Note

This function is replaced by the RPTJobPreview and RPTJobPrint functions and should no longer be used.

TagLog

TOOLBAR_BUTTONS

TlgTableWindowPressEditRecordButton

Function

The editing of the table window is blocked or enabled (toggle function).

If editing is enabled, updating of the table window is stopped at the same time.

The updating of the table window remains to be stopped afterward, even if editing is blocked by a further function call.

Syntax

BOOL TlgTableWindowPressEditRecordButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgTableWindowPressFirstButton

Function

Displays the first data records of the display area in the table window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTableWindowPressFirstButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressHelpButton

Function

Displays the online help for the table window.

Syntax

BOOL TlgTableWindowPressHelpButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressInsertRecordButton

Syntax

BOOL TlgTableWindowPressInsertRecordButton(char* lpszWindowName)

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgTableWindowPressLastButton

Function

Displays the last data records of the display area in the table window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTableWindowPressLastButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressNextButton

Function

The data records following the current display area are displayed in the table window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTableWindowPressNextButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressNextItemButton

Function

The columns of the table window are moved one column to the left, the left column taking the position of the right column.

Syntax

BOOL TlgTableWindowPressNextItemButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressOpenArchiveVariableSelectionDlgButton

Function

Opens the dialog for connecting table columns to archives and tags.

Syntax

BOOL TlgTableWindowPressOpenArchiveVariableSelectionDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressOpenDlgButton

Function

Opens the dialog for online configuration of the table window.

Syntax

BOOL TlgTableWindowPressOpenDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressOpenDlgButton example

TlgTableWindowPressOpenItemSelectDlgButton

Function

Opens the dialog for selecting the visible columns and the first column of the table window.

Syntax

BOOL TlgTableWindowPressOpenItemSelectDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressOpenTimeSelectDlgButton

Function

Opens the dialog for setting the time range to be displayed in the table columns.

Syntax

BOOL TlgTableWindowPressOpenTimeSelectDlgButton(char* lpszWindowNumber)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressPrevButton

Function

The data records preceding the current display area are displayed in the table window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTableWindowPressPrevButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressPrevItemButton

Function

The columns of the table window are moved one column to the right, the right column taking the position of the left column.

Syntax

BOOL TlgTableWindowPressPrevItemButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTableWindowPressRemoveRecordButton

Syntax

BOOL TlgTableWindowPressRemoveRecordButton(char* lpszWindowName)

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgTableWindowPressStartStopButton

Function

Updating of the table window is switched on or off (toggle function).

Syntax

BOOL TlgTableWindowPressStartStopButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Table Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressFirstButton

Function

Displays the first data records of the display area in the trend window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTrendWindowPressFirstButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressHelpButton

Function

Displays the online help for the trend window.

Syntax

BOOL TlgTableWindowPressNextButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressLastButton

Function

Displays the last data records of the display area in the trend window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTrendWindowPressLastButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressLinealButton

Function

The ruler of the trend window is shown or hidden (toggle function).

The ruler can be moved by means of the "cursor left" and "cursor right" buttons.

Syntax

BOOL TlgTableWindowPressNextButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressNextButton

Function

The data records following the current display area are displayed in the trend window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTrendWindowPressNextButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressNextItemButton

Function

Brings all trends in the trend window one layer to the front.

The trend in the foreground is moved into the background.

Syntax

BOOL TlgTrendWindowPressNextItemButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOneToOneButton

Function

Restores the standard size (1:1) in the trend window.

Syntax

BOOL TlgTrendWindowPressOneToOneButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOpenArchiveVariableSelectionDlgButton

Function

Opens the dialog for connecting trends to archives and tags.

Syntax

BOOL TlgTrendWindowPressOpenArchiveVariableSelectionDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOpenDlgButton

Function

Opens the dialog for online configuration of the trend window.

Syntax

BOOL TlgTrendWindowPressOpenDlgButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOpenItemSelectDlgButton

Function

Opens the dialog for selecting the visible trends and the trend which is to be in the foreground.

Syntax

BOOL TlgTrendWindowPressOpenItemSelectDlgButton(char* lpszWindowNumber)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressOpenTimeSelectDlgButton

Function

Opens the dialog for setting the time range to be displayed.

Syntax

BOOL TlgTrendWindowPressOpenTimeSelectDlgButton(char* lpszWindowNumber)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressPrevButton

Function

The data records preceding the current display area are displayed in the trend window.

The number of displayed data records depends on the configured time range.

Syntax

BOOL TlgTrendWindowPressPrevButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressPrevItemButton

Function

Brings all trends in the trend window one layer to the back.

The trend in the background is moved to the foreground.

Syntax

BOOL TlgTrendWindowPressPrevItemButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressPrintButton

Function

The current view of the trends is output in accordance with the display configured for the WinCC Trend Control.

Syntax

BOOL TlgTrendWindowPressPrintButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

TlgTrendWindowPressReportSaveButton

Function

The displayed trend window data is saved in a text file.

Syntax

BOOL TlgTrendWindowPressReportSaveButton (char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

TlgTrendWindowPressStartStopButton

Function

Updating of the trend window is switched on or off (toggle function).

Syntax

BOOL TlgTrendWindowPressStartStopButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressStatsResultButton

Function

Starts the evaluation of data in the selected time area.
The statistic values minimum, maximum, average and standard deviation are calculated.

Syntax

BOOL TlgTrendWindowPressStatsResultButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressStatsSelectRangeButton

Function

To select the time range for the statistics function, the rulers for start and end time are displayed.

Syntax

BOOL TlgTrendWindowPressStatsSelectRangeButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressStartStopButton example

TlgTrendWindowPressZoomInButton

Function

The zoom in the trend window is activated. The zoom range can only be selected with the mouse.

Syntax

BOOL TlgTrendWindowPressZoomInButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressZoomInButton example

TlgTrendWindowPressZoomOutButton

Function

The trend window is restored to the state in which it was before the zoom was activated. The zoom is deactivated.

The zoom range can only be selected with the mouse (also see TlgTrendWindowPressZoomInButton).

Syntax

BOOL TlgTrendWindowPressZoomOutButton(char* lpszWindowName)

Parameter

lpszWindowName

Pointer to the window title of the WinCC Online Trend Control

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgTrendWindowPressZoomOutButton example

Template

TlgGetNumberOfColumns

Function

Provides the number of columns in the table window.

The window title of the corresponding WinCC Online Table Control is passed with the lpszTemplate parameter.

Syntax

int TlgGetNumberOfColumns(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

Return value

Number of colums in a table window

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgGetNumberOfRows

Function

Provides the number of lines in the table window.

The window title of the corresponding WinCC Online Table Control is passed with the lpszTemplate parameter.

Syntax

int TlgGetNumberOfRows(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

Return value

Number of lines in the table window

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgGetNumberOfRows example

TlgGetNumberOfTrends

Function

Provides the number of trends in the trend window.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

int TlgGetNumberOfTrends(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

Return value

Number of trends in the trend window

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

TlgGetRowPosition

Function

Provides the current position of the line pointer in the table window.

The window title of the corresponding WinCC Online Table Control is passed with the lpszTemplate parameter.

Syntax

int TlgGetRowPosition(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

Return value

Current position of the line pointer in the table window

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

TlgGetRulerArchivNameTrend

Function

Provides the archive name of the trend with the nTrend number in the trend window at the ruler position.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

char* TlgGetRulerArchivNameTrend(char* lpszTemplate, int nTrend)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

nTrend

Number of the trend

(0 <= nTrend <= Number of visible trends - 1)

Return value

Archive name of the trend with the nTrend number in the trend window at the ruler position

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgGetRulerVariableNameTrend example

TlgGetRulerTimeTrend

Function

Provides the time of the trend with the nTrend number in the trend window at the ruler position.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

SYSTEMTIME TlgGetRulerTimeTrend(char* lpszTemplate, int nTrend)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

nTrend

Number of the trend

(0 <= nTrend <= Number of visible trends - 1)

Return value

Time of the trend with the nTrend number in the trend window at the ruler position

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgGetRulerTimeTrend example (Page 2278)

TlgGetRulerValueTrend

Function

Provides the value of the trend with the nTrend number in the trend window at the ruler position.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

double TlgGetRulerValueTrend(char* lpszTemplate, int nTrend)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

nTrend

Number of the trend

(0 <= nTrend <= Number of visible trends - 1)

Return value

Value of the trend with the nTrend number in the trend window at the ruler position

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

TlgGetRulerVariableNameTrend

Function

Provides the tag name of the trend with the nTrend number in the trend window.

The window title of the corresponding WinCC Online Trend Control is passed with the lpszTemplate parameter.

Syntax

char* TlgGetRulerVariableNameTrend(char* lpszTemplate, int nTrend)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Trend Control

nTrend

Number of the trend

(0 <= nTrend <= Number of visible trends - 1)

Return value

The tag name of the trend with the nTrend number in the trend window.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

See also

TlgGetRulerVariableNameTrend example

TlgGetTextAtPos

Function

Provides the content of a cell of the table window as text for process value archives and user archives.

The cell is specified by nColumn and nLine.

The window title of the corresponding WinCC Online Table Control is passed with the lpszTemplate parameter.

Syntax

char* TlgGetTextAtPos(char* lpszTemplate, int nColumn, int nLine)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

nColumn

Number of the column

nLine

Number of the line

Return value

Content of the cell of a table window as text

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgGetRulerVariableNameTrend example

TlgGetColumnPosition

Function

Provides the current position of the column pointer in the table window as column index.

Syntax

int TlgGetColumnPosition(char* lpszTemplate)

Parameter

lpszTemplate

Pointer to the window title of the WinCC Online Table Control

Return value

Current position of the column pointer in a table window

Note

The standard function is no longer supported for the new WinCC OnlineTableControl as of WinCC V7.0.

See also

TlgGetNumberOfColumns example

TlgTrendWindowActivateCurve

Function

Activates a certain trend in WinCC Online Trend Control via the configured name of the trend. This function is executed independently of the visibility or foreground position of the trend.

Syntax

BOOL TlgTrendWindowActivateCurve(char* lpszPictureName, char* lpszObjectName, char* szValue)

Parameter

lpszPictureName

Picture name

lpszObjectName

Name of Trend Control

szValue

Name of the curve

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

Note

The standard function is no longer supported for the new WinCC OnlineTrendControl as of WinCC V7.0.

3.15.2.5 Report

Report - short description

The Report group contains functions with which to start the print preview of a print job or the printout itself.

Note

Various examples are offered for the function descriptions. For functions with a similar syntax, a selected function is used as a template in the example. This example must be adapted as well.

RPTJobPreview

Function

The preview of a print job is started.

Syntax

BOOL RPTJobPreview(LPSTR lpJobName)

Parameters

lpJobName

Pointer to the name of the print job

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

RPTJobPreview example

RPTJobPrint

Function

A print job is started.

Syntax

BOOL RPTJobPrint(LPSTR lpJobName)

Parameters

lpJobName

Pointer to the name of the print job

Return value

TRUE

The function has been completed without any errors.

FALSE

An error has occurred.

RPTJobPrint example

RptShowError

Function

This function provides an error decription for a failed print job.

The function is already integrated into the RptJobPrint and RptJobPreview standard functions and does not have to be called separately.

The error description is displayed in a Global Script diagnostics window.

Note
