ActivateSystemDiagnosticsView (Screen name, Object name)

Use in user-defined functions

ActivateSystemDiagnosticsView (Screen_name, Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Screen name

Name of the screen contained in the system diagnostics view.

Object name

Object name of the system diagnostics view.

ArchiveLogFile

Description

This system function moves or copies a log to another storage location for long-term logging.

With Audit Trails, always use the "Move" (hmiMove)" mode, otherwise you will be violating the FDA guideline by duplicating the data stored.

Prior to "ArchiveLogFile" always run the system function "CloseAllLogs".

After this system function, run the "OpenAllLogs" system function.

In "Copy log" mode, the logs are not reopened until the log has been successfully copied, or unless a timeout occurs during the copy process. In "Move log" mode, the logs to be moved are renamed and the new logs are opened immediately. To move the renamed logs, a job is submitted which attempts to move them every 300 seconds if the server cannot be reached. The job is also retained after Runtime is restarted until it is executed.

Use in the function list

ArchiveLogFile (Log type, Log, Directory name, Mode)

Use in user-defined functions

ArchiveLogFile (Log_type, Log, Directory_name, Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (miAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log available for GMP compliant projects. Additional information is available under "Activating GMP-compliant configuration".

Log

Name of the log being archived.

Directory name

Path for saving the log.

Mode

0 (hmiCopy) = Copy log

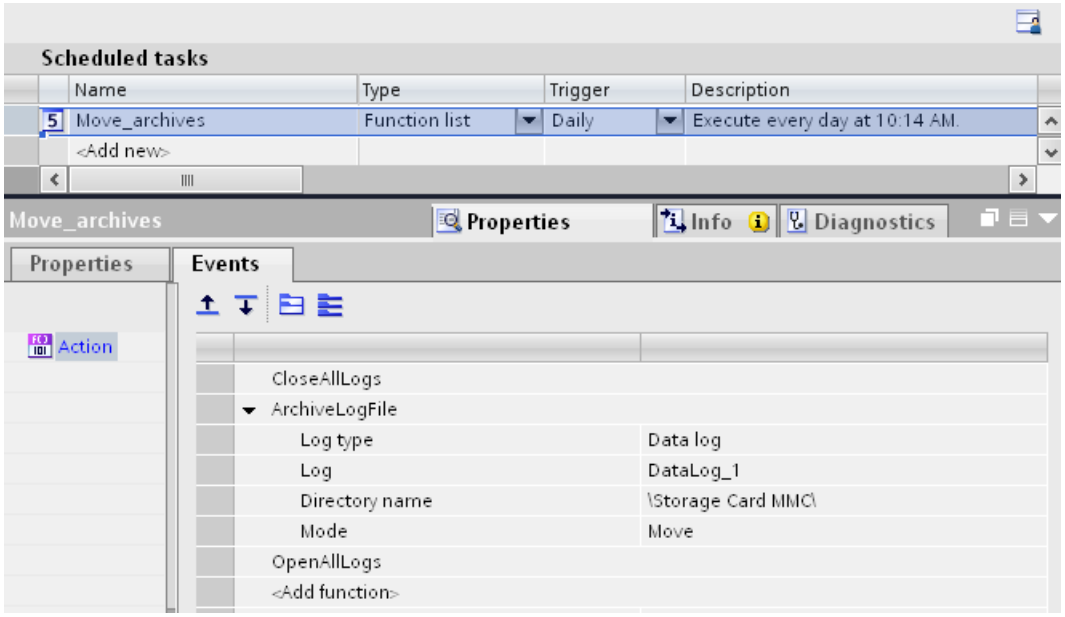
1 (hmiMove) = Move log

Application example

You want to move a log file from a local storage medium to the server in order to generate a backup copy of this file at cyclic intervals.

Notes on configuring

Set up a task in the scheduler which is executed at a specific time on a daily basis. Configure the following function list for the task:



Procedure on HMI device

- All log files will be closed.
- The log file you specified is moved to the server.
- All closed log files will be opened again.

Back up RAM file system

Description

Backs up the RAM file system in the memory medium of the HMI device.

After restarting the HMI device, the data is automatically reloaded in the RAM file system.

Applications such as the Internet Explorer save data (e.g. the last web sites called up) temporarily to the DRAM file system of the HMI device.

Use in the function list

BackupRAMFileSystem

Use in user-defined functions

BackupRAMFileSystem

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

CalibrateTouchScreen

Description

Calls a program for calibrating the touch screen.

During the calibration process, there is a prompt to touch five positions on the screen display. Touch the screen display within 30 seconds, to confirm the calibration process. If the calibration is not completed within this time span, the calibration settings are discarded. The user prompt is in English.

Use this system function the first time you start the HMI device.

Use in the function list

CalibrateTouchScreen

Use in user-defined functions

CalibrateTouchScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Note

The CalibrateTouchScreen system function cannot be simulated.

ChangeConnection

Description

Disconnects the connection to the currently used PLC in use and establishes a connection to a PLC with another address. The newly connected PLC must belong to the same device class

(S7-1200, S7-300, ...etc). With S7-1200, the use of the function is also only permitted for absolute addressing.

Note

When changing to another address, ensure that the address is not already being used by another HMI device.

The follows address types are supported:

- IP address
- MPI address

The follows PLC types are supported:

- SIMATIC S7 300/400
- SIMATIC S7-NC
- SIMOTION

Use in the function list

ChangeConnection (Connection, Address, Slot, Rack)

Use in user-defined functions

ChangeConnection (Connection, Address, Slot, Rack)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Connection

Name of the connection that is disconnected. The name is set during configuration, for example, in the "Connections" editor.

Address

MPI/PROFIBUS or IP address of the PLC to which the connection will be established.

Note

Set the address by means of a tag. The objects list displays the tags of all data types. Select only tags of the following data types:

- Ethernet connection: "String" data type
- MPI connection: "Int" data type

Slot

Slot of the PLC to which the connection will be established.

Rack

Rack of the PLC to which the connection will be established.

Application example

You want to operate one HMI device on several machines. Configure the necessary PLCs in the project, to which you want to change by pressing a key. When changing the PLC, the connection to the PLC in use is disconnected. Then the connection to the new PLC with other address parameters is reestablished. To access the values of the new PLC, configure the same tags for the PLC used.

The PLC which you have indicated when creating the project will be used as default.

1. Enter the name and address of the PLC in the "Connections" editor.
2. Configure a button in the process screen.
3. Configure the "ChangeConnection" system function on the "Press" event.
4. Enter the name of the connection and address of the PLC as parameters.

ClearAlarmBuffer

Description

Deletes alarms from the alarm buffer on the HMI device.

Note

Alarms which have not yet been acknowledged are also deleted.

Use in the function list

ClearAlarmBuffer (Alarm class number)

Use in user-defined functions

ClearAlarmBuffer (Alarm_class_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Alarm class number

Determines which alarms are to be deleted from the alarm buffer:

0 (hmiAll) = All alarms/events

1 (hmiAlarms) = Alarms of alarm class "Errors"

2 (hmiEvents) = Alarms of alarm class "Warnings"

3 (hmiSystem) = Alarms of alarm class "System"

4 (hmiS7Diagnosis) = Alarms of alarm class "Diagnosis Events"

Note

Device dependency

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

ClearAlarmBufferProtool

Description

The system function exists to ensure compatibility.

It has the same functionality as the "ClearAlarmBuffer" system function, but uses the old ProTool numbering.

Use in the function list

ClearAlarmBufferProTool (Alarm class number)

Use in user-defined functions

ClearAlarmBufferProtoolLegacy (Alarm_class_number)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Alarm class number

Alarm class number whose messages are to be deleted:

-1 (hmiAllProtoolLegacy) = All alarms/events

0 (hmiAlarmsProtoolLegacy) = Alarms of alarm class "Errors"

1 (hmiEventsProtoolLegacy) = Alarms of alarm class "Warnings"

2 (hmiSystemProtoolLegacy) = Alarms of alarm class "System"

3 (hmiS7DiagnosisProtoolLegacy) = Alarms of alarm class "Diagnosis Events"

Note
Device dependency

Alarms of alarm class "Diagnosis Events" are not available on Basic Panels.

ClearDataRecord

Description

Deletes a recipe data record.

Several data records can be deleted from one or more recipes.

Use in the function list

ClearDataRecord (Recipe number/name, Data record number/name, Confirmation, Output status message, Processing status)

Use in user-defined functions

ClearDataRecord

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data records are deleted. "0" is specified if you want to delete recipe data records from all available recipes.

Data record number/name

Number or name of the recipe data record to be deleted. "0" is specified if you want to delete all recipe data records.

Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

ClearDataRecordMemory

Description

Deletes all recipes data records from the specified storage medium.

Use in the function list

ClearDataRecordMemory (Storage location, Confirmation, Output status message, Processing status)

Use in user-defined functions

ClearDataRecordMemory (Storage_location, Confirmation, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Storage location

Determines the storage location:

0 (hmiFlashMemory) = Flash memory: Internal flash memory of the HMI device

1 (hmiStorageCard) = Storage card

2 (hmiStorageCard2) = Storage card 2

3 (hmiStorageCard3) = Storage card MultiMediaCard

4 (hmiStorageCard4) = Storage card USB

Confirmation

Determines whether the operator should confirm the deletion:

0 (hmiOff) = Off: Deletion is begun without confirmation.

1 (hmiOn) = On: The starting of the deletion process must be confirmed.

Output status message

Determines whether a status message is output after the deletion:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

ClearLog

Description

Deletes all data records in the given log.

Use in the function list

ClearLog (Log type, Log)

Use in user-defined functions

ClearLog (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail log Available for GMP-compliant projects Additional information is available under "Activating GMP-compliant configuration".

Log

Name of the log from which all entries are deleted.

CloseAllLogs

Description

Disconnects the connection between WinCC and all logs.

Note

Before you close a log, the logging function must first be stopped in the log. Use the "StopLogging" system function.

Use in the function list

CloseAllLogs

Use in user-defined functions

CloseAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. The logging process will continue in the specified log.

ControlSmartServer

Description

Starts or stops the Sm@rtServer.

Use in the function list

ControlSmartServer (Mode)

Use in user-defined functions

ControlSmartServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Specifies whether the Sm@rtServer is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: Sm@rtServer is stopped

1 (hmiStart) = Start: Sm@rtServer is started

ControlWebServer

Description

Starts or stops the Web server.

Use in the function list

ControlWebServer (Mode)

Use in user-defined functions

ControlWebServer (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Specifies whether the Web server is started or stopped.

-1 (hmiToggle) = Toggle: Toggles between the two modes

0 (hmiStop) = Stop: The Web server is stopped.

1 (hmiStart) = Start: The Web server is started.

CopyLog

Description

Copies the contents of a log to another log. Tag values can only be copied to other data logs and alarms only to other alarm logs, however.

Note

If you copy a log using the "CopyLog" system function, it is possible that external applications will be unable to read certain country-specific special characters in the logged message text of the log copy. This does not apply to WinCC Runtime. WinCC Runtime can read the copied log files without errors.

Use in the function list

CopyLog (Log type, Destination log, Source log, Mode, Delete source log)

Use in user-defined functions

CopyLog (Log_type, Destination log, Source_log, Mode, Delete_source_log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

Destination log

Name of the log into which the entries are copied (Destination log).

Source log

Name of the log from which the entries are copied (Source log).

Mode

Determines what is done with copied entries in the destination log:

0 (hmiOverwrite) = Overwrite: Existing entries are overwritten.

2 (hmiAppend) = Append: The entries are inserted at the end of the destination log. When the configured size of the log has been reached, the destination log is treated like a circular log.

Delete source log

Determines whether the source log is deleted after copying.

0 (hmiNo) = No: Is not deleted.

1 (hmiYes) = Yes: Is deleted.

DecreaseTag

Description

Subtracts the given value from the tag value.

X = X - a

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, auxiliary tags must be used. The auxiliary tags are assigned to the tag value with the "SetTag" system function.

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

Use in the function list

DecreaseTag (Tag, Value)

Use in user-defined functions

DecreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag from which the given value is subtracted.

Value

The value which is subtracted.

EditAlarm

Description

Triggers the "Edit" event for all selected alarms.

If the alarms to be edited have not yet been acknowledged, the acknowledgment takes place automatically when this system function is called up.

This system function can only be used for function keys.

Use in the function list

EditAlarm

Use in user-defined functions

EditAlarm

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Encode

Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

Use in the function list

Encode (Byte array, String, Coding)

Use in user-defined functions

Encode (Byte_array, String, Encoding)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Byte array

The tag that contains the converted value.

Note

The Byte array must be twice the size of the string length + 2. The Byte array must contain 242 array elements if the string has a length of 120 characters.

Characters are either truncated or not converted if the size is insufficient.

String

The tag of data type "String" that is converted.

Encode

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

EncodeEx

Description

Adapts the "String" data type of a tag for transfer to the automation system (AS). The tag of WinCC data type "String" is converted into the AS data type "Array of byte". The result is written to a tag.

By contrast to the Encode system function, you can define the Line break parameter. Using the Line break parameter you can delete line breaks or replace these with predefined characters.

Use in the function list

EncodeEx (Byte array, String , Encode , Line break)

Use in user-defined functions

EncodeEx (Byte_array, String, Encoding, Line_break)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Byte array

The tag that contains the converted value.

Note

The byte array must be twice the size of the string length +2. If the string has a length of 120 characters, the byte array must contain 242 array elements.

Characters are either truncated or not converted if the size is insufficient.

String

The tag of data type "String" that is converted.

Encode

0 (hmiEncodeUTF16LE) - String is encoded in UTF16LE (Unicode 16 Little Endian).

Line break

All line breaks are either deleted or replaced with predefined characters. Do not replace line breaks if set as the default value.

0 (replace with "\r\n' (0x000D, 0x000A)) - the line break is replaced with "\r\n".

1 (replace with "\n' (0x000A)) - the line break is replaced with "\n".

2 (do not replace) - the line break is not replaced.

3 (remove line breaks) - the line breaks are removed.

ExportDataRecords

Description

Exports one or all data records of a recipe to a CSV file.

One file is created per recipe.

Use in the function list

ExportDataRecords (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ExportDataRecords (Recipe_number/name,Data_record number/name, File_name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

File name

Name of the CSV file to which the recipe data records are exported. Enter the file location and the file extension (*.csv), for example, "C:\TEMP\Orange.csv".

Note

Storage of the CSV file

- If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\<File name>".
- If you only enter one file name and no path, the file will be saved in a system directory, for example, "C:\Documents and Settings\[User]".
- When only one path for the export is specified, the file name is automatically created from the respective recipe name. It is a requirement that the folder "D:\Temp\", for example, has been created. If the folder "D:\Temp" has not been created, the folder name will be used as the prefix of the file name, Temp_Recipe names.csv.

Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: CSV file is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

Application example

You want to export all data records using a key.

Notes on configuring

Configure the "ExportDataRecords" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

ExportDataRecordsWithChecksum

Description

Exports one or all data records of a recipe to a CSV file and generates a checksum for each line in the file.

One file is created per recipe.

Use in the function list

ExportDataRecordsWithChecksum (Recipe number/name, Data record number/name, File name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ExportDataRecordsWithChecksum (Recipe_number/name, Data_record number/name, File_name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which the data records are exported. Specify "0" if recipe data records are to be exported from all available recipes.

Data record number/name

Number or name of the recipe data record to be exported. Specify "0" if all recipe data records are to be exported.

File name

Name of the CSV file to which the recipe data records are exported. Enter the path and the file extension e.g. "C:\TEMP\Orange.CSV".

If a storage card is used as storage location, specify the storage location as follows: "\StorageCard\<File name>".

If you define only a file name without specifying a path, the file is saved to the directory from which Runtime was started. If write access to this directory is not enabled in the Windows 7 operating system, the file is saved to the "VirtualStore" folder of the user directory.

When only one path for the export is specified, the file name is automatically created from the respective recipe name. This requires, for example, that the directory "D:\Temp\" has been created. If the directory "D:\Temp" does not exist, the directory name is used as the prefix for the file name, Temp_Recipe names.csv.

Overwrite

Determines whether an existing CSV file with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: CSV file will not be overwritten. The export process will not be carried out.

1 (hmiOverwriteAlways) = Yes: CSV file is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithConfirmation) = With confirmation: CSV file is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the export:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Export format of the recipe data records

If ".csv" is chosen as a file extension for the export file, then only valid characters from the ANSI character set will be supported. This also applies to separators in decimal numbers and list elements. The separators used are defined in the country/regional settings of the operating system of the exporting computer.

You may also set "Unicode text" (".txt") format for the export file. This file format supports the WinCC and WinCC Runtime character set. Again, the separators used are specified in the country/regional settings of the operating system of the exporting computer. This file format always uses tab separators in list elements.

The corresponding file import function also supports the ".csv" and ".txt" (Unicode) file formats.

Application example

Using a key, you want to export all data records and assign a checksum.

Notes on configuring

Configure the "ExportDataRecordsWithChecksum" system function on the "Press" event for the desired key. Transfer the following parameters:

- Recipe number/name = 1
- Data record number/name = 0
- File name = c:\temp\orange.csv
- Overwrite = 1
- Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data records are exported.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated. All data records of Recipe 1 are exported to the orange.csv file and assigned checksums. If the file already exists, it will be overwritten.

After exporting the data records, a system message is output.

ExportImportUserAdministration

Description

Exports all users of the user administration of the currently active project to the given file or imports the users from the given file into the currently active project.

Users, their passwords and rights are saved in the user administration.

All users are overwritten when importing. The imported users are valid immediately.

Use in the function list

ExportImportUserAdministration (File name, Direction)

Use in user-defined functions

ExportImportUserAdministration (File_name, Direction)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the file which contains the passwords or to which the passwords are written. Enter the file location and the file extension (*.txt), for example, "C:\TEMP\Passwords.txt".

Note

If a storage card is used as file location, specify the file location as follows: "\StorageCard \<File name>".

Direction

Specifies whether passwords are exported or imported:

0 (hmiExport) = Export: Passwords are exported.

1 (hmiImport) = Import: Passwords are imported.

GetBrightness

Description

Reads the value of the brightness.

Use in the function list

GetBrightness (Brightness)

Use in user-defined functions

GetBrightness (Brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Brightness

The tag to which the value is written.

GetDataRecordFromPLC

Description

Transfers the selected recipe data record from the PLC to the storage medium of the HMI device.

Use in the function list

GetDataRecordFromPLC (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

GetDataRecordFromPLC (Recipe_number/name, Data_record_number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data records are transferred.

Data record number/name

Number or name of the recipe data record which is transferred from the PLC to the data medium of the HMI device.

Overwrite

Determines whether an existing recipe data record with the same name is overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data record is not overwritten. The transfer process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data record is overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data record is not overwritten until confirmed.

Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Application example

You want to transfer a data record from the PLC to the data medium of the HMI device using a key.

Notes on configuring

Configure the "GetDataRecordFromPLC" system function on the "Press" event for the desired key. Transfer the following parameters:

Recipe number/name = 1

Data record number/name = 1

Overwrite = 1

Output status message = 1

Tags can also be specified in place of the constants. Depending on the configuration, the operator can enter the desired values in the I/O field or read from the PLC. In this way, the operator can determine which recipe data record is transferred from the PLC.

Procedure on HMI device

As soon as the key is activated, the system function is triggered. The constants or tags are evaluated and the first data record of Recipe 1 is transferred from the PLC to the data medium of the HMI device. If the recipe data record already exists, it will be overwritten.

A system message is output after the transfer.

GetDataRecordName

Description

Writes the name of the given recipe and recipe data record to the given tags.

Note

If the recipe or the recipe data record do not exist, wildcards ("###") are written to the tags.

Use in the function list

GetDataRecordName (Recipe number, Data record number, Recipe name, Data record name, Processing status)

Use in user-defined functions

GetDataRecordName (Recipe_number, Data_record_number, Recipe_name, Data_record_name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number

Number of the recipe whose name is written to the given tag.

Data record number

Number of the recipe data record whose name is written to the given tag.

Recipe name

The tag to which the recipe name is written. The tag must be of the STRING type.

Data record name

The tag to which the name of the recipe data record is written. The tag must be of the STRING type.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Application example

You want to output the names of the displayed recipes and the name of the displayed recipe data record on the HMI device.

Configure the following tags:

- "RecNumber" of type INTEGER
- "RecDataNumber" of type INTEGER
- "RecName" of type STRING
- "RecDataName" of type STRING

Configure a recipe view with the tags "RecNumber" for the recipe number and "RecDataNumber" for the data record number.

Configure the "GetDataRecordName" system function on the "Press" event for a button and pass the following parameters:

- Recipe number: RecNumber
- Data record number: RecDataNumber
- Recipe name: RecName
- Data record name: RecDataName

Configure two output fields and connect these to the "RecName" and "RecDataName" tags.

Select a recipe and a data record number from the recipe view. As soon as the button is activated, the system function is triggered and the name of the recipe and the recipe data record are displayed in both output fields.

GetDataRecordTagsFromPLC

Description

Transfers the values of the recipe data record loaded in the PLC to the corresponding recipe tags.

This system function is used, for example, during teach-in mode on a machine.

Use in the function list

GetDataRecordTagsFromPLC (Recipe number/name, Processing status)

Use in user-defined functions

GetDataRecordTagsFromPLC (Recipe_number/name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe data record whose values are written from the PLC to the tags.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

GetGroupNumber

Description

Reads the number of the group to which the user logged on to the HMI device belongs, and writes it to the given tag.

Use in the function list

GetGroupNumber (Tag)

Use in user-defined functions

GetGroupNumber (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the number of the group is written.

GetPassword

Description

Writes the password of the user currently logged on to the HMI device in the given tag.

Note

Make sure that the value of the given tag is not displayed in another place in the project.

Note

The passwords of SIMATIC Logon users cannot be read.

Use in the function list

GetPassword (Tag)

Use in user-defined functions

GetPassword (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the password is written.

GetUserName

Description

Writes the user name of the user currently logged on to the HMI device in the given tag.

If the given tag has a control connection, the user name is also available in the PLC connection. This system function makes it possible, for example, to implement a user-dependent release of certain functionalities.

Use in the function list

GetUserName (Tag)

Use in user-defined functions

GetUserName (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the user name is written.

GoToEnd

Description

Executes the key function <End> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

Use in the function list

GoToEnd

Use in user-defined functions

GoToEnd

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

GoToHome

Description

Executes the key function <Home> on the HMI device.

This system function is used when the HMI device does not have this functionality by default.

The system function can only be used for the following function keys.

Use in the function list

GoToHome

Use in user-defined functions

GoToHome

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

ImportDataRecords

Description

Imports one or all data records of a recipe from a CSV file.

When a path is specified, all records of the given directory are imported.

Use in the function list

ImportDataRecords (File name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

ImportDataRecords (File_name, Data_record number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the CSV file from which the recipe data records are imported. Enter the file location and the file extension (*.csv), for example "C:\TEMP\Orange.csv".

Note

If a storage card is used as file location, specify the file location as follows: "\StorageCard \<File name>".

Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithPrompting) = With confirmation: Recipe data records are not overwritten until confirmed.

Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Configurable objects

Object	Event
Tag	Value change High limit violated Low limit violated
Function key (global)	Release Press
Function key (local)	Release Press
Screen	Loaded Cleared
Screen object	Press Release Click Change (or toggle for switch) Switch on Switch off Enable Disable
Scheduler	Time expired

ImportDataRecordsWithChecksum

Description

Imports one or all data records of a recipe from a CSV file with a checksum and verifies the checksum.

Use in the function list

ImportDataRecordsWithChecksum (File name, Data record number/name, Overwrite, Output status message, Processing status, verify checksum)

Use in user-defined functions

ImportDataRecordsWithChecksum (File_name, Data_record number/name, Overwrite, Output_status_message, Processing_status, Verify_Checksum)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

File name

Name of the CSV file from which the recipe data records are imported. Enter the path and the file extension, for example, "C:\TEMP\Orange.CSV".

If a storage card is used as storage medium, specify the storage location as follows: "\StorageCard\<File name>".

If you specify a directory instead of an individual CSV file, all files in the specified directory will be imported.

Data record number/name

Number or name of the recipe data record to be imported. Specify "0" if all recipe data records are to be imported.

Overwrite

Determines whether existing recipe data records are to be overwritten:

0 (hmiOverwriteForbidden) = No: Recipe data records are not overwritten. The import process will not be carried out.

1 (hmiOverwriteAlways) = Yes: Recipe data records are overwritten without prompting.

2 (hmiOverwriteWithConfirmation) = With confirmation: Recipe data records are not overwritten until confirmed.

Output status message

Determines whether a status message is output after the import:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example to delay execution of other system functions, until this system function has been successfully completed.

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

Verify checksum

Determines if the checksum should be verified during import:

0 (hmiFalse) = No: Checksum is not verified.

1 (hmiTrue) = Yes: Checksum is verified.

IncreaseTag

Description

Adds the given value to the value of the tags.

X = X + a

Note

The system function uses the same tag as input and output values. When this system function is used to convert a value, help tags must be used. You can use the "SetTag" system function to assign the tag value to the auxiliary tags.

If you configure the system function on the events of an alarm and the tag is not being used in the current screen, it is not ensured that the actual value of the tags is being used in the PLC. You can improve the situation by setting the "Cyclic continuous" acquisition mode.

Use in the function list

IncreaseTag (Tag, Value)

Use in user-defined functions

IncreaseTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Tag

The tag to which the given value is added.

Value

The value that is added.

InverseLinearScaling

Description

Assigns a value to the tag X, which is calculated from the value of the given tag Y using the linear function X = (Y - b) / a.

The tags X and Y must not be identical. This system function is the inverse of the "LinearScaling" system function.

Note

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

Use in the function list

InvertLinearScaling (X, Y, b, a)

Use in user-defined functions

InverseLinearScaling (X, Y, b, a)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

X

The tag which is assigned the value calculated from the linear equation.

Y

The tag that contains the value used for calculation.

b

The value which is subtracted.

a

The value through which is divided.

Example

The following program code assigns a value to the varX tag by means of the InverseLinearScaling function.

```
{
BYTE varX;
BYTE Yvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

//Inverse linear scaling
 InverseLinearScaling (varX, Yvalue, bvalue, avalue);

printf ("varX = %d\r\n, varX);
...
}
```

The saved return value can be processed in the following code.

InvertBit

Description

Inverts the value of the given tag of the "Bool" type:

- If the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

Use in the function list

InvertBit (Tag)

Use in user-defined functions

InvertBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag whose bit is set.

Example

The following program code inverts the value of the boolean tag b_value and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 0;
BOOL b_saved = b_value;

//Invert variable
invertBit(b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
  ...
}
```

InvertBitInTag

Description

Inverts a bit in the given tag:

- If the bit in the tag has the value of 1 (TRUE), it will be set to 0 (FALSE).
- If the bit in the tag has the value of 0 (FALSE), it will be set to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "InvertBit" system function instead.

Use in the function list

InvertBitInTag (Tag, Bit)

Use in user-defined functions

InvertBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which the given bit is set.

Bit

The number of the bit that is set.

When this system function is used in a user-defined function, the bits in a tag are counted from right to left. The counting begins with 0.

Example

The following program code inverts a bit at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Invert bit in bitposition
InvertBitInTag (bvalue, bitposition);
//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

LinearScaling

Description

Assigns a value to the tag Y, which is calculated from the value of the given tag X using the linear function Y= (a *X) + b.

The inverse of this function is the "InvertLinearScaling" system function.

Note

The tags X and Y must not be identical. If a tag is to be converted into itself, a auxiliary tag must be used.

The "SetTag" system function can be used to assign the value of the tags to be converted to the auxiliary tags.

Use in the function list

LinearScaling (Y, a, X, b)

Use in user-defined functions

LinearScaling (Y, a, X, b)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Y

The tag which is assigned the value calculated from the linear equation.

a

The value with which is multiplied.

X

The tag that contains the value used for calculation.

b

The value that is added.

Example

The following program code uses the LinearScaling function to assign a value to the Yvar tag.

```
{
BYTE Yvar;
BYTE Xvalue = 10;
BYTE bvalue = 3;
BYTE avalue = 4;

// linear scaling
 LinearScaling ( Yvar, avalue, Xvalue, bvalue);

printf ("Yvar = %d\r\n, Yvar);
...
}
```

The saved return value can be processed in the following code.

LoadDataRecord

Description

Loads the given recipe data record from the memory medium of the HMI device in the recipe tags. This system function is used, for example, to display a recipe data record in the recipe screen.

Activate the "Synchronize recipe view and recipe tags" option in the synchronization settings of the recipe. If this option is deactivated, the system function has no effect.

Use in the function list

LoadDataRecord (Recipe number/name, Data record number/name, Processing status)

Use in user-defined functions

LoadDataRecord (Recipe_number/name, Data_record_number/name, Confirmation, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which a recipe data record is loaded.

Data record number/name

Number or name of the recipe data record to be loaded.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

LogOff

Description

Logs off the current user on the HMI device.

Use in the function list

Logoff

Use in user-defined functions

Logoff

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Logon

Description

Logs on the current user on the HMI device.

Use in the function list

Logon (Password, User name)

Use in user-defined functions

Logon (Password, User_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Password

The tag from which the password for the user logging on is read.

If the user is logged on, the password in the tag is deleted.

User name

The tag from which the user name for the user logging on is read.

LookupText

Description

Identifies an entry from a text list. The result depends on the value and on the selected runtime language. The result is saved to a tag of data type "String".

Use in the function list

LookupText (Output text, Value, Language, Text list)

Use in user-defined functions

LookupText (Output_text, Index, Language, Text_list)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Output text

The tag to which the result is written.

Index

The tag that defines the value of the list entry.

Language

Defines the runtime language in which the list entry is identified.

- Tag
  The tag that contains the language. Enter the runtime language as decimal value of the country ID, for example, 1031 for German - Standard, 1033 for English - USA. Details are available in the VBScript basics, "Locale identifier (LCID) diagram".
- Runtime language
  Language code as per VBScript reference, for example, "de-DE" for German (Germany) or "en-US" for English (United States of America). The selection depends on the activated runtime languages.

Text list

Defines the text list. The list entry is read from the text list.

NotifyUserAction

Description

This system function is used to log user actions that are not automatically logged in the audit trail. You can also use this system function to require the user to enter an acknowledgment or an electronic signature and a comment for the operator action. Requirement for the use of the system function is that the GMP-compliant configuration is activated under "Runtime settings".

If you use the "NotifyUserAction" system function in a function, the debugger may open if you cancel your input by clicking "Cancel". To compensate for this reaction, you can use the "On Error Resume Next" statement in a function. With this instruction, the next instruction is executed after a runtime error. If you use the "On Error Resume Next" statement, output of system events is also suppressed.

Use in the function list

NotifyUserAction (Confirmation type, Mandatory commenting, Category, Object name, Description)

Use in user-defined functions

NotifyUserAction (Confirmation_type, Mandatory_commenting, Category, Object_name, Description)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Confirmation type

Establishes how the action must be confirmed

0 = (None): No confirmation required, an entry is created in the audit trail

1 = (Acknowledgement): Acknowledgment, the user must acknowledge the action; an entry is created in the audit trail

2 = (Digital Signature): Electronic signature, a dialog window opens in which the user must enter his electronic signature - an entry is created in the audit trail

Mandatory commenting

Establishes if the user has to enter a comment. The comment is logged in the audit trail.

0 = (True): True; a dialog window opens in which the user must enter a comment

1 = (False): False; no mandatory commenting

Category

Category or class name of the modified object

Object name

Name of the modified object

Description

Text which describes the archiving user action.

OpenAllLogs

Description

Reestablishes the connection between WinCC and the logs. Logging can be continued.

Note

Run the "StartLogging" system function in order to restart logging.

Use in the function list

OpenAllLogs

Use in user-defined functions

OpenAllLogs

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. You open all logs with the "Open Archive" button. Logging will be continued in the specified log.

OpenCommandPrompt

Description

Opens a Windows system prompt.

This function is used, e.g., to copy files or to call up another application.

Use in the function list

OpenCommandPrompt

Use in user-defined functions

OpenCommandPrompt

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

OpenControlPanel

Description

Opens a dialog that you can use to edit selected Control Panel settings.

This system function lets you set the following on the HMI device:

- Properties and value of the IP address
- User identification on the network
- WinCC Internet settings

Note

Project security

The "OpenControlPanelDialog" system function is used to bypass the SecureMode on the HMI device. Take the corresponding precautions to ensure the security of your project.

Use in the function list

OpenControlPanelDialog (Dialog)

Use in user-defined functions

-

Parameters

Dialog

Sets the Control Panel dialog to be opened.

- PROFINET_X1: Setting of the IP address and Ethernet parameters
- PROFINET_X3: Setting of the IP address and Ethernet parameters; only for Comfort Panel KP 1500, TP 1500; TP1900, TP2200
- WinCC Internet settings: Setting for Web Server, e-mail notification, provided the HMI device supports these functions
- Network ID: Setting for identification on the network, provided the HMI device supports these functions

OpenInternetExplorer

Description

Opens the Internet Explorer on the HMI device.

If the Internet Explorer is already open, it will be closed and reopened when you call the system function.

Note

The Internet Explorer saves data temporarily in the DRAM file system of the HMI device, e.g. the last web sites that were be called up.

This data can be saved using the "BackupRAMFileSystem" system function so that it is still available when the HMI device is restarted.

Use in the function list

OpenInternetExplorer (Start page)

Use in user-defined functions

OpenInternetExplorer (Start_page)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Start page

The page which is loaded when Internet Explorer is started, e.g. "www.siemens.com".

OpenScreenKeyboard

Description

Hides or shows the screen keyboard.

The screen keyboard remains open until the screen keyboard is explicitly closed. In this way, the screen keyboard can also be used in other applications.

Use in the function list

OpenScreenKeyboard (Layout)

Use in user-defined functions

OpenScreenKeyboard (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Layout

Specifies whether the window is opened minimized or maximized with the screen keyboard:

0 (hmiScreenKeyboardMinimized) = Minimized

1 (hmiScreenKeyboardMaximized) = Maximized

OpenTaskManager

Description

Shows the task manager.

The task manager allows changing to other open applications on the HMI device.

Note

The appearance of the task manager depends on the operating system installed.

Use in the function list

OpenTaskManager

Use in user-defined functions

OpenTaskManager

Can be used if the configured device supports user-defined scripts. For additional information, refer to "Device dependency".

Parameter

--

PageDown

Description

Executes the key function <Pagedown> on the HMI device.

This system function can only be used for function keys.

Use in the function list

PageDown

Use in user-defined functions

PageDown

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

-

PageUp

Description

Executes the key function <PageUp> on the HMI device.

This system function can only be used for function keys and tasks with a time trigger.

Use in the function list

PageUp

Use in user-defined functions

PageUp

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

-

PrintReport

Description

Prints the given report from the printer which is connected to the HMI device. The report is printed in the language which is set on the HMI device.

Note

If runtime is closed whilst log data are being printed using the system function, the report will cease to be supplied with data as soon as runtime stops.

Use in the function list

PrintReport (Report)

Use in user-defined functions

PrintReport (Report)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Report

Name of the report to be printed.

Note

If you have set up via the "Function list" dialog box a new report for the "PrintReport" function, when compiling, the following warning appears: "The report "Report_1" has no printed pages."

In order to remedy the warning, open the "Report_1" via the project view and recompile the project.

PrintScreen

Description

Prints the screen currently being displayed on the HMI device from the printer which is connected to the HMI device.

Opened windows are also printed.

Note

The printer settings are taken over from the current settings in the Windows operation system.

Use in the function list

PrintScreen

Use in user-defined functions

PrintScreen

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

--

ResetBit

Description

Sets the value of a "Bool" type tag to 0 (FALSE).

Use in the function list

ResetBit (Tag)

Use in user-defined functions

ResetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The BOOL type tag which is set to 0 (FALSE).

Example

The following program code resets the value of the boolean tag b_value to 0 by means of the ResetBit function and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 1;
BOOL b_saved = b_value;

//Reset bit
  ResetBit (b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

ResetBitInTag

Description

Sets a bit in the specified tag to 0 (FALSE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "ResetBit" system function instead.

Use in the function list

ResetBitInTag (Tag, Bit)

Use in user-defined functions

ResetBitInTag (Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which a bit is set to 0 (FALSE).

Bit

The number of the bit that is set to 0 (FALSE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

Example

The following program code sets a bit at the specified bitposition in the bvalue tag to 0 and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
ResetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

SafelyRemoveHardware

Description

Checks whether there is read or write access to the external storage medium. If there is no access, the external storage medium can be removed without data loss.

Use in the function list

SafelyRemoveHardware(Path, Result)

Use in user-defined functions

SafelyRemoveHardware(Path, Result)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Path

Path of storage medium , e.g. \Storage Card USB\

Result

The tag in which the result is entered.

TRUE : The storage medium can be removed safely. A corresponding system message will be issued.

FALSE : The storage medium can be removed safely. A corresponding system message will be issued.

SaveDataRecord

Description

Saves the current values of the recipe tags as data record to the memory medium of the HMI device.

This system function is used, for example, to save a recipe data record in the recipe screen.

Use in the function list

SaveDataRecord (Recipe number/name, Data record number/name, Overwrite, Output status message, Processing status)

Use in user-defined functions

SaveDataRecord (Recipe_number/name, Data_record_number/name, Overwrite, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Recipe number/name

Number or name of the recipe to which a recipe data record is saved.

Data record number/name

Number or name of the recipe data record to be saved. A new data record will be created if no record of this name or number was found in the recipe, independent of the value at the "Overwrite" parameter.

Overwrite

Specifies whether an existing data record is overwritten:

0 (hmiOverwriteForbidden) = No: The recipe data record is not overwritten, the data record is not saved.

1 (hmiOverwriteAlways) = Yes: The recipe data record is overwritten without a prompt for confirmation.

2 (hmiOverwriteWithPrompting) = With confirmation: The recipe data record is overwritten only with confirmation by the user.

Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

SendEMail

Description

Sends an e-mail from the HMI device to the given addressee.

This system function is used, for example, when, in the case of service, the alarm is to be passed on directly to the service technician.

Note

To send alarms as e-mails, the HMI system must have an e-mail client at its disposal.

Use in the function list

SendEMail (Address, Subject, Text, Return address)

Use in user-defined functions

SendEMail (Address, Subject, Text, Return_address)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Address

The e-mail address of the addressee.

Subject

The subject line of the e-mail.

Text

The text sent in the e-mail.

Return address

The e-mail address to which the addressee of this e-mail should send the reply.

SetAcousticSignal

Description

Configures the acoustic feedback of touch screen operation on the HMI device.

Note

The configuration that was set at Switch off is reestablished when restarting the HMI device.

Use in the function list

SetAcousticSignal (Volume)

Use in user-defined functions

SetAcousticSignal (Volume)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Volume

Determines whether and how loud an acoustic signal is emitted:

-1 (hmiToggle) = Toggle: Toggles the emission of the acoustic signal as follows: Muted > Quiet > Loud.

0 (hmiMuted) = Mute: no acoustic signal

1 (hmiQuiet) = Quiet: quiet acoustic signal

2 (hmiLoud) = Loud: loud acoustic signal

SetAlarmReportMode

Description

Switches the automatic reporting of alarms on the printer on or off.

Use in the function list

SetAlarmReportMode (Mode)

Use in user-defined functions

SetAlarmReportMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether alarms are reported automatically on the printer:

0 (hmiDisablePrinting) = Reporting off: Alarms are not printed automatically.

1 (hmiEnablePrinting) = Reporting On: Alarms are printed automatically.

-1 (hmiToggle) = Toggle: Toggles between the two modes.

SetAndGetBrightness

Description

Determines the brightness of the MP 377 Touch daylight readable display. The brightness value can be interpreted as absolute or relative to the current value.

Note

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

Use in the function list

SetAndGetBrightness (Brightness, Mode, Current value)

Use in user-defined functions

SetAndGetBrightness (Brightness, Mode, Actual brightness)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Brightness

New value for the brightness.

Mode

Specifies if the new brightness value is set as absolute or relative to the current value.

Current value

Tag in which the current brightness value is stored.

SetBit

Description

Sets the value of a "Bool" type tag to 1 (TRUE).

Use in the function list

SetBit (Tag)

Use in user-defined functions

SetBit (Tag)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The BOOL type tag which is set to 1 (TRUE).

Example

The following program code sets the value of the boolean tag b_value to 1 by means of the SetBit function and outputs the result along with the original b_saved value.

```
{
BOOL b_value = 0;
BOOL b_saved = b_value;
```

```
//Set bit
  SetBit (b_value);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",b_value, b_saved);
...
}
```

SetBitInTag

Description

Sets a bit in the given tag to 1 (TRUE).

After changing the given bit, the system function transfers the entire tag back to the PLC. It is not checked whether other bits in the tags have changed in the meantime. Operator and PLC have read-only access to the indicated tag until it is transferred back to the PLC.

Note

If the PLC supports BOOL tags, do not use this system function. Use the "SetBit" system function instead.

Use in the function list

SetBitInTag (Tag, Bit)

Use in user-defined functions

SetBitInTag(Tag, Bit)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag in which a bit is set to 1 (TRUE).

Bit

The number of the bit that is set to 1 (TRUE).

When this system function is used in a user-defined function, the bits in the specified tag will be counted from right to left independent of the PLC used. The counting begins with 0.

Note

The guaranteed update of the tags used with actual process values is absolutely conditional in terms of reliable functionality. You should therefore configure the tag in an I/O field or assign the system function to a screen object, such as a button.

If you have configured a short event such as the activation of an alarm for the system function you can only access the actual process values by setting the tag for continuous reading.

Example

The following program code sets a bit to 1 at the specified bitposition in the bvalue tag and outputs the result along with the original bsaved value.

```
{
BYTE bvalue;
BYTE bsaved = bvalue;
BYTE bitposition = 2;

//Reset bit in bitposition
SetBitInTag (bvalue, bitposition);

//print current and saved value
printf ("Current value: %d\r\n, Saved value: %d\r\n",bvalue, bsaved);
  ...
}
```

SetBrightness

Description

Determines the brightness of the display.

Note

The configuration that is set in the Control Panel will be reestablished when you restart the HMI device.

Use in the function list

SetBrightness (value)

Use in user-defined functions

SetBrightness (Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Value

New value for the brightness.

SetConnectionMode

Description

Connects or disconnects the given connection.

Note

A connection to the PLC cannot be established until the operating mode ONLINE has been set on the HMI device. Use the "SetDeviceMode" system function for this purpose.

Use in the function list

SetConnectionMode (Mode, Connection)

Use in user-defined functions

SetConnectionMode (Mode, Connection)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether a connection to the PLC is established or disconnected:

0 (hmiOnline) = Online: Connection is established.

1 (hmiOffline) = Offline: Connection is disconnected.

Connection

The PLC to which the HMI device is connected. You specify the name of the PLC in the connection editor.

Multiple use of the system function in a user-defined function

If you use the "SetConnectionMode" system function for different connections, it may be possible that not all system functions are executed correctly. Proceed as follows to prevent this situation:

1. Create a "BOOL" type tag with the start value "0".
2. Configure the "SetConnectionMode" system function on the "Value change" event of the HMI tags. If you want to disconnect three connections, for example, you must configure the system function three times.
3. In the user-defined function, apply the "InvertBit" system function to the HMI tag.

Application example

Two typical application examples for this system function are as follows:

- Test
  As long as no PLC is connected to the HMI device, no error messages will be output during the test on the HMI device. If the HMI device is connected to a PLC, the connection to the PLC can be established by pressing a key.
- Commissioning
  Several PLCs are to be configured for a system. At first, all PLCs except one are configured "Offline". After commissioning of the first PLC, the connection to each of the other PLCs is established by pressing a key. In this way, the other PLCs are started up one after another.

SetDataRecordTagsToPLC

Description

Transfers the values of the recipe tags to the PLC. The recipe tags contain the values of the data record which is displayed on the HMI device.

Use in the function list

SetDataRecordTagsToPLC (Recipe number/name, Processing status)

Use in user-defined functions

SetDataRecordTagsToPLC (Recipe_ number/name, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

SetDataRecordToPLC

Description

Transfers the given recipe data record directly from the data medium of the HMI device to the PLC with which the HMI device is connected.

Note

The values of the recipe data record don't need to be displayed on the HMI device.

Use in the function list

SetDataRecordToPLC (Recipe number/name, Data record number/name, Output status message, Processing status)

Use in user-defined functions

SetDataRecordToPLC (Recipe_number/name, Data_record_number/name, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe from which recipe data record is transferred to the PLC.

Data record number/name

Number or name of the recipe data record to be transferred to the PLC.

Output status message

Determines whether a status message is output after the transfer:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

SetDaylightSavingTime

Description

The system function "SetDaylightSavingTime" changes the setting of the HMI device from daylight saving to standard time and vice versa.

Time settings will take place immediately following system function.

Note

The "SetDaylightSavingTime" system function does not support time zones without daylight saving time.

Note

Windows 7

The system function "SetDaylightSavingTime" is not supported for PC-based HMI devices under Windows 7.

Use in the function list

SetDaylightSavingTime(DaylightSavingTime)

Use in user-defined functions

SetDaylightSavingTime (Daylight_saving_time)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Daylight Saving Time

Determines whether Daylight Saving Time is set on the HMI device:

0 = Daylight Saving Time is not activated

1 = Daylight Saving Time is activated

SetDeviceMode

Description

Toggles the operating mode on the HMI device. The following types of operation are possible: "Online", "Offline" and "Load".

Use in the function list

SetDeviceMode (Operating mode)

Use in user-defined functions

SetDeviceMode (Operating_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Operating mode

Determines the operating mode of the HMI device:

0 (hmiOnline) = Online: The connection to the PLC is established.

1 (hmiOffline) = Offline: The connection to the PLC is disconnected.

2 (hmiTransfer) = load: A project can be transferred from the configuration computer to the HMI device.

Note

If you use a PC as an HMI device, the runtime software will be exited when you change operating mode after "Load".

SetDisplayMode

Description

Changes the settings of the screen in which the runtime software runs.

The runtime software runs in full-screen mode as default. The Windows task switch is disabled.

Use in the function list

SetDisplayMode (Layout)

Use in user-defined functions

SetDisplayMode (Display mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines the settings for the screen in which the runtime software runs.

1 (hmiScreenFull): Full-screen: Title bar of the screen is not visible

2 (hmiScreenMaximized): Maximized

3 (hmiScreenRestore): Restore: The last used screen setting is used. This layout can only be used when the window is displayed minimized or maximized.

4 (hmiScreenMinimized): Minimized

5 (hmiScreenAutoAdjust): Automatic: The size of the window is set so that all screen objects in it will be visible.

6 (hmiScreenOnTop): On top; either the window appears in the foreground or the program icon associated with the window flashes on the taskbar depending on the Windows setting. The setting can be changed in the Windows configuration and applies to all Windows applications.

SetLanguage

Description

Toggles the language on the HMI device. All configured text and system events are displayed on the HMI device in the newly set language.

Use in the function list

SetLanguage (Language)

Use in user-defined functions

SetLanguage (Language)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Language

Determines which language is set on the HMI device. The following specifications are possible:

- -1 (hmiToggle) = Toggle: Changes to the next language. The sequence is determined during configuration in the "Project languages" editor.
- Number you have defined under "Languages and fonts" in the "Runtime Settings" editor. Changes to the language with the given number.
- Language you have defined under "Languages and fonts" in the "Runtime Settings" editor.
- Language abbreviation in accordance with the VBScript5 reference: This changes to the language corresponding to the specified language code, e.g. "de-DE" for German (Germany) or "en-US" for English (United States).
  An overview of the language abbreviations is available in the basic information of VBScript under the topic "Area diagram-ID (LCID) Diagram".

SetRecipeTags

Description

Changes the status of the recipe tags from "Online" to "Offline" and vice versa.

This system function is used, for example, when recipe data record values are fine tuned when starting up a machine.

Use in the function list

SetRecipeTags (Recipe number/name, Status, Output status message, Processing status)

Use in user-defined functions

SetRecipeTags (Recipe_number/name, Status, Output_status_message, Processing_status)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Recipe number/name

Number or name of the recipe in which the recipe data record is saved.

Status

Determines the status of the recipe tags:

0 (hmiOnline) = Online: Value changes of the recipe tags are transferred immediately to the PLC connected to the HMI device.

1 (hmiOffline) = Offline: Value changes to the recipe tags are only transferred to the PLC connected to the HMI device when, for example, the "SetDataRecordTagsToPLC" system function is executed.

Output status message

Determines whether a status message is output after saving:

0 (hmiOff) = Off: Status message is not output.

1 (hmiOn) = On: Status message is output.

Processing status

Returns the processing status of the system function. You can use the return value, for example, to delay execution of other system functions until this system function has been successfully completed:

2 = System function is being performed.

4 = System function was successfully completed.

12 = System function was not performed because an error has occurred.

SetScreenKeyboardMode

Description

Enables or disables the automatic display of the screen keyboard on the HMI device.

This system function is also used to prevent the display of the screen keyboard, e.g. because an external keyboard is connected to the HMI device.

Note

To enable the "SetScreenKeyboardMode" ("SetScreenKeyboardMode") system function on an HMI other than a Touch Panel device, set the "Use on-screen keyboard" check box in the "Runtime settings" dialog of the device settings.

Use in the function list

SetScreenKeyboardMode (Mode)

Use in user-defined functions

SetScreenKeyboardMode (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Mode

Determines whether the screen keyboard is hidden or shown:

0 (hmiOff) = Off: Screen keyboard is hidden

1 (hmiOn) = On: Screen keyboard is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes.

SetTag

Description

Assigns a new value to the given tag.

Note

This system function can be used to assign strings and numbers, depending on the type of tag.

Use in the function list

SetTag (Tag, Value)

Use in user-defined functions

SetTag (Tag, Value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Tag

The tag to which the given value is assigned.

Value

The value which the given tag is assigned.

Note

The "SetTag" system function is only executed after a connection has been established.

Example

The following program code uses the SetTag function to set the value of the gs_tag_bit tag to TRUE and saves the return value to the ok tag.

```
{
BOOL ok;
BOOL bvalue;

//Set the tag to true
ok = SetTag("gs_tag_bit", TRUE);
//error handling
```

```
if(ok)
{
  // succeeded
  printf ( "Function has run through.\r\n" );
bvalue = GetTagBit("gs_tag_bit");
  printf ("Value of gs_tag_bit: %d\r\n", bvalue);
}
else
{
  // failed
  printf ( "Error - function failed." );
}
...
}
```

The saved return value can be processed in the following code.

ShiftAndMask

Description

This system function converts the input bit pattern of the source tags into an output bit pattern of the target tags. This involves bit shifting and masking.

Note

If the source and target tag have a different number of bits, using the system function in the target tag can result in a violation of the value range.

Use in the function list

ShiftAndMask (Source tag, Target tag, Bits to shift, Bits to mask)

Use in user-defined functions

ShiftAndMask (Source_tag, Target_tag, Bits_to_shift, Bits_to_mask)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Source tag

The tag includes the input bit pattern. Integer-type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The actual value 72 is set at the 16-bit integer source tag: 0000000001001000.

Target tag

The output bit pattern is saved in the tag. Integer type tags, e.g. "Byte", "Char", "Int", "UInt", "Long" and "ULong" are permitted.

Example: The shifted input bit pattern is multiplied by the bit mask, with bit-by-bit logical AND operation: 0000000000001001. The resultant decimal value "8" is saved to the target tag.

Please note the following:

- The source and target tags have the same number of bits.
- The number of bits to shift is less than the number of bits in the source tag and target tag.
- Bits to mask does not have more bits than the source tag and the target tag.

Bits to shift

Number of bits by which the input bit pattern is shifted right. A negative value shifts the input bit pattern to the left.

Example: "Bits to shift" has the value "+3". The input bit pattern is shifted right by three bits when the system function is called: 0000000000001001.
Bits to the left are padded with "0". Three bits are truncated on the right. The new decimal value is "9".

Note

The left bit is "1" in a source tag of the data type with negative signed integer. This sign bit is padded with "0" when the bits are shifted right. The sign changes to "+".

Bits to mask

An integer serves as bit mask. The bit pattern is used to multiply the shifted input bit pattern. Example: Integer "2478" with the bit pattern "0000100110101110".

You can enter the bit mask in three different ways:

- Hexadecimal: First enter the prefix "0h" or "0H", followed by an optional space for better readability. Then group the bit pattern in blocks of four (0000)(1001)(1010)(1110) and set each block in hexadecimal code: (0)(9)(A)(E). Only the characters 0-9, A-F, a-f are allowed: "0h 09AE".
- Binary: First enter the prefix "0b" or "0B", followed by an optional space for better readability. Then group the binary bit pattern into blocks of four 0000 1001 1010 1110 with spaces in between as a check. Only the characters "0" or "1" are allowed: "0b 0000 1001 1010 1110".
- Decimal: Enter the value "2478" directly, without a prefix.

ShowAlarmWindow

Description

Hides or shows the alarm window on the HMI device.

Use in the function list

ShowAlarmWindow (Object name, Layout)

Use in user-defined functions

ShowAlarmWindow (Object_name, Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Object name

Name of the alarm view which is hidden or shown.

Layout

Determines whether the alarm window is hidden or shown:

0 (hmiOff) = Off: Alarm view is hidden

1 (hmiOn) = On: Alarm view is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

ShowOperatorNotes

Application

Displays the tooltip configured for the selected object.

If the system function is configured on a function key, the tooltip for the screen object that currently has the focus is displayed. If a tooltip is configured for the screen itself, you can switch to this text by pressing <Enter> or by double-clicking on the help window.

If the system function is configured on a button, only the tooltip for the current screen is displayed. If a tooltip is configured on the button itself, initially only the tooltip for the button is displayed. You can press <Enter> or double-click on the help window to switch to the tooltip for the current screen.

Note

No other screen object can be used while the help window is open. To use the screen object, close the help window.

Closing the help window

You can close the help window in the following ways:

Using the keys:

- By pressing the <HELP> key again
- By pressing the <ESC> key

Using the touch screen:

- By pressing the button

Use in the function list

ShowOperatorNotes (Layout)

Use in user-defined functions

ShowOperatorNotes (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Display mode

Determines whether the configured tooltip is hidden or shown:

0 (hmiOff) = Off: Configured tooltip is hidden

1 (hmiOn) = On: Configured tooltip is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

ShowSoftwareVersion

Description

Hides or shows the version number of the runtime software.

Use this system function if during servicing, for example, you required the version of the runtime software used.

Use in the function list

ShowSoftwareVersion (Layout)

Use in user-defined functions

ShowSoftwareVersion (Display_mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Layout

Determines whether the version number is shown:

0 (hmiOff) = Off: Version number is not shown

1 (hmiOn) = On: Version number is shown

-1 (hmiToggle) = Toggle: Toggles between the two modes

ShowSystemAlarm

Description

Displays the value of the parameter passed as a system event to the HMI device.

Use in the function list

ShowSystemAlarm (Text/value)

Use in user-defined functions

ShowSystemAlarm (Text/value)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Text/Value

The text or the value, which was output as a system alarm.

ShowSystemDiagnosticsWindow

Description

Hides or shows the system diagnostic window on the HMI device. The system diagnostic view is only available in the global screen for Comfort Panels and for WinCC Runtime Advanced.

Use in the function list

ShowSystemDiagnosticsWindow (Screen object)

Use in user-defined functions

ShowSystemDiagnosticsWindow (Target_Object_name)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Screen object

Name of the system diagnostic window which is hidden or shown.

StartLogging

Description

Starts the logging of data or alarms in the specified log. The function can also be applied to audit trails.

You can interrupt logging at runtime using the "StopLogging" system function.

Use in the function list

StartLogging (Log type, Log)

Use in user-defined functions

StartLogging (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

Log

Name of the log which is started.

StartNextLog

Description

Stops the logging of data or alarms for the given log.

Logging is continued in the next log of the segmented circular log you configured for the specified log.

If you did not configure a segmented circular log for the specified log, the system function has no effect.

Use in the function list

StartNextLog (Log type, Log)

Use in user-defined functions

StartNextLog (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

Log

Name of the log for which the logging is stopped and continued in the next log.

StartProgram

Description

Starts the specified program on the HMI device.

The runtime software continues running in the background. Alarms continue to be output and data continues to be updated.

When the given application is exited, the screen which was active during the performance of the system function is displayed on the HMI device.

This system function is used, for example, to edit recipe data records in MS Excel on the HMI device.

Note

If Windows CE is installed on the HMI device, during the configuration it must be checked whether the desired application can be started with this system function.

This system function allows all applications to be started which can be started in the "Execute" dialog of Windows CE.

The application to be started must be installed on the HMI device.

Use in the function list

StartProgram (Program name, Program parameters, Layout, Wait for program to end)

Use in user-defined functions

StartProgram (Program_name, Program_parameters, Display_mode, Wait_for_program_to_end)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Program name

Name and path of the program which is started. Upper and lower case are taken into account in this parameter.

Note

If the path contains spaces, the program can only be started correctly if the path is specified in inverted commas, e.g. "C:\Program Files\START\start.exe".

Program parameters

The parameters you transfer at the start of the program, for example a file that is opened after the start of the program.

The description of the necessary parameters is found in the documentation of the program to be started.

Layout

Determines how the program window is displayed on the HMI device:

0 (hmiShowNormal) = Normal

1 (hmiShowMinimized) = Minimized

2 (hmiShowMaximized) = Maximized

3 (ShowMinimizedAndInactive) = Minimized and inactive

Wait for program to end

Determines whether there is a change back to the project after the called up program has ended:

0 (hmiNo) = No: No change to project

1 (hmiYes) = Yes: Change to project

Note

The "Wait for program to end" parameter is only available for Runtime Advanced and Panels.

StopLogging

Description

Stops the logging of process values or alarms in the specified log. The function can also be applied to audit trails.

The "StartLogging" system function is used to resume logging at runtime.

Note

When logging is stopped, a connection between WinCC and the log files or log database still exists. Use the "CloseAllLogs" system function to disconnect this connection.

Use in the function list

StopLogging (Log type, Log)

Use in user-defined functions

StopLogging (Log_type, Log)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameter

Log type

Determines the type of log:

0 (hmiTagArchive) = Data log

1 (hmiAlarmArchive) = Alarm log

2 (hmiAudittrailArchive) = Audit trail

Log

Name of the log that is stopped.

Application example

You are in runtime and want to change the data medium on which the process values are logged.

Notes on configuring

Configure the "StopLogging" and "CloseAllLogs" system functions on the "Close Archive" button.

Configure the "OpenAllLogs" and "StartLogging" system functions on the "Open Archive" button.

As parameter transfer the respective name of the log that is to be stopped and started.

Procedure on HMI device

When the button "Close Archive" is pressed, the specified log is stopped and all open logs are closed. The data medium can be changed. The "Open Archive" button opens all logs and continues logging in the specified log.

StopRuntime

Description

Exits the runtime software and thereby the project running on the HMI device.

Use in the function list

StopRuntime (Mode)

Use in user-defined functions

StopRuntime (Mode)

Can be used if the configured device supports user-defined functions. For additional information, refer to "Device dependency".

Parameters

Mode

Determines whether the operating system is shut down after exiting runtime.

0 (hmiStopRuntime) = Runtime: Operating system is not shut down

1 (hmiStopRuntimeAndOperatingSystem) = Runtime and operating system: The operating system is shut down (not possible with WinCE)

Example

The following program code shuts down Runtime and the operating system.

```
{

//Stop runtime and shutdown
StopRuntime (hmiStopRuntimeAndOperationSystem);

}
```

The saved return value can be processed in the following code.

WinACMPGetVersion

Description

Reads out the value of the version number of WinAC MP.

Use in the function list

WinACMPGetVersion (Version, Action)

Use in user-defined functions

WinACMPGetVersion (Version, Action)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

Version

The tag that contains the value.

Action

Determines whether the version number is read out:

0 (SwitchOff) = Off: Version number is not read out.

1 (SwitchOn) = On: Version number is read out.

WinACMPSetStartAtBoot

Description

Determines whether or not WinAC MP is started automatically after startup of the HMI device.

Use in the function list

WinACMPSetStart at boot(Start at boot)

Use in user-defined functions

WinACMPSetStartAtBoot (Start at boot)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

StartAtBoot

Defines whether WinAC MP is started automatically.

0 (StartAtBootOff) = Off: WinAC MP is not started on startup of the HMI device.

1 (StartAtBootOn) = On: WinAC MP is started automatically on startup of the HMI device.

WinACSetStartMode

Description

Sets the operating mode of WinAC MP after startup of the HMI device.

Use in the function list

WinACSetStartMode (Autostart)

Use in user-defined functions

WinACSetStartMode (Autostart)

Can be used if the configured device supports user-defined functions. For more information, refer to Auto-Hotspot.

Parameters

Action

Defines whether the Autostart function of WinAC MP is activated.

0 (AutoStartOff) = Off: After startup, WinAC MP remains in the STOP operating mode.

1 (AutoStartOn) = On: After startup, WinAC MP changes to the operating mode it was in before it was closed.

VBScript for Windows

VBScript for Windows

VBScript

If you have worked with Visual Basic or Visual Basic for applications, then VBScript will seem familiar to you. If you do not know Visual Basic and are getting familiar with it, then you will learn all Visual Basic programming languages at once. The step-by-step guides from Microsoft Press are a good introduction to programming.

You will find fundamental information on VBScript language elements on the Microsoft homepage:

http://msdn.microsoft.com/en-us/library/t0aew7h6.aspx

Local ID (LCID)

An overview of all language codes can be found on the Microsoft homepage:

http://msdn.microsoft.com/en-us/goglobal/bb964664

VBScript for Windows CE

VBScript for Windows CE

Attr

Function

This property of the File control returns a number indicating the file mode that was used to open the file.

Syntax

file.Attr

Parameters

File

Reference to a File control.

Return values

The return values listed in the following table indicate the file access mode. If the return value is 0, the file is closed.

Constant	Value
None	0
fsModeInput	1
fsModeOutput	2
fsModeRandom	4
fsModeAppend	8
fsModeBinary	32

Remarks

The Attr property is read-only. Use the Open method of the File control to set the file mode.

Close

Function

This method closes an open File control.

Syntax

file.Close

Parameters

File

Name of a File control.

Return Values

None.

Remarks

Use the Open method to open a file.

CreateObject

Function

This function creates a reference to an Automation object.

Syntax

CreateObject (Object)

Parameters

Object

A string containing the ProgID of the object to create.

Return values

Returns a reference to an Automation object.

Remarks

Use CreateObject to create non-visible ActiveX controls at runtime. You cannot use CreateObject to create graphical objects such as a TreeView control or a ListView control. CreateObject produces objects that cannot respond to events. To produce objects that can respond to events, use the CreateObjectWithEvents function. The following table lists the ProgIDs for the ActiveX controls without events.

Control	ProgID
Microsoft CE File control 6.0	.file
Microsoft CE FileSystem control 6.0	.filesystem
Microsoft CE ImageList control 6.0	CEimageList.imagelistctrl

Example

```
Dim f, fwModeAppend
Set f = CreateObject("FileCtl.File")
fwModeAppend=8
f.Open "\Storage Card\testfile.txt", fwModeAppend
f.Close
```

Dir

Function

This method returns the name of a file, directory, or folder that matches a specified pattern or file attribute.

Syntax

File.Dir (Pathname,[Attributes])

Parameters

File

Reference to a FileSystem control.

Pathname

Optional. String expression that specifies a file name or path.

Attributes

Optional. Numeric expression whose sum specifies file attributes. If omitted, all files that match pathname are returned.

The following table describes the parameter settings of attributes.

Constant	Value	Description
fsAttrNormal	0	Normal
fsAttrReadOnly	1	Read only
fsAttrHidden	2	Hidden
fsAttrSystem	4	System file
fsAttrVolume	8	Volume label. If specified, all other attributes are ignored.
fsAttrDirectory	16	Directory or folder
fsAttrArchive	32	Logs

Return values

String. File name that matches pathname and attributes. Dir returns a zero-length string ("") if pathname is not found.

Remarks

Dir supports the use of multiple-character (*) and single-character (?) wildcards to specify multiple files. You must specify pathname the first time you call the Dir method. In addition, if you specify file attributes you must include pathname.
The Dir method returns the first file name that matches pathname. To get any additional file names that match pathname, call Dir again with no parameters. When no more file names

match, Dir returns a zero-length string (" "). Once a zero-length string is returned, you must specify pathname in subsequent calls.

EOF

Function

This property returns True when the end of a file opened for random or sequential input is reached.

Syntax

File.EOF

Parameters

File

Reference to a File control.

Remarks

Use the EOF property to avoid the error generated by attempting to read past the end of a file.

The EOF property returns False until the end of the file has been reached. For files opened with a fsModeRandom or fsModeBinary file mode, EOF returns False until the last executed Get statement is unable to read an entire record.

For files opened with a fsModeBinary file mode, an attempt to read through the file using the Input function until EOF returns True generates an error. Use the LOF and LOC properties instead of EOF when reading binary files with Input, or use Get when using the EOF property. For files opened with a fsModeOutput file mode, EOF always returns True.

FileCopy

Function

This method copies an existing file to a new file.

Syntax

Filesystem.FileCopy PathName, NewPathName

Parameters

Filesystem

Reference to a FileSystem object.

PathName

String that contains the path and file name.

NewPathName

String that contains the file name and path of the new file.

Return Values

None.

Remarks

FileCopy returns an error if the new file does not exist.

FileLen

Function

This method returns a value specifying the length, in bytes, of a file.

Syntax

Filesystem.FileLen(pathname)

Parameters

Filesystem

Reference to a FileSystem control.

Pathname

Required. String expression that specifies a file. The pathname can include a directory or folder.

Return Values

Returns the number of bytes in a file.

Remarks

If the specified file is open when the FileLen method is called, the value returned represents the size of the file immediately before it was opened.

FileDateTime

Function

This method returns a variant (Date) that indicates the date and time when a file was created or last modified.

Syntax

filesystem.FileDateTime(pathname)

Parameters

Filesystem

Reference to a FileSystem control.

Pathname

Required. String expression that specifies a file name. The pathname can include a directory or folder.

Return Values

Returns the date the file was last modified.

Remarks

FileDateTime returns an error if the new file does not exist.

Get

Function

This method reads data from an open disk file into a variable.

Syntax

file.Get Data, [Recnumber]

Parameters

File

Reference to a File control.

Data

Required. Variant variable into which data is read.

Recnumber

Optional. Variant. Record number at which reading begins. For files opened in binary mode, Recnumber specifies the byte position.

Return Values

None

Remarks

Data read with the Get method usually is written to a file with the Put method. The first record or byte in a file is at position 1, the second record or byte is at position 2, and so on. If you omit Recnumber, the next record or byte following the last Get or Put method (or pointed to by the last Seek function) is read.

For files opened in Random mode, the following rules apply:

- If the length of the data being read is less than the length specified in the Len clause of the Open method, Get reads subsequent records on record-length boundaries. The space between the end of one record and the beginning of the next record is padded with the existing contents of the file buffer. Because the amount of padding data cannot be determined with any certainty, it is generally advisable to match the record length with the length of the data being read.
- If Data is a Variant of numeric type, Get reads 2 bytes identifying the VarType of the Variant and then reads the data that goes into the variable. For example, when reading a Variant of VarType 3, Get reads 6 bytes: 2 bytes identifying the Variant as VarType 3 (Long) and 4 bytes containing the Long data. The record length specified by the Len clause in the Open method must be at least 2 bytes greater than the actual number of bytes required to store the variable.
- You can use the Get method to read a Variant array from a disk, but you cannot use Get to read a scalar Variant containing an array. You also cannot use Get to read objects from a disk.
- If the variable being read into is a Variant of VarType 8 (String), Get reads 2 bytes identifying the VarType and 2 bytes indicating the length of the string. Then it reads the string data. The record length specified by the Len clause in the Open method must be at least 4 bytes greater than the actual length of the string.
- If the variable being read into is a dynamic array, Get reads a descriptor whose length equals 2 plus 8 times the number of dimensions, that is, 2 + 8 * NumberOfDimensions. The record length specified by the Len clause in the Open method must be greater than or equal to the sum of all the bytes required to read the array data and the array descriptor.

For files opened in Binary mode, the Len clause in the Open method has no effect. Get reads all variables from a disk contiguously; that is, with no padding between records.

GetAttr

Function

This method returns a number representing the attributes of a file, directory, or folder.

Syntax

filesystem.GetAttr(pathname)

Parameters

File system

Reference to a FileSystem control.

Pathname

Required. String expression that specifies a file name or directory or a folder name. The pathname can include the directory or folder.

Return values

Sum of attribute values. The following table shows the sums that can be returned.

Constant	Value	Description
vbNormal	0	Normal
VbReadOnly	1	Read only
VbHidden	2	Hidden
VbSystem	4	System
VbDirectory	16	Directory or folder
VbArchive	32	File has changed since last backup

Remarks

To determine which attributes are set, use the And operator to perform a bitwise comparison of the value returned by the GetAttr method and the value of the individual file attribute you want. If the result is not zero, that attribute is set for the named file.

Input

Function

This method returns a string containing characters from a file opened in Input or Binary mode.

Syntax

file.Input(number)

Parameters

File

Reference to a File control.

Number

Any valid numeric expression that specifies the number of characters to return.

Return Values

String containing characters read from file.

Remarks

Data read with the Input method usually is written to a file with the LinePrint or Put functions. Use this method only with files opened in Input or Binary mode.

Unlike the LineInputString method, the Input method returns all the characters it reads, including commas, carriage returns, line feeds, quotation marks, and leading spaces.

With files opened for Binary access, an attempt to read through the file using the Input method until the EOF function returns True generates an error. To avoid an error, use the LOF and Loc functions instead of EOF when reading binary files with the Input method or use Get when using the EOF function.

InputFields

Function

This method reads data from an open sequential file and returns a single dimension Variant array.

Syntax

file.InputFields(number)

Parameters

File

Reference to a File control.

Number

Number of comma-delimited fields to read from the file.

Return values

Array containing the fields read from the file.

Remarks

Data read with the InputFields method usually is written to a file with WriteFields. Use this method only with files opened in Input or Binary mode.

InputFields reads standard string or numeric data without modification. The following table shows how InputFields reads other input data.

Data	Value Assigned to Variable
Delimiting comma or blank line	Empty
#ZERO#	Zero
#TRUE# or #FALSE#	True or False
#yyyy-mm-dd hh:mm:ss#	The date and/or time represented by the expression

Double quotation marks ("") within input data are discarded.
If you reach the end of the file while you are inputting a data item, the input is terminated and an error occurs.

To correctly read data from a file into variables using InputFields, use the WriteFields method instead of the LinePrint method to write the data to the files. Using WriteFields ensures each separate data field is properly delimited.

InputB

Function

This method returns bytes from a file opened in Input or Binary mode.

Syntax

file.InputB(number)

Parameters

File

Reference to a File control.

Number

Any valid numeric expression that specifies the number of bytes to return.

Return Values

Array containing bytes read from file.

Remarks

Data read with the InputB method usually is written to a file with the LinePrint or Put functions. Use this method only with files opened in Input or Binary mode.

Kill

Function

This method deletes files from a disk.

Syntax

filesystem.Kill pathname

Parameters

Filesystem

Reference to a FileSystem control.

Pathname

Required. String expression that specifies one or more file names to be deleted. The pathname can include the directory or folder.

Return Values

None.

Remarks

The Kill method supports the use of multiple-character (*) and single-character (?) wildcards to specify multiple files.
An error occurs if you try to use Kill to delete an open file.

LineInputString

Function

This method reads a single line from an open sequential file and assigns it to a string variable.

Syntax

file.LineInputString

Parameters

File

Reference to a File control.

Return Values

None.

Remarks

Data read with LineInputString usually is written from a file with LinePrint.
The LineInputString method reads from a file one character at a time until it encounters a carriage return (Chr(13)) or carriage return/line feed (Chr(13) + Chr(10)) sequence. Carriage return/line feed sequences are skipped rather than appended to the character string.

LinePrint

Function

This method writes a single line to an open sequential file.

Syntax

file.LinePrint output

Parameters

File

Reference to a File control.

Output

String expression to write to a file.

Return Values

None.

Remarks

Data written with LinePrint is usually read from a file with LineInputString.
A carriage return/line feed (Chr(13) + Chr(10)) sequence is appended to the end of the string.

Loc

Function

This property returns a number specifying the current read/write position.

Syntax

file.Loc

Parameters

File

Reference to a File control.

Remarks

For files opened with the fsModeRandom file mode, Loc returns the number of the last record read or written. For files opened with all other modes, Loc returns the position of the last byte read or written.

LOF

Function

This property returns a number representing the size, in bytes, of a file.

Syntax

file.LOF

Parameters

File

Reference to a File control.

Remarks

The LOF property can be used with the Loc property to guarantee that a read operation does not continue past the end of a file.

MkDir

Function

This method creates a new directory.

Syntax

filesystem.MkDir PathName

Parameters

Filesystem

Reference to a FileSystem control.

Pathname

String expression that contains the directory name.

Return Values

None.

Remarks

MkDir generates an error if the directory already exists.

MoveFile

Function

This method renames an existing file or a directory, including all its subdirectories.

Syntax

filesystem.MoveFile PathName, NewPathName

Parameters

Filesystem

Reference to a FileSystem control.

PathName

String that contains the file name.

NewPathName

String that contains the file name to copy to.

Return Values

None.

Open

Function

This method opens a file in either the Input (1), Output (2), Random (4), Append (8), or Binary mode (32).

Syntax

file.Open pathname, mode, [access], [lock], [reclength]

Parameters

File

Reference to a File control.

Pathname

String expression that specifies a file name.

Mode

Specifies the file mode: Input (1), Output (2), Random (4) , Append (8), or Binary (32).

Access

Operation permitted on the open file: Read, Write, or ReadWrite [Default]. (1, 2, 3)

Lock

Operations permitted on the open file by other processes: Shared, LockRead, LockWrite [Default], and LockReadWrite. (1, 2, 3, 0)

Reclength

Number, in bytes, that is less than 32,767. For files opened for random access, this value is the record length. For sequential files, this value is the number of characters buffered.

Return Values

None.

Remarks

The reclength parameter is ignored if the mode is Binary. When opening a file in Random mode, you must specifiy a record size of greater than zero or an error will occur.

Put

Function

This method writes data from a variable to a disk file.

Syntax

file.Put data, [recnumber]

Parameters

Data

Required. Variant variable that contains data to be written to disk.

Recnumber

Optional. Variant (Long). Record number (Random mode files) or byte number (Binary mode files) at which writing begins.

Return Values

None.

Remarks

Data written with Put usually is read from a file with Get.
The first record or byte in a file is at position 1, the second record or byte is at position 2, and so on. If you omit recnumber, the next record or byte after the last Get or Put method or pointed to by the last Seek function is written.

For files opened in Random mode, the following rules apply:

- If the length of the data being written is less than the length specified in the Len clause of the Open method, Put writes subsequent records on record-length boundaries. The space between the end of one record and the beginning of the next record is padded with the existing contents of the file buffer. Because the amount of padding data cannot be determined with any certainty, it generally is a good idea to have the record length match the length of the data being written. If the length of the data being written is greater than the length specified in the Len clause of the Open method, an error occurs.
- If the variable being written is a Variant of a numeric type, Put writes 2 bytes identifying the VarType of the Variant and then writes the variable. For example, when writing a Variant of VarType 3, Put writes 6 bytes: 2 bytes identifying the Variant as VarType 3 (Long) and 4 bytes containing the Long data. The record length specified by the Len clause in the Open method must be at least 2 bytes greater than the actual number of bytes required to store the variable.

You can use the Put method to write a Variant array to disk, but you cannot use Put to write a scalar Variant containing an array to disk. You also cannot use Put to write objects to disk. If the variable being written is a Variant of VarType 8 (String), Put writes 2 bytes identifying the VarType and 2 bytes indicating the length of the string. It then writes the string data. The record length specified by the Len clause in the Open method must be at least 4 bytes greater than the actual length of the string.

If the variable being written is a dynamic array, Put writes a descriptor whose length equals 2 plus 8 times the number of dimensions, that is, 2 + 8 * NumberOfDimensions. The record length specified by the Len clause in the Open method must be greater than or equal to the sum of all the bytes required to write the array data and the array descriptor. For example, the following array declaration requires 118 bytes when the array is written to disk.

For files opened in Binary mode, the Len clause in the Open method has no effect. Put writes all variables to disk contiguously; that is, with no padding between records.

RmDir

Function

This method deletes an existing empty directory.

Syntax

filesystem.RmDir PathName

Parameters

Filesystem

Reference to a FileSystem control.

PathName

String that contains the directory name.

Return Values

None.

Remarks

The directory must be empty before it can be removed. You must specify a complete file path.

Seek

Function

This property returns and sets the next position in a file that will be read or written.

Syntax

file.Seek [= position]

Parameters

File

Reference to a File control.

Position

Numeric expression that specifies a position within a file.

Remarks

The Seek property specifies the next file position, whereas the Loc property specifies the current position. Seek always will be one more than Loc, except when a file is first opened and Seek and Loc are both 1.

Negative Seek or 0 causes an error.

SetAttr

Function

This method sets attribute data for a file.

Syntax

filesystem.SetAttr pathname, attributes

Parameters

File system

Reference to a FileSystem control.

Pathname

Required. String expression that specifies a file name.

Attributes

Required. Numeric expression whose sum specifies file attributes. The following table shows the parameter settings of attributes.

Constant	Value	Description
vbNormal	0	Normal (default)
vbReadOnly	1	Read only
vbHidden	2	Hidden
VbSystem	4	System file
VbArchive	32	File has changed since last backup

Return values

None.

Remarks

A run-time error occurs if you try to set the attributes of an open file.

WriteFields

Function

This method writes data to a sequential file.

Syntax

file.WriteFields [data]

Parameters

File

Reference to a File control.

Data

Variant or Variant array of numeric or string expressions to write to a file.

Prinzip

Return Values

None.

Remarks

Data written with WriteFields is usually read from a file with InputFields.
If you omit d ata, a blank line is printed to the file.

- Numeric data is always written using the period as the decimal separator.
- For Boolean data, either #TRUE# or #FALSE# is printed. The True and False keywords are not translated, regardless of locale.
- Date data is written to the file using the universal date format. When either the date or the time component is missing or is zero, only the component provided gets written to the file.
- Nothing is written to the file if Data is Empty. However, for Null data, #NULL# is written.
- If d ata is Null, #NULL# is written to the file.

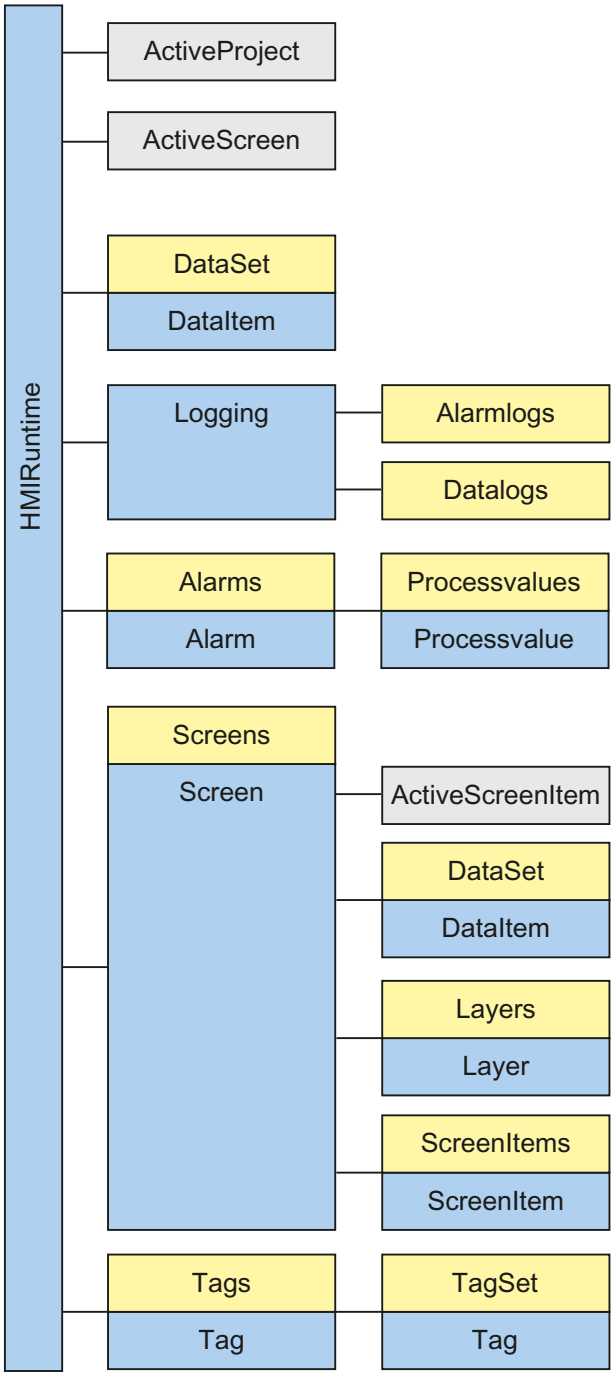
The WriteFields method inserts commas between items and quotation marks around strings as they are written to the file. You do not have to put explicit delimiters in the list. WriteFields inserts a newline character—that is, a carriage return/line feed (Chr(13) + Chr(10))—after it has written the final character in data to the file.

VBS object model

VBS object model

VBS object model in WinCC

The following screen shows the VBS object model in WinCC:



Use the WinCC object model of the graphic Runtime system to access objects and tags in Runtime.

Objects

Objects and lists are provided for access to all the objects in the graphic Runtime systems:

- Display and operating objects
- Screens
- Layers
- Tags

Properties

You can specifically change the display and operating elements and tags in Runtime via the properties of the individual objects. For example, you can enable a button with a click or trigger a color change by changing a tag value.

Methods

Methods which are applied to individual objects can be used to read out tag values for further processing or displaying alarms in Runtime.

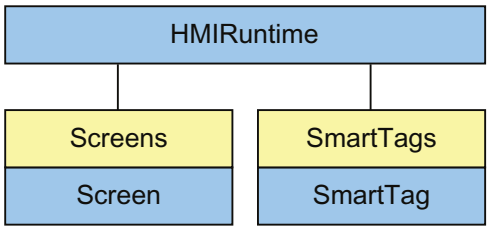
Objects

HMIRuntime

Description



Portrays the graphic runtime system.

The HMIRuntime object contains properties and methods which return the objects to the main layer, e.g. returns the ActiveScreen property of a screen object.

Application

You use the "HMIRuntime" object, e.g. as follows:

- Read or set the current Runtime language ("Language" property).
- Read name of current base screen or trigger a base screen change by setting a new screen name (property "BaseScreenName")
- Access tags (List "SmartTags")
- End runtime (Method "Stop")
- Output information on sequence tracing output (Method "Trace")
- Access the screens displayed during runtime (List "Screens")

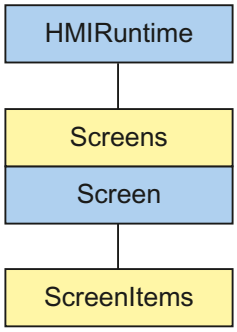
See also

ActiveScreen (Page 4152)

Screen (Page 3906)

Screen object (list)

Description



A list of screen objects.

The list contains the following two elements:

- The first element with the index 0 represents the permanent window.
- The second element with the index 1 represents the root screen.

Alternatively, the two elements can be addressed with their their names as follows:

- Permanent window: "Overview"
- Root screen: Name of the screen displayed in the root screen

If the named screen is not displayed, an error occurs during access.

Permanent window "Overview" is displayed in the objects list and in Auto complete.

Note

The alarm window and the alarm indicator are not contained in the screens list, even if they have the focus in Runtime.

Application

Use the screen property to return the screen list. In the following example, the background color is changed from black to green:

Use the object name as an index.

```
'VBS_Example_BackColor
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

Note

If you perform a screen change, the open references to the screen that is no longer available will become invalid. As a result, it is no longer possible to work with these references.

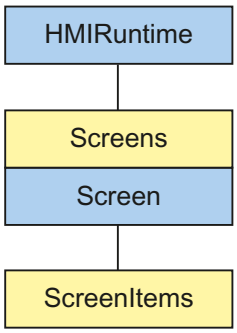
See also

Screen (Page 3906)

ScreenItems (Page 3909)

Screen

Description



Represents the process screen which is being displayed on the HMI device at the moment or the permanent window in runtime. The screen object is returned to you as a result of accessing the screen list.

The screen object also contains a list of all graphic objects in the screen that can be addressed through the list "ScreenItems".

Application

You can also use the screen object to do the following:

- Read the height and width of a screen (properties "Height" and "Width").
- Change the background color (property "BackColor").

Use the object name as an index.

In the following example, the background color is changed from black to green:

```
'VBS example background color
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

See also

ScreenItem (Page 3907)

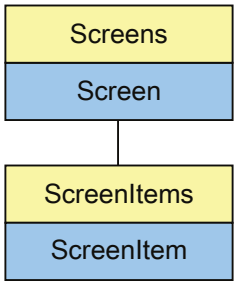
ScreenItems (Page 3909)

HMIRuntime (Page 3903)

Screen object (list) (Page 3904)

ScreenItem

Description



Represents an object in the specified screen. The ScreenItem object is an element of the ScreenItems list.

Application

You can use the ScreenItem object to access the properties of graphic objects within a screen, depending on certain events.

You use the "ScreenItem" object as follows, for example:

- "Visible" property
  Switch the visibility of an object on or off.
- "Height" and "Width" properties
  Query the width and height of an object.
- "Top" and "Left" properties
  Change the position of an object.
- "ObjectName" property
  Read the name of a graphic object
- "Parent" property
  Set a reference to the parent screen

Use the ScreenItems property to return an object to the screen. Use the object name as an index.

Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
'VBS_Example_ScreenItems

Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

Note

To save memory space in the HMI device, no object names are loaded during transfer of the project. If you still want to transfer object names, call up the Runtime settings for the respective HMI device in WinCC. You can change the setting under "General". The object name is required when the object should be accessed via the object name or for debugging a project.

The "ScreenItem" object has different properties depending on its features. The following properties are provided for every "ScreenItem" object:

- Enabled
- Height
- Left
- ObjectName
- Parent

- Top
- Type
- Visible
- Width

If a specific object type is addressed, further properties are added to the standard properties. The additional properties are provided in the descriptions of the individual object types.

See also

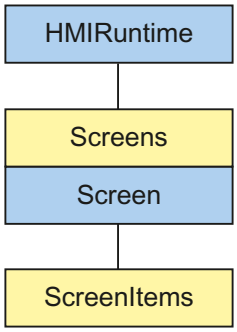
Screen (Page 3905)

Screen object (list) (Page 3904)

ScreenItems (Page 3909)

ScreenItems

Description



A list of screen item objects with all screen objects of the given process screen. The list has a parent property. This property provides a reference to the process screen in which the screen object is located.

Application

By means of the "ScreenItems" list you are able

- To edit or output all objects within the list (that is, all objects within a screen)
- To count the objects of a screen (property "Count").
- To work on a particular object in the list (method "Item").

Use the screen items property to return an object from the process screen. Use the object name as an index.

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

See also

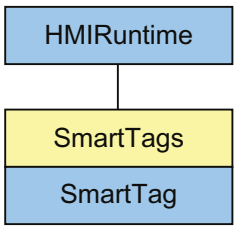
Screen (Page 3905)

HMIRuntime (Page 3903)

Screen object (list) (Page 3904)

SmartTags

Description



A list of SmartTag objects which represent all of the tags in WinCC Runtime.

Note

The SmartTags list has a limited range of functions. You can only use the tag names to access a SmartTag object. Access via the index or by using "For each" instruction is not supported.

Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

Application

Use the SmartTags list to return a SmartTag object. Use the tag name to reference the SmartTag object.

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

In Runtime Advanced and Panels you address the tag directly using its name. If the tag name corresponds to the VBS name conventions, you do not need to use the SmartTags list. Follow the example below:

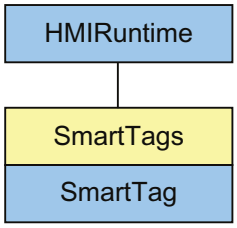
```
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(AirPressure)
HMIRuntime.Trace strAirPressure
```

See also

Access to HMI tags (Page 3552)

SmartTag

Description



Represents the value of the specified process tag. The SmartTag object is an element of the SmartTag list.

Application

The SmartTag object provides read and write access to the value of the specified process tag. The SmartTag object does not return an object reference. Use the SmartTags list to return the value of a process tag. Use the tag name as an index.

Example

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

Note

If you want to return the "TypeName" of a SmartTag object data type with the VBS function "TypeName", use the following syntax:

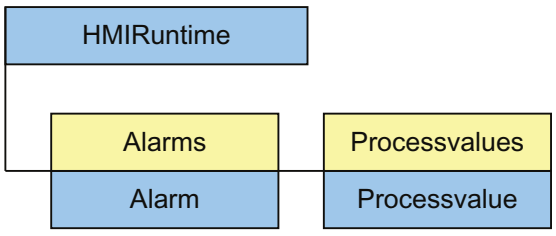
```
TypeName(SmartTags("FillLevel").value)
```

Use "SmartTags("<tag>")(index)" to access the value of an array element. Set the number of the desired array element for "index", for example, "SmartTags("AirPressure")(2)".

Objects

Alarm

Description



The alarm object is used to access the Alarms object list.

Note

The properties of the alarm object are not automatically updated when the values of the properties change.

See also

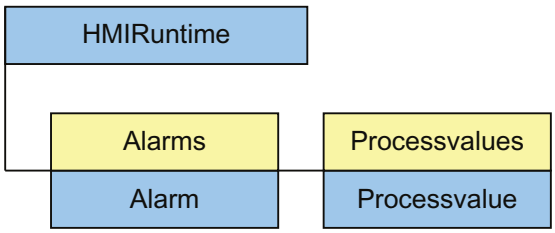
Alarms (list) (Page 3914)

HMIRuntime (Page 3923)

Processvalue (Page 4461)

Alarms (list)

Description



Use the alarm object to trigger existing messages.

Usage

Using the "Alarms" list you can:

- Access a message in the list (Item method)
- Create a new alarm object (Create method)
- Read the alarm ID of the message (AlarmID attribute)

- Read the status of a message (State property)
- Read the time stamp of the message (Timestamp property)
- Generate an instance of the alarm object (Instance property)
- Read the name of the computer on which the message came (ComputerName property)
- Read or set the name of the user who triggered the message (UserName property)
- Read or set the name of the process value blocks (ProcessValues property)
- Read or set the message commentary (Comment property)
- Read or set the message server prefix (Context property)

Example

In the following example the alarm with the alarm number "1" configured in the "HMI alarms" editor is activated.

```
'VBS360
Dim MyAlarm
Set MyAlarm = HMIRuntime.Alarms(1)
MyAlarm.State = 5 'hmiAlarmStateCome + hmiAlarmStateComment
MyAlarm.Comment = "MyComment"
MyAlarm.UserName = "Hans-Peter"
MyAlarm.ProcessValues(1) = "Process Value 1"
MyAlarm.ProcessValues(4) = "Process Value 4"
MyAlarm.Create "MyApplication"
```

See also

AlarmID (Page 4161)

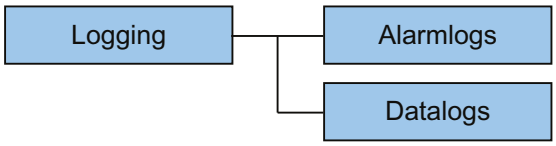
Processvalue (Page 4461)

Alarm (Page 3912)

HMIRuntime (Page 3923)

AlarmLogs (list)

Description



You can use the object to reconnect swapped-out log segments of the alarm log to Runtime or to remove previously swapped-in log segments of the alarm log. The log segments to be swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed.

If an error occurs during the operation with log segments, the applied method returns an error alarm.

Usage

- "Restore" method
  Previously swapped-out log segments of the alarm log are connected to Runtime.
- "Remove" method
  Previously swapped-in log segments of the alarm log are removed from the Runtime project.

Example

In the following example, log segments from the alarm log are swapped in and the return value is output as a trace.

```
'VBS187
```

```
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

See also

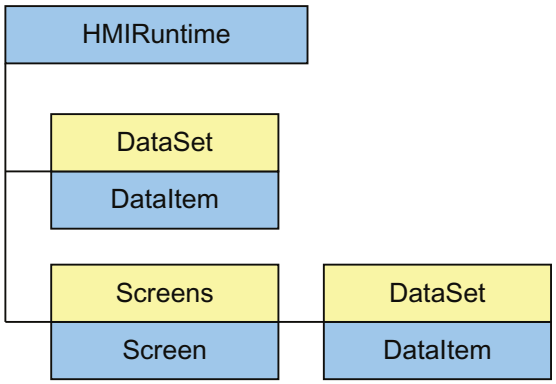
Remove (Page 4829)

DataLogs (list) (Page 3919)

Logging (Page 3928)

DataItem

Description



You can use the DataItem object to access the contents of the DataSet list. Values or object references are stored in the list as DataItem.

Access uses the name under which the value was added to the list. Single access using an index is not recommended since the index changes during adding or deleting of values. You can use the index to output the complete contents of the list. The output is in alphabetical order.

Note

For object references, ensure that the objects are capable of multi-threading.

Example

The example shows how the value of 'Motor1' is output as a trace.

```
'VBS163
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
```

The following example enumerates all DataItem objects of the DataSet list. Name and value are output as a trace.

```
'VBS164
Dim data
For Each data In HMIRuntime.DataSet
HMIRuntime.Trace data.Name & ": " & data.Value & vbNewLine
Next
```

Note

The value may not be output directly for objects.

DataSet (list) (Page 3920)

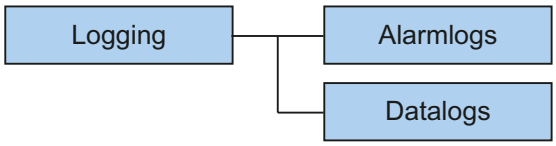
Value (Page 4691)

Name (Page 4417)

Screen object (list) (Page 3937)

DataLogs (list)

Description



You can use the object to reconnect swapped-out log segments of the data log to Runtime or to delete previously swapped-in log segments of the data log. The log segments to be swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed. You also set the type of log ("Fast data log", "Slow data log", "Fast data log and Slow data log").

If an error occurs during the operation with log segments, the applied method returns an error alarm.

Usage

- "Restore" method
  Previously swapped out log segments of the data log are connected to Runtime.
- "Remove" method
  Previously swapped-in log segments of the data log are removed from the Runtime project.

Example

In the following example, log segments from the Fast data log are swapped in and the return value is output as a trace.

```
'VBS188
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:
\Folder","2004-09-14","2004-09-20",-1,1) & vbNewLine
```

See also

Restore (Page 4834)

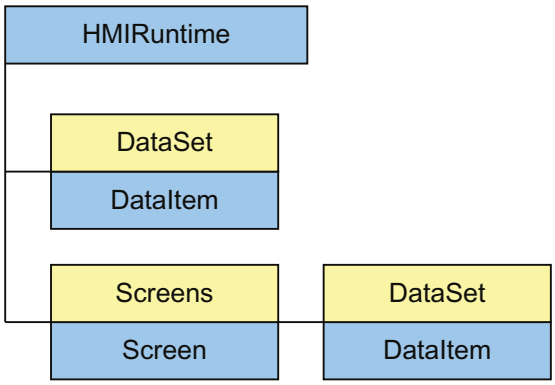
Remove (Page 4829)

AlarmLogs (list) (Page 3915)

Logging (Page 3928)

DataSet (list)

Description



Using the DataSet object, you can exchange data throughout several actions.

A DataSet object is global and defined by the screen object. You can can access the data from any VBS action.

You address the screen object according to the screen hierarchy . The DataSet object persists as long as the screen is displayed. The global object persists over the entire runtime time period.

Access uses the DataItem object.

Note

You cannot include objects with the types Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet in the DataSet list.

The DataSet object does not support any classes.

Usage

Use the "DataSet" list as follows:

- Enumeration
  Output or process all objects in the list
- "Count" property
  Output the number of elements contained
- "Item" method
  Work on a particular object in the list
- "Add" method
  Add an object to the list
- "Remove" method
  Remove a particular object from the list
- "RemoveAll" method
  Remove all objects from the list

Access to list elements is made as follows:

```
HMIRuntime.DataSet("Itemname")
```

For a picture-specific list, access is performed as follows:

```
HMIRuntime.Screens("Screenname").DataSet("Itemname")
```

You access the DataSet object of the screen as follows:

```
DataSet("Itemname")
```

If upon access the stated name does not exist in the list, VT_Empty is returned and an Exception is triggered.

Example

The example shows how a value can be entered in the list, read and removed from the list throughout various actions.

```
'VBS162
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet.Remove("motor1")
```

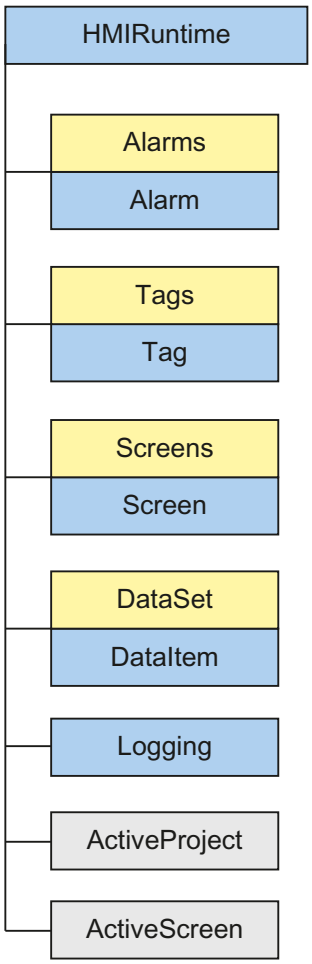
Screen object (list) (Page 3937)

HMIRuntime

Description



The HMIRuntime object represents the graphic Runtime environment.

Usage

You can use the "HMIRuntime" object as follows:

- "Language" property
  Read or set the current Runtime language
- "BaseScreenName" property
  Read or set the name of the current root screen
- "ActiveProject" property
  Read the path of the active Runtime project

- "Tags" property
  Accessing tags
- "DataSet" property
  Accessing tags in a list
- "Stop" method
  Stop Runtime
- "Trace" method
  Display messages in a diagnostics window

Example

The following command closes WinCC Runtime:

```
'VBS3
HMIRuntime.Stop
```

DataItem (Page 3916)

Screen (Page 3931)

Screen object (list) (Page 3937)

ActiveScreen (Page 4151)

Item

Description

The Item object provides a reference to the current object.

Usage

Use the Item object, for example, to address the properties of the object currently selected in the screen.

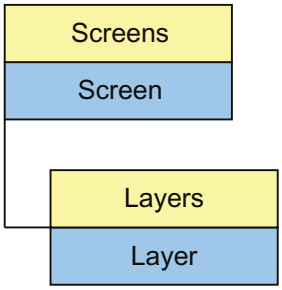
Example

In the following example, you set the background color of the object selected in the screen to red:

```
'VBS195
Item.BackColor = RGB(255,0,0)
```

Layer

Description



The Layer object returns the result of access to the layers list.

Parent object

Screen in which the screen layer is located

Usage

Depending on certain events, you can use the Layer object to obtain access to the properties of a complete layer to hide or display a layer with operating elements according to the operator authorization.

You can use the "Layer" object as follows:

- "Visible" property
  Activate or deactivate visibility of a layer
- "Name" property
  Read the name of a layer

Note

The layer property specifies the layer in which the object is located. The layer "0" is output as layer "0".

When accessed, the layers are counted up from 1 in VBS. Therefore, address level "1" with "Layers(2)".

Example

In the following example, Layer 1 is set to "invisible":

```
'VBS4
Layers(2).Visible = vbFalse
```

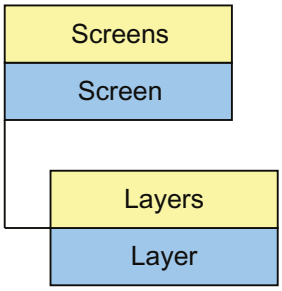
Screen object (list) (Page 3937)

Layers (list)

Description



Use the layers list to access all 32 layers of the graphical Runtime system.

Parent object

Screen in which the screen layer is located

Usage

You use the "Layers" list as follows:

- "_NewEnum" property
  Process all layers in the list
- "Count" property
  Count all layers contained in the list
- "Item" method
  Process a layer from the list

The properties represent default properties and methods of a list and are not described in detail in the WinCC documentation.

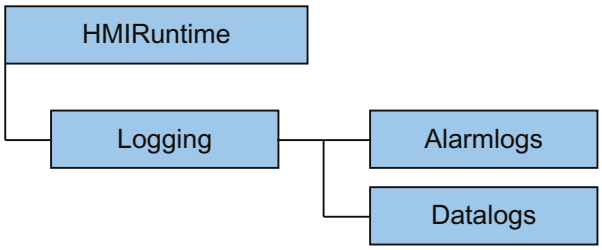
Logging

Description



You can use the object to reconnect swapped-out log segments to Runtime or to remove previously swapped-in log segments. The log segments to be swapped in are copied to the "Common logging" folder of the WinCC project. The previously swapped-in log segments are removed from the "Common logging" folder.

You use parameters to control the location from which log segments are to be swapped in. You specify the time period over which the log segments are to be swapped in or removed.

If an error occurs during the operation with log segments, the applied method returns an error alarm.

Usage

- "Restore" method
  Previously swapped out log segments of the alarm log and the data log are connected to Runtime.
- "Remove" method
  Previously swapped-in log segments of the alarm log and data log are removed from the Runtime project.

Example

In the following example, log segments from the alarm log and data log are swapped in and the return value is output as a trace.

```
'VBS189
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:
\Folder","2004-09-14","2004-09-20",-1) & vbNewLine
```

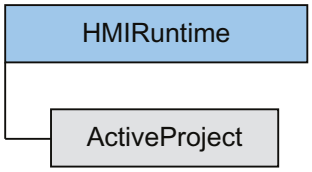
DataLogs (Page 4261)

AlarmLogs (Page 4162)

HMIRuntime (Page 3922)

Project

Description



Using the object, you can query information from the current Runtime project.

The project object is returned as the result of ActiveProject.

Usage

You can read the following using the "Project" object:

- The path of the current Runtime project ("Path" property)
- The name of the current Runtime project, without path or file extension ("Name" property)

Example

The following example returns name and path of the current Runtime project as a trace:

```
'VBS159
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

See also

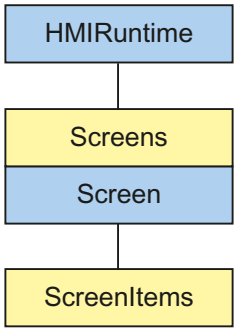
ActiveProject (Page 4151)

Name (Page 4417)

Path (Page 4447)

Screen

Description



Represents the screen which is being displayed on the HMI device at the moment or the permanent window in Runtime. The screen object is returned as a result of accessing the screen list.

The screen object also contains the following lists:

- You can address all the graphic objects in the addressed screen using the "ScreenItems" list.
- You can address all the layers in the addressed screen using the "Layers" object.

Application

You can use the screen object for the following actions, for example:

- "Width" and "Height" properties
  Reading the width and height of a screen
- "BackColor" property
  Changing the background color

Use the object name as an index.

Example

In the following example, the background color is changed from black to green:

```
'VBS_Example_BackColor
```

```
HMIRuntime.Screens("Rootscreen").BackColor = vbGreen
```

Parent object

Screen window in which the screen object is embedded.

If the screen object is the root screen, the parent object is not defined and set to zero.

Note

If you perform a screen change, the open references to screens that are no longer available will become invalid. As a result, it is no longer possible to work with these references.

Example

In the following example, the width of the first screen is increased by 20 pixels in Runtime:

```
'VBS7
Dim objScreen
Set objScreen = HMIRuntime.Screens(1)
MsgBox "Screen width before changing: " & objScreen.Width
objScreen.Width = objScreen.Width + 20
MsgBox "Screen width after changing: " & objScreen.Width
```

Notes on Cross References

All the screens you address with the standard formulation are automatically compiled by the CrossReference of WinCC and then listed in the screen properties.

```
HMIRuntime.BaseScreenName = "Screenname"
```

If you call screens with different formulations in the code, you make them known by the following section of the CrossReference:

```
' ' WINCC:SCREENNAME_SECTION_START
Const ScreenNameInAction = "ScreenName"
' WINCC:SCREENNAME_SECTION_END
The section can be inserted in VBS actions as often as required.
```

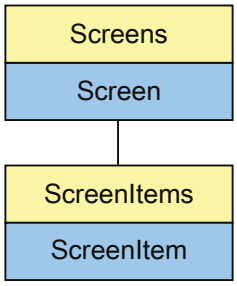
AccessPath (Page 4149)
HMIRuntime (Page 3922)
ScreenItems (list) (Page 3935)
Screen object (list) (Page 3937)

ScreenItem

Description



Represents an object in the specified screen. The ScreenItem object is an element of the ScreenItems list.

Application

You can use the ScreenItem object to access the properties of graphic objects within a screen, depending on certain events.

You use the "ScreenItem" object as follows, for example:

- "Visible" property
  Switch the visibility of an object on or off.
- "Height" and "Width" properties
  Query the width and height of an object.
- "Top" and "Left" properties
  Change the position of an object.
- "ObjectName" property
  Read the name of a graphic object
- "Parent" property
  Set a reference to the parent screen

Use the ScreenItems property to return an object to the screen. Use the object name as an index.

Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
'VBS_Example_ScreenItems

Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

Note

To save memory space in the HMI device, no object names are loaded during transfer of the project. If you still want to transfer object names, call up the Runtime settings for the respective HMI device in WinCC. You can change the setting under "General". The object name is required when the object should be accessed via the object name or for debugging a project.

The "ScreenItem" object has different properties depending on its features. The following properties are provided for every "ScreenItem" object:

- Enabled
- Height
- Left
- ObjectName
- Parent

- Top
- Type
- Visible
- Width

If a specific object type is addressed, further properties are added to the standard properties. The additional properties are provided in the descriptions of the individual object types.

Activate (Page 4744)

Layer (Page 4355)

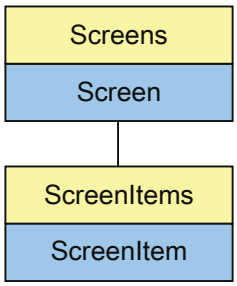
Screen (Page 3930)

ScreenItems (list) (Page 3935)

Screen object (list) (Page 3937)

ScreenItems (list)

Description



A list of ScreenItem objects with all screen objects of the specified screen. The list has a "Parent" property. This "Parent" property provides a reference to the screen in which the screen object is located.

Usage

You use the "ScreenItems" list as follows:

- To edit or output all objects within the list (that is, all objects within a screen)
- "Count" property
  Count the objects of a screen
- "Item" method
  Work on a particular object in the list

Use the screen items property to return an object from the screen. Use the object name as an index.

Example

In the following example, the background color of the "RootScreen" circle in the "myCircle" screen is set to green.

```
Dim objCircle
Set objCircle = HMIRuntime.Screens("RootScreen").ScreenItems("myCircle")
objCircle.BackColor = vbGreen
```

Peculiarities of the ScreenItem object

If you embed an external control (ActiveX control or OLE object) in WinCC, the properties of the embedded control may have the same names as the general properties of the ScreenItem object. In this case, the ScreenItem properties take priority.

You can address the properties of the embedded controls, however, via the "object" property. The "object" property is only available in ActiveX controls and OLE objects.

Example:

```
'Control1 is an embedded ActiveX-Control with property "type"
'VBS196
Dim Control
Set Control=ScreenItems("Control1")
Control.object.type

'Control1 is a WinCC-Control
'VBS197
Dim Control
Set Control=ScreenItems("Control1")
Control.type
```

Example

In the following example, you output the name of the objects in the current screen in a message box:

```
Sub OnClick(ByVal Item)
'VBS6
Dim lngAnswer
Dim lngIndex
lngIndex = 1
For lngIndex = 1 To ScreenItems.Count
lngAnswer = MsgBox(ScreenItems(lngIndex).Objectname, vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
End Sub
```

See also

Item (Page 4810)

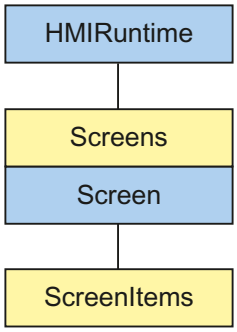
ScreenItem (Page 3932)

Screen (Page 3930)

Screen object (list) (Page 3937)

Screen object (list)

Description



Several screens can be opened simultaeously in WinCC Runtime by means of the screen window technique, whereby there is only one main screen. The "Screens" list allows access to all open screens in Runtime using the screen name. The screen list contains all hidden screens.

The access key required in the VBS environment in the HMIRuntime.Screens(<access key>) instruction must conform to the following syntax description:

```
[<Root screen name>.]<Screen window name>[:<Screen name>] ...
.<Screen window name>[:<Screen name>]
```

- The access key represents the screen hierarchy.
- You can omit the screen name at all locations in the key.
- The "AccessPath" property of the "Screen" object corresponds to the full access key.
- The root screen can be addressed via the "" access key.

Examples

The screens are addressed by specifying the hierarchy in the list. You can address the screens with or without using the screen names. In the following example, a "BaseScreenName" root screen is configured with a "ScreenWindow". The screen window contains a "ScreenName" screen.

Addressing using the screen name

```
'VBS8
Set objScreen = HMIRuntime.Screens("BaseScreenName.ScreenWindow:ScreenName")
```

Addressing without using the screen name

```
'VBS9
Set objScreen = HMIRuntime.Screens("ScreenWindow")
```

Referencing the root screen in various ways

```
'VBS10
Set objScreen = HMIRuntime.Screens(1)

'VBS11
Set objScreen = HMIRuntime.Screens("")

'VBS12
Set objScreen = HMIRuntime.Screens("BaseScreenName")
```

See also

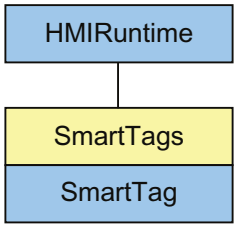
HMIRuntime (Page 3922)

Screen (Page 3930)

ScreenItem (Page 3932)

SmartTag

Description



Represents the value of the specified process tag. The SmartTag object is an element of the SmartTag list.

Application

The SmartTag object provides read and write access to the value of the specified process tag. The SmartTag object does not return an object reference. Use the SmartTags list to return the value of a process tag. Use the tag name as an index.

Example

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

Note

If you want to return the "TypeName" of a SmartTag object data type with the VBS function "TypeName", use the following syntax:

```
TypeName(SmartTags("FillLevel").value)
```

Use "SmartTags("<tag>")(index)" to access the value of an array element. Set the number of the desired array element for "index", for example, "SmartTags("AirPressure")(2)".

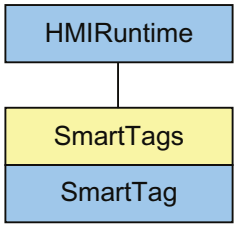
See also

HMIRuntime (Page 3922)

SmartTags (Page 3941)

SmartTags

Description



A list of SmartTag objects which represent all of the tags in WinCC Runtime.

Note

The SmartTags list has a limited range of functions. You can only use the tag names to access a SmartTag object. Access via the index or by using "For each" instruction is not supported.

Note

In order to access a tag, which has still not been created in the project, using the SmartTags list, no value is returned. Assignment to a non-existing tag is not executed:

```
Dim intVar
intVar = SmartTags("FillLevel")
```

"intVar" remains empty when the "FillLevel" tag has not been created.

Application

Use the SmartTags list to return a SmartTag object. Use the tag name to reference the SmartTag object.

```
'VBS_Example_SmartTags
'Writes tag value to local tag and returns a user-defined text through the
operating system channel for debug alarms.
```

```
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(SmartTags("AirPressure"))
HMIRuntime.Trace strAirPressure
```

In Runtime Advanced and Panels you address the tag directly using its name. If the tag name corresponds to the VBS name conventions, you do not need to use the SmartTags list. Follow the example below:

```
Dim strAirPressure
strAirPressure = "Current air pressure: " + CStr(AirPressure)
HMIRuntime.Trace strAirPressure
```

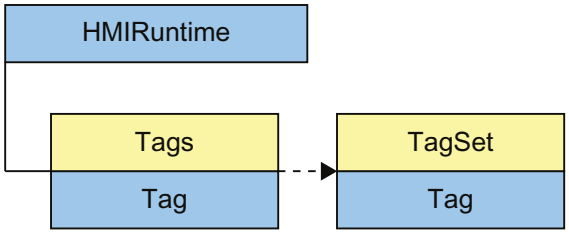
See also

HMIRuntime (Page 3922)

SmartTag (Page 3938)

Tag

Description



A tag object is returned via the "Tags" list. A tag object can be used to address all the properties and methods of a tag.

When creating a tag object, all the properties are initialized with the following values:

- Value = VT_EMPTY
- Name = Tag name

- QualityCode = BAD NON-SPECIFIC
- TimeStamp = 0
- LastError = 0
- ErrorDescription = " "

Note

A summary of possible Quality Codes can be found in WinCC Information System under key word "Communication" > "Diagnostics" or "Communication" > "Quality Codes".

Usage

Use the "Tag" object as follows:

- "Name", "QualityCode", "TimeStamp", "LastError" and "ErrorDescription" properties
  Read information on the tag
- "Write" method, "Value" property
  Set a value for a tag
- "Read" method, "Value" property
  Read a value for a tag

Example

The following example reads the value in the "Tag1" tag:

```
'VBS13
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read()
MsgBox objTag.Value
```

Declaration of tags in WinCC

Always define internal tags in VB script using the "Dim" instruction in order to prevent writing tags wrongly.

When creating a new action, the "Option explicit" instruction is automatically entered in the declaration area and cannot be deleted.

Do not use the "Option explicit" statement in your code as it can lead to Runtime errors.

Example

The following example reads the declaration value in the "lngVar" VB Script tag:

```
'VBS14
```

```
Dim lngVar
lngVar = 5
MsgBox lngVar
```

Note

Tag names must not contain any special characters.

When creating a tag, ensure it does not contain a value (Value = VT_EMPTY). Initialize the tags after declaration with the corresponding value.

Notes on Cross References

All the pictures which are addressed with the standard formulation

```
HMIRuntime.Tags("Tagname")
```

are automatically compiled by the CrossReference of WinCC and then listed in the picture properties.

If you address tags with different formulations in the code, you can make them known by the following section of the CrossReference:

```
' ' WINCC:TAGNAME_SECTION_START
Const TagNameInAction = "TagName"
' WINCC:TAGNAME_SECTION_END
```

The section can be inserted in VBS actions as often as required.

Note

Composed tag names may not be recognized by the CrossReference.

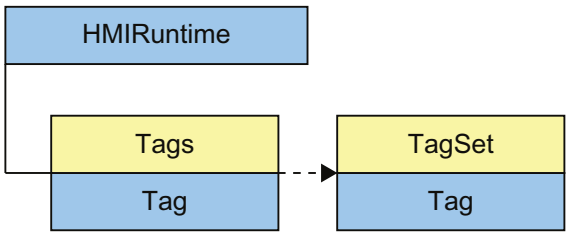
Timestamp (Page 4605)
HMIRuntime (Page 3922)
Tags (list) (Page 3945)
TagSet (list) (Page 3946)

Tags (list)

Description



The "Tags" list enables access to tags in WinCC Runtime. The result of access to the "Tags" list is returned by an object of the type "Tag". The Tag object can be used to access all the tag properties and methods.

Note

"Tags" is a list with a restricted functional scope. The tags in the list cannot be accessed via the index but only by using the tag names. The standard methods get_Count and get_NewEnum cannot be used in the Tags list.

Application

Tags in the list are accessed via:

```
HMIRuntime.Tags("Tagname")
```

The Tags list is used to declare tags (tag objects) for read and write access. The appropriate HMI tags must exist in order for the write and read acccess to be executed without error.

You can address HMI tags directly in VBScript and set and read values. If you wish to inquire about additional tag properties, such as quality code or time stamp, or wish to execute error processing, you must address the tag through tags list. The tag object returned enables access to all tag properties and methods.

Using the "CreateTagSet" method, you may generate a TagSet object which allows simultaneous access to several tags.

Example

You use tag names when you set tags.

```
'VBS16
Dim objTag
Set objTag = HMIRuntime.Tags("Tagname")
If you only use the tag name, the "TagPrefix" property is assigned the values from the
current context (the current screen window).
```

Tag (Page 3941)

TagSet (list) (Page 3946)

TagSet (list)

Description

The "TagSet" object enables simultaneous access to several tags in one call. Simultaneous access demonstrates better performance and lower communication load than single access to multiple tags.

Usage

You can use the TagSet object as follows:

- "Add" method
  Add tags to the list
- "Item" method
  Access tag objects contained in the list and their properties
- "Write" method
  Write all tags of the list
- "Read" method
  Read all tags of the list
- "Remove" method
  Remove single tags from the list
- "RemoveAll" method
  Remove all tags from the list

Tags in the list are accessed via:

```
'VBS169
Dim myTags
myTags = HMIRuntime.Tags.CreateTagSet
myTags("Tagname")
```

In order to have error-free read/write access to tags (tag objects) of the list, the respective tags must exist in WinCC.

If a read/write access error has occurred, the method used will return an error message using the "LastError" and "ErrorDescription" properties.

Example

The following example shows how to generate a TagSet object, how to add tags, and how to write values.

```
'VBS168
'Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
'Add Tags to the Collection
group.Add "Motor1"
group.Add "Motor2"
'Set the Values of the Tags
group("Motor1").Value = 3
group("Motor2").Value = 9
'Write the Values to the DataManager
group.Write
```

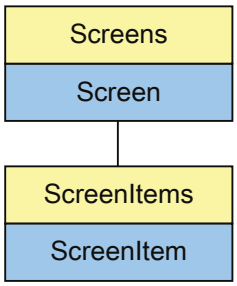
Object types

Objects A-I

AlarmControl

Description



Represents the "Alarm view" object. The AlarmControl object is an element of the ScreenItems list.

Type identifier in VBS

HMIAlarmControl

Example

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS54
Dim objControl
```

```
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 10
```

Table 10-19 Properties

Properties	Read	Write	Description
Activate (Page 4149)	P	P	Specifies whether the data to be visualized is requested by the alarm server.
AlarmListType	P	P	Specifies the alarm classes to be reported in runtime.
AllServer	P	P	Sets the display of the alarms of all available servers.
ApplyProjectSettings (Page 4172)	P	P	Specifies whether the project settings from the "HMI alarms" editor are applied.
ApplyProjectSettingsForDesignMode	P	P	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 4177)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 4177)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.
AutoSelectionColors (Page 4178)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 4179)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
Blocks	P	P	Sets the alarm blocks.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
Caption (Page 4221)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 4225)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 4226)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 4227)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 4227)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 4228)	P	P	Specifies the top margin of the table cells.
Closeable (Page 4236)	P	P	Specifies that the control can be closed in runtime.
ColumnResize (Page 4242)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 4244)	P	P	Specifies the scroll bar type.

Properties	Read	Write	Description
ColumnTitleAlignment (Page 4244)	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 4245)	P	P	Specifies whether the column title is displayed.
ControlDesignMode (Page 4538)	P	P	Specifies the design.
DefaultMsgFilterSQL	P	P	Specifies an SQL statement as default for alarm filters.
DefaultSort	P	P	Specifies the sorting order.
DefaultSort2	P	P	Specifies the sorting order.
DefaultSort2Column	P	P	Specifies the sorting order.
DisplayOptions (Page 4268)	P	P	Specifies the alarms to be displayed.
DoubleClickAction (Page 4269)	P	P	Specifies the action to be executed in runtime by double-clicking an alarm row.
ExportDirectoryChangeable (Page 4286)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4286)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4287)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4288)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4288)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4289)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 4289)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4290)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4290)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 4291)	P	P	Specifies whether the data export dialog is shown in runtime.
Filters	P	P	Specifies database criteria in SQL syntax.
Font (Page 4311)	P	P	Specifies or returns the font.
GridLineColor (Page 4325)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 4326)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HitlistColumnAdd (Page 4332) *	P	P	Transfers the selected alarm block from the list of available alarm blocks to the list of selected alarm blocks.
HitlistColumnCount (Page 4333) *	P	P	Sets the number of selected alarm blocks to be displayed in the hitlist in runtime.
HitlistColumnIndex (Page 4333)	P	P	References an alarm block that is selected for the hitlist.
HitlistColumnName (Page 4334) *	P	P	Displays the name of the alarm block of the hitlist that is referenced by means of the "HitlistColumnIndex" attribute.
HitlistColumnRemove (Page 4334) *	P	P	Cuts the marked alarm block from the list of selected alarm blocks and pastes it into the list of existing alarm blocks.
HitlistColumnRepos (Page 4334) *	P	P	Changes the sorting order of the alarm blocks. The "Up" and "Down" commands move the selected alarm block accordingly in the list.

Properties	Read	Write	Description
HitlistColumnSort (Page 4335) *	P	P	Specifies the sorting order in the hitlist for the alarm block that is referenced in "MessageColumnIndex".
HitlistColumnSortIndex (Page 4335) *	P	P	Specifies the sorting order in the hitlist for the alarm block that is referenced in "HitlistColumnIndex".
HitlistColumnVisible (Page 4336) *	P	P	The list displays the selected alarm blocks from the alarm list or hitlist that are to be used in the control in runtime.
HitListDefaultSort (Page 4336)	P	P	Sets the default sorting order in the table columns of the hitlist.
HitListMaxSourceItems (Page 4337)	P	P	Sets the maximum number of data records from the alarm log that are to be used to create the hit list.
HitListMaxSourceItemsWarn (Page 4337)	P	P	Sets the output of a warning on reaching the maximum number of data records that was specified in "HitlistMaxSourceItems".
HitListRelTime (Page 4339)	P	P	Sets a time range for the statistics.
HitListRelTimeFactor	P	P	Sets the time factor that is used in combination with the "HitlistRelativeTimeFactorType" to calculate the period for creating the hitlist statistics.
HitListRelTimeFactorType	P	P	Sets the time type that is used in combination with the "HitlistRelativeTimeFactor" to calculate the period for creating the hitlist statistics.
HorizontalGridLines (Page 4341)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 4344)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 4355)	P	P	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4379)	P	P	Sets the color of the window separation lines.
LineWidth (Page 4381)	P	P	Specifies the line thickness of the selected object.
LongTermArchiveConsistency (Page 4387)	P	P	If "LongTimeArchiveConsistency" is set to "No", 1000 alarms will be displayed in the historical alarm list (long-term) on the single station, on the server, or on the client for each server or redundant server pair.
MessageBlockAlign (Page 4397) *	P	P	Sets the mode of alignment for the table contents of the selected alarm block.
MessageBlockAutoPrecisions (Page 4397) *	P	P	Enables automatic setting of the number of decimal places.
MessageBlockCaption (Page 4398) *	P	P	Specifies the caption of the column header in the alarm view for the selected alarm block.
MessageBlockCount (Page 4398)	P	P	Specifies the number of alarm blocks that are available for the alarm list and hitlist.
MessageBlockDateFormat (Page 4399) *	P	P	Specifies the date format for displaying the alarms.
MessageBlockExponentialFormat (Page 4399) *	P	P	Specifies the exponential notation for visualization of the values of a selected alarm block.
MessageBlockFlashOn (Page 4400) *	P	P	Enables flashing of the selected alarm block in runtime when an alarm appears.
MessageBlockHideText (Page 4400) *	P	P	Enables the textual display of the content of the selected alarm block.
MessageBlockHideTitleText (Page 4401) *	P	P	Specifies textual display of the caption of the selected alarm block.
MessageBlockId (Page 4401)	P	P	Specified assignment of ID number and alarm block in the alarm view.

Properties	Read	Write	Description
MessageBlockIndex (Page 4402)	P	P	References an existing alarm block.
MessageBlockLeadingZeros (Page 4402) *	P	P	Enables the display of the selected alarm block with leading zeroes.
MessageBlockLength (Page 4403) *	P	P	Specifies the length of the selected alarm block based on the number of characters.
MessageBlockName (Page 4403)	P	P	Displays the name of the selected alarm block.
MessageBlockPrecision (Page 4404) *	P	P	Specifies the number of decimal places for the values of the selected alarm block.
MessageBlockSelected (Page 4404) *	P	P	Existing alarm blocks are blocks that are available for use in the control in runtime for the alarm list or hitlist.
MessageBlockShowDate (Page 4405) *	P	P	Specifies whether to display both the date and time in the "Time" alarm block.
MessageBlockShowIcon (Page 4405) *	P	P	Enables the display of the content of the selected alarm block as icon.
MessageBlockShowTitleIcon (Page 4406) *	P	P	Specifies textual display of the caption of the selected alarm block.
MessageBlockTextId (Page 4406)	P	P	Specifies naming of the selected alarm block by means of a text ID that was taken from the text library.
MessageBlockTimeFormat (Page 4407) *	P	P	Specifies the format for the time or period used to display the alarms.
MessageColumnAdd (Page 4408) *	P	P	Adds the selected alarm block from the list of available alarm blocks to the list of selected alarm blocks.
MessageColumnCount (Page 4409) *	P	P	Specifies the number of alarm blocks to be displayed in the alarm list in runtime.
MessageColumnIndex (Page 4409)	P	P	References an alarm block selected for the alarm list.
MessageColumnName (Page 4410) *	P	P	Shows the name of the alarm block from the alarm list, which is referenced by means of the "MessageColumnIndex" property.
MessageColumnRemove (Page 4410) *	P	P	Cuts the marked alarm block from the list of selected alarm blocks and pastes it into the list of existing alarm blocks.
MessageColumnRepos (Page 4411) *	P	P	Changes the sorting order of the alarm blocks. The "Up" and "Down" commands move the selected alarm block accordingly in the list.
MessageColumnSort (Page 4411) *	P	P	Specifies the sorting order for the alarm block that is referenced in "MessageColumnIndex" .
MessageColumnSortIndex (Page 4412) *	P	P	Specifies the sorting order for the alarm block that is referenced in "MessageColumnIndex".
MessageColumnVisible (Page 4412) *	P	P	The list shows the selected alarm blocks of the alarm list or hitlist that are are used in the alarm view in runtime.
Moveable (Page 4416)	P	P	Specifies whether the window can be moved in runtime.
MsgFilterSQL (Page 4417)	P	P	Specifies one or several SQL statements for user-defined selection of the alarms.
Name (Page 4417)	P	P	Returns the object name as STRING.
OperatorAlarms	P	P	Specifies the operator message settings.
OperatorMessageId (Page 4430) *	P	P	Default assignment of the ID number and trigger event in the alarm view.
OperatorMessageIndex (Page 4430) *	P	P	References the operator message event.

Properties	Read	Write	Description
OperatorMessageName (Page 4431) *	P	P	On alarm events, this displays the name that is referenced by means of "OperatorMessageIndex" for operator alarms.
OperatorMessageNumber (Page 4432) *	P	P	Specify an alarm number for the operator message of the selected alarm event if you do not use the operator message of WinCC.
OperatorMessageSelected (Page 4432) *	P	P	Activate the alarm events of the list that trigger operator messages.
OperatorMessageSource1 (Page 4432) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 1" of the operator message configured in Source.
OperatorMessageSource10 (Page 4437) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 10" of the operator message configured in Source.
OperatorMessageSource2 (Page 4433) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 2" of the operator message configured in Source.
OperatorMessageSource3 (Page 4433) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 3" of the operator message configured in Source.
OperatorMessageSource4 (Page 4434) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 4" of the operator message configured in Source.
OperatorMessageSource5 (Page 4434) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 5" of the operator message configured in Source.
OperatorMessageSource6 (Page 4435) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 6" of the operator message configured in Source.
OperatorMessageSource7 (Page 4435) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 7" of the operator message configured in Source.
OperatorMessageSource8 (Page 4436) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 8" of the operator message configured in Source.
OperatorMessageSource9 (Page 4436) *	P	P	Specify the alarm block of the operated alarm to be added to "Process value block 9" of the operator message configured in Source.
OperatorMessageSourceType1 (Page 4437) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType10 (Page 4442) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType2 (Page 4438) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType3 (Page 4438) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType4 (Page 4439) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType5 (Page 4439) *	P	P	Specifies the format of the source content to be transferred.

Properties	Read	Write	Description
OperatorMessageSourceType6 (Page 4440) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType7 (Page 4440) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType8 (Page 4441) *	P	P	Specifies the format of the source content to be transferred.
OperatorMessageSourceType9 (Page 4441) *	P	P	Specifies the format of the source content to be transferred.
PageMode (Page 4444)	P	P	Sets the page orientation (portrait / landscape).
PageModeMessageNumber (Page 4444)	P	P	Defines the number of alarm shown per page when paging the historical alarm list (long-term).
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 4475)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 4477)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistenceAuthorization	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4478)	-	-	Specifies how online configurations of WinCC are retained.
SelectedCellColor (Page 4493)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 4494)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 4495)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 4495)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 4496)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 4497)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 4499)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 4502)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 4503)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 4504)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 4504)	P	P	Specifies the number of lines you can mark.
ServerNames (Page 4508)	P	P	Specifies the servers of a distributed system that form the data source for the alarm view.
ShowSortButton (Page 4528)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 4529)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 4530)	P	P	Specifies whether the sorting icon is displayed.
ShowTitle (Page 4534)	P	P	Specifies the representation of the control's window title.
Sizeable (Page 4538)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 4542)	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 4547)	P	P	Specifies the background color of the status bar.

Properties	Read	Write	Description
StatusbarElementAdd (Page 4547) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4548) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4548) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4549) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4549) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 4550)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 4550) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4551) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4551) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4552)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4552) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 4553) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined element.
StatusbarElementVisible (Page 4554) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 4554) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4554)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4557)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4558)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 4558)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4559)	P	P	Specifies whether the status bar of the control is displayed.
TableColor	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2	P	P	Specifies the background color of "Row color 2".
TableForeColor	P	P	Specifies the font color of "Row color".
TableForeColor2	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 4584)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.

Properties	Read	Write	Description
TitleDarkShadowColor	P	P	Specifies the color of the dark side of shading.
TitleForeColor	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor	P	P	Specifies the color of the bright side of shading.
TitleSort	P	P	Specifies how sorting by column title is triggered.
TitleStyle	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment	P	P	Specifies or returns the position of the toolbar.
ToolbarBackColor	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex	P	P	References a button function.
ToolbarButtonLocked *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName *	P	P	Shows the name of the selected button function.
ToolbarButtonPasswordLevel *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove *	P	P	Removes the selected button function from the list.
ToolbarButtonRename *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
UseMessageColor (Page 4680)	P	P	Specifies whether scrolling is enabled.
UseSelectedTitleColor (Page 4682)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 4684)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 4702)	P	P	Specifies whether vertical separation lines are displayed.

Properties	Read	Write	Description
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-20 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 4750)	P, A	Executes the "Connect backup" button function of the control.
CopyRows (Page 4751)	P	Executes the "Copy rows" button function of the control.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 4756)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 4757)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetHistlistColumnCollection (Page 4760)	P	Returns the list of all column objects of the alarm view hitlist as "ICCAxCollection" type.
GetHitlistColumn (Page 4761)	P	Returns the column object of the alarm view hitlist designated by name or index as "ICCAxMessageColumn" type.
GetMessageBlock (Page 4762)	P	Returns the alarm block object of the alarm view designated by name or index as "ICCAxMessageBlock" type.
GetMessageBlockCollection (Page 4763)	P	Returns the list of all alarm block objects of the alarm view as "ICCAxCollection" type.
GetMessageColumn (Page 4765)	P	Returns the column object of the alarm view designated by name or index as "ICCAxMessageColumn" type.
GetOperatorMessage (Page 4766)	P	Returns the operator message object of the alarm view designated by name or index as "ICCAxOperatorMessage" type.
GetMessageColumnCollection (Page 4767)	P	Returns the list of all column objects of the message view as "ICCAxCollection" type.
GetOperatorMessageCollection (Page 4768)	P	Returns the list of all operator message objects of the alarm view as "ICCAxCollection" type.
GetRow (Page 4769)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 4770)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 4777)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 4778)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusbarElement (Page 4784)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 4785)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolbarButton (Page 4792)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.

Methods	Valid	Description
GetToolbarButtonCollection (Page 4793)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
HideAlarm (Page 4809)	P	Executes the "Hide alarm" button function of the alarm view.
LockAlarm (Page 4812)	P	Executes the "Disable alarm" button function of the alarm view.
LoopInAlarm (Page 4812)	P	Executes the "Loop in alarm" button function of the alarm view.
MoveToFirstLine (Page 4814)	P	Executes the "First alarm" button function of the alarm view.
MoveToFirstPage (Page 4814)	P	Executes the "First page" button function of the alarm view.
MoveToLastLine (Page 4815)	P	Executes the "Last alarm" button function of the alarm view.
MoveToLastPage (Page 4816)	P	Executes the "Last page" button function of the alarm view.
MoveToNextLine (Page 4817)	P	Executes the "Next alarm" button function of the alarm view.
MoveToNextPage (Page 4817)	P	Executes the "Next page" button function of the alarm view.
MoveToPreviousLine (Page 4818)	P	Executes the "Previous alarm" button function of the alarm view.
MoveToPreviousPage (Page 4819)	P	Executes the "Previous page" button function of the alarm view.
Print (Page 4822)	P, A	Executes the "Print" button function of the control.
QuitHorn (Page 4823)	P	Executes the "Acknowledge central alarm generator" button function of the alarm view.
QuitSelected (Page 4823)	P	Executes the "Single acknowledgment" button function of the alarm view.
QuitVisible (Page 4824)	P	Executes the "Group acknowledgment" button function of the alarm view.
SelectAll (Page 4837)	P	Selects all rows in a table-based control.
SelectRow (Page 4838)	P	Selects a specific row in a table-based control.
ShowComment (Page 4841)	P	Executes the "Comment dialog" button function of the recipe view.
ShowDisplayOptionsDialog (Page 4841)	P	Executes the "Display options dialog" button function of the alarm view.
ShowEmergencyQuitDialog (Page 4842)	P	Executes the "Single acknowledgment" button function of the alarm view.
ShowHelp (Page 4842)	P, A	Executes the "Help" button function of the control.
ShowHideList (Page 4843)	P	Executes the "List of alarm to hide" button function of the alarm view.
ShowHitList (Page 4843)	P	Executes the "Hitlist" button function of the alarm view.
ShowInfoText (Page 4844)	P	Executes the "About dialog" button function of the alarm view.
ShowLockDialog (Page 4844)	P	Executes the "Lock dialog" button function of the alarm view.
ShowLockList (Page 4845)	P	Executes the "Lock list" button function of the alarm view.
ShowLongTermArchiveList (Page 4845)	P	Executes the "Historical alarm list (long-term)" button function of the alarm view.
ShowMessageList (Page 4846)	P	Executes the "Alarm list" button function of the alarm view.
ShowPropertyDialog (Page 4847)	P, A	Executes the "Configuration dialog" button function of the control.
ShowSelectionDialog (Page 4848)	P	Executes the "Selection dialog" button function of the alarm view.
ShowShortTermArchiveList (Page 4849)	P	Executes the "Historical alarm list (short-term)" button function of the alarm view.
ShowSortDialog (Page 4850)	P	Executes the "Sorting dialog" button function of the alarm view.
ShowTimebaseDialog (Page 4851)	P	Executes the "Timebase dialog" button function of the alarm view.
UnhideAlarm (Page 4854)	P	Executes the "Unhide alarm" button function of the alarm view.
UnlockAlarm (Page 4855)	P	Executes the "Unlock alarm" button function of the alarm view.
UnselectAll (Page 4855)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 4856)	P	Removes the selections from a specific cell of a table-based control.

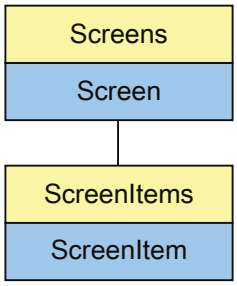
Screen object (list) (Page 3936)

AlarmView

Description



Represents the "Alarm view" object. The MessageView object is an element of the ScreenItems list.

If you change the settings for this object with a user-defined function, the changed settings are retained even after the screen is called again.

Note

The object "Simple AlarmView" cannot be dynamized with a user-defined function.

Table 10-21 Properties

Properties	Read	Write	Description
AlarmAreaHeight **			
AlarmAreaWidth **			
AlarmClasses	-	-	Specifies the alarm classes to be reported in runtime.
AlarmLog	-	-	Specifies the alarm types to be displayed in the alarm view.
AlarmSource	-	-	Specifies that alarms should be displayed.
Authorization (Page 4175)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor	A	A	Specifies the background color of the selected object.
ButtonBarElements **			Specifies that the buttons will be displayed.
ButtonBarStyle	-	-	
Columns	-	-	Specifies the columns to be displayed.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
ColumnTextAckGroup	-	-	Specifies the header for the "AckGroup" column.
ColumnTextAlarmState	-	-	Specifies the header for the "State" column.
ColumnTextAlarmText	-	-	Specifies the header for the "Text" column.
ColumnTextClassName	-	-	Specifies the header for the "Class Name" column.
ColumnTextDate	-	-	Specifies the header for the "Date" column.
ColumnTextDevice	-	-	Specifies the header for the "Device" column.
ColumnTextDiagnosable	-	-	Specifies the header for the "Diagnosable" column.
ColumnTextNumber	-	-	Specifies the header for the "Number" column.
ColumnTextTime	-	-	Specifies the header of the "Time" column.
CountOfLinesPerAlarms	-	-	
CountOfVisibleAlarms	-	-	
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.
FilterTag **			Specifies a tag of the string type for filtering alarm texts.
FilterText **			Specifies the text for filtering the alarm text.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 4309)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	A	A	Specifies the border width of the specified object when the object is in focus.
ForeColor (Page 4319)	-	-	Specifies the font color of the text for the selected object.
GridlineColor (Page 4326)	A	A	Specifies the color for the grid lines.
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalScrollingEnabled	-	-	
IsRunningUnderCE *	-	-	
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
LineAlarmView **			
Name (Page 4417)	A	A	Returns the object name as STRING.

Properties	Read	Write	Description
PreferredUseOnAck	-	-	
S7Device	-	-	
SecurityForSimpleViewEnabled **			
SelectionBackColor (Page 4499)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 4501)	A	A	Specifies the foreground color of the selected cells.
SeparateLineForAlarmText	-	-	
ShowAcknowledgeButton	-	-	
ShowAlarmsFromDate (Page 4515)	A	A	Specifies that only those message events are displayed that are saved in this tag.
ShowAlarmsToAcknowledge	-	-	Specifies that unacknowledged alarms should be displayed.
ShowColumnHeaders	-	-	
ShowHelpButton	-	-	
ShowHorizontalGridlines	-	-	
ShowLoopInAlarmButton	-	-	Specifies that the "Loop-In-Alarm" button will be displayed.
ShowMilliseconds	-	-	Display time in milliseconds.
ShowPendingAlarms	-	-	
SortByTimeDirection (Page 4540)	-	-	Specifies whether the last incoming alarm is displayed at the top of the "AlarmControl" object.
SortByTimeEnabled (Page 4540)	A	A	Specifies whether the sorting order of alarms based on the time in the "AlarmControl" object can be changed.
TableBackColor (Page 4563)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor (Page 4566)	A	A	Specifies the font color of "Row color".
TableHeaderBackColor (Page 4568)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 4569)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
VerticalScrollbarEnabled	-	-	
VerticalScrollingEnabled	-	-	
ViewType	-	-	Specifies the alarm view type.
ViewTypeForSaveStream **			Specifies the display type for the Save Stream.
Visible (Page 4703) *	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES, ** no relevant information available

Table 10-23 Properties

Properties	Read	Write	Description
AlarmLowerLimit (Page 4163)	P	P	Specifies the low limit at which the interrupt is triggered.
AlarmLowerLimitColor (Page 4163)	P	P	Specifies the bar color of the "AlarmLowerLimit" limit.
AlarmLowerLimitEnabled (Page 4164)	P	P	Specifies whether the "AlarmLowerLimit" limit is monitored.
AlarmLowerLimitRelative (Page 4164)	P	P	Specifies whether the low limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.
AlarmUpperLimit (Page 4165)	P	P	Specifies the high limit that triggers the interrupt.
AlarmUpperLimitColor (Page 4165)	P	P	Specifies the bar color of the "AlarmUpperLimit" limit.
AlarmUpperLimitEnabled (Page 4166)	P	P	Specifies whether the "AlarmUpperLimit" limit is monitored.
AlarmUpperLimitRelative (Page 4167)	P	P	Specifies whether the high limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
AverageLast15Values	P	P	Specifies that the average of the last 15 values is shown.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4188) *	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188) *	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189) *	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190) *	P	P	Specifies the flash rate of the background for the selected object.
BarBackColor (Page 4191)	P, A	P, A	Specifies the color of the bar background for the selected object.
BarBackFillStyle (Page 4191)	P	P	Specifies the fill style for the bar.
BarBackFlashingColorOff	-	-	Specifies the border background color of the object for the "OFF" state.
BarBackFlashingColorOn	-	-	Specifies the border background color of the object for the "ON" state.
BarBackFlashingEnabled	-	-	
BarBackFlashingRate	-	-	Specifies the flash rate of the background.
BarEdgeStyle	-	-	Specifies the style of the border line.

Properties	Read	Write	Description
BarOrientation	P	P	Specifies the alignment of the bar.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4215)	-	-	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
ColorChangeHysteresis (Page 4238)	P	P	Specifies the hysteresis as a percentage of the display value.
ColorChangeHysteresisEnabled (Page 4239)	P	P	Specifies whether the object is displayed with hysteresis.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
CountDivisions (Page 4252)	P	P	Specifies the number of segments into which the bar will be split by means of the large scale tick marks.
CountSubDivisions (Page 4252)	A	A	Specifies the number of scale tick marks between two main tick marks of the "Bar" object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	P	P	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302) *	-	-	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4304) *	-	-	Specifies the flash rate of the border line for the selected object.
Font (Page 4311)	-	-	Specifies or returns the font.
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
ForeColor (Page 4318)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Properties	Read	Write	Description
IntegerDigits (Page 4348)	P	P, A	Specifies the number of digits to the left of the decimal point (0 to 20).
LargeTickLabelingStep	-	-	Specifies which scale sections are labeled.
LargeTicksBold (Page 4352)	P	P	Specifies whether the long tick marks of a scale are shown in bold.
LargeTicksSize (Page 4352)	P	P	Specifies the length of the long tick marks of a scale.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
Limit4LowerLimit (Page 4369)	P	P	Specifies the low limit for "Reserve4".
Limit4LowerLimitColor (Page 4370)	P	P	Specifies the color for the "Reserve4" low limit.
Limit4LowerLimitEnabled (Page 4370)	P	P	Specifies whether the "Reserve4" low limit is monitored.
Limit4LowerLimitRelative (Page 4371)	P	P	Specifies whether the "Reserve4" low limit is evaluated as a percentage or an absolute value.
Limit4UpperLimit (Page 4371)	P	P	Specifies the high limit for "Reserve4".
Limit4UpperLimitColor (Page 4372)	P	P	Specifies the color for the "Reserve4" high limit.
Limit4UpperLimitEnabled (Page 4373)	P	P	Specifies whether the "Reserve4" high limit is monitored.
Limit4UpperLimitRelative (Page 4373)	P	P	Specifies whether the "Reserve4" high limit is evaluated as a percentage or an absolute value.
Limit5LowerLimit (Page 4374)	P	P	Specifies the low limit for "Reserve5".
Limit5LowerLimitColor (Page 4374)	P	P	Sets the color for the "Reserve5" low limit.
Limit5LowerLimitEnabled (Page 4375)	P	P	Specifies whether the "Reserve5" low limit is monitored.
Limit5LowerLimitRelative (Page 4376)	P	P	Specifies whether the "Reserve5" low limit is evaluated as a percentage or an absolute value.
Limit5UpperLimit (Page 4376)	P	P	Specifies the high limit for "Reserve5".
Limit5UpperLimitColor (Page 4377)	P	P	Specifies the color for the "Reserve5" high limit.
Limit5UpperLimitEnabled (Page 4377)	P	P	Specifies whether the "Reserve5" high limit is monitored.
Limit5UpperLimitRelative (Page 4378)	P	P	Specifies whether the "Reserve5" high limit is evaluated as a percentage or an absolute value.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line ends.
MaximumValue (Page 4392)	P, A	P, A	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 4413)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
Precision (Page 4459)	P	P	Specifies the number of decimal places (0 to 20).
ProcessValue (Page 4461)	P, A	P, A	Specifies the default for the value to be displayed.
ScaleColor (Page 4481)	P, A	P, A	Specifies the color of the scale of the selected object.
ScaleGradation (Page 4482)	P, A	P, A	Specifies the distance between two large tick marks of the scale.
ScaleLabelFieldLength *	-	-	Distance to the position of the axis label.

Properties	Read	Write	Description
ScaleLabelingDoubleLined	-	-	Specifies that the horizontal bar orientation of the scale has two lines.
ScalePosition (Page 4484)	P	P	Specifies the position of the scale of the selected object.
ScaleStart	-	-	Specifies the minimum of the scale.
ScalingType (Page 4488)	P	P	Specifies the type of bar scaling.
SegmentColoring (Page 4492)	P, A	P, A	Specifies the type of color change to be displayed in the "Bar" object if limits are exceeded.
ShowBadTagState (Page 4516)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowLargeTicksOnly (Page 4521)	P	P	Specifies or returns the length of axis sections in pixels.
ShowLimitLines	-	-	Specifies the display of a line at the limits.
ShowLimitMarkers (Page 4521)	P	P	Specifies whether the limit values are shown as a scale value.
ShowScale (Page 4527)	P	P	Specifies whether the values are also shown in a scale.
ShowSignForPositiveLabel	-	-	Specifies that a "+" is displayed for positive labels.
ShowTickLabels (Page 4532)	-	-	Specifies whether the label is shown in the scale.
ShowTrendIndicator (Page 4536)	P	P	Specifies whether the trend (rising or falling) of the measured value to be monitored is indicated by means of a small arrow.
StartValue (Page 4546)	P	P	Specifies the zero point value for the scale display.
ToleranceLowerLimit (Page 4612)	P	P	Specifies whether the "ToleranceLowerLimit" limit is monitored.
ToleranceLowerLimitColor (Page 4612)	P	P	Specifies the color for the "ToleranceLowerLimit" low limit.
ToleranceLowerLimitEnabled (Page 4613)	P	P	Specifies whether the "ToleranceLowerLimit" limit is monitored.
ToleranceUpperLimit (Page 4614)	P	P	Specifies whether the "ToleranceUpperLimit" limit is monitored.
ToleranceUpperLimitColor (Page 4614)	P	P	Specifies the color for the "ToleranceUpperLimit" high limit.
ToleranceUpperLimitEnabled (Page 4615)	P	P	Specifies whether the "ToleranceUpperLimit" limit is monitored.
ToleranceUpperLimitRelative (Page 4616)	P	P	Specifies whether the "ToleranceHigh" low limit is evaluated as a percentage or an absolute value.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
TrendIndicatorColor (Page 4641)	P	P	Specifies the color for the trend view.
Unit (Page 4667)	P, A	P, A	Specifies the unit of measurement in the "IOField" object.
UseAutoScaling	-	-	Specifies auto-scaling.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseExponentialFormat (Page 4678)	P	P	Specifies whether the numbers are displayed with exponentials (e.g. "1.00e+000").

Properties	Read	Write	Description
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
WarningLowerLimit (Page 4707)	P	P	Specifies the "WarningLowerLimit" low limit.
WarningLowerLimitColor (Page 4708)	P	P	Specifies the color for the "WarningLowerLimit" low limit.
WarningLowerLimitEnabled (Page 4708)	P	P	Specifies whether the "WarningLowerLimit" limit is monitored.
WarningLowerLimitRelative (Page 4709)	P	P	Specifies whether the "WarningLowerLimit" low limit is evaluated as a percentage or an absolute value.
WarningUpperLimit (Page 4712)	P	P	Specifies the "WarningUpperLimit" high limit.
WarningUpperLimitColor (Page 4712)	P	P	Specifies the color for the "WarningUpperLimit" high limit.
WarningUpperLimitEnabled (Page 4713)	P	P	Specifies whether the "WarningUpperLimit" limit is monitored.
WarningUpperLimitRelative (Page 4713)	P	P	Specifies whether the "WarningUpperLimit" high limit is evaluated as a percentage or an absolute value.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
ZeroPoint (Page 4742)	P	P	Specifies the position of the zero point as a percentage of the bar height.

* not visible in the ES

Table 10-24 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-27 Properties

Properties	Read	Write	Description
AdaptBorder (Page 4156)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4188)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190)	P	P	Specifies the flash rate of the background for the selected object.
BitNumber (Page 4197)	-	-	Specifies the bit whose status must change to trigger a value change.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderBrightColor3D (Page 4200)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderShadeColor3D (Page 4212)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4215)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 4218)	P	P	Specifies the width of the border for 3D display of the selected object.

Properties	Read	Write	Description
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	P	P	Specifies the line style of the selected object.
Enabled (Page 4277)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
FocusColor (Page 4308)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 4311)	-	-	Specifies or returns the font.
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4314)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4317)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4318)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4330)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 4340)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
HotKey (Page 4342)	-	-	Specifies the hotkey.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line ends.
Mode (Page 4415)	P	P	Specifies the field type of the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
PictureAlignment (Page 4454)	P	P	Specifies or returns the display type of the background image in the process picture.
PictureList	-	-	Specifies the graphic list that supplies the object with values.
PictureOff (Page 4455)	P	P	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 4455)	P	P	Specifies the screen to be displayed in the "On" state.

Properties	Read	Write	Description
Pressed (Page 4459)	P	P	Specifies whether the selected object is displayed in a pressed state.
ProcessValue (Page 4463)	-	-	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 4561)	P	P	Specifies the display style for the object:
TextList (Page 4573)	-	-	A list that contains the assignments between the output value and the output text to be actually output.
TextOff (Page 4574)	P, A	P, A	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn (Page 4575)	A	A	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 4576)	P	P	Specifies the text orientation of the selected object.
Toggle (Page 4610)	P	P	Specifies whether the selected object engages after it has been operated in runtime.
ToolTipText (Page 4627)	P	P, A	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColorPictureOff (Page 4636)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOn (Page 4636)	P	P	Specifies the color to be set to "transparent" for the "On" state of the assigned bitmap object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColorPictureOff (Page 4686)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOff" property is used for the "Off" state.
UseTransparentColorPictureOn (Page 4687)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOn" property is used for the "On" state.
VerticalAlignment (Page 4701)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowsStyle (Page 4718)	P	P	Specifies whether the object is displayed in the general Windows style.

Table 10-28 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-31 Properties

Properties	Read	Write	Description
AdaptBorder (Page 4156)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.

Properties	Read	Write	Description
BackFlashingColorOff (Page 4188)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
CheckmarkAlignment (Page 4233)	P	P	Specifies whether the fields are right aligned.
CheckmarkCount (Page 4233)	P	P	Specifies the number of fields.
CornerStyle (Page 4250)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	-	-	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4311)	-	-	Specifies or returns the font.
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4314)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4317)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4318)	P	P	Specifies the font color of the text for the selected object.

Properties	Read	Write	Description
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4340)	P	P	Specifies the horizontal alignment of the text within the selected object.
Index (Page 4344)	P	P	Specifies the background for grid control elements.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	-	-	Specifies the shape of the line ends.
LogOperation (Page 4386)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Name (Page 4417)	P	P	Returns the object name as STRING.
ProcessValue (Page 4461)	P	P	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
ShowBadTagState (Page 4516)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
Text (Page 4572)	P	P	Specifies the label for the text field.
TextOrientation (Page 4576)	P	P	Specifies the text orientation of the selected object.
Texts	-	-	Specifies the texts for the check boxes.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 4701)	P	P	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-32 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-33 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P, A	P, A	Defines the fill pattern of the specified object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P, A	P, A	Specifies the line color of the object.

Properties	Read	Write	Description
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P, A	P, A	Specifies the line thickness of the object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	A	A	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
Radius (Page 4465)	P	P, A	Specifies the radius of the selected object "Circle".
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-34 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4273)	P	P	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
EndAngle (Page 4280)	P	P	Specifies the angle at which the end point of the selected object deviates from the zero position (0°).
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Properties	Read	Write	Description
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
Name (Page 4417)	P	-	Returns the object name as STRING.
Radius (Page 4465)	P	P	Specifies the radius of the selected object "Circle".
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
StartAngle (Page 4543)	P	P	Specifies the SQL statement.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-36 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.

Table 10-39 Properties

Properties	Read	Write	Description
Analog (Page 4170)	P	P	Specifies whether the clock is displayed as an analog clock.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.

Properties	Read	Write	Description
DialColor (Page 4265)	P, A	P, A	Specifies the color of the dial in the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 4311)	-	-	Specifies or returns the font.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HourNeedleHeight (Page 4342)	P, A	P, A	Specifies the length of the hour hand in the "Clock" object.
HourNeedleWidth (Page 4343)	P, A	P, A	Specifies the width of the hour hand in the "Clock" object.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LockSquaredExtent (Page 4385)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
MinuteNeedleHeight (Page 4414)	P, A	P, A	Specifies the length of the minute hand in the "Clock" object.
MinuteNeedleWidth (Page 4415)	P, A	P, A	Specifies the width of the minute hand in the "Clock" object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
NeedleBorderColor (Page 4420)	P, A	P, A	Specifies the name of the data source.
NeedleColor (Page 4420)	P, A	P, A	Specifies the hand color in the "Clock" object.
NeedleFillStyle (Page 4421)	P	P	Specifies the fill style for the clock hand.
Picture (Page 4453)	-	-	Specifies the screen to be displayed in the graphics object in runtime.
SecondNeedleHeight (Page 4491)	P, A	P, A	Specifies the length of the seconds hand in the "Clock" object.
SecondNeedleWidth (Page 4491)	P, A	P, A	Specifies the width of the seconds hand in the "Clock" object.
ShowFocusRectangle (Page 4520)	P	P	Specifies whether the button receives a selection border when it is activated in runtime.
ShowTicks (Page 4533)	P, A	P, A	Specifies whether the tick marks are displayed in the scale of the object.
TicksColor (Page 4578)	P, A	P, A	Specifies the scale display.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-40 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-41 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BorderEndStyle (Page 4205)	P	P	Specifies the type of line ends for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
Color (Page 4236)	P	P	Specifies the line color of the selected object.
ConnectionType (Page 4248)	P	P	Specifies the type of connector. You can select one of two connection types.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
EndStyle (Page 4283)	-	-	Specifies how the line end of the selected object is displayed.
FirstConnectedObjectIndex (Page 4298)	P	P	Specifies the index number of the upper connector point.
FirstConnectedObjectName (Page 4299)	P	P	Specifies the name of the object that is docked to the upper connector point.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
LastConnectedObjectIndex (Page 4353)	P	P	Specifies the index number of the connection point to the last connected object.
LastConnectedObjectName (Page 4353)	P	P	Specifies the name of the object that is docked to the lower connector point.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
LineWidth (Page 4381)	P	P	Specifies the line thickness of the selected object.
Name (Page 4417)	P	P	Returns the object name as STRING.
Points *	-	-	Specifies the corner points.
StartStyle (Page 4545)	-	-	Specifies how the line start of the selected object is displayed.
Style (Page 4560)	P	P	Specifies the line style of the selected object.

Properties	Read	Write	Description
SwapFirstWithLastConnection (Page 4562)	P	P	Specifies whether the text in the object is shown horizontally.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies that the font size from the data source should be used.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-42 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.

Table 10-43 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4183)	A	A	Specifies the background color of the selected object.
BackFillStyle (Page 4186)	-	-	Defines the fill pattern of the specified object.
BorderBackColor (Page 4199) *	-	-	Specifies the background color of the broken border line for the selected object.

Properties	Read	Write	Description
BorderColor (Page 4203)	A	A	Specifies the line color of the object.
BorderStyle3D (Page 4215)	A	A	Specifies whether the object has a 3D border shading.
DisplaySystemTime	-	-	Specifies that the system time is displayed.
EdgeStyle (Page 4273)	-	-	Specifies the line style of the selected object.
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 4311) *	-	-	Specifies or returns the font.
ForeColor (Page 4319)	A	A	Specifies the font color of the text for the selected object.
Format	-	-	Specifies that the format of the text block is displayed.
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4330)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 4341)	A	A	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
LineWrap *	-	-	Specifies the line break within the object.
LongDateTimeFormat	-	-	Specifies that the date and time are displayed in long format.
Mode (Page 4415)	-	-	Specifies the field type of the selected object.
Name (Page 4417)	A	-	Returns the object name as STRING.
ProcessValue (Page 4461)	A	A	Specifies the default for the value to be displayed.
ShowDate	-	-	Specifies that the date is to be displayed.
ShowTime	-	-	Specifies that only the time is displayed.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
VerticalAlignment (Page 4701)	A	A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703) *	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-45 Properties

Properties	Read	Write	Description
Alarm (Page 4159)	P	P	Specifies the limit for the memory space view from which an alarm is output.
AlarmColor (Page 4160)	P	P	Specifies the alarm types to be displayed in the alarm view.
Drive (Page 4272)	P	P	Specifies the characters of the drive that is to be monitored.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
Free (Page 4322)	P	P	Returns the size of the free memory space.
FreePercent (Page 4322)	P	P	Returns the measured values for the free disk space as a percentage.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Interval (Page 4348)	P	P	Specifies the time interval for updating the displayed measured values.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
Name (Page 4417)	P	-	Returns the object name as STRING.
NormalColor	P	P	Specifies the color of the object in the normal range.
Tolerance (Page 4610)	P	P	Specifies the limit for the storage space display as of which a deviation will be reported.
ToleranceColor (Page 4611)	P	P	Specifies the colors in which the bars of the memory space display are shown as soon as the tolerance range is exceeded.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Total (Page 4632)	P	P	Returns the storage capacity.
Used (Page 4688)	P	P	Specifies whether scrolling is enabled.
UsedPercent (Page 4688)	P	P	Returns the measured values for the occupied memory space as a percentage.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Warning (Page 4706)	P	P	Specifies the limit for the memory space view from which a warning is output.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-46 Methods

DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

See also

Screen object (list) (Page 3936)

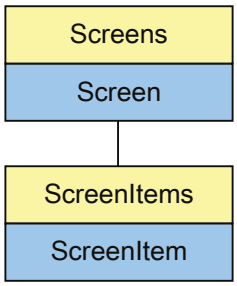
ForeignControl

Description



Object Type of ScreenItem Object. Represents the graphic object "Control"

The control object type always assumes the properties of the control type selected. In the case of controls provided by WinCC, the properties are indicated under the description of the corresponding control.

In the case of controls from external suppliers, the control properties are supplied and thus not a part of this description. However, the control properties can be queried using the "Item" property.

Type Identifier in VBS

Special WinCC type descriptions or version-independent ProgID

Use

In the following example, the object with the name "Control1" is moved 10 pixels to the right:

```
'VBS36
Dim objControl
Set objControl = ScreenItems("Control1")
```

```
objControl.Left = objControl.Left + 10
```

Special feature

The controls provided by WinCC return a special ID as the type. It can be found under the topic "Type Identification in VBS" in the individual descriptions of the WinCC controls.

Access to specific properties instead of event parameters of the third-party controls

The parameter list of an event with third-party control is not read in WinCC. To have access to custom parameters of control events, you need to implement properties in the control instead of parameters.

The following code example shows the source code of the "UserControlTestModify" control, in which the "Title" and "Description" properties are defined instead of parameters.

```
public partial class UserControlTestModify : UserControl
    {
        public event MyEventHandler MyEvent = null;

        public string Title
        {
            get;
            private set;
        }

        public string Description
        {
            get;
            set;
        }

        public UserControlTestModify()
        {
            InitializeComponent();
        }
        private void OnMyEvent(Exception e)
        {
            if (this.MyEvent!= null)
            {
               //  Place place data in Properties before invoking event.
                Title = "title";
                Description = "description"; ";
                this.MyEvent.Invoke();
            }
        }

        private void button1_Click(object sender, EventArgs e)
        {
            this.OnMyEvent (null);
        }
    }
```

The specific properties of a third-party control are not displayed in WinCC with IntelliSense.

The following example shows how to access the specific "Title" property of the third-party control "FControl" in WinCC :

```
HMIRuntime.Screens("StartScreen").ScreenItems("FControl").Title = "MyForeignControl"
```

ProgID and UserfriendlyName of third-party controls

The version-independent ProgID is returned as the type if non-WinCC controls are used.

It is possible to determine the version-dependent ProgID or "UserfriendlyName" from the ProgID: In the following example, "Control1" is a control embedded in the picture which already returns the version-independent ProgID as a result of the Type property.

Note

Since not every control has a version-dependent ProgID, an error handling measure should be integrated to query the version-dependent ProgID or UserFriendlyName. If no error handling is used, the code is terminated immediately without any result when no ProgID is found.

Determine the version-dependent ProgID as follows:

```
'VBS37
Dim objControl
Dim strCurrentVersion
Set objControl = ScreenItems("Control1")
strCurrentVersion = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type &
"\CurVer\")
MsgBox strCurrentVersion
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

Determine the UserFriendlyName as follows:

```
'VBS38
Dim objControl
Dim strFriendlyName
Set objControl = ScreenItems("Control1")
strFriendlyName = CreateObject("WScript.Shell").RegRead("HKCR\" & objControl.Type & "\")
MsgBox strFriendlyName
```

Note

In order that example above works, a multimedia control should be inserted in the picture.

If a non-WinCC control is used, it is possible that the properties provided by the control have the same names as the general ScreenItem properties. In such cases, the ScreenItem properties have priority. The "hidden" properties of an external control supplier can be accessed using the additional "object" property. Address the properties of an external control supplier as follows:

```
Control.object.type
```

The properties of the ScreenItem object are used in the case of identical names, if you use the following form:

```
Control.type
```

Properties	Read	Write	Description
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
Height (Page 4327)	P	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
ObjectName (Page 4424)	P	-	Returns the object name as STRING.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Type (Page 4664)	P	-	Returns the type of the specified object as STRING.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-56 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 4750)	P, A	Executes the "Connect backup" button function of the control.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 4756)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 4757)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetStatusbarElement (Page 4784)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 4785)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolbarButton (Page 4792)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 4793)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetTrend (Page 4794)	P, A	Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.
GetTrendCollection (Page 4795)	P, A	Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.
GetTrendWindow (Page 4797)	P, A	Returns the trend window object of the f(t) or f(x) trend view designated by name or index as "ICCAxTrendWindow" type.

Methods	Valid	Description
GetTrendWindowCollection (Page 4798)	P, A	Returns the list of all trend window objects of the f(t) or f(x) trend views as "ICCAxCollection" type.
GetXAxis (Page 4804)	P, A	Returns the X axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.
GetXAxisCollection (Page 4805)	P, A	Returns the list of all X axis objects of the f(x) trend view as "ICCAxCollection" type.
GetYAxis (Page 4806)	P, A	Returns the Y axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.
GetYAxisCollection (Page 4807)	P, A	Returns the list of all Y axis objects of the f(x) trend view as "ICCAxCollection" type.
MoveAxis (Page 4813)	P, A	Executes the "Move axes area" button function of the f(t) and f(x) trend views.
NextTrend (Page 4820)	P, A	Executes the "Next trend" button function of the f(t) and f(x) trend views.
OneToOneView (Page 4820)	P, A	Executes the "Original view" button function of the f(t) and f(x) trend views.
PreviousTrend (Page 4822)	P, A	Executes the "Previous trend" button function of the f(t) and f(x) trend views.
Print (Page 4822)	P, A	Executes the "Print" button function of the control.
ShowHelp (Page 4842)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 4847)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 4851)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 4852)	P, A	Executes the "Select time range" button function of the control.
ShowTrendSelection (Page 4852)	P, A	Executes the "Select trends" button function of the f(t) and f(x) trend views.
StartStopUpdate (Page 4853)	P, A	Executes the "Start" or "Stop" button function of the control.
ZoomArea (Page 4860)	P, A	Executes the "Zoom area" button function of the f(t) and f(x) trend views.
ZoomInOut (Page 4861)	P, A	Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.
ZoomInOutX (Page 4862)	P, A	Executes the "Zoom X axis +/-" button function of the f(x) trend view.
ZoomInOutY (Page 4863)	P, A	Executes the "Zoom Y axis +/-" button function of the f(x) trend view.
ZoomMove (Page 4863)	P, A	Executes the "Move trend area" button function of the f(t) and f(x) trend views.

Table 10-57 Properties

Properties	Read	Write	Description
AngleMax (Page 4170)	P, A	P, A	Specifies the angle for the scale end of the "Gauge" object.
AngleMin (Page 4171)	P, A	P, A	Specifies the angle for the scale start of the "Gauge" object.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackPicture	-	-	Specifies a graphic for the background.
BorderInnerStyle3D (Page 4210)	P	P	Specifies the representation of the inner part of the object border.

Properties	Read	Write	Description
BorderOuterStyle3D (Page 4211)	P	P	Specifies the representation of the outer part of the object border.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 4218)	P	P	Specifies the width of the border for 3D display of the selected object.
CaptionColor (Page 4223)	P, A	P, A	Specifies the color of the text that is displayed in the header of the selected object.
CaptionFont	-	-	Specifies the character set for the caption.
CaptionText (Page 4224)	P, A	P, A	Specifies the text that is displayed in the header of the selected object.
CaptionTop (Page 4225)	P	P	Specifies the distance of the instrument label from the top edge of the selected object.
CenterColor (Page 4228)	P, A	P, A	Sets the color for the center point of the "Gauge" object.
CenterSize (Page 4229)	P	P	Sets the diameter of the round scale center point.
DangerRangeColor (Page 4259)	P, A	P, A	Sets the color of the danger range on the scale of the "Gauge" object.
DangerRangeStart (Page 4259)	P, A	P, A	Specifies the scale value at which the danger range of the "Gauge" object begins.
DangerRangeVisible (Page 4260)	P, A	P, A	Specifies whether the danger range is displayed in the scale of the "Gauge" object. {
DialColor (Page 4265)	P, A	P, A	Specifies the color of the dial in the selected object.
DialFillStyle (Page 4266)	P	P	Specifies the type of background for the selected object.
DialPicture	-	-	Specifies a graphic for the dial.
DialSize (Page 4267)	P	P	Specifies the diameter of the scale disc based on the smaller value of the "Width" and "Height" geometry attributes.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
Flashing *	-	-	Specifies that the text block flashes.
Gradation (Page 4323)	P, A	P, A	Specifies the value difference between two main tick marks of the "Gauge" object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LockSquaredExtent (Page 4385)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
MaximumValue (Page 4392)	P, A	P, A	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 4413)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
NormalRangeColor (Page 4422)	P, A	P, A	Specifies the color of the normal range on the scale of the "Gauge" object. "
NormalRangeVisible (Page 4422)	P, A	P, A	Specifies whether the normal range in the scale of the "Gauge" object will be displayed.
PointerColor (Page 4457)	P, A	P, A	Specifies the pointer color of the "Gauge" object.
ProcessValue (Page 4461)	P, A	P, A	Specifies the default for the value to be displayed.

Properties	Read	Write	Description
ScaleLabelColor (Page 4483)	P, A	P, A	Specifies the color of the label for the scale tick marks of the "Gauge" object.
ScaleLabelFont	-	-	Specifies the font of the scale label.
ScaleTickColor (Page 4484)	P, A	P, A	Specifies the color of the scale tick marks of the "Gauge" object.
ScaleTickLabelPosition (Page 4485)	P	P	Specifies the diameter of the imaginary circle on which the scale tick label is location.
ScaleTickLength (Page 4485)	P	P	Specifies the length of the main scale ticks.
ScaleTickPosition (Page 4486)	P	P	Specifies the diameter of the assumed circle on which the scale divisions are located.
ShowDecimalPoint (Page 4519)	P	P	Specifies whether the scale is labeled with decimal figures (decimal point and one decimal place) or with whole integers.
ShowPeakValuePointer (Page 4523)	P, A	P, A	Specifies whether a slave pointer will be used for the selected object.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UnitColor (Page 4667)	P, A	P, A	Specifies the text color for the label of the measurement unit in the "Gauge" object.
UnitFont	-	-	Specifies the font for the unit.
UnitText (Page 4668)	P, A	P, A	Specifies the text for the measurement unit of the selected object.
UnitTop (Page 4669)	P	P	Specifies the distance of the measurement unit from the upper edge of the selected object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
WarningRangeColor (Page 4710)	P, A	P, A	Specifies the color of the warning range on the scale of the "Gauge" object.
WarningRangeStart (Page 4710)	P, A	P, A	Specifies the scale value from which the warning range of the "Gauge" object begins.
WarningRangeVisible (Page 4711)	P, A	P, A	Specifies whether the warning range is displayed in the scale of the "Gauge" object.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-59 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4147)	-	-	Sets the color of the specified object for the "High limit violated" event.
AdaptPicture	-	-	Specifies that the size of the object is automatically adjusted in runtime.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
AutoSizing	-	-	Specifies that the size of the object should be automatically adapted to the content.
BackColor (Page 4181)	A	A	Specifies the background color of the selected object.
BelowLowerLimitColor (Page 4196)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BitNumber (Page 4197)	-	-	Specifies the bit whose status must change to trigger a value change.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4215)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	P	P	Specifies the line style of the selected object.
Enabled (Page 4277)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
FlashTransparentColor (Page 4307)	P	P	Specifies the color of the bitmap object of a flashing graphic that is set to "transparent".
FocusColor (Page 4308)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	A	A	Specifies the border width of the specified object when the object is in focus.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4330)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line ends.
Mode (Page 4415)	-	-	Specifies the field type of the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
PictureList	-	-	Specifies the graphic list that supplies the object with values.
PictureOff (Page 4455)	-	-	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 4455)	-	-	Specifies the screen to be displayed in the "On" state.
ProcessValue (Page 4461)	P	P	Specifies the default for the value to be displayed.
ScrollBarOrientation	-	-	Specifies the orientation of the scroll bar.
ShowScrollBar	-	-	Specifies the scroll bar type.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColor (Page 4635)	P, A	P, A	Specifies which color of the allocated graphic (*.bmp, *dib) of the specified object is set to "transparent".
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseFlashTransparentColor (Page 4679)	P	P	Specifies whether the color of the bitmap object of a flashing graphic is set to "transparent".
UseTransparentColor (Page 4685)	P, A	P, A	Specifies whether the color defined with the property "TransparentColor" is shown as transparent for the selected object.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-60 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line ends.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
Picture (Page 4453)	P	P	Specifies the screen to be displayed in the graphics object in runtime.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
TransparentColor (Page 4635)	P, A	P, A	Specifies which color of the allocated graphic (*.bmp, *dib) of the specified object is set to "transparent".
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColor (Page 4685)	P, A	P, A	Specifies whether the color defined with the property "TransparentColor" is shown as transparent for the selected object.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-62 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-67 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4147)	-	-	Sets the color of the specified object for the "High limit violated" event.
AcceptOnExit (Page 4148)	P	P	Specifies whether the input field is confirmed automatically when it is left.
AcceptOnFull (Page 4148)	P	P	Specifies whether the input field will be left and confirmed automatically when the defined number of values has been entered.

Properties	Read	Write	Description
AdaptBorder (Page 4156)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
AskOperationMotive (Page 4173)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4188)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190)	P	P	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 4196)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4215)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.
ClearOnError (Page 4234)	P	P	Specifies whether an invalid input in this object is deleted automatically.
ClearOnFocus (Page 4235)	P	P	Specifies whether the field entry is deleted as soon as the I/O field is activated.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
CursorControl (Page 4256)	P	P	Specifies whether the mouse cursor jumps to the next field of the TAB sequence after leaving a field.
DataFormat (Page 4261)	P	P	Returns the data type of the IOField object.
EdgeStyle (Page 4274)	A	A	Specifies the line style of the selected object.
EditOnFocus (Page 4276)	P	P	Specifies whether data input is immediately possible if the input field is selected using the "Tab" key.
Enabled (Page 4277)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FieldLength (Page 4293)	–	-	Specifies that the "Field length string" field is read-only.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.

Properties	Read	Write	Description
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4311)	-	-	Specifies or returns the font.
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4314)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4317)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4318)	P, A	P, A	Specifies the font color of the text for the selected object.
FormatPattern (Page 4320)	P	P	Specifies the format of the output value.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4330)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HiddenInput (Page 4331)	P	P	Specifies whether the input value or a * for each character is shown during the input.
HorizontalAlignment (Page 4340)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
InputValue (Page 4346)	P	P	Defines the value entered by the user in the IO field.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	A	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
LogOperation (Page 4386)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
LowerLimit (Page 4388)	P	P	Specifies the low limit for input values.
Mode (Page 4415)	P	P	Specifies the field type of the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
ProcessValue (Page 4461)	P, A	P, A	Specifies the default for the value to be displayed.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
ShiftDecimalPoint (Page 4514)	-	-	Specifies that the "Shift decimal point" field is read-only.
ShowBadTagState (Page 4516)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowLeadingZeros	-	-	Specifies that leading zeros should be displayed.
TextOrientation (Page 4576)	P	P	Specifies the text orientation of the selected object.

Properties	Read	Write	Description
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
Unit (Page 4667)	P	P	Specifies the unit of measurement in the "IOField" object.
UpperLimit (Page 4670)	P	P	Specifies the high limit for input values.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTagLimitColors	P	P	Specifies whether the configured colors are used when limits are violated.
VerticalAlignment (Page 4701)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-68 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BorderEndStyle (Page 4205)	P, A	P, A	Specifies the type of line ends for the selected object.

Properties	Read	Write	Description
BorderStyle (Page 4213)	P, A	P, A	Specifies the type of line ends for the selected object.
Color (Page 4236)	P, A	P, A	Specifies the line color of the selected object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
EndLeft	-	-	Specifies the X position of the end point.
EndStyle (Page 4283)	P, A	P, A	Specifies how the line end of the selected object is displayed.
EndTop	-	-	Sets the Y position of the end point.
FillStyle (Page 4297)	A	A	Defines the fill pattern of the specified object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
LineWidth (Page 4381)	P, A	P, A	Specifies the line thickness of the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
RotationAngle (Page 4472)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 4473)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 4474)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
StartLeft	-	-	Specifies the X position of the starting point.
StartStyle (Page 4545)	A	A	Specifies how the line start of the selected object is displayed.
StartTop (Page 4546)	-	-	Specifies the vertical distance in pixels between the start point and the top edge of the screen.
Style (Page 4560)	P, A	P, A	Specifies the line style of the selected object.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-70 Methods

Methods	Valid	Description

Table 10-73 Properties

Properties	Read	Write	Description
AspectRatio	P	P	Specifies whether the aspect ratio is maintained when the size is changed.
AutoStart	P	P	Specifies that the Media Player should start automatically.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FileName	P, A	P, A	Specifies the name of the file to be loaded.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
PictureSizeMode	P	P	Specifies that the status bar is displayed.
PlayCount	A	A	Plays the files several times.
PlayEndless	P	P	Specifies that the media file should play endlessly.
PopupMenuEnabled	P	P	Specifies that the shortcut menu can be used.
ShowControls	P, A	P, A	Specifies that a toolbar is displayed.
ShowFeatureBackward	P	P	Specifies that the "Backward" button is displayed in runtime.
ShowFeatureForward	P	P	Specifies that the "Forward" button is displayed in runtime.
ShowFeatureFullScreen	P	P	Specifies that the Media Player can be displayed as a full screen.
ShowFeaturePause	P	P	Specifies that the Media Player can be displayed as a full screen
ShowFeaturePlay	P	P	Specifies that the "Play" button is displayed in runtime.
ShowFeatureStop	P	P	Specifies that the "Stop" button is displayed in runtime.
ShowFeatureVolume	P	P	Sets the volume.
ShowStatusBar (Page 4530)	A	A	Specifies whether the status bar is shown.
ShowTracker	A	A	Specifies that the tracker is displayed.
StepSeconds	P	P	Specifies a time in seconds that is to be skipped when the "Forward" or "Backward" button is pressed.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-75 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P	P, A	Specifies the background color of the selected object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P	P	Specifies the background color of the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
EdgeStyle (Page 4274)	-	-	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
Font (Page 4311)	-	-	Specifies or returns the font.
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4314)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4317)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4318)	P	P	Specifies the font color of the text for the selected object.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4340)	P	P	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.

Properties	Read	Write	Description
Name (Page 4417)	P	-	Returns the object name as STRING.
Text (Page 4572)	P	P	Specifies the label for the text field.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-76 Methods

Methods	Validity	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
GetSelectionText	??	
SetSelection	??	
SetSelectionText	??

Table 10-79 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode (Page 4172)	-	-	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 4177)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 4177)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.

Properties	Read	Write	Description
AutoSelectionColors (Page 4178)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 4179)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
Caption (Page 4221)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 4225)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 4226)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 4227)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 4227)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 4228)	P	P	Specifies the top margin of the table cells.
Closeable (Page 4236)	P	P	Specifies that the control can be closed in runtime.
ColumnResize (Page 4242)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 4244)	P	P	Specifies the scroll bar type.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 4245)	P	P	Specifies whether the column title is displayed.
ControlDesignMode (Page 4538)	P	P	Specifies the design.
EnableEdit (Page 4280)	P	P	Specifies whether the data shown can be edited in runtime.
ExportDirectoryChangeable (Page 4286)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4286)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4287)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4288)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4288)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4289)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 4289)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4290)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4290)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 4291)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 4311)	-	-	Specifies or returns the font.
GridLineColor (Page 4325)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 4326)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 4327)	P	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 4341)	P	P	Specifies whether horizontal separation lines are displayed.

Properties	Read	Write	Description
IconSpace (Page 4344)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4379)	P	P	Sets the color of the window separation lines.
LineWidth (Page 4381)	P	P	Specifies the line thickness of the selected object.
LoadDataImmediately (Page 4383)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
Moveable (Page 4416)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 4417)	P	-	Returns the object name as STRING.
Online (Page 4428)	P	P	Specifies the name of the data source.
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 4475)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 4477)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistenceAuthorization	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4478)	-	-	Specifies how online configurations of WinCC are retained.
SelectedCellColor (Page 4493)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 4494)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 4495)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 4495)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 4496)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 4497)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 4499)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 4502)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 4503)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 4504)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 4504)	P	P	Specifies the number of lines you can mark.
ShowSortButton (Page 4528)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 4529)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 4530)	P	P	Specifies whether the sorting icon is displayed.
ShowTitle (Page 4534)	P	P	Specifies the representation of the control's window title.
Sizeable (Page 4538)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 4542)	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 4547)	P	P	Specifies the background color of the status bar.

Properties	Read	Write	Description
StatusbarElementAdd (Page 4547) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4548) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4548) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4549) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4549) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 4550)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 4550) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4551) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4551) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4552)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4552) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 4553) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined element.
StatusbarElementVisible (Page 4554) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 4554) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4554)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4557)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4558)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 4558)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4559)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 4564)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 4564)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 4565)	P	P	
TableForeColor2 (Page 4566)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 4584)	P	P	Sets the time zone that forms the basis for the display of time values.
TimeColumnActualize (Page 4585) *	P	P	Specifies whether the values of the selected column are updated.
TimeColumnAdd (Page 4586) *	P	P	Creates a new time column.
TimeColumnAlign (Page 4586) *	P	P	Specifies how the selected time column is aligned.

Properties	Read	Write	Description
TimeColumnBackColor (Page 4587) *	P	P	Specifies the background color of the time column selected.
TimeColumnBeginTime (Page 4588) *	P	P	Specifies the starting time of the time range for a selected time column.
TimeColumnCaption (Page 4588) *	P	P	Specifies the label of the time column.
TimeColumnCount (Page 4589) *	P	P	Specifies the number of configured time columns.
TimeColumnDateFormat (Page 4589) *	P	P	Specifies which date format is used to display the selected time column.
TimeColumnEndTime (Page 4590) *	P	P	Specifies the end point of the time range for the selected time column.
TimeColumnForeColor (Page 4590) *	P	P	Specifies the font color of the time column selected.
TimeColumnHideText (Page 4591) *	P	P	Sets text format for displaying the content of a time column.
TimeColumnHideTitleText (Page 4592) *	P	P	Sets text format for displaying the time column header.
TimeColumnIndex (Page 4592)	P	P	References a configured time column.
TimeColumnLength (Page 4593) *	P	P	Specifies the width of a selected time column.
TimeColumnMeasurePoints (Page 4593) *	P	P	Specifies the number of measuring points to be displayed in the selected time column.
TimeColumnName (Page 4594) *	P	P	Specifies the name of the selected time column.
TimeColumnRangeType (Page 4594) *	P	P	Specifies the time range used for the selected time column.
TimeColumnRemove (Page 4595) *	P	P	Removes the selected time column from the list.
TimeColumnRename (Page 4595) *	P	P	Renames the time column that is referenced by means of the "TimeColumnIndex" property.
TimeColumnRepos (Page 4595) *	P	P	Changes the sorting order of the time columns, including the corresponding value columns.
TimeColumnShowDate (Page 4596) *	P	P	Specifies whether the selected time column is displayed with date and time.
TimeColumnShowIcon (Page 4596) *	P	P	Specifies whether the contents of the time column are shown as an icon.
TimeColumnShowTitleIcon (Page 4597) *	P	P	Specifies whether the values of the selected column are updated.
TimeColumnSort (Page 4597) *	P	P	Specifies how the time column referenced in "TimeColumnIndex" is sorted.
TimeColumnSortIndex (Page 4598) *	P	P	Specifies the sorting order of the time column referenced in "TimeColumnIndex".
TimeColumnTimeFormat (Page 4598) *	P	P	Defines the time format used to display a selected time column.
TimeColumnTimeRangeBase (Page 4599) *	P	P	Specifies the unit of time for calculating the time range.
TimeColumnTimeRangeFactor (Page 4600) *	P	P	Specifies the factor for calculating the time range.
TimeColumnUseValueColumnColors (Page 4600) *	P	P	Specifiess whether the selected time column is displayed in the value column colors.
TimeColumnVisible (Page 4601) *	P	P	The list shows the time columns you have created.
TimeStepBase	P	P	A time range is set via a base and a factor.
TimeStepFactor	P	P	A time range is set via a base and a factor.
TitleColor	P	P	Specifies the color of the header.

Properties	Read	Write	Description
TitleCut (Page 4606)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 4607)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 4607)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 4607)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 4608)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 4608)	P	P	Specifies how sorting by column title is triggered.
TitleStyle (Page 4609)	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment (Page 4616)	P	P	Specifies or returns the position of the toolbar.
ToolbarBackColor (Page 4616)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 4617) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 4618) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 4618) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 4619) *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled (Page 4619) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 4620) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 4620) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 4620)	P	P	References a button function.
ToolbarButtonLocked (Page 4621) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 4621) *	P	P	Shows the name of the selected button function.
ToolbarButtonPasswordLevel (Page 4622) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 4622) *	P	P	Removes the selected button function from the list.
ToolbarButtonRename (Page 4622) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 4623) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 4623) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 4624) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 4624)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 4625)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 4626)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 4626)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.

Properties	Read	Write	Description
UseColumnBackColor	P	P	Specifies whether scrolling is enabled.
UseColumnForeColor	P	P	Specifies the font used for printing.
UseSelectedTitleColor (Page 4682)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 4684)	P	P	Specifies whether a second row color is used for the representation of the table.
ValueColumnAdd *	P	P	Adds a value column.
ValueColumnAlign *	P	P	Specifies the alignment of a column.
ValueColumnAutoPrecisions *	P	P	Specifies whether the number of decimal places to be displayed is determined automatically.
ValueColumnBackColor *	P	P	Specifies the background color.
ValueColumnCaption *	P	P	Specifies a header.
ValueColumnCount *	P	P	Displays the number of value columns.
ValueColumnExponentialFormat *	P	P	Specifies that exponential notation is used in a column.
ValueColumnForeColor *	P	P	Specifies the foreground color for a value column.
ValueColumnHideText *	P	P	Specifies whether the text is displayed.
ValueColumnHideTitleText *	P	P	Specifies whether the text is displayed.
ValueColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ValueColumnLength *	P	P	Specifies the number of displayed characters.
ValueColumnName *	P	P	Specifies the name of a column.
ValueColumnPrecisions *	P	P	Specifies the number of decimal places.
ValueColumnProvider *	P	P	
ValueColumnProviderCLSID *	P	P	Specifies the provider CLSID of the data for a column.
ValueColumnRemove *	P	P	Deletes a value column.
ValueColumnRename *	P	P	Renames a value column.
ValueColumnRepos *	P	P	Specifies that a value axis is repositioned.
ValueColumnSelectTagName *	P	P	Specifies a tag.
ValueColumnShowIcon *	P	P	Specifies whether an icon is shown.
ValueColumnShowTitleIcon *	P	P	Specifies whether an icon is shown in the title.
ValueColumnSort *	P	P	Specifies the sorting type of a column.
ValueColumnSortIndex *	P	P	Specifies the sorting order.
ValueColumnTagName *	P	P	Specifies the names of the tags whose values are displayed in a column.
ValueColumnTimeColumn *	P	P	Specifies the corresponding time column.
ValueColumnVisible *	P	P	Specifies the visibility of a value column.
VerticalGridLines (Page 4702)	P	P	Specifies whether vertical separation lines are displayed.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-80 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 4750)	P	Executes the "Connect backup" button function of the control.
CalculateStatistic (Page 4751)	P	Executes the "Calculate statistics" button function of the f(t) trend view and table view.
CopyRows (Page 4751)	P	Executes the "Copy rows" button function of the control.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 4756)	P, A	Executes the "Disconnect backup" button function of the control.
Edit (Page 4757)	P	Executes the "Edit" button function of the table view.
Export (Page 4757)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRow (Page 4769)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 4770)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 4777)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 4778)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusbarElement (Page 4784)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 4785)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetTimeColumn (Page 4789)	P	Returns the time column object of the table view designated by name or index as "ICCAxTime Column" type.
GetTimeColumnCollection (Page 4790)	P	Returns the list of all time column objects of the table view as "ICCAxCollection" type.
GetToolbarButton (Page 4792)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 4793)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetValueColumn (Page 4801)	P	Returns the value column object of the f(t) trend view designated by name or index as "ICCAxValueColumn" type.
GetValueColumnCollection (Page 4802)	P	Returns the list of all value column objects of the f(t) trend view as "ICCAxCollection" type.
MoveToFirst (Page 4813)	P	Executes the "First line" button function of the control.
MoveToLast (Page 4815)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 4816)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 4818)	P	Executes the "Previous data record" button function of the control.
NextColumn (Page 4819)	P	Executes the "Next column" button function of the table view.
PreviousColumn (Page 4821)	P	Executes the "Previous column" button function of the table view.
Print (Page 4822)	P, A	Executes the "Print" button function of the control.
SelectAll (Page 4837)	P	Selects all rows in a table-based control.
SelectRow (Page 4838)	P	Selects a specific row in a table-based control.

Methods	Valid	Description
SelectStatisticArea (Page 4838)	P	Executes the "Set statistics range" button function of the table view.
ShowColumnSelection (Page 4840)	P	Executes the "Select columns" button function of the table view.
ShowHelp (Page 4842)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 4847)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 4851)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 4852)	P, A	Executes the "Select time range" button function of the control.
StartStopUpdate (Page 4853)	P, A	Executes the "Start" or "Stop" button function of the control.
UnselectAll (Page 4855)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 4856)	P	Removes the selections from a specific cell of a table-based control.

A	Runtime Advanced
P	Runtime Professional

Table 10-81 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode (Page 4172)	-	-	Specifies that the project settings are used for the design.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
Caption (Page 4221)	P	P	Specifies the text that is displayed in the header of the selected object.
Closeable (Page 4236)	P	P	Specifies that the control can be closed in runtime.
ConnectTrendWindows (Page 4248)	P	P	Specifies whether the configured trend views are connected.
ControlDesignMode (Page 4538)	P	P	Specifies the design.
ExportDirectoryChangeable (Page 4286)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4286)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4287)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4288)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4288)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4289)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 4289)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4290)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4290)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 4291)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 4311)	-	-	Specifies or returns the font.
GraphDirection (Page 4324)	P	P	Specifies at which border of the trend window the current values are displayed.
Height (Page 4327)	P	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4379)	P	P	Sets the color of the window separation lines.

Properties	Read	Write	Description
LineWidth (Page 4382)	P	P	Specifies the line thickness of the selected object.
LoadDataImmediately (Page 4383)	P	P	Specifies whether the tag values are downloaded from the logs for the time range to be displayed when you call a screen.
Moveable (Page 4416)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 4417)	P	-	Returns the object name as STRING.
Online (Page 4428)	P	P	Specifies the name of the data source.
PercentageAxis	P	P	Specifies that an axis with percentage scaling is shown.
PercentageAxisAlign	P	P	
PercentageAxisColor	P	P	Specifies the color of the percentage axis.
PrintJob	P	P	Specifies a print job
RTPersistence (Page 4477)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistenceAuthorization	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4478)	-	-	Specifies how online configurations of WinCC are retained.
ShowRuler (Page 4525)	P	P	Specifies whether a scale gradation (auxiliary line) is shown for the axis label of the "OnlineTrendControl" object.
ShowRulerInAxis (Page 4526)	P	P	Specifies whether rulers are also displayed in the time axes.
ShowScrollbars (Page 4527)	P	P	Specifies the scroll bar type.
ShowStatisticRuler	P	P	Specifies the SQL statement.
ShowTitle (Page 4534)	P	P	Specifies the representation of the control's window title.
ShowTrendIcon (Page 4535)	P	P	Specifies whether an icon is displayed below the value axes.
Sizeable (Page 4538)	P	P	Specifies that the size of an object can be changed in runtime.
StatusbarBackColor (Page 4547)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 4547) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4548) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4548) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4549) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4549) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 4550)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 4550) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4551) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4551) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4552)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4552) *	P	P	Specifies the tooltip text for the user-defined status bar element.

Properties	Read	Write	Description
StatusbarElementUserDefined (Page 4553) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined element.
StatusbarElementVisible (Page 4554) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 4554) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4554)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4557)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4558)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 4558)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4559)	P	P	Specifies whether the status bar of the control is displayed.
TimeAxes	-	-	Specifies the settings for the time axes.
TimeAxisActualize *	P	P	
TimeAxisAdd *	P	P	Inserts an axis.
TimeAxisAlignment *	P	P	Specifies the alignment of an axis.
TimeAxisBeginTime (Page 4580) *	P	P	Specifies the starting time for the display of the selected trend.
TimeAxisColor *	P	P	Specifies the color of an axis.
TimeAxisCount *	P	P	Displays the number of time axes.
TimeAxisDateFormat *	P	P	Specifies the date format.
TimeAxisEndTime (Page 4580) *	P	P	Specifies the end time for the display of the selected trend.
TimeAxisIndex	P	P	The index specifies on which axis other properties, e.g. initial value are based.
TimeAxisInTrendColor *	P	P	Specifies that the color of the trend is used for an axis.
TimeAxisLabel (Page 4581) *	P	P	Specifies the header for the time axis. Whether or not the information is evaluated depends on the "ConfigureTimeAxis(i)" property.
TimeAxisMeasurePoints *	P	P	Specifies the measuring points.
TimeAxisName *	P	P	Specifies the name of an axis.
TimeAxisRangeType *	P	P	Specifies the type of time range.
TimeAxisRemove *	P	P	Deletes a time axis
TimeAxisRename *	P	P	Renames a time axis.
TimeAxisRepos *	P	P	Specifies that the time axis is repositioned
TimeAxisShowDate *	P	P	Specifies that the date is to be displayed.
TimeAxisTimeFormat (Page 4584) *	P	P	Specifies the time format.
TimeAxisTimeRangeBase *	P	P	A time range is set via a base and a factor.
TimeAxisTimeRangeFactor *	P	P	A time range is set via a base and a factor.
TimeAxisTrendWindow *	P	P	Specifies the trend view.
TimeAxisVisible *	P	P	Specifies that the time axis is visible.
TimeBase (Page 4584)	P	P	Sets the time zone that forms the basis for the display of time values.
ToolbarAlignment (Page 4616)	P	P	Specifies or returns the position of the toolbar.

Properties	Read	Write	Description
ToolbarBackColor (Page 4616)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 4617) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 4618) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 4618) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 4619) *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled (Page 4619) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 4620) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 4620) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 4620)	P	P	References a button function.
ToolbarButtonLocked (Page 4621) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 4621) *	P	P	Shows the name of the selected button function.
ToolbarButtonPasswordLevel (Page 4622) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 4622) *	P	P	Removes the selected button function from the list.
ToolbarButtonRename (Page 4622) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 4623) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 4623) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 4624) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 4624)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 4625)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 4626)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 4626)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
TrendAdd (Page 4638) *	P	P	Creates a new trend.
TrendAutoRangeBeginTagName *	P	P	Specifies a tag that defines the initial value.
TrendAutoRangeBeginValue *	P	P	Specifies the initial value for the automatically adjusted display range.
TrendAutoRangeEndTagName *	P	P	Specifies a tag that defines the end value.
TrendAutoRangeEndValue *	P	P	Specifies a tag that defines the end value.
TrendAutoRangeSource *	P	P	Specifies the source of the display range.
TrendColor (Page 4638) *	P	P	Specifies or returns the trend view color.
TrendCount (Page 4639) *	P	P	Specifies the number of configured trends.

Properties	Read	Write	Description
TrendExtendedColorSet (Page 4639) *	P	P	Specifies whether you can configure the point color and the fill color and whether the colors are shown in runtime.
TrendFill (Page 4640) *	P	P	Specifies whether the area below the trend is shown filled.
TrendFillColor (Page 4640) *	P	P	Sets the fill color of the trend.
TrendIndex (Page 4641)	P	P	References a configured trend.
TrendLabel (Page 4642) *	P	P	Specifies the label of the selected trend.
TrendLineStyle (Page 4642) *	P	P	Specifies which line type is used for display of the trend.
TrendLineType (Page 4643) *	P	P	Specifies how the trend is displayed.
TrendLineWidth (Page 4643) *	P	P	Specifies the line thickness of the line displayed.
TrendLowerLimit (Page 4644) *	P	P	Specifies the low limit of a tag.
TrendLowerLimitColor (Page 4644) *	P	P	Specifies the color which indicates tag values below the value of "TrendLowerLimit".
TrendLowerLimitColoring (Page 4644) *	P	P	Specifies whether the selection frame is shown with the color defined by the system.
TrendName (Page 4645) *	P	P	Displays the name of the selected trend.
TrendPointColor (Page 4645) *	P	P	Specifies the color of trend points.
TrendPointStyle (Page 4646) *	P	P	Specifies how the points are displayed on the trend.
TrendPointWidth (Page 4646) *	P	P	Specifies the point width in pixels.
TrendProvider (Page 4647) *	P	P	Specifies the data supply for the selected trend.
TrendProviderCLSID *	P	P	Specifies the provider CLSID of the data for a trend.
TrendRemove (Page 4648) *	P	P	Removes selected trends from the list.
TrendRename (Page 4648) *	P	P	Renames the trend that is referenced by means of the "TrendIndex" property.
TrendRepos (Page 4649) *	P	P	Repositions the selected trend in the sequence in the trend window.
TrendSelectTagName *	P	P	Specifies a tag.
TrendTagName *	P	P	Specifies the name of the tag for the Y direction.
TrendTimeAxis *	P	P	Specifies the time axis.
TrendTrendWindow (Page 4652) *	P	P	Specifies the trend window in which the selected trend is shown.
TrendUncertainColor (Page 4652) *	P	P	Values have an uncertain status if the initial value is unknown after Runtime has been activated, or if a substitute value is used.
TrendUncertainColoring (Page 4653) *	P	P	Values have an uncertain status if the initial value is unknown after Runtime has been activated, or if a substitute value is used.
TrendUpperLimit (Page 4653) *	P	P	Specifies the high limit of a tag. If the tag drops below the value of "TrendLowerLimit", the values are marked with the color set in "TrendUpperLimitColor".
TrendUpperLimitColor (Page 4654) *	P	P	Specifies the color which indicates tag values below the value of "TrendLowerLimit".
TrendUpperLimitColoring (Page 4654) *	P	P	Specifies whether the selection frame is shown with the color defined by the system.
TrendValueAxis *	P	P	Specifies the value axis.
TrendVisible (Page 4654) *	P	P	The list contains all the trends that you have created.
TrendWindowAdd (Page 4655) *	P	P	Creates a new trend view.

Properties	Read	Write	Description
TrendWindowCoarseGrid (Page 4655) *	P	P	Specifies whether grid lines are displayed for the main scaling.
TrendWindowCoarseGridColor (Page 4656) *	P	P	Specifies the color of the grid lines for the main scaling.
TrendWindowCount *	P	P	Displays the number of trend views.
TrendWindowFineGrid (Page 4656) *	P	P	Specifies whether grid lines are displayed for the secondary scaling.
TrendWindowFineGridColor (Page 4657) *	P	P	Specifies the grid color of the main scaling.
TrendWindowForegroundTrendGrid (Page 4657) *	P	P	Specifies whether only the grid lines for the foreground trend are displayed in the selected trend window.
TrendWindowGridInTrendColor (Page 4657) *	P	P	Specifies whether the grid lines for the main scaling are displayed in the trend color.
TrendWindowHorizontalGrid (Page 4658) *	P	P	Specifies whether the horizontal grid lines are shown.
TrendWindowIndex (Page 4659)	P	P	References a configured trend window.
TrendWindowName (Page 4659) *	P	P	Specifies the name of the selected trend window.
TrendWindowRemove (Page 4659) *	P	P	Removes the selected trend view from the list.
TrendWindowRename (Page 4659) *	P	P	Changes the name of the trend window which is referenced by the "TrendWindowIndex" property.
TrendWindowRepos (Page 4660) *	P	P	Changes the order of the trend view.
TrendWindowRulerColor (Page 4660) *	P	P	Specifies the ruler color.
TrendWindowRulerLayer (Page 4660) *	P	P	Specifies the display layer of the ruler in the trend view.
TrendWindowRulerStyle (Page 4661) *	P	P	Specifies the representation of the ruler.
TrendWindowRulerWidth (Page 4662) *	P	P	Specifies the ruler width in pixels.
TrendWindows	-	-	Specifies the settings for trend views.
TrendWindowSpacePortion (Page 4662) *	P	P	Specifies the proportion of the selected trend window for display in the control.
TrendWindowStatisticRulerColor *	P	P	Specifies the color of the statistics ruler.
TrendWindowStatisticRulerStyle *	P	P	Specifies the style of the statistics ruler.
TrendWindowStatisticRulerWidth *	P	P	Specifies the width of the statistics ruler.
TrendWindowVerticalGrid (Page 4662) *	P	P	Specifies whether the vertical grid lines are displayed.
TrendWindowVisible (Page 4663) *	P	P	The list contains the trend views that you have created.
UseTrendNameAsLabel (Page 4687)	P	P	Specifies whether the "Name" or "Label" property is used as a designation for the trend in runtime.
ValueAxes	-	-	Specifies the settings for the value axes.
ValueAxisAdd *	P	P	Inserts an axis.
ValueAxisAlignment *	P	P	Specifies the alignment of an axis.
ValueAxisAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
ValueAxisAutoRange *	P	P	Specifies that the value range is determined automatically.

Properties	Read	Write	Description
ValueAxisBeginValue *	P	P	Specifies the initial value of an axis.
ValueAxisColor *	P	P	Specifies the color of a value axis.
ValueAxisCount *	P	P	Shows the number of value axes.
ValueAxisEndValue *	P	P	Specifies the end value of an axis.
ValueAxisExponentialFormat *	P	P	Specifies that the label of an axis uses exponential notation.
ValueAxisIndex	P	P	The index specifies on which axis other properties, e.g. initial value are based.
ValueAxisInTrendColor *	P	P	Specifies that the color of the trend is used for an axis.
ValueAxisLabel (Page 4695) *	P	P	Specifies the label of the value axis.
ValueAxisName *	P	P	Specifies the name of an axis.
ValueAxisPrecisions *	P	P	Specifies the number of displayed decimal places.
ValueAxisRemove *	P	P	Renames an axis.
ValueAxisRename *	P	P	Renames an axis.
ValueAxisRepos *	P	P	Specifies that the value axis is repositioned.
ValueAxisScalingType (Page 4696) *	P	P	Specifies the type of axis scaling.
ValueAxisTrendWindow *	P	P	Specifies the trend view.
ValueAxisVisible *	P	P	Specifies whether a value axis is visible.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-82 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
AttachDB (Page 4750)	P, A	Executes the "Connect backup" button function of the control.
CalculateStatistic (Page 4751)	P	Executes the "Calculate statistics" button function of the f(t) trend view and table view.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
DetachDB (Page 4756)	P, A	Executes the "Disconnect backup" button function of the control.
Export (Page 4757)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRulerData (Page 4776)	P	Returns the value of the called trend at the ruler position.
GetStatusbarElement (Page 4784)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 4790)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetTimeAxis (Page 4786)	P	Returns the time axis object of the f(t) trend view designated by name or index as "ICCAxTimeAxis" type.
GetTimeAxisCollection (Page 4788)	P	Returns the list of all time axis objects of the f(t) trend view as "ICCAxCollection" type.

Methods	Valid	Description
GetToolbarButton (Page 4792)	P	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 4793)	P	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
GetTrend (Page 4794)	P, A	Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.
GetTrendCollection (Page 4795)	P, A	Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.
GetTrendWindow (Page 4797)	P, A	Returns the trend window object of the f(t) or f(x) trend view designated by name or index as "ICCAxTrendWindow" type.
GetTrendWindowCollection (Page 4798)	P, A	Returns the list of all trend window objects of the f(t) or f(x) trend views as "ICCAxCollection" type.
GetValueAxis (Page 4799)	P	Returns the value axis object of the f(t) trend view designated by name or index as "ICCAxValueAxis" type.
GetValueAxisCollection (Page 4800)	P	Returns the list of all value axis objects of the f(t) trend view as "ICCAxCollection" type.
MoveAxis (Page 4813)	P, A	Executes the "Move axes area" button function of the f(t) and f(x) trend views.
MoveToFirst (Page 4813)	P	Executes the "First line" button function of the control.
MoveToLast (Page 4815)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 4816)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 4818)	P	Executes the "Previous data record" button function of the control.
NextTrend (Page 4820)	P, A	Executes the "Next trend" button function of the f(t) and f(x) trend views.
OneToOneView (Page 4820)	P, A	Executes the "Original view" button function of the f(t) and f(x) trend views.
PreviousTrend (Page 4822)	P, A	Executes the "Previous trend" button function of the f(t) and f(x) trend views.
Print (Page 4822)	P, A	Executes the "Print" button function of the control.
ShowHelp (Page 4842)	P, A	Executes the "Help" button function of the control.
ShowPercentageAxis (Page 4846)	P	Executes the "Relative axis" button function of the f(t) trend view.
ShowPropertyDialog (Page 4847)	P, A	Executes the "Configuration dialog" button function of the control.
ShowTagSelection (Page 4851)	P, A	Executes the "Select data connection" button function of the control.
ShowTimeSelection (Page 4852)	P, A	Executes the "Select time range" button function of the control.
ShowTrendSelection (Page 4852)	P, A	Executes the "Select trends" button function of the f(t) and f(x) trend views.
StartStopUpdate (Page 4853)	P, A	Executes the "Start" or "Stop" button function of the control.
ZoomArea (Page 4860)	P, A	Executes the "Zoom area" button function of the f(t) and f(x) trend views.
ZoomInOut (Page 4861)	P, A	Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.
ZoomInOutTime (Page 4861)	P	Executes the "Zoom time axis +/-" button function of the f(t) trend view.
ZoomInOutValues (Page 4862)	P	Executes the "Zoom value axis +/-" button function of the f(t) trend view.
ZoomMove (Page 4863)	P, A	Executes the "Move trend area" button function of the f(t) and f(x) trend views.

P	Runtime Professional

Table 10-83 Properties

Properties	Read	Write	Description
AdaptBorder (Page 4156)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4188)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
CheckmarkAlignment (Page 4233)	P	P	Specifies whether the fields are right aligned.
CheckmarkCount (Page 4233)	P	P	Specifies the number of fields.
CornerStyle (Page 4250)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	-	-	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4311)	-	-	Specifies or returns the font.

Properties	Read	Write	Description
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4314)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4317)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4318)	P	P	Specifies the font color of the text for the selected object.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4340)	P	P	Specifies the horizontal alignment of the text within the selected object.
Index (Page 4344)	P	P	Specifies the background for grid control elements.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	-	-	Specifies the shape of the line ends.
LogOperation (Page 4386)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Name (Page 4417)	P	-	Returns the object name as STRING.
ProcessValue (Page 4461)	P	P	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
ShowBadTagState (Page 4516)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
Text (Page 4572)	P	P	Specifies the label for the text field.
TextOrientation (Page 4576)	P	P	Specifies the text orientation of the selected object.
Texts	-	-	Specifies the texts for the check boxes.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 4701)	P	P	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-84 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-85 Properties

Properties	Read	Write	Description
ActualPointIndex (Page 4154)	P	P	Specifies the number of the current corner point of the selected object.
ActualPointLeft (Page 4154)	P	P	Specifies the X coordinate of the current corner point with reference to the screen origin.
ActualPointTop (Page 4155)	P	P	Specifies the Y coordinate of the current corner point with reference to the screen origin.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P, A	P, A	Defines the fill pattern of the specified object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P, A	P, A	Specifies the line thickness of the object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
EdgeStyle (Page 4274)	A	A	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.

Properties	Read	Write	Description
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
Points	-	-	Specifies the corner points.
PointsCount (Page 4458)	P	-	Specifies the number of corner points of the polyline or of the polygon.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
RotationAngle (Page 4472)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 4473)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 4474)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-86 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Properties	Read	Write	Description
ActualPointIndex (Page 4154)	P	P	Specifies the number of the current corner point of the selected object.
ActualPointLeft (Page 4154)	P	P	Specifies the X coordinate of the current corner point with reference to the screen origin.
ActualPointTop (Page 4155)	P	P	Specifies the Y coordinate of the current corner point with reference to the screen origin.

Properties	Read	Write	Description
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BorderEndStyle (Page 4205)	P; A	P	Specifies the type of line ends for the selected object.
BorderStyle (Page 4213)	P, A	P	Specifies the type of border lines for the selected object.
Color (Page 4236)	P, A	P, A	Specifies the line color of the selected object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
EndStyle (Page 4283)	A	A	Specifies how the line end of the selected object is displayed.
FillStyle (Page 4297)	A	A	Defines the fill pattern of the specified object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
LineWidth (Page 4381)	P, A	P, A	Specifies the line thickness of the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
Points	-	-	Specifies the corner points.
PointsCount (Page 4458)	P	-	Specifies the number of corner points of the polyline or of the polygon.
RotationAngle (Page 4472)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 4473)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 4474)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
StartStyle (Page 4545)	A	A	Specifies how the line start of the selected object is displayed.
Style (Page 4560)	A	A	Specifies the line style of the selected object.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-97 Properties

Properties	Read	Write	Description
AllowEdit	-	-	Enables editing.
Authorization (Page 4175)	-	-	Specifies the operating rights of the selected object in runtime.
BackButtonVisible	-	-	Enables display of the "Back" button.
BackColor (Page 4183)	A	A	Specifies the background color of the selected object.
ComboBoxFont	-	-	Sets the font type for selection list.
DataRecordNameCaption	-	-	Sets the caption for the name of the data record.
DataRecordNrCaption	-	-	Sets the caption for the number of the data record.
Display3D	-	-	Sets the 3D view.
DisplayButton2Plc	-	-	Enables the display of the "Write to PLC" button.
DisplayButtonComparison	-	-	Enables the display of the "Synchronization" button.
DisplayButtonDelete	-	-	Enables the display of the "Delete data record" button.
DisplayButtonFromPlc	-	-	Enables the display of the "Read from PLC" button.
DisplayButtonHelp	-	-	Enables the display of the "Tooltip" button.
DisplayButtonNew	-	-	Enables the display of the "Add data record" button.
DisplayButtonSave	-	-	Enables the display of the "Save" button.
DisplayButtonSaveAs	-	-	Enables the display of the "Save As" button.
DisplayComboBox	-	-	Enables the display of the selection list.
DisplayGridlines	-	-	Enables the display of grid lines.
DisplayLabeling	-	-	Enables the display labelings.
DisplayNumbers	-	-	Enables the display of numbers.
DisplaySize *	-	-	
DisplayStatusBar	-	-	Specifies that the status bar is displayed.
DisplayTable	-	-	Enablers the display of the table.
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.
EntryNameCaption	-	-	Sets the caption for the name of the recipe element.
EntryValueColFirst	-	-	Sets the "Entry value" column to first place.
EntryValueFieldLength	-	-	Sets the field length for the element value.
EntryValuePos	-	-	Sets the position of the first value.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
FixedRecipeNumber *	-	-	
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
FocusColor (Page 4309)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 4311)	-	-	Specifies or returns the font.
ForeColor (Page 4319)	A	A	Specifies the font color of the text for the selected object.
HeaderFont	-	-	Sets the header font.
Height (Page 4327)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
KeyboardOnline	-	-	Enables the use of key combinations.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
ListAreaHeight	-	-	
ListAreaWidth	-	-	
MenuButtonVisible	-	-	Enables visibility of the menu buttons.
Name (Page 4417)	A	-	Returns the object name as STRING.
NameColumnWidth	-	-	
NumberOfLines	-	-	Sets the number of rows of the selection list for the text list object, or returns the value.
Recipe	-	-	Sets the recipe.
RecipeNameCaption	-	-	Sets the caption for the name of the recipe.
RecipeNameSelected *	-	-	
RecipeNrCaption	-	-	Specifies that the "Recipe number" column is in first place.
RecipeNrColFirst	-	-	Specifies that the "Recipe number" column is in first place.
RecipeVarSelected *	-	-	
Record *	-	-	
RecordNameSelected *	-	-	
RecordNrColFirst	-	-	Specifies that the "Data record number" column is in first place.
RecordVarSelected *	-	-	
RenameButtonVisible	-	-	Enables the display of the "Rename" button.
SelectionBackColor (Page 4499)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 4501)	A	A	Specifies the foreground color of the selected cells.
StatusFont	-	-	
TableBackColor (Page 4563)	A	A	Specifies the background color of the table cells for the selected object.
TableForeColor (Page 4566)	A	A	
TableGridlineColor (Page 4567)	A	A	Specifies the color for the grid lines.
TableHeaderBackColor (Page 4568)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderForeColor (Page 4569)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
ValueCaption	-	-	Sets the labeling for values.
ValueColumnWidth	-	-	

Properties	Read	Write	Description
VerticalScrolling	-	-	Sets the display of a scroll bar for the selected object.
ViewType	-	-	Specifies the alarm view type.
ViewTypeForSaveStream *	-	-	Specifies the display type for the Save Stream.
Visible (Page 4703)	A	A	Specifies whether the selected object is visible.
VisibleItems	-	-	Sets the maximum number of visible entries.
Width (Page 4714)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Properties	Read	Write	Description
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P, A	P, A	Specifies the line thickness of the object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	A	A	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
RoundCornerHeight (Page 4474)	P	P	Sets or returns the corner radius.
RoundCornerWidth (Page 4475)	P	P	Sets or returns the corner radius.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-100 Methods

Methods	Validity	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-101 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4188)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderBrightColor3D (Page 4200)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderShadeColor3D (Page 4212)	P	P	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
BorderWidth3D (Page 4218)	P	P	Specifies the width of the border for 3D display of the selected object.
CornerStyle (Page 4250) *	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	P	P	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.

Properties	Read	Write	Description
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4311)	-	-	Specifies or returns the font.
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4314)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4317)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4318)	P	P	Specifies the font color of the text for the selected object.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4340)	P	P	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380) *	-	-	Specifies the shape of the line ends.
Mode (Page 4415)	P	P	Specifies the field type of the selected object.
Name (Page 4417)	P	-	Returns the object name as STRING.
PictureAlignment (Page 4454)	P	P	Specifies or returns the display type of the background image in the process picture.
PictureDeactivated (Page 4454)	P	P	Specifies the picture that is displayed in the "Disabled" state.
PictureOff (Page 4455)	P	P	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 4455)	P	P	Specifies the screen to be displayed in the "On" state.
Pressed (Page 4459)	P	P	Specifies whether the selected object is displayed in a pressed state.
Radius (Page 4465)	P	P	Sets the radius of the specified "Circle" object.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 4561)	P	P	Specifies the display style for the object:
Text (Page 4572)	P	P	Specifies the label for the text field.
TextOrientation (Page 4576)	P	P	Specifies the text orientation of the selected object.
Toggle (Page 4610)	P	P	Specifies whether the selected object engages after it has been operated in runtime.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.

Properties	Read	Write	Description
TransparentColorDeactivatedPictu re (Page 4635)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOff (Page 4636)	P	P	Specifies the color to be set to "transparent" for the "Off" state of the assigned bitmap object.
TransparentColorPictureOn (Page 4636)	P	P	Specifies the color to be set to "transparent" for the "On" state of the assigned bitmap object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
UseTransparentColorDeactivatedP icture (Page 4686)	P	P	Enables the use of the transparency color specified with the "TransparentColorDeactivatedPicture" property for the "Disabled" state.
UseTransparentColorPictureOff (Page 4686)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOff" property is used for the "Off" state.
UseTransparentColorPictureOn (Page 4687)	P	P	Specifies whether the transparent color defined in the "TransparentColorPictureOn" property is used for the "On" state.
VerticalAlignment (Page 4701)	P	P	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-102 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-103 Properties

Properties	Read	Write	Description
AdaptScreenToWindow (Page 4157)	-	-	Specifies whether or not the screen visualized in a screen window is adapted to fit the size of the screen window in runtime.
AdaptWindowToScreen (Page 4157)	-	-	Specifies whether or not the screen window is adapted to fit the screen it visualizes in runtime.
BorderEnabled (Page 4204)	-	-	TRUE, if the window is visualized with a border in runtime.

Properties	Read	Write	Description
CaptionText (Page 4224)	P	P	Specifies the text that is displayed in the header of the selected object.
Flashing *	-	-	Specifies that the text block flashes.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalScrollbarPosition (Page 4342)	P	P	Sets horizontal positioning of the scroll bar in a screen window with slider, or returns its value.
IndependentWindow	-	-	Specifies whether the screen window is embedded in a screen or displayed as independent screen window.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LeftOffset (Page 4369)	P	P	Sets horizontal shift of the display of a graphic object that is larger than the screen window.
MenuToolBarConfig (Page 4396)	-	-	Loads the specified configuration file with configured menu and toolbars, or returns the name of the configuration file.
MonitorNumber	-	-	Sets the monitor number.
Name (Page 4417)	P	-	Returns the object name as STRING.
ScreenName (Page 4489)	P	P	Specifies the screen to be displayed in the screen window, or returns the screen name.
ShowCaption (Page 4517)	-	-	Hides or shows the caption.
ShowScrollBars (Page 4527)	-	-	Enables the display of scroll bars.
TagPrefix (Page 4570)	P	P	Sets the prefix for all tags that exist in the screen.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
TopOffset (Page 4632)	P	P	Sets or returns the offset of the screen from the top edge of the screen window.
VerticalScrollbarPosition (Page 4703)	P	P	Specifies the vertical positioning of the scroll bar in a screen window with slider, or returns its value.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowCloseEnabled (Page 4716)	-	-	Enables closing of the window in runtime.
WindowMaximizeEnabled (Page 4717)	-	-	TRUE, if the window can be maximized in runtime.
WindowMovingEnabled (Page 4717)	-	-	TRUE, if the window can be moved in runtime.
WindowOnTop (Page 4717)	-	-	TRUE, if the object is always in the foreground in runtime.
WindowSizingEnabled (Page 4718)	-	-	Enables resizing of the specified object in runtime.
WindowStartupPosition	-	-	??
ZoomFactor (Page 4743)	P	P	Sets or reads the zoom factor of a screen or screen window.

* not visible in the ES

Table 10-104 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-107 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackPicture	-	-	Specifies a graphic for the background.

Properties	Read	Write	Description
BarBackColor (Page 4191)	P, A	P, A	Specifies the color of the bar background for the selected object.
BarColor (Page 4193)	P, A	P, A	Sets the color of the slider in the "Slider" object.
BorderBrightColor3D (Page 4200)	P, A	P, A	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderInnerStyle3D (Page 4210)	P	P	Specifies the representation of the inner part of the object border.
BorderInnerWidth3D (Page 4210)	P, A	P, A	Specifies the width of the inner border for 3D presentation of the selected object.
BorderOuterStyle3D (Page 4211)	P	P	Specifies the representation of the outer part of the object border.
BorderOuterWidth3D (Page 4211)	P, A	P, A	Sets the width of the outer border for 3D presentation of the selected object.
BorderShadeColor3D (Page 4212)	P, A	P, A	Specifies the border color of the following border parts in the 3D display of the selected object.
BorderWidth (Page 4216)	P, A	P, A	Specifies the line thickness of the object.
Caption (Page 4221)	P, A	P, A	Specifies the text that is displayed in the header of the selected object.
ContinousChange (Page 4249)	P	P	Specifies whether to transfer the value of the "ProcessValue" when the mouse button is released, or immediately on a change of the slider position in runtime.
Enabled (Page 4277)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 4308)	P, A	P, A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	P, A	P, A	Specifies the border width of the specified object when the object is in focus.
Font	-	-	Specifies or returns the font.
ForeColor (Page 4318)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
LabelColor (Page 4350)	P, A	P, A	Sets the color of the scale labeling in the "Slider" object.
Layer (Page 4355)	-	-	Specifies the value of the X coordinate of the object.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
MaximumValue (Page 4392)	P, A	P, A	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 4413)	P, A	P, A	Specifies the minimum value of the scale in the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
PositionFont	-	-	Sets the font type for the labeling.
ProcessValue (Page 4461)	P, A	P, A	Specifies the default for the value to be displayed.
ShowBar (Page 4516)	P, A	P, A	Specifies whether to display the process value along with a filled bar in the "Slider" object.
ShowPosition (Page 4524)	P, A	P, A	Adds a numerical display of the value of the slider position.
ShowThumb (Page 4532)	P, A	P, A	Displays the slider of the "Slider" object.
ShowTickLabels (Page 4532)	P, A	P, A	Specifies whether the label is shown in the scale.

Properties	Read	Write	Description
ShowTicks (Page 4533)	P, A	P, A	Specifies whether the tick marks are displayed in the scale of the object.
ThumbBackColor (Page 4577)	P, A	P, A	Specifies the background color of the slider in the "Slider" object.
ThumbPicture	-	-	Specifies a graphic object for the slider.
TickStyle (Page 4579)	P	P	Specifies the scale display.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-108 Methods

Methods	Validity	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-109 Properties

Properties	Read	Write	Description
AllowMenu (Page 4169)	-	-	Specifies whether the shortcut menu is enabled to control the Sm@rtClient view.
ConnectionType (Page 4248)	-	-	Specifies the type of connector. You can select one of two connection types.
ConnectOnStart	-	-	Sets up the connection at startup.

Properties	Read	Write	Description
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.
Flashing	-	-	Specifies that the text block flashes.
Font (Page 4311)	-	-	Specifies or returns the font.
Height (Page 4327)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
LocalCursor (Page 4384)	-	-	Specifies whether the cursor data is transferred separately in order to increase the performance.
MachineName (Page 4391)	A	A	Sets the network ID of the device that is to be monitored.
Name (Page 4417)	A	-	Returns the object name as STRING.
Password (Page 4447)	A	A	Sets the password for remote monitoring.
ScaleDenominator (Page 4487)	-	-	Sets the scaling numerator on the client.
ScaleNumerator (Page 4483)	-	-	Sets the scaling numerator on the client.
Scaling (Page 4487)	-	-	TRUE, if an additional scale is used to visualize the values.
ServerScale (Page 4507)	-	-	Specifies whether the Sm@rtClient view can be zoomed in or out.
Shared (Page 4513)	-	-	Specifies that an HMI device is shared by several Sm@rtClient Views.
ShowControls	-	-	Specifies that a toolbar is displayed.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
UseCursorKeyScroll	-	-	Sets the use of the background color of the object for printing.
ViewOnly (Page 4703)	A	A	Enables the use of the Sm@rtClient view for remote monitoring or remote maintenance.
Visible (Page 4703) *	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-111 Properties

Properties	Read	Write	Description
Appearance	-	-	Specifies the layout for this NC subroutine.
BackColor (Page 4183)	A	A	Specifies the background color of the selected object.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 4253) *	-	-	Specifies the number of lines contained in the selection list.
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.

Properties	Read	Write	Description
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 4309)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	A	A	Specifies the border width of the specified object when the object is in focus.
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
Name (Page 4417)	A	-	Returns the object name as STRING.
PLCFilter	-	-	Sets the controller type.
SelectionBackColor (Page 4499)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 4501)	A	A	Specifies the foreground color of the selected cells.
SetOfVisibleColumns	-	-	Sets the visible columns.
ShowReadButton	-	-	Enables the display of the "Read" button.
ShowTableGridlines (Page 4531)	A	A	Enables the display of gridlines in the table of the specified object.
ShowWriteButton	-	-	Enables the display of the "Write" button.
TableBackColor (Page 4563)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor (Page 4566)	A	A	??
TableHeaderBackColor (Page 4568)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 4569)	A	A	Specifies the text color in the header of the table of the selected object.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
Visible (Page 4703) *	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

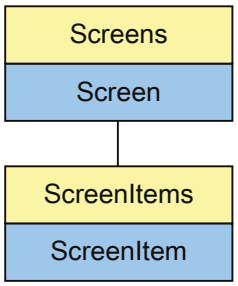
Description



Represents the "Switch" object. The Switch object is an element of the ScreenItems list.

The availability of the following object properties depends on the selected mode:

Property	"Switch with text"	"Switch with graphic"	"Switch"
CaptionColor	--	--	x
CaptionText	--	--	x
HorizontalAlignment	X	--	--
InnerBackColorOff	--	--	x
InnerBackColorOn	--	--	x
TextOn	x	--	x
TextOff	x	--	x
VerticalAlignment	x	--	--

Table 10-113 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4147)	-	-	Sets the color of the specified object for the "High limit violated" event.
Authorization (Page 4175)	-	-	Specifies the operating rights of the selected object in runtime.
AutoSizing	-	-	Specifies that the size of the object should be automatically adapted to the content.
BackColor (Page 4181)	A	A	Specifies the background color of the selected object.
BackFlashingColorOff (Page 4188) *	-	-	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188) *	-	-	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189) *	-	-	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190) *	-	-	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 4196)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BorderColor (Page 4202) *	-	-	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207) *	-	-	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209) *	-	-	Specifies the flash rate of the border line for the selected object.
BorderStyle3D (Page 4215)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4216) *	-	-	Specifies the line thickness of the object.
BorderWidth3D (Page 4218) *	-	-	Specifies the width of the border for 3D display of the selected object.
CaptionColor (Page 4223)	A	A	Specifies the color of the text that is displayed in the header of the selected object.
CaptionFont	-	-	Specifies the character set for the caption.

Properties	Read	Write	Description
CaptionText (Page 4224)	A	A	Specifies the text that is displayed in the header of the selected object.
CornerStyle (Page 4250) *	-	-	Specifies the type of border lines for the selected object.
EdgeStyle (Page 4273) *	-	-	Specifies the line style of the selected object.
Enabled (Page 4277)	A	A	Specifies whether the selected object can be operated in runtime.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300) *	-	-	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302) *	-	-	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303) *	-	-	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4304) *	-	-	Specifies the flash rate of the border line for the selected object.
FocusColor (Page 4308)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 4311)	-	-	Specifies or returns the font.
ForeColor (Page 4318)	A	A	Specifies the font color of the text for the selected object.
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4330)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
HorizontalAlignment (Page 4340)	A	A	Specifies the horizontal alignment of the text within the selected object.
InnerBackColorOff (Page 4345)	A	A	Sets the color underneath the slider of the "Switch" object for the object in OFF state.
InnerBackColorOn (Page 4346)	A	A	Sets the color underneath the slider of the "Switch" object for the object in ON state.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380) *	-	-	Specifies the shape of the line end.
Mode (Page 4415)	-	-	Specifies the field type of the selected object.
Name (Page 4417)	A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
PictureOff (Page 4455)	-	-	Specifies the screen to be displayed in the "Off" state.
PictureOn (Page 4455)	-	-	Specifies the screen to be displayed in the "On" state.
ProcessValue (Page 4463)	-	-	Specifies the default for the value to be displayed.
SwitchOrientation	-	-	Specifies the line color of the object.

Properties	Read	Write	Description
TextOff (Page 4574)	A	A	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn (Page 4575)	A	A	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 4576) *	-	-	Specifies the text orientation of the selected object.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
VerticalAlignment (Page 4701)	A	A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703) *	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-115 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4147)	-	-	Sets the color of the specified object for the "High limit violated" event.
AcceptOnExit (Page 4148)	P	P	Specifies whether the input field is confirmed automatically when it is left.
AdaptBorder (Page 4156)	-	-	Specifies whether the border of the specified object is dynamically adapted to the text size.
AskOperationMotive (Page 4173)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4188)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190)	P	P	Specifies the flash rate of the background for the selected object.
BelowLowerLimitColor (Page 4196)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BitNumber (Page 4197)	P	P	Specifies the bit whose status must change to trigger a value change.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4215)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4216)	P, A	P, A	Specifies the line thickness of the object.
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.

Properties	Read	Write	Description
CaptionBackColor (Page 4222)	P	P	Specifies the background color of the caption for the selected object.
CaptionColor (Page 4223)	P	P	Specifies the color of the text that is displayed in the header of the selected object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
CountVisibleItems (Page 4253)	P	P	Specifies the number of lines contained in the selection list.
CursorControl (Page 4256)	P	P	Specifies whether the mouse cursor jumps to the next field of the TAB sequence after leaving a field.
DrawInsideFrame (Page 4270)	-	-	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	P	P	Specifies the line style of the selected object.
EditOnFocus (Page 4276)	P	P	Specifies whether data input is immediately possible if the input field is selected using the "Tab" key.
Enabled (Page 4277)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FieldLength	-	-	Specifies that the "field length string" field is read-only.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
FocusColor (Page 4308)	-	-	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	-	-	Specifies the border width of the specified object when the object is in focus.
Font (Page 4311)	-	-	Specifies or returns the font.
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4314)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4317)	P	P	Specifies whether the text of the selected object is underlined.
ForeColor (Page 4318)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4330)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.

Properties	Read	Write	Description
HorizontalAlignment (Page 4340)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
InputValue (Page 4346)	-	-	Defines the value entered by the user in the IO field.
ItemBorderStyle (Page 4349)	P	P	Sets the separation line style in the selection list of the specified object.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	-	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
LogOperation (Page 4386)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
Mode (Page 4415)	P	P	Specifies the field type of the selected object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
OnValue	-	-	Specifies the value for the "ON" state in "two-state" mode.
ProcessValue (Page 4461)	P	P	Specifies the default for the value to be displayed.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
SelectBackColor (Page 4493)	P	P	Specifies the background color of the selected cells.
SelectForeColor (Page 4497)	P	P	Specifies the foreground color of the selected cells.
SeparatorBackColor (Page 4505)	P	P	Specifies the background color of the broken separation lines in the selection list of the specified object.
SeparatorColor (Page 4505)	P	P	Sets the color of the separation lines in the selection list of the specified object.
SeparatorCornerStyle (Page 4506)	P	P	Sets the shape of corners for the object of the type "ScreenItem" with "SymbolicIOField" format.
SeparatorLineEndShapeStyle (Page 4507)	P	P	Sets the shape of line ends for the object of the type "ScreenItem" with "SymbolicIOField" format.
SeparatorStyle (Page 4506)	P	P	Sets the separation line style in the selection list of the specified object.
SeparatorWidth (Page 4507)	P	P	Sets the width separation lines in the selection list of the specified object.
ShowBadTagState (Page 4516)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowDropDownButton	-	-	Sets the display of a button for the selection list.
ShowDropDownList	-	-	Specifies selection of the entry from a selection list.
TextList (Page 4573)	-	-	Specifies the label for the text field.
TextOff (Page 4574)	-	-	Specifies the text to be displayed in the "Off" state of the selected object.
TextOn (Page 4575)	-	-	Specifies the text to be displayed in the "On" state of the selected object.
TextOrientation (Page 4576)	P	P	Specifies the text orientation of the selected object.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.

Properties	Read	Write	Description
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 4701)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-116 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-117 Properties

Properties	Read	Write	Description
AboveUpperLimitColor (Page 4147)	-	-	Sets the color of the specified object for the "High limit violated" event.
Authorization (Page 4175)	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.

Properties	Read	Write	Description
BelowLowerLimitColor (Page 4196)	-	-	Sets the color of the specified object for the "Low limit violated" event.
BlinkColor (Page 4197)	P, A	P, A	Sets the flashing color for the "SymbolLibrary" object.
BlinkMode (Page 4198)	P	P	Sets the type of flashing graphic for the specified object.
BlinkSpeed (Page 4199)	P	P	Sets the flash rate.
ChangeMouseCursor (Page 4231)	P	P	Specifies the appearance of the cursor after its transformation in mouse over icon mode in runtime.
Enabled (Page 4277)	P, A	P, A	Specifies whether the selected object can be operated in runtime.
FillColorMode (Page 4295)	P	P	Sets the type of foreground for the specified object.
FixedAspectRatio (Page 4299)	P	P	Specifies whether the aspect ratio should be retained on changes of the icon size, or follow the change dynamically.
Flashing	-	-	Specifies that the text block flashes.
FlashingOnLimitViolation	-	-	Specifies that flashing is activated when a limit is violated.
Flip (Page 4308)	P	P	Flips the symbol on the vertical and / or horizontal center axis of the icon.
ForeColor (Page 4318)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
ProcessValue (Page 4463)	-	-	Specifies the default for the value to be displayed.
Rotation (Page 4472)	P	P	Specifies the angle of rotation in degrees of the selected object.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-118 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-119 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	A	A	Specifies the operating rights of the selected object in runtime.
BackgroundColor	A	A	Specifies the background color.
ComponentInfoText	A	A	Specifies the tooltip of the system diagnostics view in runtime.

Properties	Read	Write	Description
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
InfoArea_BackgroundColor	A	A	Specifies the background for grid control elements.
InfoArea_ColumnsMovable	A	A	Specifies the mobility of columns.
InfoArea_DefaultTextColor	A	A	Sets the text color.
InfoArea_ErrorTextBackgroundColor	A	A	Specifies the background color of a cell in error case.
InfoArea_ErrorTextColor	A	A	Sets the text color of a cell in error case.
InfoArea_FocusFrameColor	A	A	Sets the color of the focus frame.
InfoArea_FocusFrameWidth	A	A	Sets the line thickness of the focus rectangle.
InfoArea_Font	A	A	Sets the fonts of the grid views.
InfoArea_ShowGridLines	A	A	Sets the grid lines.
InfoArea_TableHeaderBackgroundColor	A	A	Specifies the background color of the table header.
InfoArea_TableHeaderTextColor	A	A	Sets the text color of the table header.
InputAddressText	A	A	Sets the input address.
ItemText_AKZ	A	A	Specifies the header for the "AKZ" column.
ItemText_Descriptor	A	A	Specifies the header for the "Descriptor" column.
ItemText_ErrorText	A	A	Specifies the header for the "ErrorText" column.
ItemText_InstallationDate	A	A	Specifies the header for the "InstallationDate" column.
ItemText_LADDR	A	A	Specifies the header for the "LADDR" column.
ItemText_Name	A	A	Sets the labeling of the "Name" column.
ItemText_OKZ	A	A	Specifies the header for the "OKZ" column.
ItemText_OperationState	A	A	Specifies the header for the "OperationState" column.
ItemText_OrderID	A	A	Specifies the header for the "OrderID" column.
ItemText_Rack	A	A	Specifies the header for the "Rack" column.
ItemText_Slot	A	A	Specifies the header for the "Slot" column.
ItemText_SoftwareRevision	A	A	Specifies the header for the "SoftwareRevision" column.
ItemText_State	A	A	Specifies the header for the "State" column.
ItemText_Station	A	A	Specifies the header for the "Station" column.
ItemText_SubAddress	A	A	Specifies the header for the "SubAddress" column.
ItemText_SubSlot	A	A	Specifies the header for the "SubSlot" column.
ItemText_SubSystem	A	A	Specifies the header for the "SubSystem" column.
ItemText_Type	A	A	Specifies the header for the "Type" column.
IV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
IV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
IV_ShowItem_ErrorText	A	A	Enables the display of the "ErrorText" column.
IV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
IV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
IV_ShowItem_Name	A	A	Enables the display of the "Name" column.
IV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
IV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.

Properties	Read	Write	Description
IV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
IV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
IV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
IV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
IV_ShowItem_State	A	A	Enables the display of the "State" column.
IV_ShowItem_Station	A	A	Enables the display of the "Station" column.
IV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
IV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
IV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
IV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Layer (Page 4355)	A	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
NavigationPath_Font	A	A	Sets the font type of the navigation path.
NavigationPath_TextColor	A	A	Sets the text color of the navigation path.
ObjectName (Page 4424)	A	-	Returns the object name as STRING.
OutputAddressText	A	A	Specifies the text for the output address.
ShowNavigationButtons	A	A	Enables the display of navigation buttons.
ShowPathInformation	A	A	Enables the display of the navigation path.
ShowSplittedView	A	A	Enables a split view.
TableHeaderFont	A	A	Specifies the text color of the header.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
Type (Page 4664)	A	-	Returns the type of the specified object as STRING.
Parent (Page 4445)	A	-	Returns the screen in which the specified object is embedded.
UV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
UV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
UV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
UV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
UV_ShowItem_Name	A	A	Enables the display of the "Name" column.
UV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
UV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
UV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
UV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
UV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
UV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
UV_ShowItem_State	A	A	Enables the display of the "State" column.
UV_ShowItem_Station	A	A	Enables the display of the "Station" column.
UV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
UV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
UV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
UV_ShowItem_Type	A	A	Enables the display of the "Type" column.

Properties	Read	Write	Description
Visible (Page 4703)	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	A	Enables the display of the "Slot" column.

Table 10-120 Methods

Table 10-121 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	A	A	Specifies the operating rights of the selected object in runtime.
BackgroundColor	A	A	Specifies the background color.
Caption (Page 4221)	A	A	Specifies the text that is displayed in the header of the selected object.
CaptionActive	A	A	Enables display of the caption.
Closable (Page 4236)	A	A	Specifies that the control can be closed in runtime.
ComponentInfoText	A	A	Specifies the tooltip of the system diagnostics view in runtime.
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
InfoArea_BackgroundColor	A	A	Specifies the background for grid control elements.
InfoArea_ColumnsMovable	A	A	Specifies the mobility of columns.
InfoArea_DefaultTextColor	A	A	Sets the text color.
InfoArea_ErrorTextBackgroundColor	A	A	Specifies the background color of a cell in error case.
InfoArea_ErrorTextColor	A	A	Sets the text color of a cell in error case.
InfoArea_FocusFrameColor	A	A	Sets the color of the focus frame.
InfoArea_FocusFrameWidth	A	A	Sets the line thickness of the focus rectangle.
InfoArea_Font	A	A	Sets the fonts of the grid views.
InfoArea_ShowGridLines	A	A	Sets the grid lines.
InfoArea_TableHeaderBackgroundColor	A	A	Specifies the background color of the table header.
InfoArea_TableHeaderTextColor	A	A	Sets the text color of the table header.
InputAddressText	A	A	Sets the input address.
ItemText_AKZ	A	A	Specifies the header for the "AKZ" column.
ItemText_Descriptor	A	A	Specifies the header for the "Descriptor" column.
ItemText_ErrorText	A	A	Specifies the header for the "ErrorText" column.
ItemText_InstallationDate	A	A	Specifies the header for the "InstallationDate" column.
ItemText_LADDR	A	A	Specifies the header for the "LADDR" column.

Properties	Read	Write	Description
ItemText_Name	A	A	Sets the labeling of the "Name" column.
ItemText_OKZ	A	A	Specifies the header for the "OKZ" column.
ItemText_OperationState	A	A	Specifies the header for the "OperationState" column.
ItemText_OrderID	A	A	Specifies the header for the "OrderID" column.
ItemText_Rack	A	A	Specifies the header for the "Rack" column.
ItemText_Slot	A	A	Specifies the header for the "Slot" column.
ItemText_SoftwareRevision	A	A	Specifies the header for the "SoftwareRevision" column.
ItemText_State	A	A	Specifies the header for the "State" column.
ItemText_Station	A	A	Specifies the header for the "Station" column.
ItemText_SubAddress	A	A	Specifies the header for the "SubAddress" column.
ItemText_SubSlot	A	A	Specifies the header for the "SubSlot" column.
ItemText_SubSystem	A	A	Specifies the header for the "SubSystem" column.
ItemText_Type	A	A	Specifies the header for the "Type" column.
IV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
IV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
IV_ShowItem_ErrorText	A	A	Enables the display of the "ErrorText" column.
IV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
IV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
IV_ShowItem_Name	A	A	Enables the display of the "Name" column.
IV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
IV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
IV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
IV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
IV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
IV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
IV_ShowItem_State	A	A	Enables the display of the "State" column.
IV_ShowItem_Station	A	A	Enables the display of the "Station" column.
IV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
IV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
IV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
IV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Layer (Page 4355)	A	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
Modal	A	A	Specifies that you must acknowledge the alarm view before continuing with your work.
NavigationPath_Font	A	A	Sets the font type of the navigation path.
NavigationPath_TextColor	A	A	Sets the text color of the navigation path.
ObjectName (Page 4424)	A	-	Returns the object name as STRING.
OutputAddressText	A	A	Specifies the text for the output address.
Resizable	A	A	Enables resizing of the window.
ShowNavigationButtons	A	A	Enables the display of navigation buttons.
ShowPathInformation	A	A	Enables the display of the navigation path.

Properties	Read	Write	Description
ShowSplittedView	A	A	Enables a split view.
TableHeaderFont	A	A	Specifies the text color of the header.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
Type (Page 4664)	A	-	Returns the type of the specified object as STRING.
Parent (Page 4445)	A	-	Returns the screen in which the specified object is embedded.
UV_ShowItem_AKZ	A	A	Enables the display of the "AKZ" column.
UV_ShowItem_Descriptor	A	A	Enables the display of the "Descriptor" column.
UV_ShowItem_InstallationDate	A	A	Enables the display of the "InstallationDate" column.
UV_ShowItem_LADDR	A	A	Enables the display of the "LADDR" column.
UV_ShowItem_Name	A	A	Enables the display of the "Name" column.
UV_ShowItem_OKZ	A	A	Enables the display of the "OKZ" column.
UV_ShowItem_OperationState	A	A	Enables the display of the "OperationState" column.
UV_ShowItem_OrderID	A	A	Enables the display of the "OrderID" column.
UV_ShowItem_Rack	A	A	Enables the display of the "Rack" column.
UV_ShowItem_Slot	A	A	Enables the display of the "Slot" column.
UV_ShowItem_SoftwareRevision	A	A	Enables the display of the "SoftwareRevision" column.
UV_ShowItem_State	A	A	Enables the display of the "State" column.
UV_ShowItem_Station	A	A	Enables the display of the "Station" column.
UV_ShowItem_SubAddress	A	A	Enables the display of the "SubAddress" column.
UV_ShowItem_SubSlot	A	A	Enables the display of the "SubSlot" column.
UV_ShowItem_SubSystem	A	A	Enables the display of the "SubSystem" column.
UV_ShowItem_Type	A	A	Enables the display of the "Type" column.
Visible (Page 4703)	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowMode	A	A	Sets the window mode.

Table 10-122 Methods

Methods	Valid	Description
Activate (Page 4744)	A	Activates the permanent window or the root screen.

Table 10-123 Properties

Properties	Read	Write	Description
AdaptBorder (Page 4156)	P	P	Specifies whether the border of the specified object is dynamically adapted to the text size.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P, A	P, A	Specifies the background color of the selected object.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4188)	P	P	Specifies the background color for flash state "Off".

Properties	Read	Write	Description
BackFlashingColorOn (Page 4188)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P, A	P, A	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderStyle3D (Page 4215)	A	A	Specifies whether the object has a 3D border shading.
BorderWidth (Page 4216)	P, A	P, A	Specifies the line thickness of the object.
BottomMargin	-	-	Sets the margin between the text and the bottom edge of the object.
CornerStyle (Page 4250)	P	P	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.
EdgeStyle (Page 4274)	A	A	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
FitToLargest	-	-	Specifies that the size of the object depends on the text length in all languages.
Flashing	-	-	Specifies that the text block flashes.
FlashingColorOff (Page 4300)	P	P	Specifies the border line color of the selected object for the flash state "Off".
FlashingColorOn (Page 4302)	P	P	Specifies the border line color of the selected object for the flash state "On".
FlashingEnabled (Page 4303)	P	P	Specifies whether the border line of the selected object flashes in runtime.
FlashingRate (Page 4304)	P	P	Specifies the flash rate of the border line for the selected object.
Font (Page 4311)	-	-	Specifies or returns the font.
FontBold (Page 4313)	P	P	Specifies whether the text of the selected object is shown in bold.
FontItalic (Page 4314)	P	P	Specifies whether the text of the selected object is shown in italics.
FontName (Page 4315)	P	P	Specifies the font of the selected object.
FontSize (Page 4316)	P	P	Specifies the font size of the text for the selected object.
FontUnderline (Page 4317)	P	P	Specifies whether the text of the selected object is underlined.

Properties	Read	Write	Description
ForeColor (Page 4318)	P, A	P, A	Specifies the font color of the text for the selected object.
Height (Page 4327)	P, A	P, A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalAlignment (Page 4340)	P, A	P, A	Specifies the horizontal alignment of the text within the selected object.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P, A	P, A	Specifies the value of the X coordinate of the object.
LeftMargin	-	-	Sets the margin between the text and the left edge of the object.
LineEndShapeStyle (Page 4380)	P	P	Specifies the shape of the line end.
LineWrap *	-	-	Specifies the line break within the object.
Name (Page 4417)	P, A	-	Returns the object name as STRING.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
RightMargin	-	-	Sets the margin between the text and the right edge of the object.
RotationAngle (Page 4472)	P	P	Specifies the angle of rotation in degrees.
RotationCenterLeft (Page 4473)	P	P	Specifies the X coordinate of the pivot point for the object in runtime.
RotationCenterTop (Page 4474)	P	P	Specifies the Y coordinate of the pivot point for the object in runtime.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
Text (Page 4572)	P, A	P, A	Specifies the label for the text field.
TextOrientation (Page 4576)	P	P	Specifies the text orientation of the selected object.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P, A	P, A	Specifies the value of the Y coordinate of the object.
TopMargin	-	-	Sets the margin between the text and the top edge of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
VerticalAlignment (Page 4701)	P, A	P, A	Specifies the vertical alignment of the text for the selected object.
Visible (Page 4703)	P, A	P, A	Specifies whether the selected object is visible.
Width (Page 4714)	P, A	P, A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-124 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

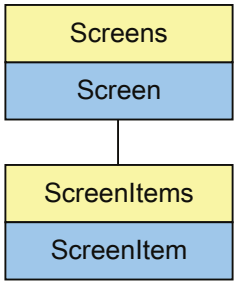
TrendRulerControl

Description



Represents the "Value table" object. The TrendRulerControl object is an element of the ScreenItems list.

Type identifier in VBS

HMITrendRulerControl

Example

In the following example, the object with the name "Control1" is moved 16 pixels to the right:

```
'VBS60
Dim objControl
Set objControl = ScreenItems("Control1")
objControl.Left = objControl.Left + 16
```

Abbreviation	Validity

P	Runtime Professional

Table 10-125 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode	-	-	Specifies that the project settings are used for the design.
AutoCompleteColumns (Page 4177)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 4177)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.
AutoPosition	P	P	Sets the automatic repositioning mode.
AutoSelectionColors (Page 4178)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 4179)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
AutoShow	P	P	Specifies the automatic display of the table of values.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BlockAlign *	P	P	Sets the alignment.
BlockAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
BlockCaption *	P	P	Sets the caption.
BlockCount *	P	P	Sets the number of blocks.
BlockDateFormat *	P	P	Specifies the date format.
BlockExponentialFormat *	P	P	Enables the use of the exponential notation.
BlockHideText *	P	P	Specifies whether the text is displayed.
BlockHideTitleText *	P	P	Specifies whether the text is displayed.
BlockId *	P	P	Sets the ID.
BlockIndex	P	P	The index specifies the block to which other properties such as names are referenced.
BlockLength *	P	P	Specifies the number of displayed characters.
BlockName *	P	P	Sets the name of a block.

Properties	Read	Write	Description
BlockPrecisions *	P	P	Specifies the number of displayed decimal places.
Blocks	-	-	Sets the alarm blocks.
BlockShowDate *	P	P	Specifies that the date is to be displayed.
BlockShowIcon *	P	P	Specifies the tootip text.
BlockShowTitleIcon *	P	P	Enables the display of title as icon.
BlockTimeFormat *	P	P	Specifies the time format.
BlockUseSourceFormat *	P	P	Enables the use of the source format.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
Caption (Page 4221)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 4225)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 4226)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 4227)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 4227)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 4228)	P	P	Specifies the top margin of the table cells.
Closeable (Page 4236)	P	P	Specifies that the control can be closed in runtime.
ColumnAdd *	P	P	Adds a column.
ColumnCount *	P	P	Displays the number of columns.
ColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ColumnName *	P	P	Specifies the name of a column.
ColumnRemove *	P	P	Removes a column.
ColumnRepos *	P	P	Repositions the column.
ColumnResize (Page 4242)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 4244)	P	P	Specifies the scroll bar type.
ColumnSort *	P	P	Sets the type of sorting.
ColumnSortIndex *	P	P	Specifies the sorting order.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.
ColumnTitles (Page 4245)	P	P	Specifies whether the column title is displayed.
ColumnVisible *	P	P	Enables the visibility of a column.
ControlDesignMode (Page 4538)	P	P	Specifies the design.
ExportDirectoryChangeable (Page 4286)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4286)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4287)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4288)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4288)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4289)	P	P	Default assignment of the ID number and export provider.

Properties	Read	Write	Description
ExportFormatName (Page 4289)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4290)	P	P	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4290)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportShowDialog (Page 4291)	P	P	Specifies whether the data export dialog is shown in runtime.
Font (Page 4311)	-	-	Specifies or returns the font.
GridLineColor (Page 4325)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 4326)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 4327)	P	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 4341)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 4344)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4379)	P	P	Sets the color of the window separation lines.
LineWidth (Page 4381)	P	P	Specifies the line thickness of the selected object.
Moveable (Page 4416)	P	P	Specifies whether the window can be moved in runtime.
Name (Page 4417)	P	-	Returns the object name as STRING.
PrintJob	P	P	Specifies a print job
RowScrollbar (Page 4475)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 4477)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistenceAuthorization	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4478)	-	-	Specifies how online configurations of WinCC are retained.
RulerType	P	P	Sets the ruler type.
SelectedCellColor (Page 4493)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 4494)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 4495)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 4495)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 4496)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 4497)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 4499)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 4502)	P	P	Specifies whether a selection frame is used for the selected cells or rows.

Properties	Read	Write	Description
SelectionRectColor (Page 4503)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 4504)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 4504)	P	P	Specifies the number of lines you can mark.
ShareSpaceWithSourceControl	P	P	Enables the display of the table of values in the visualization range of the data source.
ShowSortButton (Page 4528)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 4529)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 4530)	P	P	
ShowTitle (Page 4534)	P	P	Specifies the representation of the control's window title.
Sizeable (Page 4538)	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence (Page 4542)	P	P	Specifies how the sorting order can be changed by mouse click.
SourceControl	P	P	Sets the data source.
SourceControlType	P	P	Sets the data source type.
StatusbarBackColor (Page 4547)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 4547) *	P	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4548) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4548) *	P	P	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4549) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4549) *	P	P	Unique ID of the selected status bar element.
StatusbarElementIndex (Page 4550)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.
StatusbarElementName (Page 4550) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4551) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4551) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4552)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4552) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 4553) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined element.
StatusbarElementVisible (Page 4554) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.

Properties	Read	Write	Description
StatusbarElementWidth (Page 4554) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4554)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4557)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4558)	P	P	Default text in the status bar.
StatusbarUseBackColor (Page 4558)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4559)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 4564)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 4564)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 4565)	P	P	
TableForeColor2 (Page 4566)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 4584)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut (Page 4606)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 4607)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 4607)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 4607)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 4608)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 4608)	P	P	Specifies how sorting by column title is triggered.
TitleStyle (Page 4609)	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment (Page 4616)	P	P	Specifies or returns the position of the toolbar.
ToolbarBackColor (Page 4616)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 4617) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 4618) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 4618) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 4619) *	P	P	Specifies the number of configurable button functions.
ToolbarButtonEnabled (Page 4619) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 4620) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 4620) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 4620)	P	P	References a button function.
ToolbarButtonLocked (Page 4621) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 4621) *	P	P	Shows the name of the selected button function.

Properties	Read	Write	Description
ToolbarButtonPasswordLevel (Page 4622) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 4622) *	P	P	Removes the selected button function from the list.
ToolbarButtonRename (Page 4622) *	P	P	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 4623) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 4623) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 4624) *	P	P	Indicates whether the project engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 4624)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 4625)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 4626)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 4626)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
UseSelectedTitleColor (Page 4682)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseSourceBackColors	P	P	Specifies the use of the background color of the data source.
UseSourceForeColors	P	P	Specifies the use of the foreground color of the data source.
UseTableColor2 (Page 4684)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 4702)	P	P	Specifies whether vertical separation lines are displayed.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-126 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.
Export (Page 4757)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetRow (Page 4769)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.

Methods	Valid	Description
GetRowCollection (Page 4770)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetRulerBlock (Page 4771)	P	Returns the block object of the evaluation table designated by name or index as "ICCAxRulerBlock" type.
GetRulerBlockCollection (Page 4772)	P	Returns the list of all block objects of the evaluation table as "ICCAxCollection" type.
GetRulerColumn (Page 4774)	P	Returns the column object of the evaluation table designated by name or index as "ICCAxRulerColumn" type.
GetRulerColumnCollection (Page 4775)	P	Returns the list of all column objects of the evaluation table as "ICCAxCollection" type.
GetSelectedRow (Page 4777)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 4778)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatisticAreaColumn (Page 4779)	P	Returns the column object of the statistic area window of the evaluation window designated by name or index as "ICCAxRulerColumn" type.
GetStatisticAreaColumnCollection (Page 4781)	P	Returns the list of all column objects of the statistic area window of the evaluation table as "ICCAxCollection" type.
GetStatisticResultColumn (Page 4782)	P	Returns the column object of the statistic window of the evaluation window designated by name or index as "ICCAxRulerColumn" type.
GetStatisticResultColumnCollection (Page 4783)	P	Returns the list of all column objects of the statistic window of the evaluation table as "ICCAxCollection" type.
GetStatusbarElement (Page 4784)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 4785)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolbarButton (Page 4792)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 4793)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
Print (Page 4822)	P, A	Executes the "Print" button function of the control.
SelectAll (Page 4837)	P	Selects all rows in a table-based control.
SelectRow (Page 4838)	P	Selects a specific row in a table-based control.
ShowHelp (Page 4842)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 4847)	P, A	Executes the "Configuration dialog" button function of the control.
UnselectAll (Page 4855)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 4856)	P	Removes the selections from a specific cell of a table-based control.

Table 10-127 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	-	-	Specifies the operating rights of the selected object in runtime.
AxisXBunchCount	-	-	Sets the step width of the large ticks for the X axis.
AxisXMarkCount	-	-	Sets the step width of the ticks for the X axis.
AxisXNoOfDigits	-	-	

Properties	Read	Write	Description
AxisXShowBunchValues	-	-	Enables scale labeling of the interim values for the X axis.
AxisXStyle *	-	-	
AxisY1BunchCount	-	-	Sets the step width of the large ticks for the Y axis.
AxisY1MarkCount	-	-	Sets the step width of the large ticks for the left Y axis.
AxisY1ShowBunchValues	-	-	Enables scale labeling of the interim values for the left Y axis.
AxisY2BunchCount	-	-	Sets the step width of the large ticks for the right Y axis.
AxisY2MarkCount	-	-	Sets the step width of the ticks for the right Y axis.
AxisY2ShowBunchValues	-	-	Enables scale labeling of the interim values for the right Y axis.
BackColor (Page 4183)	A	A	Specifies the background color of the selected object.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 4253)	-	-	Specifies the number of lines contained in the selection list.
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.
EnableNavigateButtons	-	-	
EnableNavigateKeys	-	-	Specifies keyboard operation.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
FocusColor (Page 4309)	A	A	Specifies the color for the focus frame of the selected object when it is in focus.
FocusWidth (Page 4310)	A	A	Specifies the border width of the specified object when the object is in focus.
Font (Page 4311)	-	-	Specifies or returns the font.
Height (Page 4327)	A	-	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HelpText (Page 4330)	A	-	Returns the tooltip that is shown in runtime as user help for the specified object.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
Look3D	-	-	Activates 3D visualization.
Name (Page 4417)	A	-	Returns the object name as STRING.
RulerColor (Page 4479)	A	A	Specifies the color of the scale gradation (auxiliary line) of the axis labelling in the "OnlineTrendControl" object.
ScaleColor (Page 4481)	A	A	Specifies the color of the scale of the selected object.
SelectionBackColor (Page 4498) *	-	-	Specifies the background color of the selected cells.
SelectionForeColor (Page 4500) *	-	-	Specifies the foreground color of the selected cells.
ShowRuler (Page 4526)	A	A	Specifies whether a scale gradation (auxiliary line) is shown for the axis label of the "OnlineTrendControl" object.
ShowTableGridLines (Page 4531)	-	--	Enables the display of grid lines in the table.
ShowTimeAxis	-	-	Enables the display of the X axis.
ShowTimeAxisLabeling	-	-	Enables the display of the X axis labeling.
ShowValueAxis1	-	-	Enables the display of the left Y axis.
ShowValueAxis1Label	-	-	Enables the display of the labeling for left Y axis.

Properties	Read	Write	Description
ShowValueAxis2	-	-	Enables the display of the right Y axis.
ShowValueAxis2Label	-	-	Sets the window title.
ShowValueTable	-	-	Enables the display of the table of values.
ShowY1HlpLine	-	-	Enables the display of the auxiliary line.
ShowY2HlpLine	-	-	Enables the display of the auxiliary line.
TableBackColor (Page 4563)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableGridLineColor (Page 4567)	A	A	Sets the color of the gridlines in the table of the specified object.
TableHeaderBackColor (Page 4568)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 4569)	A	A	Specifies the text color in the header of the table of the selected object.
TagForExternalTime	-	-	Sets the tag for the external time.
TimeAxisBegin	-	-	Sets the start value for the time axis.
TimeAxisBeginTime	-	-	Specifies the starting time for the display of the selected trend.
TimeAxisCountPoints	-	-	Sets the number of values for the time axis.
TimeAxisEnd	-	-	Sets the end value for the time axis.
TimeAxisMode	-	-	Sets the time axis mode.
TimeAxisRange (Page 4581)	-	-	Period displayed by the time axis.
TimeAxisSide	-	-	Sets the page for new values on the time axis.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarEnabled *	-	-	Enables the use of a toolbar in the trend view.
ToolbarStyle	-	-	Sets the appearance of the toolbar.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
TrendsForPrinting *	-	-	
ValueAxis1AutoRange *	-	-	Sets the automatic adaptation of the data area.
ValueAxis1Begin	-	-	Sets the start value for the axis.
ValueAxis1End	-	-	Sets the end value for the axis.
ValueAxis1LabelLength	-	-	Sets the length of axis labeling.
ValueAxis1Style *	-	-	
ValueAxis2AutoRange *	-	-	Sets the automatic adaptation of the data area.
ValueAxis2Begin	-	-	Sets the start value for the axis.
ValueAxis2End	-	-	Sets the end value for the axis.
ValueAxis2LabelLength	-	-	Sets the length of axis labeling.
ValueAxis2Style *	-	-	Sets the automatic adaptation of the data area.
ValueY1HlpLine	-	-	Sets the value for the auxiliary line.
ValueY2HlpLine	-	-	Value for the auxiliary line on the right Y axis.
Visible (Page 4703)	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	-	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-129 Properties

Properties	Read	Write	Description
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
Color (Page 4236)	P	P	Specifies the line color of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
EndAngle (Page 4280)	P	P	Specifies the angle at which the end point of the selected object deviates from the zero position (0°).
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineWidth (Page 4381)	P	P	Specifies the line thickness of the selected object.
Name (Page 4417)	P	-	Returns the object name as STRING.
RadiusHeight (Page 4466)	P	P	Specifies the minor axis of the "Ellipsis" object.
RadiusWidth (Page 4467)	P	P	Specifies the major axis of the "Ellipsis" object.
StartAngle (Page 4543)	P	P	Specifies the SQL statement.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

Table 10-130 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-137 Properties

Properties	Read	Write	Description
ApplyProjectSettingsForDesignMode	-	-	Specifies that the project settings are used for the design.
ArchiveName *	P	P	Sets the log name.
ArchiveType	P	-	Sets the log type.
AutoCompleteColumns (Page 4177)	P	P	Specifies whether empty columns are shown if the control is wider than the configured columns.
AutoCompleteRows (Page 4177)	P	P	Specifies whether empty rows are shown if the control is longer than the number of configured rows.

Properties	Read	Write	Description
AutoSelectionColors (Page 4178)	P	P	Specifies whether the colors defined by the system are used as the selection colors for cells and rows.
AutoSelectionRectColor (Page 4179)	P	P	Specifies whether the selection frame is shown with the color defined by the system.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
Blocks	-	-	Sets the alarm blocks.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
Caption (Page 4221)	P	P	Specifies the text that is displayed in the header of the selected object.
CellCut (Page 4225)	P	P	Specifies whether the contents of the cells are abbreviated if the cells are too narrow.
CellSpaceBottom (Page 4226)	P	P	Specifies the bottom margin of the table cells.
CellSpaceLeft (Page 4227)	P	P	Sets the left indent for the table cells.
CellSpaceRight (Page 4227)	P	P	Specifies the right indent of the table cells.
CellSpaceTop (Page 4228)	P	P	Specifies the top margin of the table cells.
Closeable (Page 4236)	P	P	Specifies that the control can be closed in runtime.
ColumnAlign (Page 4241) *	P	P	Specifies how the selected column is aligned.
ColumnAutoPrecisions *	P	P	Specifies that the number of decimal places displayed for an axis is adjusted automatically.
ColumnCaption *	P	P	Sets the caption.
ColumnCount *	P	-	Displays the number of columns.
ColumnDateFormat *	P	P	Sets the display format for date information.
ColumnExponentialFormat *	P	P	Specifies that exponential notation is used in a column.
ColumnHideText *	P	P	Specifies whether the text is displayed.
ColumnHideTitleText *	P	P	Specifies whether the text is displayed.
ColumnIndex	P	P	The index specifies on which column other properties, e.g. initial value are based.
ColumnLeadingZeros *	P	P	Specifies that leading zeros should be displayed.
ColumnLength *	P	P	Specifies the number of displayed characters.
ColumnName *	P	-	Specifies the name of a column.
ColumnPrecisions *	P	P	Sets the number of decimal places.
ColumnReadonly *	P	P	Sets the read-only mode for the values in the column.
ColumnRepos *	P	P	Repositions the column.
ColumnResize (Page 4242)	P	P	Enables changes to the width of columns.
ColumnScrollbar (Page 4244)	P	P	Specifies the scroll bar type.
ColumnShowDate *	P	P	Specifies that the date is to be displayed.
ColumnShowIcon *	P	P	Enables the display of an icon.
ColumnShowTitleIcon *	P	P	Enables the display of an icon.
ColumnSort *	P	P	Sets the type of sorting.
ColumnSortIndex *	P	P	Specifies the sorting order.
ColumnTimeFormat *	P	P	Sets the display format for time information.
ColumnTitleAlignment	P	P	Specifies the type of column title alignment.

Properties	Read	Write	Description
ColumnTitles (Page 4245)	P	P	Specifies whether the column title is displayed.
ColumnVisible *	P	P	Enables the visibility of a column.
ControlDesignMode (Page 4538)	P	P	Specifies the design.
DataSource	-	-	Sets the data source.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
EnableDelete	P	P	Enables the deletion of data.
EnableEdit (Page 4280)	P	P	Specifies whether the data shown can be edited in runtime.
EnableInsert	P	P	Enables insertion of data.
ExportDirectoryChangeable (Page 4286)	P	P	Specifies whether the data export directory can be changed in runtime.
ExportDirectoryname (Page 4286)	P	P	Specifies the target directory for the exported Runtime data.
ExportFileExtension (Page 4287)	P	P	Specifies the file extension of the export file. Only the "csv" file extension is currently supported.
ExportFilename (Page 4288)	P	P	Specifies the name of the target file for the exported Runtime data.
ExportFilenameChangeable (Page 4288)	P	P	Specifies whether the export file name can be changed in runtime.
ExportFormatGuid (Page 4289)	P	P	Default assignment of the ID number and export provider.
ExportFormatName (Page 4289)	P	P	Specifies the export file format. Only the "csv" file format is currently available for the export.
ExportParameters (Page 4290)	P	-	Specifies the parameters of the selected format by means of the "Properties" dialog.
ExportSelection (Page 4290)	P	P	Specifies which runtime data of the control is exported.
ExportShowDialog (Page 4291)	P	P	Specifies whether the data export dialog is shown in runtime.
Filters	-	-	Specifies database criteria in SQL syntax.
FilterSQL	P	-	Sets an SQL statement for the filter criterion.
Font (Page 4311)	-	-	Specifies or returns the font.
GridLineColor (Page 4325)	P	P	Specifies the color for the grid lines.
GridLineWidth (Page 4326)	P	P	Specifies the width of the separation lines in pixels.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HorizontalGridLines (Page 4341)	P	P	Specifies whether horizontal separation lines are displayed.
IconSpace (Page 4344)	P	P	Specifies the spacing between icons and text in the table cells.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineColor (Page 4379)	P	P	Sets the color of the window separation lines.
LineWidth (Page 4381)	P	P	Specifies the line thickness of the selected object.
Moveable (Page 4416)	P	P	Specifies whether the window can be moved in runtime.
ObjectName (Page 4424)	P	-	Returns the object name as STRING.
PrintJobName (Page 4460)	P	P	Specifies a print job.

Properties	Read	Write	Description
RowScrollbar (Page 4475)	P	P	Specifies whether row scroll bars are displayed.
RowTitleAlignment	P	P	Specifies the type of row title alignment.
RowTitles	P	P	Specifies that row headers will be displayed.
RTPersistence (Page 4477)	P	P	Specifies how online configurations of WinCC are retained.
RTPersistenceAuthorization	P	P	Specifies the authorization required for online configuration in runtime.
RTPersistenceType (Page 4478)	-	-	Specifies how online configurations of WinCC are retained.
SelectArchiveName *	P	P	Specifies definition of the log by name.
SelectedCellColor (Page 4493)	P	P	Specifies the background color of the selected cell.
SelectedCellForeColor (Page 4494)	P	P	Specifies the font color of the selected cell.
SelectedRowColor (Page 4495)	P	P	Specifies the background color of the selected row.
SelectedRowForeColor (Page 4495)	P	P	Specifies the font color of the selected row.
SelectedTitleColor (Page 4496)	P	P	Specifies the background color of a selected table header.
SelectedTitleForeColor (Page 4497)	P	P	Specifies the font color of the selected table header.
SelectionColoring (Page 4499)	P	P	Specifies whether selection colors are used for cells or rows.
SelectionRect (Page 4502)	P	P	Specifies whether a selection frame is used for the selected cells or rows.
SelectionRectColor (Page 4503)	P	P	Specifies the color of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionRectWidth (Page 4504)	P	P	Specifies the line width of the selection rectangle in the alarm window if SelectionType equals "1".
SelectionType (Page 4504)	P	P	Specifies the number of lines you can mark.
ShowSortButton (Page 4528)	P	P	Specifies whether the sorting button is shown above the vertical scroll bar.
ShowSortIcon (Page 4529)	P	P	Specifies whether the sorting icon is displayed.
ShowSortIndex (Page 4530)	P	P	Specifies whether a sort index is displayed.
ShowTitle (Page 4534)	P	P	Specifies the representation of the control's window title.
Sizeable	P	P	Specifies that the size of an object can be changed in runtime.
SortSequence	P	P	Specifies how the sorting order can be changed by mouse click.
StatusbarBackColor (Page 4547)	P	P	Specifies the background color of the status bar.
StatusbarElementAdd (Page 4547) *	-	P	Creates a new, user-defined status bar element.
StatusbarElementAutoSize (Page 4548) *	P	P	Specifies whether the width of the selected status bar element is set automatically.
StatusbarElementCount (Page 4548) *	P	-	Specifies the number of configurable status bar elements.
StatusbarElementIconId (Page 4549) *	P	P	Default assignment of the ID number and icon of a status bar element.
StatusbarElementId (Page 4549) *	P	-	Returns the ID number of the selected status bar element.
StatusbarElementIndex (Page 4550)	P	P	References a status bar element. You can use this property to assign the values of other properties to a specific element of the status bar.

Properties	Read	Write	Description
StatusbarElementName (Page 4550) *	P	P	Displays the object name of the selected status bar element.
StatusbarElementRemove (Page 4551) *	P	P	Removes the selected status bar element.
StatusbarElementRename (Page 4551) *	P	P	Renames the user-defined status bar element that is referenced by means of the "StatusbarElementIndex" property.
StatusbarElementRepos *	P	P	Specifies the index that is assigned to the element.
StatusbarElements (Page 4552)	-	-	Specifies the elements that are to be shown in the status bar.
StatusbarElementText *	P	P	Specifies the text of the currently selected status bar element.
StatusbarElementTooltipText (Page 4552) *	P	P	Specifies the tooltip text for the user-defined status bar element.
StatusbarElementUserDefined (Page 4553) *	P	-	Indicates whether the project engineer has added the toolbar button as a new user-defined element.
StatusbarElementVisible (Page 4554) *	P	P	In the list, activate the status bar elements that you wish to display in runtime.
StatusbarElementWidth (Page 4554) *	P	P	Specifies the width of the selected status bar element in pixels.
StatusbarFont	-	-	Status bar font
StatusbarFontColor (Page 4554)	P	P	Specifies the color of the text in the status bar.
StatusbarShowTooltips (Page 4557)	P	P	Specifies whether tooltips are displayed for the elements of the status bar in runtime.
StatusbarText (Page 4558)	P	-	Default text in the status bar.
StatusbarUseBackColor (Page 4558)	P	P	Specifies whether the background color of the status bar is shown.
StatusbarVisible (Page 4559)	P	P	Specifies whether the status bar of the control is displayed.
TableColor (Page 4564)	P	P	Specifies the background color of the rows. Use this to open the color selection dialog.
TableColor2 (Page 4564)	P	P	Specifies the background color of "Row color 2".
TableForeColor (Page 4565)	P	P	
TableForeColor2 (Page 4566)	P	P	Specifies the font color of "Row color 2".
TimeBase (Page 4584)	P	P	Sets the timebase.
TitleColor	P	P	Specifies the color of the header.
TitleCut (Page 4606)	P	P	Specifies whether the contents of the fields of a header should be abbreviated if the column is too narrow.
TitleDarkShadowColor (Page 4607)	P	P	Specifies the color of the dark side of shading.
TitleForeColor (Page 4607)	P	P	Specifies the font color of the table header for the selected status.
TitleGridLineColor (Page 4607)	P	P	Specifies the color of separation lines in the table header.
TitleLightShadowColor (Page 4608)	P	P	Specifies the color of the bright side of shading.
TitleSort (Page 4608)	P	P	Specifies how sorting by column title is triggered.
TitleStyle (Page 4609)	P	P	Specifies whether a shading color is used for the table header.
ToolbarAlignment (Page 4616)	P	P	Specifies or returns the position of the toolbar.

Properties	Read	Write	Description
ToolbarBackColor (Page 4616)	P	P	Specifies the background color of the toolbar.
ToolbarButtonActive (Page 4617) *	P	P	Specifies whether the function linked to the button is activated in runtime.
ToolbarButtonAdd (Page 4618) *	P	P	Creates a new, user-defined button function.
ToolbarButtonBeginGroup (Page 4618) *	P	P	Specifies whether a separator is inserted before the selected button function.
ToolbarButtonClick	P	P	Clicks a toolbar button.
ToolbarButtonCount (Page 4619) *	P	-	Specifies the number of configurable button functions.
ToolbarButtonEnabled (Page 4619) *	P	P	Specifies whether a user-defined toolbar button can be operated.
ToolbarButtonHotKey (Page 4620) *	P	P	Shows the hotkey for the selected button function.
ToolbarButtonId (Page 4620) *	P	P	Unique ID number for the selected button function.
ToolbarButtonIndex (Page 4620)	P	P	References a button function.
ToolbarButtonLocked (Page 4621) *	P	P	Specifies whether the clicked, pressed in state is displayed for a user-defined toolbar button.
ToolbarButtonName (Page 4621) *	P	-	Shows the name of the selected button function.
ToolbarButtonPasswordLevel (Page 4622) *	P	P	Shows the authorization for the selected button function.
ToolbarButtonRemove (Page 4622) *	P	-	Removes the selected button function from the list.
ToolbarButtonRename (Page 4622) *	P	-	Renames the user-defined toolbar element that is referenced by means of the "ToolbarButtonIndex" property.
ToolbarButtonRepos (Page 4623) *	P	P	Changes the sequence of button functions.
ToolbarButtons	-	-	Specifies which buttons are available for the toolbar.
ToolbarButtonTooltipText (Page 4623) *	P	P	Specifies the tooltip text for the button.
ToolbarButtonUserDefined (Page 4624) *	P	-	Indicates whether the project engineer has added the toolbar button as a new user-defined button.
ToolbarButtonVisible *	P	P	Specifies that the button is visible.
ToolbarShowTooltips (Page 4624)	P	P	Specifies whether the tooltips for the button functions are displayed in runtime.
ToolbarUseBackColor (Page 4625)	P	P	Specifies whether the background color for the toolbar is shown.
ToolbarUseHotKeys (Page 4626)	P	P	Specifies whether the hotkeys for the button functions are activated in runtime.
ToolbarVisible (Page 4626)	P	P	Specifies whether the toolbar of the control is displayed.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
UseSelectedTitleColor (Page 4682)	P	P	Specifies whether a selection color is used for the headers of selected table cells.
UseTableColor2 (Page 4684)	P	P	Specifies whether a second row color is used for the representation of the table.
VerticalGridLines (Page 4702)	P	P	Specifies whether vertical separation lines are displayed.
Visibility	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-138 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property with VBScript during runtime.
CopyRows (Page 4751)	P	Executes the "Copy rows" button function of the control.
CutRows (Page 4753)	P	Executes the "Cut rows" button function of the recipe view.
DeleteRows (Page 4756)	P	Executes the "Delete rows" button function of the recipe view.
Export (Page 4757)	P, A	Executes the "Export log" or "Export data" button function of the control.
GetColumn (Page 4758)	P	Returns the column object of the recipe view designated by name or index as "ICCAxUAColumn" type.
GetColumnCollection (Page 4759)	P	Returns the list of all column objects of the recipe view as "ICCAxCollection" type.
GetRow (Page 4769)	P	Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.
GetRowCollection (Page 4770)	P	Returns the list of all row objects of the table-based controls as "ICCAxDataRowCollection" type.
GetSelectedRow (Page 4777)	P	Returns the selected row object of a table-based control as "ICCAxDataRow" type.
GetSelectedRows (Page 4778)	P	Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.
GetStatusbarElement (Page 4784)	P, A	Returns the element of the control's status bar designated by name or index as "ICCAxStatusbarElement" type.
GetStatusbarElementCollection (Page 4785)	P, A	Returns the list of all status bar elements of the control as "ICCAxCollection" type.
GetToolbarButton (Page 4792)	P, A	Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.
GetToolbarButtonCollection (Page 4793)	P, A	Returns the list of all button functions of the control toolbar as "ICCAxCollection" type.
MoveToFirst (Page 4813)	P	Executes the "First line" button function of the control.
MoveToLast (Page 4815)	P	Executes the "Last data record" button function of the control.
MoveToNext (Page 4816)	P	Executes the "Next data record" button function of the control.
MoveToPrevious (Page 4818)	P	Executes the "Previous data record" button function of the control.
PasteRows (Page 4821)	P	Executes the "Insert rows" button function of the recipe view.
Print (Page 4822)	P, A	Executes the "Print" button function of the control.
ReadTags (Page 4824)	P	Executes the "Read tags" button function of the recipe view.
SelectAll (Page 4837)	P	Selects all rows in a table-based control.
SelectRow (Page 4838)	P	Selects a specific row in a table-based control.
ServerExport (Page 4839)	P	Executes the "Export log" button function of the recipe view.
ServerImport (Page 4840)	P	Executes the "Import log" button function of the recipe view.
ShowHelp (Page 4842)	P, A	Executes the "Help" button function of the control.
ShowPropertyDialog (Page 4847)	P, A	Executes the "Configuration dialog" button function of the control.
ShowSelectArchive (Page 4847)	P	Executes the "Select data connection" button function of the recipe view.
ShowSelection (Page 4848)	P	Executes the "Selection dialog" button function of the recipe view.

Methods	Valid	Description
ShowSelectTimeBase (Page 4849)	P	Executes the "Timebase dialog" button function of the recipe view.
ShowSort (Page 4850)	P	Executes the "Sorting dialog" button function of the recipe view.
UnselectAll (Page 4855)	P	Removes all selections from the cells of a table-based control.
UnselectRow (Page 4856)	P	Removes the selections from a specific cell of a table-based control.
WriteTags (Page 4860)	P	Executes the "Write tags" button function of the recipe view.

Table 10-139 Properties

Properties	Read	Write	Description
Appearance (Page 3930)	-	-	Specifies the layout for this NC subroutine.
Authorization (Page 4175) *	-	-	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4183)	A	A	Specifies the background color of the selected object.
Columns	-	-	Specifies the columns to be displayed.
ColumnsMoveable	-	-	Specifies that the columns can be moved.
CountVisibleItems (Page 4253)	-	-	Specifies the number of lines contained in the selection list.
Enabled (Page 4279)	A	A	Specifies whether the selected object can be operated in runtime.
FitToSize	-	-	Specifies that the size of the object should be automatically adapted to the content.
Flashing	-	-	Specifies that the text block flashes.
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
Name (Page 4417)	A	-	Returns the object name as STRING.
SelectionBackColor (Page 4499)	A	A	Specifies the background color of the selected cells.
SelectionForeColor (Page 4501)	A	A	Specifies the foreground color of the selected cells.
ShowTableGridlines (Page 4531)	-	-	Enables the display of gridlines in the table of the specified object.
TableBackColor (Page 4563)	A	A	Specifies the background color of the table cells for the selected object.
TableFont	-	-	Specifies the font in the table.
TableForeColor (Page 4566)	A	A	
TableGridlineColor (Page 4567)	A	A	Specifies the color for the grid lines.
TableHeaderBackColor (Page 4568)	A	A	Specifies the background color in the header of the table of the selected object.
TableHeaderFont	-	-	Specifies the text color of the header.
TableHeaderForeColor (Page 4569)	A	A	Specifies the text color in the header of the table of the selected object.

Properties	Read	Write	Description
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
Visible (Page 4703) *	A	A	Specifies whether the selected object is visible.
Width (Page 4714)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

* not visible in the ES

Table 10-140 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Table 10-141 Properties

Properties	Read	Write	Description
AskOperationMotive (Page 4173)	P	P	Specifies whether the reason for operating this object is logged.
Authorization (Page 4175)	P	P	Specifies the operating rights of the selected object in runtime.
BackColor (Page 4181)	P	P	Specifies the background color of the selected object.
BackColorBottom (Page 4184)	P	P	Specifies the color for the lower / right part of the .
BackColorTop (Page 4184)	P	P	Sets the color for the upper / left part of the slider.
BackFillStyle (Page 4185)	P	P	Defines the fill pattern of the specified object.
BackFlashingColorOff (Page 4188)	P	P	Specifies the background color for flash state "Off".
BackFlashingColorOn (Page 4188)	P	P	Specifies the background color for flash state "On".
BackFlashingEnabled (Page 4189)	P	P	Specifies whether the background of the specified object flashes in runtime.
BackFlashingRate (Page 4190)	P	P	Specifies the flash rate of the background for the selected object.
BorderBackColor (Page 4199)	P	P	Specifies the background color of the broken border line for the selected object.
BorderColor (Page 4202)	P	P	Specifies the line color of the object.
BorderFlashingColorOff (Page 4206)	P	P	Specifies the border line color of the selected object for the flash state "Off".
BorderFlashingColorOn (Page 4207)	P	P	Specifies the border line color of the selected object for the flash state "On".
BorderFlashingEnabled (Page 4208)	P	P	Specifies whether the border line of the selected object flashes in runtime.
BorderFlashingRate (Page 4209)	P	P	Specifies the flash rate of the border line for the selected object.
BorderStyle (Page 4213)	P	P	Specifies the type of border lines for the selected object.
BorderWidth (Page 4216)	P	P	Specifies the line thickness of the object.
CornerStyle (Page 4250)	-	-	Specifies the type of border lines for the selected object.
DrawInsideFrame (Page 4270)	P	P	Specifies whether the border line of the selected object with a line thickness greater than 1 should be drawn within the border or symmetrically to the border.

Properties	Read	Write	Description
EdgeStyle (Page 4274)	-	-	Specifies the line style of the selected object.
Enabled (Page 4277)	P	P	Specifies whether the selected object can be operated in runtime.
FillPatternColor (Page 4296)	P	P	Specifies the color of the fill pattern for the selected object.
Flashing	-	-	Specifies that the text block flashes.
Height (Page 4327)	P	P	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
HighLimitColor (Page 4332)	P	P	Specifies the color of the top or right scroll button in a scroll bar.
JumpToLimitsAfterMouseClick (Page 4350)	P	P	Specifies the length of the long tick marks of a scale.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	P	P	Specifies the value of the X coordinate of the object.
LineEndShapeStyle (Page 4380)	-	-	Specifies the shape of the line end.
LogOperation (Page 4386)	P	P	Specifies whether, after operating this object, an alarm is output to the alarm system.
LowLimitColor (Page 4390)	P	P	Specifies the color of the bottom or left scroll button in a scroll bar.
MarginToBorder (Page 4391)	P	P	Specifies the width of the 3D border in pixels.
MaximumValue (Page 4392)	P	P	Specifies the maximum value of the scale in the selected object.
MinimumValue (Page 4413)	P	P	Specifies the minimum value of the scale in the selected object.
Name (Page 4417)	P	-	Returns the object name as STRING.
OperationSteps (Page 4429)	P	P	Specifies by how many steps the slider of the scrollbar is moved with one mouseclick.
ProcessValue (Page 4461)	P	P	Specifies the default for the value to be displayed.
RelativeFillLevel (Page 4470)	P	P	Specifies the fill percentage for the object.
ShowBadTagState (Page 4516)	P	P	Specifies whether an object is grayed out if its associated tag has a bad quality code or tag state.
ShowFillLevel (Page 4519)	P	P	Specifies whether the selected object is filled.
StyleSettings (Page 4561)	P	P	Specifies the display style for the object:
TextOrientation (Page 4576)	P	P	Specifies the text orientation of the selected object.
ThumbBackColor (Page 4577)	P	P	Specifies the background color of the slider in the "Slider" object.
ToolTipText (Page 4627)	P	P	Specifies the tooltip text.
Top (Page 4629)	P	P	Specifies the value of the Y coordinate of the object.
Transparency (Page 4633)	P	P	Specifies and returns the transparency percentage of the object.
UseDesignColorScheme (Page 4674)	P	P	Specifies the font used for printing.
UseDesignShadowSettings (Page 4676)	P	P	Specifies whether the object is displayed with the shading defined in the active design.
Visible (Page 4703)	P	P	Specifies whether the selected object is visible.
Width (Page 4714)	P	P	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.
WindowsStyle (Page 4718)	P	P	Specifies whether the object is displayed in the general Windows style.

Table 10-142 Methods

Methods	Valid	Description
Activate (Page 4744)	P, A	Activates the permanent window or the root screen.
ActivateDynamic (Page 4747)	P	Dynamically activates a trigger and the specified cycle for a property at runtime.
DeactivateDynamic (Page 4754)	P	Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/during Runtime.

Font (Page 4311)	-	-	Specifies or returns the font.
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
Name (Page 4417)	A	-	Returns the object name as STRING.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
Width (Page 4714)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

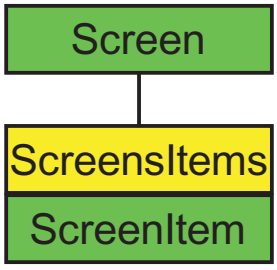
ScreenItem (Page 3906)

ScreenItems (Page 3908)

ZoneQualityView

Description



Represents the "ZoneSignal" object. The ZoneQualityView object is an element of the ScreenItems list.

Abbreviation	Validity
Pa	Panels
A	Runtime Advanced
P	Runtime Professional

Table 10-147 Properties

Properties	Read	Write	Description
Height (Page 4327)	A	A	Sets the height of the specified "Ellipsis", "Circle" and "Rectangle" objects.
Layer (Page 4355)	-	-	Returns the layer that contains an object as LONG in the screen.
Left (Page 4366)	A	A	Specifies the value of the X coordinate of the object.
Name (Page 4417)	A	-	Returns the object name as STRING.
Top (Page 4629)	A	A	Specifies the value of the Y coordinate of the object.
Width (Page 4714)	A	A	Sets the width of the specified "Ellipsis", "Circle" and "Rectangle" objects.

ScreenItem (Page 3906)

ScreenItems (Page 3908)

Properties

Properties A

AboveUpperLimitColor

Description

Defines the color of the specified object for the case "High limit exceeded".

See also

SymbolLibrary (Page 4098)

GraphicIOField (Page 4011)

Switch (Page 4089)

SymbolicIOField (Page 4093)

IOField (Page 4021)

AcceptOnExit

Description

Specifies whether the input field will be confirmed automatically when it is left.

Access in Runtime: Read and write

Syntax

Object.**AcceptOnExit**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "IOField" or "SymbolicIOField".

BOOLEAN

Optional TRUE, if the input field will be confirmed automatically when it is left.

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

AcceptOnFull

Description

Specifies whether the input field will be left and confirmed automatically when the set number of values have been entered.

Access in Runtime: Read and write

Syntax

Object.**AcceptOnFull**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the input field will be left and confirmed automatically when the set number of values have been entered.

See also

IOField (Page 4021)

AccessPath

Description

Returns the storage path of a screen.

Access during runtime: Read

Syntax

Object.**AccessPath**

Object

Necessary. A "Screen" object.

Example

In the following example, the path of the picture "ScreenWindow1" is issued:

```
'VBS67
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
MsgBox objScreen.AccessPath
```

See also

Screen (Page 3930)

Activate

Description

Determines whether the data to be displayed are requested by the alarm server.

Access in Runtime: Read and write

Syntax

Object.**Activate**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the data to be displayed are requested by the alarm server.

See also

AlarmControl (Page 3947)

Active

Description

Specifies whether the data that is to be shown is requested by the log server.

Access in Runtime: Read and write

Syntax

Object.**Active**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl," or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the data that is to be shown is requested by the log server.

Comments

The screen opening times are reduced if you do not set this attribute. You can change the value dynamically.

To differentiate between the "Activate" property and the "Activate" methods, the property is addressed via "Object".

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

ActiveProject

Description

Returns the specified project.

Access in Runtime: Read

Syntax

Object.**ActiveProject**

Object

Required A "HMIRuntime" object.

See also

HMIRuntime (Page 3922)

Project (Page 3929)

ActiveScreen

Description

Returns an object of type "Screen" which shows the screen that currently has the focus.

Note

If you query the "ActiveScreen" property in a function, it may be due to a ScreenSavers that the property does not return a valid "Screen" object but "Nothing" and a system alarm is displayed.

Access during runtime: Read

Syntax

Object.ActiveScreen

Object

Necessary. An object of the "HMIRuntime" type.

Comments

Which screen is returned depends on whether the root screen or the permanent window has the focus.

The ActiveScreen property returns NOTHING if no screen has the focus. This is the case, for example, if a different window has the focus. With the instruction "If not [printout] Is Nothing" you can query whether a screen is going to be returned:

```
'VBS_Example_ActiveScreen
Dim objActiveScreen
Set objActiveScreen = HmiRuntime.ActiveScreen
If Not objActiveScreen Is Nothing Then
'found an active screen
HmiRuntime.Trace("There is an active screen." & vbCrLf)
Else
'found NO active screen
HmiRuntime.Trace("There is NO active screen." & vbCrLf)
End If
```

ActiveScreen

Description

Returns a "Screen" type object, which represents the screen which has the focus at the moment.

Note

If you query the "ActiveScreen" property in a user-defined function, it may be due to a screen saver that the property does not return a valid "screen" object but "Nothing". A system message will be issued.

Access in Runtime: Read

Syntax

Object.ActiveScreen

Object

Required An object of the "HMIRuntime" type.

Comments

Which screen is returned depends on whether the root screen or the permanent window has the focus.

The ActiveScreen property returns NOTHING if no screen has the focus. That is the case, for example, when another window has the focus. With the statement "If not [expression] is nothing" you are able to interrogate whether a screen is to be returned:

```
VBS example ActiveScreen
```

```
Dim objActiveScreen
Set objActiveScreen = HmiRuntime.ActiveScreen
If not objActiveScreen is nothing then
'found an active screen
HmiRuntime.Trace("There is an active screen." & vbCrLf)
Else
'found NO active screen
HmiRuntime.Trace("There is NO active screen." & vbCrLf)
End if
```

ActiveScreenItem

Description

References the screen object that currently has the focus.

It is only if the screen of the respective "Screen" object is currently selected and has an input field that the "ActiveScreenItem" property of the "Screen" object will be occupied with a valid "ScreenItem" object. In all other cases if, for example, another screen from the "Screens" list, an independent window within WinCC or another application is selected, this property is not supplied on the screens, i.e. assigned "Nothing".

Application

You use the "ActiveScreenItem" object to address the properties of the object that has the focus in Runtime.

ActiveScreenItem

Description

References the screen object which currently has the focus.

The "ActiveScreenItem" property of the "Screen" object is only assigned a valid "ScreenItem" object if the screen of the corresponding "Screen" object is active and has an input field. In all other cases, for example, with a different screen from the "Screens" list, an independent window within WinCC or a different application will be selected, this property will not apply to the screens and will be occupied with "Nothing".

Application

The "ActiveScreenItem" object is used to address the object property which has the focus in runtime.

ActualPointIndex

Description

Specifies the number of the current corner point of the selected object.

Access in Runtime: Read and write

Syntax

Object.**ActualPointIndex**[=Int]

Object

Required A "ScreenItem" object with the formats "Polyline" or "Polygon".

Int

Optional A value or a constant that specifies the number of the current corner point of the selected object.

See also

Polyline (Page 4060)

Polygon (Page 4057)

TubePolyline (Page 4125)

ActualPointLeft

Description

Specifies the X coordinate of the current corner point with reference to the screen origin. The screen source is at the top left of the object. Every corner is identified by an index which is derived from the number ("PointCount") of the existing corners.

Access in Runtime: Read and write

Syntax

Object.**ActualPointLeft**[=Int]

Object

Required An object of the "ScreenItem" type with the format "Polyline," or "Polygon".

Int

Optional A value or a constant that specifies the X coordinate of the current corner point with reference to the screen origin.

Comments

Changing the value can have an effect on the properties "Width" (object width) and "Left" (X coordinate of the object position).

See also

Polyline (Page 4060)

Polygon (Page 4057)

TubePolyline (Page 4125)

ActualPointTop

Description

Specifies the Y coordinate of the current corner point with reference to the screen origin. The screen source is at the top left of the object.

Access in Runtime: Read and write

Syntax

Object.**ActualPointTop**[=Int]

Object

Required An object of the "ScreenItem" type with the format "Polyline," or "Polygon".

Int

Optional A value or a constant that specifies the Y coordinate of the current corner point with reference to the screen origin.

Comments

Changing the value can have an effect on the properties "Height" (object height) and "Top" (X coordinate of the object position).

See also

Polyline (Page 4060)

Polygon (Page 4057)

TubePolyline (Page 4125)

AdaptBorder

Description

Specifies whether the border of the selected object will be dynamically adapted to the text size.

Access in Runtime: Read and write

Syntax

Object.**AdaptBorder**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Checkbox" or "OptionGroup".

BOOLEAN

Optional TRUE, if the border of the selected object will be dynamically adapted to the text size.

See also

TextField (Page 4107)

IOField (Page 4021)

SymbolicIOField (Page 4093)

Button (Page 3968)

CheckBox (Page 3974)

OptionGroup (Page 4054)

AdaptFontSizeToLineHeight

Description

Specifies whether the font size will be adapted to the line height.

Access in Runtime: Read and write

Syntax

Object.**AdaptFontSizeToLineHeight**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the font size will be adapted to the line height.

See also

AlarmControl (Page 3947)

AdaptScreenToWindow

Description

Specifies whether or not the screen displayed in a screen window adapts to the size of the screen window in Runtime. .

Access in Runtime: Read

Syntax

Object.**AdaptScreenToWindow**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE, if the screen adapts to the screen window size.

FALSE, if the screen does not adapt to the screen window size.

See also

AlarmControl (Page 3947)

ScreenWindow (Page 4078)

AdaptWindowToScreen

Description

Specifies whether or not the screen window adapts to the screen it displays in Runtime.

Access in Runtime: Read

Syntax

Object.**AdaptWindowtoScreen**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Screenwindow".

BOOLEAN

TRUE, if the screen window size adapts to the screen.

FALSE, if the screen window size does not adapt to the screen.

See also

ScreenWindow (Page 4078)

AddAssignment

Description

Adds an entry.

Address

Description

Specifies the web address that will be opened in the HTML browser.

Access in Runtime: Read and write

Syntax

Object.**Address**[=STRING]

Object

Required A "ScreenItem" object with the format "HTMLBrowser".

STRING

Optional A value or a constant that contains the web address.

See also

HTMLBrowser (Page 4019)

AdjustBorder3DWithStyle

Description

Specifies whether the 3D border width will be displayed in the general Windows style.

Access in Runtime: Read and write

Syntax

Object.**AdjustBorder3DWithStyle**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Button".

BOOLEAN

Optional TRUE, if the 3D border width will be displayed in the general Windows style.

See also

Button (Page 3968)

AdjustRulerWindow

Description

Specifies whether the ruler window is adapted every time the trend view is displayed.

Access in Runtime: Read and write

Syntax

Object.**AdjustRulerWindow**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE, if the ruler window is adapted every time the trend view is displayed.

Comments

TRUE, if the ruler window will be moved and then shown and hidden, it will be displayed at the original position in the original size.

See also

OnlineTrendControl (Page 4045)

Alarm

Description

Specifies the limit for the storage space display as of which an alarm will be reported.

Access in Runtime: Read and write

Syntax

Object.**Alarm**[=Int]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Int

Optional A value or a constant that specifies the limit for the storage space display as of which an alarm will be reported.

See also

DiskSpaceView (Page 3991)

AlarmColor

Description

Specifies the color in which the bars will be shown as soon as the alarm area is reached.

Access in Runtime: Read and write

Syntax

Object.**AlarmColor**[=Color]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Color

Optional A value or a constant that specifies the color in which the bar will be shown as soon as the warning area is exceeded.

See also

DiskSpaceView (Page 3991)

AlarmFilter

Description

Specifies a SQL-Statement for selecting the alarms that will be shown in the alarm window.

Alarm list and hit list filtering and sorting settings

Access in Runtime: Read and write

Syntax

Object.**AlarmFilter**[=String]

Object

Required A "ScreenItem" object with the format "AlarmControl".

String

Optional A value or a constant that specifies a SQL-Statement for selecting the alarms that will be shown in the alarm window.

See also

AlarmControl (Page 3947)

AlarmHigh

Description

Defines the top limit value at which an alarm should be triggered or returned.
The type of evaluation (percentage or absolute) is specified with the "TypeAlarmHigh" property.

Access in Runtime: Write and read

Syntax

Object.AlarmHigh[=REAL]

Object

Required A "ScreenItem" object with the format "Bar".

REAL

Value for the upper limit

See also

Bar (Page 3961)

AlarmID

Description

Returns the AlarmID of the Alarm object. The AlarmID is unique and is assigned by the system.

AlarmID (readonly)

See also

Alarms (list) (Page 3913)

AlarmLogs

Description

Returns an object of type "AlarmLogs".

Access in Runtime: Read

Syntax

Object.**AlarmLogs**

Object

Required A "Logging" object.

See also

Logging (Page 3927)

AlarmLow

Description

Defines the bottom limit value at which an alarm should be triggered or returned.
The type of evaluation (percentage or absolute) is specified with the "TypeAlarmLow" property.

Access in Runtime: Write and read

Syntax

Object.AlarmLow[=REAL]

Object

Required A "ScreenItem" object with the format "Bar".

REAL

Value for the lower limit

See also

Bar (Page 3961)

AlarmLowerLimit

Description

Specifies the upper limit at which the alarm will be triggered.

Access in Runtime: Read and write

Syntax

Object.**AlarmLowerLimit**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the lower limit at which the alarm will be triggered.

Comments

The type of evaluation (percentage or absolute) is established using the "AlarmLowerLimitRelative" property.

The "AlarmLowerLimitEnable" property establishes whether the monitoring of this limit is enabled.

See also

Bar (Page 3961)

AlarmLowerLimitColor

Description

Specifies the bar color of the "AlarmLowerLimit" limit.

The "AlarmLowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

Syntax

Object.**AlarmLowerLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that specifies the bar color for the "AlarmLowerLimit" limit.

See also

Bar (Page 3961)

AlarmLowerLimitEnabled

Description

Specifies whether the "AlarmLowerLimit" limit is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**AlarmLowerLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the "AlarmLowerLimit" limit is to be monitored.

Comments

The following values will be established via the properties "AlarmLowerLimit", "AlarmLowerLimitColor" and "AlarmLowerLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

AlarmLowerLimitRelative

Description

Establish whether the lower limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.

Access in Runtime: Read and write

Syntax

Object.**AlarmLowerLimitRelative**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the lower limit at which the interrupt is triggered is evaluated as a percentage.

See also

Bar (Page 3961)

AlarmUpperLimit

Description

Establishes the upper limit at which the interrupt will be triggered.

Access in Runtime: Read and write

Syntax

Object.**AlarmUpperLimit**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that defines the upper limit at which an interrupt will be triggered.

Comments

The type of evaluation (percentage or absolute) is defined using the "AlarmUpperLimitRelative" property.

The "AlarmUpperLimitEnable" property defines whether or not monitoring of this limit is enabled.

See also

Bar (Page 3961)

AlarmUpperLimitColor

Description

Defines the bar color for the "AlarmUpperLimit" limit.

The "AlarmUpperLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

Syntax

Object.**AlarmUpperLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that defines the bar color for the "AlarmUpperLimit" limit.

See also

Bar (Page 3961)

AlarmUpperLimitEnabled

Description

Specifies whether the "AlarmUpperLimit" value is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**AlarmUpperLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the "AlarmUpperLimit" value is monitored.

Comments

The following values will be defined using the properties "AlarmUpperLimit", "AlarmUpperLimitColor" and "AlarmUpperLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

AlarmUpperLimitRelative

Description

Establish whether the upper limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.

Access in Runtime: Read and write

Syntax

Object.**AlarmUpperLimitRelative**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the upper limit at which the interrupt is triggered is evaluated as a percentage or an absolute value.

See also

Bar (Page 3961)

Alignment

Description

Determines the layout of the scale (left/right or top/bottom) depending on the position of the bar object or returns it.

Access in Runtime: Read and write

Syntax

Object.**Alignment**[=ScalePosition]

Object

Required An object of the "ScreenItem" type with the format "Bar".

ScalePosition

1: Right or bottom .

0: Left or top.

See also

Bar (Page 3961)

AlignmentLeft

Description

Defines or returns the horizontal alignment of the text. Value range from 0 to 2.

Access in Runtime: Read and write

Syntax

Object.**AlignmentLeft**[=HorizontalAlignment]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "RoundButton", "CheckBox", "OptionGroup", "MultilineEdit", "ComboBox", "ListBox".

HorizontalAlignment

0: Alignment left

1: Alignment centered

2: Alignment right

AlignmentTop

Description

Defines or returns the vertical alignment of the text. Value range from 0 to 2.

Access in Runtime: Read and write

Syntax

Object.**AlignmentTopt**[=VerticalAlignment]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "RoundButton", "CheckBox", "OptionGroup".

VerticalAlignment

0: Alignment left

1: Alignment centered

2: Alignment right

AllowMenu

Description

Establishes whether the shortcut menu should be enabled to control the Sm@rtClient view.

Syntax

Object.**AllowMenu**

Object

Required A "ScreenItem" object with the format "SmartClientView".

See also

SmartClientView (Page 4085)

AllowPersistence

Description

Specifies whether the persistence is adjustable.

Access in Runtime: Read and write

Syntax

Object.**AllowPersistence**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the persistence is adjustable.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

Analog

Description

Specifies whether the clock should be shown as an analog clock.

Access in Runtime: Read and write

Syntax

Object.**Analog**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Clock".

BOOLEAN

Optional TRUE, if the clock should be shown as an analog clock.

See also

Clock (Page 3984)

AngleAlpha

Description

Defines or returns depth angle a for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

AngleBeta

Description

Defines or returns depth angle b for the 3D-effect of the "3DBarGraph" object. Value range in degrees from 0 to 90.

AngleMax

Description

Specifies the angle of the scale end of the "Gauge" object.

Access in Runtime: Read and write

Syntax

Object.**AngleMax**[= DOUBLE]

Object

Required A "ScreenItem" object with the format "Gauge".

DOUBLE

Optional A value or a constant that specifies the angle in degrees.

Comments

The start and end of the scale gradations are described with the properties "AngleMin" and "AngleMax" in angle degrees.

The value of the AngleMin property must always be less than the value of the AngleMax property. The zero degree angle is located at the 3 o´clock position on the scale. Positive angle values are counted clockwise.

See also

Gauge (Page 4008)

AngleMin

Description

Specifies the angle of the scale start of the "Gauge" object.

Access in Runtime: Read and write

Syntax

Object.**AngleMin**[= DOUBLE]

Object

Required A "ScreenItem" object with the format "Gauge".

DOUBLE

Optional A value or a constant that specifies the angle in degrees.

Comments

The start and end of the scale gradations are described with the properties "AngleMin" and "AngleMax" in angle degrees.

The value of the AngleMin property must always be less than the value of the AngleMax property.

The zero degree angle is located at the 3 o´clock position on the scale. Positive angle values are counted clockwise.

See also

Gauge (Page 4008)

Application

Description

Supplies the content of the application window Read only access.

See also

ScriptDiagnostics (Page 4080)

ApplyProjectSettings

Description

Specifies whether the project settings are applied from the "HMI alarms" editor.

Access in Runtime: Read and write

Syntax

Object.**ApplyProjectSettings**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

BOOLEAN

TRUE: The message blocks configured in the "HMI messages" editor are applied to the message view with their properties. The message blocks are displayed with these properties in the message view.

FALSE: The properties are not applied.

See also

AlarmControl (Page 3947)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

AskOperationMotive

Description

Specifies whether the reason for operating this object will be logged. When operating the specified object in Runtime, a dialog opens in which the operator enters the reason for the operation in text format.

Access in Runtime: Read and write

Syntax

Object.**AskOperationMotive**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "IOField", "SymbolicIOField" or "WindowSlider".

BOOLEAN

Optional TRUE, if the reason for operating this object will be logged.

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

WindowSlider (Page 4139)

Listbox (Page 4027)

Assignments

Description

A list which contains the assignments between the output value and the output text actually to be output. The assignments are dependent on the set list type. You determine the list type with the ListType property.

Access in Runtime: Read

Syntax

Object.**Assignments**

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

See also

SymbolicIOField (Page 4093)

AssumeOnExit

Description

Specifies whether the entered text is applied after leaving the input field, e.g. with the <TAB> key or a mouseclick.

Access in Runtime: Read and write

Syntax

Object.**AssumeOnExit**

Object

Required An object of the "ScreenItem" type with the format "IOField", "SymbolicIOField".

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

AssumeOnFull

Description

Specifies whether the input field is left automatically after a complete input (the specified number of characters was entered) and the input is applied.

Access in Runtime: Read and write

Syntax

Object.AssumeOnFull[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "IOField", "SymbolicIOField".

BOOLEAN

TRUE: is applied.

FALSE: is not applied.

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

Authorization

Description

Specifies the operating rights of the selected object in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Authorization**[=HMIRTAuthorization]

Object

Required An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "UserArchiveControl", "StatusForce", "Slider", "SymbolLibrary", "OnlineTrendControl", "AlarmControl", "UserView", "Checkbox", "OptionGroup", "WindowSlider", "OleView", "Connector" oder "SoftKey".

HMIRTAuthorization

Optional A value or a constant that establishes the operating rights of the specified object in Runtime.

AutoCompleteColumns

Description

Adds empty columns if the Control width is greater than the width of columns configured.

Access in Runtime: Read and write

Syntax

Object.**AutoCompleteColumns**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

BOOLEAN

TRUE: The empty columns are displayed.

FALSE: The empty columns are not displayed.

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AutoCompleteRows

Description

Enables the insertion of empty rows if the Control length is greater than the number of rows configured.

Access in Runtime: Read and write

Syntax

Object.**AutoCompleteRows**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

BOOLEAN

TRUE: The empty rows are displayed.

FALSE: The empty rows are not displayed.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AutoScroll

Description

Specifies how the alarm view behaves when new alarms appear.

The specific choice of alarm lines is only possible if "AutoScroll" is not enabled.

The "AutoScroll" property is disabled if the "MsgCtrlFlag" = "-1" attribute is set. The most up-to-date alarm is then shown at the top of the alarm view.

Access in Runtime: Read and write

Syntax

Object.**AutoScroll**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmView".

BOOLEAN

Optional TRUE, if a new alarm is appended to and chosen from the list shown in the alarm window. If necessary, the visible area of the alarm window can be moved.

FALSE, if a new alarm is not selected. The visible area of the alarm window is not altered.

See also

AlarmControl (Page 3947)

AutoSelectionColors

Description

Enables the display of default system colors as selection color for cells and rows.

Access in Runtime: Read and write

Syntax

Object.**AutoSelectionColors**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

BOOLEAN

TRUE: The system color is used.

FALSE: The customized color is used.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

AutoSelectionRectColor

Description

Defines a system color for the selection border.

Access in Runtime: Read and write

Syntax

Object.**AutoSelectionRectColors** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

BOOLEAN

TRUE: The system color is used.

FALSE: The customized color is used.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

Average

Description

Specifies whether a mean value is shown from the last 15 values.

Access in Runtime: Read and write

Syntax

Object.**Average**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if a mean value is shown from the last 15 values.

Axe property

Description

Defines or returns the position of the 3D bar in the coordinate system. Value range from 0 to 2.

0: The 3D-bar is displayed on the X-axis.

1: The 3D-bar is displayed on the Y-axis.

2: The 3D-bar is displayed on the Z-axis.

AxisSection

Description

Defines or returns the distance between two long axis sections. The information on the distance is given in scale units and is dependent on the minimum and maximum values configured.

Properties B

BackBorderWidth

Description

Defines or returns the width of the 3D border in pixels. The value for the width is dependent on the size of the object.

BackColor

Description

Specifies the background color of the selected object.

Access in Runtime: Read and write

Syntax

Object.**BackColor**[= Color]

Object

Required An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllpticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicIOField", "GraphicView", "Bar", "UserArchivControl", "StatusForce", "Gauge", "Slider", "SymbolLibrary", "RulerTrendControl", "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl", "UserView", "Checkbox", "OptionGroup", "WindowSlider", "Connector", "Group" or an object of the "Screen" type.

Color

Optional A value or a constant that specifies the background color.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

The background color is not visible if the "BorderStyle" property has the value "0".

BackColor

Description

Determines the background color of the given object.

Access during runtime: Read and Write

Syntax

Object.**BackColor** [= Color]

Object

Required An object of type "ScreenItem" with the characteristic "Line", "Polyline", "Ellipse", "Circle", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "GraphicView", "Bar", "RecipeView", "StatusForce", "Gauge", "Slider", "SymbolLibrary", "TrendView", "MessageView" or "UserView" or an object of type "Screen".

Color

Optional A value or constant which determines the background color.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

The background color is not visible if the "BorderStyle" property has the value of "0."

BackColor2

Description

Defines or returns the bar color for the display of the current value. LONG write-read access.

BackColor3 property

Description

Defines or returns the color of the bar background. LONG write-read access.

BackColorBottom

Description

Specifies the color for the lower / right part of the Sliders.

Access in Runtime: Read and write

Syntax

Object.**BackColorBottom**[=Color]

Object

Required A "ScreenItem" object with the format "WindowSlider".

Color

Optional A value or a constant that specifies the color for the lower / right part of the Sliders.

See also

WindowSlider (Page 4139)

BackColorTop

Description

Specifies the color for the upper / left part of the Sliders.

Access in Runtime: Read and write

Syntax

Object.**BackColorTop**[=Color]

Object

Required A "ScreenItem" object with the format "WindowSlider".

Color

Optional A value or a constant that specifies the color for the upper / left part of the Sliders.

See also

WindowSlider (Page 4139)

BackFillStyle

Description

Specifies the fill style of the selected object.

Access in Runtime: Read and write

Syntax

Object.**BackFillStyle**[= THmiFillStyle]

Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "GraphicView", "Bar", "Clock", "Gauge", "Slider", "SymbolLibrary", "CheckBox", "OptionGroup" or "WindowSlider".

THmiFillStyle

Optional A value or a constant that specifies the fill style.

hmiFillStyleTransparent (65536): Transparent fill

hmiFillStyleSolid (0): Object is filled with the specified color

Default setting: Solid

BackFillStyle

Description

Determines the fill style of the specified object.

Access during runtime: Read and Write

Syntax

Object.BackFillStyle [= THmiFillStyle]

Object

Required. An object of the "ScreenItem" type with the characteristic "Ellipse," "Circle", "Rectangle" or "Polygon".

THmiFillStyle

Optional. A value or constant which determines the fill style.

hmiFillStyleTransparent (65536): Transparent fill

hmiFillStyleTransparent (0): Object is filled with the specified color

Default setting: Solid

See also

DateTimeField (Page 3989)

ProjectName (Page 4062)

BackFillStyleReadOnlySpecial

Description

Specifies that the "Background fill style" can only be read.

Access in Runtime: Read and write

Syntax

Object.**BackFillStyleReadOnlySpecial**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the "Background fill style" can only be read.

See also

IOField (Page 4021)

BackFlashColorOff

Description

Defines or returns the color of the object background for the flash status "Off". LONG write-read access.

BackFlashColorOn

Description

Defines or returns the color of the object background for the flash status "On". LONG write-read access.

BackFlashingColorOff

Description

Specifies the color of the background for the flashing status "off".

Access in Runtime: Read and write

Syntax

Object.**BackFlashingColorOff**[=Color]

Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField" or "Bar".

Color

Optional A value or a constant that specifies the color of the background for the flashing status "off".

BackFlashingColorOn

Description

Specifies the color of the background for the flashing status "on".

Access in Runtime: Read and write

Syntax

Object.**BackFlashingColorOn**[=Color]

Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField" or "Bar".

Color

Optional A value or a constant that specifies the color of the background for the flashing status "on".

BackFlashingEnabled

Description

Specifies whether the background of the specified object will flash in Runtime.

Access in Runtime: Read and write

Syntax

Object.**BackFlashingEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField" or "Bar".

BOOLEAN

Optional TRUE, if the background of the specified object is flashing in Runtime.

See also

BackFlashingRate

Description

Specifies the flash rate of the background for the specified object.

Access in Runtime: Read and write

Syntax

Object.**BackFlashingRate**[=FlashingRate]

Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField" or "Bar".

FlashingRate

hmiFlashingRateSlow (0): The length of the flashing rate is 250 ms.

hmiFlashingRateMedium (1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast (2): The length of the flashing rate is 1000 ms.

Background

Description

TRUE, when the background of the 3D-bar graph object should be visible. BOOLEAN write-read access.

BarBackColor

Description

Specifies the color of the bar background for the selected object.

Access during runtime: Read and write

Syntax

Object.**BarBackColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "Bar," or "Slider".

Color

Optional A value or a constant that specifies the color of the bar background.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

BarBackFillStyle

Description

Specifies the fill style for the bar.

Access in Runtime: Read and write

Syntax

Object.**BarBackFillStyle**[=FillStyle]

Object

Required A "ScreenItem" object with the format "Bar".

FillStyle

hmiFillStyleTransparent (65536): Transparent fill style

hmiFillStyleSolid (0): Solid fill style

hmiFillStyleBackwardDiagonal (131075): Diagonal fill style striped towards the top right

hmiFillStyleCross (131076): Checked fill style

hmiFillStyleDiagonalCross (131077): Diagonal checked fill style

hmiFillStyleForwardDiagonal (131074): Diagonal fill style striped towards the top left

See also

Bar (Page 3961)

BarColor

Description

Specifies the color of the slider in the "Slider" object.

Access during runtime: Read and Write

Syntax

Object.**BarColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Slider".

Color

Optional A value or a constant that specifies the color of the slider.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255).

For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

The range extends from "RangeMin" to the position of the controller.

See also

Slider (Page 4082)

BarDepth

Description

Defines or returns the depth of the bar in pixels.

BarHeight property

Description

Defines or returns the height of the bar in pixels.

BarStartValue

Description

Specifies the value of the zero point of the scale.

Access in Runtime: Read and write

Syntax

Object.**BarStartValue**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the value of the zero point for the scale.

See also

Bar (Page 3961)

BarWidth

Description

Defines or returns the width of the bar in pixels.

BaseScreenName

Description

Reads the name of the current root screen or triggers a root screen change by setting a new screen name.

Access in Runtime: Read and write

Syntax

Object.**BaseScreenName**[= STRING]

Object

Required An "HMIRuntime" object.

STRING

Optional A value or a constant that contains the screen name.

Comments

You can also use the property to establish which screen is currently being displayed.

BaseX property

Description

Defines or returns the horizontal distance of the right bar edge to the left edge of the object field in pixels.

BaseY property

Description

Defines or returns the vertical distance of the bottom bar edge to the top edge of the objet field.

BeginTime(i)

Description

Specifies the start time of the time range to be shown in the trend view. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**BeginTime**(i)[=Time]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" oder "OnlineTableControl".

Time

Optional A value or a constant which determines the start time of the time range to be shown in the trend view.

Comments

The parameter i indicates the number of the trend.

If "BeginTime(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "BeginTime(i)".

See also

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

BelowLowerLimitColor

Description

Defines the color of the specified object for the case "Low limit exceeded".

See also

Switch (Page 4089)

SymbolicIOField (Page 4093)

IOField (Page 4021)

BitNumber

Description

Specifies the bit whose status must change to trigger a value change.

Access in Runtime: Read and write

Syntax

Object.**BitNumber**[=Int]

Object

Required A "ScreenItem" object with the formats "SymbolicIOField", "Button" or "GraphicIOField".

Int

Optional Specifies the bit whose status must change to trigger a value change.

Comments

The tag being used must be of type BYTE, WORD or DWORD.

See also

SymbolicIOField (Page 4093)

Button (Page 3968)

GraphicIOField (Page 4011)

BlinkColor

Description

Specifies the color in which the "SymbolLibrary" object will flash.

Access during runtime: Read and Write

Syntax

Object.**BlinkColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "SymbolLibrary".

Color

Optional A value or a constant that specifies the flash color.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

SymbolLibrary (Page 4098)

BlinkMode

Description

Sets the type of flash picture for the specified object.

Access during runtime: Read and write

Syntax

Object.**BlinkMode**[=SymbolLibBlinkMode]

Object

Required A "ScreenItem" object with the format "SymbolLibrary".

SymbolLibBlinkMode

hmiSymbolLibraryFlashingNone (0): Flashing is switched off.

hmiSymbolLibraryFlashingInvisible (1): The flash picture is invisible.

hmiSymbolLibraryFlashingShaded (2): The flash picture is given a colored, shaded surface. The color of the surface corresponds to the settings in the property "BlinkColor".

hmiSymbolLibraryFlashingSolid (3): The flash picture is given a colored, unshaded surface. The color of the surface corresponds to the settings in the property "BlinkColor".

See also

SymbolLibrary (Page 4098)

BlinkSpeed

Description

Specifies the flash rate.

Fast - 250: The length of the flashing rate is 250 ms. Medium - 500: The length of the flashing rate is 500 ms.

Slow - 1000: The length of the flashing rate is 1000 ms. The default value is medium - 500.

Access in Runtime: Read and write

Syntax

Object.**BlinkSpeed**[=FlashingRate]

Object

Required A "ScreenItem" object with the format "SymbolLibrary".

FlashingRate

hmiFlashingRateSlow (0): The length of the flashing rate is 250 ms.

hmiFlashingRateMedium (1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast (2): The length of the flashing rate is 1000 ms.

See also

SymbolLibrary (Page 4098)

BorderBackColor

Description

Specifies the background color of the broken border line for the specified object.

Access in Runtime: Read and write

Syntax

Object.**BorderBackColor**[=Color]

Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "GraphicView", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

Color

Optional A value or a constant that specifies the background color of the broken border line for the specified object.

BorderBrightColor3D

Description

Specifies the frame color of the following frame parts in case of a 3D display of the specified object:

- External frame parts at the top and bottom
- Internal frame parts at the top and right

Access in Runtime: Read and write

Syntax

Object.**BorderBrightColor3D**[= Color]

Object

Required A "ScreenItem" object with the formats "Button", "Roundbutton" or "Slider".

Color

Optional A value or a constant that specifies the frame color. Default setting is white.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Button (Page 3968)

Slider (Page 4082)

BorderShadeColor3D (Page 4212)

BorderBrightColor3D

Description

Determines the frame color of the following frame parts in the 3D display of the given object:

- Outer frame parts above and below
- Inner frame parts below and right

Access during runtime: Read and Write

Syntax

Object.BorderBrightColor3D [= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Slider".

Color

Optional A value or constant which determines the frame color. Default setting is white.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

BorderColor

Description

Specifies the line color of the specified object.

Access in Runtime: Read and write

Syntax

Object.**BorderColor**[= Color]

Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

Color

Optional A value or a constant that specifies the line color.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

BorderColor

Description

Specifies the line color of the selected object.

Access during runtime: Read and Write

Syntax

Object.BorderColor [= Color]

Object

Necessary. An object of the "ScreenItem" type with the characteristics "Ellipse", "Circle", "Rectangle", "Polygon", "TextField", "IOField" or "SymbolicIOField".

Color

Optional A value or constant which determines the line color.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

Used for the following object types:

Rectangle

See also

DateTimeField (Page 3989)

ProjectName (Page 4062)

BorderColorBottom

Description

Defines or returns the border color for the bottom/right part of the object. LONG write-read access.

BorderColorTop

Description

Defines or returns the border color for the top/left part of the object. LONG write-read access.

BorderEnabled

Description

TRUE, when the window is displayed with borders in Runtime. Read only access.

See also

ScreenWindow (Page 4078)

ScriptDiagnostics (Page 4080)

BorderEndStyle

Description

Specifies the type of line-end shapes for the specified object.

Access in Runtime: Read and write

Syntax

Object.**BorderEndStyle**[=Int]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline" or "Connector".

Int

Optional A value or a constant that specifies the type of line-end shapes for the specified object.

See also

Line (Page 4025)

Polyline (Page 4060)

Connector (Page 3986)

BorderFlashColorOff

Description

Defines or returns the color of the object lines for the flashing status "Off". LONG write-read access.

BorderFlashColorOn

Description

Defines or returns the color of the object lines for the flashing status "On". LONG write-read access.

BorderFlashingColorOff

Description

Specifies the color of the border line for the selected object for the flashing status "off".

Access in Runtime: Read and write

Syntax

Object.**BorderFlashingColorOff**[=Color]

Object

Required A "ScreenItem" object with the formats "Ellipse", "Kreis", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "off".

BorderFlashingColorOn

Description

Specifies the color of the border line for the selected object for the flashing status "on".

Access in Runtime: Read and write

Syntax

Object.**BorderFlashingColorOn**[=Color]

Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "on".

BorderFlashingEnable

Description

Specifies whether the border line of the selected object will flash in runtime.

Access in Runtime: Read and write

Syntax

Object.**BorderFlashingEnable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

BOOLEAN

Optional TRUE, if the border line of the object is flashing.

BorderFlashingRate

Description

Specifies the flash rate of the border line for the selected object.

Access in Runtime: Read and write

Syntax

Object.**BorderFlashingRate**[=FlashingRate]

Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

FlashingRate

hmiFlashingRateSlow (0): The length of the flashing rate is 250 ms.

hmiFlashingRateMedium (1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast (2): The length of the flashing rate is 1000 ms.

BorderInnerStyle3D

Description

Specifies the display of the internal part of the object border.

Access in Runtime: Read and write

Syntax

Object.**BorderInnerStyle3D**[=GaugeBorder3DStyle]

Object

Required A "ScreenItem" object with the formats "Gauge" or "Slider".

GaugeBorder3DStyle

hmiGaugeBorder3DStyleNone (0): There is no internal part of the object border.

hmiGaugeBorder3DStyleRecessed (1): The object border is shown in relief.

hmiGaugeBorder3DStyleRaised (2): The object border is shown raised.

hmiGaugeBorder3DStyleGray (3): The object border has a uniform gray border.

hmiGaugeBorder3DStyleColored (4): The object border has a uniform colored border. The border color corresponds to the background color.

See also

Gauge (Page 4008)

Slider (Page 4082)

BorderInnerWidth3D

Description

Specifies the width of the inner border for the 3D presentation of the selected object.

Access in Runtime: Read and write

Syntax

Object.**BorderInnerWidth3D**[= LONG]

Object

Required A "ScreenItem" object with the format "Slider".

LONG

Optional A value or a constant that specifies the width in pixels of the inner border.

See also

Slider (Page 4082)

BorderOuterStyle3D

Description

Specifies the display of the external part of the object border.

Access in Runtime: Read and write

Syntax

Object.**BorderOuterStyle3D**[=GaugeBorder3DStyle]

Object

Required A "ScreenItem" object with the formats "Gauge" or "Slider".

GaugeBorder3DStyle

hmiGaugeBorder3DStyleNone (0): There is no internal part of the object border.

hmiGaugeBorder3DStyleRecessed (1): The object border is shown in relief.

hmiGaugeBorder3DStyleRaised (2): The object border is shown raised.

hmiGaugeBorder3DStyleGray (3): The object border has a uniform gray border.

hmiGaugeBorder3DStyleColored (4): The object border has a uniform colored border. The border color corresponds to the background color.

See also

Gauge (Page 4008)

Slider (Page 4082)

BorderOuterWidth3D

Description

Specifies the width of the outer border for the 3D presentation of the selected object.

Access in Runtime: Read and write

Syntax

Object.**BorderOuterWidth3D**[= LONG]

Object

Required A "ScreenItem" object with the format "Slider".

LONG

Optional A value or a constant that specifies the width in pixels of the outer border.

See also

Slider (Page 4082)

BorderShadeColor3D

Description

Specifies the frame color of the following frame parts in case of a 3D display of the specified object:

- Internal frame parts at the top and bottom
- External frame parts at the bottom and right

Access in Runtime: Read and write

Syntax

Object.**BorderShadeColor3D**[= Color]

Object

Required A "ScreenItem" object with the formats "Button", "Roundbutton" or "Slider".

Color

Optional A value or a constant that specifies the color of the shading. Default setting is

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Button (Page 3968)

Slider (Page 4082)

BorderShadeColor3D

Description

Determines the frame color of the following frame parts in the 3D display of the given object:

- Inner frame parts above and below
- Outer frame parts below and right

Access during runtime: Read and Write

Syntax

Object.BorderShadeColor3D [= Color]

Object

Required. An object of the "ScreenItem" type with the characteristic "Slider."

Color

Optional. A value or constant which determines the shade color. Default setting is

Remarks

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the corresponding decimal values (value range from 0 to 255) for each of the three RGB values. For example, the color "red" is represented as follows: RGB(255, 0, 0). Furthermore, you can use the VBS color constants such as vbRedor vbGreen.

BorderStyle

Description

Specifies the type of border lines for the specified object.

Access in Runtime: Read-only

Syntax

Object.**BorderStyle**[=Int]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup", "WindowSlider", "Connector", "PrintRecipe" or "PrintMessage".

Int

Optional A value or a constant that specifies the type of border lines for the specified object.

0 = filled line

1 = broken line

2 = dotted line

3 = dashed and dotted line

4 = dash - dot - dot line

Listbox (Page 4027)

BorderStyle3D

Description

Specifies whether the selected object has a 3D border shadow.

Access during runtime: Read and write

Syntax

Object.**BorderStyle3D**[= BOOLEAN]

Object

Necessary. A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "GraphicView", "GraphicIOField" or "Bar".

BOOLEAN

Optional TRUE, if the object has a 3D border shadow.

Used for the following object types:

Auto-Hotspot

See also

TextField (Page 4107)

Bar (Page 3961)

BorderStyle3D

Description

Determines whether the given object has 3D border shading.

Access during runtime: Read and Write

Syntax

Object.BorderStyle3D [= BOOLEAN]

Object

Required. An object of the type "ScreenItem" with the characteristic "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicView", "GraphicIOField" or "Bar".

BOOLEAN

Optional. TRUE, if the object has 3D border shading.

See also

DateTimeField (Page 3989)

BorderWidth

Description

Specifies the line thickness of the selected object.

Access during runtime: Read and write

Syntax

Object.**BorderWidth**[= LONG]

Object

Necessary. An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Gauge", "Slider", "Checkbox", "OptionGroup" or "WindowSlider".

LONG

Optional A value or a constant that specifies the line weight in pixels.

Used for the following object types:

Rectangle

BorderWidth

Description

Determines the LineWidth of the given object.

Access during runtime: Read and Write

Syntax

Object.BorderWidth [= LONG]

Object

Required. An object of the type "ScreenItem" with the characteristic "Ellipse", "Circle", "Gauge", "Rectangle", "Polygon" or "TextField".

LONG

Optional. A value or constant which determines the line width in pixels.

See also

ProjectName (Page 4062)

BorderWidth3D

Description

Specifies the width of the border for the 3D representation of the selected object.

Access in Runtime: Read and write

Syntax

Object.BorderWidth3D [= LONG]

Object

Required A "ScreenItem" object with the format "Roundbutton".

LONG

Optional A value or constant which determines the width of the inner border in pixels.

See also

Switch (Page 4089)

Gauge (Page 4008)

RoundButton (Page 4074)

BottomConnectedConnectionPointIndex

Description

Specifies or sets the index number of the bottom connecting point.

LONG write-read access.

BottomConnectedObjectName

Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

BoxAlignment

Description

TRUE, when the fields are arranged aligned to the right. BOOLEAN write-read access.

BoxCount

Description

Defines or returns the number of fields. Value range from 0 to 31.

BoxType

Description

Defines or returns the field type. Value range from 0 to 2:

- 0: Edition
- 1: Input
- 2: I/O field

Button1Width

Description

Defines or returns the width of the Button 1 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

Button2Width

Description

Defines or returns the width of the Button 2 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

Button3Width

Description

Defines or returns the width of the Button 3 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

Button4Width

Description

Defines or returns the width of the Button 4 in pixels.
When the SameSize property is set to TRUE, all the buttons are specified the same width.

ButtonColor

Description

Defines or returns the color of the slider. LONG write-read access.

ButtonCommand

Description

Specifies the display in the message view.

Access in Runtime: Read and write

Syntax

Object.**ButtonCommand**[=Long]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Long

Optional A value or a constant which specifies the display in the message view.

AlarmControl (Page 3947)

Properties C

Caption

Description

Specifies the text that will be displayed in the title line of the selected object.

Access in Runtime: Read and write

Syntax

Object.**Caption**[= STRING]

Object

Required An object of the "ScreenItem" type with the format "Slider", "FunctionTrendControl", "OnlineTableControl", "AlarmControl", "ScreenWindow" or "UserArchiveControl".

STRING

Optional A value or a constant that contains the text that will be shown in the title line.

See also

Slider (Page 4082)

UserArchiveControl (Page 4130)

SystemDiagnoseWindow (Page 4103)

TrendRulerControl (Page 4110)

Caption

Description

Determines the text which is displayed in the caption line of the given object.

Access during runtime: Read and Write

Syntax

Object.Caption [= STRING]

Object

Required. An object of the "ScreenItem" type with the characteristic "Slider."

STRING

Optional. A value or a constant which contains the text which is displayed in the caption.

CaptionBackColor

Description

Specifies the background color of the title line for the selected object.

Access in Runtime: Read and write

Syntax

Object.**CaptionBackColor**[=Color]

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

Color

Optional A value or a constant that specifies the background color of the title line for the selected object.

See also

SymbolicIOField (Page 4093)

CaptionColor

Description

Specifies the color of the text that will be displayed in the title line of the selected object.

Access in Runtime: Read and write

Syntax

Object.**CaptionColor**[= Color]

Object

Required A "ScreenItem" object with the formats "SymbolicIOField", "Switch" or "Gauge".

Color

Optional A value or a constant that specifies the text color.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

SymbolicIOField (Page 4093)

Switch (Page 4089)

Gauge (Page 4008)

CaptionColor

Description

Determines the color of the text which is displayed in the title bar of the given object.

Access during runtime: Read and Write

Syntax

Object.CaptionColor [= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "Switch," or "Gauge".

Color

Optional A value or constant which determines the text color.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

CaptionText

Description

Specifies the text that will be displayed in the title line of the selected object.

Access in Runtime: Read and write

Syntax

Object.**CaptionText**[= STRING]

Object

Required A "ScreenItem" object with the formats "Switch" or "Gauge".

STRING

Optional A value or a constant that contains the text that will be shown in the title line.

See also

Switch (Page 4089)

Gauge (Page 4008)

ScreenWindow (Page 4078)

CaptionTop

Description

Specifies the distance of the instrument labels to the upper edge of the selected object. You can position the instrument labels only in line with the vertical diameter of the scale. The value of the attribute refers to the height of the specified object. The height establishes the upper edge of the specified object and the lower edge of the lettering.

Access in Runtime: Read and write

Syntax

Object.**CaptionTop**[=Double]

Object

Required A "ScreenItem" object with the format "Gauge".

Double

Optional A value or a constant that specifies the distance of the instrument labels to the upper edge of the selected object.

Value range from 0 to 1

0: The lower edge of the lettering is positioned on the upper limit of the selected object. The text is no longer visible as it is positioned outside of the selected object.

1: The lower edge of the lettering is positioned on the lower limit of the selected object.

See also

Gauge (Page 4008)

CellCut

Description

Specifies whether the contents of the cells are abbreviated if the cells are too narrow.

Access in Runtime: Read and write

Syntax

Object.**CellCut** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

BOOLEAN

TRUE, if the contents are abbreviated.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

CellSpaceBottom

Description

Defines the bottom margin of the table cells.

Access in Runtime: Read

Syntax

Object.**CellSpaceBottom**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

CellSpaceLeft

Description

Specifies the cell space left which is used in the table cells.

Access in Runtime: Read

Syntax

Object.**CellSpaceLeft**

Object

Required An object of the "ScreenItem" type with the format "MessageView", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

CellSpaceRight

Description

Defines the right indent of the table cells.

Access in Runtime: Read

Syntax

Object.**CellSpaceRight**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

CellSpaceTop

Description

Defines the top margin of the table cells.

Access in Runtime: Read

Syntax

Object.**CellSpaceTop**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

CenterColor

Description

Specifies the color of the center of the "Gauge" object.

Access during runtime: Read and Write

Syntax

Object.**CenterColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Gauge".

Color

Optional A value or a constant that specifies the color of the center.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Gauge (Page 4008)

CenterSize

Description

Specifies the diameter of the round scale center point.

Access in Runtime: Read and write

Syntax

Object.**CenterSize**[=Single]

Object

Required A "ScreenItem" object with the format "Gauge".

Single

Optional A value or a constant that specifies the diameter of the round scale center point.

Value range from 0.03 to 1

1: The diameter corresponds to the smaller value of the geometry attribute "Width" or "Height".

See also

Gauge (Page 4008)

CentrePoint

Description

Specifies the position of the center point.

Access in Runtime: Read and write

Syntax

Object.**CentrePoint**[=Point]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Point

Optional A value that specifies the position of the center point.

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

CentrePointLeft

Description

Specifies the horizontal distance in pixels of the center point from the left edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**CentrePointLeft**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value that specifies the horizontal distance in pixels of the center point from the left edge of the screen.

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

CentrePointTop

Description

Specifies the vertical distance in pixels of the center point from the upper edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**CentrePointTop**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value that specifies the vertical distance in pixels of the center point from the upper edge of the screen.

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

ChangeMouseCursor

Description

Specifies how the appearance of the mouse cursor changes in Runtime when it is above the icon.

Access in Runtime: Read and write

Syntax

Object.**ChangeMouseCursor**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "SymbolLibrary".

BOOLEAN

Optional TRUE, if the mouse cursor has the appearance of an arrow even when it is positioned above the icon.

FALSE, if the mouse cursor has the apparance of a 3D arrow with a green lightning symbol. This indicates in Runtime that the respective objective can be operated.

See also

SymbolLibrary (Page 4098)

CheckAlarmHigh

Description

TRUE, when the "AlarmHigh" limit value is to be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmHigh", "ColorAlarmHigh" and "TypeAlarmHigh" properties.

CheckAlarmLow

Description

TRUE, when the "AlarmLow" limit value is to be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "AlarmLow", "ColorAlarmLow" and "TypeAlarmLow" properties.

CheckLimitHigh4

Description

TRUE, when the "Reserve 4" upper limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh4", "ColorLimitHigh4" and "TypeLimitHigh4" properties.

CheckLimitHigh5

Description

TRUE, when the "Reserve 5" upper limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitHigh5", "ColorLimitHigh5" and "TypeLimitHigh5" properties.

CheckLimitLow4

Description

TRUE, when the "Reserve 4" lower limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow4", "ColorLimitLow4" and "TypeLimitLow4" properties.

CheckLimitLow5

Description

TRUE, when the "Reserve 5" lower limit value should be monitored. BOOLEAN write/read access.
The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "LimitLow5", "ColorLimitLow5" and "TypeLimitLow5" properties.

CheckMarkAlignment

Description

Specifies whether the fields are right aligned.

Access in Runtime: Read and write

Syntax

Object.**CheckMarkAlignment**[=ContentAlignment]

Object

Required A "ScreenItem" object with the formats "Checkbox" or "OptionGroup".

ContentAlignment

(0): The fields are arranged left aligned.

(1): The fields are arranged right aligned.

See also

OptionGroup (Page 4054)

CheckMarkCount

Description

Specifies the number of fields.

Access in Runtime: Read and write

Syntax

Object.**CheckMarkCount**[=Int]

Object

Required A "ScreenItem" object with the formats "Checkbox" or "OptionGroup".

Int

Optional A value or a constant that specifies the number of fields. Value range from 0 to 31

See also

OptionGroup (Page 4054)

CheckToleranceHigh

Description

TRUE, when the "ToleranceHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceHigh", "ColorToleranceHigh" and "TypeToleranceHigh" properties.

CheckToleranceLow

Description

TRUE, when the "ToleranceLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "ToleranceLow", "ColorToleranceLow" and "TypeToleranceLow" properties.

CheckWarningHigh

Description

TRUE, when the "WarningHigh" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningHigh", "ColorWarningHigh" and "TypeWarningHigh" properties.

CheckWarningLow

Description

TRUE, when the "WarningLow" limit value is to be monitored. BOOLEAN write/read access. The limit value, the display on reaching the limit value and the type of evaluation are defined by means of the "WarningLow", "ColorWarningLow" and "TypeWarningLow" properties.

ClearOnError

Description

Specifies whether an invalid input in this object will be deleted automatically.

Access in Runtime: Read and write

Syntax

Object.**ClearOnError**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if an invalid input in this object will be deleted automatically.

See also

IOField (Page 4021)

ClearOnFocus

Description

Specifies whether the field entry will be deleted as soon as the I/O field is activated.

Access in Runtime: Read and write

Syntax

Object.**ClearOnFocus**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the field entry is deleted as soon as the I/O field is activated.

See also

IOField (Page 4021)

ClearOnNew

Description

TRUE, when the field entry is deleted as soon as the I/O field has the focus. BOOLEAN write-read access.

Closable

Description

Specifies whether the window can be closed in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Closable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the window can be closed in Runtime.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

SystemDiagnoseWindow (Page 4103)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

CloseButton

Description

TRUE, when the window is provided with a "Close" button. Read only access.

Color

Description

Specifies the line color of the specified object.

Access in Runtime: Read and write

Syntax

Object.**Color**[= Color]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "EllipticalArc" or "CircularArc".

Color

Optional A value or a constant that specifies the line color.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Line (Page 4025)

Polyline (Page 4060)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

TubeArcObject (Page 4121)

TubeDoubleTeeObject (Page 4123)

TubePolyline (Page 4125)

TubeTeeObject (Page 4128)

Color

Description

Determines the line color of the given object.

Access during runtime: Read and Write

Syntax

Object.Color [= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "Line," or "Polyline".

Color

Optional A value or constant which determines the line color.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

ColorAlarmHigh

Description

Defines or returns the bar color for the "AlarmHigh" limit value. LONG write/read access. The "CheckAlarmHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorAlarmLow

Description

Defines or returns the bar color for the "AlarmLow" limit value. LONG write/read access. The "CheckAlarmLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorBottom

Description

Defines or returns the color for the bottom/right stop of the slider object. LONG write-read access.

ColorChangeHysteresis

Description

Specifies hysteresis as a percentage of the display value.

The "ColorChangeHysteresisEnable" property must have the value TRUE so that the hysteresis can be calculated.

Access in Runtime: Read and write

Syntax

Object.**ColorChangeHysteresis**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the hysteresis as a percentage of the display value.

See also

Bar (Page 3961)

ColorChangeHysteresisEnabled

Description

Determines whether the object will be displayed with a hysteresis.

Access in Runtime: Read and write

Syntax

Object.**ColorChangeHysteresisEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the object will be displayed with a hysteresis.

See also

Bar (Page 3961)

ColorChangeType

Description

TRUE, if the change of color should occur segment by segment in the case of a color change (e.g. on reaching a limit value). If set to FALSE, it defines the change of color for the entire bar. BOOLEAN write-read access.

ColorLimitHigh4

Description

Defines or returns the color for the "Reserve 4" upper limit value. LONG write/read access. The "CheckLimitHigh4" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorLimitHigh5

Description

Defines or returns the color for the "Reserve 5" upper limit value. LONG write/read access. The "CheckLimitHigh5" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorLimitLow4

Description

Defines or returns the color for the "Reserve 4" lower limit value. LONG write/read access. The "CheckLimitLow4" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorLimitLow5

Description

Defines or returns the color for the "Reserve 5" lower limit value. LONG write/read access. The "CheckLimitLow5" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorToleranceHigh

Description

Defines or returns the color for the "ToleranceHigh" upper limit value. LONG write/read access. The "CheckToleranceHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorToleranceLow

Description

Defines or returns the color for the "ToleranceLow" lower limit value. LONG write/read access. The "CheckToleranceLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorTop

Description

Defines or returns the color for the top/left stop of the slider object. LONG write-read access.

ColorWarningHigh

Description

Defines or returns the color for the "WarningHigh" upper limit value. LONG write/read access. The "CheckWarningHigh" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColorWarningLow

Description

Defines or returns the color for the "WarningLow" lower limit value. LONG write/read access. The "CheckWarningLow" property must have been set to TRUE if the bar color should change on reaching the limit value.

ColumnAlign

Description

Specifies how the selected column is aligned.

The following settings are possible:

Value	Description	Explanation
0	Left	The column selected is displayed left-justified.
1	Centered	The column selected is displayed centered.
2	Right	The column selected is displayed right-justified.

The attribute can be made dynamic with the name **ColumnAlign**. The data type is LONG.

ColumnColor(i)

Description

Determines the color of the i column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**ColumnColor(i)**[=Color]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

Color

Optional A value or a constant that specifies the color of the i column pair.

See also

OnlineTableControl (Page 4037)

ColumnDisplayName(i)

Description

Specifies the name for the selected column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**ColumnDisplayName(i)**[=String]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

String

Optional A value or a constant that specifies the name for the selected column pair.

See also

OnlineTableControl (Page 4037)

ColumnResize

Description

Enables changes to the width of columns.

Access in Runtime: Read and write

Syntax

Object.**ColumnResize**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

BOOLEAN

TRUE: You can change the width of the columns.

FALSE: You cannot change the width of the columns.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

ColumnSizingEnable

Description

Specifies whether the width of the columns in the alarm window can be changed. The width of the columns can be changed only if the "AutoScroll" property is not enabled.

Access in Runtime: Read and write

Syntax

Object.**ColumnSizingEnable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE if the width of the columns in the alarm window can be changed.

See also

AlarmControl (Page 3947)

ColumnSrollbar

Description

Enables the display of column scroll bars.

Access in Runtime: Read

Syntax

Object.**ColumnScrollbar**[=Scrollbar]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

Scrollbar

0 = (No) The column scrollbars are not displayed.

1 = (if required) The column scrollbars are displayed if the space requirement of the control is greater in vertical direction than the available display area.

2 = (always) The column scrollbars are always displayed.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

ColumnTitleAlign

Description

Specifies the type of column title alignment.

Access in Runtime: Read

Syntax

Object.**ColumnTitleAlign**[=Align]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

Align

0 = The column headers are shown left aligned.

1 = The column headers are shown centered.

2 = The column headers are shown right aligned.

3 = The column headers are aligned as the corresponding content.

See also

AlarmControl (Page 3947)

ColumnTitles

Description

Enables the display of the column header.

Access in Runtime: Read

Syntax

Object.**ColumnTitle**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl".

BOOLEAN

BOOLEAN

TRUE: The column header is displayed.

FALSEThe column header is not displayed.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

ColumnUpdateEnabled(i)

Description

Specifies whether the selected column pair will be shown statically or dynamically.

Access in Runtime: Read and write

Syntax

Object.**ColumnUpdateEnabled(i)**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE if the column pair is to be shown statically.

Comments

The "CurrentColumnIndex" property references the column pair that is currently active.

See also

OnlineTableControl (Page 4037)

Command

Description

Specifies whether there is a forced update of the values displayed in the control.

Access in Runtime: Read and write

Syntax

Object.**Command**[=String]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "OnlineTableControl".

String

Optional A value or a constant which specifies whether there is a forced update of the values displayed in the control.

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

Comment

Description

Reads or sets the Alarm object comment.

CommonTimeAxisColor

Description

Specifies the color of the mutual X axis.

Access in Runtime: Read and write

Syntax

Object.**CommonTimeAxisColor**[=Color]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

Color

Optional A value or a constant that specifies the color of the common x axis.

See also

OnlineTrendControl (Page 4045)

ComputerName

Description

Returns the name of the computer on which the alarm object was triggered.

ComputerName (readonly)

ConfigureTimeAxis(i)

Description

Specifies whether a common time axis is used for all the trends in the trend view.

Access in Runtime: Read and write

Syntax

Object.**ConfigureTimeAxis(i)**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE, if a common axis is used for all the trends in the trend view.

See also

OnlineTrendControl (Page 4045)

ConnectionType

Description

Specifies the type of connector. It is possible to select between two connection types.

Access in Runtime: Read and write

Syntax

Object.**ConnectionType**[=ConnectorConnectionType]

Object

Required An object of the "ScreenItem" type with the format "Connector".

ConnectorConnectionType

(0): Automatic: Both objects are connected by a polyline made up of horizontal and vertical parts.

(1): Single: Both objects are connected by a straight line between the connecting points. The fields are arranged right-justified.

See also

SmartClientView (Page 4085)

Connector (Page 3986)

ConnectTrendWindows

Description

Specifies whether the configured trend views are connected. The requirement is that you have configured several trend views.

The connected trend views have the following properties:

- A common X axis
- A scrollbar
- A ruler

Access in Runtime: Read

Syntax

Object.**ConnectTrendWindows**[=Boolean]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Boolean

TRUE = All configured trend views are connected.

FALSE = The trend views are displayed separately.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

Context

Description

Reads or sets the alarm object server prefix.

ContinousChange

Description

Specifies whether the value of the "ProcessValue" property will be transferred when the mouse button is released or as soon as the slider position changes in Runtime.

Access in Runtime: Read and write

Syntax

Object.**ContinousChange**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Slider".

BOOLEAN

Optional TRUE, if the value of the property "ProcessValue" will be transferred when the mouse button is released or as soon as the slider position changes in Runtime.

See also

Slider (Page 4082)

CornerStyle

Description

Specifies the type of border lines for the specified object.

Access in Runtime: Read-only

Syntax

Object.**ConerStyle**[=Int]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "TubePolyLone", "GraphicIOField", "Bar", "Checkbox", "OptionGroup", "WindowSlider", "Connector", "MultiLineEdit" or "ComboBox".

Int

Optional A value or a constant that specifies the type of border lines for the specified object.

0 = filled line

1 = broken line

2 = dotted line

3 = dashed and dotted line

4 = dash - dot - dot line

See also

IOField (Page 4021)
TextField (Page 4107)
OptionGroup (Page 4054)

Count

Description

Returns the number of elements in the specified list.

Access in Runtime: Read

Syntax

Object.Count

Object

Required A "Collection" object.

CountDivisions

Description

Specifies the number of segments in which the bar will be divided by the large marking lengths of the scale.

Access in Runtime: Read and write

Syntax

Object.**CountDivisions**[=Int]

Object

Required A "ScreenItem" object with the format "Bar".

Int

Optional A value or a constant that specifies the number of segments in which the bar will be divided by the large marking lengths of the scale.

0-100: An object can be divided into a maximum of 100 segments

= 0: The optimum number of segments will be established automatically.

See also

Bar (Page 3961)

CountSubDivisions

Description

Specifies the number of scale marking lengths between two main marking lengths of the "Bar" object.

Access in Runtime: Read and write

Syntax

Object.**CountSubDivisions**[= LONG]

Object

Required A "ScreenItem" object with the format "Bar".

LONG

Optional A value or a constant that specifies the number of scale segments.

See also

Bar (Page 3961)

CountValueColumns

Description

Returns the number of configured trends or column pairs (visible and invisible) of the window.

Access in Runtime: Read and write

Syntax

Object.**CountValueColumns**[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

Int

Optional A value or a constant that returns the number of configured trends or column pairs (visible and invisible) of the window.

See also

OnlineTableControl (Page 4037)

CountVisibleItems

Description

Specifies how many lines the selection list will contain. If the number of configured texts is greater than this value, then the selection list will have a vertical scroll bar.

Access in Runtime: Read and write

Syntax

Object.**CountVisibleItems**[=Int]

Object

Required An object of the "ScreenItem" type with the format "SymbolicIOField", "StatusForce", "OnlineTrendControl" or "UserArchivControl".

Int

Optional A value or a constant that specifies how many lines the selection list will contain.

See also

SymbolicIOField (Page 4093)

UserView (Page 4137)

StatusForce (Page 4087)

Listbox (Page 4027)

TrendView (Page 4118)

CurrentColumnIndex

Description

Specifies which settings can be assigned to a selected column pair. The property is evaluated by other properties. Valid values for the index have values from 0 to -1. The "CountValueColumns" property contains the number of column pairs that are to be shown.

Access in Runtime: Read and write

Syntax

Object.**CurrentColumnIndex**[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

Int

Optional A value or a constant that specifies which settings can be assigned to a particular column pair.

Comments

The "NumItems" property contains the number of trends / column pairs to be shown.

See also

OnlineTableControl (Page 4037)

CurrentContext

Description

Returns a character string depending on the use of the function.

If the function is contained in a screen in the screen window, CurrentContext returns the symbolic server name which supplies the screen. Example: "WinCCProject_MyComputer::"

If the function is contained in the main screen, an empty character string is returned.

Access in Runtime: Read

Syntax

Object.**CurrentContext**

Object

Required A "HMIRuntime" object.

See also

HMIRuntime (Page 3922)

CurrentCurveIndex

Description

Specifies the index for the active trends.

Access in Runtime: Read and write

Syntax

Object.**CurrentCurveIndex**[=Int]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTrendControl".

Int

Optional A value or a constant that specifies the index of the trends that are currently active.

Comments

The "CurrentCurveIndex" property is evaluated by other properties so that their settings can be assigned to a specific trend. Valid values range from 0 to -1. The "CurvesCount" property contains the number of trends to be shown.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

CursorControl

Description

Specifies whether the mouse cursor jumps to the next field of the TAB order after leaving the field.

Access in Runtime: Read and write

Syntax

Object.**CursorControl**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "IOField" or "SymbolicIOField".

BOOLEAN

Optional. TRUE, if the mouse cursor jumps to the next field of the TAB-order after leaving the field.

Comments

For this purpose, the "CursorMode" property must be set to TRUE.

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

CurveColor(i)

Description

Specifies the color of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**CurveColor(i)**[=Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Color

Optional A value or a constant that specifies the color of the selected trend.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

CurveLineWidth(i)

Description

Specifies the line weight of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**CurveLineWidth(i)**[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

Int

Optional A value or a constant that specifies the line weight of the selected trend. Value range from 0 to 10.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

CurvesCount

Description

Returns the number of configured trends or column pairs (visible and invisible) of the window.

Access in Runtime: Read and write

Syntax

Object.**CurvesCount**[=Int]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Int

Optional A value or a constant that returns the number of configured trends or column pairs (visible and invisible) of the window.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

CurveUpdateEnabled(i)

Description

Specifies whether the selected trend will be shown statically or dynamically.

Access in Runtime: Read and write

Syntax

Object.**CurveUpdateEnabled(i)**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE if the trend is to be shown statically.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

Properties D

DangerRangeColor

Description

Specifies the color of the danger range of the scale of the "Gauge" object.

The "DangerRangeVisible" property must have the value TRUE so that the danger range is displayed.

Access during runtime: Read and write

Syntax

Object.**DangerRangeColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Gauge".

Color

Optional A value or a constant that specifies the color of the danger range.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Gauge (Page 4008)

DangerRangeVisible (Page 4260)

DangerRangeStart

Description

Specifies at which scale value the danger range of the "Gauge" object will start.

The "DangerRangeColor" property must have the value TRUE so that the danger range is displayed.

Access in Runtime: Read and write

Syntax

Object.**DangerRangeStart**[= DOUBLE]

Object

Required A "ScreenItem" object with the format "Gauge".

DOUBLE

Optional A value or a constant that specifies the scale value for the start of the danger range.

Comments

The range extends from the value "Gefahr" through to the end of the scale.

See also

Gauge (Page 4008)

DangerRangeVisible (Page 4260)

DangerRangeVisible

Description

Specifies whether the danger range in the scale of the "Gauge" object will be displayed.

Access in Runtime: Read and write

Syntax

Object.**DangerRangeVisible**[= BOOLEAN]

Object

Required A "ScreenItem" object with the format "Gauge".

BOOLEAN

Optional TRUE, if the danger range will be displayed in the scale.

Comments

Specifies the color of the danger range with the "DangerRangeColor" property.

Specifies the start of the danger range with the "DangerRangeStart" property.

See also

Gauge (Page 4008)

DataFormat

Description

Returns the data type of the I/O field object. Read only access.

Value range from 0 to 3.

0: Binary

1: Decimal

2: String

3: Hexadecimal

See also

IOField (Page 4021)

DataIndex(i)

Description

Returns the current index for the data of the current trend.

Access in Runtime: Read and write

Syntax

Object.**DataIndex(i)**[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the current index of the data for the current trend.

See also

FunctionTrendControl (Page 4004)

DataLogs

Description

Returns an object of type "DataLogs".

Access in Runtime: Read

Syntax

Object.**DataLogs**

Object

Required A "Logging" object.

See also

Logging (Page 3927)

DataLogTag

Description

Specifies which tag is linked with the selected trend.

Access in Runtime: Read and write

Syntax

Object.**DataLogTag**[=HmiLoggingTag]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "OnlineTableControl".

HmiLoggingTag

Optional A value or a constant that specifies which tags are linked to the selected trend.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

DataSet

Description

Returns an object of type "DataSet".

Access in Runtime: Read

Syntax

Object.**DataSet**

Object

Required A "Screen" object.

See also

HMIRuntime (Page 3922)

Screen (Page 3930)

DataX(i)

Description

Inserts one single data record and must be set prior to the call of "InsertData(i)".

Access in Runtime: Read and write

Syntax

Object.**DataX(i)**[=object]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

object

Optional A value or a constant that inserts one single data record.

See also

FunctionTrendControl (Page 4004)

DataXY(i)

Description

Inserts several data records as Array with value pairs and must be set before calling "InsertData(i)".

The data in the Array are applied if "DataX(i)" is a VT_EMPTY type. Otherwise, the single value pair resulting from "DataX(i)" and "DataY(i)" will be used in the attribute "InsertData(i)".

Access in Runtime: Read and write

Syntax

Object.**DataXY**(i)[=object]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

object

Optional A value or a constant which inserts several data records as Array with value pairs.

See also

FunctionTrendControl (Page 4004)

DataY(i)

Description

Inserts one single data record and must be set prior to the call of "InsertData(i)".

Access in Runtime: Read and write

Syntax

Object.**DataY**(i)[=Double]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Double

Optional A value or a constant that inserts one single data record.

See also

FunctionTrendControl (Page 4004)

DeleteData(i)

Description

Specifies which data from the data buffer of the active trend will be deleted.

TRUE:

Access in Runtime: Read and write

Syntax

Object.**DeleteData**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if all the data of the trend is to be deleted.

FALSE, if the value pair at position "DataIndex(i)" is to be deleted.

See also

FunctionTrendControl (Page 4004)

DeleteEnable

Description

Specifies whether the recipe view can be cleared in Runtime.

Access in Runtime: Read and write

Syntax

Object.**DeleteEnable**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the recipe view can be cleared in Runtime.

DialColor

Description

Specifies the color of the dial for the selected object.

Access during runtime: Read and Write

Syntax

Object.**DialColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "Clock," or "Gauge".

Color

Optional A value or a constant that specifies the color of the dial.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Gauge (Page 4008)

DialFillStyle

Description

Specifies the type of background of the selected object.

Access in Runtime: Read and write

Syntax

Object.**DialFillStyle**[=GaugeBackStyle]

Object

Required A "ScreenItem" object with the format "Gauge".

GaugeBackStyle

hmiGaugeBackStyleSolid (0): The rectangular background of the display is filled with the specified border color. The scale is filled with the specified background color.

solid backstyle.

hmiGaugeBackStyleFrameTransparent (1): The rectangular background of the Gauge is transparent. The scale is filled with the specified background color. As a result, a circular display can be shown.

Identifies only frame is transparent.

hmiGaugeBackStyleTransparent (2): The rectangular background and the scale are transparent.

Identifies a transparent backstyle.

See also

Gauge (Page 4008)

DialSize

Description

Specifies the diameter of the scale in relation to the smaller value of the geometry attributes "Width" and "Height".

Access in Runtime: Read and write

Syntax

Object.**DialSize**[=Single]

Object

Required A "ScreenItem" object with the format "Gauge".

Single

Optional A value or a constant that establishes the diameter of the scale in relation to the smaller value of the geometry attributes "Width" and "Height".

See also

Gauge (Page 4008)

Direction

Description

Defines or returns the bar direction or the position of the slider object.

Access in Runtime: Read and write

Syntax

Object.**Direction** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "Bar" or "Slider".

BOOLEAN

0 = top

1 = bottom

2 = left

3 = right

DisplayName(i)

Description

Specifies the name for the selected trend.

Access in Runtime: Read and write

Syntax

Object.**DisplayName**(i)[=String]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

String

Optional A value or a constant that specifies the name for the selected trend.

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 4004)

DisplayOptions

Description

Specifies which messages are displayed.

Access in Runtime: Read

Syntax

Object.**DisplayOptions** [=DisplayOption]

Object

Required A "ScreenItem" object with the format "AlarmControl".

DisplayOption

0: All messages

1: Only displayed messages

2: Only hidden messages

See also

AlarmControl (Page 3947)

DoubleClickAction

Description

Sepcifies the action to be executed in Runtime by double-clicking on a message line.

Access in Runtime: Read

Syntax

Object.**DoubleClickAction**[=ClickAction]

Object

Required A "ScreenItem" object with the format "AlarmControl".

ClickAction

Value	Description	Description
0	none	No action.
1	Loop-in-alarm	Calls the "Loop-in-alarm" function.
2	Open comments dialog	Calls the "Comments dialog" button function.
3	Open Infotext dialog	Calls the "Infotext dialog" button function.
4	Column-dependent	The action is determined by the column in which you double-clicked.

See also

AlarmControl (Page 3947)

DrawAlwaysInsideFrame

Description

Specifies whether the border line of the selected object should be illustrated with a line weight greater than 1 within the border or symmetrically to the border.

Access in Runtime: Read and write

Syntax

Object.**DrawAlwaysInsideFrame**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Rectangle".

BOOLEAN

Option TRUE, if the border line of the specified object will be illustrated with a line weight greater than 1 within the border.

See also

Rectangle (Page 4072)

DrawEnhancedHTMLBrowser

Description

Specifies the style of the HTML-Browsers.

Access in Runtime: Read and write

Syntax

Object.**DrawEnhancedHTMLBrowser**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "HTMLBrowser".

BOOLEAN

Optional TRUE, if an extended HTML-Browser will be displayed.

See also

HTMLBrowser (Page 4019)

DrawInsideFrame

Description

Specifies whether the border line of the selected object should be illustrated with a line weight greater than 1 within the border or symmetrically to the border.

Access in Runtime: Read and write

Syntax

Object.**DrawInsideFrame**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "GraphicView", "GraphicIOField", "Bar", "CheckBox", "OptionGroup", "WindowSlider" or "Connector".

BOOLEAN

Optional TRUE, if the border line of the specified object will be illustrated with a line weight greater than 1 within the border.

See also

CheckBox (Page 3974)

OptionGroup (Page 4054)

WindowSlider (Page 4139)

Connector (Page 3986)

RoundButton (Page 4074)

DrawStylishButton

Description

Specifies whether the button will be displayed in the general Windows style.

Access in Runtime: Read and write

Syntax

Object.**DrawStylishButton**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Button".

BOOLEAN

Optional TRUE, if the button will be displayed in the general Windows style.

See also

Button (Page 3968)

Drive

Description

Specifies the characters of the drive that is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**Drive**[=String]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

String

Optional A value or a constant that specifies the characters of the drive that is to be monitored.

See also

DiskSpaceView (Page 3991)

Properties E-F

EdgeStyle

Description

Determines the line style of the given object.

Access during runtime: Read and Write

Syntax

Object.EdgeStyle [= THmiLineStyle]

Object

Required. An object of the type "ScreenItem" with the characteristic "Ellipse", "Circle", "Rectangle", "Polygon", "TextField" or "IOField".

THmiLineStyle

Optional. A value or constant that defines the line style. Value range from -1 to 4.

The objects "Ellipse", "Circle", "Rectangle" and "Polygon" support the line style:

- hmiLineStyleSolid (0): solid line
- hmiLineStyleDash (1): dashed line
- hmiLineStyleDot (2): dotted line
- hmiLineStyleDashDot (3): dash dot line
- hmiLineStyleDashDotDot (4): dash dot dot line

The objects "TextField" and "IOField" support only the line style:

- hmiLineStyleNone (-1): no line
- hmiLineStyleSolid (0): solid line

Default setting: hmiLineStyleSolid

See also

GraphicIOField (Page 4011)

Switch (Page 4089)

CircleSegment (Page 3979)

DateTimeField (Page 3989)

Ellipse (Page 3993)

EdgeStyle

Description

Specifies the line style of the selected object.

Access in Runtime: Read and write

Syntax

Object.**EdgeStyle**[= THmiLineStyle]

Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField" "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

THmiLineStyle

Optional A value or a constant that specifies the line style. Value range from -1 to 4.

The objects "Ellipse", "Circle", "Rectangle" and "Polygon" support the line styles:

- hmiLineStyleSolid (0): solid line
- hmiLineStyleDash (1): broken line
- hmiLineStyleDot (2): dotted line
- hmiLineStyleDashDot (3): dash - dot line
- hmiLineStyleDashDotDot (4): dash - dot - dot line

The objects "TextField" and "IOField" support only the line styles:

- hmiLineStyleNone (-1): no line
- hmiLineStyleSolid (0): solid line

Default setting: hmiLineStyleSolid

Editable(i)

Description

Specifies whether a column pair can be edited. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**Editable**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE, if the column pair can be edited. The column pair is referenced by the parameter i.

See also

OnlineTableControl (Page 4037)

EditAtOnce

Description

TRUE, if accessing the field with the <TAB> key permits input immediately and without further action. BOOLEAN write-read access.

EditEnabled

Description

Specifies whether edit mode is enabled for a cell, if the property "Editable(i)" has the value TRUE.

Access in Runtime: Read and write

Syntax

Object.**EditEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE, if the edit mode is enabled for a cell if the property "Editable(i)" has the value TRUE.

See also

OnlineTableControl (Page 4037)

EditOnFocus

Description

Specifies whether the data input is immediately possible if the input field is selected using the <Tab> key.

Access in Runtime: Read and write

Syntax

Object.**EditOnFocus**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "IOField" or "SymbolicIOField".

BOOLEAN

Optional TRUE, if the data input is immediately possible and the input field has been selected using the <Tab> key.

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

Enabled

Description

Specifies whether the selected object can be operated in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Enabled**[= BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "StatusForce", "Clock", "Gauge", "Slider", "SymbolLibrary", "OnlineTableControl", "OnlineTrendControll, "FunctionTrendControl", "UserView", "HTMLBrowser", "Checkbox", "OptionGroup", "WindowSlider", "OleView", "Connector","DiskSpaceView", "ChannelDiagnose" or "UserArchiveControl".

BOOLEAN

Optional TRUE, if the specified object can be operated in Runtime.

Enabled

Description

Determines whether the given object can be operated in runtime.

Access during runtime: Read and Write

Syntax

Object.Enabled [= BOOLEAN]

Object

Required. An object of the type "ScreenItem" with the characteristic "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "RecipeView", "StatusForce", "Slider", "SymbolLibrary", "TrendView", "MessageView", "UserView" or "BrowserView".

BOOLEAN

Optional. TRUE, if the given object can be operated.

UserView (Page 4137)

DateTimeField (Page 3989)

EnableEdit

Description

Enables editing of the data displayed during runtime.

Access in Runtime: Read and write

Syntax

Object.**EnableEdit**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl", "UserArchiveControl".

BOOLEAN

TRUE: The data can be changed in Runtime.

FALSE: The data cannot be changed.

See also

UserArchiveControl (Page 4130)

OnlineTableControl (Page 4037)

EndAngle

Description

Specifies the angle at which the end point of the selected object deviates from the zero position (0°).

Access in Runtime: Read and write

Syntax

Object.**EndAngle**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value or a constant that specifies the angle at which the end point of the selected object deviates from the zero position (0°).

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

TubeArcObject (Page 4121)

EndPoint

Description

Specifies the position of the end point.

Access in Runtime:

Syntax

Object.**EndPoint**[=Point]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Point

Optional A value that specifies the position of the end point.

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

EndPointLeft

Description

Specifies the horizontal distance in pixels of the end point from the left edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**EndPointLeft**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value that specifies the horizontal distance in pixels of the end point from the left edge of the screen.

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

EndPointTop

Description

Specifies the vertical distance in pixels of the end point from the upper edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**EndPointTop**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value that specifies the vertical distance in pixels of the end point from the upper edge of the screen.

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

EndStyle

Description

Specifies how the line-end shapes of the selected object will be displayed.

Access in Runtime: Read and write

Syntax

Object.**EndStyle**[= THmiLineEndStyle]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline" or "Connector".

THmiLineEndStyle

Optional A value or a constant that specifies the line-end shapes.

hmiLineEndStyleNone (0): The line has no end symbol.

hmiLineEndStyleFilledArrow (2): The line ends with a filled arrowhead.

See also

Line (Page 4025)

Polyline (Page 4060)

Connector (Page 3986)

EndStyle

Description

Determines how the line end of the given object is displayed.

Access during runtime: Read and Write

Syntax

Object.EndStyle [= THmiLineEndStyle]

Object

Required. An object of the "ScreenItem" type with the characteristic "Line," or "Polyline".

THmiLineEndStyle

Optional. A value or constant which determines the line end.

hmiLineEndStyleNone (0): The line has no end symbol.

hmiLineEndStyleFilledArrow (2): The line ends with a filled arrow.

EndTime(i)

Description

Specifies the end time of the time range to be shown in the trend view. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**EndTime**(i)[=Time]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTabelControl".

Time

Optional A value or a constant that specifies the end time of the time range that is to be shown in the trend window.

Comments

The parameter i indicates the number of the trend.

If "EndTime(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "EndTime(i)".

See also

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

ErrorDescription

Description

Returns one of the following error descriptions in English:

Output	Description
" "	OK
"Operation Failed"	Execution error
"Variable not found"	Tag error
"Server down"	Server not available.
"An error occured for one or several tags"	Multi Tag Error (Error in one or several tags)

To obtain an error description, first of all carry out the Read method.

Note

If the error occurs when accessing via the TagSet object, evaluate the ErrorDescription property for each tag of the TagSet object.

Access in Runtime: Read

Syntax

Object.**ErrorDescription**

Object

Required A "Tag" object.

Example

The following example shows the error description for the "Tag1" tag:

```
'VBS72
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objtag.Read
MsgBox objTag.ErrorDescription
```

The following example adds two tags to the TagSet list and outputs the ErrorDescription property as Trace:

```
'VBS179
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "ErrorDescription: " & group.ErrorDescription & vbNewLine
```

The ErrorDescription property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "ErrorDescription: " & group("Motor1").ErrorDescription & vbNewLine
```

See also

Tag (Page 3941)

TagSet (list) (Page 3945)

Exponent

Description

TRUE, when the display of numbers should be with exponents (e.g."1.00e+000"). BOOLEAN write-read access.

ExportDirectoryChangeable

Description

Enables changing of the directory for data export in Runtime.

Syntax

Object.**ExportDirectoryChangeable**=[Boolean]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Boolean

TRUE, the directory for the data export can be changed in Runtime.

FALSE, the directory for the data export cannot be changed in Runtime.

OnlineTrendControl (Page 4045)

ExportDirectoryname

Description

Defines the directory to which the exported Runtime data is written.

Access in Runtime: Read and write

Syntax

Object.**ExportDirectoryname**[=String]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

String

Optional A value or a constant which specifies the directory.

OnlineTrendControl (Page 4045)

ExportFileExtension

Description

Specifies the file extension of the export file. Only the file extension "csv" is supported.

Syntax

Object.**ExportFileExtension**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

ExportFilenameChangeable

Description

Enables renaming of the export file in Runtime.

Syntax

Object.**ExportFilenameChangeable**=[Boolean]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Boolean

TRUE, , the file name of the export file can be changed in Runtime.

FALSE, , the file name of the export file cannot be changed in Runtime.

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

ExportFormatGuid

Description

Default assignment of the ID number and export provider.

Syntax

Object.**ExportFormatGuid**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

See also

AlarmControl (Page 3947)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

ExportParameters

Description

Specifies the parameters of the selected format by means of the properties dialog.

Access in Runtime: Read and write

Syntax

Object.**ExportParameters**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

See also

AlarmControl (Page 3947)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

ExportSelection

Description

Specifies which runtime data of the control is exported.

Syntax

Object.**ExportSelection**=[Boolean]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Boolean

Value	Description	Explanation
0	all	All Runtime data of the control is exported.
1	Selection	Selected Runtime data of the control is exported.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

ExportShowDialog

Description

Enables the display of the export dialog during runtime.

Access in Runtime: Read and write

Syntax

Object.**ExportShowDialog** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchivControl", "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

Optional TRUE, if the dialog box is shown in Runtime.

.

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

ExportXML

ExportXML

Only used internally.

The attribute can be assigned dynamic properties by means of the name **ExportXML**.

ExtendedOperation

Description

TRUE, when the slider regulator is set at the respective end value (minimum/maximum value). This is done by clicking the mouse in an area outside the current regulator setting. BOOLEAN write-read access.

ExtendedZoomingEnable

Description

Specifies whether the operator can zoom the screen in or out in runtime by turning the mouse wheel.

Access during runtime: Read and write

Syntax

Object.**ExtendedZoomingEnable**[=BOOLEAN]

Object

Necessary. A "Screen" object.

BOOLEAN

Optional TRUE, if the operator can zoom the screen in and out in runtime.

Example

The following example shows how the extended zoom can be enabled for the NewPDL1 screen:

```
'VBS155
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
objScreen.ExtendedZoomingEnable = 1
```

See also

Screen (Page 3930)

ExtraSpaceForLabelDisplay

Description

Specifies the extra space required for the label.

Access in Runtime: Read and write

Syntax

Object.**ExtraSpaceForLabelDisplay**[=Int]

Object

Required A "ScreenItem" object with the format "Bar".

Int

Optional A value that specifies the extra space required for the label.

See also

Bar (Page 3961)

FieldLengthReadOnlySpecial

Description

Specifies that the "field length string" field is read-only.

Access during runtime: Read and write

Syntax

Object.**FieldLengthReadOnlySpecial**[=BOOLEAN]

Object

Necessary. A "ScreenItem" object with the format "IOField"".

BOOLEAN

Optional TRUE, if the "field length string" can only be read.

Used for the following object types:

IOField

See also

IOField (Page 4021)

FillColor

Description

Defines or returns the fill pattern color for the object.

Access during runtime: Read and write

Syntax

Object.**FillColor**[=LONG]

Object

Necessary. An object of the "ScreenItem" type with the format "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Roundbutton", "Switch", "Bar", "StatusForce", "Clock", "Gauge", "Slider", "Checkbox".

Determination of Color Value

The color is displayed in RGB format (Red, Green, Blue). Enter the appropriate decimal value for each of the three RGB values.

Example:

RGB(200, 150, 100)

Example

The following example defines the fill color for "ScreenWindow1" to blue:

```
'VBS73
Dim objScreen
Set objScreen = HMIRuntime.Screens("ScreenWindow1")
```

```
objScreen.FillStyle = 131075
objScreen.FillColor = RGB(0, 0, 255)
```

FillColorMode

Description

Specifies the type of foreground for the selected object.

Access in Runtime: Read and write

Syntax

Object.**FillColorMode**[=SymbolLibAppearance]

Object

Required A "ScreenItem" object with the format "SymbolLibrary".

SymbolLibAppearance

hmiSymbolLibraryAppearanceOriginal (0): The surface is gray.

hmiSymbolLibraryAppearanceShaded (1): The display is shaded.

hmiSymbolLibraryAppearanceSolid (2): The display is solid.

hmiSymbolLibraryAppearanceTransparent (3): The display is gray.

See also

SymbolLibrary (Page 4098)

Filling

Description

TRUE, when the object can be filled by closed border lines (e.g. representing the fill level of a tank). BOOLEAN write-read access.
The fill level of the object is set by means of the "FillingIndex" property.

FillingIndex

Description

Defines the %age value (related to the height of the object) to which the object with closed border line is to be filled.
The fill level is represented by the current background color. The unfilled background is transparent.

FillPatternColor

Description

Specifies the color of the fill pattern for the selected object.

Access in Runtime: Read and write

Syntax

Object.**FillPatternColor**[=Color]

Object

Required An object of the "ScreenItem" type with the format "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "GraphicView", "Bar", "Checkbox", "OptionGroup" or "WindowSlider".

Color

Optional A value or a constant that establishes the color of the fill pattern for the specified object.

See also

Ellipse (Page 3993)

CheckBox (Page 3974)

OptionGroup (Page 4054)

WindowSlider (Page 4139)

Listbox (Page 4027)

ProjectName (Page 4062)

FillStyle

Description

Specifies the fill style of the selected object.

Access in Runtime: Read and write

Syntax

Object.**FillStyle**[= THmiLineFillStyle]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "EllipticalArc" or "CircularArc".

THmiLineFillStyle

Optional A value or a constant that specifies the fill style.

hmiLineFillStyleTransparent (0): transparent fill

hmiLineFillStyleSolid (1): object is filled with the specified color

Default setting: hmiLineFillStyleSolid

See also

Line (Page 4025)

Polyline (Page 4060)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

FillStyle

Description

Determines the fill style of the specified object.

Access during runtime: Read and Write

Syntax

Object.FillStyle [= THmiLineFillStyle]

Object

Required. An object of the "ScreenItem" type with the characteristic "Line," or "Polyline".

THmiLineFillStyle

Optional. A value or constant which determines the fill style.

hmiLineFillStyleTransparent (0): Transparent fill

hmiLineFillStyleSolid (1): Object is filled with the specified color

Default setting: hmiLineFillStyleSolid

FillStyle2

Description

Defines or returns the fill style of the bar.

FillstyleAlignment

Description

Specifies the alignment within the specified object.

Filter

Description

Specifies criteria in SQL syntax for the database.

Access in Runtime: Read and write

Syntax

Object.**Filter**[=String]

Object

Required A "ScreenItem" object with the format "PrintMessage".

String

Optional A value or a constant which specifies the criteria in SQL syntax for the database.

FirstConnectedObjectIndex

Description

Specifies the index number of the upper connector point.

Access in Runtime: Read and write

Syntax

Object.**FirstConnectedObjectIndex**[=Int]

Object

Required A "ScreenItem" object with the format "Connector".

Int

Int

See also

Connector (Page 3986)

FirstConnectedObjectName

Description

Specifies the object name of the object that is docked at the upper connector point.

Access in Runtime: Read and write

Syntax

Object.**FirstConnectedObjectName**[=String]

Object

Required A "ScreenItem" object with the format "Connector".

String

String

See also

Connector (Page 3986)

FixedAspectRatio

Description

Specifies whether the aspect ratio should be maintained or changed when the symbol size is altered.

Access in Runtime: Read and write

Syntax

Object.**FixedAspectRatio**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "SymbolLibrary".

BOOLEAN

Optional TRUE, if the aspect ratio should be maintained when the symbol size is altered.

See also

SymbolLibrary (Page 4098)

FlashBackColor

Description

TRUE, when flashing of the background is activated. BOOLEAN write-read access

FlashBorderColor

Description

TRUE, when flashing of the object lines is activated. BOOLEAN write-read access.

FlashFlashPicture

Description

TRUE, when flashing of the flash picture is activated. BOOLEAN write-read access.

FlashForeColor

Description

TRUE, when flashing of the text is activated. BOOLEAN write-read access.

FlashingColorOff

Description

Specifies the color of the border line for the selected object for the flashing status "off".

Access in Runtime: Read and write

Syntax

Object.**FlashingColorOff**[=Color]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "off".

Connector (Page 3986)

RoundButton (Page 4074)

FlashingColorOn

Description

Specifies the color of the border line for the selected object for the flashing status "on".

Access in Runtime: Read and write

Syntax

Object.**FlashingColorOn**[=Color]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

Color

Optional A value or a constant that specifies the color of the border line of the selected object for the flashing status "on".

RoundButton (Page 4074)

FlashingEnable

Description

Specifies whether the border line of the selected object will flash in runtime.

Access in Runtime: Read and write

Syntax

Object.**FlashingEnable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

BOOLEAN

Optional TRUE, if the border line of the object is flashing.

OptionGroup (Page 4054)
Connector (Page 3986)
RoundButton (Page 4074)

FlashingRate

Description

Specifies the flash rate of the border line for the selected object.

Access in Runtime: Read and write

Syntax

Object.**FlashingRate**[=FlashingRate]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField", "Bar", "Checkbox", "OptionGroup" or "Connector".

FlashingRate

hmiFlashingRateSlow (0): The length of the flashing rate is 1000 ms.

hmiFlashingRateMedium (1): The length of the flashing rate is 500 ms.

hmiFlashingRateFast (2): The length of the flashing rate is 250 ms.

RoundButton (Page 4074)

FlashPicReferenced

Description

TRUE, when the assigned flash picture is to be saved. Otherwise, only the associated object reference is saved. Read only access.

FlashPicture

Description

Returns the flash picture. Read-only access.
The graphic (*.BMP or *.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.
In this context, the "FlashPicReferenced" property defines whether the flash picture should be saved or referenced together with the object.

FlashRate

Description

Defines or returns the flash frequency. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FlashRateBackColor

Description

Defines or returns the flash frequency for the object background. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FlashRateBorderColor

Description

Defines or returns the flash frequency for the lines of the object. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FlashRateFlashPic

Description

Defines or returns the flash frequency for the flash picture. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FlashRateForeColor

Description

Defines or returns the flash frequency for the object label. Value range from 0 to 2.

0 = slow

1 = medium

2 = fast

FlashTransparentColor

Description

Specifies the color of the bitmap object of a flashing graphic that is set to "transparent".

Access in Runtime: Read and write

Syntax

Object.**FlashTransparentColor**[=Color]

Object

Required A "ScreenItem" object with the format "GraphicIOField".

Color

Optional A value or a constant that specifies the color of the bitmap object of a flashing graphic that is set to "transparent".

See also

GraphicIOField (Page 4011)

Flip

Description

Flips the symbol on the vertical and / or horizontal center axis of the symbol.

Access in Runtime: Read and write

Syntax

Object.**Flip**[=SymbolLibFlip]

Object

Required A "ScreenItem" object with the format "SymbolLibrary".

SymbolLibFlip

hmiSymbolLibraryFlipNone (0): The symbol is not flipped.

hmiSymbolLibraryFlipHorizontal (1): The symbol is flipped horizontally.

hmiSymbolLibraryFlipVertical (2): The symbol is flipped vertically.

hmiSymbolLibraryFlipBoth (3): The symbol is flipped horizontally and vertically.

See also

SymbolLibrary (Page 4098)

FocusColor

Description

Specifies that the color for the focus border of the selected object is currently active.

Access in Runtime: Read and write

Syntax

Object.**FocusColor**[= Color]

Object

Required A "ScreenItem" object with the formats "SymbolicIOField", "Button", "Switch", "GraphicIOField", "RecipeView", "StatusForce", "Slider", "TrendView", "MessageView" or "AlarmView".

Color

Optional A value or a constant that specifies the frame color.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

GraphicIOField (Page 4011)

Slider (Page 4082)

AlarmControl (Page 3947)

FocusColor

Description

Determines the color for the focus frame of the given object that has the focus.

Access during runtime: Read and Write

Syntax

Object.FocusColor [= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "Button", "Switch", "GraphicIOField", "RecipeView", "StatusForce", "Slider", "TrendView" or "MessageView".

Color

Optional A value or constant which determines the frame color.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

AlarmView (Page 3958)

RecipeView (Page 4068)

TrendView (Page 4118)

StatusForce (Page 4087)

FocusWidth

Description

Specifies the border width of the specified object if the object is currently active.

Access in Runtime: Read and write

Syntax

Object.**FocusWidth**[= LONG]

Object

Required A "ScreenItem" object with the formats "SymbolicIOField", "Button", "Switch", "GraphicIOField", "RecipeView", "StatusForce", "Slider", "TrendView", "MessageView" or "AlarmView".

LONG

Optional A value or a constant that specifies the border width in pixels. Value range from 1 to 10.

See also

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

GraphicIOField (Page 4011)

Slider (Page 4082)

AlarmControl (Page 3947)

FocusWidth

Description

Determines the border width of the given object if the object has a focus.

Access during runtime: Read and Write

Syntax

Object.FocusWidth [= LONG]

Object

Required. An object of type "ScreenItem" with the characteristic "SymbolicIOField", "Button", "Switch", "GraphicIOField", "RecipeView", "StatusForce", "Slider", "TrendView" or "MessageView".

LONG

Optional. A value or constant which determines the border width in pixels. Value range from 1 to 10.

See also

AlarmView (Page 3958)

RecipeView (Page 4068)

TrendView (Page 4118)

StatusForce (Page 4087)

BatteryView (Page 3967)

Font

Description

Specifies or returns the font.

The font object has the following sub-properties

- Size (Font Size)
- Bold (yes/no)
- Name (font name)
- Italic (yes/no)
- Underline (underline yes/no)
- StrikeThrough (yes/no)

If two font properties are directly assigned, only the default property "Name" is assumed.

Access during runtime: Read and write

Syntax

Object.**Font** [=Font]

Object

Necessary. An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl", "MediaPlayer", "FunctionTrendControl" or "Slider".

Font

Font

Example

```
'VBS74
Dim objControl1
Dim objControl2
Set objControl1 = ScreenItems("Control1")
Set objControl2 = ScreenItems("Control2")
objControl2.Font = objControl1.Font ' take over only the type of font
```

FontBold

Description

Specifies whether the text of the selected object should be shown in bold.

Access in Runtime: Read and write

Syntax

Object.**FontBold**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" or "OptionGroup".

BOOLEAN

Optional TRUE, if the text of the selected object should be shown in bold.

See also

FontItalic

Description

Specifies whether the text of the selected object should be shown in italic.

Access in Runtime: Read and write

Syntax

Object.**FontItalic**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" or "OptionGroup".

BOOLEAN

Optional TRUE, if the text of the selected object should be shown in italic.

FontName

Description

Specifies the font of the selected object.

Access in Runtime: Read and write

Syntax

Object.**FontName**[=String]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" or "OptionGroup".

String

Optional A value or a constant that specifies the font of the selected object.

See also

FontSize

Description

Specifies the font size of the text for the selected object.

Access in Runtime: Read and write

Syntax

Object.**FontSize**[=Int]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" oder "OptionGroup".

Int

Optional A value or a constant that specifies the font size of the text for the selected object.

See also

ProjectName (Page 4062)

FontUnderline

Description

Specifies whether the text of the selected object should be underlined.

Access in Runtime: Read and write

Syntax

Object.**FontUnderline**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Bar", "Checkbox" oder "OptionGroup".

BOOLEAN

Optional TRUE, if the text of the selected object should be shown underlined.

See also

ProjectName (Page 4062)

ForeColor

Description

Specifies the font color of the text for the selected object.

Access in Runtime: Read and write

Syntax

Object.**ForeColor**[=Color]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "Bar", "RecipeView", "Slider", "SymbolLibrary", "MessageView", "Checkbox" or "OptionGroup".

Color

Optional A value or a constant that specifies the font color of the text for the selected object.

See also

Group (Page 4017)
MultiLineEdit (Page 4032)
Listbox (Page 4027)
RoundButton (Page 4074)

ForeColor

Description

Determines the text color of the given object.

Access during runtime: Read and Write

Syntax

Object.ForeColor [= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "Bar", "RecipeView", "Slider" or "SymbolLibrary".

Color

Optional A value or constant which determines the text color.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

AlarmView (Page 3958)
DateTimeField (Page 3989)
ProjectName (Page 4062)

ForeFlashColorOff

Description

Defines or returns the color of the text for flash status "Off". LONG write-read access.

ForeFlashColorOn

Description

Defines or returns the color of the text for flash status "On". LONG write-read access.

FormatPattern

Description

Specifies the format of the output value.
Access in Runtime: Read and write

Syntax

Object.**FormatPattern**[=String]

Object
Required A "ScreenItem" object with the format "IOField".

String
Optional A value or a constant that specifies the format of the output value.

See also

IOField (Page 4021)

FormatPatternReadOnlySpecial

Description

Specifies that the "format pattern" field can only be read.

Access in Runtime: Read and write

Syntax

Object.**FormatPatternReadOnlySpecial**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the "format pattern" field can only be read.

See also

IOField (Page 4021)

FormatType

Description

Specifies the data type of the selected object.

Access in Runtime: Read and write

Syntax

Object.**FormatType**[=IOFieldDataFormat]

Object

Required A "ScreenItem" object with the format "IOField".

IOFieldDataFormat

hmiOutputFormatString (2): String

hmiOutputFormatDecimal (1): Decimal

hmiOutputFormatHexadecimal (3): Hexadecimal

hmiOutputFormatBinary (0): Binary

hmiOutputFormatDate (4): Date

hmiOutputFormatTime (5): Time

hmiOutputFormatDateTime (6): Date and time

See also

IOField (Page 4021)

Free

Description

Returns the size of the free disk space.

Access in Runtime: Read and write

Syntax

Object.**Free**[=Double]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Double

Optional A value or a constant that returns the size of the free disk space.

See also

DiskSpaceView (Page 3991)

FreePercent

Description

Returns the measured values for the free disk space as a percentage. The values can be queried in Runtime. The values cannot be predefined.

Access in Runtime: Read and write

Syntax

Object.**FreePercent**[=Int]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Int

Optional A value or a constant that returns the measured values for the free disk space as a percentage.

See also

DiskSpaceView (Page 3991)

FreezeProviderConnections

Description

Specifies whether the properties for the data connection ("TagProviderType(i)", "Source.."...) can be changed without the change becoming effective immediately. If you change from, for example, "XDataLogTag(i)" illegal combinations with "YDataLogTag(i)" could arise.

This means attributes must have the value TRUE before changing the data connection "FreezeProviderConnections". After changing all the properties for the data connection, "FreezeProviderConnection" will be set to FALSE and the changes will become effective.

Access in Runtime: Read and write

Syntax

Object.**FreezeProviderConnections**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the properties for the data connection ("TagProviderType(i)", "Source.."...) can be changed without the change becoming effective immediately.

See also

FunctionTrendControl (Page 4004)

Properties G-H

GetSelectionText

Description

Returns the selected text of the "MultiLineEdit" object.

Gradation

Description

Specifies the value difference between two main marking lengths of the "Gauge" object.

Access in Runtime: Read and write

Syntax

Object.**Gradation**[= LONG]

Object

Required A "ScreenItem" object with the format "Gauge".

LONG

Optional A value or a constant that specifies the value difference.

See also

Gauge (Page 4008)

GraphDirection

Description

Specifies at which border of the trend view the current values are displayed.

Access in Runtime: Read and write

Syntax

Object.**GraphDirection**[=Direction]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Direction

0: Positive values run to the right and upwards.

-1: Positive values run to the left and upwards.

-2: Positive values run to the right and upwards.

-3: Positive values run to the right and downwards.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

GridBackColor

Description

Specifies the background color for the recipe view in Runtime.

Access in Runtime: Read and write

Syntax

Object.**GridBackColor**[=Color]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

Color

Optional A value or a constant that specifies the background color in the recipe view in Runtime.

GridForeColor

Description

Defines the font color for the recipe view.

Access in Runtime: Read and write

Syntax

Object.**GridForeColor**[=Color]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

Color

Optional A value or a constant that specifies the font color for the recipe view.

GridLineColor

Description

Specifies the color for the grid lines.

Access in Runtime: Read and write

Syntax

Object.**GridlineColor**[=Color]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Color

Optional A value or a constant that specifies the color of the grid lines.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

GridLineColor

Color of the row divider / content - GridLineColor

Defines the color of row/column dividers in table contents. The button opens the "Color selection" dialog.

The attribute can be assigned dynamic properties by means of the name **GridLineColor**.

See also

AlarmView (Page 3958)

GridLineWidth

Description

Defines the line weight of the row/column dividers in pixels.

Access in Runtime: Read and write

Syntax

Object.**GridLineWidth**[=Width]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Width

Optional A value or a constant which specifies the width of the grid line.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

Height

Description

Specifies the height of the selected objects "Ellipse", "Circle" and "Rectangle".

Access during runtime: Read and write

The other objects only have read access to the property.

Syntax

Object.**Height**[= LONG]

Object

Necessary. A "Screen" object or an object of type "ScreenItem". This property is a standard property of the ScreenItem-Objekts and is therefore available for all formats.

LONG

Optional A value or a constant that specifies the height in pixels. This parameter can be set only for the objects "Ellipse", "Circle" and "Rectangle".

Example

The following example halves the height of all objects of the image "NewPDL1", whose name starts with "Circle":

```
'VBS75
Dim objScreen
Dim objCircle
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
'
'Searching all circles
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
If "Circle" = Left(strName, 6) Then
'
'to halve the height of the circles
Set objCircle = objScreen.ScreenItems(strName)
```

```
objCircle.Height = objCircle.Height / 2
End If
Next
```

HelpText

Description

Returns the tooltip that is shown in Runtime as an operating aid for the specified object.

Access in Runtime: Read

Syntax

Object.HelpText

Object

Required An object of the "ScreenItem" type with the format "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "GraphicIOField" or "OnlineTrendControl".

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

GraphicIOField (Page 4011)

HelpText

Description

Returns the tooltip that is shown in Runtime as an operating aid for the specified object.

Access in Runtime: Read

Syntax

Object.HelpText

Object

Required An object of the type "ScreenItem" with the characteristic "IOField", "SymbolicIOField", "Button", "Switch", "GraphicIOField" or "TrendView".

See also

TrendView (Page 4118)

DateTimeField (Page 3989)

HiddenInput

Description

Specifies whether the input value or a * for each character will be shown during the input.

Access in Runtime: Read and write

Syntax

Object.**HiddenInput**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the input value is not shown during the input. An * is shown for each character.

See also

IOField (Page 4021)

HideTagNames

Description

Specifies whether the tag name is shown in the f/t() trend view.

Access in Runtime: Read and write

Syntax

Object.**HideTagNames**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE, if the tag names are displayed.

See also

OnlineTrendControl (Page 4045)

HighLimitColor

Description

Specifies the color of the top or right scroll button in a scroll bar.

Access in Runtime: Read and write

Syntax

Object.**HighLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "WindowSlider".

Color

Optional A value or a constant that specifies the color of the top or right scroll button in a scroll bar.

See also

WindowSlider (Page 4139)

HitlistColumnAdd

Description

Transfers the selected message block from the list of available message blocks to the list of selected message blocks.

Access in Runtime: Read and write

Syntax

Object.**HitlistColumnAdd**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

HitlistColumnCount

Description

Specifies the number of message blocks displayed in the hitlist in Runtime.

Access in Runtime: Read and write

Syntax

Object.**HitlistColumnCount**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

HitlistColumnIndex

Description

References a message block selected for the hitlist. Using this attribute you can assign the values of other attributes to a specific message block of the hitlist.

Values between 0 and "HitlistColumnCount" minus 1 are valid for "HitlistColumnIndex". Attribute "HitlistColumnCount" defines the number of message blocks selected for the hitlist. The "HitlistColumnIndex" attribute can be assigned dynamic properties by means of attribute **HitlistColumnRepos**.

Access in Runtime: Read and write

Syntax

Object.**HitlistColumnIndex**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

HitlistColumnName

Description

Displays the name of the message block of the hitlist which is referenced with attribute "HitlistColumnIndex". You cannot edit this name.

Access in Runtime: Read and write

Syntax

Object.**HitlistColumnName**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

See also

AlarmControl (Page 3947)

HitlistColumnRemove

Description

Removes the marked message block from the list of selected message blocks and inserts it in the list of existing message blocks.

Access in Runtime: Read and write

Syntax

Object.**HitlistColumnRemove** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

See also

AlarmControl (Page 3947)

HitlistColumnRepos

Description

Resorts the message blocks. The "Up" and "Down" commands move the selected message block accordingly in the list. This moves the message block in Runtime Control towards the front or towards the back.

Access in Runtime: Read and write

Syntax

For hitlist: Object.**HitlistColumnRepos** For message list: Object.**MessageColumnRepos**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

See also

AlarmControl (Page 3947)

HitlistColumnSort

Description

Defines the sorting order of the message block referenced in "HitlistColumnIndex" in the hitlist.

Access in Runtime: Read and write

Syntax

Object.**HitlistColumnSort** [=Sort]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

Sort

0: No sorting.

1: Ascending sorting from the lowest to highest value

2 Descending sorting from the highest to lowest value

See also

AlarmControl (Page 3947)

HitlistColumnSortIndex

Description

Defines the sorting order of the message block referenced in "HitlistColumnIndex" in the hitlist. The sorting criterion is removed from "HitlistColumnSort" if you set a "0" value..

Access in Runtime: Read and write

Syntax

Object.**HitlistColumnSortIndex**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

See also

AlarmControl (Page 3947)

HitlistColumnVisible

Description

The selected message blocks of the message list or hitlist which are used in Runtime in the control are displayed in the list.

Access in Runtime: Read and write

Syntax

For hitlist: Object.**HitlistColumnVisible** For message list: Object.**MessageColumnVisible**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

See also

AlarmControl (Page 3947)

HitlistDefaultSort

Description

Defines the default sorting order in the table columns of the hitlist.

Access in Runtime: Read and write

Syntax

Object.**HitlistDefaultSort**[=Sort]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

Sort

0: The list is sorted in ascending order of frequency.

1:: The list is sorted in descending order of frequency.

See also

AlarmControl (Page 3947)

HitlistMaxSourceItems

Description

Specifies the maximum number of data records that can be used from the alarm log to create the hit list. The value can be anything between "0 - 10000".

Access in Runtime: Read and write

Syntax

Object.**HitlistMaxSourceItems**[=Long]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Long

Optional A value or a constant that specifies the maximum number of data records that can be used from the alarm log to create the hit list.

See also

AlarmControl (Page 3947)

HitlistMaxSourceItemsWarning

Description

Specifies whether a warning should be given if the maximum number of data records that is defined in "HitlistMaxSourceItems" is reached.

Access in Runtime: Read and write

Syntax

Object.**HitlistMaxSourceItemsWarning**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if a warning is given as soon as the maximum number of data records that is defined in "HitlistMaxSourceItems" is reached.

See also

AlarmControl (Page 3947)

HitlistRelativeTimeFactor

Description

Specifies the time factor which, alongside the time type "HitlistRelativeTimeFactorType", determines the time period in which the statistics of the hit list will be created.

If you do not wish to specify a period of time, set the time factor to "0".

Access in Runtime: Read and write

Syntax

Object.**HitlistRelativeTimeFactor**[=Long]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Long

Optional A value or a constant that specifies the time factor.

See also

AlarmControl (Page 3947)

HitlistRelativeTimeFactorType

Description

Specifies the time type which, alongside the time factor "HitlistRelativeTimeFactor", determines the time period in which the statistics of the hit list will be created.

Access in Runtime: Read and write

Syntax

Object.**HitlistRelativeTimeFactorType**[=AlarmViewAdvancedTimeFactorUnit]

Object

Required A "ScreenItem" object with the format "AlarmControl".

AlarmViewAdvancedTimeFactorUnit

hmiAlarmViewAdvancedTimeFactorUnitMinute (0): The time range for the statistics will be measured in minutes.

hmiAlarmViewAdvancedTimeFactorUnitHour (1): The time range for the statistics will be measured in hours.

hmiAlarmViewAdvancedFactorUnitDay (2): The time range for the statistics will be measured in days.

hmiAlarmViewAdvancedTimeFactorUnitWeek (3): The time range for the statistics will be measured in weeks.

hmiAlarmViewAdvancedTimeFactorUnitMonth (4): The time range for the statistics will be measured in months.

See also

AlarmControl (Page 3947)

HitListRelTime

Description

Sets a time range for the statistics.

If you do not wish to specify a period of time, set the time factor to "0".

Access in Runtime: Read and write

Syntax

Object.**HitListRelTime**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: If no time range is specified in the selection, the specified time range is used for the statistics.

FALSE: The specified time range is not used.

See also

AlarmControl (Page 3947)

HorizontalAlignment

Description

Specifies the horizontal alignment of the text within the specified object.

Access in Runtime: Read and write

Syntax

Object.**HorizontalAlignment**[= THmiHorizontalAlignment]

Object

Required A "ScreenItem" object with the formats "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "CheckBox", "OptionGroup", "PageNumber", "ProjectName", "ReportName", "OdbcDatabaseField".

THmiHorizontalAlignment

Optional A value or a constant that specifies the horizontal alignment of the text.

hmiAlignmentLeft (0):The text is arranged flush left in the object.

hmiAlignmentCentered (1): The text is arranged horizontally centered in the object.

hmiAlignmentRight (2): The text is arranged flush right in the object.

See also

TextField (Page 4107)

IOField (Page 4021)

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

CheckBox (Page 3974)

OptionGroup (Page 4054)

AlarmControl (Page 3947)

MultiLineEdit (Page 4032)

Listbox (Page 4027)

RoundButton (Page 4074)

HorizontalAlignment

Description

Determines the horizontal alignment of the text within the given object.

Access during runtime: Read and Write

Syntax

Object.HorizontalAlignment [= THmiHorizontalAlignment]

Object

Required An object of the "ScreenItem" type with the characteristics "TextField", "IOField", "SymbolicIOField", "Button" or "Switch".

THmiHorizontalAlignment

Optional A value or constant which determines the horizontal alignment of the text.

hmiAlignmentLeft (0): The text is aligned left justified in the object.

hmiAlignmentCentered (1): The text is centered horizontally in the object.

hmiAlignmentRight (2): The text is aligned right justified in the object.

See also

DateTimeField (Page 3989)

ProjectName (Page 4062)

HorizontalGridLines

Description

Defines whether horizontal separating lines will be displayed.

Access in Runtime: Read and write

Syntax

Object.**HorizontalGridLines**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: Horizontal grid lines are displayed.

FALSE: Horizontal grid lines are not displayed.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

HorizontalScrollbarPosition

Description

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

See also

ScreenWindow (Page 4078)

Hotkey property

Description

Returns the function key related to the mouse operation in respect of a button object.

Read only access.

See also

Button (Page 3968)

HourNeedleHeight

Description

Specifies the length of the hour hand in the "Clock" object.

Access in Runtime: Read and write

Syntax

Object.**HourNeedleHeight**[= LONG]

Object

Required A "ScreenItem" object with the format "Clock".

LONG

Optional A value or a constant that specifies the length of the hour hand.

Specify the length of the hour hand as a percentage relating to the radius of the clock face.

See also

Clock (Page 3984)

HourNeedleWidth

Description

Specifies the width of the hour hand in the "Clock" object.

Access in Runtime: Read and write

Syntax

Object.**HourNeedleWidth**[= LONG]

Object

Required A "ScreenItem" object with the format "Clock".

LONG

Optional A value or a constant that specifies the width of the hour hand.

Specify the width of the hour hand as a percentage relating to double the length of the clock face.

See also

Clock (Page 3984)

Hysteresis property

Description

TRUE, when the display should appear with hysteresis. BOOLEAN write-read access.

HysteresisRange

Description

Defines the hysteresis in % of the displayed value or returns it.
The Hysteresis property must be set to TRUE for the hysteresis to be calculated.

Properties I-J

IconSpace

Description

Defines the spacing between the icons and text in the table cells. The value is active if and icon and text are displayed.

Access in Runtime: Read and write

Syntax

Object.**IconSpace**[=Space]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

Space

Optional Value which specifies the spacing.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

Index

Description

Specifies the index for the selected text field.

Access in Runtime: Read and write

Syntax

Object.**Index**[=Int]

Object

Required A "ScreenItem" object with the formats "Checkbox" or "OptionGroup".

Int

Optional A value or a constant that specifies the index of the selected text field.

See also

OptionGroup (Page 4054)

Listbox (Page 4027)

InnerBackColorOff

Description

Specifies the color under the slider of the "Switch" object if the object is in OFF status.

Access during runtime: Read and Write

Syntax

Object.**InnerBackColorOff**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Switch".

Color

Optional A value or a constant that specifies the color for the OFF status.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Switch (Page 4089)

InnerBackColorOn

Description

Specifies the color under the slider of the "Switch" object if the object is in ON status.

Access during runtime: Read and Write

Syntax

Object.**InnerBackColorOn**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Switch".

Color

Optional A value or a constant that specifies the color for the ON status.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Switch (Page 4089)

InputValue

Description

Defines the value to be entered by the user in the I/O field. The value is not displayed in the I/O field when the property is set.

If you want the value to be displayed in the I/O field after confirmation with the <Return> key, configure a direct connection between the properties "input value" and "output value". The direct connection is only practical when no tag is connected to the output value, but the user can nevertheless query the specified value, for example, through a script.

LONG write-read access.

See also

SymbolicIOField (Page 4093)

IOField (Page 4021)

InsertData(i)

Description

Specifies which data will be inserted for the active trend.

Access in Runtime: Read and write

Syntax

Object.**InsertData**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControi".

BOOLEAN

Optional TRUE, if "DataIndex(i)" is ignored and the data added to the rear of the data buffer.

FALSE, if the data is inserted at the position "DataIndex(i)" of the data buffer.

Comments

The trend view is redrawn in every operation with "InsertData(i)".

See also

FunctionTrendControl (Page 4004)

InsertEnable

Description

Specifies whether an entry can be made in the recipe view in Runtime.

Access in Runtime: Read and write

Syntax

Object.**InsertEnable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if an entry can be made in the recipe view in Runtime.

Instance

Description

Returns an instance of the alarm object.

IntegerDigits

Description

Establishes the number of integer digits (0 to 20).

Access in Runtime: Read and write

Syntax

Object.**IntegerDigits**[=Int]

Object

Required A "ScreenItem" object with the format "Bar".

Int

Optional A value or a constant that specifies the number of integer digits (0 to 20).

See also

Bar (Page 3961)

Interval

Description

Specifies the time interval for updating the displayed measured value. You enter the value in minutes.

Access in Runtime: Read and write

Syntax

Object.**Interval**[=Int]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Int

Optional A value or a constant that specifies the time interval for updating the measured values.

See also

DiskSpaceView (Page 3991)

ItemBorderBackColor

Description

Defines or returns the background color for dividing lines in the selection list of the text list object. LONG write-read access. The background color is only visible with the property setting ItemBorderStyle > 0.

ItemBorderColor

Description

Defines or returns the color for deviding lines in the selection list of the text list object. LONG write-read access.

ItemBorderStyle

Description

Specifies the line style of the separation lines in the selection list of the selected object.

Access in Runtime: Read and write

Syntax

Object.**ItemBorderStyle**[=LineStyle]

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

LineStyle

hmiLineStyleNone (-1): The selection list has no separation lines.

hmiLineStyleSolid (0): The selection list has solid separation lines.

hmiLineStyleDash (1): The selection list has broken separation lines.

hmiLineStyleDot (2): The selection list has dotted separation lines.

hmiLineStyleDashDot (3): The selection list has dash - dot lines as separation lines.

hmiLineStyleDashDotDot (4): The selection list has dash - dot - dot lines as separation lines.

See also

SymbolicIOField (Page 4093)

ItemBorderWidth

Description

Defines or returns the dividing line weight in pixels in the selection list of the text list object.

JumpToLimitsAfterMouseClick

Description

Specifies whether the slider will be set to the associated end value. The end value is the minimum or maximum value. To set the slider to the end value, users click on the area outside of the current slider setting.

Access in Runtime: Read and write

Syntax

Object.**JumpToLimitsAfterMouseClick**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "WindowSlider".

BOOLEAN

Optional TRUE, if the slider will be set to the associated end value.

See also

WindowSlider (Page 4139)

Properties K-L

LabelColor

Description

Specifies the color of the scale label in the "Slider" object.

Access in Runtime: Read and write

Syntax

Object.**LabelColor**[= Color]

Object

Required A "ScreenItem" object with the format "Slider".

Color

Optional A value or a constant that specifies the color of the scale label.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Slider (Page 4082)

Language

Description

Determines the current Runtime language.

Access in Runtime: Read and write

Syntax

Object.**Language**[= LONG]

Object

Required A "HMIRuntime" object.

LONG

Optional A value or a constant that specifies the national code.

Comments

Specify the Runtime language in VBS with a national code, e.g. 1031 for German, 2057 for English etc.. Refer to the VBScript basics under the topic "Current local ID (LCID) diagram" for an overview of all the national codes.

See also

HMIRuntime (Page 3922)

LanguageSwitch

Description

Returns the value which defines where the language dependent assigned texts are stored. Read only access.

TRUE, if the texts are managed in the project texts editor. Translations into other languages are made in the project texts editor.

FALSE, when the texts are managed directly in the object. Translations into other languages can be made by means of the export/import function.

LargeTicksBold

Description

Specifies whether the long marking lengths of a scale are shown in bold.

Access in Runtime: Read and write

Syntax

Object.**LargeTicksBold**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""Bar".

BOOLEAN

Optional. TRUE, if the long marking lengths of a scale are shown in bold.

See also

Bar (Page 3961)

LargeTicksSize

Description

Specifies the length of the long marking lengths of a scale.

Access in Runtime: Read and write

Syntax

Object.**LargeTicksSize**[=Int]

Object

Required A "ScreenItem" object with the format "Bar".

Int

Optional A value or a constant that specifies the length of the long marking lengths of a scale.

See also

Bar (Page 3961)

LastConnectedObjectIndex

Description

Specifies the index number of the connection point for the last, connected object.

Access in Runtime: Read and write

Syntax

Object.**LastConnectedObjectIndex**[=Int]

Object

Required A "ScreenItem" object with the format "Connector".

Int

Int

See also

Connector (Page 3986)

LastConnectedObjectName

Description

Specifies the object name of the object that is docked at the lower connector point.

Access in Runtime: Read and write

Syntax

Object.**LastConnectedObjectName**[=String]

Object

Required A "ScreenItem" object with the format "Connector".

String

String

See also

Connector (Page 3986)

LastError

Description

Returns an error code regarding the success of the last operation, e.g. information on a tag write or read process:

Code in hexadecimal notation	Description
0x00000000	OK
0x80040001	Execution error
0x80040002	Tag error
0x80040003	Server not available.
0x80040004	Multi Tag Error; error in one or several tags

To obtain an error description, first of all carry out the Read method.

Note

If the error occurs when accessing via the TagSet object, evaluate the LastError property for each tag of the TagSet object.

To obtain a statement about the quality of the supplied value, use the "QualityCode" property. To obtain a description of the error, use the "ErrorDescription" property.

Access during runtime: Read

Syntax

Object.**LastError**

Object

Necessary. A "Tag" object.

Example

The following example shows the error code for the "Tag1" tag:

```
'VBS77
Dim objTag
```

```
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.LastError
```

The following example adds two tags to the TagSet list and outputs the LastError property as Trace:

```
'VBS178
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
HMIRuntime.Trace "LastError: " & group.LastError & vbNewLine
```

The LastError property of a tag contained in the list may be accessed as follows:

```
HMIRuntime.Trace "LastError: " & group("Motor1").LastError & vbNewLine
```

See also

Tag (Page 3941)

TagSet (list) (Page 3945)

Layer

Description

Returns the layer that contains an object as LONG in the screen. There is a total of 32 layers available, whereby Layer "0" is the bottom layer and Layer "31" the top layer.

The configured objects are initially in the background of a layer.

Access during runtime: Read

Syntax

Object.**Layer**

Object

Necessary. A "ScreenItem" object.

Note

The Layer property specifies the layer in which the object is located. The layer "0" is output as layer "0".

When accessed, the layers are counted up from 1 in VBS. Therefore, address the level "1" with layers(2).

Example

The following example displays the name and layer of all objects in the screen "NewPDL1":

```
'VBS78
Dim objScreen
Dim objScrItem
Dim lngAnswer
Dim lngIndex
Dim strName
lngIndex = 1
Set objScreen = HMIRuntime.Screens("NewPDL1")
For lngIndex = 1 To objScreen.ScreenItems.Count
strName = objScreen.ScreenItems.Item(lngIndex).ObjectName
Set objScrItem = objScreen.ScreenItems(strName)
lngAnswer = MsgBox(strName & " is in layer  " & objScrItem.Layer,vbOKCancel)
If vbCancel = lngAnswer Then Exit For
Next
```

Layer00Checked

Description

TRUE, when limit 0 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer00Value and Layer00Color properties.

Layer00Color

Description

Defines or returns the color for limit 0. LONG write/read access.
When monitoring of the limit value is activated (Layer00Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer00Value

Description

Determines the value for "Limit 0" or returns it.
Monitoring only takes effect when the Layer00Checked property value is set to TRUE.

Layer01Checked

Description

TRUE, when limit 1 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer01Value and Layer01Color properties.

Layer01Color

Description

Defines or returns the color for limit 1. LONG write/read access.
When monitoring of the limit value is activated (Layer01Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer01Value

Description

Determines the value for "Limit 1" or returns it.
Monitoring only takes effect when the Layer01Checked property value is set to TRUE.

Layer02Checked

Description

TRUE, when limit 2 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer02Value and Layer02Color properties.

Layer02Color

Description

Defines or returns the color for limit 2. LONG write/read access.
When monitoring of the limit value is activated (Layer02Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer02Value

Description

Determines the value for "Limit 2" or returns it.
Monitoring only takes effect when the Layer02Checked property value is set to TRUE.

Layer03Checked

Description

TRUE, when limit 3 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer03Value and Layer03Color properties.

Layer03Color

Description

Defines or returns the color for limit 3. LONG write/read access.
When monitoring of the limit value is activated (Layer03Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer03Value

Description

Determines the value for "Limit 3" or returns it.
Monitoring only takes effect when the Layer03Checked property value is set to TRUE.

Layer04Checked

Description

TRUE, when limit 4 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer04Value and Layer04Color properties.

Layer04Color

Description

Defines or returns the color for limit 4. LONG write/read access.
When monitoring of the limit value is activated (Layer04Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer04Value

Description

Determines the value for "Limit 4" or returns it.
Monitoring only takes effect when the Layer04Checked property value is set to TRUE.

Layer05Checked

Description

TRUE, when limit 5 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer05Value and Layer05Color properties.

Layer05Color

Description

Defines or returns the color for limit 5. LONG write/read access.
When monitoring of the limit value is activated (Layer05Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer05Value

Description

Determines the value for "Limit 5" or returns it.
Monitoring only takes effect when the Layer05Checked property value is set to TRUE.

Layer06Checked

Description

TRUE, when limit 6 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer06Value and Layer06Color properties.

Layer06Color

Description

Defines or returns the color for limit 6. LONG write/read access.
When monitoring of the limit value is activated (Layer06Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer06Value

Description

Determines the value for "Limit 6" or returns it.
Monitoring only takes effect when the Layer06Checked property value is set to TRUE.

Layer07Checked

Description

TRUE, when limit 7 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer07Value and Layer07Color properties.

Layer07Color

Description

Defines or returns the color for limit 7. LONG write/read access.
When monitoring of the limit value is activated (Layer07Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer07Value

Description

Determines the value for "Limit 7" or returns it.
Monitoring only takes effect when the Layer07Checked property value is set to TRUE.

Layer08Checked

Description

TRUE, when limit 8 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer08Value and Layer08Color properties.

Layer08Color

Description

Defines or returns the color for limit 8. LONG write/read access.
When monitoring of the limit value is activated (Layer08Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer08Value

Description

Determines the value for "Limit 8" or returns it.
Monitoring only takes effect when the Layer08Checked property value is set to TRUE.

Layer09Checked property

Description

TRUE, when limit 9 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer09Value and Layer09Color properties.

Layer09Color

Description

Defines or returns the color for limit 9. LONG write/read access.
When monitoring of the limit value is activated (Layer09Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer09Value

Description

Determines the value for "Limit 9" or returns it.
Monitoring only takes effect when the Layer09Checked property value is set to TRUE.

Layer10Checked

Description

TRUE, when limit 10 should be monitored. BOOLEAN write/read access.
Limit value and representation are defined with the Layer10Value and Layer10Color properties.

Layer10Color

Description

Defines or returns the color for limit 10. LONG write/read access.
When monitoring of the limit value is activated (Layer10Checked property), the bar turns to the color defined by this attribute on reaching the limit value.

Layer10Value

Description

Determines the value for "Limit 10" or returns it.
Monitoring only takes effect when the Layer10Checked property value is set to TRUE.

LayerDeclutteringEnable

Description

Indicates whether the layers of a screen can be shown or hidden dependent on the set minimum and maximum zoom.

Access during runtime: Read

Syntax

Object.**LayerDeclutteringEnable**

Object

Necessary. A "Screen" object.

Example:

The example outputs the LayerDecluttering property of the "NewPDL1" screen as Trace.

```
'VBS156
Dim objScreen
```

```
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen (Page 3930)

Layers

Description

Returns an object of type "Layers".

Access in Runtime: Read

Syntax

Object.**Layers**

Object

Required A "Screen" object.

See also

Screen (Page 3930)

LeaveMarginForBorder

Description

Specifies whether an additional margin will be left for borders.

Access in Runtime: Read and write

Syntax

Object.**LeaveMarginForBorder**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if an additional margin is enabled for borders.

See also

Bar (Page 3961)

LeaveMarginForMarkers

Description

Specifies whether an additional margin will be left for markers.

Access in Runtime: Read and write

Syntax

Object.**LeaveMarginForMarkers**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if an additional margin is enabled for markers.

See also

Bar (Page 3961)

Left

Description

Specifies the value of the X coordinate of the selected object.

Access during runtime: Read and write

Syntax

Object.**Left**[= DOUBLE]

Object

Necessary. A "ScreenItem" object. This property is a standard property of the ScreenItem-Objekts and is therefore available for all formats.

DOUBLE

Optional A value or a constant that contains the value of the X coordinate in pixels (measured from the top left edge of the screen).

Comments

The X coordinate refers to the top left corner of the rectangle that surrounds the object. The screen limits are also monitored in runtime. If the assigned coordinate value exceeds the display size, the user-defined function is interrupted with an error message.

Used for the following object types:

IOField

Rectangle

Slider

LeftComma property

Description

Defines or returns the number of digits to the left of the decimal point (0 to 20).

LeftOffset

Description

Defines or returns the distance of the picture from the left edge of the picture window.

The picture is displayed as a cutout of the picture window. The picture scroll bars are located at the left and upper edge of the picture. If you wish to display the picture in the picture window by using the horizontal and vertical positioning of the picture scroll bars, use the properties "HorizontalScrollBarPosition" and "VerticalScrollBarPosition" for such positioning.

See also

ScreenWindow (Page 4078)

LightEffect property

Description

TRUE, when the light effect should be activated. BOOLEAN write-read access.

Limit4LowerLimit

Description

Specifies the lower limit for ""Reserve4".

The "Limit4LowerLimitEnable" property must be set to TRUE so that the limit "Reserve4"" can be monitored.

Access in Runtime: Read and write

Syntax

Object.**Limit4LowerLimit**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the lower limit for "Reserve4".

Comments

The "Limit4LowerLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

See also

Bar (Page 3961)

Limit4LowerLimitColor

Description

Specifies the color for the lower limit "Reserve4".

The "Limit4LowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

Syntax

Object.**Limit4LowerLimitColor**[=Color]

Object

Required A ""ScreenItem" object with the format "Bar"."

Color

Optional A value or a constant that specifies the color for the lower limit ""Reserve4".

See also

Bar (Page 3961)

Limit4LowerLimitEnabled

Description

Specifies whether the lower limit ""Reserve4"" is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**Limit4LowerLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the lower limit ""Reserve4" is to be monitored.

Comments

The following values will be specified with the properties ""Limit4LowerLimit", "Limit4LowerLimitColor" and "Limit4LowerLimitRelative"":

Limit

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

Limit4LowerLimitRelative

Description

Specifies whether the lower limit "Reserve4" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

Syntax

Object.**Limit4LowerLimitRelative**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional. TRUE,, if the lower limit "Reserve4" is to be evaluated as a percentage.

See also

Bar (Page 3961)

Limit4UpperLimit

Description

Specifies the lower limit for "Reserve4".

The "Limit4UpperLimitEnable"" property must be set to TRUE so that the limit ""Reserve4" can be monitored.

Access in Runtime: Read and write

Syntax

Object.**Limit4UpperLimit**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the upper limit for "Reserve4".

Comments

The "Limit4UpperLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

See also

Bar (Page 3961)

Limit4UpperLimitColor

Description

Specifies the color for the upper limit ""Reserve4".

The "Limit4UpperLimitEnable"" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

Syntax

Object.**Limit4UpperLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that specifies the color for the upper limit "Reserve4".

See also

Bar (Page 3961)

Limit4UpperLimitEnabled

Description

Specifies whether the upper limit "Reserve4" is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**Limit4UpperLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem"" object with the format "Bar".

BOOLEAN

Optional TRUE, if the upper limit ""Reserve4" is to be monitored.

Comments

The following values will be specified with the properties ""Limit4UpperLimit", "Limit4UpperLimitColor" and "Limit4UpperLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

Limit4UpperLimitRelative

Description

Specifies whether the upper limit "Reserve4" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

Syntax

Object.**Limit4UpperLimitRelative**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the upper limit "Reserve4" is to be evaluated as a percentage.

See also

Bar (Page 3961)

Limit5LowerLimit

Description

Specifies the lower limit for "Reserve5"".

The "Limit5LowerLimitEnable" property must be set to TRUE so that the limit ""Reserve5" can be monitored.

Access in Runtime: Read and write

Syntax

Object.**Limit5LowerLimit**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the lower limit for "Reserve5"".

Comments

The "Limit5LowerLimitRelative" property specifies whether the object is evaluated as a percentage or absolutely.

See also

Bar (Page 3961)

Limit5LowerLimitColor

Description

Specifies the color for the lower limit ""Reserve5"".

The "Limit5LowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

Syntax

Object.**Limit5LowerLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that specifies the color for the lower limit ""Reserve5".

See also

Bar (Page 3961)

Limit5LowerLimitEnabled

Description

Specifies whether the lower limit "Reserve5" is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**Limit5LowerLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the lower limit ""Reserve5" is to be monitored.

Comments

The following values will be defined using the properties "Limit5LowerLimit", "Limit5LowerLimitColor" and "Limit5LowerLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

Limit5LowerLimitRelative

Description

Specifies whether the lower limit ""Reserve5" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

Syntax

Object.**Limit5LowerLimitRelative**[=BOOLEAN]

Object

Required A "ScreenItem"" object with the format ""Bar"".

BOOLEAN

Optional TRUE, if the lower limit ""Reserve5" is to be evaluated as a percentage.

See also

Bar (Page 3961)

Limit5UpperLimit

Description

Specifies the lower limit for "Reserve5".

The ""Limit5UpperLimitEnable" property must be set to TRUE so that the limit ""Reserve5" can be monitored.

Access in Runtime: Read and write

Syntax

Object.**Limit5UpperLimit**[=Double]

Object

Required A ""ScreenItem"" object with the format "Bar".

Double

Optional A value or a constant that specifies the upper limit for ""Reserve5".

Comments

The "TypeLimitHigh5" property specifies whether the object is evaluated as a percentage or absolutely.

See also

Bar (Page 3961)

Limit5UpperLimitColor

Description

Specifies the color for the upper limit "Reserve5"".

The "Limit5UpperLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

Syntax

Object.**Limit5UpperLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that specifies the color for the upper limit ""Reserve5".

See also

Bar (Page 3961)

Limit5UpperLimitEnabled

Description

Specifies whether the upper limit "Reserve5" is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**Limit5UpperLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the upper limit ""Reserve5"" is to be monitored.

See also

Bar (Page 3961)

Limit5UpperLimitRelative

Description

Specifies whether the upper limit "Reserve5" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

Syntax

Object.Limit5UpperLimitRelative[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the upper limit "Reserve5" is to be evaluated as a percentage.

See also

Bar (Page 3961)

LimitHigh4

Description

Determines the upper limit value for "Reserve 4" or returns it.
The CheckLimitHigh4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh4 property.

LimitHigh5

Description

Determines the upper limit value for "Reserve 5" or returns it.
The CheckLimitHigh5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitHigh5 property.

LimitLow4

Description

Determines the lower limit value for "Reserve 4" or returns it.
The CheckLimitLow4 property must be set to TRUE in order that the "Reserve 4" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow4 property.

LimitLow5

Description

Determines the lower limit value for "Reserve 5" or returns it.
The CheckLimitLow5 property must be set to TRUE in order that the "Reserve 5" limit value can be monitored.
The type of the evaluation (in percent or absolute) is defined in the TypeLimitLow5 property.

LimitMax

Description

Determines the upper limit value as an absolute value depending on the data format or returns it.
If the displayed value exceeds the upper limit value, it is displayed by a sequence of *** (not displayable).

LimitMin

Description

Determines the lower limit value as an absolute value depending on the data format or returns it.
If the displayed value exceeds the upper limit value, it is displayed by a sequence of *** (not displayable).

LineColor

Description

Specifies the color of the window dividers. The button opens the "Color selection" dialog.

LineWidth

Description

Specifies the line weight of the selected object.

Access in Runtime: Read and write

Syntax

Object.LineWidth [= LONG]

Object

Required A "ScreenItem" object with the formats "Line" "Polyline", "EllipticalArc", "CircularArc" or "Connector".

LONG

Optional A value or a constant that specifies the line weight in pixels.

See also

Line (Page 4025)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

LineWidth

Description

Determines the LineWidth of the given object.

Access during runtime: Read and Write

Syntax

Object.LineWidth [= LONG]

Object

Required. An object of the "ScreenItem" type with the characteristic "Line," or "Polyline".

LONG

Optional. A value or constant which determines the line width in pixels.

See also

OnlineTrendControl (Page 4045)

ListType property

Description

Returns the data type displayed in the case of a text list object. Read only access.

Value range from 0 to 2.

0 = decimal

1 = binary

2 = bit

LoadDataImmediately

Description

Specifies whether in the event of a screen impact the tag values should be downloaded from the archives for the time range that is to be shown.

Access in Runtime: Read and write

Syntax

Object.**LoadDataImmediately**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

Optional TRUE, if in the event of a screen impact the tag values should be downloaded from the archives for the time range that is to be shown.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

Localizable

Description

Specifies whether a font should be assigned and can be formatted for each Runtime language.

Access in Runtime: Read and write

Syntax

Object.**Localizable**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl" or "UserArchiveControl".

BOOLEAN

Optional TRUE, if a font should be assigned and can be formatted for each Runtime language.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

LocalCursor

Description

Establishes whether the cursor data is transferred separately in order to increase the performance.

Syntax

Object.**LocalCursor**

Object

Required A "ScreenItem" object with the format "SmartClientView".

See also

SmartClientView (Page 4085)

LockSquaredExtent

Description

Specifies whether the size of the clock can be adjusted with the mouse.

Access in Runtime: Read and write

Syntax

Object.**LockSquaredExtent**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "Clock" or "Gauge".

BOOLEAN

Optional TRUE, if the size of the clock can be adjusted by dragging the mouse on the selection points to the desired aspect ratio.

See also

Clock (Page 3984)

Gauge (Page 4008)

LockStatus

Description

TRUE, when a locked measuring point should be displayed. BOOLEAN write-read access.

LockText

Description

Defines the label of a button for a locked measuring point.
The LockStatus property must be set to TRUE for the label to be displayed.

LockTextColor

Description

Defines or returns the color of the button label for a locked measuring point. LONG write/read access.
The LockStatus property must be set to TRUE for the background color to be displayed.

Logging

Description

Returns an object of type "Logging".

Access in Runtime: Read

Syntax

Object.**Logging**

Object

Required A "HMIRuntime" object.

See also

HMIRuntime (Page 3922)

LogOperation

Description

Specifies whether, after operating this object, an alarm is output on the alarm system.

Access in Runtime: Read and write

Syntax

Object.**LogOperation**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "IOField", "SymbolicIOField", "CheckBox", "OptionGroup" or "WindowSlider".

BOOLEAN

Optional. TRUE, if, after operating this object, an alarm is output on the alarm system.

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

CheckBox (Page 3974)

OptionGroup (Page 4054)

WindowSlider (Page 4139)

Listbox (Page 4027)

LongStrokesBold

Description

TRUE, when the long sections of a scale should be displayed in bold face. BOOLEAN write-read access.

LongStrokesOnly

Description

TRUE, when only the long sections of a scale should be displayed . BOOLEAN write-read access.

LongStrokesSize

Description

Defines or returns the length of the axis section in pixels.

LongStrokesTextEach

Description

Returns the value which defines which sections of the scale displayed should be labeled (1 = every section, 2 = every second section, etc.). Read only access

LongTermArchiveConsistency

LongTermArchiveConsistency

If "LongTimeArchiveConsistency" is set to "No", 1000 messages are displayed in the long-term archive list on the single-user system, server or client for each server, or for each redundant server pair.

If the "LongTimeArchiveConsistency" is set to "yes", the most recent 1000 messages are displayed on the client of all servers or redundant server pair in the long-term archive list.

The attribute can be assigned dynamic properties by means of the name **LongTimeArchiveConsistency** .

See also

AlarmControl (Page 3947)

LowerLimit

Description

Specifies the lower limit for input values.

Access in Runtime: Read and write

Syntax

Object.**LowerLimit**[=Double]

Object

Required A "ScreenItem" object with the format "IOField"".

Double

Optional A value or a constant that specifies the lower limit for input values.

See also

IOField (Page 4021)

LowerLimitColor(i)

Description

Specifies the color that identifies the tag values for the selected trend and which lie below the value of "LowerLimitValue(i)". Whether the information is evaluated depends on the property "LowerLimitEnabled(i)".

Access in Runtime: Read and write

Syntax

Object.**LowerLimitColor**(i)[=Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

Color

Optional A value or a constant which specifies the color which identifies tag values of the specified trend which are below the value of "LowerLimitValue(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

LowerLimitEnabled(i)

Description

Specifies whether the information from "LowerLimitColor(i)" is used to identify the tag values that lie beneath the value of "LowerLimitValue(i)".

Access in Runtime: Read and write

Syntax

Object.**LowerLimitEnabled**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the information from "LowerLimitColor(i)" is used to identify the tag values that lie beneath the value of "LowerLimitValue(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

LowerLimitValue(i)

Description

???Specifies whether the tag values which drop below the value of "LowerLimitValue(i)" are marked by the color specified in "LowerLimitColor(i)". Whether the specification is evaluated depends on the attribute "LowerLimitEnabled(i)".

Access in Runtime: Read and write

Syntax

Object.**LowerLimitValue**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that determines if the tag values that fall short of the "LowerLimitValue(i)" are to be identified with the color specified in "LowerLimitColor(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

LowLimitColor

Description

Specifies the color of the bottom or left scroll button in a scroll bar.

Access in Runtime: Read and write

Syntax

Object.**LowLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "WindowSlider".

Color

Optional A value or a constant that specifies the color of the bottom or left scroll button in a scroll bar.

See also

WindowSlider (Page 4139)

Properties M-N

MachineName

Description

Specifies the network code of the device that is to be monitored.

Enter the name or the port of the device as the network code.

Access in Runtime: Read and write

Syntax

Object.**MachineName**= [STRING]

Object

Required A "ScreenItem" object with the format "SmartClientView".

STRING

Optional A value or a constant that contains the network code.

See also

SmartClientView (Page 4085)

MarginToBorder

Description

Specifies the width of the 3D border in pixels. The value of the width is dependent on the size of the object.

Access in Runtime: Read and write

Syntax

Object.**MarginToBorder**[=Int]

Object

Required A ""ScreenItem" object with the format "WindowSlider".

Int

Optional A value or a constant that specifies the width of the 3D border in pixels.

See also

WindowSlider (Page 4139)

Marker property

Description

TRUE, when the limit values should be displayed as scale values. BOOLEAN write-read access.

Max property

Description

Defines or returns the absolute value in the case of a full value display. This value is displayed if the scale display is active.

MaximizeButton property

Description

TRUE, when the object can be maximized in Runtime. Read only access.

MaximumValue

Description

Specifies the maximum value of the scale in the selected object.

Access in Runtime: Read and write

Syntax

Object.MaximumValue [= DOUBLE]

Object

Required A "ScreenItem" object with the formats "Bar", "Gauge", "Slider" or "WindowSlider".

DOUBLE

Optional A value or a constant that specifies the maximum value.

See also

Bar (Page 3961)

Gauge (Page 4008)

Slider (Page 4082)

WindowSlider (Page 4139)

MaximumValue

Description

Determines the maximum value of the scale in the given object.

Access during runtime: Read and Write

Syntax

Object.MaximumValue [= DOUBLE]

Object

Required. An object of the type "ScreenItem" with the characteristic "Bar", "Gauge" or "Slider".

DOUBLE

Optional. A value or constant which determines the maximum value.

MCGUBackColorOff

Description

Defines or returns the background color for flash status "Off" in the case of the "Departed Unacknowledged" status. LONG write-read access.

MCGUBackColorOn

Description

Defines or returns the background color for flash status "On" in the case of the "Departed Unacknowledged" status. LONG write-read access.

MCGUBackFlash

Description

TRUE, when the background should flash when a message departs unacknowledged. BOOLEAN write-read access.

MCGUTextColorOff

Description

Defines or returns the color of the text for flash status "Off" for the "Outgoing unacknowledged" status. LONG write-read access.

MCGUTextColorOn

Description

Defines or returns the background color of the text for flash status "On" for the "Outgoing unacknowledged" status. LONG write-read access.

MCGUTextFlash

Description

TRUE, when the font should flash when a message departs unacknowledged. BOOLEAN write-read access.

MCKOBackColorOff

Description

Defines or returns the background color for flash status "Off" in the case of the "Arrived" status. LONG write-read access.

MCKOBackColorOn

Description

Defines or returns the background color for flash status "On" in the case of the "Arrived" status. LONG write-read access.

MCKOBackFlash

Description

TRUE, when the background should flash when a message arrives. BOOLEAN write-read access.

MCKOTextColorOff

Description

Defines or returns the color of the text for flash status "Off" for the "Incoming" status. LONG write-read access.

MCKOTextColorOn

Description

Defines or returns the background color of the text for flash status "On" for the "Incoming" status. LONG write-read access.

MCKOTextFlash

Description

TRUE, when the font should flash when a message arrives. BOOLEAN write-read access.

MCKQBackColorOff

Description

Defines or returns the background color for flash status "Off" in the case of the "Departed Acknowledged" status. LONG write-read access.

MCKQBackColorOn

Description

Defines or returns the background color for flash status "On" in the case of the "Departed Acknowledged" status. LONG write-read access.

MCKQBackFlash

Description

TRUE, when the background should flash when a message departs acknowledged. BOOLEAN write-read access.

MCKQTextColorOff

Description

Defines or returns the color of the text for flash status "Off" for the "Outgoing acknowledged" status. LONG write-read access.

MCKQTextColorOn

Description

Defines or returns the background color of the text for flash status "On" for the "Outgoing acknowledged" status. LONG write-read access.

MCKQTextFlash

Description

TRUE, when the font should flash when a message departs acknowledged. BOOLEAN write-read access.

MCText

Description

Defines or returns the label for the respective message class.

MenuToolBarConfig

Description

Loads the given configuration file with configured menu and toolbars or returns the name of the configuration file.

Access in Runtime: Read and write

Syntax

Object.**MenuToolBarConfig**[=STRING]

Object

Required A "HMIRuntime" object.

STRING

Optional The configuration file with user-defined menu and toolbars.

See also

HMIRuntime (Page 3922)

ScreenWindow (Page 4078)

MessageBlockAlign

Description

Aligns the contents of a selected message block in the table.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockAlign** [=Align]

Object

Required An object of the "ScreenItem" type with the format "AlarmContro", "TrendRulerControl", "OnlineTableControl", "UserArchiveControl".

Align

Value	Description	Explanation
0	Left	Aligns the contents of a selected message block to the left.
1	Centered	Aligns the contents of a selected message block to the center.
2	Right	Aligns the contents of a selected message block to the right.

See also

AlarmControl (Page 3947)

MessageBlockAutoPrecisions

Description

Enables automatic setting of the number of decimal places.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockAutoPrecisions**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: The number of decimal places is specified automatically.

FALSE: The value in the "Decimal places" field is effective.

See also

AlarmControl (Page 3947)

MessageBlockCaption

Description

Specifies the caption of the column header in the message view for the selected message block. You can only edit the labels after having disabled the "Apply project settings" option. The entered caption is effective in all Runtime languages.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockCaption**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageBlockCount

Description

Specifies the number of available message blocks which are available for the message list and hit list.

Access in Runtime: Read

Syntax

Object.**MessageBlockCount**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageBlockDateFormat

Description

Defines the date format for displaying messages.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockDateFormat**[=DateFormat]

Object

Required A "ScreenItem" object with the format "AlarmControl".

DateFormat

Value	Description
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.10.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2010.
dd/MM/yy	Day/Month/Year, e.g. 24/12/10.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2010.

See also

AlarmControl (Page 3947)

MessageBlockExponentialFormat

Description

Specifies the exponential notation for visualization of the values of a selected message block.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockExponentialFormat**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are displayed in decimal format.

See also

AlarmControl (Page 3947)

MessageBlockFlashOn

Description

Enables flashing of the selected message block in Runtime after a message was activated.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockFlashOn**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: The content of the message block flashes.

FALSE: The content of the message block does not flash.

See also

AlarmControl (Page 3947)

MessageBlockHideText

Description

Enables the textual display of the content of a selected message block.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockHideText**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: The content is not shown as a text. The option is not activated.

FALSE: The content is shown as a text. The option is activated.

See also

AlarmControl (Page 3947)

MessageBlockHideTitleText

Description

Enables the display of the header of a selected message block in text format.

Syntax

Object.**MessageBlockHideTitleText**=[BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE : The header is not shown as a text. The option is not activated.

FALSE : The header is shown as a text. The option is activated.

See also

AlarmControl (Page 3947)

MessageBlockId

Description

Specified assignment of ID number and message block in the message view.

Access in Runtime: Read

Syntax

Object.**MessageBlockID**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageBlockIndex

Description

References an existing message block. You can assign the values of other attributes to a certain message block by using the attribute. Valid values for "MessageBlockIndex" are between 0 and "MessageBlockCount" minus 1.

The "MessageBlockIndex" attribute can be dynamized by the **MessageBlockRepos** attribute.

Access in Runtime: Read

Syntax

Object.**MessageBlockIndex**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageBlockLeadingZeros

Description

Enables the display of selected message blocks with leading zero format.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockLeadingZeros**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: Leading zeros are displayed. The number of leading zeros is specified in the properties.

FALSE: Leading zeros are not displayed.

See also

AlarmControl (Page 3947)

MessageBlockLength

Description

Defines the length of the message block selected based on the number of characters. You can only enter a value if the "Apply project settings" field is disabled.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockLength**[=Int]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Int

Value which specifies the length of the message block.

See also

AlarmControl (Page 3947)

MessageBlockName

Description

Displays the object name of the message block selected. You cannot edit this name.

Access in Runtime: Read

Syntax

Object.**MessageBlockName**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageBlockPrecisions

Description

Specifies the decimal precision of the values of a selected message block. You can only enter the value if the "Automatic" option is deactivated.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockPrecisions**[=Precision]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Precision

Number of decimal places

See also

AlarmControl (Page 3947)

MessageBlockSelected

Description

The available message block can be used in Runtime control for the message list or hitlist.

Select the "Message blocks" tab to activate existing message blocks as required in the Control. Select the "Hitlist" and "Message list" tabs to configure the hitlist and message list based on the available blocks.

Syntax

Object.**MessageBlockSelected**]

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageBlockShowDate

Description

Enables the display of a date in the "Time" message block in addition to the time.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockFlashOn**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: The date and the time are displayed.

FALSE: The time is displayed.

See also

AlarmControl (Page 3947)

MessageBlockShowIcon

Description

Enables the display of the content of a selected message block as icon.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockShowIcon**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: The content is shown as an icon.

FALSE: The content is not shown as an icon.

See also

AlarmControl (Page 3947)

MessageBlockShowTitleIcon

Description

Specifies whether the header of the selected message block is displayed as a text.

Syntax

Object.**MessageBlockShowTitleIcon**=[BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE : The header is shown as an icon.

FALSE : The header is not shown as an icon.

See also

AlarmControl (Page 3947)

MessageBlockTextId

Description

Specifies the caption of the selected message block using a Text ID which was derived from the text library. The caption is adapted automatically if a user changes the Runtime language.

You can only enter a text ID after having disabled the "Apply project settings" option.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockTextId**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageBlockTimeFormat

Description

Defines which time format or duration format is used for displaying the messages.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockTimeFormat**[=TimeFormat]

Object

Required A "ScreenItem" object with the format "AlarmControl".

TimeFormat

The following time formats are available:

Value	Explanation
Automatic	The time format is set automatically.
HH:mm:ss	Hours:Minutes:Seconds, e.g. 15:35:44
HH:mm:ss.ms	Hours:Minutes:Seconds.Milliseconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds.Milliseconds AM/PM, e.g. 03:35:44.240 PM.

The following duration formats are available:

Value	Explanation
Automatic	The duration format is determined automatically.
d H:mm:ss	Day Hours:Minutes:Seconds, e.g. 1 2:03:55.
H:mm:ss.	Hours:Minutes:Seconds, e.g. 26:03:55.
m:ss	Minutes:Seconds, Example: 1563:55.
s	Seconds, e.g. 93835.

See also

AlarmControl (Page 3947)

MessageBlockType

Description

Specifies the number of available message blocks which are available for the message list and hit list.

Access in Runtime: Read and write

Syntax

Object.**MessageBlockType**[=BlockType]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BlockType

Value	Description	Description
0	System block	The message block belongs to the system block category
1	Text block	The message block belongs to the user text block category
2	Process value block	The message block belongs to the process value block category
3	Hitlist block	The message block belongs to the message blocks of the hitlist.

See also

AlarmControl (Page 3947)

MessageClass

Description

Defines the respective limit violation (Alarm High, Alarm Low, Warning High, Warning Low, etc.) for which the "Display Text", "Incoming -", "Incoming acknowledged -", and "Outgoing unacknowledged -" settings have been configured.

MessageColumnAdd

Description

Adds the selected message block from the list of existing message blocks to the list of selected message blocks.

Access in Runtime: Read

Syntax

Object.**MessageColumnAdd**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageColumnCount

Description

Specifies the number of message blocks to be displayed in the message list in Runtime.

Access in Runtime: Read

Syntax

Object.**MessageColumnCount**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageColumnIndex

Description

References a message block selected for the message list. Using this attribute you can assign the values of other attributes to a specific message block of the message list.

Valid values for "MessageColumnIndex" are between 0 and "MessageColumnCount" minus 1. The "MessageColumnIndex" attribute can be dynamized by the attribute **MessageColumnRepos**.

Access in Runtime: Read and write

Syntax

Object.**MessageColumnIndex**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageColumnName

Description

Shows the name of the message block in the message list which is referenced with the "MessageColumnIndex" property. You cannot edit this name.

Access in Runtime: Read

Syntax

Object.**MessageColumnName**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageColumnRemove

Description

Removes the marked message block from the list of selected message blocks and inserts it in the list of existing message blocks.

Access in Runtime: Read and write

Syntax

Object.**MessageColumnRemove**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageColumnRepos

Description

Resorts the message blocks. The "Up" and "Down" commands move the selected message block accordingly in the list. This places the message block further forward or back in the message view in Runtime.

Syntax

Object.**MessageColumnRepos**

Object.**HitlistColumnRepos**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageColumnSort

Description

Defines the sorting order of the message block referenced in "MessageColumnIndex" .

Access in Runtime: Read and write

Syntax

Object.MessageColumnSort [=Sort]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Sort

0: No sorting.

1: Ascending sorting from the lowest to highest value

2 Descending sorting from the highest to lowest value

See also

AlarmControl (Page 3947)

MessageColumnSortIndex

Description

Defines the sorting order of the message block referenced in "MessageColumnIndex". The sorting criterion is removed from "MessageColumnSort" if you set a "0" value.

Access in Runtime: Read and write

Syntax

Object.**MessageColumnSortIndex**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageColumnVisible

Description

The selected message blocks of the message list or hit list which are used in Runtime in the message view are displayed in the list.

Syntax

Object.**HitlistColumnVisible**

Object.**MessageColumnVisible**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

MessageListType

Description

Selection field for defining the active list for picture calls.

Syntax

Object.**MessageListType**=[ListType]

Object

Required A "ScreenItem" object with the format "AlarmControl".

ListType

Value	Description	Description
0	Message list	The currently active messages are displayed after a picture was called.
1	Short-term archive list	A short-term archive list displays the logged messages after the picture was called. The display is updated immediately on activation of new messages.
2	Long-term archive list	A long-term archive list displays the logged messages after a picture was called.
3	Lock list	Only the currently locked messages are displayed after a picture was called.
4	Hitlist	The configured statistics data is displayed after a picture was called.
5	List of messages to be hidden	The messages to be hidden are displayed at the call of a picture.

AlarmControl (Page 3947)

Min

Description

Defines or returns the absolute value in the case of the smallest value display. This value is displayed if the scale display is active.

MinimumValue

Description

Specifies the minimum value of the scale in the selected object.

Access in Runtime: Read and write

Syntax

Object.MinimumValue [= DOUBLE]

Object

Required A "ScreenItem" object with the formats "Bar", "Gauge", "Slider" or "WindowSlider".

DOUBLE

Optional A value or a constant that specifies the minimum value.

See also

Bar (Page 3961)

Gauge (Page 4008)

Slider (Page 4082)

WindowSlider (Page 4139)

MinimumValue

Description

Determines the minimum value of the scale in the given object.

Access during runtime: Read and Write

Syntax

Object.MinimumValue [= DOUBLE]

Object

Required. An object of the type "ScreenItem" with the characteristic "Bar", "Gauge" or "Slider".

DOUBLE

Optional. A value or constant which determines the minimum value.

MinuteNeedleHeight

Description

Specifies the length of the minute hand in the ""Clock" object.

Access in Runtime: Read and write

Syntax

Object.MinuteNeedleHeight[= LONG]

Object

Required A "ScreenItem" object with the format "Clock".

LONG

Optional A value or a constant that specifies the length of the minute hand.

Specify the length of the minute hand as a percentage relating to the radius of the clock face.

See also

Clock (Page 3984)

MinuteNeedleWidth

Description

Specifies the width of the minute hand in the "Clock" object.

Access in Runtime: Read and write

Syntax

Object.**MinuteNeedleWidth**[= LONG]

Object

Required A "ScreenItem" object with the format "Clock".

LONG

Optional A value or a constant that specifies the width of the minute hand.

Specify the width as a percentage relating to double the length of the minute hand.

See also

Clock (Page 3984)

Mode

Description

Specifies the field type of the selected object.

Access during runtime: Read and write

Syntax

Object.**Mode**[=IOFieldType]

Object

Necessary. A "ScreenItem" object with the formats "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch" or "GraphicIOField".

IOFieldType

hmiIOFieldInput (1): input field

hmiIOFieldOutput (0): output field

hmiIOFieldInOutput (2): input and output field

Used for the following object types:

IOField

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

GraphicIOField (Page 4011)

DateTimeField (Page 3989)

RoundButton (Page 4074)

Movable

Description

Specifies whether the window can be moved in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Movable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional. TRUE, if the window can be moved in Runtime.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

MsgFilterSQL

Description

Specifies one or more SQL statements for the customized selection of the messages. Several customized selections are connected with "OR". If you have configured a fixed selection "DefaultMsgFilterSQL", the SQL statements of "DefaultMsgFilterSQL" and "MsgFilterSQL" are connected with "AND".

Syntax

Object.**MsgFilterSQL**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

Name

Description

Returns the object name as STRING. The returned value is dependent upon the used object.

Access during runtime: Read

Syntax

Object.**Name**

Object

Necessary. An object of the "Tag", "Project", "DataItem", "Layer" and "ScreenItem" type with the format "FunctionTrendControl"

Comments

Dependent on the specified object, the following object names will be returned:

- Tag: Name of the tag without server and tag prefix.
- Project: Name of the current Runtime project.
- DataItem: Name of the DataItem object.
- Layer: Name of the layer.
- FunctionTrendControl : Name of the trend referenced by the "Index" property.

Note

Use the "Name" property to address a tag in the Tags" list. Tag names are structured in WinCC according to the following scheme:

<Tag prefix><Name of tag>

If you only specify the tag name, the tag prefix is applied from the screen window shortcut.

Example

The following example returns the name of the current Runtime project as Trace:

```
'VBS160
HMIRuntime.Trace "Name: " & HMIRuntime.ActiveProject.Name & vbNewLine
```

NeedleBorderColor

Description

Specifies the line color of the pointer in the ""Clock"" object.

Access in Runtime: Read and write

Syntax

Object.**NeedleBorderColor**[= Color]

Object

Required A "ScreenItem" object with the format "Clock".".

Color

Optional A value or a constant that specifies the line color of the pointer.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen .

See also

Clock (Page 3984)

NeedleColor

Description

Specifies the hand color of the "Clock" object.

You must have configured the "NeedleFillStyle" property as "Transparent" for the pointer color to be shown.

Access in Runtime: Read and write

Syntax

Object.**NeedleColor**[= Color]

Object

Required A "ScreenItem" object with the format "Clock".".

Color

Optional A value or a constant that specifies the pointer color.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Clock (Page 3984)

NeedleFillStyle

Description

Specifies whether the pointers are filled or transparent:

0: The pointers are filled in the pointer fill color and shown with a margin in the foreground color.

1: The pointers appear to be transparent and will be indicated by a margin in the foreground color.

Access in Runtime: Read and write

Syntax

Object.**NeedleFillStyle**[=NeedleFillStyle]

Object

Required A "ScreenItem" object with the format ""Clock".

NeedleFillStyle

hmiNeedleFillStyleTransparent (1): The pointers are filled in the pointer fill color and shown with a margin in the foreground color.

Identifies a transparent clock hand.

hmiNeedleFillStyleSolid (0): The pointers appear to be transparent and will be indicated by a margin in the foreground color.

Identifies a opaque clock hand.

See also

Clock (Page 3984)

NormalRangeColor

Description

Specifies the color of the normal range on the scale of the "Gauge" object.

The "NormalRangeVisible" property must have the value TRUE so that the normal range is displayed.

Access during runtime: Read and write

Syntax

Object.**NormalRangeColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Gauge".

Color

Optional A value or a constant that specifies the color of the normal range.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Gauge (Page 4008)

NormalRangeVisible

Description

Specifies whether the normal range in the scale of the ""Gauge" object will be displayed.

Access in Runtime: Read and write

Syntax

Object.**NormalRangeVisible**[= BOOLEAN]

Object

Required A "ScreenItem" object with the format "Gauge".

BOOLEAN

Optional TRUE, if the normal range will be displayed in the scale.

Comments

Specify the color of the normal range with the ""NormalRangeColor" property.

See also

Gauge (Page 4008)

NumberLines

Description

Defines or return the number of lines the text list object should contain. If the amount of configured text is larger than this value, the selection list receives a vertical scroll bar.

NumberOfValues(i)

Description

Specifies the number of values that are shown in the trend window. The property "TagProviderType(i)"" must have the value -1. Whether the information is evaluated depends on the property "UseMeasurePoints(i)".".

Access in Runtime: Read and write

Syntax

Object.**NumberOfValues**(i)[=Int]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the number of values that are shown in the trend window.

Comments

Number of value pairs for trend i (from tag provider)

See also

FunctionTrendControl (Page 4004)

Properties O-P

Object

Description

If you use a Control that is not a standard WinCC control, it could be that the properties provided by the Control have the same names as the general ScreenItem properties. In this case, the ScreenItem properties take priority. You can access the "hidden" properties of an outside provider Controls via the additional ""object" property.

Syntax

Object.Object

Object

Required A "ScreenItem" object with the format ""ForeignControl".

Application example

To do this, address the properties of an outside provider control in the following way:

Control.object.type

If you are using only the form Control.type, the properties of the ScreenItem object will be used in case of identical names.

ObjectName

Description

Returns the name of the specified object.

Access in Runtime: Read

Syntax

Object.ObjectName

Object

Required A "ScreenItem" object. This property is a standard property of the ScreenItem object and is therefore available for all formats.

ObjectSizeDeclutteringEnable

Description

Specifies whether only the objects within a set size range are displayed.

Access during runtime: Read

Syntax

Object.**ObjectSizeDeclutteringEnable**

Object

Necessary. A "Screen" object.

Example

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen (Page 3930)

ObjectSizeDeclutteringMax

Description

Returns the upper size range for the display suppression of objects of the specified screen as LONG.

Access during runtime: Read

Syntax

Object.**ObjectSizeDeclutteringMax**

Object

Necessary. A "Screen" object.

Example

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen (Page 3930)

ObjectSizeDeclutteringMin

Description

Returns the lower size range for the display suppression of objects of the specified screen as LONG.

Access during runtime: Read

Syntax

Object.**ObjectSizeDeclutteringMin**

Object

Necessary. A "Screen" object.

Example

The example outputs the Decluttering properties of the screen "NewPDL1" as Trace.

```
'VBS157
Dim objScreen
Set objScreen = HMIRuntime.Screens("NewPDL1")
HMIRuntime.Trace "Min: " & objScreen.ObjectSizeDeclutteringMin & vbNewLine
HMIRuntime.Trace "Max: " & objScreen.ObjectSizeDeclutteringMax & vbNewLine
HMIRuntime.Trace "Enable: " & objScreen.LayerDeclutteringEnable & vbNewLine
```

See also

Screen (Page 3930)

OCXState

Description

Sepcifies the status of the OCX.

Access in Runtime: Read and write

Syntax

Object.**OCXState**[=Stream]

Object

Required A "ScreenItem" object with the format "ForeignControl".

Stream

Optional A value or a constant that specifies the status of the OCX.

See also

ForeignControl (Page 4000)

Online

Description

Specifies start and stop of the updating.

Access in Runtime: Read and write

Syntax

Object.**Online**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

Optional TRUE, if the updated display should be stopped. The values are stored in the cache and when the button is reactivated they are added . FALSE, if the updated display is to be continued.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnTop

Description

TRUE, when the object should remain in the foreground in Runtime. Read only access.

OperationMessage property

Description

TRUE, if an alarm should be output when an operation is performed. BOOLEAN write-read access.
The operation is sent to the alarm system and is logged. The alarm system can be used to output an alarm in an alarm line, for example.

Particularities for I/O field, text list, and slider

The reason for the operation can only be entered if the "OperationReport" property has been set to TRUE.

OperationReport property

Description

TRUE, if the reason for an operation should be recorded. BOOLEAN write/read access. When the object is used or operated in Runtime, a dialog opens in which the operator can input the reason for the operation in the form of text. The operation is sent to the message system, and is archived.

OperationSteps

Description

Specifies by how many steps the slider of the scrollbar is moved with one mouseclick.

Access in Runtime: Read and write

Syntax

Object.**OperationSteps**[=Int]

Object

Required A ""ScreenItem" object with the format "WindowSlider".

Int

Optional A value or a constant which specifies by how many steps the slider of the scrollbar is moved with one mouseclick.

See also

WindowSlider (Page 4139)

OperatorMessageID

Description

Specified assignment of ID number and trigger event in the message view.

Syntax

Object.**OperatorMessageID**[=MessageID]

Object

Required A "ScreenItem" object with the format "AlarmControl".

MessageID

Value	Description	Description
0	Lock	Trigger event "Lock"
1	Unlock	"Unlock" Trigger Event
2	Hide	Trigger event "Hide"
3	Unhide	Trigger event "Unhide"
4	Ackn	Trigger event "Acknowledge"

See also

AlarmControl (Page 3947)

OperatorMessageIndex

Description

References an operator message event. You can assign the values of other properties to a specific operator message by using the property.

Syntax

Object.**OperatorMessageIndex** [=MessageIndex]

Object

Required A "ScreenItem" object with the format "AlarmControl".

MessageIndex

Value	Description
0	Message event "Lock"
1	"Unlock" Message Event
2	Message event "Hide"
3	Message event "Unhide"
4	Message event "Acknowledge"

See also

AlarmControl (Page 3947)

OperatorMessageName

Description

Indicates the name which is referenced with the "OperatorMessageIndex" in message events for operator messages. You cannot edit this name.

Syntax

Object.**OperatorMessageName**[=Name]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Name

Value	Description
Lock	Message event "Lock"
Unlock	Message event "Enable"
Hide	Message event "Hide"
Unhide	Message event "Unhide"
Quit	Message event "Ackn."

See also

AlarmControl (Page 3947)

OperatorMessageNumber

Description

Specify a message number for the operator message of the selected message event if you do not use the operator message of WinCC.

Syntax

Object.**OperatorMessageNumber**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSelected

Description

Activate the message events which trigger operator messages in the list.

Syntax

Object.**OperatorMessageSelected**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource1

Description

Define the message block of an operated message to be added to "Process value block 1" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 1" of the operator message. Select "1" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource1**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource2

Description

Define the message block of an operated message to be added to "Process value block 2" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 2" of the operator message. Select "2" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource2**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource3

Description

Define the message block of an operated message to be added to "Process value block 3" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 3" of the operator message. Select "3" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource3**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource4

Description

Define the message block of an operated message to be added to "Process value block 4" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 4" of the locked message, e.g. "Motor faulty" should be displayed in "Process value block 4" of the operator message. Select "4" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource4**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource5

Description

Define the message block of an operated message to be added to "Process value block 5" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 5" of the operator message. Select "User text block 1" under process value "5" as the message block of the operated message.

Syntax

Object.**OperatorMessageSource5**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource6

Description

Define the message block of an operated message to be added to "Process value block 6" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 6" of the operator message. Select "6" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource6**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource7

Description

Define the message block of an operated message to be added to "Process value block 7" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 7" of the operator message. Select "7" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource7**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource8

Description

Define the message block of an operated message to be added to "Process value block 8" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 8" of the operator message. Select "8" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource8**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource9

Description

Define the message block of an operated message to be added to "Process value block 9" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process

value block 9" of the operator message. Select "9" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource9**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSource10

Description

Define the message block of an operated message to be added to "Process value block 10" of the operator message configured in Source.

An operator message is to be generated to indicate that a message was locked. The content of "User text block 1" of the locked message, e.g. "Motor faulty", is to be displayed in "Process value block 10" of the operator message. Select "10" at process value as the message lock of the operated message "User text block 1".

Syntax

Object.**OperatorMessageSource10**

Object

Required A "ScreenItem" object with the format "AlarmControl".

See also

AlarmControl (Page 3947)

OperatorMessageSourceType1

Description

Specifies the format of the source content for the transfer.

Syntax

Object.**OperatorMessageType1**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Description
0	Text	Transfer the source content in text format.
1	Value	Transfer the source content as value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType2

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType2**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType3

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType1**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType4

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType4**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType5

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType5**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType6

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType6**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType7

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType7**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType8

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType8**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType9

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType9**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

OperatorMessageSourceType10

Description

Specifies in what format the content of the source is transferred.

Syntax

Object.**OperatorMessageType10**[=Type]

Object

Required A "ScreenItem" object with the format "AlarmControl".

Type

Value	Description	Explanation
0	Text	The content of the source is transferred as a text.
1	Value	The content of the source is transferred as a value.

See also

AlarmControl (Page 3947)

Orientation

Description

Specifies the text direction (orientation) of the selected object.

Access in Runtime: Read and write

Syntax

Object.**Orientation**[=TextOrientation]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "Bar", "OnlineTrendControl", "FunctionTrendControl", "Checkbox", "OptionGroup" or "WindowSlider".

TextOrientation

hmiTextHorizontal (0): The text is shown horizontally.

hmiTextRotated90Degree (-1): The text is shown vertically and left justified.

hmiTextRotated270Degree (1): The text is shown vertically and right justified.

See also

TextField (Page 4107)

IOField (Page 4021)

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

Bar (Page 3961)

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

CheckBox (Page 3974)

OptionGroup (Page 4054)

WindowSlider (Page 4139)

OutputFormat

Description

Returns the value for the representation of the output value. The representation is dependent on the data format. Read only access.

OutputValue

Description

Determines the default setting for the value to be displayed or returns it.
This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

PageMode

Description

Enables paging is in the long-term archive list. Allows you to display all messages of the short-term archive in the long-term archive list. Use the "Messages per page" property to determine the number of messages output per page.

The page up/down buttons of the toolbar can be used if paging is enabled.

Syntax

Object.**PageMode**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

TRUE: Scrolling in the long-term log list is possible.

FALSE: Scrolling in the long-term log list is not possible.

See also

AlarmControl (Page 3947)

PageModeMessageNumber

Description

Defines the number of messages shown per page when paging the long-term archive list.

Syntax

Object.**PageModeMessageNumber**

Object

Required A "ScreenItem" object with the format "AlarmContro".

BOOLEAN

Optional TRUE, if the dialog box is shown in Runtime.

See also

AlarmControl (Page 3947)

Parent

Description

Returns the screen in which the specified object is embedded.

Access in Runtime: Read

Syntax

Object.Parent

Object

Required A "ScreenItem" object. This property is a standard property of the ScreenItem object and is therefore available for all formats.

Application example

The following example writes the name of the root screen in "BaseScreenName" tag:

```
'VBS_Example_Parent
Dim objScrItem, BaseScreenName
Set objScrItem = HMIRuntime.Screens(1).ScreenItems(1)
BaseScreenName = "Name of BaseScreen: " & objScrItem.Parent.ObjectName
```

Path

Description

Returns the path of the current project without the file names as STRING. For a WinCC client without its own path, the path is returned in UNC format, otherwise the local path is returned.

Access during runtime: Read

Syntax

Object.**Path**

Object

Necessary. A "Project" object.

Example

The following example returns the project path as Trace:

```
'VBS161
HMIRuntime.Trace "Path: " & HMIRuntime.ActiveProject.Path & vbNewLine
```

See also

Project (Page 3929)

Password

Description

Determines the password for the loading of the remote monitor.

Access during runtime: Read and Write

Syntax

Object.Password = [STRING]

Object

Required. An object of the "ScreenItem" type with the characteristic "SmartClientView."

STRING

Optional. A value or constant which contains the password.

See also

SmartClientView (Page 4085)

PersistentRTAuthorization

Description

Specifies the authorization for operators which is necessary to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration. Whether the information is evaluated depends on the value of the property "AllowPersistance". This does not apply for the message view.

Access in Runtime: Read and write

Syntax

Object.**PersistentRTAuthorization**[=RtAuthorization]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

RtAuthorization

Optional A value or a constant that specifies the authorization for operators to change the persistence setting.

See also

AlarmControl (Page 3947)

PersistentRTCSAuthorization

Description

Specifies the operator authorization to be able to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration. Whether the information is evaluated depends on the value of the property "AllowPersistance". This does not apply for the message view.

Access in Runtime: Read and write

Syntax

Object.**PersistentRTCSAuthorization**[=RtAuthorization]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

RtAuthorization

Optional A value or a constant that specifies the operator authorization to change the persistence setting.

See also

AlarmControl (Page 3947)

PersistentRuntime

Description

Specifies whether changed settings in the window will also be maintained after a screen change.

Access in Runtime: Read and write

Syntax

Object.**PersistentRuntime**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" oder "OnlineTableControl".

BOOLEAN

Optional. TRUE, if changed settings in the window will also be maintained after a screen change.

Comments

The "AllowPersistance" property specifies whether the information will be evaluated.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

PersistentRuntimeAuthorization

Description

Specifies the access authorization to change the persistence setting in Runtime. The value to be entered corresponds to the number which has the desired authorization in the user administration.

Access in Runtime: Read and write

Syntax

Object.**PersistentRuntimeAuthorization**[=HmiRTAuthorization]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

HmiRTAuthorization

Optional A value or a constant that specifies the access authorization required to change the persistence setting in Runtime.

Comments

The "AllowPersistance" property specifies whether the information will be evaluated. This does not apply for the message view.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

PersistentToDownload

Description

Specifies whether the settings will be maintained until the next ES download.

Access in Runtime: Read and write

Syntax

Object.**PersistentToDownload**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the settings will be maintained until the next ES download.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

PersistentToDownloadAuthorization

Description

Specifies the access authorization required to change the settings until the next ES download.

Access in Runtime: Read and write

Syntax

Object.**PersistentToDownloadAuthorization**[=HmiRTAuthorization]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

HmiRTAuthorization

Optional A value or a constant that specifies the access authorization required to change the settings until the next ES download.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

PicAlignment

Description

Specifies the alignment within the specified object.

PicDeactReferenced

Description

TRUE, when the picture assigned for the "Disable" status should be saved in the RoundButton object. Otherwise, only the associated object reference is saved. Read only access.

PicDeactTransparent

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Disabled" status should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicDeactUseTransColor" property is "True".

PicDeactUseTransColor

Description

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

PicDownReferenced

Description

TRUE, when the picture assigned for the "On" status is to be saved. Otherwise, only the associated object reference is saved. Read only access.

PicDownTransparent

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "On" status should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicDownUseTransColor" property is "True".

PicDownUseTransColor

Description

TRUE, when the transparent color defined by the "PicDownTransparent" property for the "On" status should be used. BOOLEAN write-read access.

PicReferenced

Description

TRUE, when the assigned picture is references the object and is not saved in it. Read only access.

PicTransColor

Description

Defines or returns which color of the assigned bitmap object (.bmp, .dib) should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicUseTransColor" property is "True".

Picture

Description

Specifies the screen that will be displayed in the graphics object in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Picture**[=Image]

Object

Required A ""ScreenItem" object with the formats "GraphicView", "Clock"" or ""SymbolLibrary".".

Image

Optional A value or a constant that specifies the screen that will be displayed in the graphics object in Runtime.

Comments

The picture (*.BMP or *.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.

See also

GraphicView (Page 4014)

Clock (Page 3984)

SymbolLibrary (Page 4098)

PictureAlignment

Description

Defines or returns the mode of representation of the background image in the process picture.

LONG write-read access.

See also

Button (Page 3968)

RoundButton (Page 4074)

PictureDeactivated

Description

Specifies the picture that is displayed in the "Deactivated" state.

Access during runtime: Read and write

Syntax

Object.**PictureDeactivated**[=Image]

Object

Required A ""ScreenItem" object with the format ""Roundbutton".

Image

Optional A value or a constant that specifies the picture that will be displayed in the "Deactivated" status.

Comments

The picture must be located in the "GraCS" folder of the current project in order to integrate it.

PictureName

Description

Defines the path and file name of the background image in the process picture or returns it. LONG write-read access.

PictureOff

Description

Specifies the picture that is displayed in the "Off" status.

Access during runtime: Read and write

Syntax

Object.**PictureOff**[=Image]

Object

Required A "ScreenItem"" object with the formats ""Button", ""Roundbutton", "Switch"" or "GraphicIOField".

Image

Optional A value or a constant that specifies the picture that will be displayed in the "Off" status.

Comments

The picture (*.BMP or *.DIB) must be in the "GraCS" folder of the current project so that you can integrate it.

See also

Button (Page 3968)

Switch (Page 4089)

GraphicIOField (Page 4011)

PictureOn

Description

Specifies the screen that will be displayed in the "on" state.

Access in Runtime: Read and write

Syntax

Object.**PictureOn**[=Image]

Object

Required A "ScreenItem" object with the formats "Button", "Roundbutton", "Switch" or "GraphicIOField".

Image

Optional A value or a constant that specifies the screen that will be displayed in the "on" state.

Comments

The screen (*.BMP or *.DIB) must be in the "GraCS" folder of the current project in order to be able to integrate it.

See also

Button (Page 3968)

Switch (Page 4089)

GraphicIOField (Page 4011)

PictureUp

Description

Defines the picture to be displayed in the "Off" status or returns the picture name.
The picture (*.BMP or *.DIB) must be located in the "GraCS" folder of the current project so that it can be integrated.

PicUpReferenced

Description

TRUE, when the picture assigned for the "Off" status should be saved in the object. Otherwise, only the associated object reference is saved. Read only access.

PicUpTransparent

Description

Defines or returns which color of the bitmap object (.bmp, .dib) assigned to the "Off" status should be set to "transparent". LONG Write/Read Access.
The color is only set to "Transparent" if the value of the "PicUpUseTransColor" property is "True".

PicUpUseTransColor

Description

TRUE, when the transparent color defined by the "PicUpTransparent" property for "Off" status should be used. BOOLEAN write-read access.

PicUseTransColor

Description

TRUE, when the transparent color defined by the "PicDeactTransparent" property for the "Disable" status should be used. BOOLEAN write-read access.

Pinned

Description

Defines whether the display of the picture window in Runtime depends on the process picture in which the picture window was configured.

PointCount

Description

Defines or returns the number of corner points. Each corner point has position coordinates and is identified via an index.

PointerColor

Description

Specifies the pointer color of the "Gauge" object.

Access during runtime: Read and Write

Syntax

Object.**PointerColor**[= Color]

Object

Required An object of the ""ScreenItem" type with the characteristic "Gauge".

Color

Optional A value or a constant that specifies the pointer color.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Gauge (Page 4008)

PointsCount

Description

Specifies the number of corner points of the polyline or of the polygon.

Access in Runtime: Read and write

Syntax

Object.**PointsCount**[=Int]

Object

Required A "ScreenItem" object with the formats "Polyline" or "Polygon".

Int

Optional A value or a constant that specifies the number of corner points of the polyline.

See also

Polyline (Page 4060)

Polygon (Page 4057)

TubePolyline (Page 4125)

Position

Description

Defines the presetting for the position of the slider.

This value is used as the start value in Runtime.

To operate the process value linked to this attribute, it is necessary that the process value is also linked to the "Position" event. You will find the event "Position" in the "Event" tab, in the topic tree under SliderCtrl\Property Topics\Control Properties\Value.

Precision

Description

Specifies the number of decimal places (0 to 20).

Access in Runtime: Read and write

Syntax

Object.**Precision**[=Int]

Object

Required A "ScreenItem" object with the format "Bar".

Int

Optional A value or a constant that specifies the number of decimal places (0 to 20).

See also

Bar (Page 3961)

PredefinedAngles

Description

Defines or returns the depth of the display of the 3DBarGraph object. Value range from 0 to 3.

0 = cavalier

1 = isometric

2 = axionometric

3 = freely defined

Pressed

Description

Specifies whether the selected object is displayed in a pressed state.

Access in Runtime: Read and write

Syntax

Object.**Pressed**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Roundbutton".

BOOLEAN

Optional TRUE, if the selected object is displayed in a pressed state.

See also

Button (Page 3968)

PrintConfiguration

Description

Specifies the log for the printout.

Access in Runtime: Read and write

Syntax

Object.**PrintConfiguration**[=HMIPrintConfiguration]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl" or "UserArchiveControl".

HMIPrintConfiguration

Optional A value or a constant which specifies the log for the printout.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

PrintJobName

Description

Defines the print job triggered by the print function of the "Print" toolbar button. The recommended print job is set for the control by default.

Open the "Select Print Job" dialog using the selection button.

Syntax

Object.**PrintJobName**]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "FunctionTrendControl", "OnlineTableControl", "OnlineTrendControl", "TrendRulerControl", "UserArchiveControl".

See also

AlarmControl (Page 3947)

PrintVisibleColumnsOnly

Description

Specifies whether only the current visible columns should be output in quick print.

Access in Runtime: Read and write

Syntax

Object.**PrintVisibleColumnsOnly**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if only the current visible columns should be output in quick print.

Process

Description

Defines or returns presetting for the value to be displayed.
This value is used in Runtime when the associated tag cannot be connected or updated when a picture is started.

Processvalue

Description

Specifies the default for the value to be displayed.

This value will be used in runtime if the associated tag is not connected or has not been updated when the screen starts.

Access during runtime: Read and write

Syntax

Object.**Processvalue**[=DOUBLE]

Object

Necessary. A "ScreenItem" object with the formats "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "GraphicIOField", "Bar", "Gauge", "Slider", "SymbolLibrary", "CheckBox", "OptionGroup"" or "WindowSlider".

DOUBLE

Optional A value or a constant that includes the default value.

Comments

If you want to assign the "ProcessValue" SmartTags property, then you must formulate the assignment as follows:

'Examples for the assignment of SmartTags

```
'Example 1
IOField.ProcessValue = SmartTags("TagName").Value
'Example 2
HmiRuntime.Screens("Screen_1").ScreenItems("IOField_1").ProcessValue =
SmartTags("Tag_1").Value
```

See also

IOField (Page 4021)

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

GraphicIOField (Page 4011)

Bar (Page 3961)

Gauge (Page 4008)

Slider (Page 4082)

SymbolLibrary (Page 4098)

CheckBox (Page 3974)

OptionGroup (Page 4054)

WindowSlider (Page 4139)

DateTimeField (Page 3989)

Processvalue

Description

Defines the presetting for the value to be displayed.

This value is used in runtime when a screen is started and the associated tag has not been connected nor updated.

Access during runtime: Read and Write

Syntax

Object.Processvalue [=DOUBLE]

Object

Required. An object of the "ScreenItem" type with the characteristic "Bar," "Gauge", "IOField" or "Slider".

DOUBLE

Optional. A value or constant which contains preset the Web address.

Remarks

To assign SmartTags to the "ProcessValue" property, you must formulate the assignment as follows:

```
Examples of the assignment of SmartTags

'Example 1

IOField.ProcessValue = SmartTags("TagName").Value

'Example 2

HmiRuntime.Screens("Screen_1").ScreenItems("IOField_1").ProcessValue
 = SmartTags("Tag_1").Value
```

See also

SymbolLibrary (Page 4098)

Button (Page 3968)

Switch (Page 4089)

ProgID

Description

In the case of non-WinCC controls, the version-independent ProgID is returned as the type.

See also

ForeignControl (Page 4000)

ProjectPath

Description

Contains the path and name of the associated project.

Access in Runtime: Read-only

Syntax

Object.**ProjectPath**[=String]

Object

Required A "ScreenItem" object with the format "AlarmControl".

String

Optional A value or a constant that specifies which path and name the associated project will contain.

See also

AlarmControl (Page 3947)

Properties Q-R

QualityCode

Description

Returns the quality of a tag value after reading the tag as SHORT. After a tag has been written, the value is invalid.

Access during runtime: Read

Syntax

Object.**QualityCode**

Object

Necessary. An object of the "HMIRuntime" type.

Example

The following example indicates the quality of the read value when no errors have occurred during the reading process:

```
'VBS83
Dim objTag
Dim lngLastErr
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
lngLastErr = objTag.LastError
If 0 = lngLastErr Then
MsgBox objTag.QualityCode
End If
```

See also

Tag (Page 3941)

Radius

Description

Determines the radius of the given object "Circle."

Access during runtime: Read and Write

Syntax

Object.Radius [= LONG]

Object

Required. An object of the "ScreenItem" type with the characteristic "Circle".

LONG

Optional. A value or constant which determines the radius in pixels.

Radius

Description

Specifies the radius of the selected object "Circle".

Access in Runtime: Read and write

Syntax

Object.**Radius**[= LONG]

Object

Required An object of the "ScreenItem" type with the format "Circle", "CircleSegment", "CircularArc" or "Roundbutton".

LONG

Optional A value or a constant that specifies the radius in pixels.

See also

Circle (Page 3977)

CircleSegment (Page 3979)

CircularArc (Page 3982)

RadiusHeight

Description

Determines the secondary axis of the object "Ellipse".

Access during runtime: Read and Write

Syntax

Object.RadiusHeight

Object

Required. An object of the "ScreenItem" type with the characteristic "Ellipse."

LONG

Optional. A value or constant which determines the secondary axis in pixels.

RadiusHeight

Description

Specifies the minor axis of the ""Ellipse" object.

Access in Runtime: Read and write

Syntax

Object.RadiusHeight

Object

Required A "ScreenItem" object with the formats "Ellipse", "EllipseSegment" or "EllipticalArc".

LONG

Optional A value or a constant that specifies the minor axis in pixels.

See also

Ellipse (Page 3993)

EllipseSegment (Page 3995)

EllipticalArc (Page 3998)

TubeArcObject (Page 4121)

RadiusWidth

Description

Determines the main axis of the object "Ellipse".

Access during runtime: Read and Write

Syntax

Object.RadiusWidth

Object

Required. An object of the "ScreenItem" type with the characteristic "Ellipse."

LONG

Optional. A value or constant which determines the main axis in pixels.

RadiusWidth

Description

Specifies the major axis of the "Ellipse" object.

Access in Runtime: Read and write

Syntax

Object.RadiusWidth

Object

Required A "ScreenItem" object with the formats "Ellipse", "EllipseSegment" or "EllipticalArc".

LONG

Optional A value or a constant that specifies the major axis in pixels.

See also

Ellipse (Page 3993)

EllipseSegment (Page 3995)

EllipticalArc (Page 3998)

TubeArcObject (Page 4121)

ReadOnly

Description

Specifies whether the Control has read and write access in Runtime.

Access in Runtime: Read and write

Syntax

Object.**ReadOnly**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the Control has read and write access in Runtime.

RecipeName

Description

Returns the name of the recipe that is currently being displayed in the "RecipeView".

Access in Runtime: Read

Syntax

Object.RecipeName

Object

Required A "ScreenItem" object with the format "RecipeView".

RecipeNumber

Description

Returns the number of the recipe that is currently being displayed in the "RecipeView".

Access in Runtime: Read

Syntax

Object.RecipeNumber

Object

Required A "ScreenItem" object with the format "RecipeView"".

RecordName

Description

Returns the name of the recipe data record that is currently being displayed in the "RecipeView".

Access in Runtime: Read

Syntax

Object.RecordName

Object

Required A "ScreenItem" object with the formats "RecipeView" or "PrintRecipe".

RecordNumber

Description

Returns the number of the recipe data record that is currently being displayed in the "RecipeView".

Access in Runtime: Read

Syntax

Object.RecordNumber

Object

Required A "ScreenItem" object with the format "RecipeView".

ReferenceRotationLeft

Description

Defines or returns the X-coordinate of the reference point about which the object should be rotated in Runtime.
The value of the x coordinate is relative to the object width. Enter the value in percent starting from the left edge of the rectangle enclosing the object.

ReferenceRotationTop

Description

Defines or returns the Y-coordinate of the reference point about which the object should be rotated in Runtime.

The value of the Y-coordinate is relative to the object height. Enter the value in percent starting from the top edge of the rectangle enclosing the object.

RelativeFillLevel

Description

Specifies the fill percentage for the object.

Access in Runtime: Read and write

Syntax

Object.**RelativeFillLevel**[=Int]

Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "Button", "Roundbutton", "GraphicView", "Checkbox", "OptionGroup" or "WindowSlider".

Int

Optional A value or a constant that specifies the fill percentage of the object.

See also

Ellipse (Page 3993)

Circle (Page 3977)

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

Rectangle (Page 4072)

TextField (Page 4107)

Button (Page 3968)

GraphicView (Page 4014)

OptionGroup (Page 4054)

WindowSlider (Page 4139)

Relevant property

Description

TRUE, when the object will be taken into account when forming the group display. BOOLEAN write-read access.

RemoveAssignment

Description

Removes an entry.

RemoveAllAssignment

Description

Deletes all entries.

RightComma property

Description

Defines or returns the number of decimal places (0 to 20).

Rotation

Description

Specifies the angle of rotation in degrees of the selected object. The angle of rotation is measured counterclockwise.

Access in Runtime: Read and write

Syntax

Object.**Rotation**[=SymbolLibRotation]

Object

Required A "ScreenItem" object with the format "SymbolLibrary".

SymbolLibRotation

hmiSymbolLibraryRotationNone (0): The object rotates by 0 degrees.

hmiSymbolLibraryRotation90Degree (90): The object rotates by 90 degrees.

hmiSymbolLibraryRotation180Degree (180): The object rotates by 180 degrees.

hmiSymbolLibraryRotation270Degree (270): The object rotates by 270 degrees.

See also

SymbolLibrary (Page 4098)

RotationAngle

Description

Specifies the angle of rotation in degrees.

Access in Runtime: Read and write

Syntax

Object.**RotationAngle**[=Int]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Polygon" or "TextField".

Int

Optional A value or a constant that specifies the angle of rotation in degrees.

Comments

In Runtime the object rotates clockwise on the reference point.

See also

Line (Page 4025)

Polyline (Page 4060)

Polygon (Page 4057)

TextField (Page 4107)

TubeTeeObject (Page 4128)

RotationCenterLeft

Description

Establishes the X coordinates of the pivot point to rotate the object in Runtime.

Access in Runtime: Read and write

Syntax

Object.**RotationCenterLeft**[=Int]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Polygon"" or "TextField".

Int

Optional A value or a constant that specifies the X coordinates of the pivot point to rotate the object in runtime.

Comments

The value of the X coordinate is relative to the object width. Specify the value as a percentage from the left edge of the rectangle that surrounds the object.

See also

Line (Page 4025)

Polyline (Page 4060)

Polygon (Page 4057)

TextField (Page 4107)

RotationCenterTop

Description

Specifies the Y coordinates of the pivot point to rotate the object in Runtime.

Access in Runtime: Read and write

Syntax

Object.**RotationCenterTop**[=Int]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Polygon" or "TextField".

Int

Optional A value or a constant that specifies the Y coordinates of the pivot point to rotate the object in Runtime.

Comments

The value of the Y coordinate is relative to the object width. Specify the value as a percentage from the upper edge of the rectangle that surrounds the object.

See also

Line (Page 4025)

Polyline (Page 4060)

Polygon (Page 4057)

TextField (Page 4107)

RoundCornerHeight

Description

Defines or returns the corner radius.
Enter the value as a percentage of half the height of the object.

See also

Rectangle (Page 4072)

RoundCornerWidth

Description

Defines or returns the corner radius.
Enter the value as a percentage of half the width of the object.

See also

Rectangle (Page 4072)

RowNumber

Description

Specifies the row number of the Row object of a Table Control.

See also

AlarmControl (Page 3947)

RowScrollbar

Description

Enables the display of row scroll bars.

Syntax

Object.**RowScrollbar**[=ScrollbarVisibility]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "TrendRulerControl" or "OnlineTableControl".

ScrollbarVisibility

Value	Description	Description
0	no	No row scroll bars.
1	as required	Row scroll bars are displayed if horizontal space requirements of the control are greater than the actually available display area.
2	always	Row scroll bars are always displayed.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

RowSizingEnable

Description

Specifies whether the row height can be changed.

The "RowSizingEnable" property is then only disabled if both properties "RowSizingEnable" and "AdaptFontSizeToLineHeight" have the value FALSE.

Access in Runtime: Read and write

Syntax

Object.**RowSizingEnable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the row height can be changed.

See also

AlarmControl (Page 3947)

RowTitleAlign

Row label alignment - RowTitleAlign

Specifies the type of row label alignment.

The following settings are available:

Value	Description	Description
0	left	The row headers are aligned left.
1	centered	The row headers are aligned to center.
2	right	The row headers are aligned right.

The attribute can be assigned dynamic properties by means of the name **RowTitleAlign**.

See also

AlarmControl (Page 3947)

RTPersistence

Description

Specifies how online configurations of WinCC are retained.

Syntax

Object.**RTPersistence**[=RTPersistence]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "TrendRulerControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

RTPersistence

Value	Description	Explanation
0	Discard	The current online configurations are discarded at the next picture change.
1	Retain	The current online configurations are retained at the next picture change.
2	Reset	All online configurations made are lost. The picture is set to the contents found in the configuration system.

See also

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

RTPersistencePasswordLevel

Description

Displays the authorization for online configuration. You can edit the authorization using the selection button. Authorizations are configured in the user administration.

Syntax

Object.**RTPersistencePasswordLevel**

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "TrendRulerControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

See also

AlarmControl (Page 3947)

RTPersistenceType

Description

Specifies how online configurations of WinCC are retained.

Syntax

Object.**RTPersistenceType**[=RTPersistenceType]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTrendControl", "TrendRulerControl" or "OnlineTableControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

RTPersistenceType

Value	Description	Explanation
0	Do not retain	Online configurations are not retained. These are lost at the next picture change.
1	Retain during runtime	Online configurations are retained during runtime. These are lost on exiting.
2	Retain permanently	Online configurations are retained permanently. These are also available after restart.

AlarmControl (Page 3947)

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

RulerColor

Description

Specifies the color of the scale gradation (help line) of the axis label in the "OnlineTrendControl" object.

Access in Runtime: Read and Write

Syntax

Object.**RulerColor**[= Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Color

Optional A value or a constant that specifies the color of the scale gradation.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

TrendView (Page 4118)

RulerPrecision(i)

Description

Specifies the number of decimal places with which a measurement value of the specified trend will be displayed if it is measured via the function "Display value here".

Access in Runtime: Read and write

Syntax

Object.**RulerPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the specified trend will be displayed if it is measured via the function "Display value here".

See also

OnlineTrendControl (Page 4045)

RulerXPrecision(i)

Description

Specifies the number of decimal places with which a measurement value of the X coordinate will be displayed. Whether the information is evaluated depends on the value of the property "XAxisMode(i)".

Access in Runtime: Read and write

Syntax

Object.**RulerXPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the X coordinate will be displayed.

Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the X coordinate of the measurement value.

See also

FunctionTrendControl (Page 4004)

RulerYPrecision(i)

Description

Specifies the number of decimal places with which a measurement value of the Y coordinate will be displayed. Whether the information is evaluated depends on the value of the property "XAxisMode(i)".".

Access in Runtime: Read and write

Syntax

Object.**RulerYPrecision**(i)[=Int]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the number of decimal places with which a measurement value of the Y coordinate will be displayed.

Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the Y coordinate of the measurement value.

See also

FunctionTrendControl (Page 4004)

Properties S

SameSize

Description

TRUE, when all four buttons of a Group Display object have the same size. BOOLEAN write-read access.

ScaleColor

Description

Specifies the color of the scale of the selected object.

Access in Runtime: Read and write

Syntax

Object.**ScaleColor**[= Color]

Object

Required An object of the "ScreenItem" type with the format "Bar" or "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Color

Optional A value or a constant that specifies the color of the scale.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

ScreenItem object with the format "Bar": For the color to be displayed, the property ""ShowScale" must have the value TRUE.

See also

Bar (Page 3961)

TrendView (Page 4118)

ScaleGradation

Description

Specifies the distance between two large marking lengths of the scale.

Access in Runtime: Read and write

Syntax

Object.**ScaleGradation**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the distance between two large marking lengths of the scale.

See also

Bar (Page 3961)

ScaleLabelColor

Description

Specifies the color of the label for the scale gradation of the "Gauge" object.

Access during runtime: Read and Write

Syntax

Object.**ScaleLabelColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Gauge".

Color

Optional A value or a constant that specifies the label color of the scale gradation.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Gauge (Page 4008)

ScaleNumerator

Description

Defines the counter for scaling on the client.

Syntax

Object.**ScaleNumerator =[Int]**

Object

Required A "ScreenItem" object with the format "SmartClientView".

Int

Optional A value or a constant that specifies the value.

See also

SmartClientView (Page 4085)

ScalePosition

Description

Specifies the position of the scale of the selected object. The "ShowScale" property must be set to TRUE so that the scale can be displayed.

Access in Runtime: Read and write

Syntax

Object.**ScalePosition**[=ScalePosition]

Object

Required A "ScreenItem" object with the format "Bar".

ScalePosition

hmiScalePositionLeftUp (0): For a vertical bar the scale will be displayed at the top. For a horizontal bar the scale will be shown at the left.

hmiScalePositionRightDown (1): For a vertical bar the scale will be displayed at the bottom. For a horizontal bar the scale will be shown at the right.

See also

Bar (Page 3961)

ScaleTickColor

Description

Specifies the color of the scale gradation of the "Gauge" object.

Access in Runtime: Read and write

Syntax

Object.**ScaleTickColor**[= Color]

Object

Required A "ScreenItem" object with the format "Gauge".

Color

Optional A value or a constant that specifies the color of the scale gradation.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Gauge (Page 4008)

ScaleTickLabelPosition

Description

Specifies the diameter of the assumed circle on which the label of the scale divisions is located.

Access in Runtime: Read and write

Syntax

Object.**ScaleTickLabelPosition**[=Double]

Object

Required A "ScreenItem" object with the format "Gauge".

Double

Optional A value or a constant that specifies the diameter of the assumed circle on which the label of the scale division is located.

Value range from 0 to 1

0: The label is located in the center of the scale.

1: The diameter of the assumed circle for the label is the smaller value of the geometry properties "Width" and "Height". A part of the label can lie outside the object limits and is therefore invisible.

See also

Gauge (Page 4008)

ScaleTickLength

Description

Specifies the length of the main markings for the scale division. The value refers to half the smaller value of the geometry properties "Width" and "Height".

The length of the marking lengths for the fine divisions is 0.5* scale width.

Access in Runtime: Read and write

Syntax

Object.**ScaleTickLength**[=Double]

Object

Required A "ScreenItem" object with the format "Gauge".

Double

Optional A value or a constant that specifies the length of the main markings of the scale.

Value range 0 to scale end value

0: There are no scale divisions. The divisions of the scale in the areas are not visible.

Scale end value: The scale divsion ranges from the mid point of the scale disc to the value specified by the scale end value.

See also

Gauge (Page 4008)

ScaleTickPosition

Description

Specifies the diameter of the assumed circle on which the scale divisions are located.

The main markings of the scale divisions lie with their outward-facing ends on this circle.

Access in Runtime: Read and write

Syntax

Object.**ScaleTickPosition**[=Double]

Object

Required A "ScreenItem" object with the format "Gauge".

Double

Optional A value or a constant that specifies the diameter of the assumed circle on which the scale divisions are located.

Value range from 0 to 1

0: The scale divisions are located in the center of the scale.

1: The diameter of the assumed circle for the label is the scale divisions is the smaller value of the geometry properties ""Width" and "Height".

See also

Gauge (Page 4008)

ScaleTicks

Description

Defines the number of segments into which the bar will be subdivided by large tick marks of the scale:
0-100: Object can be divided into a maximum of 100 segments
= 0: The optimum number of segments is set automatically.

ScaleDenumerator

Description

Defines the counter for scaling on the client.

Syntax

Object.**ScaleDenumerator=[Int]**

Object

Required A "ScreenItem" object with the format "SmartClientView".

Int

Optional A value or a constant that specifies the value.

See also

SmartClientView (Page 4085)

Scaling

Description

TRUE, when a scale should also be used to represent a value. BOOLEAN write-read access.

See also

SmartClientView (Page 4085)

ScalingType

Description

Specifies the type of bar scaling.

Access in Runtime: Read and write

Syntax

Object.**ScalingType**[=BarScalingType]

Object

Required A "ScreenItem" object with the format "Bar"".

BarScalingType

Optional A value or a constant that specifies the type of bar scaling.

- hmiBarScalingLinear (0): Linear
  The large marks are distributed evenly over the scale. The distance between the large marks corresponds to the value of the "axis section" attribute.
- hmiBarScalingLogarithmic (1): Logarithmic
  The distribution of the large marks on the scale follows a logarithmic function.
  The reprsentation of low values is very strongly highlighted.
- hmiBarScalingNegativeLogarithmic (2): Negative logarithmic
  The distribution of the large marks on the scale follows a negative logarithmic function. The representation of high values is very strongly highlighted.
- hmiBarScalingAutomatic (3): Automatic
  The large marks are distributed evenly over the scale. The distance between the large marks is specified automatically.
- hmiBarScalingTangent (4): Tangents
  The distribution of the large marks on the scale highlights the representation of the low and high values.
- hmiBarScalingQuadratic(5): Square
  The distribution of the large marks follows a square function. The representation of high values is highlighted.
- hmiBarScalingCubic (6): Cubic
  The distribution of the large marks on the scale follows a cubic function. This highlights the representation of large values.

Comments

For the color to be displayed, the property "ShowScale" must have the value TRUE.

See also

Bar (Page 3961)

ScreenItems

Description

Returns the ScreenItems list.

Access in Runtime: Read

Syntax

Object.ScreenItems

Object

Required A "ScreenItems"." object.

ScreenName

Description

Defines the picture to be displayed in the picture window in Runtime or returns the picture name.

Note

Always enter picture names without the extension "PDL" for reasons of compatibility with future versions.

See also

ScreenWindow (Page 4078)

Screens

Description

Returns the Screens list. The Screens list contains two elements: The first element with the index 0 represents the permanent window. The second element with the index 1 represents the root screen. Alternatively, the two elements can be addressed by means of their names. Use "Overview" for the permanent window and "Base" for the root screen.

Note

The alarm window and the alarm indicator are not contained in the Screens list, even if they have the focus in Runtime.

Access in Runtime: Read

Syntax

Object.Screens

Object

Required A "Screens" object.

Scrollable

Description

Specifies whether the DXF screen display supports the Scroll functions in Runtime mode.

Access in Runtime: Read and write

Syntax

Object.**Scrollable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "DXFView".

BOOLEAN

Optional TRUE, if the DXF screen display supports the Scroll functions in Runtime mode.

ScrollBars

Description

TRUE, when the object is equipped with a scroll bar in Runtime. Read only access.

ScrollPositionX

Description

Specifies the horizontal positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

ScrollPositionY

Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

SecondNeedleHeight

Description

Specifies the length of the second hand in the "Clock" object.

Access in Runtime: Read and write

Syntax

Object.**SecondNeedleHeight**[= LONG]

Object

Required A ""ScreenItem" object with the format "Clock".

LONG

Optional A value or a constant that specifies the length of the second hand.

Specify the length of the second hand as a percentage relating to the radius of the clock face.

See also

Clock (Page 3984)

SecondNeedleWidth

Description

Specifies the width of the second hand in the "Clock" object.

Access in Runtime: Read and write

Syntax

Object.**SecondNeedleWidth**[= LONG]

Object

Required An object of the type "ScreenItem" with the definition "Clock".

LONG

Optional A value or a constant that specifies the width of the second hand. Specify the width as a percentage relating to double the length of the second hand.

See also

Clock (Page 3984)

SegmentColoring

Description

Specifies the type of color change that should be displayed in the "Bar" if the limits are exceeded.

Access in Runtime: Read and write

Syntax

Object.**SegmentColoring**[= THmiBarColorType]

Object

Required A "ScreenItem" object with the format "Bar".

THmiBarColorType

Optional A value or a constant that specifies the type of color change. Value range from 0 to 1.

hmiBarColorEntire (0): Color change applied to the entire bar.

hmiBarColorSegmented (1): Color change applied to segments.

See also

Bar (Page 3961)

SelBGColor

Description

Defines or returns the background color of the selected entry in a text list object. LONG write-read access.

SelectedText

Description

Shows the text defined with the "Selected field" (SelIndex) attribute which is highlighted in the combobox or list box.

See also

Listbox (Page 4027)

SelectBackColor

Description

Specifies the background color of the selected text entry for the selected object.

Access in Runtime: Read and write

Syntax

Object.**SelectBackColor**[=Color]

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

Color

Optional A value or a constant that specifies the background color of the selected text entry of the selected object.

See also

SymbolicIOField (Page 4093)

SelectedCellColor

Description

Specifies the background color of a selected cell. You open a color selection dialog box with the button.

Access in Runtime: Read and write

Syntax

Object.**SelectedCellColor**=[Color]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

Color

Optional A value or a constant which specifies the background color.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectedCellForeColor

Description

Specifies the font color of the selected cell. You open a color selection dialog box with the button.

Access in Runtime: Read and write

Syntax

Object.**SelectedCellForeColor**=[Color]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

Color

Optional A value or a constant which specifies the font color.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectedIndex

Description

Defines and returns the index of which the associated text is highlighted in the combobox or list box.

The maximum value is the number of lines (NumberLines) of the object.

See also

Listbox (Page 4027)

SelectedRowColor

Description

Specifies the background color of the selected line. You open a color selection dialog box with the button.

Access in Runtime: Read and write

Syntax

Object.**SelectedRowColor**[=Color]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

Color

Optional A value or a constant which specifies the background color.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectedRowForeColor

Description

Specifies the font color of the selected row. You open a color selection dialog box with the button.

Access in Runtime: Read and write

Syntax

Object.**SelectedRowForeColor**[=Color]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

Color

Optional A value or a constant which specifies the font color.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectedTitleColor

Description

Specifies the background color of a selected table header. You open a color selection dialog box with the button.

The settings are only active in Runtime if the "Marking color" option is enabled.

Access in Runtime: Read and write

Syntax

Object.**SelectedTitleColor**[=Color]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

Color

Optional A value or a constant which specifies the background color.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectedTitleForeColor

Description

Specifies the font color of the marked table header. You open the color selection dialog box with the button.

The setting is only effective in Runtime when the "Marking color" option is activated.

Access in Runtime: Read and write

Syntax

Object.**SelectedTitleForeColor**[=Color]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

Color

Optional A value or a constant which specifies the font color.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectForeColor

Description

Specifies the color of the selected text entry for the selected object.

Access in Runtime: Read and write

Syntax

Object.**SelectForeColor**[=Color]

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

Color

Optional A value or a constant that specifies the color of the selected text entry of the selected object.

See also

SymbolicIOField (Page 4093)

SelectionBackColor

Description

Specifies the background color of the selected cells.

Access in Runtime: Read and write

Syntax

Object.**SelectionBackColor**[= Color]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl", "StatusForce", "OnlineTrendControl", "AlarmControl", "UserView".

Color

Optional A value or a constant that sepcifies the background color of the selected row.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

TrendView (Page 4118)

SelectionBackColor

Description

Determines the background color of the selected cells.

Access during runtime: Read and Write

Syntax

Object.SelectionBackColor [= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView," "StatusForce", "MessageView" or "UserView".

Color

Optional A value or constant which determines the background color of the selected row.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

AlarmView (Page 3958)

RecipeView (Page 4068)

StatusForce (Page 4087)

UserView (Page 4137)

SelectionColoring

Description

Enables the use of selection colors for cells or rows.

Access in Runtime: Read and write

Syntax

Object.**SelectionColoring**[=GridSelectionColoring]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

GridSelectionColoring:

Value	Description	Description
0	None	No selection colors for cells and rows.
1	Cell	Selection color for cell.
2	Row	Selection color for row.
3	Cell and row	Selection colors for cell and row.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectionForeColor

Description

Specifies the foreground color of the selected cells.

Access in Runtime: Read and write

Syntax

Object.**SelectionForeColor**

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

Comments

You can use the "RGB" function to specify the color in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

TrendView (Page 4118)

SelectionForeColor

Description

Determines the foreground color of the selected cells.

Access during runtime: Read and Write

Syntax

Object.SelectionForeColor

Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView," "StatusForce", "MessageView" or "UserView".

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

AlarmView (Page 3958)

RecipeView (Page 4068)

StatusForce (Page 4087)

UserView (Page 4137)

SelectionMode

Description

Defines whether and how a message line can be selected.

.

Access in Runtime: Read and write

Syntax

Object.**SelectionMode**[=Mode]

Object

Required A "ScreenItem" object with the format "MessageView".

Mode

0 - NoSelection: Prevents the selection of a message. Acknowledgement affects the oldest pending message.

1 - Cell: Enables the selection of fields in the message line. Acknowledgement affects the selected message.

2 - Line: Enables the selection of a message line. Acknowledgement affects the selected message.

SelectionMode

Description

Specifies whether and how the alarm line can be selected.

Access in Runtime: Read and write

Syntax

Object.**SelectionMode**[=AlarmViewAdvancedSelectionMode]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

AlarmViewAdvancedSelectionMode

hmiAlarmViewAdvancedSelectionModeNone (0): Prevents the selection of an alarm. An acknowledgement always affects the oldest pending alarm.

hmiAlarmViewAdvancedSelectionModeCell (1): Enables the selection of fields in the alarm line. An acknowledgement always effects the selected alarm.

hmiAlarmViewAdvancedSelectionModeLine (2): Enables the selection of an alarm line. An acknowledgement always effects the selected alarm.

See also

AlarmControl (Page 3947)

SelectionRect

Description

Enables the use of a selection border for selected cells or rows.

Access in Runtime: Read and write

Syntax

Object.**SelectionRect**[=GridSelectionBorder]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

GridSelectionBorder.

Value	Description	Description
0	None	No selection border is drawn for selected cells or rows.
1	Cell	A selection border is drawn for the selected cell.
2	Row	A selection border is drawn for the selected row.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectionRectColor

Description

Specifies the color of the rectangle in the message window if SelectionType equals "1".

Access in Runtime: Read and write

Syntax

Object.**SelectionRectColor**[=Color]

Object

Required A "ScreenItem" object with the format "MessageView".

Color

Optional A value or a constant which specifies the color.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectionRectWidth

Description

Specifies the line width of the selection rectangle in the message window when the the SelectionType is "1".

Access in Runtime: Read and write

Syntax

Object.**SelectionRectWidth**[=Int]

Object

Required A "ScreenItem" object with the format "MessageView".

Int

Optional A value or a constant which specifies the line width.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SelectionType

Description

Specifies the number of lines you can mark.

The following settings are available:

Value	Description	Explanation
0	None	No line is marked.
1	Single selection	One line can be marked.
2	Multiple selection	Several lines can be marked.

The attribute can be made dynamic with the name SelectionType. The data type is LONG.

SelTextColor

Description

Defines or returns the color of the text of the selected entry in the text list object. LONG write-read access.

SeparatorBackColor

Description

Specifies the background color of the broken separation lines in the selection list of the specified object.

Access in Runtime: Read and write

Syntax

Object.**SeparatorBackColor**[=Color]

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

Color

Optional A value or a constant that specifies the background color of the broken separation lines in the selection list of the specified object.

See also

SymbolicIOField (Page 4093)

SeparatorColor

Description

Specifies the color of the separation lines in the selection list of the specified object.

Access in Runtime: Read and write

Syntax

Object.**SeparatorColor**[=Color]

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

Color

Optional A value or a constant that specifies the color of the separation lines in the selection list of the specified object.

See also

SymbolicIOField (Page 4093)

SeparatorCornerStyle

Description

Specifies the shape of the corners for the object of the type "ScreenItem" with the format "SymbolicIOField".

See also

SymbolicIOField (Page 4093)

SeparatorStyle

Description

Specifies the line style of the separation lines in the selection list of the selected object.

Access in Runtime: Read and write

Syntax

Object.**SeperatorStyle**[=LineStyle]

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

LineStyle

hmiLineStyleNone (-1): The selection list has no separation lines.

hmiLineStyleSolid (0): The selection list has solid separation lines.

hmiLineStyleDash (1): The selection list has broken separation lines.

hmiLineStyleDot (2): The selection list has dotted separation lines.

hmiLineStyleDashDot (3): The selection list has dash - dot lines as separation lines.

hmiLineStyleDashDotDot (4): The selection list has dash - dot - dot lines as separation lines.

See also

SymbolicIOField (Page 4093)

SeparatorWidth

Description

Specifies the width of the separation lines in the selection list of the specified object.

Access in Runtime: Read and write

Syntax

Object.**SeparatorWidth**[=Int]

Object

Required A "ScreenItem" object with the format "SymbolicIOField"".

Int

Optional A value or a constant that specifies the width of the separation lines in the selection list of the specified object.

See also

SymbolicIOField (Page 4093)

SeperatorLineEndShapeStyle

Description

Specifies the shape of the line ends for the object of the type "ScreenItem" with the format "SymbolicIOField".

See also

SymbolicIOField (Page 4093)

ServerScale

Description

Establishes whether the Sm@rtClient view should be zoomed in or out.

Syntax

Object.**ServerScale =[Int]**

Object

Required A "ScreenItem" object with the format "SmartClientView".

Int

Optional A value or a constant that specifies the value.

See also

SmartClientView (Page 4085)

ServerNames

Description

Specifies the servers of a distributed system from which the message view draws data. The information is given in form of: NameServer1;NameServer2;NameServer3.

Access in Runtime: Read-only

Syntax

Object.**ServerNames**[=String]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl" or "UserName".

String

Optional A value or a constant that specifies the server of a distributed system from which the alarm window receives information.

See also

AlarmControl (Page 3947)

ServerPrefix

Description

Defines the server containing the picture to be displayed in the picture window in Runtime or returns the server name.
Enter the server name followed by two colons: "<Servername>::". No check is made as to whether the server actually exists.

SetAllAssignment

Description

Sets all entries.

SetSelection

Description

Sets a list of the lines which are selected.

SetpointTrendArchiveStartId(i)

Description

Specifies the starting position from which the values of the setpoint trend will be read from the recipe. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

Syntax

Object.**SetpointTrendArchiveStartId**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the starting position from which the values of the setpoint trend will be read from the recipe.

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 4004)

SetpointTrendColor(i)

Description

Specifies the color of a setpoint trend. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

Syntax

Object.**SetpointTrendColor**(i)[=Color]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

Color

Optional A value or a constant that specifies the color of a setpoint trend.

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 4004)

SetpointTrendNumberOfValues(i)

Description

Specifies the number of value pairs of a setpoint trend. Whether the information is evaluated depends on the value of the property "ShowSetpointTrend(i)".

Access in Runtime: Read and write

Syntax

Object.**SetpointTrendNumberOfValues**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the number of value pairs of a setpoint trend.

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 4004)

SetProps

Description

Sets the value of the property.

ShareTimeAxis

Description

Specifies whether the trends of a trend window are displayed with a shared X axis.

Access in Runtime: Read and write

Syntax

Object.**ShareTimeAxis**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional. TRUE, if the trends of the trend window are displayed with a shared X axis.

See also

OnlineTrendControl (Page 4045)

ShareTimeColumn

Description

Specifies whether a shared time column will be used in the table window.

Access in Runtime: Read and write

Syntax

Object.**ShareTimeColumn**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE, if a shared time column will be used in the table window.

See also

OnlineTableControl (Page 4037)

ShareValueAxis

Description

Specifies whether the trends of a trend window are displayed with a shared Y axis.

Access in Runtime: Read and write

Syntax

Object.**ShareValueAxis**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrendControl".

BOOLEAN

Optional TRUE, if the trends of the trend window are displayed with a shared Y axis.

See also

OnlineTrendControl (Page 4045)

ShareXAxis

Description

Specifies whether the trends of a trend window are displayed with a shared X axis.

Access in Runtime: Read and write

Syntax

Object.**ShareXAxis**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the trends of the trend window are displayed with a shared X axis.

See also

FunctionTrendControl (Page 4004)

ShareYAxis

Description

Specifies whether the trends of a trend window are displayed with a shared Y axis.

Access in Runtime: Read and write

Syntax

Object.**ShareYAxis**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the trends of the trend window are displayed with a shared Y axis.

See also

FunctionTrendControl (Page 4004)

Shared

Description

Specifies that an HMI device is shared by several Sm@rtClient Views.

Syntax

Object.**Shared**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "SmartClientView".

See also

SmartClientView (Page 4085)

ShiftDecimalPointReadOnlySpecial

Description

Specifies that the "Shift decimal point" field can only be read.

Access in Runtime: Read and write

Syntax

Object.**ShiftDecimalPointReadOnlySpecial**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the "Shift decimal point" field can only be read.

See also

IOField (Page 4021)

ShortenCellText

Description

Specifies whether the content of the fields of an alarm line should be shortened if the column width is too small.

Access in Runtime: Read and write

Syntax

Object.**ShortenCellText**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the content of the fields of an alarm line should be shortened if the column width is too small.

See also

AlarmControl (Page 3947)

ShortenColumnHeaderText

Description

Specifies whether the content of the fields of a title line should be shortened if the column width is too small.

Access in Runtime: Read and write

Syntax

Object.**ShortenColumnHeaderText**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the content of the fields of a title line should be shortened if the column width is too small.

See also

AlarmControl (Page 3947)

ShowAlarmsFromDate

Description

Specifies that only those message events are displayed that are saved in this tag.

Access in Runtime: Read and write

Syntax

Object.**ShowAlarmsFromDate**[=Tag]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

Tag

Optional A value or a constant which specifies that only those message events are displayed that are saved in this tag.

See also

AlarmView (Page 3958)

ShowBadTagState

Defines whether the object is grayed out when a bad QualityCode or tag status is detected.

Yes	If the quality code or the the tag status are poor, the object is grayed out or the settings for the grid color are used.
No	If the quality code or the the tag status are poor, the object is not grayed out or the settings for the grid color are not used.

CheckBox (Page 3974)

Bar (Page 3961)

WindowSlider (Page 4139)

SymbolicIOField (Page 4093)

IOField (Page 4021)

OptionGroup (Page 4054)

ShowBar

Description

Specifies whether the displayed process value in the "Slider" object is also shown by a filled bar.

Access in Runtime: Read and write

Syntax

Object.ShowBar

Object

Required A "ScreenItem" object with the format "Slider".

Optional TRUE, if the process value is also shown by a filled bar.

See also

Slider (Page 4082)

ShowBorder

Description

Specifies whether the window will be shown with a border.

Access in Runtime: Read and write

Syntax

Object.**ShowBorder[**=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE if the window is to be shown with a border.

ShowCaption

Description

Specifies whether the title line is hidden or shown.

+C1763

Access in Runtime: Read and write

Syntax

Object.**ShowCaption**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl","FunctionTrendControl", "OnlineTableControl", "AlamControl", "ScreenWindow", "ApplicationWindow" or "UserArchiveControl".

BOOLEAN

Optional TRUE, if the title line is shown.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

ScreenWindow (Page 4078)

ScriptDiagnostics (Page 4080)

ShowColumn(i)

Description

Specifies whether a column pair that is referenced via the "CurrentColumnIndex" property is shown.

Access in Runtime: Read and write

Syntax

Object.**ShowColumn**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

Optional TRUE, if a column pair that is referenced via the "CurrentColumnIndex" property is shown.

See also

OnlineTableControl (Page 4037)

ShowCurve(i)

Description

Specifies whether a trend that is referenced via the "CurrentCurveIndex" property is shown.

Access in Runtime: Read and write

Syntax

Object.**ShowCurve**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if a trend that is referenced via the "CurrentCurveIndex" property is shown.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ShowDecimalPoint

Description

Specifies whether the scale is identified with decimal figures (decimal point and one decimal place) or with whole integers.

Access in Runtime: Read and write

Syntax

Object.**ShowDecimalPoint**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Gauge".

BOOLEAN

Optional TRUE, if the scale is identified with decimal figures (decimal point and one decimal place).

See also

Gauge (Page 4008)

ShowFillLevel

Description

Specifies whether the selected object is filled.

Access in Runtime: Read and write

Syntax

Object.**ShowFillLevel**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "Rectangle", "Polygon", "TextField", "Button", "Roundbutton", "GraphicView", "Checkbox", "OptionGroup"" or "WindowSlider".".

BOOLEAN

Optional TRUE, if the selected object is filled.

See also

Ellipse (Page 3993)
Circle (Page 3977)
EllipseSegment (Page 3995)
CircleSegment (Page 3979)
Rectangle (Page 4072)
Polygon (Page 4057)
TextField (Page 4107)
Button (Page 3968)
GraphicView (Page 4014)
OptionGroup (Page 4054)
WindowSlider (Page 4139)

ShowFocusRectangle

Description

Specifies whether the button is given a selection border when it is activated in Runtime.
Access in Runtime: Read and write

Syntax

Object.**ShowFocusRectangle**[=BOOLEAN]

Object
Required A "ScreenItem" object with the format "Clock".

BOOLEAN
Optional TRUE, if the button is given a selection border when it is activated in Runtime.

See also

Clock (Page 3984)

ShowInputControls

Description

Establishes whether additional fields exist for entering the address and password.

Syntax

Object.**ShowInputControls**

Object

Required A "ScreenItem" object with the format "SmartClientView".

ShowLargeTicksOnly

Description

Defines or returns the length of the axis section in pixels.

See also

Bar (Page 3961)

ShowLimitMarkers

Description

Specifies whether the limit value is shown as a scale value.

Access in Runtime: Read and write

Syntax

Object.**ShowLimitMarkers**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the limit value is shown as a scale value.

See also

Bar (Page 3961)

ShowMainFrame

Description

Specifies whether the entire bar object is provided with a border.

Access in Runtime: Read and write

Syntax

Object.**ShowMainFrame**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Option TRUE, if the entire bar object is shown with a border.

See also

Bar (Page 3961)

ShowMessagesAtDate

Description

Determines at which time the alarms will be displayed.

Note

This function does not filter out alarms, it positions the display range of the alarm list as of the specified date.

Access during runtime: Read and Write

Syntax

Object.ShowMessagesAtDate [= DATE]

Object

Required. An object of the "MessageView" type.

Remarks

To assign SmartTags to the "ShowMessagesAtDate" property, you must formulate the assignment as follows:

```
'Example 1
HmiRuntime.Screens("Screen_1").ScreenItems("Alarm
view_1").ShowMessagesAtDate = SmartTags("intern_1").Value
'Example 2
HmiRuntime.Screens("Screen_1").ScreenItems("Alarm
view_1").ShowMessagesAtDate = CDate(SmartTags("intern_1"))
SmartTag "intern_1" must be of the "DateTime" type.
```

See also

AlarmView (Page 3958)

ShowOverflowIndicator

Description

Specifies whether an overflow indicator is shown when the process value exceeds or falls short of the limit value.

Access in Runtime: Read and write

Syntax

Object.**ShowOverflowIndicator**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""Bar".".

BOOLEAN

TRUE, if an overflow indicator is shown when the process value exceeds or falls short of the limit value.

See also

Bar (Page 3961)

ShowPeakValuePointer

Description

Specifies whether a slave pointer will be used for the selected object.

The slave pointer shows the maximum pointer deflection provided in Runtime while the process screen is loaded. If you reload the process screen, the slave pointer will be reset.

Access in Runtime: Read and write

Syntax

Object.**ShowPeakValuePointer**[= BOOLEAN]

Object

Required A "ScreenItem" object with the format "Gauge".

BOOLEAN

Optional TRUE, if the slave pointer is used.

See also

Gauge (Page 4008)

ShowPeakValuePointer

Description

Determines whether a pointer for the given object is to be used.

The pointer shows the maximum hand deflection in runtime as long as the process screen is loaded. When you reload the process screen, the pointer is reset.

Access during runtime: Read and Write

Syntax

Object.ShowPeakValuePointer [= BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the characteristic "Gauge".

BOOLEAN

Optional. TRUE, if the pointer is used.

ShowPosition

Description

Specifies whether the value of the current slider position should also be displayed numerically. The value is then displayed beneath the slider.

Access in Runtime: Read and write

Syntax

Object.**ShowPosition**[= BOOLEAN]

Object

Required A "ScreenItem" object with the format "Slider".

BOOLEAN

Optional TRUE, if the value is also shown.

See also

Slider (Page 4082)

ShowRowHeaders

Description

Specifies whether the message view contains a column with consecutive numbering of the existing messages.

Access in Runtime: Read and write

Syntax

Object.**ShowRowHeaders**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the message view contains a column with consecutive numbering of the existing messages.

See also

AlarmControl (Page 3947)

ShowRuler

Description

Specifies whether a scale division (help line) is displayed for an axis label of the object "OnlineTrendControl".

Access in Runtime: Read and write

Syntax

Object.**ShowRuler**[= BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the scale gradation is shown.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ShowRuler

Description

Determines whether a scale gradation (help lines) is expanded for the axis label of the object "TrendView".

Access during runtime: Read and Write

Syntax

Object.ShowRuler [= BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the characteristic "TrendView".

BOOLEAN

Optional. TRUE, if the scale gradation is shown.

See also

TrendView (Page 4118)

ShowRulerInAxis

Description

Enables the display of rulers in the time axis.

Access in Runtime: Read and write

Syntax

Object.**ShowRulerInAxis**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The rulers are also displayed in the time axes.

FALSE: The rulers are not displayed in the time axes.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

ShowScale

Description

Specifies whether the values will also be shown in a scale.

Access in Runtime: Read and write

Syntax

Object.**ShowScale**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the values will also be shown in a scale.

See also

Bar (Page 3961)

ShowScrollbars

Description

Scroll bars - ShowScrollbars

Enables the display of scroll bars.

Access in Runtime: Read and write

Syntax

Object.**ShowScrollbars**[=ShowScrollbars]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

ShowScrollbars

Value	Description	Explanation
0	no	The display of scroll bars is disabled.
1	as required	Scroll bars are displayed if space requirements of the control are greater than the actual display area.
2	always	The scroll bars are always displayed.

See also

ScreenWindow (Page 4078)

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

ShowSetpointTrend(i)

Description

Specifies whether a setpoint trend that belongs to a trend that is referenced via "CurrentCurveIndex" should be shown.

Access in Runtime: Read and write

Syntax

Object.**ShowSetpointTrend**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if a setpoint trend that belongs to a trend that is referenced via CurrentCurveIndex" should be shown.

See also

FunctionTrendControl (Page 4004)

ShowSortButton

Description

Enables the display of a sorting button above the vertical scroll bar. Click this sorting button to sort the selected column based on the configured sorting criteria. The sorting button is not displayed if the table does not contain a vertical scroll bar.

Access in Runtime: Read and write

Syntax

Object.**ShowSortButton**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

BOOLEAN

TRUE: The sorting key is displayed. You can sort the selected column.

FALSE: The sorting key is not displayed.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

ShowSortIcon

Description

Enables the display of the sorting icon.

Access in Runtime: Read and write

Syntax

Object.**ShowSortIcon**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

BOOLEAN

TRUE: The sorting icon is displayed.

FALSE: The sorting icon is not displayed.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

ShowSortIndex

Description

Specifies whether a sort index is displayed.

Access in Runtime: Read and write

Syntax

Object.**ShowSortIcon**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

BOOLEAN

TRUE: A sort index is displayed.

FALSE: A sort index is not displayed.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

ShowStatusBar

Description

Specifies whether the status bar is shown.

Access in Runtime: Read and write

Syntax

Object.**ShowStatusBar**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl" or "HTMLBrowser".

BOOLEAN

Optional TRUE, if the status bar is shown.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

HTMLBrowser (Page 4019)

MediaPlayer (Page 4030)

ShowTableGridlines

Description

Specifies whether the gridlines are shown in the table of the selected object.

Access in Runtime: Read and write

Syntax

Object.**ShowTableGridlines**[= BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "StatusForce", "OnlineTrendControl" or "UserView".

BOOLEAN

Optional TRUE, if gridlines are shown.

See also

TrendView (Page 4118)

ShowTableGridlines

Description

Determines whether gridlines are shown in the table of the given object.

Access during runtime: Read and Write

Syntax

Object.ShowTableGridlines [= BOOLEAN]

Object

Required. An object of the "ScreenItem" type with the characteristic "StatusForce".

BOOLEAN

Optional. TRUE, if gridlines are displayed.

See also

StatusForce (Page 4087)

UserView (Page 4137)

ShowThumb

Description

Specifies whether the slider of the "Slider" object will be displayed.

Access in Runtime: Read and write

Syntax

Object.**ShowThumb**[= BOOLEAN]

Object

Required A "ScreenItem" object with the format "Slider".

BOOLEAN

Optional TRUE, if the slider is shown.

See also

Slider (Page 4082)

ShowTickLabels

Description

Specifies whether the label is shown in the scale.

Access during runtime: Read and write

Syntax

Object.**ShowTickLabels**[= BOOLEAN]

Object

Necessary. A "ScreenItem" object with the formats "Bar" or "Slider".

BOOLEAN

Optional TRUE, if the label is shown.

Comments

The increments for the measured value are automatically established dependent upon the specified measurement range and the size of the object.

Used for the following object types:

Slider

See also

Bar (Page 3961)

Slider (Page 4082)

ShowTicks

Description

Specifies whether the marking lengths are shown in the scale of the selected object.

Access during runtime: Read and write

Syntax

Object.**ShowTicks**[= BOOLEAN]

Object

Necessary. A "ScreenItem" object with the formats "Clock" or "Slider".

BOOLEAN

Optional TRUE, if the marking lengths are shown.

Used for the following object types:

Slider

See also

Clock (Page 3984)

Slider (Page 4082)

ShowTitle

Description

Defines representation the Control window header.

Access in Runtime: Read and write

Syntax

Object.**ShowTitle**[=WindowHeaderStyle]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "FunctionTrendControl", "UserArchiveControl", "TrendRulerControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

WindowHeaderStyle

Value	Designation	Description
0	No	No window title.
1	Normal	The window title consists of a WinCC icon and text. The text is entered in the "Text" field.
2	Narrow	The window title consists only of text. The text is entered in the "Text" field.

See also

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

AlarmControl (Page 3947)

ShowToolBar

Description

Specifies whether the toolbar is shown.

Access in Runtime: Read and write

Syntax

Object.**ShowToolBar**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl" or "HTMLBrowser".

BOOLEAN

Optional TRUE, if a toolbar will be displayed.

See also

AlarmControl (Page 3947)

HTMLBrowser (Page 4019)

ShowTrendIcon

Description

Enables the display of an icon below the value axes. The icon indicates the trend currently displayed in the foreground.

Access in Runtime: Read and write

Syntax

Object.**ShowTrendIcon**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The icon is displayed.

FALSE: The icon is not displayed.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

ShowTrendIndicator

Description

Specifies whether the tendency (increasing or falling) of the measurement value that is to be monitored is shown with a small arrow.

Access in Runtime: Read and write

Syntax

Object.**ShowTrendIndicator**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the tendency (increasing or falling) of the measurement value that is to be monitored is shown with a small arrow.

See also

Bar (Page 3961)

ShowVerticalGridlines

Description

Specifies whether the columns of the message view are separated by vertical lines.

Access in Runtime: Read and write

Syntax

Object.**ShowVerticalGridlines**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the columns of the alarm window will be separated by vertical separation lines.

See also

AlarmControl (Page 3947)

ShowXValuesExponential(i)

Description

Specifies whether a value of the X coordinate is shown in exponential format. Whether the information is evaluated depends on the property "XAxisMode(i)".".

Access in Runtime: Read and write

Syntax

Object.**ShowXValuesExponential**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if a value of the X coordinate is shown in exponential format.

Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the X coordinate of the measurement value.

See also

FunctionTrendControl (Page 4004)

ShowYValuesExponential(i)

Description

Specifies whether a value of the Y coordinate is shown in exponential format. Whether the information is evaluated depends on the property "XAxisMode(i)". ".

Access in Runtime: Read and write

Syntax

Object.**ShowYValuesExponential**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if a value of the Y coordinate is shown in exponential format.

Comments

The parameter i indicates the number of the trend.

You use the function "Display value here" to view the Y coordinate of the measurement value.

See also

FunctionTrendControl (Page 4004)

SignificantMask property

Description

Is required in Runtime to display the active message class with the highest priority.
The value of the SignificantMask property represents an internal system output value does not require any specific configuration by the user. Updating is initiated in Runtime by clicking on the object.

Sizeable property

Description

TRUE, when it should be possible to change the size of the object in Runtime. BOOLEAN write-read access.

In the case of application window and picture window: Read only access

See also

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

AlarmControl (Page 3947)

SkinName

Description

The control style can be defined in this selection field.

Access in Runtime: Read and write

Syntax

Object.**SkinName**[=SkinName]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView", "RulerControl".

SkinName

The following settings are available:

Value	Designation	Description
	Project setting	The style corresponds to the project settings in WinCC Explorer.
0	Classic	"Classic" WinCC style
1	Standard	New WinCC V7 style

SmallChange

Description

Defines how many steps the controller can be moved with one mouse click or returns the value.

SmartTags

Description

Returns the SmartTags list.

Access in Runtime: Read

Syntax

Object.SmartTags

Object

Required A ""HMIRuntime" object.

Sort

Description

Specifies the sorting criteria in SQL syntax for the database.

Access in Runtime: Read and write

Syntax

Object.**Sort**[=String]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

String

Optional A value or a constant that specifies the sort criteria in SQL syntax for the database.

SortByTimeDirection

Description

Specifies whether the last incoming message is shown at the top of the "AlarmControl" object (ascending sorting order).

Access in Runtime: Read and write

Syntax

Object.**SortByTimeDirection**[= BOOLEAN]

Object

Required A "ScreenItems" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the last incoming alarm is shown at the top.

See also

AlarmControl (Page 3947)

AlarmView (Page 3958)

SortByTimeEnable

Description

Specifies whether the sorting direction can be altered in Runtime.

Access in Runtime: Read and write

Syntax

Object.**SortByTimeEnable**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the sorting direction can be altered in Runtime.

See also

AlarmView (Page 3958)

SortByTimeEnabled

Description

Specifies whether the sorting of the messages can be altered according to the time in the "AlarmControl" object.

Access in Runtime: Read and write

Syntax

Object.**SortByTimeEnabled**[= BOOLEAN]

Object

Required A "ScreenItems" object with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the sorting can be altered by the device operator.

SortOnColumnHeaderClick

Description

Specifies whether the alarm text blocks can be sorted via the column header of the alarm text block.

Access in Runtime: Read and write

Syntax

Object.**SortOnColumnHeaderClick**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

BOOLEAN

Optional TRUE, if the message blocks can be sorted by the column header of the message blocks.

See also

AlarmControl (Page 3947)

SortSequence

Description

Specifies how to change the sorting order by mouse click.

Access in Runtime: Read and write

Syntax

Object.**SortSequence**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "RecipeView", "RulerControl".

BOOLEAN.

Value	Description	Description
0	Up/down/none	You can toggle between ascending, descending and no sorting by means of mouse click.
1	Up/down	You can toggle between ascending and descending sorting order by means of mouse click.

See also

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

SortTimeAscending

Description

Determines whether the last message received is displayed on top (ascending sorting order) in the "MessageView" object.

Access during runtime: Read and Write

Syntax

Object.SortTimeAscending [= BOOLEAN]

Object

Required. An object of the "MessageView" type.

BOOLEAN

Optional. TRUE, if the last message received is displayed on top.

SortTimeEnable

Description

Determines whether the sorting of messages can be changed according to time in the "MessageView" object.

Access during runtime: Read and Write

Syntax

Object.SortTimeEnable [= BOOLEAN]

Object

Required. An object of the "MessageView" type.

BOOLEAN

Optional. TRUE, if the sorting can be changed by the operator on the device.

StartAngle

Description

Specifies the angle at which the start point of the selected object deviates from the zero position (0°).

Access in Runtime: Read and write

Syntax

Object.**StartAngle**[=Int]

Object

Required A "ScreenItem" object with the formats "EllipseSegment", "CircleSegment", "EllipticalArc" or "CircularArc".

Int

Optional A value or a constant that specifies the angle at which the start point of the specified object deviates from the zero position (0°).

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

TubeArcObject (Page 4121)

StartPoint

Description

Specifies the beginning of the object or returns it.

StartPointLeft

Description

Specifies the horizontal distance in pixels from the left edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**StartPointLeft**[=Int]

Object

Required An object of the "ScreenItem type with the format "Line"".

Int

Optional A value that specifies the horizontal distance in pixels of the start point from the left edge of the screen.

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

StartStyle

Description

Specifies how the line-start style of the specified object will be displayed.

Access in Runtime: Read and write

Syntax

Object.**StartStyle**[= THmiLineEndStyle]

Object

Required A ""ScreenItem" object with the formats ""Line", "Polyline" or ""Connector".

THmiLineEndStyle

Optional A value or a constant that specifies the line-start style. Value range from 0 to 1.

hmiLineEndStyleNone (0): The line has no start symbol.

hmiLineEndStyleFilledArrow (2): The line starts with a filled arrowhead.

See also

Line (Page 4025)

Polyline (Page 4060)

Connector (Page 3986)

StartStyle

Description

Determines how the line start of the given object is displayed.

Access in Runtime: Read and write

Syntax

Object.StartStyle [= THmiLineEndStyle]

Object

Required An object of the "ScreenItem" type with the characteristic "Line," or "Polyline".

THmiLineEndStyle

Optional A value or constant which determines the line start. Value range from 0 to 2.

hmiLineEndStyleNone (0): The line has no start symbol.

hmiLineEndStyleFilledArrow (2): The line starts with a filled arrow.

StartTop

Description

Specifies the vertical distance in pixels of the start point from the upper edge of the screen.

Access in Runtime: Read and write

Syntax

Object.**StartTop**[=Int]

Object

Required An object of the "ScreenItem" type with the format "Line"".

Int

Optional A value that specifies the vertical distance in pixels of the start point from the upper edge of the screen.

See also

EllipseSegment (Page 3995)

CircleSegment (Page 3979)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

Line (Page 4025)

StartValue

Description

Defines the value of the zero point of the scale indicator.

Defines or returns the absolute value for the zero point.

See also

Bar (Page 3961)

State

Description

Returns the status of a message.

The following table shows the possible states of a message:

State	Alarm Log Status
1	Came In
2	Went Out
5	Came in and comment
6	Gone and comment

StatusbarBackColor

Description

Defines the background color of the status bar. You open a color selection dialog box with the button. Enable the "Display" option to active the setting.

AlarmControl (Page 3947)

StatusbarElementAutoSize

Description

Enables autosizing of the width of a status bar element selected.

Access in Runtime: Read and write

Syntax

Object.**StatusbarElementAutoSize**

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "FunctionTrendControl", "RecipeView", "RulerControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The width of the selected element is set automatically.

FALSE: The width of the selected element is not set automatically.

.

StatusbarElements

Description

Specifies the elements that are to be shown in the status bar.

Access in Runtime: Read and write

Syntax

Object.**StatusbarElements**[=Long]

Object

Required A "ScreenItem" object with the format "AlarmView".

Long

Optional A value or a constant that specifies the elements that are shown in the status bar.

See also

AlarmControl (Page 3947)

StatusbarElementUserDefined

Description

Indicates whether the project engineer has added the status bar element as a new custom element.

Access in Runtime: Read and write

Syntax

Object.**StatusbarElementUserDefined**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTrendControl", "OnlineTableControl", "FunctionTrendControl", "RecipeView", "RulerControl".

BOOLEAN

TRUE: The element of the status bar is customized.

FALSE: The element of the status bar is specified by the system.

StatusbarShowArchiveName

Description

Specifies whether the archive name will be displayed in the status bar.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowArchiveName**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the archive name will be displayed in the status bar.

StatusbarShowColumn

Description

Specifies whether the current number of selected data record columns will be displayed.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowColumn**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, specifies whether the current number of selected data record columns will be displayed.

StatusbarShowRecord

Description

Specifies whether the field coordinates of the selected data record will be displayed in the status bar.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowRecord**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the field coordinates of the selected data record will be displayed in the status bar.

StatusbarShowRow

Description

Specifies whether the current number of selected data record rows will be displayed.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowRow**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the current number of selected data record rows will be displayed.

StatusbarShowText

Description

Specifies whether the current status of the database will be displayed in the status bar.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowText**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, specifies whether the current status of the database will be displayed in the status bar.

StatusbarShowTooltips

Description

Enables the display of tooltips for the status bar elements in Runtime.

Access in Runtime: Read and write

Syntax

Object.**StatusbarShowTooltips**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "UserArchiveControl", "TrendRulerControl".

BOOLEAN

TRUE: The tooltips are displayed.

FALSE: The tooltips are not displayed.

StatusbarUseBackColor

Description

Sets a background color for the status bar.

Access in Runtime: Read and write

Syntax

Object.**StatusbarUseBackColor**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "UserArchiveControl", "TrendRulerControl".

BOOLEAN

TRUE: The background color of the status bar is displayed.

FALSE: The background color of the status bar is not displayed.

Style

Description

Specifies the line style of the selected object.

Access in Runtime: Read and write

Syntax

Object.**Style**[= THmiLineStyle]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "EllipticalArc", "CircularArc" or "Connector".

THmiLineStyle

Optional A value or a constant that specifies the line style. Value range from 0 to 4.

hmiLineStyleSolid (0): solid line

hmiLineStyleDash (1): broken line

hmiLineStyleDot (2): dotted line

hmiLineStyleDashDot (3): dash - dot line

hmiLineStyleDashDotDot (4): dash - dot - dot line

Default setting: hmiLineStyleSolid

See also

Line (Page 4025)

EllipticalArc (Page 3998)

CircularArc (Page 3982)

Connector (Page 3986)

Style

Description

Determines the line style of the given object.

Access during runtime: Read and Write

Syntax

Object.Style [= THmiLineStyle]

Object

Required. An object of the "screen item" type with the characteristic "Line," or "Polyline".

THmiLineStyle

Optional. A value or constant that defines the line style. Value range from 0 to 4.

hmiLineStyleSolid (0): solid line

hmiLineStyleDash (1): dashed line

hmiLineStyleDot (2): dotted line

hmiLineStyleDashDot (3): dash dot line

hmiLineStyleDashDotDot (4): dash dot dot line

Default setting: hmiLineStyleSolid

StyleSettings

Description

Defines the style in which the object is displayed.

User Defined	Shows the object according to the respective settings.
Global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

SwapDimensionsWithOrientation

Description

Specifies whether the values for the height and width of the bar should be automatically replaced if the bar alignment is changed.

Access in Runtime: Read and write

Syntax

Object.**SwapDimensionsWithOrientation**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the values for the height and width of the bar should be automatically replaced if the bar alignment is changed.

See also

Bar (Page 3961)

SwapFirstWithLastConnection

Description

Specifies whether the text in the object is shown horizontally.

Access in Runtime: Read and write

Syntax

Object.**SwapFirstWithLastConnection**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Connector".".

BOOLEAN

Optional TRUE, if the text in the object is shown horizontally.

See also

Connector (Page 3986)

Properties T

TableBackColor

Description

Specifies the background color of the table cells for the selected object.

Access in Runtime: Read and write

Syntax

Object.**TableBackColor**[= Color]

Object

Required An object of the "ScreenItem" type with the format "UserArchivControl", "StatusForce", "OnlineTrendControl", "AlarmControl" or "UserView".

Color

Optional A value or a constant that specifies the background color of the table cells.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

TableBackColor

Description

Determines the background color of the table cells of the given object.

Access during runtime: Read and Write

Syntax

Object.TableBackColor [= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView", "StatusForce", "TrendView", "MessageView" or "UserView".

Color

Optional A value or constant which determines the background color of the table cells.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

TableFocusOnButtonCommand

Description

Specifies whether by clicking on a Button in a script in Runtime the table of the Controls will be activated.

Access in Runtime: Read and write

Syntax

Object.**TableFocusOnButtonCommand**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmView".

BOOLEAN

Optional TRUE, if by clicking on a Button in a script in Runtime the table of the Controls will be activated.

See also

AlarmControl (Page 3947)

TableForeColor

Description

Specifies the font color of the rows. You open a color selection dialog box with the button.

TableForeColor

Description

Specifies the text color used in the table cells of the selected object.

Access in Runtime: Read and write

Syntax

Object.**TableForeColor**[= Color]

Object

Required A "ScreenItem" object with the formats "RecipeView", ""StatusForce", "MessageView" or ""UserView".

Color

Optional A value or a constant that specifies the text color used in the table cells.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

TableForeColor

Description

Determines the text color in the table cells of the given object.

Access during runtime: Read and Write

Syntax

Object.TableForeColor [= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView," "StatusForce", "MessageView" or "UserView".

Color

Optional A value or constant which determines the text color of the table cells.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

RecipeView (Page 4068)

StatusForce (Page 4087)

UserView (Page 4137)

TableForeColor2

Description

Specifies the font color of "Row color 2". You open a color selection dialog box with the button.

The settings are only active in Runtime if the "Row color 2" option is enabled. The font colors of "Row color 2" and "Row color 1" are used alternately in this case.

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

TableGridLineColor

Description

Specifies the color of the gridlines in the table of the selected object.

Access in Runtime: Read and write

Syntax

Object.**TableGridLineColor**[= Color]

Object

Required A "ScreenItem" object with the formats "RecipeView", "TrendView" or "UserView".

Color

Optional A value or a constant that specifies the color of the gridlines in a table.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

TableGridLineColor

Description

Determines the color of the gridlines in the table of the given object.

Access during runtime: Read and Write

Syntax

Object.TableGridLineColor [= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView," "MessageView", "TrendView" or "UserView".

Color

Optional A value or constant which determines the color of the gridlines of the table.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

TrendView (Page 4118)

UserView (Page 4137)

TableHeaderBackColor

Description

Specifies the background color in the header of the table of the selected object.

Access during runtime: Read and Write

Syntax

Object.**TableHeaderBackColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView", "StatusForce", "TrendView", "MessageView," or "UserView".

Color

Optional A value or a constant that specifies the background color in the header.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

TableHeaderForeColor

Description

Specifies the text color in the header of the table of the selected object.

Access during runtime: Read and Write

Syntax

Object.**TableHeaderForeColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristics "RecipeView", "StatusForce", "TrendView", "MessageView" or "UserView".

Color

Optional A value or a constant that specifies the text color in the header.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

RecipeView (Page 4068)

StatusForce (Page 4087)

TrendView (Page 4118)

TagName

Description

The "Index" property references a trend. "TagName" defines the tag linked to this trend. It is specified in the form "Archivname\Variablenname" to display tags in a process value archive or "TasgName" to display an internal or external tag which is not stored in an archive.

TagPrefix

Description

A tag prefix can be assigned for a screen window that is prefixed to all tags which are used in the screen. In this way, a picture that is embedded in a picture window retains access to its own tags while another accesses other tags.

The "TagPrefix" property specifies the prefix that is prefixed to all tags which are available in the screen.

The change to the tag prefix does not become effective until the screen is reloaded. This happens automatically when changing screens, otherwise the screen name must be reassigned.

The prefix is freely definable but must match the name of the structure tag.

Example

The "InOutput" screen should be displayed in the screen window. The "InOutput" screen contains 3 I/O fields which are bound to a structure tag. The structure tag consists of the elements EA1, EA2, EA3; one element each for every I/O field.

Three such structure tags with the structure names Struct1, Struct2 and Struct3 are defined in the project for example.

The tag prefix is the structure name with a following period in this case. If you specify Struct2., for example, as a tag prefix (the period is necessary to address the elements of the structure tags syntactically correctly as structure elements), the I/O fields in the "InOutput" screen are bound with the elements of structure tag Struct2:

Tag prefix: "Struct2."

- Output value (first I/O field): EA1
- Output value (second I/O field): EA2
- Output value (third I/O field): EA3

The current tag binding in the screen window is therefore

- Output value (first I/O field): Struct2.EA1
- Output value (second I/O field): Struct2.EA2
- Output value (third I/O field): Struct2.EA3

See also

ScreenWindow (Page 4078)

Tags

Description

Returns an object of type "Tags".

Access during runtime: Read

Syntax

Object.**Tags**

Object

Necessary. An object of the "HMIRuntime" type.

Example

The following example accesses the tag "Tag1":

```
'VBS86
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
```

See also

HMIRuntime (Page 3922)

Template

Description

Returns the template for displaying the window content of the "Application Window" object. Read only access.

The following templates are possible depending on the property value:

Window Contents = Global Script

"GSC diagnostics"
The application window is supplied by applications of the Global Script. The results of the diagnosis system are displayed.

"GSC Runtime"
The application window is supplied by applications of the Global Script. The analysis results regarding characteristics in Runtime are displayed.

Window Contents = Print Jobs

"All Jobs":
The application window is supplied by the logging system. The available reports are displayed as a list.

"All Jobs - Context Menu":
The application window is supplied by the logging system. The available reports are displayed as a list. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

"Job Detail View":
The application window is supplied by the logging system. The available reports are displayed in a selection menu. Detailed information is displayed for the selected report.

"Selected Jobs - Context Menu":
The application window is supplied by the logging system. The available reports are displayed as a list. This list only contains reports which you have activated the option "Mark for print job list" in the "Print Job Properties" dialog. The shortcut menu enables the selection of print options, display of a print preview as well as a printout of the log.

See also

ScriptDiagnostics (Page 4080)

Text

Description

Specifies the labeling for the text field.

Access in Runtime: Read and write

Syntax

Object.**Text**[= STRING]

Object

Required A "ScreenItem" " object with the formats "TextField", "CheckBox" or "OptionGroup".

STRING

Optional A value or a constant that specifies the labeling.

See also

TextField (Page 4107)

CheckBox (Page 3974)

OptionGroup (Page 4054)

MultiLineEdit (Page 4032)

Listbox (Page 4027)

RoundButton (Page 4074)

Text

Description

Determines the labeling of the text field.

Access during runtime: Read and Write

Syntax

Object.Text [= STRING]

Object

Required. An object of the "ScreenItem" type with the characteristic "TextField".

STRING

Optional. A value or constant which determines the label text color.

TextList

Description

A list which contains the assignments between the output value and the output text actually to be output. The assignments are dependent on the set list type. You determine the list type with the ListType property.

Access in Runtime: Read

Syntax

Object.**TextList**

Object

Required A "ScreenItem" object with the format "SymbolicIOField".

See also

Button (Page 3968)

SymbolicIOField (Page 4093)

TextOff

Description

Specifies the text that will be displayed in the status "off" of the selected object.

Access in Runtime: Read and write

Syntax

Object.**TextOff**[= STRING]

Object

Required A "ScreenItem" object with the formats "SymbolicIOField", ""Button" or "Switch".

STRING

Optional A value or a constant that specifies the labeling for the status "off".

Comments

The property is only available if the referenced object "SymbolicIOField", "Button" or "Switch" is type "Text".

See also

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

TextOff

Description

Determines the text which is displayed in the "Off" status of the given object.

Access during runtime: Read and Write

Syntax

Object.TextOff[= STRING]

Object

Required. An object of the "ScreenItem" type with the characteristic "Button," and "Switch".

STRING

Optional. A value or constant which determines the label for the "Off" status.

Remarks

The property is only available if the referenced "Button" or "Switch" object is of the "Text" type.

TextOn

Description

Specifies the text that will be displayed in the status "on" of the selected object.

Access in Runtime: Read and write

Syntax

Object.**TextOn**[= STRING]

Object

Required A "ScreenItem" object with the formats "SymbolicIOField", "Button" or ""Switch".

STRING

Optional A value or a constant that specifies the labeling for the status "on".

Comments

The property is only available if the referenced object "Button" or Switch" is type ""Text".

See also

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

TextOn

Description

Determines the text which is displayed in the "On" status of the given object.

Access during runtime: Read and Write

Syntax

Object.TextOn[= STRING]

Object

Required. An object of the "ScreenItem" type with the characteristic "Button," and "Switch".

STRING

Optional. A value or constant which determines the label for the "On" status.

Remarks

The property is only available if the referenced "Button" or "Switch" object is of the "Text" type.

TextOrientation

Description

Specifies the text direction (orientation) of the selected object.

Access in Runtime: Read and write

Syntax

Object.**TextOrientation**[=TextOrientation]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "Button", "Switch", "Bar", "OnlineTrendControl", "FunctionTrendControl", "Checkbox", "OptionGroup" or "WindowSlider".

TextOrientation

hmiTextHorizontal (0): The text is shown horizontally.

hmiTextRotated90Degree (-1): The text is shown vertically and left justified.

hmiTextRotated270Degree (1): The text is shown vertically and right justified.

See also

CheckBox (Page 3974)

Button (Page 3968)

RoundButton (Page 4074)

Switch (Page 4089)

SymbolicIOField (Page 4093)

IOField (Page 4021)

TextField (Page 4107)

OptionGroup (Page 4054)

ThumbBackColor

Description

Specifies the background color of the slider in the ""Slider" object.

Access in Runtime: Read and write

Syntax

Object.**ThumbBackColor**[= Color]

Object

Required A "ScreenItem" object with the formats ""Slider" or "WindowSlider".".

Color

Optional A value or a constant that specifies the background color of the slider.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Slider (Page 4082)

WindowSlider (Page 4139)

ThumbBackColor

Description

Determines the background color of the slider in the "Slider" object.

Access during runtime: Read and Write

Syntax

Object.ThumbBackColor[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Slider".

Color

Optional A value or constant which determines the background color of the slider.

Comments

You can use the "RGB" function to establish the colors in the RGB format (red, green, blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

TicksColor

Description

Specifies the color of the hour markers on the face of the "Clock" object.

Access during runtime: Read and Write

Syntax

Object.**TicksColor**[= Color]

Object

Required An object of the "ScreenItem" type with the characteristic "Clock".

Color

Optional A value or a constant that specifies the color of the hour markers.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255).

For example, the color "red" is shown as: RGB(255, 0, 0). You can also use the VBScript color constants such as vbRed or vbGreen.

See also

Clock (Page 3984)

TickStyle

Description

Specifies the scale display.

Access during runtime: Read and write

Syntax

Object.**TickStyle**[=SliderTickStyle]

Object

Necessary. A "ScreenItem" object with the format "Slider"".

SliderTickStyle

hmiSliderTickStyleNone (0): The object has no scale.

Identifies no strokes.

hmiSliderTickStyleEffect1 (1): The scale consists of main gradations only. The scale is black on a white background.

Identifies main strokes (black-white).

hmiSliderTickStyleEffect2 (2): The scale consists of main gradations only. The scale is white on a black background.

Identifies main strokes (white-black).

hmiSliderTickStyleNormal (3): The scale consists of simple gradations.

Identifies normal strokes.

Comments

Because of the automatic scaling it is possible that in some parts two marking lengths of the scale can be positioned directly adjacent to one another (looks like a wider marking length). You can correct this effect by slightly lengthening or shortening the slider object.

You you can also completely suppress the display of the scale ("WithAxes").

Used for the following object types:

Slider

Slider (Page 4082)

TimeAxisBeginTime(i)

Description

Specifies the start time of the display for the selected trend. Whether the information that is evaluated should be dependent on the properties ""UseTimeRange(i)" and "ShareTimeAxis".

Access in Runtime: Read and write

Syntax

Object.**TimeAxisBeginTime**(i)[=Time]

Object

Required A "ScreenItem" object with the format "OnlineTrend"".

Time

Optional A value or a constant that specifies the start time of the display for the selected trend.

See also

OnlineTrendControl (Page 4045)

TimeAxisEndTime

Description

Specifies the end time of the display for the selected trend. Whether the information is evaluated depends on the properties "Autorange", "UseTimeRange(i)" " and "ShareTimeAxis".

Access in Runtime: Read and write

Syntax

Object.**TimeAxisEndTime**[=Time]

Object

Required A "ScreenItem" object with the format "OnlineTrend".

Time

Optional A value or a constant that specifies the end time of the display for the selected trend.

See also

OnlineTrendControl (Page 4045)

TimeAxisLabel(i)

Description

Specifies the labeling of the time axis. Whether the information is evaluated depends on the property "ConfigureTimeAxis(i)".

Access in Runtime: Read and write

Syntax

Object.**TimeAxisLabel**(i)[=String]

Object

Required A "ScreenItem" object with the format "OnlineTrend".

String

Optional A value or a constant that specifies the labeling of the time axis.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

TimeAxisRange

Description

Time span that will be displayed by the time axis.

Access in Runtime: Read and write

Syntax

Object.**TimeAxisRange**[=Decimal]

Object

Required A "ScreenItem" object with the format "TrendView".

Decimal

Optional Time span that will be displayed by the time axis.

See also

TrendView (Page 4118)

TimeAxisShowGridLines(i)

Description

Specifies whether the trend window is shown with grid lines that run parallel to the x axis.

Access in Runtime: Read and write

Syntax

Object.**TimeAxisShowGridLines**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrend".

BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the x axis.

Comments

The distance between two grid lines can be altered with the "TimeAxisGridLineInterval(i)" property.

See also

OnlineTrendControl (Page 4045)

TimeAxisShowLargeIncrements(i)

Description

Specifies whether the time axis is scaled with long marking lengths.

Access in Runtime: Read and write

Syntax

Object.**TimeAxisShowLargeIncrements**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrend".

BOOLEAN

Optional TRUE, if the time axis is scaled with long marking lengths.

Comments

The distance of two long marking lines can be altered with the ""TimeAxisLargeIncrementSize(i) property.

See also

OnlineTrendControl (Page 4045)

TimeAxisShowSmallIncrements(i)

Description

Specifies whether the time axis is scaled with short marking lengths.

Access in Runtime: Read and write

Syntax

Object.**TimeAxisShowSmallIncrements**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTrend".

BOOLEAN

Optional TRUE, if the time axis is scaled with short marking lengths.

Comments

The distance of two short marking lines can be altered with the "TimeAxisSmallIncrementSize(i)" property.

See also

OnlineTrendControl (Page 4045)

TimeAxisTimeFormat(i)

Description

Specifies the format of the information along the time axis for the selected trend.

Access in Runtime: Read and write

Syntax

Object.**TimeAxisTimeFormat**(i)[=TimeFormat]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl","FunctionTrendControl" or "OnlineTableControl".

TimeFormat

(0): The information is carried out in the form hh:mm.

(1): The information is carried out in the form hh:mm:ss.

(2): The information is carried out in the form hh:mm:ss.ms.

(3): The information is carried out in the form hh:mm (full hours).

(4): The information is carried out in the form hh:mm:ss (full minutes).

(5): The information is carried out in the form hh:mm:ss:ms (full seconds).

(6): The information is carried out in the form dd_mm_yy_hh_mm.

(7): The information is carried out in the form dd_mm_yy_hh_mm (full hours).

(8): The information is carried out in the form dd_mm_yy.

(9): The information is carried out in the form dd_mm_yy_ (full days).

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

TimeBase

Description

Specifies the time zone in which the time values will be displayed.

Access in Runtime: Read and write

Syntax

Object.**TimeBase**[=TimeBase]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "OnlineTableControl", "AlarmControl" or "UserArchiveControl".

TimeBase

hmiTimeBaseLocalTimezone (0): Local time

hmiTimeBaseServerTimezone (1): Time zone of the server

hmiTimeBaseUTC (2): UTC (Universal Time Coordinated)

hmiTimeBaseProjectSetting (3): Project settings

Comments

Set the time mode in accordance with the computer settings on the properties page of the computer in WinCC Explorer. The following selection is offered:

TrendRulerControl (Page 4110)

TimeColumnActualize

Description

Enables the update of values in the selected column.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

TRUE: The time column is actualized.

FALSE: The time column is not actualized. This setting can be useful when comparing tables.

See also

OnlineTableControl (Page 4037)

TimeColumnAdd

Description

Creates a new time column.

Syntax

Object.**TimeColumnAdd**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnAlign

Description

Defines the mode of alignment of the time column selected.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnAlign**[=HorizontalAlignment]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

HorizontalAlignment

Value	Description	Description
0	left	The time column selected is displayed on the left.
1	Centered	The time column selected is aligned to center.
2	right	The time column selected is displayed on the right.

See also

OnlineTableControl (Page 4037)

TimeColumnAlignment(i)

Description

Specifies the alignment of the time column of a column pair i. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnAlignment**(i)[=AlignmentHorizontal]

Object

Required A "ScreenItem" object with the format "TableView".".

AlignmentHorizontal

hmiAlignmentLeft (0): The text is shown left justified.

hmiAlignmentCentered (1): The text is shown centered.

hmiAlignmentRight (2): The text is shown right justified.

See also

OnlineTableControl (Page 4037)

TimeColumnBackColor

Description

Specifies the background color of the time column selected. You open a color selection dialog box with the button.

The setting is useful if:

- The "Use value column colors" option is disabled
- The "Font color" option is set in the "Use column color" field of the "General" tab.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnBackColor**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnBeginTime

Description

Defines the start of the time range for a selected time column. .

Syntax

Object.**TimeColumnBeginTime**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnCaption

Description

Defines the caption of the time column.

Syntax

Object.**TimeColumnCaption**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnCount

Description

Defines the number of time columns configured.

Syntax

Object.**TimeColumnCount**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnDateFormat

Description

Defines the date format for visualizing a selected time column.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnDateFormat**[=DateFormat]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

DateFormat

Value	Description
Automatic	The date format is set automatically.
dd.MM.yy	Day.Month.Year, e.g. 24.12.10.
dd.MM.yyyy	Day.Month.Year, e.g. 24.12.2010.

Value	Description
dd/MM/yy	Day/Month/Year, e.g. 24/12/10.
dd/MM/yyyy	Day/Month/Year, e.g. 24/12/2010.

See also

OnlineTableControl (Page 4037)

TimeColumnEndTime

Description

Defines the end of the time range of a selected time column.

Syntax

Object.**TimeColumnBeginTime**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnForeColor

Description

Specifies the font color of the time column selected. You open a color selection dialog box with the button.

The setting is effective:

- When the option "in the colors of the value column" is not activated.
- When the "Font color" option is activated in the "Use column color" area of the "General" tab.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnForeColor**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnFormat(i)

Description

Specifies the format of the time columns for the selected column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnFormat**(i)[=TimeFormat]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

TimeFormat

(0): The information is carried out in the form hh:mm.

(1): The information is carried out in the form hh:mm:ss.

(2): The information is carried out in the form hh:mm:ss.ms.

(3): The information is carried out in the form hh:mm (full hours).

(4): The information is carried out in the form hh:mm:ss (full minutes).

(5): The information is carried out in the form hh:mm:ss:ms (full seconds).

(6): The information is carried out in the form dd_mm_yy_hh_mm.

(7): The information is carried out in the form dd_mm_yy_hh_mm (full hours).

(8): The information is carried out in the form dd_mm_yy.

(9): The information is carried out in the form dd_mm_yy_ (full days).

See also

OnlineTableControl (Page 4037)

TimeColumnHideText

Description

Sets text format for displaying the content of a time column.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

TRUE: The content is not shown as a text.

FALSE: The content is shown as a text.

See also

OnlineTableControl (Page 4037)

TimeColumnHideTitleText

Description

Sets text format for displaying the time column header.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

TRUE: The header is not shown as a text.

FALSE: The header is shown as a text.

See also

OnlineTableControl (Page 4037)

TimeColumnIndex

Description

References a configured time column. You can assign the values of other properties to a specific time column by using the property.

Valid values for "TimeColumnIndex" are between 0 and "TimeColumnCount" minus 1. The "TimeColumnCount" property indicates the number of configured time columns.

Syntax

Object.**TimeColumnIndex**

Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl"

See also

OnlineTableControl (Page 4037)

TimeColumnLength

Description

Specifies the width of a selected time column.

Syntax

Object.**TimeColumnLength**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnMeasurePoints

Description

Defines the number of measurement points to be displayed in the time column selected.

Syntax

Object.**TimeColumnMeasurePoints**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnName

Description

Specifies the name of a selected time column.

Syntax

Object.**TimeColumnName**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnRangeType

Description

Defines the time range setting for the time column selected.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnRangeType**[=TimeRangeType]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

TimeRangeType

Value	Description	Description
0	Time range	Defines the start time and time range of the time column.
1	Start to end time	Defines the start and end time for the time column.
2	Number of measurement points	Defines the start time and the number of measurement points for the time column.

OnlineTableControl (Page 4037)

TimeColumnRemove

Description

Removes the selected time column from the list.

Syntax

Object.**TimeColumnRemove**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnRename

Description

Changes the name of the time column which is referenced by the "TimeColumnIndex" property. With "TimeColumnRename" you also dynamize the "TimeColumnName" property.

Syntax

Object.**TimeColumnRename**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnRepos

Description

Repositions the order of time columns and of corresponding value columns. "Up" and "Down" move the time column selected up or down in the list. This moves the time column and corresponding value columns in the table towards the front or towards the back.

Syntax

Object.**TimeColumnRepos**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnShowDate

Description

Enables the display of the date and time in the time column selected.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnShowDate**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

TRUE: The date and the time are displayed. The date format is defined in the "Date format" field.

FALSE: The date is not displayed. Only the time is displayed.

See also

OnlineTableControl (Page 4037)

TimeColumnShowIcon

Description

Enables the display of time column contents as icon.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnActualize**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

TRUE: The content is shown as an icon.

FALSE: The content is not shown as an icon.

See also

OnlineTableControl (Page 4037)

TimeColumnShowTitleIcon

Description

Specifies whether the values of the selected column are updated.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnShowTitleIcon** [=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

TRUE: The header is shown as an icon.

FALSE: The header is not shown as an icon.

See also

OnlineTableControl (Page 4037)

TimeColumnSort

Description

Specifies how the time column referenced in "TimeColumnIndex" is sorted.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnSort** [=TimeColumnSort]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

TimeColumnSort

Value	Description	Description
0	no	No sorting
1	Ascending	Ascending order, starting at the lowest value.
2	Descending	Descending order, starting at the highest value.

.

See also

OnlineTableControl (Page 4037)

TimeColumnSortIndex

Description

Specifies the sorting order of the time column referenced in "TimeColumnIndex". If you set the value to "0", the sorting criterion is removed in "TimeColumnSort".

Syntax

Object.**TimeColumnSortIndex**

Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl"

See also

OnlineTableControl (Page 4037)

TimeColumnTimeFormat

Description

Defines the time format for visualizing a selected time column.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnTimeFormat**[=TimeFormat]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

TimeFormat

Value	Description
Automatic	The time format is set automatically.
HH:mm:ss.ms	Hours:Minutes:Seconds, e.g. 15:35:44.240.
hh:mm:ss tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44 PM.
hh:mm:ss.ms tt	Hours:Minutes:Seconds AM/PM, e.g. 03:35:44.240 PM.

See also

OnlineTableControl (Page 4037)

TimeColumnTimeRangeBase

Description

Defines the time unit for calculating the time range.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnTimeRangeBase**[=TimeRangeBase]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

TimeRangeBase

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

See also

OnlineTableControl (Page 4037)

TimeColumnTimeRangeFactor

Description

Defines the factor for calculating the time range. Only integer factors are valid.

Syntax

Object.**TimeColumnTimeRangeFactor**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeColumnUseValueColumnColors

Description

Defines whether the selected time column will be displayed in the value column colors.

Access in Runtime: Read and write

Syntax

Object.**TimeColumnUseValueColumnColors**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

BOOLEAN

TRUE: The selected time column is displayed in the colors of the value column. The settings in the "Font color" and "Background color" fields are disabled.

FALSE: The selected time column is displayed in the colors which are specified in the "Font color" and "Background color" fields.

See also

OnlineTableControl (Page 4037)

TimeColumnVisible

Description

The list shows the time columns you created. Select the time columns to be displayed in the table from the list.

Click a time column entry in the list to adapt the properties and to define the time range of the time column.

Syntax

Object.**TimeColumnVisible**

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

See also

OnlineTableControl (Page 4037)

TimeJumpColor(i)

Description

Specifies the color that is identified in the time jump available in the log. Whether the information is evaluated depends on the property "TimeJumpEnabled(i)".".

Access in Runtime: Read and write

Syntax

Object.**TimeJumpColor**(i)[=Color]

Object

Required A "ScreenItem"" object with the formats ""OnlineTrend" or ""TableView".".

Color

Optional A value or a constant that specifies the color that identifies the time jump available in the log.

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

TimeJumpEnabled(i)

Description

Specifies if the time jumps available in the log are identified in the color set up in "TimeJumpColor(i)".

Access in Runtime: Read and write

Syntax

Object.**TimeJumpEnabled**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend" or ""TableView".

BOOLEAN

Optional TRUE, if the time jumps available in the log are identified in the color specified in "TimeJumpColor(i)".

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

TimeOverlapColor(i)

Description

Specifies the color that is identified in the time overlap available in the log. Whether the information is evaluated depends on the attribute "TimeOverlapEnabled(i)".".

Access in Runtime: Read and write

Syntax

Object.**TimeOverlapColor**(i)[=Color]

Object

Required A "ScreenItem" object with the formats "OnlineTrend" or ""TableView".

Color

Optional A value or a constant that specifies the color that identifies the time overlap available in the log.

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

TimeOverlapEnabled(i)

Description

Specifies if the time overlaps available in the log are identified in the color set up in "TimeOverlapColor(i)".

Access in Runtime: Read and write

Syntax

Object.**TimeOverlapEnabled**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend"" or "TableView".

BOOLEAN

Optional TRUE, if the time jumps overlaps available in the log are identified in the color specified in ""TimeOverlapColor(i)"".

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

TimeRangeBase(i)

Description

Specifies the unit for determining the time interval of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**TimeRangeBase**(i)[=TagLoggingTimeUnit]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

TagLoggingTimeUnit

(1): The time intervals are set up in milliseconds.

hmiCurveTimeRangeBase500ms (500): The time intervals are set up in 500 ms.

hmiCurveTimeRangeBaseSecond (1000): The time intervals are set up in seconds.

hmiCurveTimeRangeBaseMinute (60000): The time intervals are set up in minutes.

hmiCurveTimeRangeBaseHour (3600000): The time intervals are set up in hours.

hmiCurveTimeRangeBaseDay (86400000): The time intervals are set up in days.

Comments

The time range to be displayed for the trend i is achieved by multiplying the values "TimeRangeBase(i)" and "TimeRangeFactor(i)", whereby the value of "TimeRangeBase(i)" is interpreted in milliseconds. The "TimeRangeBase(i" and "TimeRangeFactor(i)" properties are only evaluated if the "TimeRange" property has the value "-1".

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

TimeRangeFactor(i)

Description

Specifies the factor for determining the time interval of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**TimeRangeFactor**(i)[=Int]

Object

Required A "ScreenItem" object with the formats "OnlineTrend", "FunctionTrendView" or "TableView".

Int

Optional A value or a constant that specifies the factor for determining the time interval of the selected trend.

Comments

The time range to be displayed for the trend i is achieved by multiplying the values ""TimeRangeBase(i and "TimeRangeFactor(i)", whereby the value of "TimeRangeBase(i)" is

interpreted in milliseconds. The "TimeRangeBase(i" and "TimeRangeFactor(i)" " properties are only evaluated if the property "TimeRange" has the value "-1".

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

Timestamp

Description

Returns the time stamp of the last read access of a tag in local time as DATE.

Access in Runtime: Read

Syntax

Object.**TimeStamp**

Object

Required A "Tag" object.

Comments

To show the TimeStamp property in plain text, use the VBS function "FormatDateTime(Date[, NamedFormat])". The output is dependent on the language setting. To adjust the language, use the VBS function "SetLocale´()".

If you want to return the time stamp sorted by date, day and time, use the NamedFormat parameter or the VBS functions like Year, WeekDay, Day, Hour, Minute, Second. The name of a week day can be obtained using the VBS function WeekdayName.

Examples

The following example issues the time stamp of the tag "Tag11" with the aid of the function "FormatDateTime":

```
'VBS87
Dim objTag
Dim lngCount
lngCount = 0
Set objTag = HMIRuntime.Tags("Tag11")
objTag.Read
SetLocale("en-gb")
MsgBox FormatDateTime(objTag.TimeStamp)    'Output: e.g. 06/08/2002 9:07:50
```

```
MsgBox Year(objTag.TimeStamp)    'Output: e.g. 2002
MsgBox Month(objTag.TimeStamp)    'Output: e.g. 8
MsgBox Weekday(objTag.TimeStamp)    'Output: e.g. 3
MsgBox WeekdayName(Weekday(objTag.TimeStamp))    'Output: e.g. Tuesday
MsgBox Day(objTag.TimeStamp)    'Output: e.g. 6
MsgBox Hour(objTag.TimeStamp)    'Output: e.g. 9
MsgBox Minute(objTag.TimeStamp)    'Output: e.g. 7
MsgBox Second(objTag.TimeStamp)    'Output: e.g. 50
For lngCount = 0 To 4
MsgBox FormatDateTime(objTag.TimeStamp, lngCount)
Next
'lngCount = 0: Output: e.g. 06/08/2002 9:07:50
'lngCount = 1: Output: e.g. 06 August 2002
'lngCount = 2: Output: e.g. 06/08/2002
'lngCount = 3: Output: e.g. 9:07:50
'lngCount = 4: Output: e.g. 9:07
```

The following example issues the time stamp of the tag "Tag1":

```
'VBS88
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Read
MsgBox objTag.TimeStamp
```

Tag (Page 3941)

TitleBackColor

Description

Specifies the background color of the table headers for the selected status. You open a color selection dialog box with the button.

TitleCut

Description

Defines whether the content of the fields of a title bar should be shortened if the column width is too small. Write/Read access.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

TitleDarkShadowColor

Description

Specifies the color of the dark side of shading. You open a color selection with the button. The settings are only active if the "Shading Color" option is enabled.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

TitleForeColor

Description

Specifies the font color of the table headers for the selected status. You open a color selection dialog box with the button.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

TitleGridLineColor

Description

Defines the color of row/column dividers in the table header. You open a color selection dialog box with the button.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

TitleLightShadowColor

Description

Specifies the color of the bright side of shading. You open a color selection dialog box with the button. The setting is only effective when the "Shading color" option is activated.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

Titleline

Description

TRUE, when the control has a title bar and it can be moved in Runtime. BOOLEAN write-read access.

TitleSort

Description

Defines how to trigger sorting by column title. You can only sort by column title if the "Auto-scrolling" option is disabled.

Access in Runtime: Read and write

Syntax

Object.**TitleSort**[=GridSortTrigger]

Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl", "OnlineTrendControl", "MessageView", "RecipeView".

GridSortTrigger

Value	Description	Explanation
0	No	Sorting by column header is disabled.
1	With click	Sorting is triggered by clicking in the column header.
2	With double-click	Sorting is triggered by double-clicking in the column title.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

TitleStyle

Description

Specifies whether to set a shading color for the table header.

Access in Runtime: Read and write

Syntax

Object.**TitleStyle**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTableControl", "OnlineTrendControl", "MessageView", "RecipeView".

BOOLEAN

Value	Description	Description
0	Flat	Disables the use of shading colors. Flat header style.
1	Button	Enables the use of shading colors. 3D representation of the header.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

Toggle

Description

Specifies whether the selected object engages after it has been operated in Runtime.

Access in Runtime: Read and write

Syntax

Object.**Toggle**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""Roundbutton".".

BOOLEAN

Optional TRUE, if the selected object engages after it has been operated in Runtime.

See also

Button (Page 3968)

Tolerance

Description

Specifies the limit for the storage space display as of which a deviation will be reported.

Access in Runtime: Read and write

Syntax

Object.**Tolerance**[=Int]

Object

Required A "ScreenItem" object with the format "DiskSpaceView"".

Int

Optional A value or a constant that specifies the limit for the storage space display as of which a deviation will be reported.

See also

DiskSpaceView (Page 3991)

ToleranceColor

Description

Specifies the colors in which the bars of the storage space display will be shown as soon as the tolerance range is exceeded.

Access in Runtime: Read and write

Syntax

Object.**ToleranceColor**[=Color]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Color

Optional A value or a constant that specifies the colors in which the bars of the storage space display will be shown as soon as the tolerance range is exceeded.

See also

DiskSpaceView (Page 3991)

ToleranceHigh property

Description

Defines or returns the limit value for "Tolerance high".
The type of the evaluation (in percent or absolute) is defined in the "TypeToleranceHigh" property.
The monitoring of the limit value is only valid if the "CheckToleranceHigh" property is set to "TRUE".

ToleranceLow property

Description

Defines or returns the limit value for "Tolerance low".
The type of the evaluation (in percent or absolute) is defined in the "TypeToleranceLow" property.
The monitoring of the limit value is only valid if the "CheckToleranceLow" property is set to "TRUE".

ToleranceLowerLimit

Description

Specifies whether the "ToleranceLowerLimit"" limit is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**ToleranceLowerLimit**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies whether the limit "ToleranceLowerLimit" is monitored.

See also

Bar (Page 3961)

ToleranceLowerLimitColor

Description

Specifies the color for the lower limit "ToleranceLowerLimit"".

Access in Runtime: Read and write

Syntax

Object.**ToleranceLowerLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that specifies the color for the lower limit "ToleranceLowerLimit" ".

Comments

The "ToleranceLowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

See also

Bar (Page 3961)

ToleranceLowerLimitEnabled

Description

Specifies whether the "ToleranceLowerLimit" limit is to be monitored. The limit, the display when the limit has been reached, and the type of evaluation are set with the properties "ToleranceLowerLimit", "ToleranceLowerLimitColor" and "ToleranceLowerLimitRelative".

Access in Runtime: Read and write

Syntax

Object.**ToleranceLowerLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the "ToleranceLowerLimit" limit is to be monitored.

See also

Bar (Page 3961)

ToleranceLowerLimitRelative

Description

Specifies whether the lower limit "ToleranceLowerLimit" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

Syntax

Object.**ToleranceLowerLimitRelative**[=BOOLEAN]

Object

Required A ""ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the lower limit "ToleranceLowerLimit" is to be evaluated as a percentage or an absolute value.

See also

Bar (Page 3961)

ToleranceUpperLimit

Description

Specifies whether the "ToleranceUpperLimit" limit is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**ToleranceUpperLimit**[=Double]

Object

Required A "ScreenItem" object with the format ""Bar".

Double

Optional A value or a constant that specifies whether the limit "ToleranceUpperLimit" is monitored.

Comments

The following values will be specified with the properties "ToleranceUpperLimit", "ToleranceUpperLimitColor"" and "ToleranceUpperLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

ToleranceUpperLimitColor

Description

Specifies the color for the upper limit "ToleranceUpperLimit".

Access in Runtime: Read and write

Syntax

Object.**ToleranceUpperLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".".

Color

Optional A value or a constant that specifies the color of the upper limit "ToleranceUpperLimit"".

See also

Bar (Page 3961)

ToleranceUpperLimitEnabled

Description

Specifies whether the "ToleranceUpperLimit"" limit is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**ToleranceUpperLimitEnabled**[=BOOLEAN]

Object

Required A ""ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the "ToleranceUpperLimit" limit is to be monitored.

Comments

The following values will be specified with the properties "ToleranceUpperLimit",", "ToleranceUpperLimitColor" and "ToleranceUpperLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

ToleranceUpperLimitRelative

Description

Specifies whether the lower limit "ToleranzHigh"" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

Syntax

Object.**ToleranceUpperLimitRelative**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""Bar".

BOOLEAN

Optional TRUE, if the lower limt "ToleranzHigh" is to be evaluated as a percentage or an absolute value.

See also

Bar (Page 3961)

ToolbarAlignment

Description

Defines or returns the position of the toolbar. Write/Read access.

See also

ToolbarBackColor

Description

Background color - ToolbarBackColor

Specifies the background color of the toolbar. Open the "Color selection" dialog by clicking the button.

The background color you configured is only displayed if the "Display" option is enabled.

Access in Runtime: Read and write

Syntax

Object.**ToolbarBackColor**[=Color]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView".

Color

Optional A value or a constant which specifies the background color.

ToolbarButtonActive

Description

Activates a button function in Runtime. Clicking the button in Runtime triggers the corresponding function.

Access in Runtime: Read and write

Syntax

Object.**ToolbarButtonActive**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView".

BOOLEAN

TRUE: The function connected to the key is active.

FALSE: The function connected to the key is not active. You can connect your own functions to the key by local scripts.

ToolbarButtonBeginGroup

Description

Inserts a leading separator (vertical line) for the selected button function on the toolbar. These separators can be used to group the icons of the button functions.

Access in Runtime: Read and write

Syntax

Object.**ToolbarButtonBeginGroup**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView".

BOOLEAN

TRUE: The separator is inserted in front of the selected key function.

FALSE: The separator is not inserted in front of the selected key function.

ToolbarButtonUserDefined

Description

Indicates whether the project engineer has added a new user-defined toolbar button.

Syntax

Object.**ToolbarButtonUserDefined**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "FunctionTrendControl", "TrendRulerControl", "UserArchiveControl".

Boolean

TRUE: The key of the toolbar is customized.

FALSE: The key of the toolbar is specified by the system.

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

ToolbarShowTooltips

Description

Enables the display of tooltips for the button functions in Runtime. The property can be dynamized with the ToolbarShowTooltips name. The property for specifying the tooltip text is "ToolbarButtonTooltipText".

Access in Runtime: Read and write

Syntax

Object.**ToolbarShowTooltips**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "FunctionTrendControl", "RecipeView", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The tooltips are displayed.

FALSE: The tooltips are not displayed.

TrendRulerControl (Page 4110)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

OnlineTrendControl (Page 4045)

ToolbarUseBackColor

Description

Enables the display of the background color for a toolbar.

Access in Runtime: Read and write

Syntax

Object.**ToolbarUseBackColor**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "FunctionTrendControl", "RecipeView", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The background color of the toolbar is displayed.

FALSE: The background color of the toolbar is not displayed.

OnlineTrendControl (Page 4045)

ToolbarUseHotKeys

Description

Activates the hotkeys for button functions in Runtime. Insert the hotkeys for button functions in the "Hotkey" field.

Access in Runtime: Read and write

Syntax

Object.**ToolbarUseHotKeys**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "FunctionTrendControl", "RecipeView", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The hotkeys are activated.

FALSE: The hotkeys are not activated.

OnlineTrendControl (Page 4045)

ToolbarVisible

Description

Specifies whether the toolbar of the control is displayed.

Access in Runtime: Read and write

Syntax

Object.**ToolbarVisible**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "TrendRulerControl", "OnlineTableControl", "FunctionTrendControl", "UserArchiveControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The toolbar is displayed.

FALSE: The toolbar is not displayed.

OnlineTrendControl (Page 4045)

ToolbarVisible

Description

Enables the display of the Control toolbar.

Access in Runtime: Read and write

Syntax

Object.**ToolbarVisible**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "MessageView", "RulerControl", "OnlineTableControl", "OnlineTrendControl", "FunctionTrendControl", "RecipeView".

BOOLEAN

TRUE: The toolbar is displayed.

FALSE: The toolbar is not displayed.

ToolTipText

Description

Specifies the tooltip text.

Access in Runtime: Read and write

Syntax

Object.**ToolTipText**[=String]

Object

Required A "ScreenItem" object with the formats "Line", "Polyline", "Ellipse", "Circle", "EllipseSegment", "CircleSegment", "EllipticalArc", "CircularArc", "Rectangle", "Polygon", "TextField", "IOField", "SymbolicIOField", "Button", "Roundbutton", "Switch", "GraphicView", "GraphicIOField", "Bar", "StatusForce", "Checkbox", "OptionGroup", "WindowSlider", "OleView" or "Connector".

String

Optional A value or a constant that specifies the tooltip text.

Listbox (Page 4027)

Top

Description

Specifies the value of the Y coordinate of the selected object.

Access during runtime: Read and write

Syntax

Object.**Top**[= DOUBLE]

Object

Necessary. A "ScreenItem" object. This property is a standard property of the ScreenItem object and is therefore available for all formats.

DOUBLE

Optional A value or a constant that contains the value of the Y coordinate in pixels (measured from the top left edge of the screen).

Comments

The Y coordinate refers to the top left corner of the rectangle that surrounds the object. The screen limits are also monitored in runtime. If the assigned coordinate value exceeds the display size, the user-defined function is interrupted with an error message.

Used for the following object types:

IOField

Rectangle

Slider

TopConnectedConnectionPointIndex

Description

Specifies or sets the index number of the top connecting point.

LONG write-read access.

TopConnectedObjectName

Description

Specifies or sets the object name of the object which is docked on at the bottom connecting point.

LONG write-read access.

TopOffset

Description

Defines or returns the distance of the picture from the top edge of the picture window.

The picture is displayed as a cutout of the picture window. The picture scroll bars are located at the left and upper edge of the picture. If you wish to display the picture in the picture window by using the horizontal and vertical positioning of the picture scroll bars, use the properties "HorizontalScrollBarPosition" and "VerticalScrollBarPosition" for such positioning.

See also

ScreenWindow (Page 4078)

Total

Description

Returns the storage capacity.

Access in Runtime: Read and write

Syntax

Object.**Total**[=Double]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Double

Optional A value or a constant that returns the storage capacity.

See also

DiskSpaceView (Page 3991)

Transparency

Description

Defines and returns the percentage transparency of the object.

0 = no transparency; 100 = complete transparency (invisible)

The text and fields of the graphic objects are only transparent at "100."

In runtime, a completely transparent object (invisible) is also functional.

TransparentColor

Description

Specifies which color of the allocated graphic (*.bmp, *dib) of the specified object will be set to "transparent".

The "UseTransparentColor" property must have the value TRUE so that the color will be shown as transparent.

Access in Runtime: Read and write

Syntax

Object.**TransparentColor**[= Color]

Object

Required An object of type "ScreenItem" with the formats "GraphicView" or "GraphicIOField".

Color

Optional A value or a constant that specifies the color that will be shown transparent.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

GraphicView (Page 4014)

GraphicIOField (Page 4011)

UseTransparentColor (Page 4685)

TransparentColorDeactivatedPicture

Description

Specifies which color of the allocated bitmap object will be set to "transparent" for the status "disabled".

Access in Runtime: Read and write

Syntax

Object.**TransparentColorDeactivatedPicture**[=Color]

Object

Required A ""ScreenItem" object with the format ""Roundbutton".

Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to transparent" for the status "disabled".

Comments

The "PicDeactUseTransColor" property must have the value TRUE so that the color can be set to ""transparent".

TransparentColorPictureOff

Description

Specifies which color of the allocated bitmap object will be set to transparent" for the status "off".

Access in Runtime: Read and write

Syntax

Object.**TransparentColorPictureOff**[=Color]

Object

Required A "ScreenItem" object with the format "Roundbutton".

Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to transparent" for the status "off".

See also

Button (Page 3968)

TransparentColorPictureOn

Description

Specifies which color of the allocated bitmap object will be set to transparent" for the status "on".

Access in Runtime: Read and write

Syntax

Object.**TransparentColorPictureOn**[=Color]

Object

Required A "ScreenItem" object with the format "Roundbutton".

Color

Optional A value or a constant that specifies which color of the allocated bitmap object will be set to "transparent" for the status "on".

Comments

The "PicDownUseTransColor"" property must have the value TRUE so that the color can be set to "transparent".

See also

Button (Page 3968)

Trend

Description

TRUE, when the tendency (rising or falling) of the measuring value being monitored should be displayed by a small arrow. BOOLEAN write-read access.

TrendActualize

Description

Enables the update of a selected trend.

Access in Runtime: Read and write

Syntax

Object.**TrendActualize**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The selected trend is always actualized.

FALSE: The selected trend is not actualized. This setting is useful when a logged trend is compared with a current trend.

Description

Defines the end of the time range for data connections of a selected trend.

.

See also

FunctionTrendControl (Page 4004)

TrendExtendedColorSet

Description

Enables configuration of the point and fill colors and the display of colors in Runtime.

Access in Runtime: Read and write

Syntax

Object.**TrendExtendedColorSet**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The settings in the "Point color" and "Fill color" fields are configurable and effective in Runtime.

FALSE: The settings in the "Point color" and "Fill color" fields are not configurable and effective in Runtime.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendFill

Description

Specifies if the area beneath the trend is to be filled.

Access in Runtime: Read and write

Syntax

Object.**TrendFill**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The area beneath the trend is shown filled. You can define the trend color as fill color if the "Advanced" option is deactivated.

FALSE: The trend is not shown filled.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendFillColor

Description

Specifies the fill color of the trend. The settings are only active if the "Filled" option is enabled. Open the "Color selection" dialog by clicking the button.

The settings are only active if the "Advanced" option is enabled.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendIndex

Description

References a configured trend. You can assign the values of other properties to a specific trend by using the property. The index must always be set before you change the properties of a trend in runtime.

Valid values for "TrendIndex" are between 0 and "TrendCount" minus 1. The "TrendCount" property indicates the number of configured trends.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendIndicatorColor

Description

Specifies the color for the trend indicator. The trend indicator represents the tendency (increasing or falling) of the measurement value that is to be monitored with a small arrow. To activate the trend indicator, the property "ShowTrendIndicator" must have the value TRUE.

Access in Runtime: Read and write

Syntax

Object.**TrendIndicatorColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that specifies the color of the trend indicator.

See also

Bar (Page 3961)

TrendLabel

Description

Defines the label of the trend selected. The label is displayed in Runtime if the value at attribute "UseTrendNameAsLabel" is "FALSE".

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendLineStyle

Example

Defines the line style for trend visualization.

Access in Runtime: Read and write

Syntax

Object.**TrendLineStyle**[=LineStyle]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

LineStyle

Value	Description	Explanation
0	Solid	The trend is visualized as solid line.
1	Dashed	The trend is visualized as dashed line.
2	Dotted	The trend is visualized as dotted line.
3	Dash dot	The trend is visualized as dot-dash line.
4	Dash Dot Dot	The trend is visualized as dash-dot-dot line.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendLineType

Description

Defines how to visualize a trend.

Access in Runtime: Read and write

Syntax

Object.**TrendLineType**[=LineType]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

LineType

Value	Description	Explanation
0	None	Only the dots are displayed.
1	Line	Visualizes a trend with linear interconnection of points.
2	Stepped	Visualizes a stepped trend and its interconnected points.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendLineWidth

Description

Defines the line weight of the line displayed.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendLowerLimit

Description

Specifies the low limit of a tag. If the tag drops below the value of "TrendLowerLimit", the values are marked with the color set in "TrendLowerLimitColor". The specification is effective if the "TrendLowerLimitColoring" property has the value "TRUE".

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendLowerLimitColor

Description

Specifies the color which marks tag values which are below the value of "TrendLowerLimit". The setting is effective if the "TrendLowerLimitColoring" attribute has the value "TRUE".

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendLowerLimitColoring

Description

Enables the "TrendLowerLimitColor" attribute for identifying tag values which are less than the value at "TrendLowerLimitValue".

Syntax

Object.**TrendLowerLimitColoring** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Boolean

TRUE: The "TrendLowerLimitColor" property is effective.

FALSE: The "TrendLowerLimitColor" property is not effective.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendMeasurePoints

Number of measurement points - TrendMeasurePoints

Defines the number of measurement points for visualization of selected trends.

Defines the number of value pairs provided to the trend from a user archive.

The attribute can be assigned dynamic properties by means of the name **TrendMeasurePoints**.

See also

FunctionTrendControl (Page 4004)

TrendName

Description

Displays the name of the selected trend. The name is defined on the "Trends" tab. The "TrendName" property can be dynamized by the TrendRename property.

Access in Runtime: Read and write

Syntax

Object.**TrendName**

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendPointColor

Description

Defines the color of trend points. Open the "Color selection" dialog by clicking the button.

The settings are only active if the "Advanced" option is enabled.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendPointStyle

Description

Defines the dot style for trend visualization.

Access in Runtime: Read and write

Syntax

Object.**TrendPointStyle**[=PointStyle]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

PointStyle

Value	Description	Explanation
0	None	The points are not displayed.
1	Dots	The trend points are visualized with a size of one pixel. The setting in the "Dot width" field is deactivated.
2	Squares	The dots are displayed as square. The setting in the "Dot width" field is active.
3	Circles	The dots are displayed as circles. The setting in the "Dot width" field is active.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendPointWidth

Description

Sets the dot width in pixels. You can only define the dot width for the "square" and "circular" type.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendProvider

Description

Specifies the data source for a selected trend.

Access in Runtime: Read and write

Syntax

Object.**TrendProvider**[=Provider]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Provider

Value	Description	Explanation
0	None	No data source configured for implementation in Runtime by means of a user-defined function.
1	Archive tags	Data source with archive tags of a process value archive.
2	HMI tags	Data supply with tag values of HMI tags
3	Recipe data	Data supply with columns of a recipe

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendRangeType

Description

Defines the time range for providing data to the selected trend.

You can only define the number of measuring points if you select user archives as the data source.

Access in Runtime: Read and write

Syntax

Object.**TrendRangeType**[=RangeType]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

RangeType

Value	Description	Explanation
0	Time range	Defines the start time and the time range for the data connection.
1	Start to end time	Defines the start and end time for the data connection.
2	Number of measurement points	Defines the start time and the number of measurement points for the data connection.

See also

FunctionTrendControl (Page 4004)

TrendRemove

Description

Removes selected trends from the list.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendRename

Description

Changes the name of the trend which is referenced by the "TrendIndex" property.

With "TrendRename" you also dynamize the "TrendName" property.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendRepos

Description

Repositions the trend in the trend window. "Up" and "Down" move the selected trend up or down in the list. This moves the trend towards the foreground or background for visualization in Runtime.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendSelectTagNameX

Description

Opens the dialog box for selecting the tag name for the data supply of the X axis in the f(x) trend view. Programmers can use the property to let the user select a tag name with a button for example.

See also

FunctionTrendControl (Page 4004)

TrendSelectTagNameY

Description

Opens the dialog box for selecting the tag name for the data supply of the Y axis in the f(x) trend view. Programmers can use the property to let the user select a tag name with a button for example.

See also

FunctionTrendControl (Page 4004)

TrendTag

Description

Specifies which tag is linked with the selected trend.

You enter the value either in the form "archive name/tag name", to show tags of a process value archive, or in the form "tag name" to show an internal or an external tag that will now be saved in an archive.

Access in Runtime: Read and write

Syntax

Object.**TrendTag**[=HmiTag]

Object

Required A ""ScreenItem" object with the format "OnlineTrend".

HmiTag

Optional A value or a constant that specifies which tags are linked with the selected trend.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

TrendTagNameX

Description

Shows the name of the bound HMI tag or column for the X axis. You select an HMI tag or a column with the selection button.

Access in Runtime: Read and write

Syntax

Object.**TrendTagNameX**

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

See also

FunctionTrendControl (Page 4004)

TrendTagNameY

Description

Shows the name of the bound HMI tag or column for the Y axis. You select an HMI tag or a column with the selection button.

Access in Runtime: Read and write

Syntax

Object.**TrendTagNameX**

Object

Required. An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

See also

FunctionTrendControl (Page 4004)

TrendTimeRangeBase

Description

Defines the time unit for calculating the time range.

Access in Runtime: Read and write

Syntax

Object.**TrendTimeRangeBase**[=TimeRangeBase]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

TimeRangeBase

Value	Description
500	500 ms
1000	1 second
60000	1 minute
3600000	1 hour
86400000	1 day

See also

FunctionTrendControl (Page 4004)

TrendTimeRangeFactor

Description

Defines the factor for calculating the time range. Only integer factors are valid. .

See also

FunctionTrendControl (Page 4004)

TrendTrendWindow

Description

Defines the trend window for visualizing the trend selected. Define the available trend windows in the "Trend window" tab.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendUncertainColor

Description

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. With the "TrendUncertainColor" property you specify the color which is used for marking these values. Whether the information is evaluated depends on the "TrendUncertainColoring" property.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendUncertainColoring

Description

Value are in uncertain state if the initial value is unknown after runtime has been activated, or if a substitute value is used. The "TrendUncertainColoring" attribute is used to enable identification of such values based on the color set in "TrendUncertainColor".

Access in Runtime: Read and write

Syntax

Object.**TrendUncertainColoring**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The setting of the "TrendUncertainColor" property is effective.

FALSE: The setting of the "TrendUncertainColor" property is not effective.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendUpperLimit

Description

Specifies the high limit of a tag. If the tag drops below the value of "TrendUpperLimit", the values are marked by the color set in "TrendUpperLimitColor". The specification is effective if the "TrendUpperLimitColoring" attribute has the value "TRUE".

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendUpperLimitColor

TrendUpperLimitColor

Specifies the color of tag values which are less than the value at "TrendLowerLimit". This setting is only active if the value at attribute "TrendUpperLimitColoring" is "TRUE".

The attribute can be assigned dynamic properties by means of the name **TrendUpperLimitColor**.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendUpperLimitColoring

Description

Specifies whether the selection frame is shown with the specified color.

Access in Runtime: Read and write

Syntax

Object.**TrendUpperLimitColoring**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The setting of the "TrendUpperLimitColor" attribute is effective.

FALSE: The setting of the "TrendUpperLimitColor" attribute is not effective.

TrendWindowAdd

Description

Create a new trend view.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowCoarseGrid

Description

Enables the display of grid lines for the main scale.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowCoarseGrid**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The grid lines for the main scaling are displayed.

FALSE: The grid lines for the main scaling are not displayed.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowCoarseGridColor

Description

Specifies the grid color of the main scale. Open the "Color selection" dialog by clicking the button.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowFineGrid

Description

Enables the display of grid lines for the secondary scale.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowFineGrid**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The grid lines for the auxiliary scaling are displayed.

FALSE: The grid lines for the auxiliary scaling are not displayed.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowFineGridColor

Description

Specifies the grid color of the main scale. Open the "Color selection" dialog by clicking the button.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowForegroundTrendGrid

Description

Enables the display of grid lines only for the foreground trend in the trend window.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowForegroundTrendGrid**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The grid lines for the foreground trend are displayed.

FALSE: The grid lines for the foreground trend are not displayed.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowGridInTrendColor

Description

Sets the trend color for the visualization of the grid lines for the main scale.

Access in Runtime: Read and write

Syntax

Object.**AutoSelectionRectColors** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The grid lines are displayed in the trend color.

FALSE: The grid lines are displayed with the color set in the "Color" field.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowHorizontalGrid

Description

Enables the display of horizontal grid lines.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowHorizontalGrid**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The horizontal grid lines are displayed.

FALSE: The horizontal grid lines are not displayed.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowIndex

Description

References a configured trend view. You can assign the values of other properties to a specific trend window by using the property.

Valid values for "TrendWindowIndex" are between 0 and "TrendWindowCount" minus 1. The "TrendWindowCount" property indicates the number of configured trend windows.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowName

Description

Defines the name of the trend window selected.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowRemove

Description

Removes the selected trend view from the list.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowRename

Description

Changes the name of the trend window which is referenced by the "TrendWindowIndex" property.

With "TrendWindowRename" you also dynamize the "TrendWindowName" property.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowRepos

Description

Changes the order of the trend view. "Up" and "Down" move the selected trend up or down in the list.

The sorting order in the list defines the position in the Control. The first trend view is shown in the lowest position, the last trend view in the highest position.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowRulerColor

Description

Specifies the ruler color. Open the "Color selection" dialog by clicking the button.

The color can be configured and displayed if "1 - graphic" is set for visualization.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowRulerLayer

Description

Specifies the display layer of the ruler in the trend view.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowRulerLayer**[=RulerLayer]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

RulerLayer

Value	Description	Explanation
0	Under grid	The ruler is visualized on a layer under the grid.
1	Between grid and trend	The ruler is positioned on top of the trend and under the grid.
2	On top of trend	The ruler is positioned on top of the trend.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowRulerStyle

Description

Defines the appearance of the ruler.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowRulerStyle** [=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl", (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The ruler is displayed as a single black line.

FALSE: The ruler is is displayed in the configured "Color" and "Width".

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowRulerWidth

Description

Defines the width of the ruler in pixels.

The width can be configured and displayed if "1 - graphic" is set for visualization.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowSpacePortion

Description

Specifies the proportion of the trend widow to be used for the selected curve.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowVerticalGrid

Description

Enables the display of vertical grid lines.

Access in Runtime: Read and write

Syntax

Object.**TrendWindowVerticalGrid**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The vertical grid lines are displayed.

FALSE: The vertical grid lines are not displayed.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendWindowVisible

Description

The trend lines which you have created are listed in the list.

Activate the trend views in the list which you want to display in the control.

Click a list entry to adapt the ruler and grid line properties.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

TrendXAxis

Description

Defines the X axis to be used for the trend selected. Define the available X axes inn the "X Axes" tab.

See also

FunctionTrendControl (Page 4004)

TrendYAxis

Description

Defines the Y axis to be used for the trend selected. Define the available Y axes inn the "Y Axes" tab.

See also

FunctionTrendControl (Page 4004)

Type

Description

Returns the type of the specified object as STRING. Name diagram: Hmi<ObjectName>, e.g. HmiCircle for the "circle" screen object.

Access in Runtime: Read

Syntax

Object.Type

Object

Required A "ScreenItem" object.

TypeAlarmHigh

Description

TRUE, when the upper limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeAlarmLow

Description

TRUE, when the lower limit value, at which an alarm is triggered, should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeLimitHigh4

Description

TRUE, when the "Reserve 4" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeLimitHigh5

Description

TRUE, when the "Reserve 5" upper limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeLimitLow4

Description

TRUE, when the "Reserve 4" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeLimitLow5

Description

TRUE, when the "Reserve 5" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeToleranceHigh

Description

TRUE, when the "Tolerance high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeToleranceLow

Description

TRUE, when the "Tolerance low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeWarningHigh

Description

TRUE, when the "Warning high" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

TypeWarningLow

Description

TRUE, when the "Warning low" lower limit value should be evaluated as a percentage. FALSE, when the evaluation should be as an absolute value. BOOLEAN write-read access.

Properties U-W

UncertainStateColor(i)

Description

Specifies the color for the identification of values with an uncertain status.

Access in Runtime: Read and write

Syntax

Object.**UncertainStateColor**(i)[=Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Color

Optional A value or a constant that specifies the color for the identification of values with an uncertain status.

Comments

The parameter i indicates the number of the trend.

If the start value of a value is not known after Runtime has been activated or a substitute value is used, then this value has an uncertain status.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

UncertainStateEnabled(i)

Description

Specifies if values with an uncertain status are identified with the color set up in "ReplacementColor(i)"".

If the start value of a value is not known after Runtime has been activated or a substitute value is being used, then this value is considered to have an uncertain status.

Access in Runtime: Read and write

Syntax

Object.**UncertainStateEnabled**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if values with an uncertain status are identified with the color specified in ""ReplacementColor(i".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

Unit

Description

Specifies the unit of measurement in the "IOField" object.

See also

Bar (Page 3961)

IOField (Page 4021)

UnitColor

Description

Specifies the text color for the label of the measurement unit in the "Gauge" object

Access in Runtime: Read and write

Syntax

Object.**UnitColor**[= Color]

Object

Required A "ScreenItem" object with the format "Gauge".

Color

Optional A value or a constant that specifies the text color for the measurement unit.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Gauge (Page 4008)

UnitText

Description

Specifies the text for the measurement unit of the selected object.

Access in Runtime: Read and write

Syntax

Object.**UnitText**[= STRING]

Object

Required A "ScreenItem" object with the format ""Gauge".

STRING

Optional A value or a constant that specifies the text for the measurement unit.

Comments

Enter a text to show, for example, the physical unit of the displayed value. It is standard for no text to be set as a default.

See also

Gauge (Page 4008)

UnitTop

Description

Specifies the distance of the measurement unit to the upper edge of the selected object. The lettering can be positioned only in line with the vertical diameter of the scale. The value of the property refers to the height of the selected object and is measured from the upper edge of the selected object to the lower edge of the lettering.

Access in Runtime: Read and write

Syntax

Object.UnitTop[=Double]

Object

Required A ""ScreenItem" object with the format "Gauge".

Double

Optional A value or a constant that specifies the distance of the measurement unit to the upper edge of the selected object.

Value range from 0 to 1

0: The lower edge of the lettering is positioned on the upper limit of the selected object. The text is no longer visible as it is positioned outside of the selected object.

1: The lower edge of the lettering is positioned on the lower limit of the selected object.

See also

Gauge (Page 4008)

UnselBGColor property

Description

Defines or returns the background color of entries in the text list object which are not selected. LONG write-read access.

UnselTextColor property

Description

Defines or returns the color of the text for entries in the text list object which are not selected. LONG write-read access.

UpdateCycle property

Description

Returns the type and frequency of updating the picture window in Runtime. Read only access.

UpdateEnable

Description

Specifies whether the recipe view can be altered in Runtime.

Access in Runtime: Read and write

Syntax

Object.**UpdateEnable**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "UserArchiveControl".

BOOLEAN

Optional TRUE, if the recipe view can be altered in Runtime.

UpperLimit

Description

Specifies the upper limit for input values.

Access in Runtime: Read and write

Syntax

Object.**UpperLimit**[=Double]

Object

Required A "ScreenItem" object with the format "IOField".

Double

Optional A value or a constant that specifies the upper limit for input values.

See also

IOField (Page 4021)

UpperLimitColor(i)

Description

Specifies the color that identifies the tag values that lie above the value of ""UpperLimitValue(i)". Whether the information is evaluated depends on the value of the property ""UpperLimitEnabled(i)".

Access in Runtime: Read and write

Syntax

Object.**UpperLimitColor**(i)[=Color]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

Color

Optional A value or a constant that identifies the tag values that lie above the value of ""UpperLimitValue(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

UpperLimitEnabled(i)

Description

Specifies whether the information from "UpperLimitColor(i)" is used to identify the tag values that lie above the value of "UpperLimitValue(i)".

Access in Runtime: Read and write

Syntax

Object.**UpperLimitEnabled**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl" or "OnlineTableControl".

BOOLEAN

Optional TRUE, if the information from "UpperLimitColor(i)"" is used to identify the tag values that lie above the value of "UpperLimitValue(i)".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

UpperLimitValue(i)

Description

Specifies whether the tag values that exceed the "UpperLimitValue(i)" are to be identified with the color specified in "UpperLimitColor(i)"". Whether the information is evaluated depends on the value of the property "UpperLimit(i)".".

Access in Runtime: Read and write

Syntax

Object.**UpperLimitValue**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies whether the tag values that exceed the ""UpperLimitValue(i)" value are to be identified with the color specified in UpperLimitColor(i)"".

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

UseAllServers

Description

Specifies whether the data to be shown in the alarm window can be requested from all servers in a distributed system. Alarm Logging must be activated on the respective servers.

Access in Runtime: Read-only

Syntax

Object.**UseAllServers**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "AlarmView".

BOOLEAN

Optional. TRUE, if the data to be shown in the alarm window can be requested from all servers in a distributed system.

See also

AlarmControl (Page 3947)

UseBarBorderConstraints

Description

Specifies whether the bar border is restricted to specific values.

Access in Runtime: Read and write

Syntax

Object.**UseBarBorderConstraints**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional. TRUE, if the bar border is restricted to specific values.

See also

Bar (Page 3961)

UseTagLimitColors

Description

Specifies that colors are used.

UseDesignColorShema

Description

Defines whether the colors defined for the current design in the global color scheme will be used for this object.

TRUE if the object is displayed with the colors from the global color scheme defined for this object type.

FALSE if the object is displayed with the colors as per the settings in the object.

BOOLEAN write-read access.

UseEffectiveProcessValue

Description

Specifies whether an actual percentage made up of maximum value, minimum value, average of the last 15 values and hysteresis will be used.

Access in Runtime: Read and write

Syntax

Object.**UseEffectiveProcessValue**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if an actual percentage made up of maximum value, minimum value, average of the last 15 values and hysteresis will be used.

See also

Bar (Page 3961)

UseExponentialFormat

Description

Specifies whether the figures are shown exponentially (e.g. "1,00e+000").

Access in Runtime: Read and write

Syntax

Object.**UseExponentialFormat**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the figures are shown exponentially (e.g. "1,00e+000").

See also

Bar (Page 3961)

UseFlashTransparentColor

Description

Specifies whether the color of the bitmap object of a flashing graphic will be set to ""transparent".

Access in Runtime: Read and write

Syntax

Object.**UseFlashTransparentColor**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "GraphicIOField".

BOOLEAN

Optional TRUE, if the color of the bitmap object of a flashing graphic will be set to "transparent".

See also

GraphicIOField (Page 4011)

UseGDI

Description

Specifies whether the ellipse is shown via GDI or GDI+.

Access in Runtime: Read and write

Syntax

Object.**UseGDI**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Ellipse".

BOOLEAN

Optional TRUE, if the ellipse is shown via GDI.

See also

Ellipse (Page 3993)

UseMeasurePoints(i)

Description

Specifies whether the time range for the selected trend will be determined by measuring points or the end time. Whether the information is evaluated depends on the properties "TimeAxisEndTime", "TimeAxisBeginTime(i)".

Define time range for curve i through measure points (TRUE) or end time (FALSE) (for time based tag providers)

Access in Runtime: Read and write

Syntax

Object.**UseMeasurePoints**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl"or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the time range for the selected trend will be determined by measuring points.

Comments

The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

UseMessageColor

Description

Specifies whether the agreed colors of the message classes are displayed.

Access in Runtime: Read and write

Syntax

Object.**UseMessageColor**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl".

BOOLEAN

TRUE: The colors are displayed.

FALSE: The color settings specified for the table content on the "Layout" tab are effective.

See also

AlarmControl (Page 3947)

UseMultipleLimits

Description

Specifies whether one or more pairs of limits are shown as a selection or a line.

Access in Runtime: Read and write

Syntax

Object.**UseMultipleLimits**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""Bar".

BOOLEAN

Optional TRUE, if one or more pairs of limits are displayed as a selection or a line.

See also

Bar (Page 3961)

UseScaleConstraints

Description

Specifies whether the distance between two large marking lengths of the scale are calculated from the minimum and maximum values.

Access in Runtime: Read and write

Syntax

Object.**UseScaleConstraints**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the distance between two large marking lengths of the scale are calculated from the minimum and maximum values.

See also

Bar (Page 3961)

UseScaledBarBorder

Description

Specifies whether the rectangle that surrounds the object is shown dependent of the scale or as a default.

Access in Runtime: Read and write

Syntax

Object.**UseScaledBarBorder**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".".

BOOLEAN

Optional TRUE, if the rectangle that surrounds the object is shown dependent on the scale.

See also

Bar (Page 3961)

UseSelectedTitleColor

Description

Specifies whether to use a selection color for the headers of selected table cells.

Access in Runtime: Read and write

Syntax

Object.**UseSelectedTitleColor**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "AlarmControl", "TrendRulerControl".

BOOLEAN

TRUE: A marking color is used. The "Background" and "Font" settings are active in Runtime.

FALSE: A marking color is not used. The "Background" and "Font" settings are disabled in Runtime.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

UseSeparateDiagrams

Description

Specifies whether the trends are shown staggered.

Access in Runtime: Read and write

Syntax

Object.**UseSeparateDiagrams**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "FunctionTrendView".

BOOLEAN

Optional TRUE, if the trends are shown staggered.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

UseSimplePresicionOffset

Description

Specifies how the field length will be calculated for the labeling of the scale.

Access in Runtime: Read and write

Syntax

Object.**UseSimplePresicionOffset**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the field length will be calculated for the labeling of the scale.

See also

Bar (Page 3961)

UseTableColor2

Description

Specifies whether to use a second row color for the representation of the table.

Access in Runtime: Read and write

Syntax

Object.**UseTableColor2**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl", "FunctionTrendControl", "AlarmControl", "TrendRulerControl".

BOOLEAN

TRUE: The settings of "RowColor 2" are used in alternation with "RowColor1".

FALSE: The settings of "RowColor 1" are used for all rows.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

UseTimeRange(i)

Description

Specifies how the time range that is to be shown for the selected trend will be defined.

Access in Runtime: Read and write

Syntax

Object.**UseTimeRange**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend","FunctionTrendView" or "TableView".

BOOLEAN

Optional TRUE, if the time range that is to be shown is defined by means of a start time ("TimeAxisBeginTime(i)") and an end time ("TimeAxisEndTime").

FALSE,, if the time range that is to be shown is defined by means of a start time ("TimeAxisBeginTime(i)") and an end time "TimeRangeBase(i)" and "TimeRangeFactor(i)".

Comments

The parameter i indicates the number of the trend.

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

UseTransparentColor

Description

Specifies whether the color described with the property "TransparentColor" will be shown as transparent for the selected object.

Access in Runtime: Read and write

Syntax

Object.**UseTransparentColor**[= BOOLEAN]

Object

Required A "ScreenItem" object with the formats "GraphicView" or "GraphicIOField".

BOOLEAN

Optional TRUE, if the specified color is to be shown as transparent.

See also

GraphicView (Page 4014)

GraphicIOField (Page 4011)

UseTransparentColorDeactivatedPicture

Description

Specifies if the transparent color defined with the property "TransparentColorDeactivatedPicture" for the status "disabled" will be used.

Access in Runtime: Read and write

Syntax

Object.**UseTransparentColorDeactivatedPicture**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""Roundbutton".

BOOLEAN

Optional TRUE, if the transparent color definded with the property "TransparentColorDeactivatedPicture" for the status "disabled" will be used.

UseTransparentColorPictureOff

Description

Specifies if the transparent color defined with the property "TransparentColorPictureOff" for the status "off" will be used.

Access in Runtime: Read and write

Syntax

Object.**UseTransparentColorPictureOff**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Roundbutton".

BOOLEAN

Optional TRUE, if the transparent color defined with the property "TransparentColorPictureOff" for the status "off" will be used.

See also

Button (Page 3968)

UseTransparentColorPictureOn

Description

Specifies if the transparent color defined with the property "TransparentColorPictureOn" for the status "on" will be used.

Access in Runtime: Read and write

Syntax

Object.**UseTransparentColorPictureOn**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Roundbutton".

BOOLEAN

Optional TRUE, if the transparent color defined with the property "TransparentColorPictureOn" for the status "on" will be used.

See also

Button (Page 3968)

UseTrendNameAsLabel

Description

Specifies whether the "Name" or "Label" property is used as a designation for the trend in Runtime.

Access in Runtime: Read and write

Syntax

Object.**UseTrendNameAsLabel**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl", "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

BOOLEAN

TRUE: The name configured under "Properties > Properties > Trends > Name" is used.

FALSE: The name configured under "Properties > Properties > Trends > Label" is used.

See also

FunctionTrendControl (Page 4004)

OnlineTrendControl (Page 4045)

Used

Description

Returns the size of the used disk space.

Access in Runtime: Read and write

Syntax

Object.**Used**[=Double]

Object

Required A "ScreenItem" object with the format ""DiskSpaceView".

Double

Optional A value or a constant that returns the size of the used disk space.

See also

DiskSpaceView (Page 3991)

UsedPercent

Description

Returns the measured value for the used disk space as a percentage. The values can be queried in Runtime. The values cannot be predefined.

Access in Runtime: Read and write

Syntax

Object.**UsedPercent**[=Int]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Int

Optional A value or a constant that returns the measured value for the used disk space as a percentage.

See also

DiskSpaceView (Page 3991)

UserArchiveNumberOfValues(i)

Description

Specifies the number of values that are loaded from the recipe. The "TagProviderType(i)"" property must have the value -2.

Access in Runtime: Read and write

Syntax

Object.**UserArchiveNumberOfValues**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

Int

Optional A value or a constant that specifies the number of values that are loaded from the recipe.

Comments

The parameter i indicates the number of the trend.

If "UserArchiveNumberOfValues(i)"" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with ""FreezeProviderConnections"" before changing ""UserArchiveNumberOfValues(i)"".

See also

FunctionTrendControl (Page 4004)

UserArchiveStartId(i)

Description

Specifies the data record starting from which the values for the selected trend are loaded from the recipe. The "TagProviderType(i)"" property must have the value -2.

Access in Runtime: Read and write

Syntax

Object.**UserArchiveStartId**(i)[=Int]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

Int

Optional A value or a constant that specifies the data record starting from which the values for the selected trend are loaded from the recipe.

Comments

The parameter i indicates the number of the trend.

If "UserArchiveStartId(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with ""FreezeProviderConnections" before changing ""UserArchiveStartId(i)".

See also

FunctionTrendControl (Page 4004)

UserName

Description

Returns the name of the user who triggered the alarm object.

UserValue1 property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

UserValue2 property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

UserValue3 property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

UserValue4 property

Description

Defines or returns a value.
The value can be evaluated by a script, for example. This value is neither evaluated nor displayed in Runtime.

ValidateFormatPattern

Description

Specifies that the "format pattern" field can be checked for specific characters.

Access in Runtime: Read and write

Syntax

Object.**ValidateFormatPattern**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "IOField".

BOOLEAN

Optional TRUE, if the "format pattern" field can be checked for specific characters.

See also

IOField (Page 4021)

Value

Description

Specifies a value for the object being used or returns it.

Access during runtime: Read and write

Syntax

Object.**Value**[=VARIANT]

Object

Necessary. An object of type "Tag", "DataItem" or "ScreenItem" with the format "Gauge".

VARIANT

Optional The value that is specified dependent on the object being used:

- Tag.Value: returns the tag value for the last read access or specifies the future tag value. Use the "Read" method to read the tag value from the "Value" property. You assign a new tag value to the "Value" property with the "Write" method.
- Dataset.Value: Specifies a value or returns a copy of the value or the object reference. When returning object references, ensure that the object reference is multithread-capable.
- ScreenItem("Gauge_1").Value: Specifies the value to which the pointer points. The value range within the values set via the properties "ValueMin",and "ValueMax".

Examples

The following example writes a new value in the "Tag1" tag:

```
'VBS94
Dim objTag
Set objTag = HMIRuntime.Tags("Tag1")
objTag.Value = 50
objTag.Write
```

The example shows how to add a value to a list of tags and output it as a trace. After that, the value is changed, output again and then removed. It make sense to perform this in several different actions:

```
'VBS198
HMIRuntime.DataSet.Add "motor1", 23
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet("motor1").Value = 55
HMIRuntime.Trace "motor1: " & HMIRuntime.DataSet("motor1").Value & vbNewLine
HMIRuntime.DataSet.Remove("motor1")
```

DataItem (Page 3916)

Tag (Page 3941)

ValueAxisAutorange(i)

Description

Specifies whether the value range of the Y axis is determined automatically or via the values "ValueAxisBegin(i)" and "ValueAxisEnd(i)".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisAutorange**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the value range of the Y axis is established automatically or via the values "ValueAxisBegin(i)" and "ValueAxisEnd(i)"".

See also

FunctionTrendControl (Page 4004)

ValueAxisBegin(i)

Description

Specifies the lower limit of the value range for the selected trend that is to be displayed. Whether the information is evaluated depends on the properties "Autorange" and "ShareValueAxis".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisBegin**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the lower limit of the value range of the selected trend that is to be shown.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisDecimalPrecision(i)

Description

Specifies the number of decimal places for the value range of the selected trend.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisDecimalPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the formats "OnlineTrend" or "FunctionTrendView".

Int

Optional A value or a constant that specifies the number of decimal places for the value range of the selected trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisEnd(i)

Description

Specifies the upper limit of the value range of the selected trend that is to be displayed. Whether the information is evaluated depends on the properties "Autorange" and "ShareValueAxis".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisEnd**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the upper limit of the value range of the selected trend that is to be shown.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisGridLineInterval(i)

Description

Specifies the distance between two grid lines. Whether the information is evaluated depends on the properties "ValueAxisShowGridLines(i)" and "TimeAxisShowGridLines(i)".".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisGridLineInterval**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the distance between two grid lines.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisLabel(i)

Description

Specifies the labeling of the value axis. Whether the information is evaluated depends on the property "ConfigureTimeAxis(i)".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisLabel**(i)[=String]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

String

Optional A value or a constant that specifies the labeling of the value axis.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisLargeIncrementSize(i)

Description

Specifies the distance between two long marking lengths of the scale. Whether the information is evaluated depends on the properties "ValueAxisShowLargeIncrements(i)" and ""TimeAxisShowLargeIncrements(i)".".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisLargeIncrementSize**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the distance between two marking lengths of the scale.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisScalingType(i)

Description

Specifies the type of axis scaling.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisScalingType**(i)[=AxisScalingType]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

AxisScalingType

hmiBarScalingLinear (0): Linear axis scaling.

hmiBarScalingLogarithmic (1): Logarithmic axis scaling

hmiBarScalingNegativeLogarithmic (2): Negative logarithmic axis scaling

Comments

The parameter i indicates the number of the trend. The parameter i indicates the number of the trend.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisShowGridLines(i)

Description

Specifies whether the trend window is shown with grid lines that run parallel to the y axis.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisShowGridLines(**i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the y axis.

Comments

The distance between two grid lines can be altered with the "ValueAxisGridLineInterval(i)" property.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisShowLargeIncrements(i)

Description

Specifies whether the value axis is scaled with long marking lengths.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisShowLargeIncrements**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the value axis is scaled with long marking lengths.

Comments

The distance of two long marking lines can be altered with the "ValueAxisLargeIncrementSize(i)"" property.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisShowSmallIncrements(i)

Description

Specifies whether the value axis is scaled with short marking lengths.

Access in Runtime: Read and write

Syntax

Object.**ValueAxisShowSmallIncrements**(i)[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

BOOLEAN

Optional TRUE, if the value axis is scaled with short marking lengths.

Comments

The distance between two short marking lines can be altered with the "ValueAxisSmallIncrementSize(i)" property.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueAxisSmallIncrementSize(i)

Description

Specifies the distance between two short marking lengths of the scale. Whether the information is evaluated depends on the properties ""ValueAxisShowSmallIncrements(i)")" and ""TimeAxisShowSmallIncrements(i)".".

Access in Runtime: Read and write

Syntax

Object.**ValueAxisSmallIncrementSize**(i)[=Double]

Object

Required An object of the "ScreenItem" type with the format "OnlineTrendControl" or "FunctionTrendControl".

Double

Optional A value or a constant that specifies the distance between two short marking lengths of the scale.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ValueColumnAlignment(i)

Description

Specifies the alignment of the tag values of this column pair. The parameter i indicates the number of the column pair.

Access in Runtime: Read and write

Syntax

Object.**ValueColumnAlignment**(i)[=AlignmentHorizontal]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

AlignmentHorizontal

hmiAlignmentLeft (0): The text is shown left justified.

hmiAlignmentCentered (1): The text is shown centered.

hmiAlignmentRight (2): The text is shown right justified.

See also

OnlineTableControl (Page 4037)

ValueColumnPrecision(i)

Description

Specifies the number of decimal places that are shown in this value column. The parameter i indicates the number of the column pair. A maximum of 16 decimal places can be shown.

Access in Runtime: Read and write

Syntax

Object.**ValueColumnPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the format "OnlineTableControl".

Int

Optional A value or a constant that specifies the number of decimal places that are shown in this value column.

See also

OnlineTableControl (Page 4037)

VerticalAlignment

Description

Specifies the vertical alignment of the text within the selected object.

Access in Runtime: Read and write

Syntax

Object.**VerticalAlignment**[=AlignmentVertical]

Object

Required An object of the "ScreenItem" type with the format "TextField", "IOField", "SymbolicIOField", "DateTimeField", "Button", "Switch", "Checkbox" or "OptionGroup".

AlignmentVertical

A value that specifies the vertical alignment.

hmiAlignmentTop (0): The text will be shown in the upper margin.

hmiAlignmentMiddle (1): The text will be shown in the middle.

hmiAlignmentBottom (2): The Text will be shown in the lower margin.

See also

TextField (Page 4107)

IOField (Page 4021)

SymbolicIOField (Page 4093)

Button (Page 3968)

Switch (Page 4089)

OptionGroup (Page 4054)

DateTimeField (Page 3989)

RoundButton (Page 4074)

VerticalAlignment

Description

Determines the vertical alignment of the text within the given object.

Access during runtime: Read and Write

Syntax

Object.VerticalAlignment [= THmiVerticalAlignment]

Object

Required An object of the "ScreenItem" type with the characteristics "TextField", "IOField", "SymbolicIOField", "Button" or "Switch".

THmiVerticalAlignment

Optional A value or constant which determines the vertical alignment of the text.

hmiAlignmentTop (0): The text is aligned at the top of the object.

hmiAlignmentMiddle (1): The text is centered vertically in the object.

hmiAlignmentBottom (2): The text is aligned at the bottom in the object.

See also

ProjectName (Page 4062)

VerticalGridLines

Description

Enables the display of vertical dividers.

Access in Runtime: Read and write

Syntax

Object.**VerticalGridLines**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "AlarmControl", "OnlineTableControl", "UserArchiveControl", "TrendRulerControl".

BOOLEAN

TRUE: Vertical grid lines are displayed.

FALSE: Vertical grid lines are not displayed.

See also

UserArchiveControl (Page 4130)

TrendRulerControl (Page 4110)

OnlineTableControl (Page 4037)

AlarmControl (Page 3947)

VerticalScrollbarPosition

Description

Specifies the vertical positioning of the scroll bar in a picture window with slider, or returns its value.

The picture is displayed in the picture window by positioning the horizontal and vertical scroll bars. If you wish to display the picture as a cutout where the scroll bars are located at the left and upper edge of the picture, use the properties "OffsetLeft" and "OffsetTop" as the origin of this cutout.

See also

ScreenWindow (Page 4078)

ViewOnly

Description

Specifies whether the Sm@rtClient display will be used for remote monitoring or remote maintenance.

Remote maintenance means that settings can be changed on the monitored device.

Remote monitoring means that settings of the monitored device cannot be changed.

Access in Runtime: Read and write

Syntax

Object.**ViewOnly**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "SmartClientView".

BOOLEAN

Optional TRUE, if the Sm@rtClient display is to be used only for remote monitoring.

See also

SmartClientView (Page 4085)

Visible

Description

Specifies whether the selected object is visible.

Access during runtime: Read and write

Syntax

Object.**Visible**[=BOOLEAN]

Object

Necessary. An object of the type "ScreenItem".

BOOLEAN

Optional TRUE, if the object is visible.

Used for the following object types:

Rectangle

TubeTeeObject (Page 4128)
TubePolyline (Page 4125)

Warning

Description

Specifies the limit for the storage space display as of which a warning will be reported.

Access in Runtime: Read and write

Syntax

Object.**Warning**[=Int]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Int

Optional A value or a constant that specifies the limit for the storage space display as of which a warning will be reported.

See also

DiskSpaceView (Page 3991)

WarningColor

Description

Specifies the color in which the bar of the storage space display will be shown as soon as the warning area is reached.

Access in Runtime: Read and write

Syntax

Object.**WarningColor**[=Color]

Object

Required A "ScreenItem" object with the format "DiskSpaceView".

Color

Optional A value or a constant that specifies the color in which the bar of the storage space display will be shown as soon as the warning area is exceeded.

See also

DiskSpaceView (Page 3991)

WarningHigh

Description

Defines or returns the upper limit value for "Warning High".
In order that the limit value is monitored, the "CheckWarningHigh" property must be set to TRUE.
The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningHigh" and "TypeWarningHigh" properties.

WarningLow

Description

Defines or returns the lower limit value for "Warning Low".
In order that the limit value is monitored, the "CheckWarningLow" property must be set to TRUE.
The display on reaching the limit value and the type of evaluation are defined by means of the "ColorWarningLow" and "TypeWarningLow" properties.

WarningLowerLimit

Description

Specifies the lower limit for "WarningLowerLimit".

The ""WarningLowerLimitEnable" property must have the value TRUE so that the limit is monitored.

Access in Runtime: Read and write

Syntax

Object.**WarningLowerLimit**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the lower limit for "WarningLowerLimit".

Comments

The following values will be specified with the properties "WarningLowerLimitColor" and "WarningLowerLimitRelative":

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

WarningLowerLimitColor

Description

Specifies the color for the lower limit ""WarningLowerLimit".

The ""WarningLowerLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

Syntax

Object.**WarningLowerLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that specifies the color for the lower limit "WarningLowerLimit".

Comments

The following values are specified by the "WarningUpperLimit", "WarningUpperLimitColor" and "WarningUpperLimitRelative" properties:

- Limit
- Representation upon reaching the limit
- Type of evaluation

See also

Bar (Page 3961)

WarningLowerLimitEnabled

Description

Specifies whether the limit ""WarningLowerLimit" is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**WarningLowerLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the "WarningLowerLimit" limit is to be monitored.

Comments

The following values will be specified with the properties "WarningLowerLimit", "WarningLowerLimitColor" and "WarningLowerLimitRelative":

Limit

Representation upon reaching the limit

Type of evaluation

See also

Bar (Page 3961)

WarningLowerLimitRelative

Description

Determines whether the lower limit "WarningLowerLimit" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

Syntax

Object.**WarningLowerLimitRelative**[=BOOLEAN]

Object

Required A ""ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the lower limit ""WarningLowerLimit" is to be evaluated as a percentage.

See also

Bar (Page 3961)

WarningRangeColor

Description

Specifies the color of the warning range on the scale of the "Gauge" object.

The "WarningRangeVisible" property must have the value TRUE so that the warning range is displayed.

Access in Runtime: Read and write

Syntax

Object.**WarningRangeColor**[= Color]

Object

Required A "ScreenItem" object with the format "Gauge".

Color

Optional A value or a constant that specifies the color of the warning range.

Comments

Use the "RGB" function to establish the colors in RGB format (red, green blue). To do this, enter the appropriate decimal value for each of the three RGB values (range from 0 to 255). For example, the color "red" is shown as such: RGB(255, 0, 0). You can also use the VBS color constants like vbRed or vbGreen.

See also

Gauge (Page 4008)

WarningRangeStart

Description

Specifies at which scale value the warning range of the "Gauge" object will start.

The "WarningRangeVisible" property must have the value TRUE so that the warning range is displayed.

Access in Runtime: Read and write

Syntax

Object.**WarningRangeStart**[= DOUBLE]

Object

Required A "ScreenItem" object with the format "Gauge".

DOUBLE

Optional A value or a constant that contains the scale value for the start of the warning range.

Comments

The range extends from the value "Warning" through to the value "Danger". If no range is activated for "Danger", then the range for "Warning" extends to the end of the scale.

See also

Gauge (Page 4008)

WarningRangeVisible

Description

Specifies whether the warning range in the scale of the "Gauge" object will be displayed.

Access in Runtime: Read and write

Syntax

Object.**WarningRangeVisible**[= BOOLEAN]

Object

Required A "ScreenItem" object with the format "Gauge".

BOOLEAN

Optional TRUE, if the warning range will be displayed in the scale.

Comments

Specifies the color of the warning range with the ""WarningRangeColor" property.

Specifies the start of the warning range with the "WarningRangeStart"" property.

See also

Gauge (Page 4008)

WarningRangeColor (Page 4708)

WarningRangeStart (Page 4708)

WarningUpperLimit

Description

Specifies the upper limit for "WarningUpperLimit".

The "WarningUpperLimitEnable"" property must have the value TRUE so that the limit is monitored.

Access in Runtime: Read and write

Syntax

Object.**WarningUpperLimit**[=Double]

Object

Required A "ScreenItem" object with the format "Bar".

Double

Optional A value or a constant that specifies the upper limit for ""WarningUpperLimit".

Comments

The following values will be specified with the properties "WarningUpperLimitColor" and "WarningUpperLimitRelative":

- Representation upon reaching the limit
- Type of evaluation

See also

Bar (Page 3961)

WarningUpperLimitColor

Description

Specifies the color for the upper limit "WarningUpperLimit".

The ""WarningUpperLimitEnable" property must have the value TRUE if the bar color is to change once the limit has been reached.

Access in Runtime: Read and write

Syntax

Object.**WarningUpperLimitColor**[=Color]

Object

Required A "ScreenItem" object with the format "Bar".

Color

Optional A value or a constant that specifies the color for the upper limit "WarningUpperLimit".

See also

Bar (Page 3961)

WarningUpperLimitEnabled

Description

Specifies whether the limit ""WarningUpperLimit" is to be monitored.

Access in Runtime: Read and write

Syntax

Object.**WarningUpperLimitEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".".

BOOLEAN

Optional TRUE, if the "WarningUpperLimit" limit is to be monitored.

See also

Bar (Page 3961)

WarningUpperLimitRelative

Description

Determines whether the lower limit "WarningUpperLimit" is to be evaluated as a percentage or as an absolute value.

Access in Runtime: Read and write

Syntax

Object.**WarningUpperLimitRelative**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "Bar".

BOOLEAN

Optional TRUE, if the lower limit "WarningUpperLimit" is to be evaluated as a percentage.

See also

Bar (Page 3961)

Width

Description

Specifies the width of the selected objects "Ellipse", "Circle" and "Rectangle".

Access in Runtime: Read and write.

The other objects only have read access to the property.

Syntax

Object.**Width**[=LONG]

Object

Required A "Screen" object or an object of type "ScreenItem". This property is a standard property of the ScreenItem-object and is therefore available for all formats.

LONG

Optional A value or a constant that specifies the width in pixels. This parameter can only be set for the objects "Ellipse", Circle" and "Rectangle".

WinCCStyle

Description

Defines the style in which the object is displayed.

User Defined	Shows the object according to the respective settings.
Global	Shows the object in a globally defined design.
Windows Style	Shows the object in Windows style.

WindowBorder

Description

TRUE, when the window is displayed with borders in Runtime. Read only access.

WindowCloseEnabled

Description

Specifies whether the window can be closed in Runtime.

Access in Runtime: Read and write

Syntax

Object.**WindowCloseEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend", "FunctionTrendView" or "TableView".

BOOLEAN

Optional TRUE, if the window can be closed in Runtime.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

WindowMaximizeenabled

Description

TRUE, when the object can be maximized in Runtime. Read only access.

See also

ScreenWindow (Page 4078)

ScriptDiagnostics (Page 4080)

WindowMovingEnabled

Description

TRUE, when the object can be moved in Runtime. Read only access.

See also

ScreenWindow (Page 4078)

ScriptDiagnostics (Page 4080)

WindowOnTop

Description

TRUE, when the object should remain in the foreground in Runtime. Read only access.

See also

ScreenWindow (Page 4078)

ScriptDiagnostics (Page 4080)

WindowsContens

Description

Supplies the content of the application window Read only access.

See also

ScriptDiagnostics (Page 4080)

WindowSizingEnabled

Description

Specifies whether the size of the specified object can be changed in Runtime.

Access in Runtime: Read and write

Syntax

Object.**WindowSizingEnabled**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "OnlineTrend", "FunctionTrendView" or "TableView".

BOOLEAN

Optional. TRUE, if the size of the selected object can be changed in Runtime.

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OnlineTableControl (Page 4037)

WindowsStyle

Description

Specifies whether the object will be displayed in the general Windows style.

Access in Runtime: Read and write

Syntax

Object.**WindowsStyle**[=BOOLEAN]

Object

Required A "ScreenItem" object with the formats "Button" or "WindowSlider".

BOOLEAN

Optional TRUE, if the object will be displayed in the general Windows style.

See also

Button (Page 3968)

WindowSlider (Page 4139)

Properties X-Z

XAxisAdd

Description

Creates a new X axis.

Syntax

Object.**XAxisAdd**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

XAxisAlign

Description

Defines the alignment mode for a selected axis.

Syntax

Object.**XAxisAlign**[=Alignement]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Alignment

Value	Description	Description
0	Bottom	The X axis selected is displayed below the trend.
1	Top	The X axis selected is displayed above the trend.

XAxisAutoPrecisions

Description

Enables automatic setting of the decimal precision.

Access in Runtime: Read and write

Syntax

Object.**XAxisAutoPrecisions**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

TRUE: The number of decimal places is specified automatically.

FALSE: The value configured under "Properties > X axis > Format > Decimal places" is effective.

See also

FunctionTrendControl (Page 4004)

XAxisAutorange(i)

Description

Specifies whether the value range of the X axis is determined automatically or via the attributes "XAxisBegin(i)" and "XAxisEnd(i)".

Access in Runtime: Read and write

Syntax

Object.**XAxisAutorange**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

BOOLEAN

Optional TRUE, if the value range of the X axis is determined automatically or via the values "XAxisBegin(i)" and "XAxisEnd(i)".

See also

FunctionTrendControl (Page 4004)

XAxisBegin(i)

Description

Specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex". Whether the information is evaluated depends on the properties "XAxisAutorange(i)" and "ShareXAxis".

Access in Runtime: Read and write

Syntax

Object.**XAxisBegin**(i)[=String]

Object

Required A ""ScreenItem" object with the format ""FunctionTrendView".

String

Optional A value or a constant that specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex".

See also

FunctionTrendControl (Page 4004)

XAxisBeginValue

Description

Specifies the lower range of values of the axis selected. To configure the value, deactivate the "Automatic" option in "Value range".

See also

FunctionTrendControl (Page 4004)

XAxisColor

Description

Use this attribute to define the color for the common X-axis.

Access in Runtime: Read and write

Syntax

Object.**XAxisColor**[=COLOR]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Color

The color is defined as an RGB value.

See also

FunctionTrendControl (Page 4004)

XAxisCount

Description

Defines the number of X axes configured.

Syntax

Object.**XAxisCount**

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl"..

See also

FunctionTrendControl (Page 4004)

XAxisDecimalPrecision(i)

Description

Specifies the number of decimal places with which the scaling value of the X axis will be displayed.

Access in Runtime: Read and write

Syntax

Object.**XAxisDecimalPrecision**(i)[=Int]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

Int

Optional A value or a constant that specifies the number of decimal places with which the scaling value for the X axis will be displayed.

See also

FunctionTrendControl (Page 4004)

XAxisEnd(i)

Description

Specifies the lower limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex". Whether the information is evaluated depends on the properties "XAxisAutorange(i)"" and "ShareXAxis".

Access in Runtime: Read and write

Syntax

Object.**XAxisEnd**(i)[=String]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

String

Optional A value or a constant that specifies the upper limit of the X axis of a trend that has been referenced with the property "CurrentCurveIndex".

See also

FunctionTrendControl (Page 4004)

XAxisEndValue

Description

Specifies the upper range of values of the axis selected. To configure the value, deactivate the "Automatic" option in "Value range".

See also

FunctionTrendControl (Page 4004)

XAxisExponentialFormat

Description

Enables the exponential notation for visualization of a selected axis.

Access in Runtime: Read and write

Syntax

Object.**XAxisExponentialFormat** [=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are displayed in exponential format.

See also

FunctionTrendControl (Page 4004)

XAxisGridLineInterval(i)

Description

Specifies the distance between two grid lines of the X axis. Whether the information is evaluated depends on the value of the property ""XAxisShowGridLines(i)".".

Access in Runtime: Read and write

Syntax

Object.**XAxisGridLineInterval**(i)[=Double]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".".

Double

Optional A value or a constant that specifies the distance between two grid lines of the X axis.

See also

FunctionTrendControl (Page 4004)

XAxisIndex

Description

References a configured X axis. You can assign the values of other properties to a specific X axis by using the property.

Valid values for "Index" are between 0 and "XAxisCount" minus 1. The "ToolbarButtonCount" property specifies the number of configured X axes.

See also

FunctionTrendControl (Page 4004)

XAxisInTrendColor

Description

Enables the display of an axis selected in the trend color. The color of the first trend is activated if several trends are displayed in the trend window. The order of the trends is determined in the "Trends" properties.

Access in Runtime: Read and write

Syntax

Object.**XAxisInTrendColor**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

BOOLEAN

TRUE: The selected axis is displayed in the trend color. The setting in the "Color" field is disabled.

FALSE: The selected axis is displayed in the color which is set in the "Color" field.

See also

FunctionTrendControl (Page 4004)

XAxisLabel(i)

Description

Specifies the labeling of the X axis of a trend that has been referenced with the property "CurrentCurveIndex", dependent upon the value of "XAxisMode(i)".

Access in Runtime: Read and write

Syntax

Object.**XAxisLabel**(i)[=String]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

String

Optional A value or a constant that specifies the labeling of the X axis of a trend that has been referenced with the property "CurrentCurveIndex".

See also

FunctionTrendControl (Page 4004)

XAxisLargeIncrementSize(i)

Description

Specifies the distance of two long marking lengths of the X axis. Whether the information is evaluated depends on the property "XAxisShowLargeIncrements(i)".".

Access in Runtime: Read and write

Syntax

Object.**XAxisLargeIncrementSize**(i)[=Double]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

Double

Optional A value or a constant that specifies the distance of two long marking lengths of the scaling of the X axis.

See also

FunctionTrendControl (Page 4004)

XAxisMode(i)

Description

Specifies whether a mutual time axis will be used in the trend window for all trends.

Specifies time units used by tag logging controls.

Access in Runtime: Read and write

Syntax

Object.**XAxisMode**(i)[=TrendViewTimeAxisMode]

Object

Required A "ScreenItem" object with the format "FunctionTrendContol".

TrendViewTimeAxisMode

(1): The time axis will be scaled.

(2): No time range has been specified. Only a random sample will be displayed.

(3): The time range will be established via tags.

(4): The time range will be defined by constant values.

Comments

Specifies whether a mutual X axis will be used in the trend window for all trends.

See also

FunctionTrendControl (Page 4004)

XAxisName

Description

Specifies the name of a selected axis.

Syntax

Object.**XAxisName**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

XAxisPrecisions

Description

Specifies the decimal precision for displaying the axis selected. To configure the value, deactivate the "Automatic" option in "Format".

See also

FunctionTrendControl (Page 4004)

XAxisRemove

Description

Removes the selected axis from the list.

Syntax

Object.**XAxisRemove**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

XAxisRepos

Description

Changes the sorting order of the axes. "Up" and "Down" move the axis selected up or down in the list. The order in the list determines the position of the axis in the trend view in Runtime. If the alignment is identical and the axis is further up in the list, it is shown at a position further away from the trend.

Syntax

Object.**XAxisRepos**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

XAxisScalingType(i)

Description

Specifies the type of scaling for the X axis. Whether the information is evaluated depends on the value of the property "XAxisMode(i)".".

Access in Runtime: Read and write

Syntax

Object.**XAxisScalingType**(i)[=AxisScalingType]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

AxisScalingType

hmiBarScalingLinear (0): Linear axis scaling.

hmiBarScalingLogarithmic (1): Logarithmic axis scaling

hmiBarScalingNegativeLogarithmic (2): Negative logarithmic axis scaling

Comments

The parameter i indicates the number of the trend.

See also

FunctionTrendControl (Page 4004)

XAxisShowGridLines(i)

Description

Specifies whether the trend window is shown with grid lines that run parallel to the X axis. The distance between two grid lines can be altered with the ""XAxisGridLineInterval(i)" property.

Access in Runtime: Read and write

Syntax

Object.**XAxisShowGridLines**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

BOOLEAN

Optional TRUE, if the trend window is shown with grid lines that run parallel to the X axis.

See also

FunctionTrendControl (Page 4004)

XAxisShowLargeIncrements(i)

Description

Specifies whether the X axis is scaled with long marking lengths. The distance of two long marking lines can be altered with the "XAxisLargeIncrementSize(i)"" property.

Access in Runtime: Read and write

Syntax

Object.**XAxisShowLargeIncrements**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format ""FunctionTrendView".

BOOLEAN

Optional TRUE, if the X axis is scaled with long marking lengths.

See also

FunctionTrendControl (Page 4004)

XAxisShowSmallIncrements(i)

Description

Specifies whether the X axis is scaled with short marking lengths. The distance of two short marking lines can be altered with the "XAxisSmallIncrementSize(i)" property.

Access in Runtime: Read and write

Syntax

Object.**XAxisShowSmallIncrements**(i)[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

BOOLEAN

Optional TRUE, if the X axis is scaled with short marking lengths.

See also

FunctionTrendControl (Page 4004)

XAxisSmallIncrementSize(i)

Description

Specifies the distance of two short marking lengths of the X axis. Whether the information is evaluated depends on the property "XAxisShowSmallIncrements(i)".".

Access in Runtime: Read and write

Syntax

Object.**XAxisSmallIncrementSize**(i)[=Double]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

Double

Optional A value or a constant that specifies the distance of two short marking lengths of the X axis scaling.

See also

FunctionTrendControl (Page 4004)

XAxisTrendWindow

Description

Specifies in which trend view the selected axis is used. The available trend views are specified in the properties in "Trends".

Access in Runtime: Read and write

Syntax

Object.**XAxisTrendWindow**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

XAxisVisible

Description

The list shows all axes you created.

Activate the axes which are to be displayed in the trend views in the list.

Click an axis in the list to adapt the properties and to assign the axis to a trend view.

See also

FunctionTrendControl (Page 4004)

XDataLogTag(i)

Description

Specifies the tag that will be shown along the X axis. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**XDataLogTag**(i)[=HmiLoggingTag]

Object

Required A ""ScreenItem" object with the format "FunctionTrendView".

HmiLoggingTag

Optional A value or a constant that specifies which tag will be shown along the X axis.

Comments

If "XOnlineTag(i)"" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent mmediate acceptance of the change with "FreezeProviderConnections before changing "XOnlineTag(i).

See also

FunctionTrendControl (Page 4004)

XOnlineTag(i)

Description

Specifies the tag that will be shown along the X axis. The property "TagProviderType(i)"" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**XOnlineTag**(i)[=HmiTag]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

HmiTag

Optional A value or a constant that specifies which tag will be shown along the X axis.

Comments

The parameter i indicates the number of the trend.

If "XOnlineTag(i)" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent an immediate acceptance of the change with "FreezeProviderConnections" before changing "XOnlineTag(i)".

See also

FunctionTrendControl (Page 4004)

YAxisAdd

Description

Creates a new X axis.

Syntax

Object.**YAxisAdd**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

YAxisAlign

Description

Specifies how the selected axis is aligned.

Syntax

Object.**YAxisAlign**[=Alignement]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

Alignment

Value	Description	Explanation
0	Left	The X axis selected is displayed on left side of the trend.
1	Right	The selected Y axis is displayed to the right of the trend.

YAxisAutoPrecisions

Description

Enables automatic setting of the decimal precision.

Access in Runtime: Read and write

Syntax

Object.Y**AxisAutoPrecisions**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

TRUE: The number of decimal places is specified automatically.

FALSE: The value configured under "Properties > Y axis > Format > Decimal places" is effective.

See also

FunctionTrendControl (Page 4004)

YAxisAutoRange

Value range automatic - X/YAxisAutoRange

Enables automatic calculation of the value range of the axis selected.

Value	Description
TRUE	The range of values is calculated automatically.
FALSE	The range of values is calculated based in the values configured in the "from" and "to" fields.

The X axis attribute can be assigned dynamic properties by means of the name **XAxisAutoRange**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisAutoRange**.

See also

FunctionTrendControl (Page 4004)

YAxisBeginValue

Description

Specifies the lower value range of the selected axis. To configure the value, deactivate the "Automatic" option in "Value range".

See also

FunctionTrendControl (Page 4004)

YAxisColor

Description

Specifies the color of the axis selected. Open the "Color selection" dialog by clicking the button. . The setting is only active if the "Use trend color" field is disabled.

Syntax

Object.**YAxisColor**[=COLOR]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl" or "OnlineTrendControl" (Runtime Professional) or "HMITrendView" (Runtime Advanced).

Color

The color is defined as an RGB value.

See also

FunctionTrendControl (Page 4004)

YAxisCount

Description

Defines the number of Y axes configured.

Syntax

Object.**YAxisCount**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

YAxisEndValue

Description

Specifies the upper value range of the selected axis. To configure the value, deactivate the "Automatic" option in "Value range".

See also

FunctionTrendControl (Page 4004)

YAxisExponentialFormat

Description

Enables the exponential notation for visualization of a selected axis.

Access in Runtime: Read and write

Syntax

Object.**YAxisExponentialFormat** [=BOOLEAN]

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

BOOLEAN

TRUE: The values are displayed in exponential format.

FALSE: The values are displayed in exponential format.

See also

FunctionTrendControl (Page 4004)

YAxisIndex

Description

References a configured Y axis. You can assign the values of other properties to a specific Y axis by using the property.

Valid values for "Index" are between 0 and "YAxisCount" minus 1. The "ToolbarButtonCount" property specifies the number of configured Y axes.

See also

FunctionTrendControl (Page 4004)

YAxisInTrendColor

Description

Enables the display of an axis selected in the trend color. The color of the first trend is activated if several trends are displayed in the trend window. The order of the trends is determined in the "Trends" properties.

Access in Runtime: Read and write

Syntax

Object.**YAxisInTrendColor**[=BOOLEAN]

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

BOOLEAN

TRUE: The selected axis is displayed in the trend color. The setting in the "Color" field is disabled.

FALSE: The selected axis is displayed in the color which is set in the "Color" field.

See also

FunctionTrendControl (Page 4004)

YAxisLabel

Description

Defines the label text for a selected axis.

See also

FunctionTrendControl (Page 4004)

YAxisName

Description

Specifies the name of the selected axis.

Syntax

Object.**XAxisName**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

YAxisPrecisions

Description

Specifies the decimal precision for displaying the axis selected. To configure the value, deactivate the "Automatic" option in "Format".

See also

FunctionTrendControl (Page 4004)

YAxisRename

Description

Changes the name of the Y axis which is referenced by the "YAxisIndex" property.

Syntax

Object.**YAxisRename**

Object

Required An object of the "ScreenItem" type with the format "FunctionTrendControl".

YAxisRemove

Description

Removes the selected axis from the list.

Syntax

Object.**YAxisRemove**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

YAxisRepos

Description

Changes the order of the axes. "Up" and "Down" move the selected axis up or down in the list.

The order in the list determines the position of the axis in the trend view in Runtime. The axis output position is moved away from the trend if the axis is moved further up in the list and the orientation is the same.

Syntax

Object.**YAxisRepos**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

YAxisScalingType

Scaling - X/YAxisScalingType

Defines the scaling mode for a selected axis.

The following settings are available:

Value	Description
0	Linear
1	Logarithmic
2	Logarithmically negated

The X axis attribute can be assigned dynamic properties by means of the name **XAxisScalingType**.

The Y axis attribute can be assigned dynamic properties by means of the name **YAxisScalingType**.

See also

FunctionTrendControl (Page 4004)

YAxisTrendWindow

Description

Specifies in which trend view the selected axis is used. The available trend views are specified in the properties in "Trends".

Access in Runtime: Read and write

Syntax

Object.**YAxisTrendWindow**

Object

Required A "ScreenItem" object with the format "FunctionTrendControl".

See also

FunctionTrendControl (Page 4004)

YAxisVisible

Description

The list shows all axes you created.

Activate the axes which are to be displayed in the trend views in the list.

Click an axis in the list to adapt the properties and to assign the axis to a trend view.

See also

FunctionTrendControl (Page 4004)

YDataLogTag(i)

Description

Specifies the tag that will be shown along the Y axis. The property "TagProviderType(i)"" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**YDataLogTag**(i)[=HmiLoggingTag]

Object

Required A "ScreenItem" object with the format "FunctionTrendView"".

HmiLoggingTag

Optional A value or a constant that specifies which tag will be shown along the Y axis.

Comments

If "YOnlineTag(i)"" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "YOnlineTag(i)"".

See also

FunctionTrendControl (Page 4004)

YOnlineTag(i)

Description

Specifies the tag that will be shown along the Y axis. The property "TagProviderType(i)" must have the value -1.

Access in Runtime: Read and write

Syntax

Object.**YOnlineTag**(i)[=HmiTag]

Object

Required A "ScreenItem" object with the format "FunctionTrendView".

HmiTag

Optional A value or a constant that specifies which tag will be shown along the Y axis.

Comments

The parameter i indicates the number of the trend.

If "YOnlineTag(i)"" is changed, illegal combinations with different attributes for the data connection could arise. This means you have to prevent immediate acceptance of the change with "FreezeProviderConnections" before changing "YOnlineTag(i)".

See also

FunctionTrendControl (Page 4004)

ZeroPoint

Description

Specifies the position of the zero point as a percentage of the bar height. The zero point can also be located outside of the displayed area.

The "ScalingType" property must be set to "Auto".

The "ShowScale" property must be set to "TRUE".

Access in Runtime: Read and write

Syntax

Object.**ZeroPoint**[=Int]

Object

Required A ""ScreenItem" object with the format ""Bar".

Int

Optional A value or a constant that specifies the position of the zero point as a percentage of the bar height.

See also

Bar (Page 3961)

ZeroPointValue

Description

Defines the value of the zero point of the scale indicator.

Defines or returns the absolute value for the zero point.

Zoom/Zoomfactor

Description

Sets or reads the zoom factor of a screen or screen window.

If the indicated zoom factor is smaller than the minimum value, the zoom factor is automatically set to the minimum value. If the indicated zoom factor is larger than the minimum value, the zoom factor is automatically set to the maximum value.

The minimum value of the zoom factor is at 2%, the maximum value at 800%.

With the Screen Object the zoom factor is indicated as a numeric value and with a picture window object, it is indicated in percent.

Zoom: Zoom factor of picture

Zoomfactor: Zoom factor of picture window

Example

The following example doubles the zoom factor of the current picture:

```
'VBS97
HMIRuntime.ActiveScreen.Zoom = HMIRuntime.ActiveScreen.Zoom * 2
```

See also

ScreenWindow (Page 4078)

Zoomable

Description

Specifies whether the DXF screen display supports the zoom functions in Runtime mode.

Access in Runtime: Read and write

Syntax

Object.**Zoomable**[=BOOLEAN]

Object

Required A "ScreenItem" object with the format "DXFView".

BOOLEAN

Optional TRUE, if the DXF screen display supports the zoom functions in Runtime mode.

Methods

Methods A-G

Activate

Description

Activates the permanent window or the root screen.

To activate a not selected screen, use the "BaseScreenName" property.

It only makes sense to use the activate method with the following operable screen objects. An error message is output at screen objects which cannot be operated, for example rectangles.

- I/O field
- Switch
- Symbol library
- Trend view
- f(x) trend view
- HTML browser
- Slider
- Graphic I/O field

- Symbolic I/O field
- Button
- Alarm view
- User view
- Recipe view
- Sm@rtClient View
- Status/Force

Syntax

Expression.Activate

Expression

Necessary. An output which returns an object of the "Screen" or "ScreenItem" type.

Parameters

--

ActivateDynamic

Description

Dynamically activates a trigger and the specified cycle for a property at runtime. This requires a VB script at the property as well as a trigger set to "On demand". Every time the trigger is activated a different activation cycle can be used.

Syntax

```
Expression.ActivateDynamic (ByVAl bstrPropertyName As String, ByVal
bstrCycleName As String)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Parameter	Description
bstrPropertyName	Name of property to which trigger relates.
bstrCycleName	Name of activation cycle, e.g. "CycleTime1s".

Add

Description of TagSet Object

Adds a tag to the list. A tag may be added to the tag object by using name or reference.

syntax

```
Expression.Add [Tag]
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be added to the list.

Example:

In the following example, a TagSet object is generated and a tag is added.

```
'VBS170
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
```

Tag objects may also be added as follows.

```
'VBS171
Dim Tag
Set Tag = HMIRuntime.Tags("Motor2")
Dim group2
Set group2 = HMIRuntime.Tags.CreateTagSet
group2.Add Tag
```

Description of DataSet Object

Adds a value or object reference to the list.

Note

The Data Set Object does not support classes.
Objects of type Screen, Screens, ScreenItem, ScreenItems, Tag and TagSet cannot be included in the DataSet list.
For object references it must be ascertained that objects are multiread-enabled.

syntax

```
Expression.Add [vtName], [vtUserData]
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

VARIANT

Parameters	Description
vtName	Name by which value or tag are to be added to list.
vtUserData	Value to be added to list.

Example:

In this example, a value is included in the DataSet list.

```
'VBS172
HMIRuntime.DataSet.Add "Motor1",23
```

AttachDB method

Description

Executes the "Connect backup" key function of the control.

Syntax

```
Ausdruck.AttachDB()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

FunctionTrendControl (Page 4004)

AlarmControl (Page 3947)

CalculateStatistic

Description

Executes the "calculate statistics" key function of the f(t) trend view.

Syntax

```
Ausdruck.CalculateStatistic()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

CopyRows

Description

Executes the "Copy lines" key function of the control.

Syntax

```
Ausdruck.CopyRows()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

UserArchiveControl (Page 4130)

AlarmControl (Page 3947)

Create

Description

Creates a new Alarm object.

Syntax

```
Expression.Create (VARIANT vtApplication)
```

Expression

Required An expression which returns an object of type "Alarm".

Parameters

```
VARIANT
```

Parameters	Description
vtApplication	Name of alarm object (optional)

See also

OnlineTrendControl (Page 4045)

CreateTagSet

Description

Creates a new TagSet object. This object may be used for optimized multi-tag access.

syntax

```
Expression.CreateTagSet()
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

VARIANT

Example:

The following example shows how to create a TagSet object.

```
'VBS168
'Build a Reference to the TagSet Object
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
```

CutRows

Description

Executes the "Cut rows" key function of the recipe view.

Syntax

```
Ausdruck.CutRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

UserArchiveControl (Page 4130)

DeactivateDynamic

Description

Deactivates the trigger of the "ActivateDynamic" method used for the specified property in/ during runtime.

Syntax

```
Ausdruck.DeactivateDynamic(ByVal bstrPropertyName As String)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

String

Parameters	Description
bstrPropertyName	Name of property to which trigger relates.

GetColumn

Description

Returns the column object of the recipe view designated by name or index as "ICCAxUAColumn" type.

Syntax

```
Ausdruck.GetColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the column of the recipe view

Example

```
'VBS312
Dim ctrl
Dim objColumn
Set ctrl = ScreenItems("RecipeControl")
Set objColumn = ctrl.GetColumn("Field1")
objColumn.Length = 30
Set objColumn = ctrl.GetColumn(3)
objColumn.Align = 2
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "Column" listing, for example, you write "objColumn.Align" instead of "objColumn.ColumnAlign".

GetColumnCollection

Description

Returns the list of all column objects of the recipe view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS313
Dim ctrl
Dim coll
Dim field
Set ctrl = ScreenItems("RecipeControl")
Set coll = ctrl.GetColumnCollection
HMIRuntime.Trace "Number of fields:" & coll.Count & vbCrLf
For Each field In coll
 HMIRuntime.Trace field.Name & vbCrLf
 HMIRuntime.Trace field.Type & vbCrLf
 HMIRuntime.Trace field.Length & vbCrLf
 HMIRuntime.Trace field.Caption & vbCrLf
Next
```

GetHistlistColumnCollection

Description

Returns the list of all column objects of the message view hit list as "ICCAxCollection" type.

Syntax

```
Expression.GetHitlisteColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS315
Dim ctrl
Dim coll
Dim hitlistcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetHitlistColumnCollection
HMIRuntime.Trace "Number of hitlist columns:" & coll.Count & vbCrLf
For Each hitlistcol In coll
 HMIRuntime.Trace hitlistcol.Index & vbCrLf
 HMIRuntime.Trace hitlistcol.Name & vbCrLf
 HMIRuntime.Trace hitlistcol.Sort & vbCrLf
 HMIRuntime.Trace hitlistcol.SortIndex & vbCrLf
Next
```

GetHitlistColumn

Description

Returns the column object of the message view hit list designated by name or index as "ICCAxMessageColumn" type.

Syntax

```
Expression.GetHitlistColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of hitlist column

Example

```
'VBS314
Dim ctrl
Dim objHitlistColumn
Set ctrl = ScreenItems("AlarmControl")
Set objHitlistColumn = ctrl.GetHitlistColumn("Date")
objHitlistColumn.Sort = 2
Set objHitlistColumn = ctrl.GetHitlistColumn("AverageComeGo")
objHitlistColumn.Visible = FALSE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "HitlistColumn" listing, for example, you write "objHitlistColumn.Visible" instead of "objHitlistColumn.HitlistColumnVisible".

GetMessageBlock

Description

Returns the message block of the message view designated by name or index as "ICCAxMessageBlock" type.

Syntax

```
Expression.GetMessageBlock(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of message block.

Example

```
'VBS316
Dim ctrl
Dim objMsgBlock
Set ctrl = ScreenItems("AlarmControl")
Set objMsgBlock = ctrl.GetMessageBlock("Date")
objMsgBlock.Align = 2
Set objMsgBlock = ctrl.GetMessageBlock("Number")
objMsgBlock.LeadingZeros = 4
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageBlock" listing, for example, you write "objMsgBlock.Align" instead of "objMsgBlock.MessageBlockAlign".

GetMessageBlockCollection

Description

Returns the list of all message block objects of the message view as "ICCAxCollection" type.

Syntax

```
Expression.GetMessageBlockCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS317
Dim ctrl
Dim coll
Dim msgblock
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageBlockCollection
For Each msgblock In coll
 msgblock.Align = 1
 msgblock.Length = 12
 msgblock.Selected = TRUE
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageBlock" listing, for example, you write "msgblock.Align" instead of "msgblock.MessageBlockAlign".

GetMessageColumn

Description

Returns the column object of the message view designated by name or index as "ICCAxMessageColumn" type.

Syntax

```
Expression.GetMessageColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column in message list.

Example

```
'VBS318
Dim ctrl
Dim objMessColumn
Set ctrl = ScreenItems("AlarmControl")
Set objMessColumn = ctrl.GetMessageColumn("Date")
objMessColumn.Visible = FALSE
Set objMessColumn = ctrl.GetMessageColumn("Number")
objMessColumn.Sort = 1
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "MessageColumn" listing, for example, you write "objMessColumn.Visible" instead of "objMessColumn.MessageColumnVisible".

GetOperatorMessage

Description

Returns the operator message object of the message view designated by name or index as "ICCAxOperatorMessage" type.

Syntax

```
Expression.GetOperatorMessage(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of operator message

Example

```
'VBS320
Dim ctrl
Dim objOpMess
Set ctrl = ScreenItems("AlarmControl")
Set objOpMess = ctrl.GetOperatorMessage(0)
objOpMess.Source1 = "Number"
objOpMess.SourceType1 = 1
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "OperatorMessage" listing, for example, you write "objOpMess.Source1" instead of "objOpMess.OperatorMessageSource1".

Expression.GetMessageColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS319
Dim ctrl
Dim coll
Dim msgcol
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetMessageColumnCollection
HMIRuntime.Trace "Number of message columns:" & coll.Count & vbCrLf
For Each msgcol In coll
 HMIRuntime.Trace msgcol.Index & vbCrLf
 HMIRuntime.Trace msgcol.Name & vbCrLf
 HMIRuntime.Trace msgcol.Sort & vbCrLf
 HMIRuntime.Trace msgcol.SortIndex & vbCrLf
```

```
Next
```

GetOperatorMessageCollection

Description

Returns the list of all operator message objects of the message view as "ICCAxCollection" type.

Syntax

```
Expression.GetOperatorMessageCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS321
Dim ctrl
Dim coll
Dim opmsg
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetOperatorMessageCollection
```

```
For Each opmsg In coll
 HMIRuntime.Trace opmsg.Index & vbCrLf
 HMIRuntime.Trace opmsg.Name & vbCrLf
 HMIRuntime.Trace opmsg.Number & vbCrLf
 HMIRuntime.Trace opmsg.Selected & vbCrLf
Next
```

GetRow

Description

Returns the row object defined by its row number in the table-based controls as "ICCAxDataRow" type.

Syntax

```
Expression.GetRow(ByVal IRow As Long)
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

Long

Parameters	Description
IRow	Number of the desired line of the control.

Example

```
'VBS356
Dim coll
Dim ctrl
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("UAControl")
Set coll = ctrl.GetRowCollection
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
 HMIRuntime.trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & "  "
```

```
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
  HMIRuntime.trace ctrl.GetRow(0).CellText(lCellIndex) & "  "
  HMIRuntime.trace ctrl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.trace vbNewLine
Next
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

GetRowCollection

Description

Returns the list of all row objects of the table-based controls type "ICCAxDataRowCollection".

Syntax

```
Expression.GetRowCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Properties of the ICCAxDataRowCollection

The ICCAxDataRowCollection refers to runtime data. The data is read-only. It is not possible to add and edit the data.

The following properties are available for the ICCAxDataRowCollection:

- Count - Determines the number of rows in the collection.
- Item - Access to an individual row within the collection via the row number. Numbering runs from 1 to Count. A Row object is returned.

Example

```
'VBS357
Dim ctrl
Dim coll
Dim lIndex
Dim lCellIndex
Set ctrl = ScreenItems("AlarmControl")
Set coll = ctrl.GetRowCollection
HMIRuntime.Trace "Number of message rows:" & coll.Count & vbCrLf
'enumerate and trace out row numbers
For lIndex = 1 To coll.Count
 HMIRuntime.Trace "Row: " & (ctrl.GetRow(lIndex).RowNumber) & "  "
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To ctrl.GetRow(lIndex).CellCount
  HMIRuntime.Trace ctrl.GetMessageColumn(lCellIndex -1).Name & " "
  HMIRuntime.Trace ctrl.GetRow(lIndex).CellText(lCellIndex) & "  "
 Next
 HMIRuntime.Trace vbNewLine
Next
```

GetRulerBlock

Description

Returns the block object of the evaluation table designated by name or index as "ICCAxRulerBlock" type.

Syntax

```
Expression.GetRulerBlock(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the block in the evaluation table

Example

```
'VBS322
Dim ctrl
Dim objRulerBlock
Set ctrl = ScreenItems("RulerControl")
Set objRulerBlock = ctrl.GetRulerBlock(0)
objRulerBlock.Caption = "RulerBlock1"
Set objRulerBlock = ctrl.GetRulerBlock("Name")
objRulerBlock.Length = 10
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerBlock" listing, for example, you write "objRulerBlock.Caption" instead of "objRulerBlock.BlockCaption".

GetRulerBlockCollection

Description

Returns the list of all block objects of the evaluation table as "ICCAxCollection" type.

Syntax

```
Expression.GetRulerBlockCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS323
Dim ctrl
Dim coll
Dim rulerblock
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerBlockCollection
For Each rulerblock In coll
 rulerblock.Align = 1
 rulerblock.Length = 12
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerBlock" listing, for example, you write "rulerblock.Align" instead of "rulerblock.RulerBlockAlign".

GetRulerColumn

Description

Returns the column object of the evaluation table designated by name or index as "ICCAxRulerColumn" type.

Syntax

```
Expression.GetRulerColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the column of the evaluation

Example

```
'VBS324
Dim ctrl
Dim objRulercol
Set ctrl = ScreenItems("RulerControl")
Set objRulercol = ctrl.GetRulerColumn("Name")
objRulercol.Sort = 0
Set objRulercol = ctrl.GetRulerColumn("ValueY")
objRulercol.Visible = FALSE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "RulerColumn" listing, for example, you write "objRulercol.Visible" instead of "objRulercol.ColumnVisible".

GetRulerColumnCollection

Description

Returns the list of all column objects of the evaluation table as "ICCAxCollection" type.

Syntax

```
Expression.GetRulerColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS325
Dim ctrl
Dim coll
Dim rulercol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetRulerColumnCollection
HMIRuntime.Trace "Number of ruler columns:" & coll.Count & vbCrLf
For Each rulercol In coll
```

```
  HMIRuntime.Trace rulercol.Index & vbCrLf
  HMIRuntime.Trace rulercol.Name & vbCrLf
  HMIRuntime.Trace rulercol.Sort & vbCrLf
  HMIRuntime.Trace rulercol.SortIndex & vbCrLf
Next
```

GetRulerData

Description

Returns the value of the called trend at the ruler position.

Syntax

```
Expression.GetRulerData(ByVal RulerIndex As Long, pvValue As
Variant, Optional pvTimeStamp As Variant, Optional pvFlags As
Varian) Long
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Parameters

Parameters	Description
RulerIndex	0 =Ruler
pvValue	Value of X axis
pvTimeStamp	Time or value of the Y axis
pvFlags	Qualitycode

Example

```
'VBS326
Dim ctrl
Dim objTrend
Dim objIOField1
Dim objIOField2
Dim rulvalue
Dim rultime
```

```
Set ctrl = ScreenItems( "Control1" )
Set objTrend = ctrl.GetTrend( "Trend 1" )
Set objIOField1 = ScreenItems( "I/O Field1" )
Set objIOField2 = ScreenItems( "I/O Field2" )
objTrend.GetRulerData 0, rulvalue, rultime
objIOField1.OutputValue = rulvalue
objIOField2.OutputValue = rultime
```

GetSelectedRow

Description

Returns the selected row object of a table-based control as "ICCAxDataRow" type.

Syntax

```
Expression.GetSelectedRow()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Example

```
'VBS358
Dim ctrl
 Dim lCellIndex
 Dim lCellCount
 Dim headingRow
 Dim selectedRow
 Set ctrl = ScreenItems("TableControl")
 Set headingRow = ctrl.GetRow(0)
 Set selectedRow = ctrl.GetSelectedRow
 lCellCount = headingRow.CellCount
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To lCellCount
  HMIRuntime.trace headingRow.CellText(lCellIndex) & ":  "
  HMIRuntime.trace selectedRow.CellText(lCellIndex)
    HMIRuntime.trace vbNewLine
 Next
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

GetSelectedRows

Description

Returns the selected row objects of a table-based control as type "ICCAxDataRow" for multiple selection.

Syntax

```
Expression.GetSelectedRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Example

```
'VBS359
Dim ctrl
 Dim lCellIndex
 Dim lCellCount
 Dim lRowIndex
```

```
Dim lRowCount
Dim headingRow
Dim selectedRow
Dim selectedRows
Set ctrl = ScreenItems("TableControl")
Set headingRow = ctrl.GetRow(0)
Set selectedRows = ctrl.GetSelectedRows
lCellCount = headingRow.CellCount
lRowCount = selectedRows.Count
'enumerate selected rows
For lRowIndex = 1 To lRowCount
 Set selectedRow = selectedRows(lRowIndex)
 HMIRuntime.Trace "Row number: " & CStr(lRowIndex) & vbNewLine
 'enumerate and trace out column titles and cell texts
 For lCellIndex = 1 To lCellCount
  HMIRuntime.trace headingRow.CellText(lCellIndex) & ":  "
  HMIRuntime.trace selectedRow.CellText(lCellIndex)
    HMIRuntime.trace vbNewLine
 Next
Next
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Row" listing, for example, you write "objRow.CellCount" instead of "objRow.RowCellCount".

GetStatisticAreaColumn

Description

Returns the column object of the statistic area window of the evaluation window designated by name or index as "ICCAxRulerColumn" type.

Syntax

```
Ausdruck.GetStatisticAreaColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics area window.

Example

```
'VBS327
Dim ctrl
Dim objStatAreaCol
Set ctrl = ScreenItems("RulerControl")
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("DatasourceY")
objStatAreaCol.Visible = FALSE
Set objStatAreaCol = ctrl.GetStatisticAreaColumn("ValueY(LL)")
objStatAreaCol.Sort = 1
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatisticAreaColumn" listing, for example, you write "objStatAreaCol.Visible" instead of "objStatAreaCol.ColumnVisible".

GetStatisticAreaColumnCollection

Description

Returns the list of all column objects of the statistic area window of the evaluation table as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetStatisticAreaColumnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS328
Dim ctrl
Dim coll
Dim statcol
Set ctrl = ScreenItems("RulerControl")
Set coll = ctrl.GetStatisticAreaColumnCollection
HMIRuntime.Trace "Number of statistic Area columns:" & coll.Count & vbCrLf
For Each statcol In coll
 HMIRuntime.Trace statcol.Index & vbCrLf
 HMIRuntime.Trace statcol.Name & vbCrLf
 HMIRuntime.Trace statcol.Sort & vbCrLf
 HMIRuntime.Trace statcol.SortIndex & vbCrLf
Next
```

GetStatisticResultColumn

Description

Returns the column object of the statistic window of the evaluation window designated by name or index as "ICCAxRulerColumn" type.

Syntax

```
Ausdruck.GetStatisticResultColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of column of statistics window.

Example

```
'VBS329
Dim ctrl
Dim objStatResCol
Set ctrl = ScreenItems("RulerControl")
Set objStatResCol = ctrl.GetStatisticResultColumn("MaxValue")
objStatResCol.Visible = FALSE
Set objStatResCol = ctrl.GetStatisticResultColumn("Average")
objStatResCol.Sort = 2
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatisticResultColumn" listing, for example, you write "objStatResCol.Visible" instead of "objStatResCol.ColumnVisible".

GetStatusbarElement

Description

Returns the element of the control status bar designated as name or index as type "ICCAxStatusbarElement".

Syntax

```
Ausdruck.GetStatusbarElement(ByVal vIndex As Variant)
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of status bar element.

Example

```
'VBS331
Dim ctrl
Dim objStatusBar
Set ctrl = ScreenItems( "Control1" )
Set objStatusBar = ctrl.GetStatusbarElement(1)
objStatusBar.Visible = FALSE
Set objStatusBar = ctrl.GetStatusbarElement(3)
objStatusBar.Width = 10
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatusbarElement" listing, for example, you write "objStatusBar.Visible" instead of "objStatusBar.StatusbarElementVisible".

Description

Returns the list of all status bar elements of the control as type "ICCAxCollection".

Syntax

```
Ausdruck.GetStatusbarElementCollection()
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS332
Dim ctrl
Dim coll
Dim statelement
Set ctrl = ScreenItems.Item("Control1")
Set coll = ctrl.GetStatusbarElementCollection
HMIRuntime.Trace "Number of statusbar elements:" & coll.Count & vbCrLf
For Each statelement In coll
 HMIRuntime.Trace statelement.Name & vbCrLf
 HMIRuntime.Trace statelement.Width & vbCrLf
 HMIRuntime.Trace statelement.Text & vbCrLf
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "StatusbarElement" listing, for example, you write "statelement.Name" instead of "statelement.StatusbarElementName".

GetTimeAxis

Description

Returns the time object that is specified by name or index for the f(t) trend view as "ICCAxTimeAxis" type.

Syntax

```
Expression.GetTimeAxis(ByVal vIndex As Variant)
```

Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time axis.

Example

```
'VBS333
Dim ctrl
Dim objTimeAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTimeAxis = ctrl.GetTimeAxis(1)
objTimeAxis.Visible = FALSE
Set objTimeAxis = ctrl.GetTimeAxis("axis 2")
objTimeAxis.Label = "Time axis 2"
objTimeAxis.DateFormat = "dd.MM.yy"
objTimeAxis.TimeFormat = "HH:mm:ss.ms"
objTimeAxis.RangeType = 2
'The format to be used for date and time entries depends on the
'regional settings and language options in the operating system.
objTimeAxis.BeginTime = "06.04.2010 9:33:18"
'objTimeAxis.BeginTime = "04/06/2010 9:33:18"
objTimeAxis.MeasurePoints = 100
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "TimeAxis" listing, for example, you write "objTimeAx.Visible" instead of "objTimeAx.TimeAxisVisible".

GetTimeAxisCollection

Description

Returns a list of all time objects of the f(t) trend view as "ICCAxCollection" type.

Syntax

```
Expression.GetTimeAxisCollection()
```

Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for ICCAxCollection:

- Count
- Item

The following functions are available for ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS334
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis1
Dim objTimeAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis1 = ctrl.GetTimeAxisCollection.AddItem("TimeAxis2010")
Set objTimeAxis2 = ctrl.GetTimeAxisCollection.AddItem("TimeAxis2011")
objTimeAxis1.TrendWindow = objTrendWnd.Name
objTimeAxis1.Label = "2010"
objTimeAxis1.RangeType = 1
'The format to be used for date and time entries depends on the
'regional settings and language options in the operating system.
objTimeAxis1.BeginTime = "01.01.2010 0:00:00"
'objTimeAxis1.BeginTime = "01/01/2010 0:00:00"
objTimeAxis1.EndTime = "31.12.2010 11:59:59"
```

```
'objTimeAxis1.EndTime = "12/31/2010 11:59:59"
objTimeAxis2.TrendWindow = objTrendWnd.Name
objTimeAxis2.Label = "2011"
objTimeAxis2.RangeType = 1
objTimeAxis2.BeginTime = "01.01.2011 0:00:00"
'objTimeAxis2.BeginTime = "01/01/2011 0:00:00"
objTimeAxis2.EndTime = "31.12.2011 11:59:59"
'objTimeAxis2.EndTime = "12/31/2011 11:59:59"
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis2.Name
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "TimeAxis" listing, for example, you write "objTimeAxis1.Label" instead of "objTimeAxis1.TimeAxisLabel".

GetTimeColumn

Description

Returns the time column object of the table view designated by name or index as "ICCAxTime Column" type.

Syntax

```
Ausdruck.GetTimeColumn(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of time column.

Example

```
'VBS335
Dim ctrl
Dim objTimeCol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol = ctrl.GetTimeColumn("Timecolumn1")
objTimeCol.ShowDate = FALSE
Set objTimeCol = ctrl.GetTimeColumn("Timecolumn2")
objTimeCol.Visible = FALSE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "TimeColumn" listing, for example, you write "objTimeColumn.ShowDate" instead of "objTimeColumn.TimeColumnShowDate".

GetTimeColumnCollection

Description

Returns the list of all time column objects of the table view as "ICCAxCollection" type.

Syntax

```
Expression.GetTimeColumnCollection()
```

Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for ICCAxCollection:

- Count
- Item

The following functions are available for ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS336
Dim ctrl
Dim objTimeCol1
Dim objTimeCol2
Dim coll
Dim timecol
Set ctrl = ScreenItems("TableControl")
Set objTimeCol1 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2010")
Set objTimeCol2 = ctrl.GetTimeColumnCollection.AddItem("TimeColumn2011")
objTimeCol1.Caption = "2010"
objTimeCol1.RangeType = 1
'The format to be used for date and time entries depends on the
'regional settings and language options in the operating system.
objTimeCol1.BeginTime = "01.01.2010 0:00:00"
'objTimeCol1.BeginTime = "01/01/2010 0:00:00"
objTimeCol1.EndTime = "31.12.2010 11:59:59"
'objTimeCol1.EndTime = "12/31/2010 11:59:59"
objTimeCol2.Caption = "2011"
objTimeCol2.RangeType = 0
objTimeCol2.BeginTime = "01.01.2011 0:00:00"
'objTimeCol2.BeginTime = "01/01/2011 0:00:00"
objTimeCol2.TimeRangeFactor = 1
objTimeCol2.TimeRangeBase = 3600000
Set coll = ctrl.GetTimeColumnCollection
For Each timecol In coll
 timecol.Align = 1
 timecol.Length = 12
 timecol.BackColor = RGB(240,240,0)
 timecol.ForeColor = RGB(130,160,255)
Next
```

GetToolbarButton

Description

Returns the button function designated by name or index on the control toolbar as "ICCAxToolbarButton" type.

Syntax

```
Ausdruck.GetToolbarButton(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of toolbar button function.

Example

```
'VBS337
Dim ctrl
Set ctrl = ScreenItems( "Control1" )
Dim toolbu
Set toolbu = ctrl.GetToolbarButton ("ShowHelp")
HMIRuntime.Trace "Name: " & toolbu.Name & vbCrLf
HMIRuntime.Trace "Index: " & toolbu.Index & vbCrLf
HMIRuntime.Trace "Hotkey: " & toolbu.HotKey & vbCrLf
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "ToolbarButton" listing, for example, you write "toolbu.Index" instead of "toolbu.ToolbarButtonIndex".

GetTrend

Description

Returns the f(t) or f(x) trend view designated by name or index as "ICCAxTrend" or "ICCAxFunctionTrend" type.

Syntax

```
Ausdruck.GetTrend(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve.

Example for Runtime Professional

```
'VBS339
Dim ctrl
```

```
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrend = ctrl.GetTrend( "Trend 1" )
objTrend.PointStyle = 1
objTrend.LineWidth = 4
Set objTrend = ctrl.GetTrend(2)
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag2"
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Trend" listing, for example, you write "objTrend.PointStyle" instead of "objTrend.TrendPointStyle".

GetTrendCollection

Description

Returns the list of all trends of the f(t) or f(x) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetTrendCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example for Runtime Professional

```
'VBS340
Dim ctrl
Dim objTrendWnd
Dim objTimeAxis
Dim objValAxis
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objTimeAxis = ctrl.GetTimeAxisCollection.AddItem("myTimeAxis")
Set objValAxis = ctrl.GetValueAxisCollection.AddItem("myValueAxis")
objTimeAxis.TrendWindow = objTrendWnd.Name
objValAxis.TrendWindow = objTrendWnd.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.Provider = 1
objTrend.TagName = "Archive\ArchiveTag1"
objTrend.TrendWindow = objTrendWnd.Name
objTrend.TimeAxis = objTimeAxis.Name
objTrend.ValueAxis = objValAxis.Name
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "Trend" listing, for example, you write "objTrend.TagName" instead of "objTrend.TrendTagName".

GetTrendWindow

Description

Returns the trend view object of the f(t) trend view or the f(x) trend view designated by name or index as "ICCAxTrendWindow" type.

Syntax

```
Ausdruck.GetTrendWindow(ByVal vIndex As Variant)
```

Expression

Required An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of curve window.

Example for Runtime Professional

```
'VBS341
Dim ctrl
Dim objTrendWnd
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindow(1)
objTrendWnd.Visible = FALSE
Set objTrendWnd = ctrl.GetTrendWindow("trend window 2")
objTrendWnd.VerticalGrid = TRUE
objTrendWnd.FineGrid = TRUE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "TrendWindow" listing, for example, you write "objTrendWnd.Visible" instead of "objTrendWnd.TrendWindowVisible".

GetValueAxis

Description

Returns the value axis object of the f(t) trend view designated by name or index as "ICCAxValueAxis" type.

Syntax

```
Ausdruck.GetValueAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the value axis

Example

```
'VBS343
Dim ctrl
Dim objValAxis
Set ctrl = ScreenItems("OnlineTrendControl")
Set objValAxis = ctrl.GetValueAxis(1)
objValAxis.Visible = FALSE
Set objValAxis = ctrl.GetValueAxis("axis 2")
objValAxis.Label = "Value axis 2"
objValAxis.ScalingType = 0
objValAxis.Precisions = 2
objValAxis.AutoRange = TRUE
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "ValueAxis" listing, for example, you write "objValueAx.Visible" instead of "objValueAx.ValueAxisVisible".

GetValueAxisCollection

Description

Returns the list of all value axis objects of the f(t) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetValueAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS344
Dim ctrl
Dim objTrendWnd
Dim objValAxis1
Dim objValAxis2
Dim objTrend
Set ctrl = ScreenItems("OnlineTrendControl")
Set objTrendWnd = ctrl.GetTrendWindowCollection.AddItem("myWindow")
Set objValAxis1 = ctrl.GetValueAxisCollection.AddItem("myValueAxis1")
Set objValAxis2 = ctrl.GetValueAxisCollection.AddItem("myValueAxis2")
objValAxis1.TrendWindow = objTrendWnd.Name
objValAxis1.Label = "Value1"
objValAxis2.TrendWindow = objTrendWnd.Name
objValAxis2.inTrendColor = TRUE
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend1")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis1.Name
Set objTrend = ctrl.GetTrendCollection.AddItem("myTrend2")
objTrend.TrendWindow = objTrendWnd.Name
objTrend.ValueAxis = objValAxis2.Name
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "ValueAxis" listing, for example, you write "objValueAxis1.Label" instead of "objValueAxis1.ValueAxisLabel".

GetValueColumn

Description

Returns the value column object defined by name or index for the tabular view as "ICCAxValueColumn" type.

Syntax

```
Expression.GetValueColumn(ByVal vIndex As Variant)
```

Expression

Necessary. Expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of the value column of the f(t) trend view.

Example

```
'VBS345
Dim ctrl
Dim objValueColumn
Set ctrl = ScreenItems("TableControl")
Set objValueColumn = ctrl.GetValueColumn("Valuecolumn1")
objValueColumn.Precisions = 4
Set objValueColumn = ctrl.GetValueColumn(2)
objValueColumn.ExponentialFormat = TRUE
```

Note

When you use the "Get..." methods to access properties from the control object list rather than with the control object, you have to omit the prefix of the property with the name of the list.

For the "ValueColumn" listing, for example, you write "objValueColumn.Precisions" instead of "objValueColumn.ValueColumnPrecisions".

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

GetValueColumnCollection

Description

Returns the list of all value column objects of the f(t) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetValueColulmnCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS346
Dim ctrl
Dim objValCol1
Dim objValCol2
Dim coll
Dim valcol
Set ctrl = ScreenItems("TableControl")
Set objValCol1 = ctrl.GetValueColumnCollection.AddItem("ValueColumn1")
Set objValCol2 = ctrl.GetValueColumnCollection.AddItem("ValueColumn2")
objValCol1.Caption = "Value Archive"
objValCol1.Provider = 1
objValCol1.TagName = "ProcessValueArchive\arch1"
objValCol1.TimeColumn = "TimeColumn1"
objValCol2.Caption = "Value Tag"
objValCol2.Provider = 2
objValCol2.TagName = "tagxx"
objValCol2.TimeColumn = "TimeColumn2"
Set coll = ctrl.GetValueColumnCollection
For Each valcol In coll
 valcol.Align = 2
 valcol.Length = 10
 valcol.AutoPrecisions = TRUE
Next
```

GetXAxis

Description

Returns the X axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.

Syntax

```
Ausdruck.GetXAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of X axis.

Example

```
'VBS347
Dim ctrl
Dim objXAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAx = ctrl.GetXAxis(1)
objXAx.Visible = FALSE
Set objXAx = ctrl.GetXAxis("axis 2")
objXAx.Label = "X axis 2"
objXAx.ScalingType = 0
objXAx.Precisions = 2
objXAx.Color = RGB(109,109,109)
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "XAxis" listing, for example, you write "objXAx.Visible" instead of "objXAx.XAxisVisible".

GetXAxisCollection

Description

Returns the list of all X axis objects of the f(x) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetXAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS348
Dim ctrl
Dim objXAxis1
Dim objXAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objXAxis1 = ctrl.GetXAxisCollection.AddItem("myXAxis1")
objXAxis1.Label = "temperature"
Set objXAxis2 = ctrl.GetXAxisCollection.AddItem("myXAxis2")
objXAxis2.Label = "pressure"
Set coll = ctrl.GetXAxisCollection
HMIRuntime.Trace "Number of XAxis:" & coll.Count & vbCrLf
For Each axes In coll
 HMIRuntime.Trace axes.Name & vbCrLf
 HMIRuntime.Trace axes.Label & vbCrLf
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "XAxis" listing, for example, you write "objXAxis1.Label" instead of "objXAxis1.XAxisLabel".

GetYAxis

Description

Returns the Y axis object of the f(x) trend view designated by name or index as "ICCAxValueAxis" type.

Syntax

```
Ausdruck.GetYAxis(ByVal vIndex As Variant)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

Parameters	Description
vIndex	Index or name of Y axis.

Example

```
'VBS349
Dim ctrl
Dim objYAx
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAx = ctrl.GetYAxis(1)
objYAx.Visible = FALSE
Set objYAx = ctrl.GetYAxis("axis 2")
objYAx.Label = "Y axis 2"
objYAx.Align = 0
objYAx.Precisions = 3
objYAx.EndValue = 90.000
objYAx.BeginValue = 10.000
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "YAxis" listing, for example, you write "objYAx.Visible" instead of "objYAx.YAxisVisible".

GetYAxisCollection

Description

Returns the list of all Y axis objects of the f(x) trend view as "ICCAxCollection" type.

Syntax

```
Ausdruck.GetYAxisCollection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

Features and functions of the ICCAxCollection

The following properties are available for the ICCAxCollection:

- Count
- Item

The following functions are available for the ICCAxCollection:

- AddItem(vName) As Object
- RemoveItem(vIndex)

Example

```
'VBS350
Dim ctrl
Dim objYAxis1
Dim objYAxis2
Dim coll
Dim axes
Set ctrl = ScreenItems("FunctionTrendControl")
Set objYAxis1 = ctrl.GetXAxisCollection.AddItem("myYAxis1")
objYAxis1.Label = "temperature"
Set objYAxis2 = ctrl.GetXAxisCollection.AddItem("myYAxis2")
objYAxis2.Label = "pressure"
Set coll = ctrl.GetYAxisCollection
HMIRuntime.Trace "Number of YAxis:" & coll.Count & vbCrLf
For Each axes In coll
 HMIRuntime.Trace axes.Name & vbCrLf
 HMIRuntime.Trace axes.Label & vbCrLf
Next
```

Note

When you use the "Get..." methods to access properties from the Control object list rather than with the Control object, you have to omit the prefix of the property with the name of the list.

For the "YAxis" listing, for example, you write "objYAxis1.Label" instead of "objYAxis1.YAxisLabel".

Methods H-R

HideAlarm

Description

Executes the "Hide alarm" button function of the alarm view.

Syntax

```
Expression.HideAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

InsertData

Description

Adds data to the called trend.

Syntax

```
Expression.InsertData(dblAxisX As Variant, dblAxisY As Variant)
```

Expression

Necessary. An expression which returns an object of the "Trend" type.

Parameters

Parameters	Description
dblAxisX	Value of X axis
dblAxisY	Value of Y axis

Example

```
'VBS300
Dim lngFactor
Dim dblAxisX
Dim dblAxisY
Dim objTrendControl
Dim objTrend
Set objTrendControl = ScreenItems("Control1")
Set objTrend = objTrendControl.GetTrend("Trend 1")
For lngFactor = -100 To 100
dblAxisX = CDbl(lngFactor * 0.02)
dblAxisY = CDbl(dblAxisX * dblAxisX + 2 * dblAxisX + 1)
objTrend.InsertData dblAxisX, dblAxisY
Next
```

Item

Description

Returns an element from a list.

Syntax

Expression.Item(Index)

Expression

Necessary. An expression which returns a list.

Parameters

Index

The name or the index number of an element of the list:

- ScreenItems-Listing: Use an object name, e.g. "HmiRuntime.Screens(1).ScreenItems("Circle")", or the index number.
- Screens-Listing: Use either the name or the index number.
- SmartTags-Listing: You can only use the tag name as index in the SmartTags list. A counting of all tags is not possible.

If the transferred value does not correspond with an element in the list, an error occurs. The return value has the value "Nothing".

```
On Error Resume Next
Dim screen
Set screen = HmiRuntime.Screens("Screen_1")
If (screen is Nothing)
then...
Else...
End If
```

Best practice for optimizing auto-completion support is to use combined addressing by means of screen name and object name, e.g. `"HmiRuntime.Screens("Screen").ScreenItems("Circle")"`.

Example

The item method is the default method for lists. Therefore, the results are the same for the following two examples:

```
'VBS_Example_Item
HMIRuntime.Screens.Item(1)
HMIRuntime.Screens(1)
```

Both instructions reference the respective base screen.

LockAlarm

Description

Executes the "Disable alarm" button function of the alarm view.

Syntax

```
Expression.LockAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

LoopInAlarm

Description

Executes the "Loop in alarm" button function of the alarm view.

Syntax

```
Expression.LoopInAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

MoveAxis

Description

Executes the "Move axes area" button function of the f(t) and f(x) trend views.

Syntax

```
Expression.MoveAxis()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

MoveToFirst

Description

Executes the "First line" button function of the control.

Syntax

```
Expression.MoveToFirst()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

UserArchiveControl (Page 4130)

MoveToFirstLine

Description

Executes the "First alarm" button function of the alarm view.

Syntax

```
Ausdruck.MoveToFirstLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

MoveToFirstPage

Description

Executes the "First page" button function of the alarm view.

Syntax

```
Ausdruck.MoveToFirstPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

MoveToLast

Description

Executes the "last data record" button function of the control.

Syntax

```
Ausdruck.MoveToLast()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

UserArchiveControl (Page 4130)

MoveToLastLine

Description

Executes the "Last alarm" button function of the alarm view.

Syntax

```
Ausdruck.MoveToLastLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

AlarmControl (Page 3947)

MoveToLastPage

Description

Executes the "Last page" button function of the alarm view.

Syntax

```
Ausdruck.MoveToLastPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

MoveToNext

Description

Executes the "next data record" button function of the control.

Syntax

```
Ausdruck.MoveToNext()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

UserArchiveControl (Page 4130)

MoveToNextLine

Description

Executes the "Next alarm" button function of the alarm view.

Syntax

```
Ausdruck.MoveToNextLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

MoveToNextPage

Description

Executes the "Next page" button function of the alarm view.

Syntax

```
Ausdruck.MoveToNextPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

MoveToPrevious

Description

Executes the "previous data record" button function of the control.

Syntax

```
Ausdruck.MoveToPrevious()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

UserArchiveControl (Page 4130)

MoveToPreviousLine

Description

Executes the "Previous alarm" button function of the alarm view.

Syntax

```
Ausdruck.MoveToPreviousLine()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

MoveToPreviousPage

Description

Executes the "Previous page" button function of the alarm view.

syntax

```
Ausdruck.MoveToPreviousPage()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

NextColumn

Description

Executes the "Next column" button function of the table view.

Syntax

```
Ausdruck.NextColumn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTableControl (Page 4037)

NextTrend

Description

Executes the "Next trend" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.NextTrend()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

OneToOneView

Description

Executes the "Original view" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.OneToOneView()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

PasteRows

Description

Executes the "Insert rows" button function of the recipe view.

Syntax

```
Expression.PasteRows()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

PreviousColumn

Description

Executes the "Previous column" button function of the table view.

Syntax

```
Ausdruck.PreviousColumn()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTableControl (Page 4037)

PreviousTrend

Description

Executes the "Previous trend" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.PreviousTrend()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

Print

Description

Executes the "Print" button function of the control.

Syntax

```
Ausdruck.Print()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)
OnlineTableControl (Page 4037)
TrendRulerControl (Page 4110)
UserArchiveControl (Page 4130)
FunctionTrendControl (Page 4004)
AlarmControl (Page 3947)

QuitHorn

Description

Executes the "Acknowledge central alarm generator" button function of the alarm view.

Syntax

```
Ausdruck.QuitHorn()
```

Expression
Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

QuitSelected

Description

Executes the "Single acknowledgment" button function of the alarm view.

Syntax

```
Ausdruck.QuitSelected()
```

Expression
Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

QuitVisible

Description

Executes the "Group acknowledgment" button function of the alarm view.

Syntax

```
Ausdruck.QuitVisible()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ReadTags

Description

Executes the "Read tags" button function of the recipe view.

Syntax

```
Ausdruck.ReadTags()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

Read

Description of Tag Object

Reads out the status of a tag (tag object) shortly after the moment it was called. At the same time, the tag object is provided with the values read. Upon reading a tag, its value, quality code and time stamp are determined. The "LastError" property can be used to determine whether the call was successful.

The "Name" and "Tagprefix" properties are not changed by this.

If the value of the tag is read successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values
Name	Tag name (unchanged)
QualityCode	Quality level
Timestamp	Current tag time stamp
LastError	0
ErrorDescription	" "

If the value of the tag is not read successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	VT_Empty
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Read operation error codes
ErrorDescription	Error description on LastError

syntax

```
Expression.Read([Readmode])
```

Expression

Necessary. An expression which returns a tag object. The return value of the Read method is the value of the tag read out.

Parameters

The optional "Readmode" parameter enables the distinction between two types of reading:

Parameters	Description
0	The tag value is read from the process image (cache). 0 is the default value.
1	The value of a tag is read directly from AS or channel (direct).

If the "Readmode" parameter is omitted, the value is read from the process image by default. The return value of the Read method is the tag value read out as VARIANT.

Reading From the Process Image

When reading from the process image, the tag is logged on and, from that moment, polled cyclically from the PLC. The login cycle is dependent on the configured trigger. The value is read from the tag image by WinCC. For Close Picture, the tag actions are ended again. The call is characterized by the following:

- The value is read by WinCC from the tag image.
- The call is faster in comparison to direct reading (except with the first call: The first call basically takes longer because the value from the PLC must be read out and logged on.)
- The duration of the call is not dependent on the bus load or AS.

Behavior in actions with a tag trigger

All of the tags contained in the tag trigger are already known with Open Picture and are registered with the defined monitoring time. Since all tags are requested at once, the best possible optimization can be targeted from the channel. If a tag, contained in the trigger, is requested with Read during an action, the value already exists and is transferred directly to the call. If a tag is requested which is not contained in the trigger, the behavior is the same as with a standard trigger.

Behavior in actions with a cyclic trigger

tags are registered with half of the cycle time with the first call. For every other call, the value is present.

Behavior in event-driven actions

The tag is registered in the "upon change" mode with the first call. Process tags that are registered in the "upon change" mode correspond with a cyclic read job with a cycle time of 1s.

If an event (e.g. mouse click) requests a value asynchronously, the tag is transferred to the tag image. The tag is requested cyclically from the AS as of this point in time and therefore increases the basic load. To bypass this increase in the basic load, the value can also be read synchronously. The synchronous call causes a one-off increase in the communication load but the tag is not transferred to the tag image.

Direct reading

In the case of direct reading, the current value is returned. The tag is not registered cyclically, the value is requested from the AS one time only. Direct reading has the following properties:

- The value is read explicitly from the AS.
- The call takes longer compared to reading from the process image.
- The duration of the call is dependent on the bus load and AS, amongst other things.

Example

Reading a tag directly from AS or channel

```
'VBS100
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read(1)    'Read direct
MsgBox vntValue
```

Reading a tag from the process image

```
'VBS101
Dim objTag
Dim vntValue
Set objTag = HMIRuntime.Tags("Tagname")
vntValue = objTag.Read    'Read from cache
MsgBox vntValue
```

Description of TagSet Object

The TagSet object offers the option of reading several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

Expression

Necessary. An expression which returns an object of type "TagSet".

Reading From the Process Image

The TagSet object offers the advantage of requesting several tags in one read command. The tags are registered in the process image as a group, improving performance in the process.

Direct reading

Since one call may process several read commands, performance is enhanced in comparison to single calls.

Example

The following example shows how tags are included in the TagSet list, how tag values are imported and subsequently read.

```
'VBS174
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Read
HMIRuntime.Trace "Motor1: " & group("Motor1").Value & vbNewLine
HMIRuntime.Trace "Motor2: " & group("Motor2").Value & vbNewLine
```

If the optional parameter "Readmode" is set to 1, the process tags are not registered but read directly from AS or channel.

```
group.Read 1
```

Refresh

Description

Drawing all visible pictures again.

syntax

```
Expression.Refresh
```

Expression

Necessary. An expression which returns a "Screens" or "Screen" type object.

Parameter

--

Examples

The first example forces all visible pictures to be drawn again:

```
'VBS149
HMIRuntime.Screens.Refresh
```

The second example forces the basic picture to be immediately redrawn:

```
'VBS150
HMIRuntime.Screens(1).Refresh
```

See also

Screen (Page 3930)

HMIRuntime (Page 3922)

Remove

Description of TagSet Object

Removes a tag from the TagSet list. The tag may be removed by name or reference to a tag object.

Syntax

```
Expression.Remove [Tag]
```

Expression

Required An expression that returns an object of type "TagSet".

Parameters

VARIANT

Parameters	Description
Tag	Name of a WinCC tag or reference to a tag object to be removed from the list.

Example

The following example shows how several tags are included in the TagSet list, and how to remove a tag again.

```
'VBS175
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.Remove "Motor1"
```

Description of DataSet Object

Deletes the element specified in parameter "Name" from a list.

Syntax

```
Expression.Remove [Name]
```

Expression

Required An expression which returns an object of type "DataSet".

Parameters

VARIANT

Parameters	Description
Name	Name of the object to be removed from the list.

Example

The example shows how to remove the object "motor1" from the list.

```
'VBS166
HMIRuntime.DataSet.Remove("motor1")
```

Description of objects Logging, AlarmLogs, DataLogs

The method deletes previously swapped-in log segments from the Runtime project.

Log segments that were deleted using the "Remove" method are removed from the "Common logging" folder of the project.

The call may require a somewhat longer time period, depending on the log data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be

avoided if you start the call in a Global Scripting action, such as starting the action through a trigger tag.

The process of disconnecting and clearing logs creates a CPU load. This will affect performance.

Note

Calling up the "Remove" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

Syntax

Objects Logging, AlarmLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [ServerPrefix]
```

Expression

Required An expression that returns an object of type "Logging" or "AlarmLogs".

Object DataLogs

```
Expression.Remove [TimeFrom] [TimeTo] [TimeOut] [Type] [ServerPrefix]
```

Expression

Required An expression that returns an object of type "DataLogs".

Parameters

TimeFrom

Point in time, from which the logs are to be cleared.
When specifying the time information, a short form is also possible. This is described in the "Time format" section.

TimeTo

Time up to which log segments are to be cleared.
When specifying the time information, a short form is also possible. This is described in the "Time Format" section.

Timeout

Timeout in milliseconds.
If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

Type

Type of log.
The parameter can (optionally) be used only to delete log segments of the tag logging.
The following values can be entered:

Assigned value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

ServerPrefix

Reserved for future versions.

Return value

If an error occurred during deletion of the log segments, the method will return an error alarm. Additional information may be found under the subject heading "Error alarms from database area".

Time format

The format for specifying time information is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the time may be specified in the "YYYY-MM" or "YYYY-MM-DD hh" format. Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all log segments between September 2004 up to and including October 4.

Example

In the following example, log segments within a certain time period that were swapped in (again) after the fact are removed and the return value is output as a trace.

```
'VBS182
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("2004-08-22","2004-09-22",-1) &
vbNewLine
```

In the following example, all log segments that were swapped-in (again) after the fact are removed and the return value is output as a trace.

```
'VBS183
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Remove("","",-1) & vbNewLine
```

RemoveAll

Description of TagSet Object

Deletes all tags from a TagSet list.

syntax

```
Expression.RemoveAll
```

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

--

Example:

The following example shows how several tags are included in the TagSet list, and how to remove all tags again.

```
'VBS176
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Motor1"
group.Add "Motor2"
group.RemoveAll
```

Description of DataSet Object

Deletes all values or object references from a DataSet list.

syntax

```
Expression.RemoveAll
```

Expression

Necessary. An expression which returns an object of type "DataSet".

Parameters

--

Example:

The example shows how all objects are removed from the list.

```
'VBS167
HMIRuntime.DataSet.RemoveAll
```

See also

DataSet (list) (Page 3919)

Restore

Description of objects Logging, AlarmLogs, DataLogs

The method adds swapped-out log segments to the Runtime project.

Upon swapping-in, the log segments are copied to the "Common logging" folder of the project. Therefore the appropriate storage capacity must be available.

The call may require a somewhat longer time period, depending on the log data. This may block the processing of subsequent scripts. Blockage of actions within the picture may be avoided if you start the call in a Global Scripting action, such as starting the action through a trigger tag.

The connecting/copying of the logs generates a CPU load because the SQL server experiences additional load, especially if signature checking is activated. Copying of log segments will slow down hard disk access.

If signature checking is activated, an error message is returned if an unsigned or modified log is to be swapped in. There is always only one error alarm returned, even if several errors occurred during a swap-in process. Additionally, a WinCC system alarm is generated for each log segment. An entry is added to the Windows event viewer in the "Application" section. This provides the opportunity to check which log segments are creating the error.

- With an unsigned log, the return value "0x8004720F" is returned. The event viewer contains the entry "Validation of database <db_name> failed! No signature found!".
  The log is swapped in.
- With a changed log, the return value "0x80047207" is returned. The event viewer contains the entry "Validation of database <db_name> failed!".
  The log is not swapped in.

Note

Calling up the "Restore" method is presently only possible at the server. There is an example, however, which shows how the method may be started by the client from a server.

Syntax

Objects Logging, AlarmLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut]
[ServerPrefix]
```

Expression

Required An expression that returns an object of type "Logging" or "AlarmLogs".

Object DataLogs

```
Expression.Restore [SourcePath] [TimeFrom] [TimeTo] [TimeOut] [Type]
[ServerPrefix]
```

Expression

Required An expression that returns an object of type "DataLogs".

Parameters

SourcePath

Path to log data.

TimeFrom

Point in time, from which the logs are to be swapped in.
When specifying the time information, a short form is also possible. This is described in the "Time format" section.

TimeTo

Time up to which log segments are to be swapped in.
When specifying the time information, a short form is also possible. This is described in the "Time Format" section.

Timeout

Timeout in milliseconds.
If you enter "-1" as a value, the wait will be infinite. If you enter a value of "0", there will be no wait.

Type

Type of log.
The parameter can (optionally) be used only to store log segments of the tag logging.
The following values can be entered:

Assigned value	Type	Description
1	hmiDataLogFast	Tag Logging Fast data
2	hmiDataLogSlow	Tag Logging Slow data
3	hmiDataLogAll	Tag Logging Fast and Slow data

ServerPrefix

Reserved for future versions.

Return value

If an error occurred while swapping in log segments, the method will return an error message. Additional information may be found under the subject heading "Error alarms from database area".

Time format

The format for specifying time information is defined as follows: YYYY-MM-DD hh:mm:ss, where YYYY represents the year, MM the month, DD the day, hh the hour, mm the minute and ss the second. For example, the time of 2 minutes and one second past 11 o'clock on July 26, 2004 is displayed as follows: 2004-07-26 11:02:01.

For parameters "TimeFrom" and "TimeTo" the statement of data and time is also possible in short form. Not all format fields must be filled in this case. The short form means that the information on date and time may be lacking one or several parameters, beginning with the value for seconds. For example, the statement may be in the form of "YYYY-MM" or "YYYY-MM-DD hh". Using the statement "TimeFrom" = "2004-09" and "TimeTo" = "2004-10-04" all log segments between September 2004 up to and including October 4.

Example

In the following example, all log segments since the start of the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS184
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.Restore("D:\Folder","2004-09-14","",-1) &
vbNewLine
```

In the following example, all Tag Logging Slow log segments in the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS185
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.DataLogs.Restore("D:\Folder","2004-09-14
12:30:05","2004-09-20 18:30",-1,2) & vbNewLine
```

In the following example, all Alarm Logging log segments up to the specified time period are swapped in again, and the return value is output as a trace.

```
'VBS186
HMIRuntime.Trace "Ret: " & HMIRuntime.Logging.AlarmLogs.Remove("","2004-09-20",-1) &
vbNewLine
```

Methods S-Z

SelectAll

Description

Selects all rows in a table-based control.

Syntax

```
Expression.SelectAll()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

OnlineTableControl (Page 4037)

TrendRulerControl (Page 4110)

UserArchiveControl (Page 4130)

AlarmControl (Page 3947)

SelectedStatisticArea

Description

Executes the "Set statistics range" button function of the table view.

Syntax

```
Ausdruck.SelectedStatisticArea()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTableControl (Page 4037)

SelectRow

Description

Selects a specific row in a table-based control.

Syntax

```
Expression.SelectRow(ByVal IRow As Long, Optional bExtendSelection
As Boolean)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Parameters	Description
IRow	Number of the row to be selected.
bExtendSelection	Indicates as an option whether the current selection will be extended. Is only relevant if multiple selections are possible.

Example

- Row 1 is currently selected. If SelectRow(2, True) is called, then row 1 and row 2 will be selected.
- Row 1 is currently selected. If SelectRow(2, False) or SelectRow(2) is called without an optional parameter, then only row 2 will be selected.

TrendRulerControl (Page 4110)

UserArchiveControl (Page 4130)

AlarmControl (Page 3947)

ServerExport

Description

Executes the "Export log" button function of the recipe view.

Syntax

```
Ausdruck.ServerExport()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

ServerImport

Description

Executes the "Import log" button function of the recipe view.

Syntax

```
Ausdruck.ServerImport()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

ShowColumnSelection

Description

Executes the "Select columns" button function of the table view.

Syntax

```
Ausdruck.ShowColumnSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTableControl (Page 4037)

ShowComment

Description

Executes the "Comment dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowComment()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

AlarmControl (Page 3947)

ShowDisplayOptionsDialog

Description

Executes the "Display options dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowDisplayOptionsDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowEmergencyQuitDialog

Description

Executes the "Single acknowledgment" button function of the alarm view.

Syntax

```
Ausdruck.ShowEmergencyQuitDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowHelp

Description

Executes the "Help" button function of the control.

Syntax

```
Ausdruck.ShowHelp()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

See also

OnlineTrendControl (Page 4045)
OnlineTableControl (Page 4037)
TrendRulerControl (Page 4110)
UserArchiveControl (Page 4130)
FunctionTrendControl (Page 4004)
AlarmControl (Page 3947)

ShowHideList

Description

Executes the "List of alarm to hide" button function of the alarm view.

Syntax

```
Ausdruck.ShowHideList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowHitList

Description

Executes the "Hitlist" button function of the alarm view.

Syntax

```
Ausdruck.ShowHitList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowInfoText

Description

Executes the "About dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowInfoText()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowLockDialog

Description

Executes the "Lock dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowLockDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowLockList

Description

Executes the "Lock list" button function of the alarm view.

Syntax

```
Ausdruck.ShowLockList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowLongTermArchiveList

Description

Executes the "Historical alarm list (long-term)" button function of the alarm view.

Syntax

```
Ausdruck.ShowLongTermArchiveList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowMessageList

Description

Executes the "Alarm list" button function of the alarm view.

Syntax

```
Ausdruck.ShowMessageList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowPercentageAxis

Description

Executes the "Relative axis" button function of the f(t) trend view.

Syntax

```
Ausdruck.ShowPercentageAxis()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTrendControl (Page 4045)

ShowPropertyDialog

Description

Executes the "Configuration dialog" button function of the control.

Syntax

```
Ausdruck.ShowPropertyDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

VARIANT

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

TrendRulerControl (Page 4110)

UserArchiveControl (Page 4130)

FunctionTrendControl (Page 4004)

AlarmControl (Page 3947)

ShowSelectArchive

Description

Executes the "Select data connection" button function of the recipe view.

Syntax

```
Ausdruck.ShowSelectArchive()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

ShowSelection

Description

Executes the "Selection dialog" button function of the recipe view.

Syntax

```
Ausdruck.ShowSelection ()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

ShowSelectionDialog

Description

Executes the "Selection dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowSelectionDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowSelectTimeBase

Description

Executes the "Timebase dialog" button function of the recipe view.

Syntax

```
Ausdruck.ShowSelectTimeBase()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

ShowShortTermArchiveList

Description

Executes the "Historical alarm list (short-term)" button function of the alarm view.

Syntax

```
Ausdruck.ShowShortTermArchiveList()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowSort

Description

Executes the "Sorting dialog" button function of the recipe view.

Syntax

```
Ausdruck.ShowSort()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

ShowSortDialog

Description

Executes the "Sorting dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowSortDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

ShowTagSelection

Description

Executes the "Select data connection" button function of the control.

Syntax

```
Ausdruck.ShowTagSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

--

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

FunctionTrendControl (Page 4004)

ShowTimebaseDialog

Description

Executes the "Timebase dialog" button function of the alarm view.

Syntax

```
Ausdruck.ShowTimebaseDialog()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

--

See also

AlarmControl (Page 3947)

ShowTimeSelection

Description

Executes the "Select time range" button function of the control.

Syntax

```
Ausdruck.ShowTimeSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

FunctionTrendControl (Page 4004)

ShowTrendSelection

Description

Executes the "Select trends" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.ShowTrendSelection()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

-- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

FunctionTrendControl (Page 4004)

StartStopUpdate

Description

Executes the "Start" or "Stop" button function of the control.

Syntax

```
Ausdruck.StartStopUpdate()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

OnlineTableControl (Page 4037)

FunctionTrendControl (Page 4004)

Stop

Description

Closes WinCC Runtime.

Syntax

Expression.Stop

Expression

Required An expression which returns an "HMIRuntime" type object.

Parameters

--

See also

HMIRuntime (Page 3922)

Trace

Description

Returns a user-defined text through the operating system channel for debug alarms.

The methods HMIRuntime.Trace works only in a PC-based environment. The text transferred as parameter can be displayed using the diagnostics tools "GSC Diagnostics" or "ApDiag". You can use the "ShowSystemAlarm" system function if you need to run a trace without using external tools.

Syntax

Expression.Trace"STRING"

Expression

Required An expression which returns an "HMIRuntime" type object.

Parameters

STRING

The text which is issued as a debug alarm. The transferred text can be displayed using the diagnostics tools "GSC Diagnostics" or "ApDiag". You can use the "ShowSystemAlarm" system function if you need to run a trace without using external tools.

Example

In the following example a debug alarm is issued:

```
'VBS example trace
HMIRuntime.Trace "Customized error message"
```

See also

HMIRuntime (Page 3922)

UnhideAlarm

Description

Executes the "Unhide alarm" button function of the alarm view.

Syntax

```
Ausdruck.UnhideAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

UnlockAlarm

Description

Executes the "Unlock alarm" button function of the alarm view.

Syntax

```
Ausdruck.UnlockAlarm()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

AlarmControl (Page 3947)

UnselectAll

Description

Removes all selections from the cells of a table-based control.

Syntax

```
Expression.UnselectAll()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTableControl (Page 4037)

TrendRulerControl (Page 4110)

UserArchiveControl (Page 4130)

AlarmControl (Page 3947)

UnselectRow

Description

Removes the selections from a specific cell of a table-based control.

Syntax

```
Expression.UnselectRow(ByVal IRow As Long)
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

Long

Parameters	Description
IRow	Number of the row to be selected.

See also

OnlineTableControl (Page 4037)

TrendRulerControl (Page 4110)

UserArchiveControl (Page 4130)

AlarmControl (Page 3947)

Write

Description of Tag Object

Writes a value to a tag. The "LastError" property can be used to determine whether the call was successful.

If the value of the tag is set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	0
ErrorDescription	" "

If the value of the tag is not set successfully, the properties of the tag object are assigned the following values:

Property	Allocation
Value	Tag values set by the user (unchanged)
Name	Tag name (unchanged)
QualityCode	Bad Out of Service
Timestamp	0
LastError	Write operation error codes
ErrorDescription	Error description on LastError

syntax

```
Expression.Write [Value],[Writemode]
```

Expression

Necessary. An expression which returns a tag object.

Parameters

The value to be written can be transferred directly to the method as a parameter. If the parameter is not specified, the value in the "Value" property is used. The "Writemode" option parameter can be used to select whether the tag value should be written synchronously or asynchronously. If the "Writemode" parameter is not used, writing is performed asynchronously as its default value.

During the writing process, no information is supplied on the status of the tags.

The "Value" property contains the value which was set before or during the writing operation, therefore is may not correspond to the real current value of the tag. If the data on the tag should be updated, use the Read method.

Parameters	Description
Value (optional)	The tag value is specified. The specified value overwrites the value in the "Value" property in the tag object. The tag value is not specified. The tag receives the current value from the "Value" property of the tag object.
Writemode (optional)	0 or empty: The tag value is written asynchronously. 0 is the default value. 1: The tag value is written synchronously.

On asynchronous writing, it is written immediately into the tag image. The user does not receive any feedback if the value has been written in the programmable controller, too.

In the case of synchronous writing (direct to the PLC), the writing operation actually occurs when the PLC is ready to operate. The use receives a check-back message if the writing operation was not successful.

Example

Asynchronous writing

```
'VBS104
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write
MsgBox objTag.Value
```

or

```
'VBS105
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5
MsgBox objTag.Value
```

Synchronous writing

```
'VBS106
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Value = 5
objTag.Write ,1
MsgBox objTag.Value
```

or

```
'VBS107
Dim objTag
Set objTag = HMIRuntime.Tags("Var1")
objTag.Write 5, 1
MsgBox objTag.Value
```

Description of TagSet Object

The TagSet object offers the option of writing several tags in one call.

Functionality here is mostly identical with that of a tag object. In the following, only deviations thereof are described.

Expression

Necessary. An expression which returns an object of type "TagSet".

Parameters

In order to write different values, the "Value" property of individual tag objects must be set, and write must be called thereafter without the "Value" parameter. Since the write commands are grouped into one call, it results in improved performance compared to single calls.

In a TagSet object, it is not possible to pass on a value using the "Write" method. Individual values must be set using the "Value" property of the individual tag objects.

Example

The following example shows how tags are included in the TagSet list, how tag values are set and subsequently written.

```
'VBS173
Dim group
Set group = HMIRuntime.Tags.CreateTagSet
group.Add "Wert1"
group.Add "Wert2"
group("Wert1").Value = 3
group("Wert2").Value = 9
group.Write
```

If you set the optional parameter "Writemode" equal to 1, the process tags are written synchronously (directly to AS).

```
group.Write 1
```

WriteTags

Description

Executes the "Write tags" button function of the recipe view.

Syntax

```
Expression.WriteTags()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

UserArchiveControl (Page 4130)

ZoomArea

Description

Executes the "Zoom area" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.ZoomArea()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ZoomInOut

Description

Executes the "Zoom +/-" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.ZoomInOut()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

ZoomInOutTime

Description

Executes the "Zoom time axis +/-" button function of the f(t) trend view.

Syntax

```
Ausdruck.ZoomInOutTime()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTrendControl (Page 4045)

ZoomInOutValues

Description

Executes the "Zoom value axis +/-" button function of the f(t) trend view.

Syntax

```
Ausdruck.ZoomInOutValues()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameter

- -

See also

OnlineTrendControl (Page 4045)

ZoomInOutX

Description

Executes the "Zoom X axis +/-" button function of the f(x) trend view.

Syntax

```
Ausdruck.ZoomInOutX()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

FunctionTrendControl (Page 4004)

ZoomInOutY

Description

Executes the "Zoom Y axis +/-" button function of the f(x) trend view.

Syntax

```
Ausdruck.ZoomInOutY()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

FunctionTrendControl (Page 4004)

ZoomMove

Description

Executes the "Move trend area" button function of the f(t) and f(x) trend views.

Syntax

```
Ausdruck.ZoomMove()
```

Expression

Necessary. An expression that returns an object of the "ScreenItem" type.

Parameters

- -

See also

OnlineTrendControl (Page 4045)

FunctionTrendControl (Page 4004)

10.9 Mobile Wireless

10.9.1 Field of application of the Mobile Panel Wireless

Introduction

The Mobile Panel Wireless enables you to move through the plant without restrictions and with or without security technology. You can operate and monitor moving machine parts or the entire plant depending on the situation. You can plan, configure, simulate and extend wireless networks quickly and reliably.

The Mobile Panels Wireless are based on standardized WLAN technology and are specially tailored to the requirements of automation.

WLAN area

A WLAN area is the area of the plant in which the HMI device communicates with the PLC over a wireless local area network. The wireless coverage of the network has a sufficient signal strength in this area.

The WLAN of a plant is formed by the radio area of one or more Access Points.

Access Point

The Access Point serves as a gateway between the wireless and hard-wired network. The HMI device communicates with an Access Point via WLAN. You can operate the different machines or plants without annoying cables. The HMI device is connected to a network in which it communicates with a PLC via the access point.

Effective range

Safety-related operator input is only possible in a limited part of a WLAN area upstream of a machine or plant known as the effective range. One exception to this rule is the emergency stop, which works in the entire WLAN area.

The configured effective ranges are stored in the HMI device. The HMI device can only log on to a machine within the effective range. This also requires there no other HMI device is logged on in the same effective range.

To ensure clear logon and machine operator inputs, one effective range must not overlap another effective range.

Tags

Effective ranges are formed by the spatial assignment of tags to a machine or plant. Tags create a geometrical space which is relevant for logon to a machine. After logon you operate the machine using acknowledgement buttons.

A distinction is made between two types of tags:

- Transponder
- RFID tag

Transponder

After successful logon to a machine, the spanned geometrical area will be monitored. The distance between the HMI device and the transponder can only be measured if the two devices are in the reception range of each other. When you leave the effective range, safety-related operator input of the machine with acknowledgment buttons is prevented.

Zones in the transponder system

Zones are configurable objects within a transponder system. A zone is defined by the maximum distance from one or more transponders. In a hard-wired Mobile Panel, the length of the connection cable defines a zone around a connection box.

Zones are operating areas in which safety-related operator input is not possible. To enter a zone, you have to configure a screen change to the correct process picture.

RFID tag

After successful logon to a machine, the spanned geometrical area is not monitored. Monitoring therefore calls for an additional organizational measure, for example: a light barrier or a protective fence. The protection area is separated from the plant by a security system. The protection area is the area in the plant in which you operate one or more machines in fail-safe operation. One or more RFID Tags are distributed within protection zones. The protection area is not a configurable object.

10.9.2 How does the transponder system work?

Overview

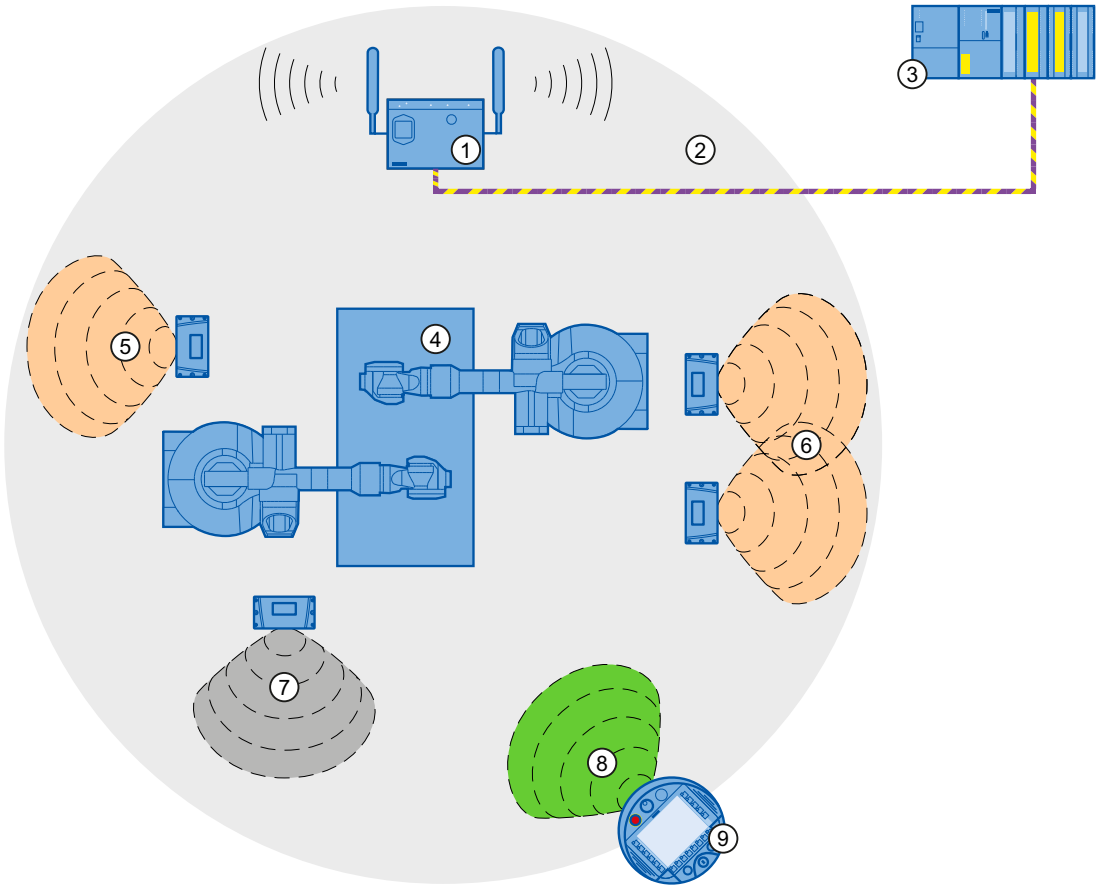
To give a basic understanding of all this, the following section describes the interaction between:

- HMI device
- Zone
- Effective range
- Transponder

Note

You should always assign administrator rights or set up encryption to protect the project containing a Mobile Panel Wireless for fail-safe operation against unauthorized access.

Principle of operation in the transponder system



1 Access Point
2 WLAN of the Access Point
3 PLC
4 Plant
5 Effective range "Robot 1" with a transponder
6 Effective range "Robot 2" with two transponders
7 Zone "Zone 1" with a transponder
8 Radio area of the HMI device
9 HMI device

Example:

- A screen change is configured for "Zone 1".
- Transponder1 is assigned to the "Robot 2" effective range.
- The operator enters the radio cone of the transponder to receive the transponder ID.

- To log onto the machine "Robot 2", the operator presses the object "Effective range - Name".
- The "Effective range - Logon" dialog box opens. The operator enters the effective range ID and confirms with "OK". The dialog is closed.
- If the logon was successful, then the acknowledgement buttons will be active.
- The HMI device measures the distance from the transponder which is less than the configured distance of the effective range.

Result:

The operator is logged onto the machine "Robot 2". The operating element "Effective range - Name" is green and shows the name of the effective range "Robot 2".

If the HMI device is logged onto the effective range, then the following will apply:

- The operator may not leave the effective range without logging off. If the operator leaves the effective range without logging off for more than 30 seconds, a local rampdown will occur.
- No other HMI device can log onto the machine.

To log off from the machine, the operator presses the operating element "Effective range - Name". A logoff dialog is displayed. The operator confirms the dialog.

After successful logoff, another operator can log on to the machine "Robot2".

When the operator enters "Zone 1", a screen change will take place.

10.9.3 How does the RFID system work?

Overview

RFID stands for radio frequency identification. RFID allows wireless identification of objects without contact or visual sighting.

For a basic understanding, the following section describes the interaction between:

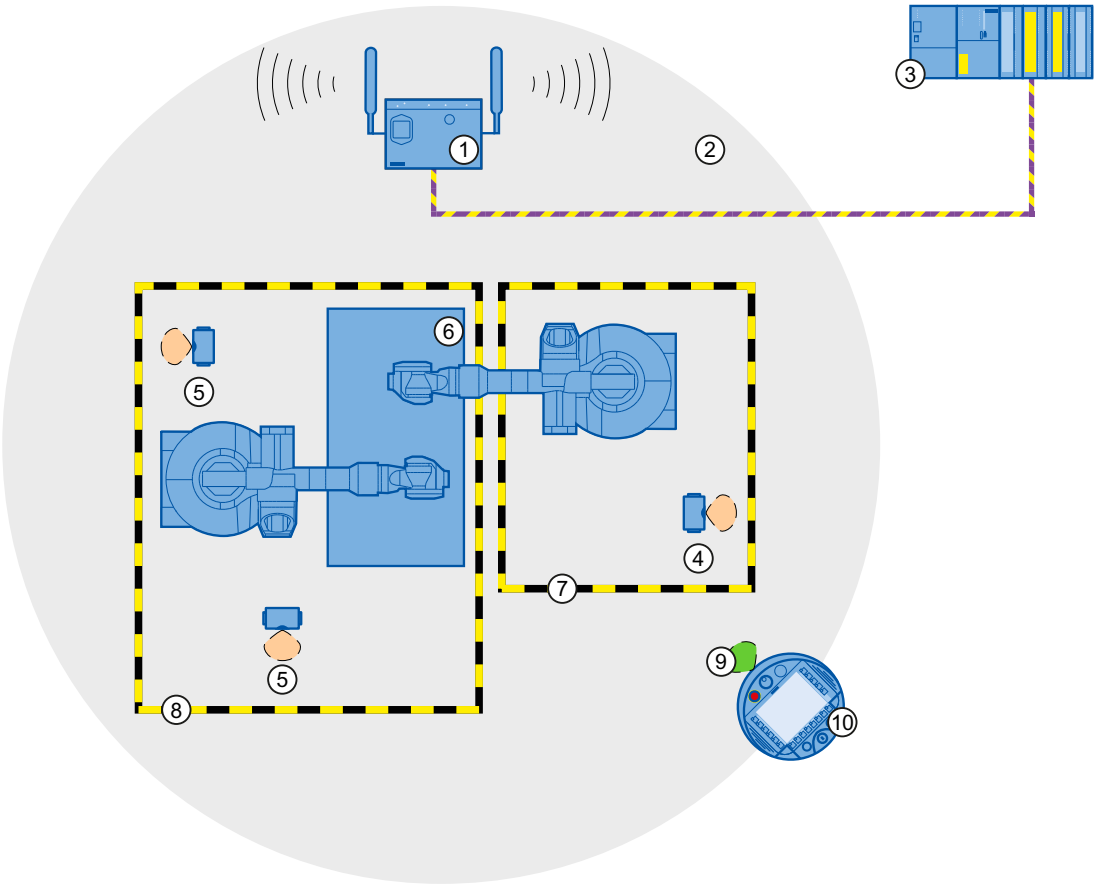
- HMI device
- Effective range (RFID)
- RFID tag

Note

RFID Tags in the plant area

You may only affix RFID Tags in restricted plant areas that are protected by additional protective measures, for example, protective railings.

Principle of operation in the RFID system



① Access Point
② WLAN of the Access Point
③ PLC
④ RFID tag with effective range (RFID) for logon to "Robot 1"
⑤ RFID tag with effective range (RFID) for logon to "Robot 2"
⑥ Plant
⑦ Protective area limit of the machine "Robot1"
⑧ Protective area limit of the machine "Robot2"
⑨ Radio area of the HMI device
⑩ HMI device

Example:

- "RFID Tag1" is assigned to the effective range (RFID) "Robot1".
- An operator enters the restricted plant area. The operator manually switches to the screen with the configured operating element "Effective range - Name (RFID)".

- At "RFID Tag1", he presses the "Scan" button.
  During the logon operation, the button is yellow and displays the text "Scanning…".
- The "Effective range - Logon" dialog box opens. The operator enters the effective range (RFID) ID and confirms it with "OK". The dialog is closed.
- The "Confirmation of logon" dialog box opens. The operator confirms logon with the acknowledgment button.
- If logon was successful, the acknowledgement buttons are active.

Result:

The operator is logged on to the machine "Robot 1" and operates the machine within the protection area in fail-safe operation. The operating element "Effective range - Name (RFID)" is green and shows the name of the effective range (RFID) "Robot1".

If the HMI device is logged on to the machine, the following applies:

- The user may not leave the protection area without logging off from the machine. If the operator leaves the protection area without logging off, a local rampdown occurs.
- No other HMI device can log on to this machine.

To log off from the machine, the operator presses the operating element "Effective range - Name (RFID)". A logoff dialog is displayed. The operator confirms the dialog.

After successful logoff, another operator can log on to the machine "Robot 1".

10.9.4 Configuring the Mobile Panel V2 for fail-safe operation

10.9.4.1 Configuration overview

Introduction

Additional steps in the TIA Portal are necessary before the configuration of the Mobile Panels V2 for fail-safe operation. This affects the following HMI devices:

- Mobile Panel 277F IWLAN V2
- Mobile Panel 277F IWLAN (RFID Tag)

Procedures overview

1. Creating PLC for fail-safe operation
2. Installing a general station description (GSD)
3. Creating a module from the GSD file
4. Creating a connection between a module from the GSD file and the PLC
5. Creating Mobile Panel V2 for fail-safe operation

See also

Creating Mobile Panel (Page 4875)

Creating a module from the GSD file (Page 4871)

Installing a general station description (GSD) (Page 4871)

Creating PLC for fail-safe operation (Page 4870)

Creating a connection between a module and the PLC (Page 4874)

10.9.4.2 Creating PLC for fail-safe operation

Requirement

A project is open

Procedure

1. Click "Add new device" in the project navigation.
2. Click "PLC" in the "Add new device" dialog.
3. Select a PLC for fail-safe operation, for example, CPU-315F-2PN/DP. The "Devices & Networks" editor opens.
4. Open the device view.
5. Select the device and click on "Device overview".
6. Select the device.
7. Click "Properties > PROFINET interface [X2] >Ethernet addresses > Interface connected with > Add new subnet" in the inspector window.
8. Enter the IP address under "IP protocol > Set IP address in the project".
9. Enter a time for "Properties > PROFINET interface [X2] > F parameter > Set default F monitoring time for F I/O of this interface".
10. Specify the properties for fail-safe operation in "Properties > Fail-safe"
    - "F-capability activated"
    - "Basis for PROFIsafe addresses"
11. Specify further properties for fail-safe operation as usual, for example, protection level.

Result

You have created a PLC in the project and made the settings for fail-safe operation.

See also

Configuration overview (Page 4867)

10.9.4.3 Installing a general station description (GSD)

Introduction

A GSD file (device master data file) contains all the IO device properties. The language used to describe the GSD files is GSDML (Generic Station Description Markup Language). Install a GSD file to expand the hardware catalog.

Requirement

- The "Devices & Networks" editor is open.
- The "Network view" is open.
- The GSD file is available on your PC.

The GSD file can be found online:

GSD file of Mobile Panel V2 for fail-safe operation (http://support.automation.siemens.com/WW/view/de/19241467)

Procedure

1. Click "Options > Install general station description (GSD)".
2. In the "Install general station description" dialog, choose the directory in which the GSD files are located.
3. Select the GSD file from the list.
4. Click the "Install" button.
5. To create a log file for the installation, click on the "Save log file" button.

Result

You have installed the GSD file. You can find the new devices installed by means of the GSD files in the hardware catalog under "Additional field devices > PROFINET". Any problems that occur during the installation can be traced using the log file.

See also

Configuration overview (Page 4867)

10.9.4.4 Creating a module from the GSD file

Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- The GSD file is installed.
- The "Network view" is opened in the "Devices & Networks" editor.

Procedure

1. Open the hardware catalog.
2. Open the directory "Additional field devices > PROFINET-IO > HMI > Siemens AG > SIMATIC HMI > 277".
3. Now open the folder of the Mobile Panel V2 for fail-safe operation whose device type you also have as hardware:
   - Mobile Panel 277F IWLAN V2 or
   - Mobile Panel 277F IWLAN V2 (RFID tag)
4. For Mobile Panel 277F IWLAN V2, select the module with the order number 6AV6645-0EC01-0AX1.

5. For Mobile Panel 277F IWLAN V2 (RFID tag), select the module with the order number 6AV6645-0EF01-0AX1.

Note

The order number of the module in the GSD file has to match the order number of the Mobile Panel V2 in the software.

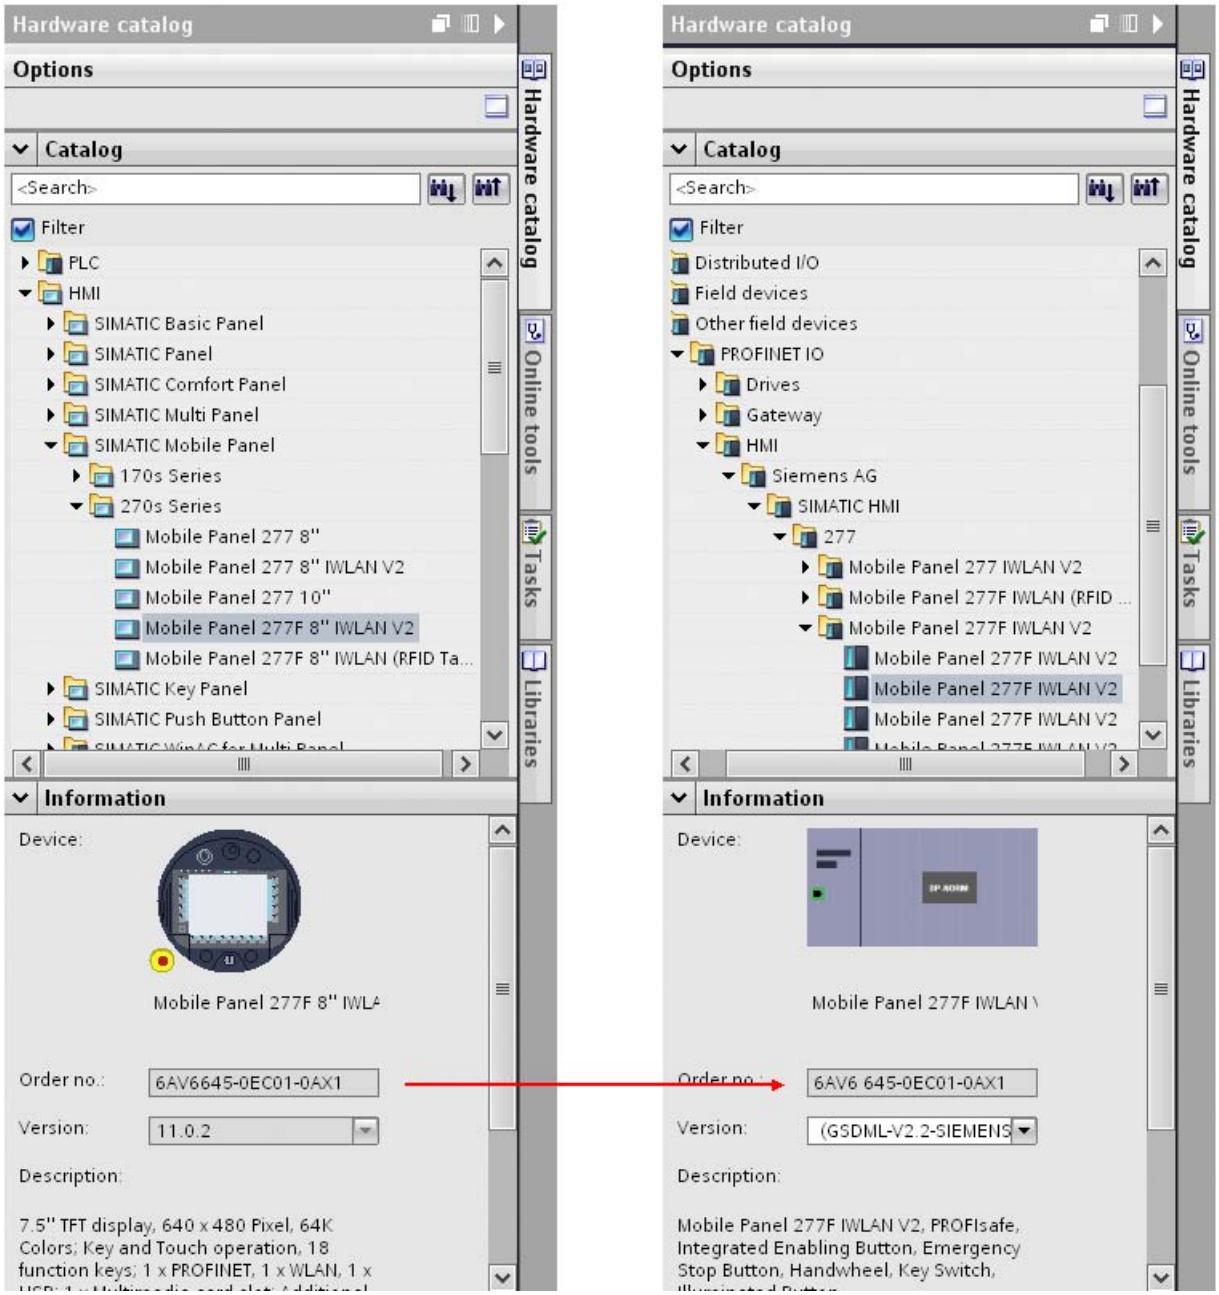


Figure 10-2 Left: Mobile Panel in the software. Right: Module in the GSD file

6. Drag-and-drop the desired module into the network view.

Result

You have created a module from the GSD file in your project.

See also

PROFIsafe address (Page 4891)

Configuration overview (Page 4867)

10.9.4.5 Creating a connection between a module and the PLC

Requirements

- A PLC for fail-safe operation is created in the project e.g. CPU-315F-2PN/DP.
- The GSD file is installed.
- A module from the GSD file has been created.
- The "Devices & Networks" editor is open.

Procedure

1. Open the "Network view".
2. Select the module and right-click on "Not assigned". The shortcut menu is opened.
3. Select "Assign new IO controller". A dialog box opens.
4. Select the IO controller and confirm with OK. A connection is established.
5. Open the device view
6. Click on "Mobile277Failsafe_IO_1" in the device overview.
7. Specify the properties for fail-safe operation in the inspector window under "Properties > PROFIsafe":
   - "F-block ID"
   - "F-Source-Add"
   - "F-Dest-Add"
8. Click on the module in the device view.
9. Assign a name under "Properties > General > Name" in the inspector window.
10. Assign an IP address under "PROFINET interface [X1] > Ethernet addresses > IP protocol > Set IP address in the project".

Result

The module from the GSD file is connected to the PLC. The module adopts the settings made in the PLC for PROFIsafe and PROFINET.

See also

Configuration overview (Page 4867)

10.9.4.6 Creating Mobile Panel

Requirement

- The inspector window is open.
- A PLC for fail-safe operation is created in the project, for example, CPU-315F-2PN/DP.
- The GSD device is created in the project.

Inserting Mobile Panel into the project.

1. Click "Add new device" in the project navigation.
2. Click on "HMI" in the "Add new device" dialog.
3. Select a Mobile Panel V2 for fail-safe operation, for example, Mobile Panel 277F IWLAN V2. The device is inserted into the project.

Note

Select the corresponding Mobile Panel for the module already installed from the GSD file.

Defining properties

1. Open the "Devices and Networks" editor.
2. Open the "Device view".
3. Select the Mobile Panel in the work area.
4. Open "Properties > General" in the inspector window.
5. To facilitate assignment in the project, enter the name of the associated module under "Name"
6. Enter the same IP address as in the module under "Set IP address in the project".
7. Activate "Set IP address using a different method".

Result

Entering the same IP address as in the device enables error-free communication. Alternatively, you can set the IP address on the Mobile Panel after loading the project.

See also

Configuration overview (Page 4867)

10.9.5 Basics

10.9.5.1 Zones

Introduction

The following section applies only to the Mobile Panels Wireless, e.g. Mobile Panel 277 IWLAN V2 and Mobile Panel 277F IWLAN V2. The "Zones" work area is only visible for these HMI devices.

Note

For more information refer to the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Depending on the HMI device selected, open the work area in the project window by double-clicking on "Zones" or "Zones and effective ranges".

Work area

The "Zones" work area displays the zones that have been set up and the transponders assigned to them.

Inspector window

When a zone is selected, you can edit the names, display names and the limits of the zone under the "General" category. The zone has the "On entry" and "On exit" zones. Assign the "ActivateScreen" system function to the events.

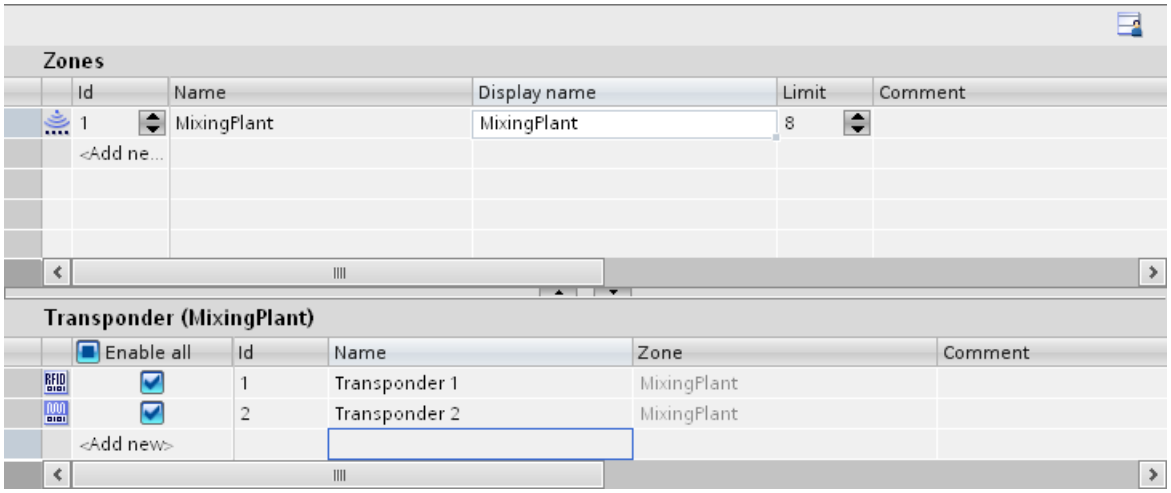
10.9.5.2 Zones working area

Introduction

The "Zones" work area displays the zones and the transponders assigned to them in table format. You create a list of transponders and assign certain transponders to a zone. The limit of the zone is defined by the maximum distance from the transponders.

Principle

The work area consists of the "Zones" and "Transponders" tables.



If you select a zone in the "Zones" table, the "Transponder" table displays the following:

- Transponder enabled: The transponder is assigned to the selected zone.
- Transponder deactivated: The transponder is not yet assigned to any zone.
- Transponder not available: The transponder has already been assigned to another zone. To undo the assignment, switch to the relevant zone and deactivate the transponder.

The zone and transponder IDs are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 254 zones may be configured.
- The zone ID must be unique and fall within the range from 1 - 254.
- You can initially configure transponders without assigning them to a zone.
- There may be no more than 255 transponders assigned to a zone.
- The transponder ID must be unique and fall within the range from 1 - 65534.

The transponder IDs are set on the transponder.

10.9.5.3 Effective ranges

Introduction

The following section applies only to the Mobile Panels Wireless that support fail-safe operation, e.g. Mobile Panel 277F IWLAN V2. The "Effective ranges" work area is only visible for these HMI devices.

You set up effective ranges in order to control safety related operations. An effective range is defined by the maximum distance from one or more transponders.

Note

For more information refer to the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Open the work area in the project window by double-clicking on "Zones & effective ranges". Click the "Effective ranges" tab.

Work area

The "Effective ranges" work area displays the effective ranges that have been set up and the transponders assigned to them.

Inspector window

When an effective range is selected, you can edit the names, display names and the limits of the effective range under the "General" category.

When you select a transponder, you can see both the effective range and the zone that are assigned to that transponder. You can only assign a transponder to one effective range so that the effective ranges do not overlap.

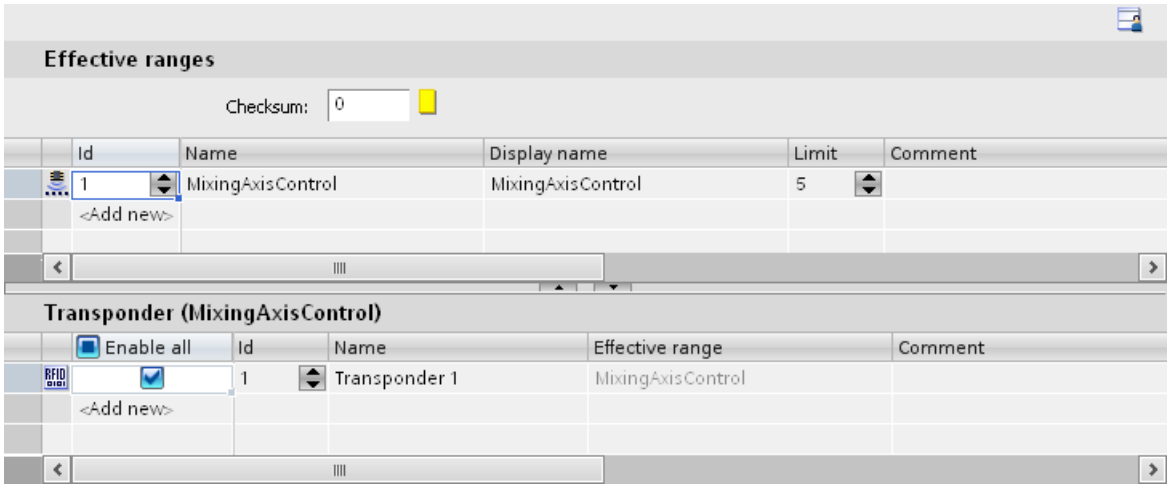
10.9.5.4 Effective ranges working area

Introduction

The "Effective ranges" work area displays the effective ranges and their transponders in table format. You create a list of transponders and assign certain transponders to an effective range. The limit of the effective range is defined by the maximum distance from the transponders.

Principle

The work area consists of the "Effective ranges" and "Transponders" tables.



The HMI device calculates a checksum from the local data so that the configured effective ranges and transponders reliably match those locally on the machine. The project cannot be started on the HMI device unless the local checksum agrees with the checksum stored in the "Effective ranges" editor.

When you select an effective range from the "Effective ranges" table, the "Transponder" table displays the following:

- Transponder enabled: The transponder is assigned to the selected effective range.
- Transponder deactivated: The transponder is not yet assigned to any effective range.
- Transponder not available: The transponder has already been assigned to another effective range. To undo the assignment, switch to the relevant effective range and deactivate the transponder.
- The zone assigned to the transponder is displayed in addition to the effective range.

The effective range and transponder IDs are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 127 effective ranges may be configured.
- The effective range ID must be unique and fall within the range from 1 - 127.
- The display name of an effective range must not be the same as its ID.
- You can initially configure transponders without assigning them to an effective range.
- There may be no more than 127 transponders assigned to an effective range.
- The transponder ID must be unique and fall within the range from 1 - 65534.

The transponder IDs are set on the transponder.

Effective range in Runtime

To log on to the effective range in Runtime, only the display name of the effective range appears to the operator in the Runtime language. The operator reads the effective range ID in the plant and enters it on the HMI device. This ensures that the right machine operated. The acknowledgment buttons are activated after successful logon.

10.9.5.5 Effective ranges (RFID)

Introduction

The following section only applies to the Mobile Panel 277F IWLAN (RFID tag) which supports fail-safe operation with RFID. The "Effective ranges (RFID)" work area is only visible with these HMI devices.

To monitor safety-related operator inputs, you set up effective ranges (RFID).

Note

For more information, refer to the operating instructions of the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

Open

Open the work area in the project window by double-clicking on "Effective ranges (RFID)".

Work area

The "Effective ranges (RFID)" work area displays the effective ranges that have been set up and the RFID Tags assigned to them.

Inspector window

When an effective range (RFID) is selected, you can edit the name, display name and ID of the effective range under the "General" category.

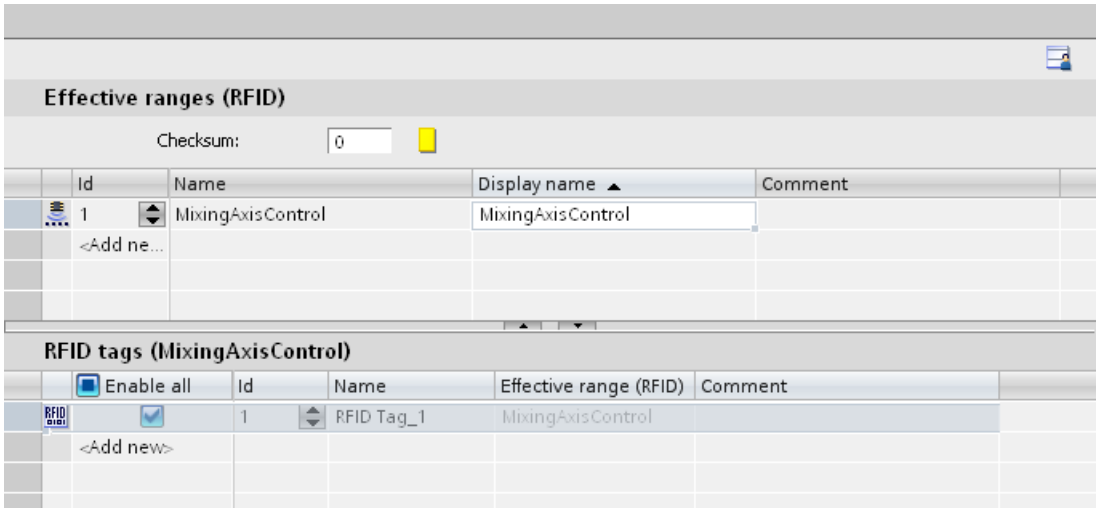
10.9.5.6 Work area for effective ranges (RFID)

Introduction

The "Effective ranges (RFID)" work area displays the effective ranges (RFID) and their RFID Tags in table format. You create a list of RFID Tags and assign specific RFID Tags to an effective range.

Principle

The work area consists of the "Effective ranges (RFID)" and "RFID Tags" tables.



The HMI device calculates a checksum from the local data so that the configured effective ranges (RFID) and RFID Tags reliably match those locally on the machine. The project cannot be started on the HMI device unless the local checksum agrees with the checksum stored in the "Effective ranges (RFID)" editor.

When you select an effective range (RFID) in the "Effective ranges (RFID)" table, the "RFID Tags" table displays the following:

- RFID Tag enabled: The RFID Tag is assigned to the selected effective range (RFID).
- RFID Tag disabled: The RFID Tag is not yet assigned to any effective range (RFID).
- RFID Tag not available: The RFID Tag has already been assigned to another effective range (RFID). To undo the assignment, switch to the relevant effective range (RFID) and deactivate the RFID Tag.

The IDs of the effective ranges (RFID) and RFID Tags are initially assigned automatically. They can be changed, however.

Please note the following:

- A maximum of 127 effective ranges (RFID) may be configured.
- The effective range (RFID) ID must be unique and fall within the range from 1 - 127.
- The display name of an effective range (RFID) must not be the same as its ID.
- You can initially configure RFID Tags without assigning them to an effective range (RFID).
- A maximum of 127 RFID Tags is available to assign to an effective range (RFID).
- The RFID Tag ID must be unique and fall within the range 1-65534.

The RFID Tag ID is written to the RFID Tag by the HMI device.

Effective range in Runtime

To log on to the effective range (RFID) in Runtime, only the display name of the effective range (RFID) is displayed to the operator in the Runtime language. The operator reads the effective range (RFID) ID in the plant and enters it on the HMI device. This ensures that the right machine operated. The acknowledgment buttons are activated after successful logon.

10.9.6 Working with zones

10.9.6.1 Configuring a zone

Validity

The next section applies to all Mobile Panels Wireless, e.g. Mobile Panel 277 IWLAN.

Introduction

You will have to set up a zone in order to carry out plant-specific operator control and monitoring tasks.

Requirements

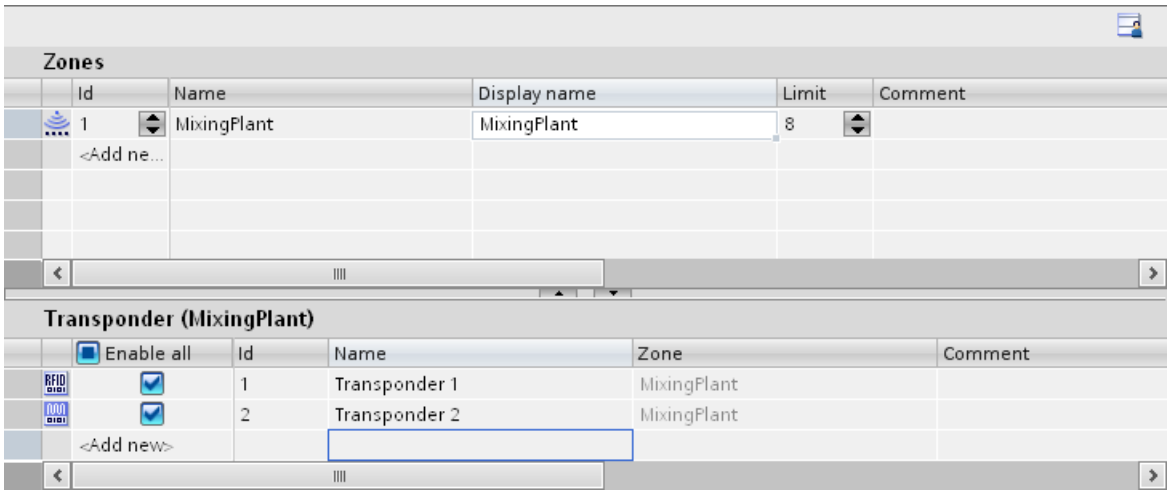
- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Zones" work area is open.

Procedure

1. Double-click "Add..." in the "Zones" table.
2. Enter the "MixingPlant" zone in the "Name" field.
3. Enter "MixingSystem" as the "Display name" for the zone at runtime. Enter zone "1" in the "ID" field.
4. Enter "8" meters as the zone "Limit".
5. Double-click "Add..." in the "Transponders" table.
6. Enter "Transponder 1" as the "Name" of the transponder.
7. Enter transponder "1" in the "ID" field.
   Then set transponder IDs on the transponder.
8. Enable the assignment of "Transponder 1".
   "Transponder 1" is assigned to the "MixingPlant" zone.
9. Repeat steps 6 to -9 accordingly for "Transponder 2".
   "Transponder 2" is assigned to the "MixingPlant" zone.

Result

The "MixingPlant" zone is configured as two conical areas arranged at a distance of 8 meters, regardless of the effective ranges: one area around "Transponder 1" and one around "Transponder 2".



The display name designates the zone in the set editing language. An overview of the display names can be found in the "Project texts" editor.

10.9.6.2 Displaying the screen on entering a zone

Introduction

Configure a screen change when entering and leaving the zone.

Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel 277 IWLAN.
- The "MixingPlant" zone is configured.
- The "Plant_1" screen has been created and opened.
- The "MixingPlant_1" screen has been created and opened.
- The "Zones" work area is open.

Procedure

1. Select the "MixingPlant" zone from the "Zones" table.
2. Click "Properties> Events" in the Inspector window.
3. Click the event "On entry".

4. Select the "ActivateScreen" system function in the "function list".
5. Select "MixingPlant_1" as the "Screen name".
6. Click the event "On exit".
7. Select the "ActivateScreen" system function in the function list.
8. Select "Plant_1" as the "Screen name".

Result

The "MixingPlant_1" screen is displayed on the HMI device when you enter the "MixingPlant" zone. When you exit the zone, the "Plant_1" screen appears once more.

10.9.6.3 Displaying an object in relation to the zone

Validity

The following example is independent of the WLAN and applies to all Mobile Panels.

Introduction

You configure an I/O field that is only visible within a specific zone.

Requirements

- A Mobile Panel which supports zones has been created, for example, Mobile Panel 277 IWLAN.
- The "Zone_id" variable of the "Int" data type has been created.
- A "Plant_1_Overview" screen has been created.

Procedure

1. Open the "Runtime Settings > General" editor.
2. Select the "Zone_id" tag as the "ID Zone/ Effective range".
3. Open the screen "Plant_1_Overview".
4. Drag and drop the "I/O box" object from the toolbox into the screen.
5. Click "Properties > Animations" in the Inspector window.
6. Click "Layout > Visibility."
7. Select "Zone_id" as the "tag".
8. Select "from" 1 "to" 1 as the "Range".
9. Enable "Visible".

Result

The IO field is only visible at runtime under the following conditions:

- The hard-wired Mobile Panel is connected to a connection box with ID = 1.
- The Mobile Panel Wireless is located in a zone with ID = 1, for example, the "MixingPlant" zone.

10.9.7 Working with effective ranges

10.9.7.1 Overview

Introduction

The following configuration guide describes the steps needed to set up an effective range for fail-safe operation on a Mobile Panel Wireless.

Procedures overview

1. Configuring the effective range:
   You configure the "MixingAxisControl" effective range as a conical area around "Transponder1 " at a distance of 5 meters.
2. Configuring the name of the effective range:
   To ensure logon to the effective range, configure the object "Effective range - Name".
3. Configuring additional effective range objects:
   Configure additional objects for displaying the position and signal strength within an effective range.
4. Set parameters for loading:
   - PROFIsafe communication
   - WLAN network
   - Power management
   - Interface
5. Configure the data channel
6. Configure network operation
7. Set the transponder
8. Commissioning effective ranges
9. Switching on and Testing the HMI device
10. Start loading manually
11. Acknowledging the effective range at the plant:
    You acknowledge the effective ranges and their transponders.

12. Determine the checksum
13. Load the project once again with checksum:
    Enter the checksum you have determined in the project and load the project once again.
14. Test effective range

Note

For detailed information on items 5 to 14, refer to the operating instructions of the HMI device.

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

10.9.7.2 Configure effective range

Introduction

You set up an effective range in order to control safety related operator input upstream of a machine or plant.

Requirements

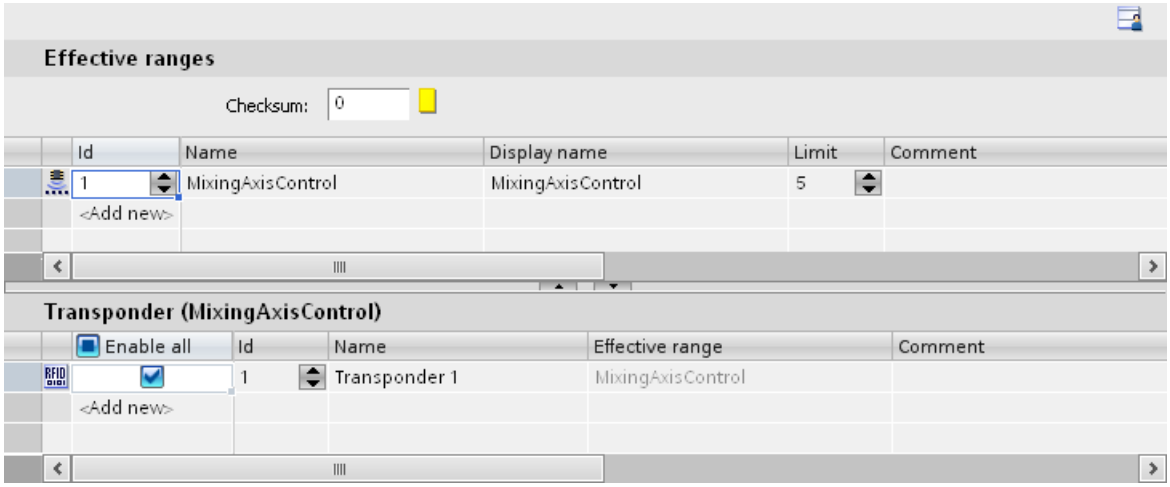
- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Effective ranges" work area is open.

Procedure

1. Double-click "Add..." in the "Effective Ranges" table.
2. Enter "MixingAxisControl" as the "Name" of the effective range.
3. Enter "Mixing_axis_PLC" as the "Display name" for the effective range at runtime.
4. Enter effective range "1" in the "ID" field.
   Make sure that the effective range ID matches the ID on the machine.
5. Enter "5" meters as the "Limit" of the effective range.
6. Double-click "Add..." in the "Transponders" table.
7. Enter "Transponder 1" as the "Name" of the transponder.
8. Enter transponder "1" in the "ID" field.
   Then set transponder IDs on the transponder.
9. Enable the assignment of "Transponder 1".
   "Transponder 1" is assigned to the "MixingAxisControl" effective range.

Result

You configure the "MixingAxisControl" effective range as a conical area around "Transponder 1" at a distance of 5 meters, regardless of the zones.



The display name designates the effective range in the set editing language. An overview of the display names can be found in the "Project texts" editor.

10.9.7.3 Configuring the effective range name

Introduction

Configure at least the "Effective range - Name" object so that an operator can log on and off a machine using an effective range. If you do not configure an effective range object for a Mobile Panel Wireless for fail-safe operation, a warning appears during generation.

Requirements

A screen has been created and opened.

Procedure

1. Select the "Effective range - Name" object from the "Advanced objects" category in the toolbox.
2. Drag and drop the "Effective range - Name" object from the toolbox into the screen.

Result

If the operator clicks an object during runtime, he initiates logon or logoff of the HMI device to a machine that is assigned to an effective range.

See also

Effective range name (Page 3152)

10.9.7.4 Configuring additional Mobile Wireless objects

Introduction

You will need to configure other objects in order to display further information about the effective range during testing, for example.

Requirements

A screen has been created and opened.

Procedure

1. Select the "Effective range - Signal" object from the "Elements" category in the toolbox.
2. Drag and drop the "Effective range - Signal" object from the toolbox into the screen.
3. Repeat steps 1 and 2 with the "WLAN - Reception" object.

Result

The "Effective range - Signal" object indicates how accurately the Mobile Panel Wireless is within an effective range. The "WLAN - Reception Quality" object displays the signal strength of the WLAN wireless connection.

See also

Effective range signal (Page 3156)

WLAN reception (Page 3157)

10.9.8 Working with effective ranges (RFID)

10.9.8.1 Overview

Validity

The next section applies only to Mobile Panels Wireless with RFID, for example, Mobile Panel 277F IWLAN (RFID Tag).

Introduction

The following configuration guide describes the steps required to set up an effective range (RFID) for fail-safe operation on a Mobile Panel Wireless with RFID.

Procedures overview

1. Configure effective range (RFID):
   You configure the effective range (RFID) "MixingAxisControl".
2. Configuring the name of the effective range (RFID):
   To ensure logon to the effective range, configure the object "Effective range - Name (RFID)".
3. Set parameters for loading
4. Configure the data channel
5. Configure network operation
6. Install RFID Tag in the plant
7. Turn on the HMI device and enable loading mode
8. Loading a project
9. Write the suitable IDs to the RFID Tags in the plant
10. Determine the checksum
11. Load the project once again with checksum:
    Enter the checksum you have determined in the project and load the project once again.
12. Test effective range (RFID)

Note

For detailed information on items 4 to 12, refer to the operating instructions of the HMI device.

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

10.9.8.2 Configuring effective range (RFID)

Introduction

You set up an effective range (RFID) to control safety-related operator input upstream of a machine or plant.

Requirements

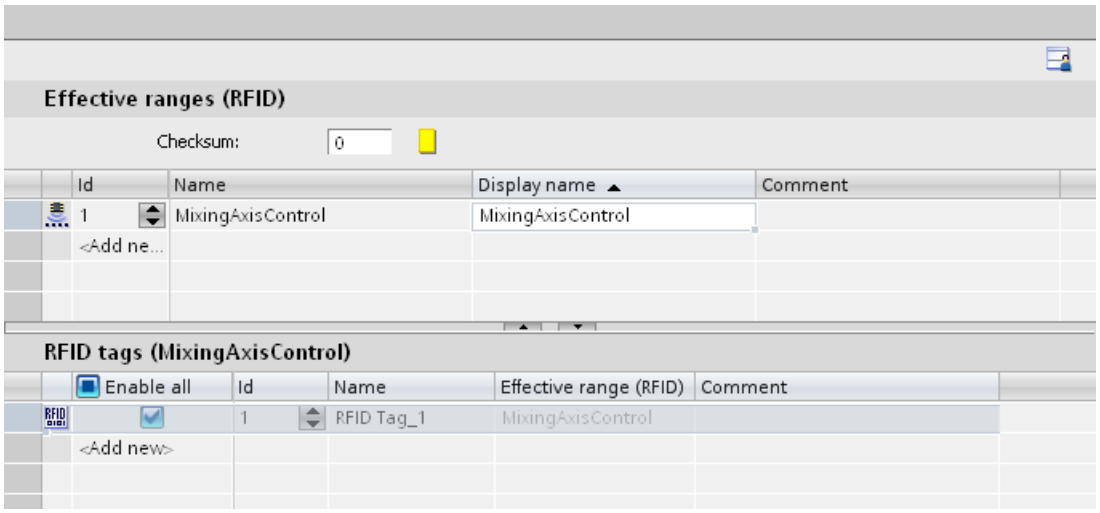
- A suitable editing language, e.g. English, must have been set in the "Project languages" editor.
- The "Effective ranges (RFID)" work area is open.

Procedure

1. Double-click "Add..." in the "Effective Ranges (RFID)" table.
2. Enter "MixingAxisControl" as the "Name" of the effective range (RFID).
3. Enter "MixingAxisControl" in the "Display name" field of the effective range (RFID).
4. Enter "1" in the "ID" field of the effective range (RFID).
   Make sure that the effective range (RFID)-ID matches the ID on the machine.
5. Double-click "Add..." in the "RFID Tag table.
6. Enter "RFID Tag 1" as the "Name" of the RFID Tag.
7. Enter "1" as the "ID" of the RFID Tag. Then set the RFID Tag-ID for the RFID Tag.
8. Enable the assignment of "RFID Tag 1".
   "RFID Tag 1" is assigned to the effective range (RFID) "MixingAxisControl".

Result

The effective range (RFID) "MixingAxisControl" is configured.



The display name describes the effective range (RFID) in the set editing language. An overview of the display names can be found in the "Project texts" editor.

10.9.8.3 Configuring the effective range name (RFID)

Introduction

Configure the "Effective range - Name" object so that an operator can log on and off a machine using an effective range (RFID). If you do not configure the "Effective range-Name" object for a Mobile Panel Wireless RFID with (RFID), a warning will appear during generation.

Requirements

A screen has been created and opened.

Procedure

1. Select the "Effective range - Name (RFID)" object from "<Elements" in the toolbox.
2. Drag and drop the "Effective range - Name (RFID)" object from the toolbox into the screen.

Result

If the operator clicks an object during runtime, he will initiate logon or logoff of the HMI device to a machine which has been assigned to an effective range (RFID).

See also

Effective range name (RFID) (Page 3154)

10.9.9 Reference

10.9.9.1 PROFIsafe address

Validity

The PROFIsafe address is only available for fail-safe operation for the Mobile Panel Wireless.

Note

Additional information on fail-safe operation can be found in the operating instructions for the HMI device:

Complete documentation for Mobile Wireless (http://support.automation.siemens.com/WW/view/en/26268960)

PROFIsafe address

The PROFIsafe address used for fail-safe I/Os in PROFIsafe communication is unique on the entire network and on all stations. On the Mobile Panel Wireless, you create a default value in the project and load it to the HMI device. You can also store a PROFIsafe address on the HMI device.

The PROFIsafe address fall within the range from 1 to 65534. The two PROFIsafe addresses (in the Engineering System and on the HMI device) are checked for formal validity.

The PROFIsafe address is loaded as follows at the start of Runtime:

- You programmed a valid PROFIsafe address in the Control Panel.
  The HMI loads the PROFIsafe address set in the Control Panel.
- You did not program a valid PROFIsafe address in the Control Panel.
  The HMI loads the PROFIsafe address set in the project.

Note

The invalid address 65.535 is programmed by default in the Control Panel of the HMI device. The HMI loads the address set in the project.

See also

Power Management (Page 4892)

Zone ID / connection point ID (Page 4893)

10.9.9.2 Power Management

Validity

In the "Runtime Settings > Power Management" editor, configure the energy-saving mode of a Mobile Panel.

Power Management

The Mobile Panel Wireless can save energy in the following ways:

- Reduce brightness - minimal saving
- Switch off display - significant saving

You can also indicate after how long without operator input the power management function is enabled. The communication link is maintained. The time for "Switch monitor off" is longer than the time for "Reduce brightness".

See also

PROFIsafe address (Page 4889)

10.9.9.3 Zone ID / connection point ID

Validity

In the "Runtime Settings > General" configure an internal tag which, depending on the value, shows specific information on the display of the HMI device.

Note

Mobile Panels Wireless with RFID

For Mobile Panels Wireless with RFID, the area "Zone ID / Connection point ID" is not available.

Zone ID / connection point ID

This field is used to configure an internal tag that contains the following value at runtime in relation to the type of HMI device:

- The ID of the connection box or effective range to which the hard-wired Mobile Panel is connected.
- The ID of the zone in which the Mobile Panel Wireless is located. If the value is set to 255, then the HMI device is not in any zone.

See also

PROFIsafe address (Page 4889)

10.10 Planning tasks

10.10.1 Field of application of the Scheduler

Definition

You can use the Scheduler to configure tasks to run independent of the screen in the background. You create tasks by linking system functions or scripts to a trigger. The linked functions will be called when the triggering event occurs.

Example of an application

The Scheduler is used to execute event-controlled tasks automatically. For example, you use a task to automate the following:

- Regular swap out of log data
- Printout of an alarm report when an alarm buffer overflow occurs
- Printout of a report at shift end
- Monitoring a tag
- Monitoring of a user change

Note

The availability of the listed examples is determined by the HMI device.

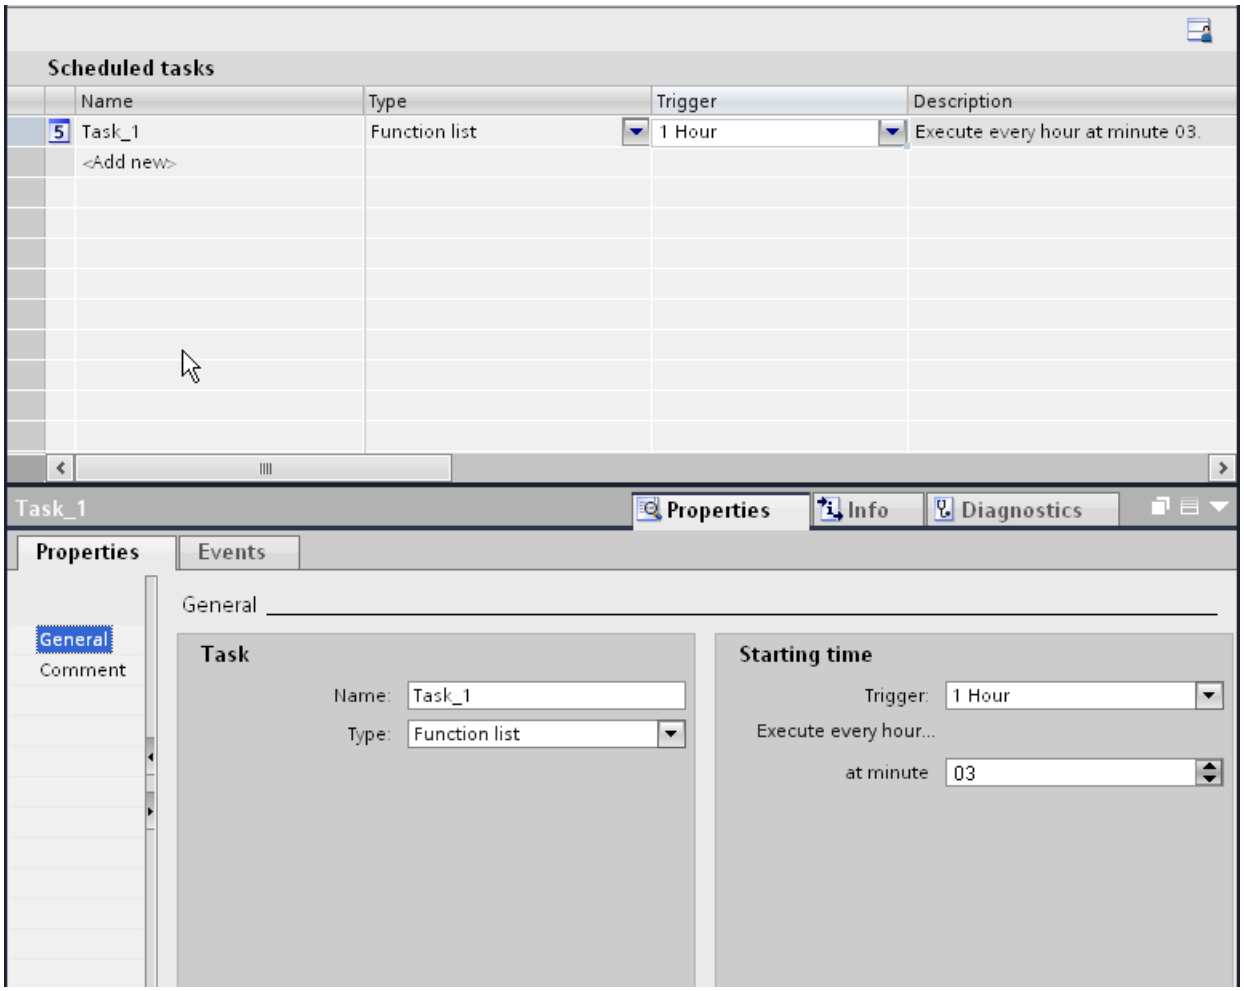
See also

Work area of the "Scheduler" editor (Page 4896)

10.10.2 Working with tasks and triggers

Introduction

A task consists of a trigger and a task type.



Starting a task

Controlled by a trigger, the Scheduler starts the task linked to the trigger.

10.10.3 Basics

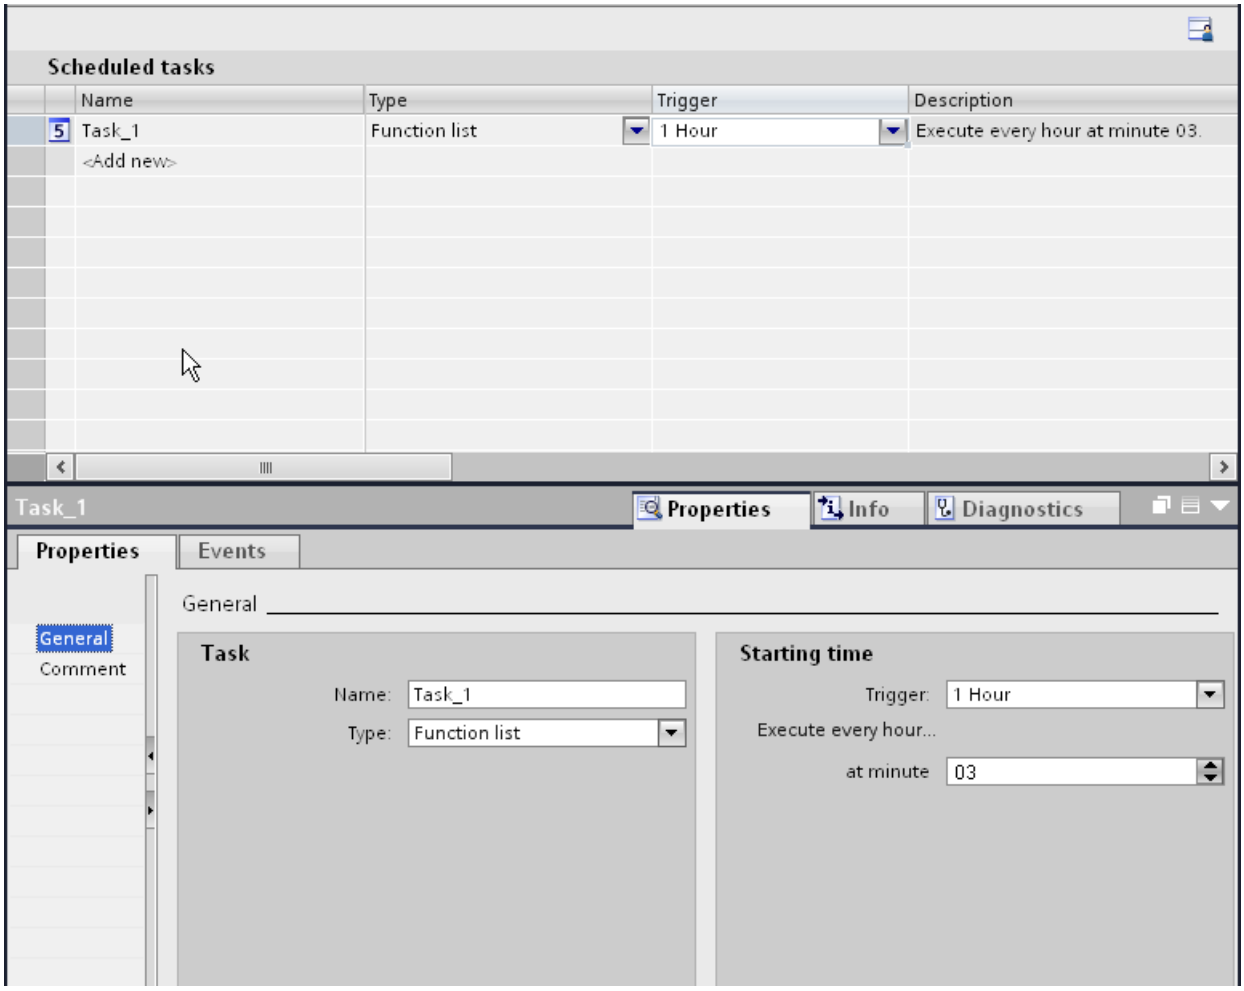
10.10.3.1 Work area of the "Scheduler" editor

Introduction

Double-click on "Scheduler" to open it in the project view. The work area shows the scheduled tasks, which consist of the trigger and the task type, for example, the function list.

Structure

The work area consists of the table of jobs.



The table of tasks shows specified tasks with their properties, such as triggers. You select a task type and a trigger. You assign a name and a comment to the task. The description provides a written summary of the task including the timing for the task.

Inspector window

The "Properties" tab of the Inspector window is split into two parts.

The "Job" area lists the name of the job and the job type. The "Starting time" area shows the trigger. The area is different depending on the trigger selected.

In the "Events" tab use the function list with system functions that will be executed in the task.

Note

You can obtain more detailed information about the elements of the user interface using the tooltips. To do so, move the mouse pointer to the relevant object or press <F1> if the object has already been selected.

See also

Field of application of the Scheduler (Page 4892)

Triggers (Page 4898)

10.10.3.2 Function list

Function list

A trigger starts the function list. The function list is executed line by line. Each line contains a system function. You can configure exactly one function list for each task.

Note

The choice of configurable system functions in a function list depends on the selected trigger and the HMI device.

10.10.3.3 Function list

Function list

A trigger starts the function list. The function list is executed line by line. Each line contains a system function or a local script. You can configure exactly one function list for each task.

Note

The choice of configurable system functions in a function list depends on the selected trigger and the HMI device.

Processing of system functions and scripts

System functions and scripts in a function list are processed in Runtime sequentially from top to bottom.

Auto-Hotspot

Use a script with loops, conditional statements and abort conditions to program non-sequential and conditional procedures.

10.10.3.4 Triggers

Triggers

Introduction

A trigger is linked to a task and forms the triggering event which will call this task. The task is executed when the trigger occurs.

Event trigger

When a task is linked to a system event, the task will be triggered by the event. System events include, for example, Runtime stop, screen change, user change, etc.

Each system event can only be configured once for each HMI device.

Deactivating job

If you do not need a certain job temporarily, deactivate the job in the Engineering System. You also use the trigger "Deactivated" to make a previously configured system event available once again.

Example: Task "A" is planned with the system event "Shutdown". This system event is then no longer available for another task "B". Select "Disabled" as the trigger for task "A" to make the "Runtime stop" system event available again.

Note

The available triggers depend on the HMI device.

See also

Work area of the "Scheduler" editor (Page 4894)

Triggers

Introduction

A trigger is linked to a task and forms the triggering event which will call this task. The task is executed when the trigger occurs.

Types of triggers

The Scheduler recognizes different types of triggers:

Acyclic triggers

They consist of a specification for the date and time of day. Tasks with an acyclic trigger are performed once by the Scheduler on the specified date and at the specified time.

Cyclic triggers

Tasks linked to a cyclic trigger occur regularly at a specific point in time.

- Standard cycle: With a standard cycle, the beginning of the first interval coincides with the start of Runtime. The length of the interval is determined by the cycle.
- Trigger with defined starting time: You specify a start time and a time interval. You can use cyclic triggers to perform tasks on a daily or weekly basis, for example. For example, you can select a "Weekly" trigger to specify a week as the interval. You specify the beginning of the interval with the day of the week and the time of day.

Note

User-defined cycles

You have defined your own cycles. You can only use cycles in the Scheduler whose maximum value amounts to one hour.

Event trigger

When a task is linked to a system event, the task will be triggered by the event. In contrast to cyclic triggers, system events usually occur acyclically. A Runtime stop is a system event, for example.

Each system event can only be configured once for each HMI device.

Deactivating job

If you do not need a certain job temporarily, deactivate the job in the Engineering System. You also use the trigger "Deactivated" to make a previously configured system event available once again.

Example: Task "A" is planned with the "User change" system event. This system event is then no longer available for another task "B". Select "Disabled" as the trigger for task "A" to make the "User change" system event available again.

Note

The available triggers depend on the HMI device.

Timers for cyclic triggers

Timers for cyclic and acyclic triggers

You have the option to change the start time of a task dynamically in Runtime. You can select an HMI variable as the timer. The value of the tag determines the start time for the task during Runtime.

Note

An HMI tag must be of the type "DateTime". A PLC tag must be of the type "Date and Time" or "DTL".

As long as the operator does not change the tag after Runtime starts, the start time configured in the task is valid. As soon as the operator enters a change to the tag, the current value of the tag is always the start time. To reset the configured time as the start time, the operator has to enter the configured time again.

10.10.4 Planning jobs

10.10.4.1 Planning tasks with acyclic triggers

Introduction

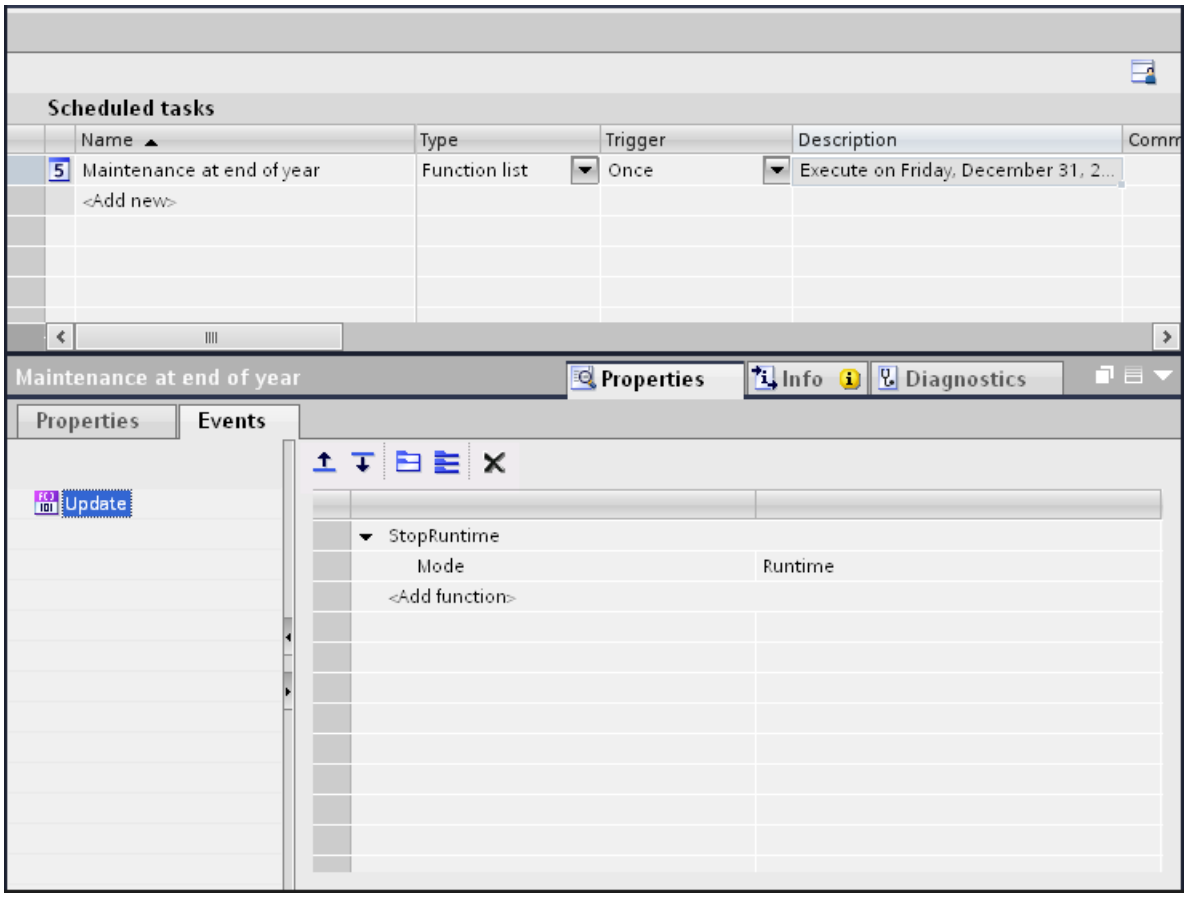
You are planning a one-time Runtime stop for maintenance work. The task starts a function which requires Runtime to stop.

Requirements

- The "Scheduler" editor is open.
- The Inspector window is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Maintenance at end of year" as the "Name."
3. Select "Once" as the "Trigger."
4. Select "31.12.2008" in the "Properties > Properties > General > on" field of the Inspector window.
5. Enter the time "18:00" in the "at" field.
6. Click "Properties > Events" in the Inspector window.
7. Select the "StopRuntime" system function in the function list.
8. Select "Runtime" as the "Mode".



Result

The task is executed once. Runtime will be stopped at 18:00 on December 31, 2008.

Note

"StopRuntime" event on RT Professional

Please note that the "StopRuntime" event means runtime is in the process of ending and that some functionalities are therefore no longer available.

10.10.4.2 Planning tasks with cyclic triggers

Introduction

You plan a job that provides a weekly printout of a report.

Requirements

- A "Weekly report" report has been created.
- The "Scheduler" editor is open.
- The Inspector window is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Weekly report printout for end of shift" as the "Name."
3. Select "Weekly" as the "Event".
4. Open the "Properties" tab in the Inspector window.
5. Select "Friday" in the "on day" field of the "Starting point" area.
6. Enter the time "18:00" in the "at" field in the "Starting point" area.
7. Click in the "Events" tab of the "Function list" on the entry "No function."
8. Select "Print/PrintReport" as the function.
9. Select "Weekly report" report.

Result

The task is executed weekly. The report "Weekly report" will be printed every Friday at 18:00 hours.

10.10.4.3 Planning tasks with event triggers

Introduction

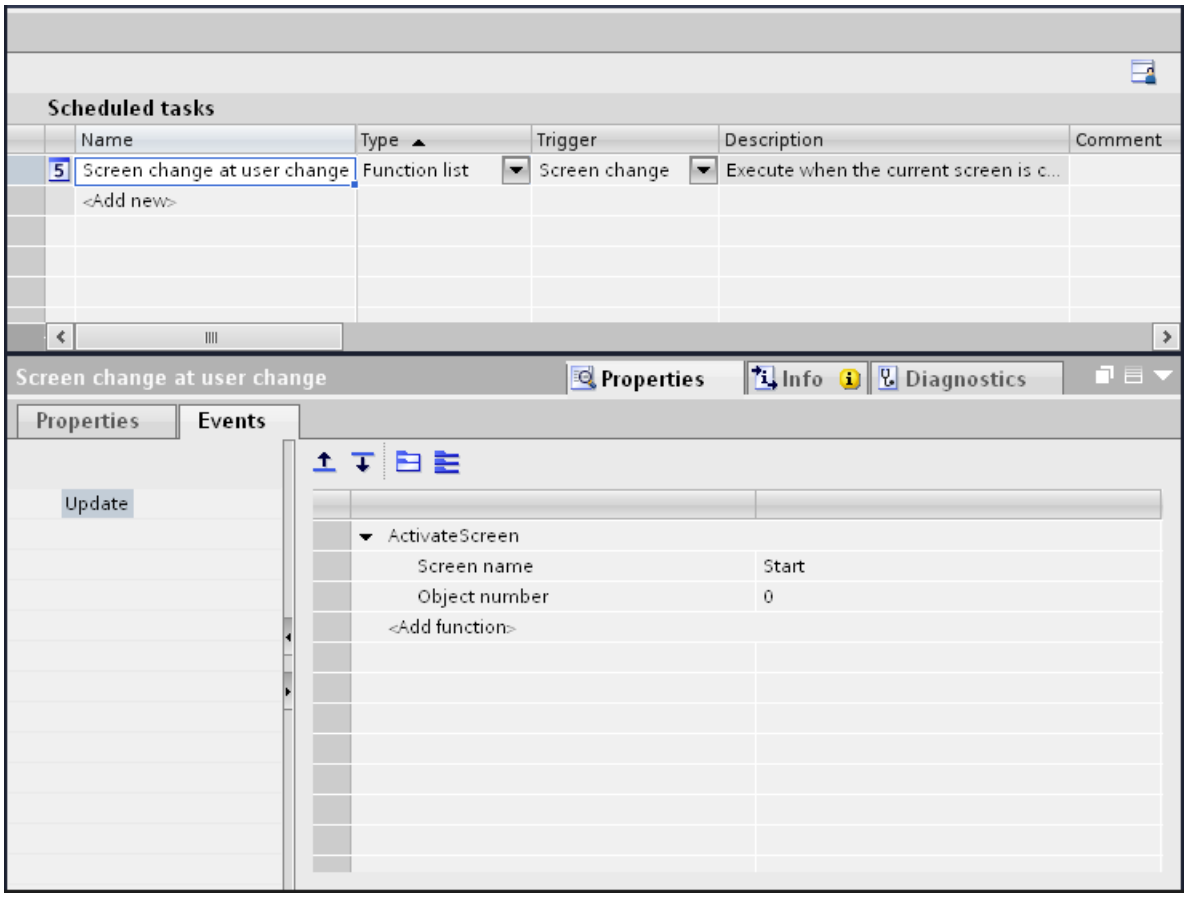
You plan a task that generates a screen change when the user changes.

Requirements

- The "Scheduler" work area is open.
- You have created the "Start" screen.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Screen change at user change" as the "Name."
3. Select "User change" as the "Trigger."
4. In the Inspector window, select "Properties > Events".
5. Select the "Screen/ActivateScreen" system function in the function list.
6. Select the "Start" screen in the screen name field.



Result

The task is executed with the "User change" event. When a new user logs on successfully, the "Start" screen is called up.

10.10.4.4 Administer task

Changing the designation

1. In the work area, double-click the field in the "Name" column.
2. Change the name of the task.
3. Confirm your entry with <Return>.

As an alternative, you can change the designation in the "Job > Name" box of the Inspector window.

Changing triggers

1. In the work area, mark the field in the "Trigger" column.
2. Open the drop-down list using the button and select the trigger you require.

You can alternatively change the trigger in the "Starting time" area of the Inspector window.

Deleting a task

1. Select one or more lines for the tasks to be deleted.
2. Open the shortcut menu with the right button and select the menu command "Delete".

As an alternative, delete one or more tasks by using the <Del> button.

10.10.5 Examples

10.10.5.1 Example: Terminating Runtime every day

Task

You plan a job that terminates Runtime every day at the end of work.

Requirements

- The "Scheduler" work area is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Runtime stop at end of work" as the "Name."
3. Select "Daily" as the "Event."
4. Open the "Properties" tab in the Inspector window.
5. Enter the time "21:00" in the "at" field in the "Starting point" area.
6. Open the "Events" tab in the Inspector window.
7. Click the "No function" entry in the "Function list".
8. Select "System functions/System/StopRuntime" as the function.

Result

Runtime is terminated every day at 21:00.

10.10.5.2 Example: Update user following change of user

Task

Configure an I/O field which displays the logged on user. Configure a task which updates the I/O field when the logged on user changes.

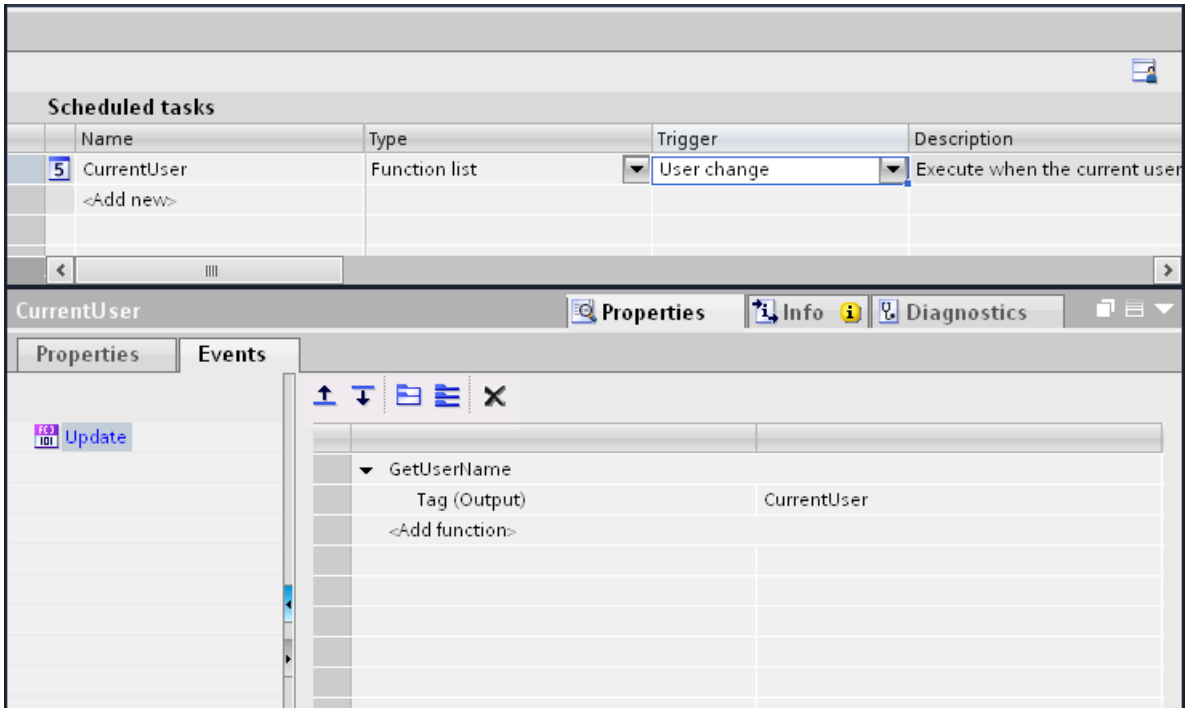
Requirements

- A "CurrentUser" tag of the "String" type is created.
- A screen has been created and opened.
- An I/O field is created in the screen.

Procedure

1. Click on the "I/O field" object.
2. In the Inspector window, select "Properties > Properties > General":
   - Select "String" as the "Display format."
   - Select "CurrentUser" as the "Variable."
   - Select "Output" as the mode.
3. Change to the work area of the Scheduler.
4. Click "Add..." in the table of the task area.

5. Enter "CurrentUser" as the "Name".
6. Select "User change" as the "Trigger."
7. In the Inspector window, select "Properties > Events".
8. Select the system function "ReadUserName" from the "User Management" group in the function list.
9. Select "CurrentUser" as the "Variable."



Result

When a new user logs on successfully, the "ReadUserName" function is called up. The "CurrentUser" tag is updated and displayed in the I/O field of the newly logged on user.

If a user does not log on successfully, the logged on user is logged off. The I/O field continues to display the user previously logged on until a new user logs on successfully.

10.10.5.3 Example: Changing the starting point of a job in Runtime

Example: Changing the starting point of a task in Runtime

Introduction

A cyclic trigger, for example "Starting daily at 18:00," is configured in the Engineering System. The time "18:00" is fixed as a constant. To change the start time in Runtime, select a tag as the "Timer." The value of the tag determines the start time of the task during Runtime.

Task

You plan a task that swaps out log data daily and has the "LogTime" tag as the timer. You configure a "LogTime" tag in an input field.

Requirements

- The "DataLogSource" source log has been created as a data log.
- The "DataLogDestination" destination log has been created as a data log.
- A "ChangeLogTime" screen has been created.

Procedures overview

1. Creating a timer tag: You create a tag with which you change the starting point of the log data swap in Runtime.
2. Configuring a Date/time field: The operator changes the starting point of the task by using the Date/Time field in Runtime.
3. Configure the task with a timer tag: You create a task whose start time can be changed dynamically in Runtime.

Result

If nothing is entered in the "LogDataTimeField" input field, then the task starts daily at 18:00 by default. The log data are swapped out. If an operator enters 19:00 in the "LogDataTimeField" input field, then the log data are swapped out at 19:00. Provided the value of the tag is not changed again before the task starts.

See also

Example: 2. Configuring a Date/time field (Page 4908)

Example: 1. Configuring a tag for Runtime

Task

In the following example you configure the "LogTime" variable.

Procedure

1. Open the "HMI tags" editor.
2. Click "Add..." in the table of the task area.
3. Enter "LogTime" as the "Name" of the variable.
4. Select "Internal variable" in the "Connection" column.
5. Select "DateTime" in the "Date type" column.

Result

A variable of the "DateTime" type has been created.

Example: 2. Configuring a Date/time field

Task

In the following example you configure a Date/time field. To change the starting point of the task in Runtime, link the "LogTime" variable to the Date/time field.

Requirements

- The "LogTime" variable of the "DateTime" type has been created.
- The "ChangeLogTime" screen is open.

Procedure

1. In the toolbox view, drag-and-drop a "Date/time field" from the "Basic objects" category to the screen.
2. In the Inspector window, click "Properties >Properties > General".
3. Disable the "System time."
4. Click "Variable" and select "LogTime."
5. Disable "Display date" and enable "Display time."
6. Select "Input/output" as the "Mode."
7. Click "Properties > Miscellaneous."
8. Enter "LogDataTimeField" as the "Name".

Result

The operator enters a time using the created date/time field.

See also

Example: Changing the starting point of a task in Runtime (Page 4904)

Example: 3. Configuring a swap to archive with a timer variable

Task

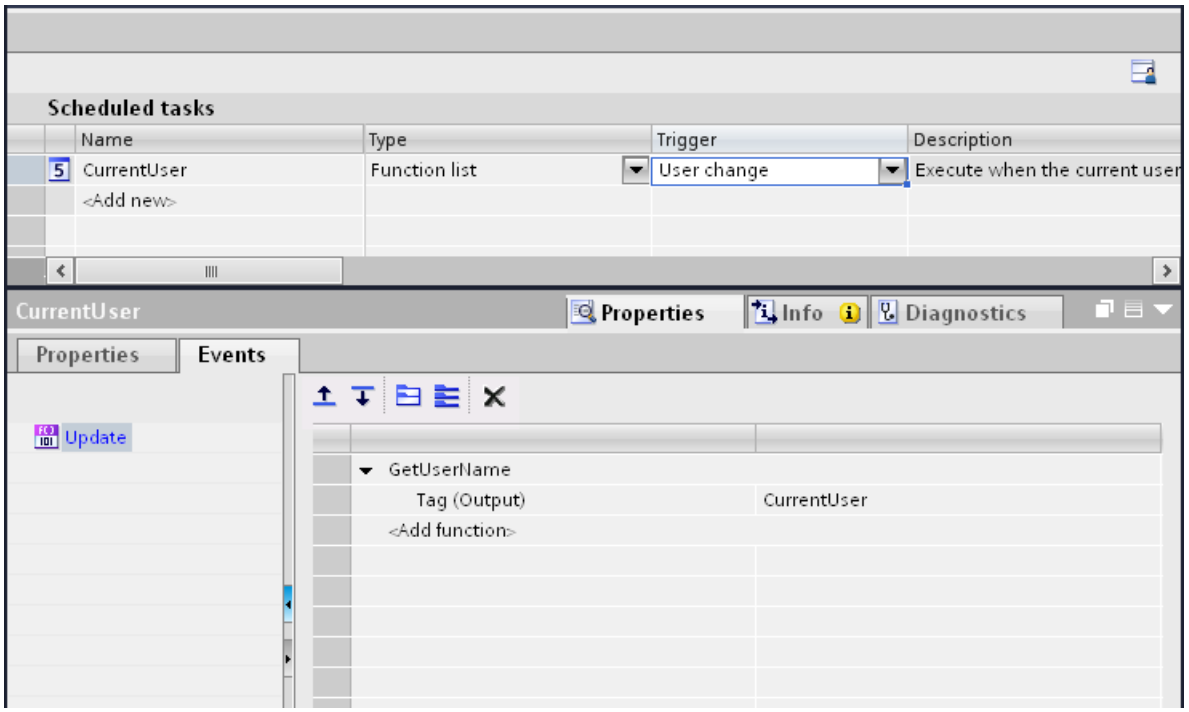
In the following example you configure a task with a timer tag with which you change the starting point of the task in Runtime.

Requirements

- The "LogTime" tag has been created.
- The "DataLogSource" source log has been created as a data log.
- The "DataLogDestination" destination log has been created as a data log.
- The Scheduler work area is open.

Procedure

1. Click "Add..." in the table of the task area.
2. Enter "Swap out log daily at a tag time" as the "Name".
3. Select "Daily" as the "Trigger".
4. In the Inspector window "Properties >Properties > General > at" enter the time "18:00".
5. Select the "LogTime" tag as the "Standard timer".
6. In the Inspector window, open "Properties > Events".
7. Select the "System functions/Logs/CopyLog" system function in the function list.
8. Select these settings:
   - Select "Data log" as the "Log type".
   - Select "DataLogDestination" as the "Destination log".
   - Select "DataLogSource" as the "Source log".
   - Select "Overwrite" as the "Mode".
   - Select "Yes" for "Delete source log".



Result

If nothing is entered in the "LogDataTimeField" input field, then the task starts daily at 18:00 by default. The log data are swapped out. If an operator enters 19:00 in the "LogDataTimeField" input field, then the log data are swapped out at 19:00. Provided the value of the tag is not changed again before the task starts.

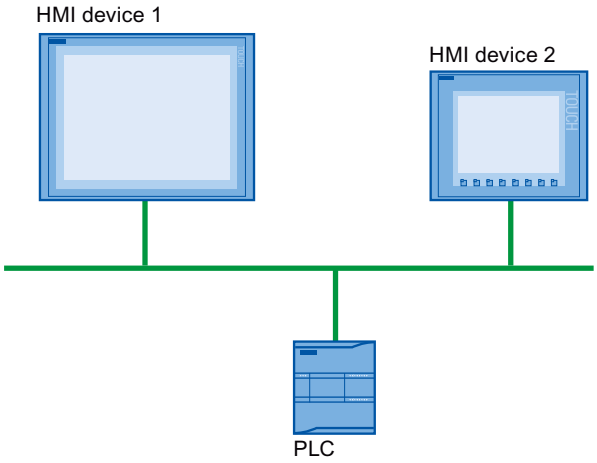
10.11 Communicating with PLCs

10.11.1 Basics of communication

10.11.1.1 Communication between devices

Communication

The data exchange between two devices is known as communication. The devices can be interconnected directly or via a network. The interconnected devices in communication are referred to as communication partners.



Data transferred between the communication partners may serve different purposes:

- Display processes
- Operate processes
- Output alarms
- Archive process values and alarms
- Document process values and alarms
- Administer process parameters and machine parameters

Communication partners

Communication between the following devices is described in more detail in this section:

- PLC
  The PLC controls a process by means of a user program.
- HMI device
  You use the HMI device to operate and monitor the process.

Basic information for all communication

The basis for all types of communication is a network configuration. In a network configuration, you specify the connection that exists between the configured devices.

With the network configuration, you also ensure the necessary prerequisites for communication, in other words:

- Every device in a network is assigned a unique address.
- The devices carry out communication with consistent transmission characteristics.

Automation system

The following characteristics describe an automation system:

- The PLC and HMI device are interconnected
- The network between the PLC and HMI device is configured

Communication between HMI devices

The HTTP protocol is available for communication between HMI devices.

For more detailed information, refer to the documentation on the SIMATIC HMI HTTP protocol.

Communication via a uniform and vendor-neutral interface

With OPC (Openess Productivity Collaboration), WinCC has a uniform and manufacturer-neutral software interface. This interface enables standardized data exchange between industrial, office, and manufacturing applications.

For more detailed information, refer to the documentation for OPC.

10.11.1.2 Devices and networks in the automation system

Introduction

To set up an automation system, you must configure, parameterize, and interconnect the individual devices.

You insert PLCs and HMI devices into the project in the same way. Likewise, you configure the two devices in the same way.

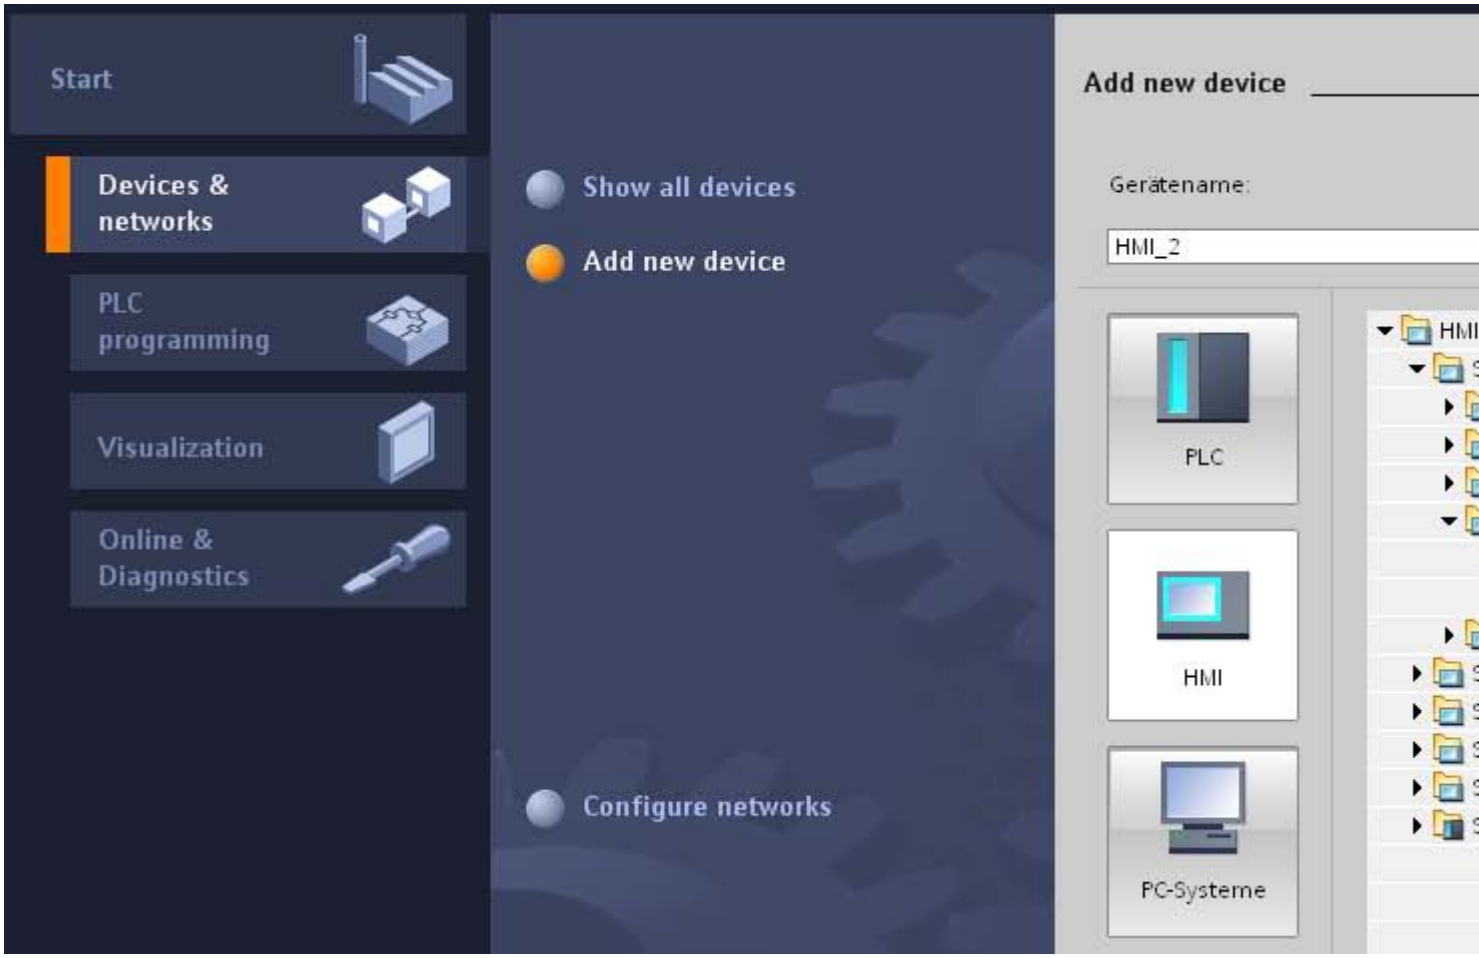
Automation system setup:

1. Insert PLC into the project.
2. Insert HMI device into the project.
3. Network the devices together.
4. Interconnect the devices.

Inserting devices

If you have created a project, you can add a device in the portal view or project view.

- Portal view



- Project view

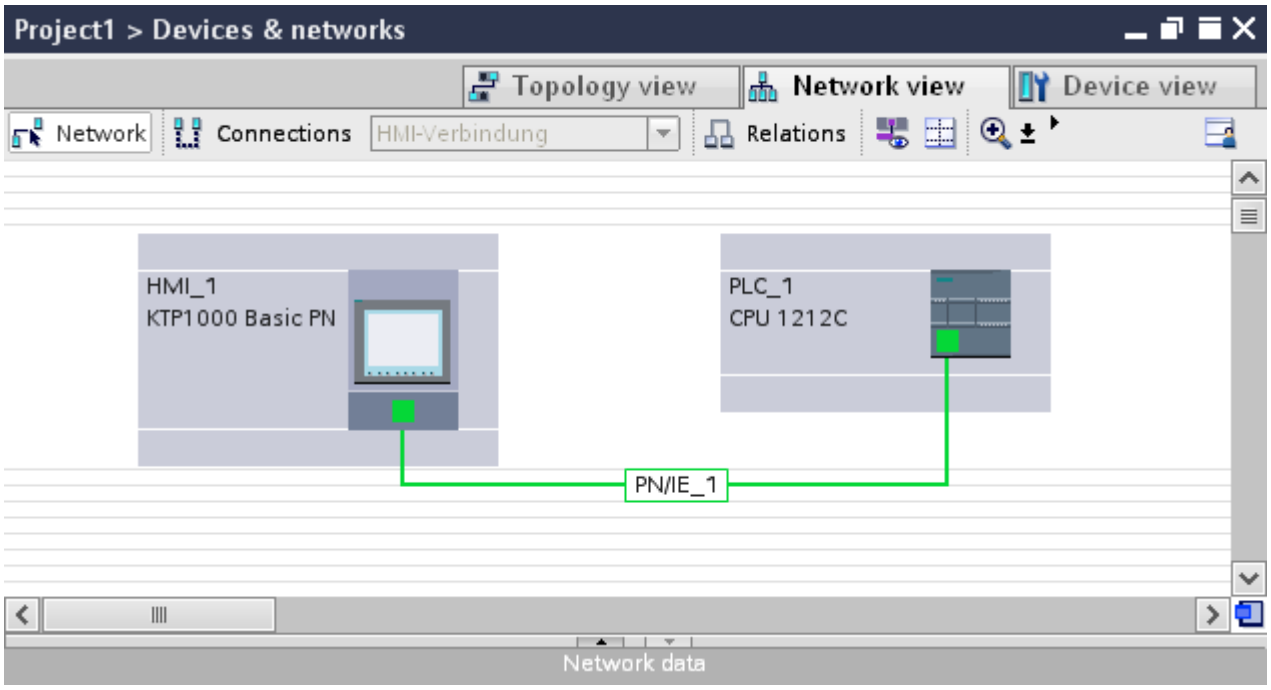
Networking devices

You can network the interfaces of the communication-capable devices conveniently in the "Devices & Networks" editor. In the networking step, you configure the physical device connections.

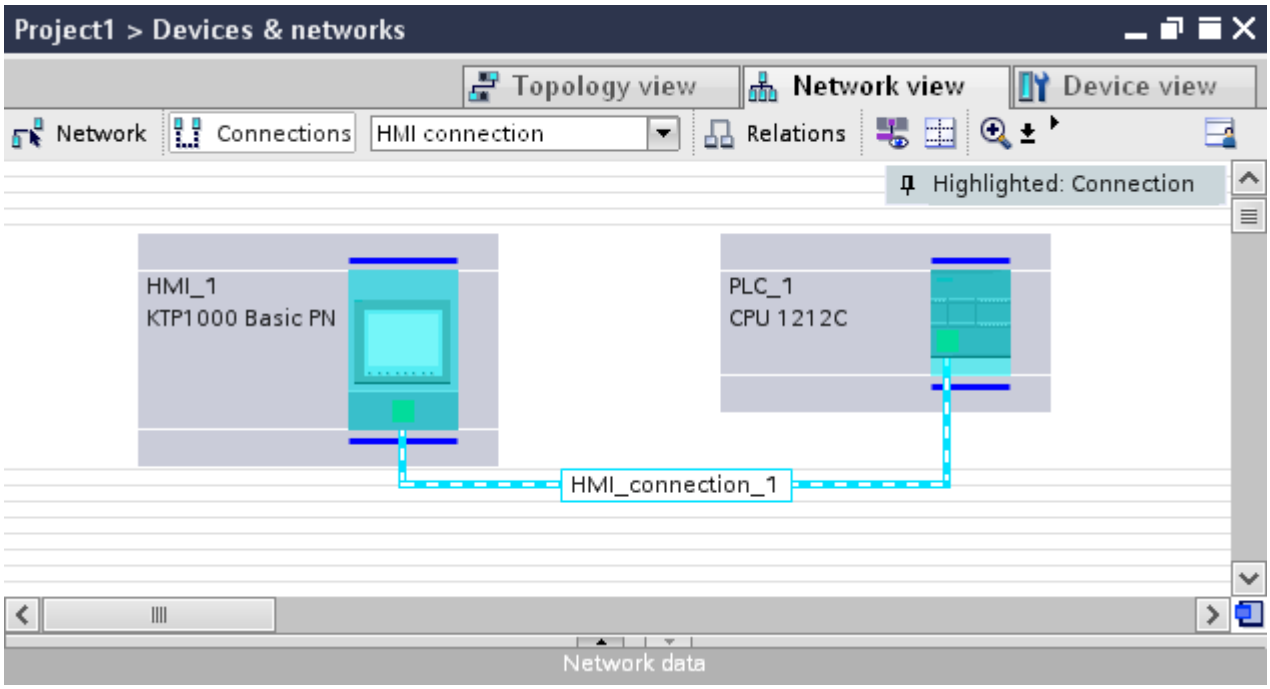


The tabular network overview supplements the graphical network view with the following additional functions:

- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect communication-capable components to subnets that have been created.

Connecting devices

After you network the devices together, you configure the connection. You configure the "HMI connection" connection type for communication with the HMI device.



10.11.1.3 Data exchange using tags

Communication using tags

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

Working with tags

See the chapter "Working with tags" for further information about configuring tags.

10.11.1.4 Data exchange using area pointers

Communication using area pointers

Area pointers are parameter fields. WinCC receives information from these parameter fields in Runtime during the course of the project. This information contains data on the location and size of data areas in the PLC.

During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

The area pointers are managed centrally in the "Connections" editor. Area pointers are used to exchange data from specific user data areas.

You use the following area pointers in WinCC:

- Data record
- Date/time
- Coordination
- Job mailbox
- Date/time PLC
- Project ID
- Screen number

The availability of the various area pointers is determined by the HMI device used.

10.11.1.5 Communication drivers

Communication drivers

A communication driver is a software component that establishes a connection between a PLC and an HMI device. The communication driver thus enables the assignment of process values to HMI tags.

The interface as well as the profile and transmission speed can be chosen, depending on the HMI device used and the connected communication partner.

10.11.2 Editors for communication

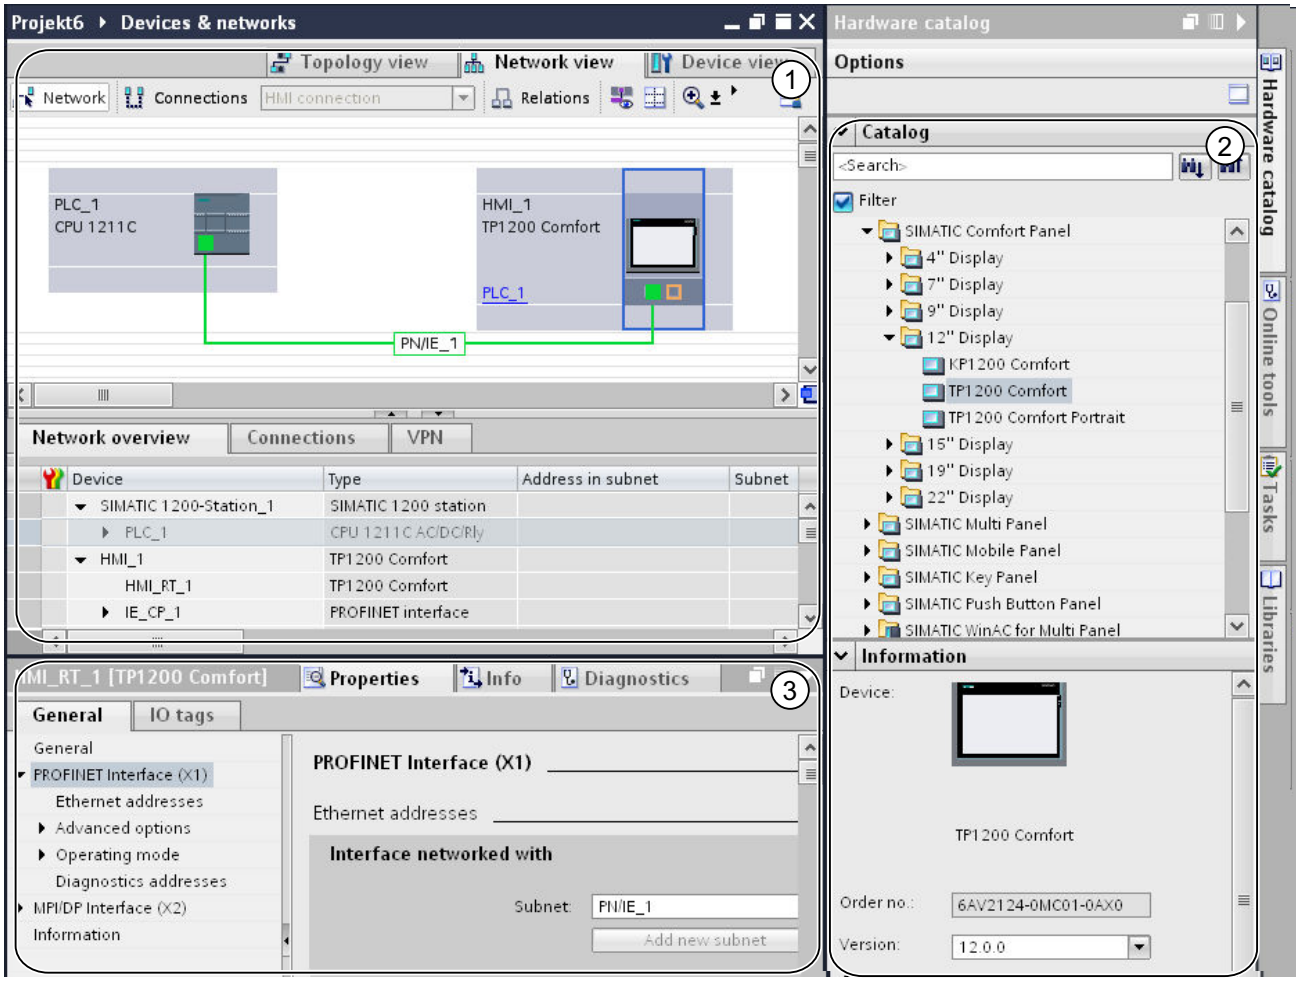
10.11.2.1 "Devices & networks" editor

Function of the hardware and network editor

The "Devices & networks" editor is the development environment for networking, configuring and assigning parameters to devices and modules.

Configuration

The "Devices & networks" editor consists of the following components:



1 Device view, network view, topology view
2 Hardware catalog
3 Inspector window

The "Devices & networks" editor provides you with three different views of your project. You can switch between these three views at any time depending on whether you want to produce and edit individual devices and modules, entire networks and device configurations or the topological structure of your project.

The inspector window contains information on the object currently marked. Here you can change the settings for the object marked.

Drag the devices and modules you need for your automation system from the hardware catalog to the network, device or topology view.

10.11.2.2 Network view

Introduction

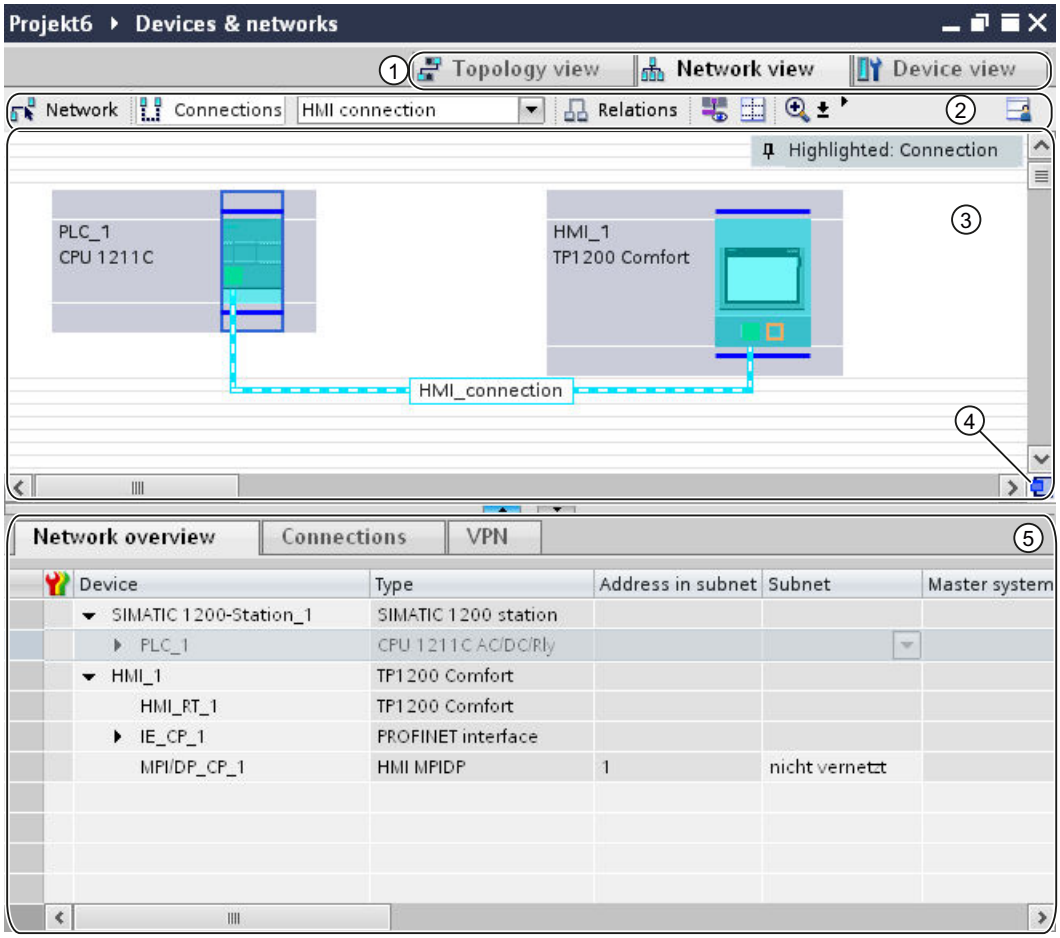
The network view is a working area of the hardware and network editor.

You undertake the following tasks in network view:

- Configuring and assign device parameters
- Networking devices with one another

Structure

The following diagram shows the components of the network view:



① Changeover switch: device view / network view / topology view
② Toolbar of network view
③ Graphic area of network view
④ Overview navigation
⑤ Table area of network view

You can use your mouse to change the spacing between the graphic and table areas of the network view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down.

You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Mode to network devices.
	Mode to create connections. You can define the connection type using the drop-down list.
	Mode to create relations.
	Show interface addresses.
	Adjust the zoom setting. You can select the zoom setting or enter it directly in the drop-down list. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Show page breaks Enables page break preview. Dotted lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the network view displays any network-related devices, networks, connections and relations. In this area, you add devices from the hardware catalog, connect them with each other via their interfaces and configure the communication settings.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

The table area of the network view includes various tables for the devices, connections and communication settings present:

- Network overview
- Connections
- I/O communication

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

10.11.2.3 Network data

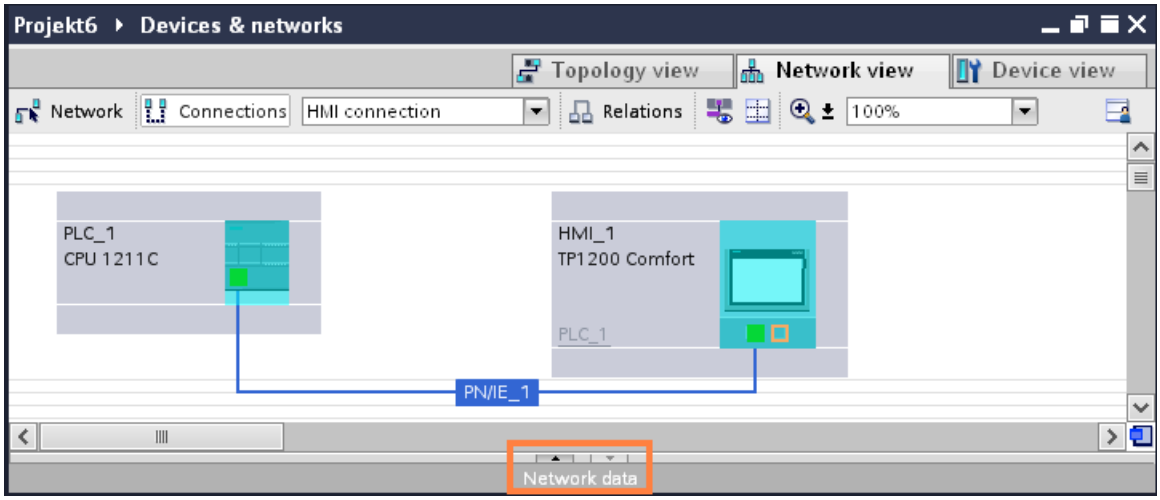
Introduction

The "Network view" editor also gives you a tabular view of the "Network data" in addition to the graphic network view.

You have the following selections in the "Network data" editor:

- Network overview
- Connections
- VPN
- I/O communication

You open the "Network data" below the graphic network overview.



Basic functions

The network data are displayed in tabular form and support the following basic functions for editing a table:

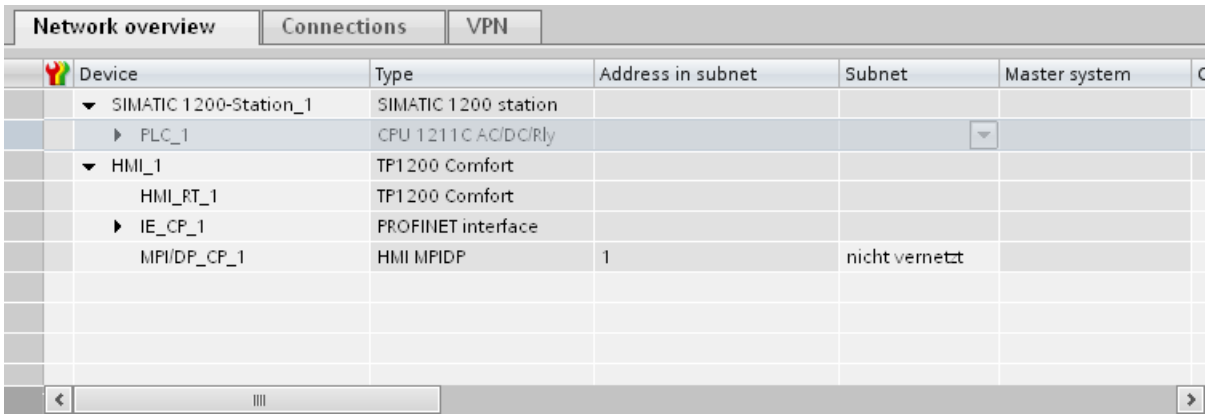
- Displaying and hiding table columns
  Note: The columns of relevance to configuration cannot be hidden.
- Optimizing column width
- Sorting table
- Displaying the meaning of a column, a row or cell using tooltips.

Network overview

The tabular network overview adds the following functions to the graphic network view:

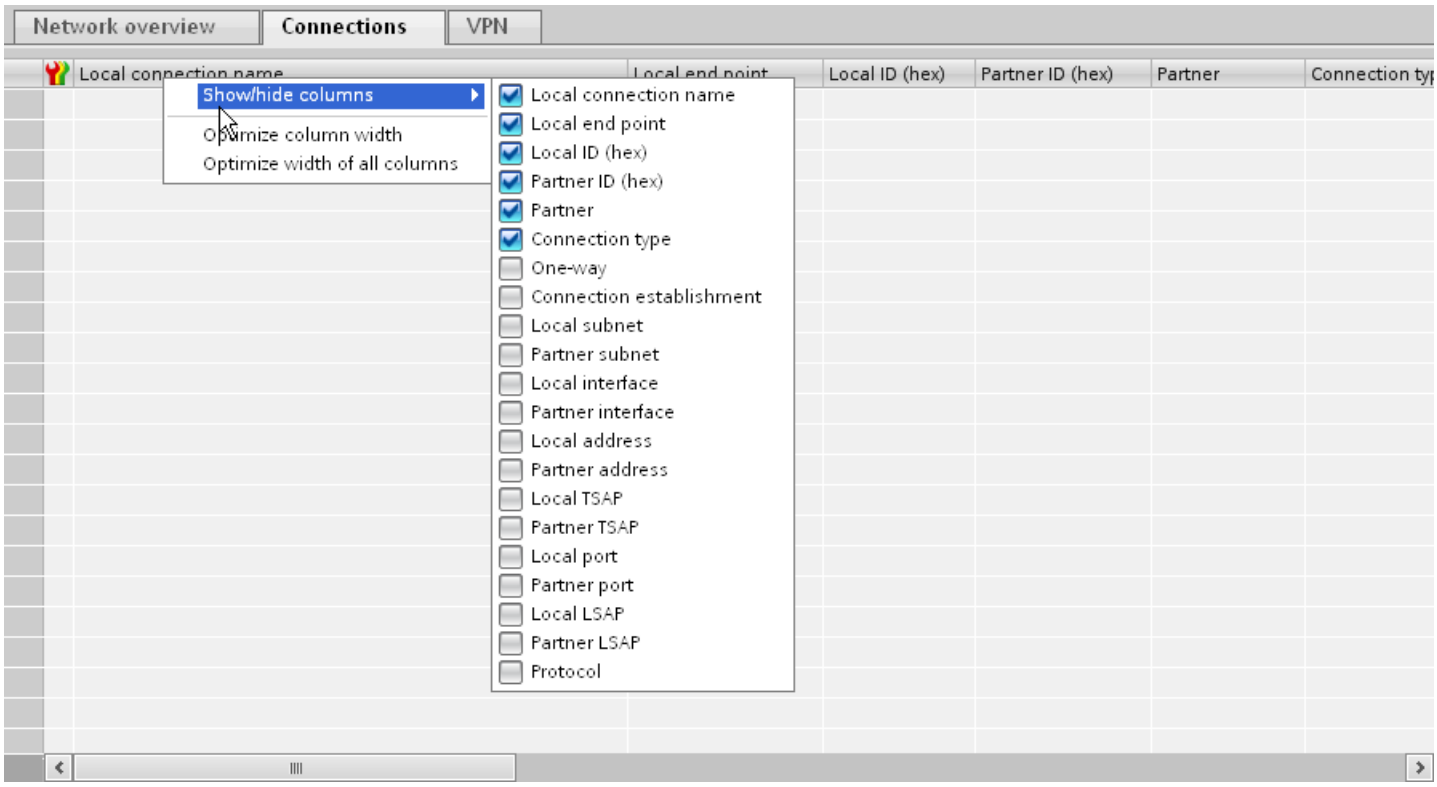
- You obtain detailed information on the structure and parameter settings of the devices.
- Using the "Subnet" column, you can connect components capable of communication with created subnets.

The



Connections

You will find additional network data under "Connections".



10.11.2.4 Diagnostics of online connections

Diagnostics of online connections

You can read out the diagnostics data of existing connections in the TIA Portal.

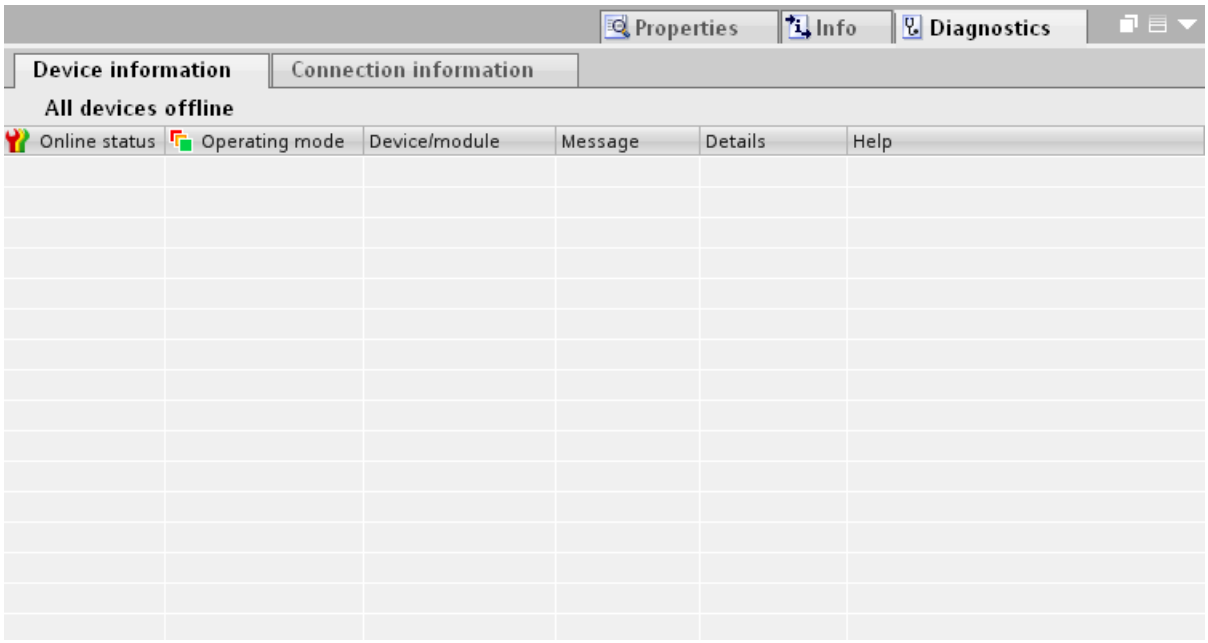
The "Diagnostics" function shows the connection data in tabular form in the Inspector window.

Requirements

- Devices must be in "Online" mode.

Device information

The diagnostics data of all devices in "Online" mode is displayed in the "Diagnostics > Device information" Inspector window.



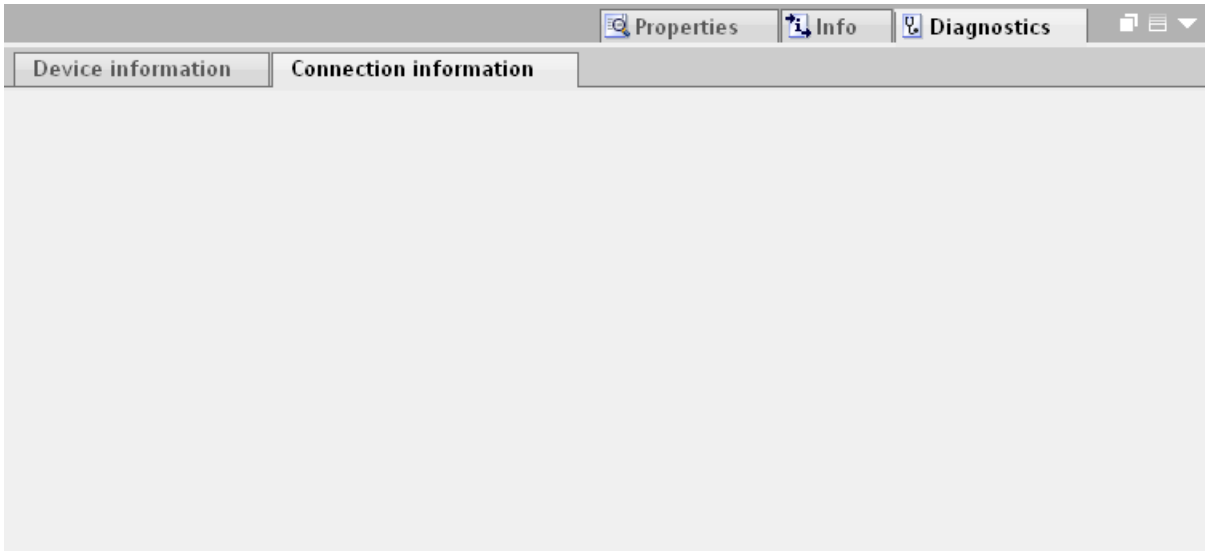
The following data is displayed:

- Online status
- Operating mode
- Device / module
- Alarm
- Details
- Help

Connection information

Use the "Connection information" function to display the diagnostics data of the connection selected in the "Devices&Networks" editor.

A graphic displays the communication partners of the connection and by which communication driver they are connected with each other.



The following data is displayed:

- End point
- Interface
- Subnet
- Address
- TSAP
- Number of HMI resources

10.11.2.5 Device view

Introduction

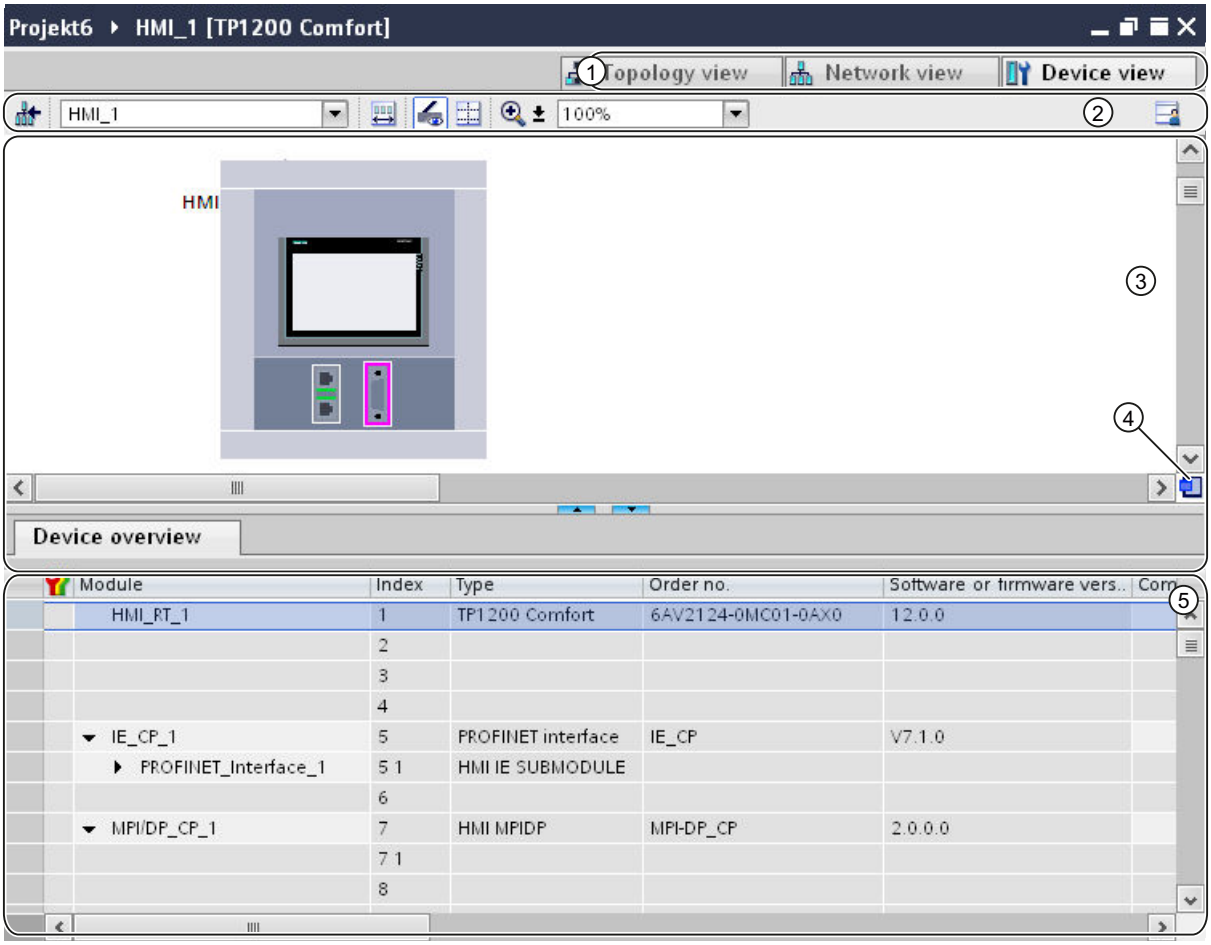
The device view is a working area of the hardware and network editor.

You undertake the following tasks in device view:

- Configuring and assign device parameters
- Configuring and assign module parameters

Structure

The following diagram shows the components of the device view:



① Changeover switch: device view / network view / topology view
② Toolbar of device view
③ Graphic area of the device view
④ Overview navigation
⑤ Table area of device view

You can use your mouse to change the spacing between the graphic and table areas of the device view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Switches to the network view. Note: The device view can switch between the existing devices using the drop-down list.
	Show the area of unplugged modules.
	Show module labels.
	Adjust the zoom setting. Select the zoom setting or enter it directly in the drop-down list. You can use the Zoom symbol to zoom in or out incrementally or to drag a frame around an area to be enlarged. With signal modules, you can recognize the address labels from a zoom level of 200% or higher.
	Show page breaks Enables page break preview. Dotted lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the device view displays hardware components and if necessary the associated modules that are assigned to each other via one or more racks. In the case of devices with racks, you have the option of installing additional hardware objects from the hardware catalog into the slots on the racks.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

The table area of the device view gives you an overview of the modules used and the most important technical and organizational data.

You can use the shortcut menu of the title bar of the table to adjust the tabular display.

10.11.2.6 Topology view

Introduction

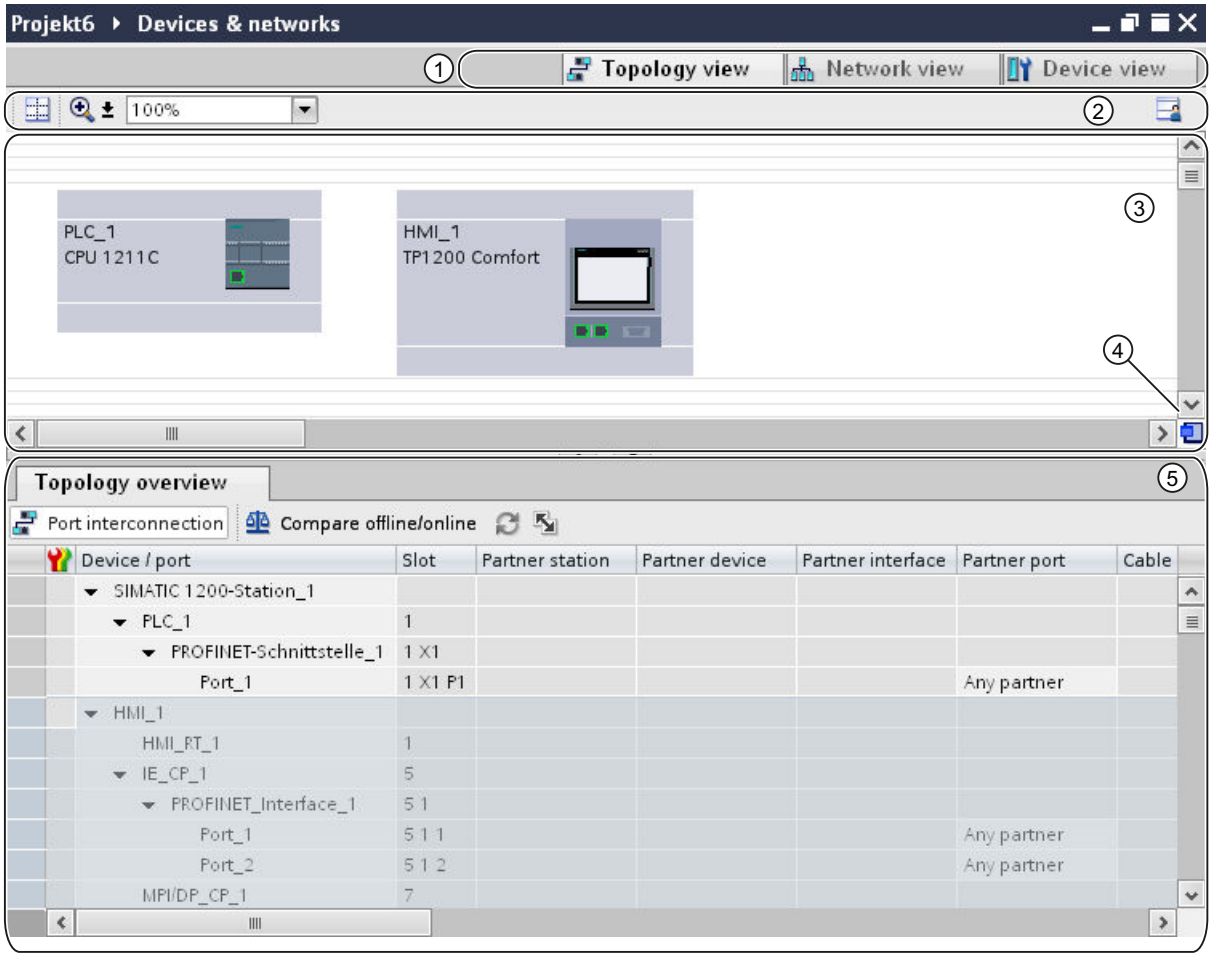
The topology view is a working area of the hardware and network editor.

You undertake the following tasks in topology view:

- Displaying the Ethernet topology
- Configuring the Ethernet topology
- Identify and minimize differences between the desired and actual topology

Structure

The following figure provides an overview of the topology view.



① Changeover switch: device view / network view / topology view
② Topology view toolbar
③ Graphic area of the topology view
④ Overview navigation
⑤ Table area of the topology view

You can use your mouse to change the spacing between the graphic and table areas of the topology view.

To do this, click on the upper edge of the table view and expand or contract this by moving the mouse with the mouse button held down. You can use the two small arrow keys to minimize, maximize or select the latest table structure of the table view with just one click.

Toolbar

The toolbar provides the following functions:

Icon	Meaning
	Adjusting the zoom setting. You can select the zoom setting via the drop-down list or enter it directly. You can also zoom in or zoom out the view in steps using the zoom symbol or draw a frame around an area to be zoomed in.
	Show page breaks Enables page break preview. Dotted lines will be displayed at the positions where the pages will break when printed.
	Remember layout Saves the current table view. The layout, width and visibility of columns in the table view is stored.

Graphic area

The graphic area of the topology view displays Ethernet modules with their appropriate ports and port connections. Here you can add additional hardware objects with Ethernet interfaces.

Overview navigation

Click in the overview navigation to obtain an overview of the created objects in the graphic area. By holding down the mouse button, you can quickly navigate to the desired objects and display them in the graphic area.

Table area

This displays the Ethernet or PROFINET modules with their appropriate ports and port connections in a table. This table corresponds to the network overview table in the network view.

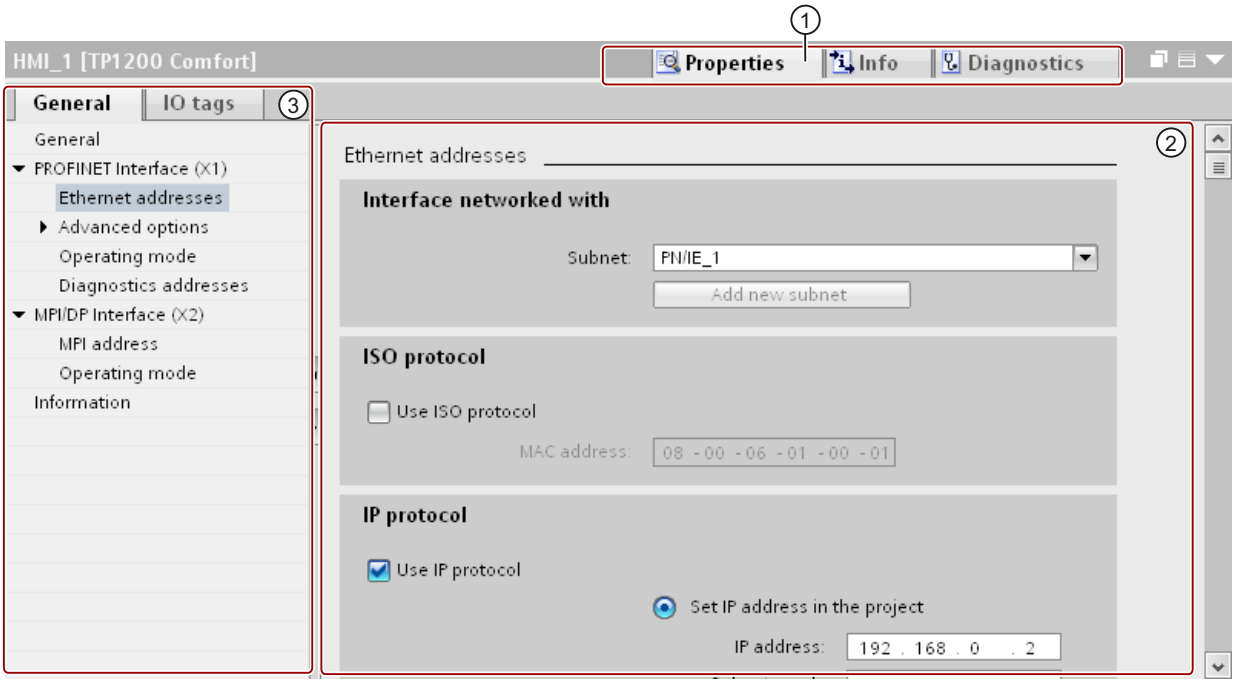
You can use the shortcut menu of the title bar of the table to adjust the tabular display.

10.11.2.7 Inspector window

The properties and parameters shown for the object selected can be edited in the inspector window.

Structure

The inspector window consists of the following components:



① Switch between various information and work areas

② Navigation between various pieces of information and parameters

③ Display showing the selected information and parameters

Function

The information and parameters in the inspector window are split into different types of information:

- Properties
- Info
- Diagnostics

To display the corresponding information and parameters, click in the area you want. The "Properties" area is the most important one for configuring an automation system. This area is displayed by default.

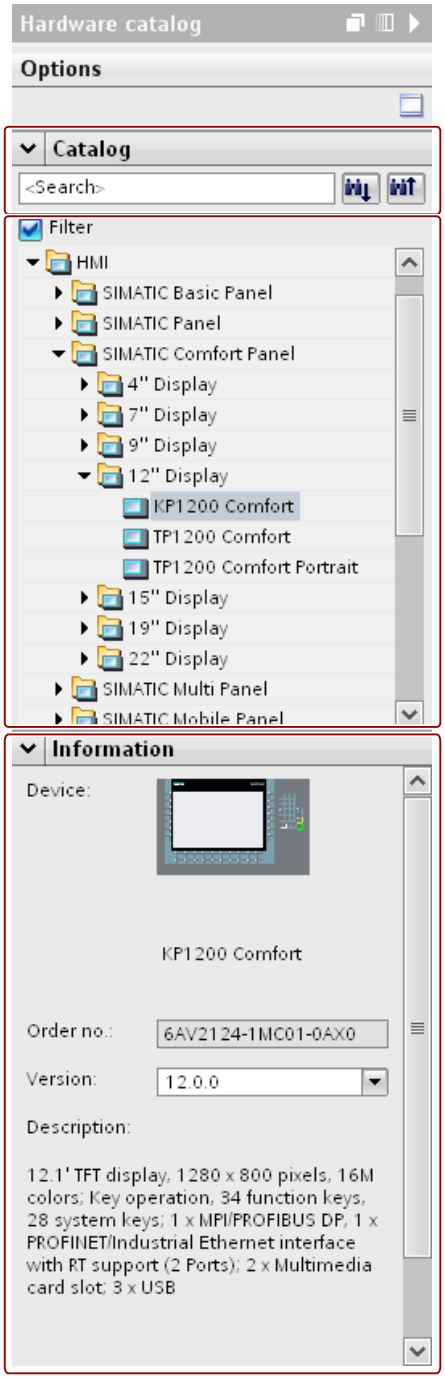
The left pane of the inspector window is used for area navigation. Information and parameters are arranged there in groups. If you click on the arrow symbol to the left of the group name, you can expand the group if sub-groups are available. If you select a group or sub-group, the corresponding information and parameters are displayed in the right pane of the inspector window and can be edited there too.

10.11.2.8 Hardware catalog

The "Hardware catalog" task card gives you easy access to a wide range of hardware components.

Structure

The "Hardware catalog" task card consists of the following panes:



① "Catalog" pane, search and filter function
② "Catalog" pane, component selection
③ "Information" pane

Search and filter function

The search and filter functions of the "Catalog" pane make it easy to search for particular hardware components. You can limit the display of the hardware components to certain criteria using the filter function. For example, you can limit the display to objects that you can also place within the current context or which contain certain functions.

Objects that can be used in the current context include, for example, interconnectable objects in the network view or only modules compatible with the device in the device view.

Component selection

The component selection in the "Catalog" pane contains the installed hardware components in a tree structure. You can move the devices or modules you want from the catalog to the graphic work area of the device or network view.

Installed hardware components without a license are grayed out. You cannot use non-licensed hardware components.

Hardware components belonging to various components groups thematically are partially implemented as linked objects. When you click on such linked hardware components, a catalog tree opens in which you can find the appropriate hardware components.

Information

The "Information" pane contains detailed information on the object selected from the catalog:

- Schematic representation
- Name
- Order number
- Version number
- Description

10.11.2.9 Information on hardware components

In the hardware catalog, you can display information on selected hardware components in the "Information" pane. You can also display further information on the selected hardware components using the shortcut menu.

Access to further information

If you select a hardware object in the hardware catalog and open the shortcut menu, you not only have the "Copy" function available but also three options for accessing information on Service & Support:

- Information regarding product support
- FAQs
- Manuals

The required information is displayed in the work area of the hardware and network editor.

Note

You can only access Service & Support when you are connected to the Internet and the function is enabled. By default, the function is disabled.

To enable the function, refer to the instructions in the section "Enabling product support".

Information regarding product support

Here, you have access to general information on hardware and software components. The order number of the selected hardware object is entered automatically in the search mask. You can, however, also search for other hardware and software components.

FAQs

Here, you have access to "Frequently Asked Questions" (FAQs). You can view various entries on hardware and software questions. Using a detailed search mask, you can filter the required topics.

Manuals

Here, you have access to the manuals of the various hardware components. This is particularly useful if the configuration, addressing or parameter assignment you are planning requires more detailed knowledge of the hardware you are using.

10.11.3 Networks and connections

10.11.3.1 SIMATIC communication networks

Communication networks

Overview

Communication networks are a central component of modern automation solutions. Industrial networks have to fulfill special requirements, for example:

- Coupling of automation systems as well as simple sensors, actuators, and computers.
- The information has to be correct and has to be transferred at the right moment.
- Robust against electromagnetic disturbances, mechanical stresses and soiling
- Flexible adaptation to the production requirements

Industrial networks belong to the LANs (Local Area Networks) and allow communication within a limited area.

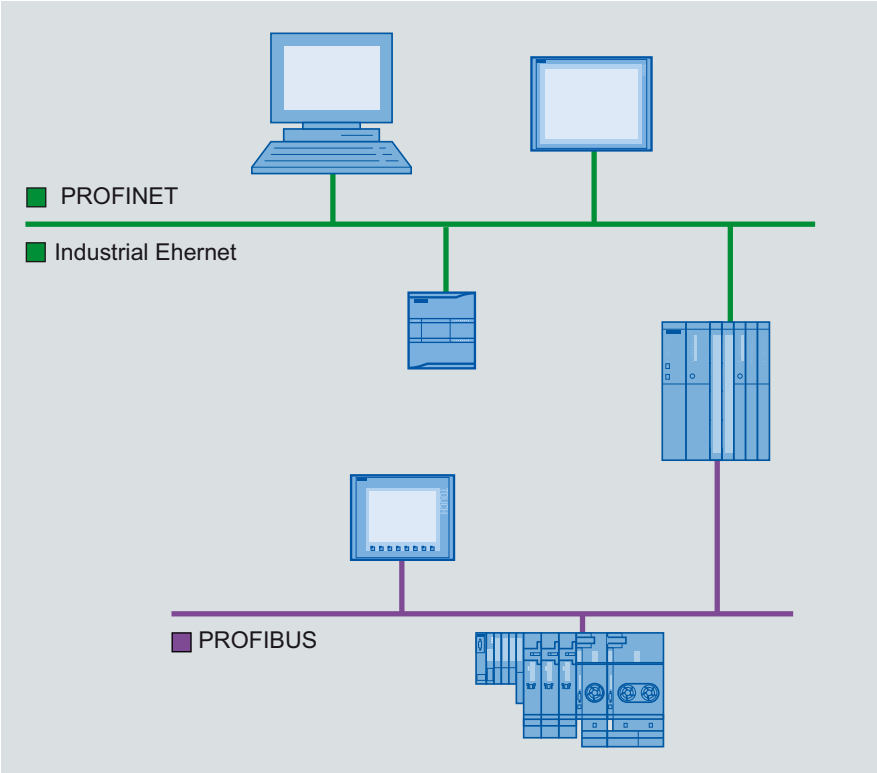
Industrial networks fulfill the following communication functions:

- Process and field communication of the automation systems including sensors and actuators
- Data communication between automation systems
- IT communication for integrating the modern information technology

Overview of the networks

This section examines the following networks:

- **Industrial Ethernet**
  The industrial network standard for all levels
- **PROFINET**
  The open Industrial Ethernet standard for automation
- **PROFIBUS**
  The international standard for the field area and market leader at the field busses
- **MPI**
  The integrated interface of the SIMATIC products
- **PPI**
  The integrated interface specially for the S7-200



PROFINET and Ethernet

Industrial Ethernet

Industrial Ethernet, which is based on IEEE 802.3, enables you to connect your automation system to your office networks. Industrial Ethernet provides IT services that you can use to access production data from the office environment.

Ethernet network

An Ethernet network allows you to interconnect all devices that are connected to the network via an integrated Ethernet interface or a communication module. This enables connection of multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

PROFINET

PROFINET is an open standard for industrial automation defined by IEEE 61158 and based on Industrial Ethernet. PROFINET makes use of IT standards all the way to the field level and enables plant-wide engineering.

With PROFINET, you can realize high-performance automation solutions for applications with stringent real-time requirements.

PROFIBUS

PROFIBUS DP

PROFIBUS DP (distributed I/O) is used to connect the following devices:

- PLCs, PCs, HMI devices
- Distributed I/O devices, e.g., SIMATIC ET 200
- Valves
- Drives

PROFIBUS DP's fast response times make it ideally suited for the manufacturing industry.

Its basic functionality includes cyclic exchange of process data between the master and PROFIBUS DP slaves, as well as diagnostics.

PROFIBUS network

You can connect an HMI device within the PROFIBUS network to any SIMATIC S7 module that has an integrated PROFIBUS or PROFIBUS DP interface. You can thereby connect multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

You configure the SIMATIC S7-200 PLC as a passive device in the network. You connect the SIMATIC S7-200 using the DP connector or a PROFIBUS communication module.

MPI

MPI

MPI (Multi-Point Interface) is the integrated interface for SIMATIC products:

- PLCs
- HMI devices
- Programming device/PC

Small subnets with the following characteristics are set up with MPI:

- Short distances
- Few devices
- Small data quantities

MPI network

You connect the HMI device to the MPI interface of the SIMATIC S7 PLC. This enables connection of multiple HMI devices to one SIMATIC S7 PLC and multiple SIMATIC S7 PLCs to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used. Additional information is available in the documentation for the respective HMI device.

Network architectures

MPI is based on the PROFIBUS standard (IEC 61158 and EN 50170) and supports the following bus topologies:

- Line
- Star
- Tree

An MPI subnet contains a maximum of 127 devices and consists of multiple segments. Each segment contains a maximum of 32 devices and is limited by terminating resistors. Repeaters are used to connect segments. The maximum cable length without a repeater is 50 m.

PPI

Introduction

PPI (point-to-point interface) is an integrated interface that was developed specially for the SIMATIC S7-200. A PPI network typically connects S7-200 PLCs. However, other SIMATIC PLCs (e.g., S7-300 and S7-400) or HMI devices can communicate with a SIMATIC S7-200 in the PPI network.

PPI network

A PPI connection is a point-to-point connection. The HMI device is the master. The SIMATIC S7-200 is the slave.

You can connect a maximum of one SIMATIC S7-200 to an HMI device. You use the serial connector of the CPU to connect the HMI device. You can connect multiple HMI devices to one SIMATIC S7-200. From the perspective of the SIMATIC S7-200, only one connection at a time is possible.

Note

The PPI network can contain a maximum of four masters in addition to the HMI device. For performance reasons, do not configure more than four devices at a time as a master in the PPI network.

Network architectures

PPI is based on the PROFIBUS standard (IEC 61158 and EN 50170) and supports the following bus topologies:

- Line
- Star

Multi-master networks with a maximum of 32 masters are set up with PPI:

- An unlimited number of masters can communicate with each slave.
- A slave can be assigned to multiple masters.

The RS 485 repeater can be used to extend the PPI network. Modems can also be connected to the PPI network.

10.11.3.2 Configuring networks and connections

Networking devices

Introduction

The "Devices & Networks" editor is provided for configuring connections. You can network devices in the editor. You can also configure and assign parameters to devices and interfaces. You then configure the required connections between the networked devices.

In the "Devices & Networks" editor you configure HMI connections with the PLCs:

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

You configure the HMI connections to other PLCs in the "Connections" editor of the respective HMI device.

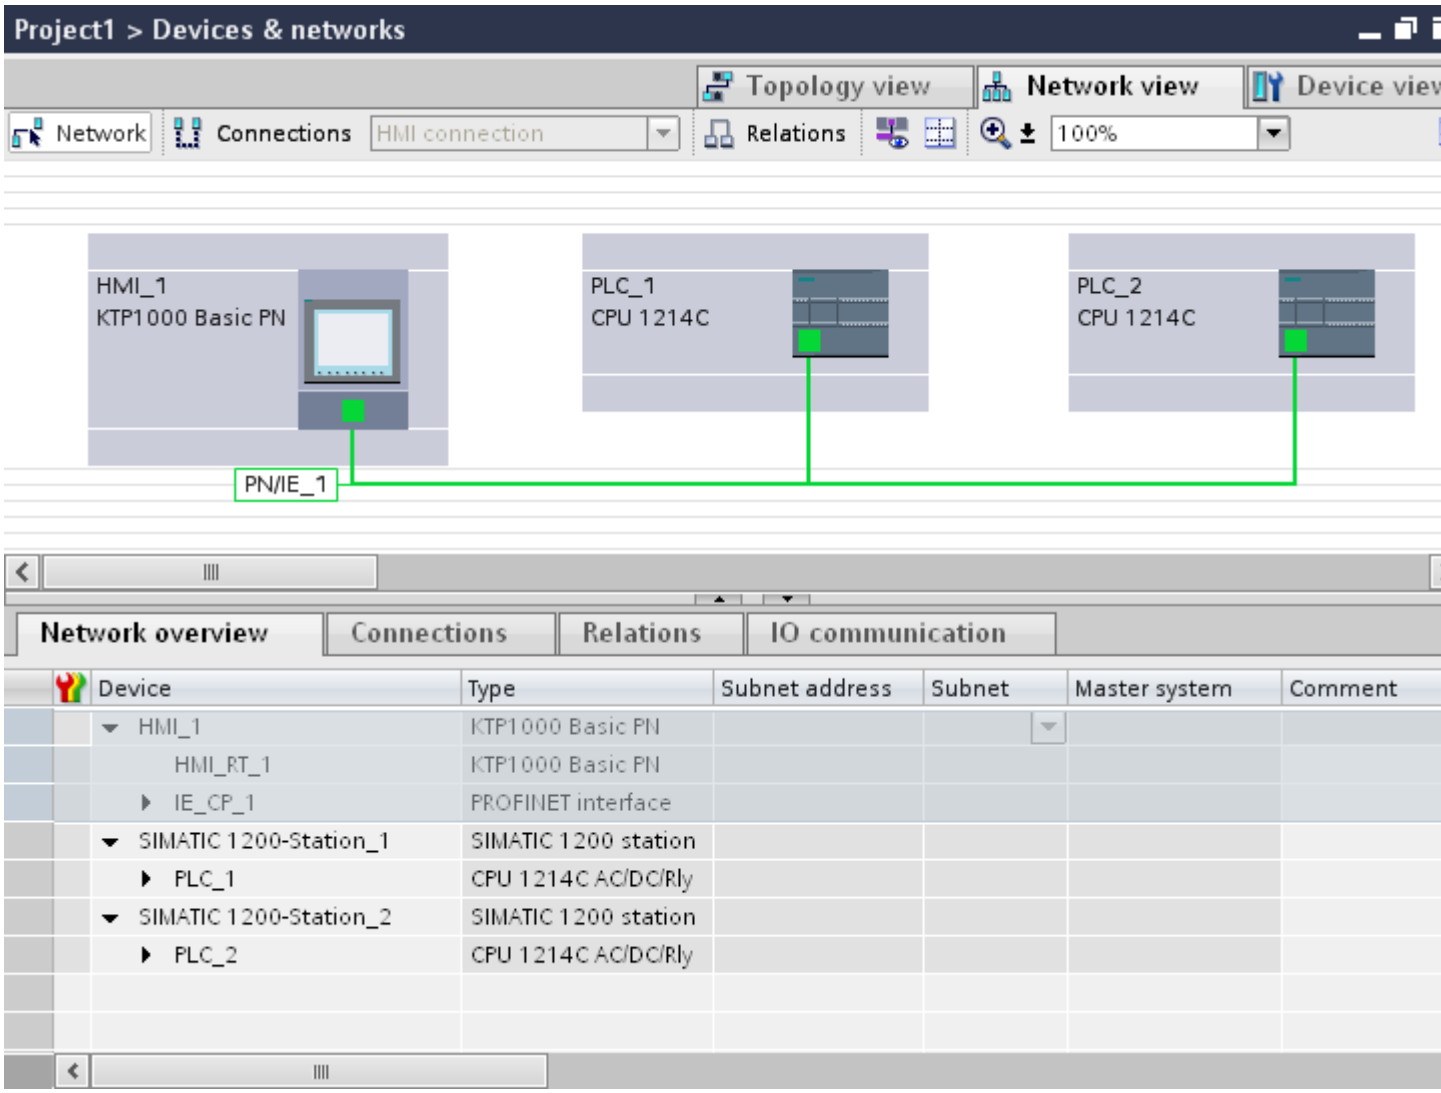
Networking devices

The network view of the "Devices & Networks" editor includes a graphical area and a tabular area. You can use the graphical area to network the devices in the project with drag-and-drop. The tabular area provides an overview of the devices and their components.

You can network the following PLCs together with HMI devices in the "Devices & Networks" area.

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

All other PLCs are available in the TIA-Portal and are configured "not integrated". You configure "not integrated" connections in the "Connections" editor of the HMI device.



With the networking step, you configure the physical connection of the communication partners. The networking of devices is depicted by lines that are colored according to the interface.

Configuring an integrated connection in the "Devices & Networks" editor

Introduction

You configure an HMI connection between the HMI device and a SIMATIC S7 PLC in the "Devices & Networks" editor. This HMI connection is the direct connection between the communication partners that you have created in a project.

Integrated connections

Connections of devices within a project are referred to as integrated connections. In the case of integrated connections, you can directly configure addresses of PLC tags.

Note

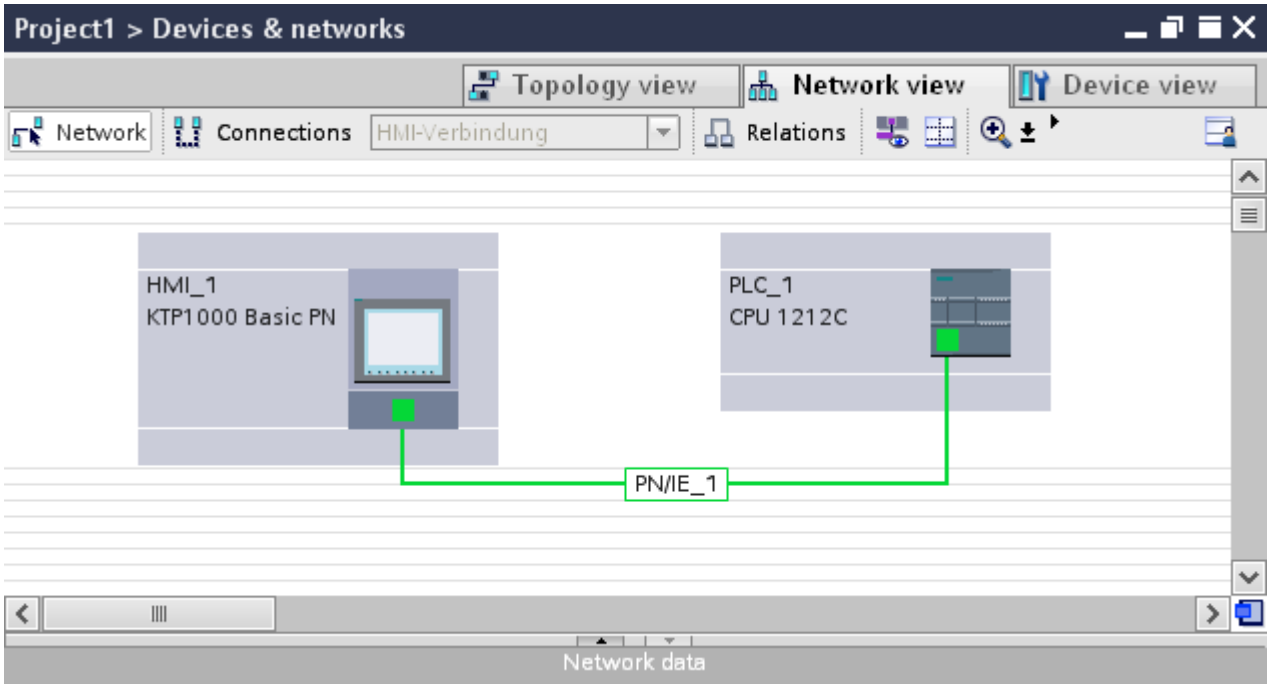
An HMI connection can be configured in the "Devices & Networks" editor for the following PLCs only:

- SIMATIC S7 1500
- SIMATIC S7 1200
- SIMATIC S7 300
- SIMATIC S7 400

You configure the HMI connections to all other PLCs in the "Connections" editor of the HMI device.

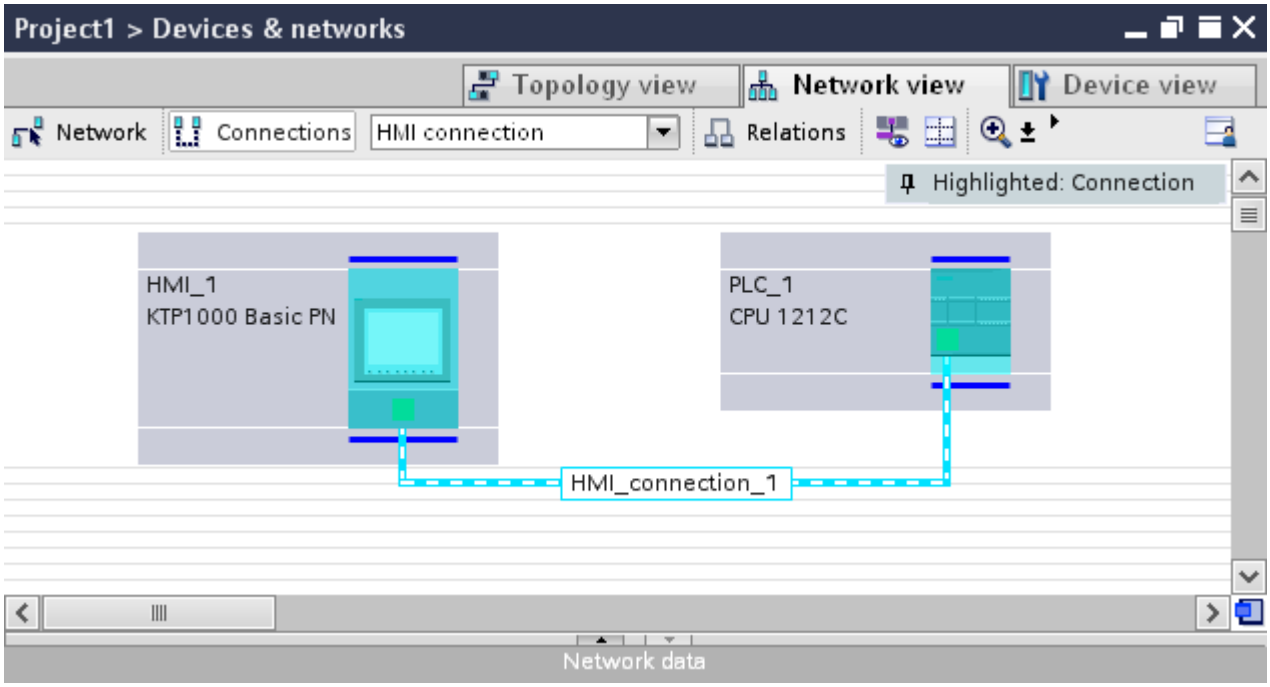
Configuring an HMI connection in the "Devices & Networks" editor

1. Insert an HMI device and a SIMATIC S7 PLC in your project.



2. Switch to "Connections" mode.
3. Select the "HMI connection" connection type.

4. Use a drag-and-drop operation to interconnect the two PROFINET interfaces.



5. Change the IP address and subnet mask address parameters according to the requirements of your project.

Special considerations of the "Devices & Networks" editor

Introduction

If you are configuring or have already configured networks or HMI connections, the "Devices & Networks" editor supports you with the following functions:

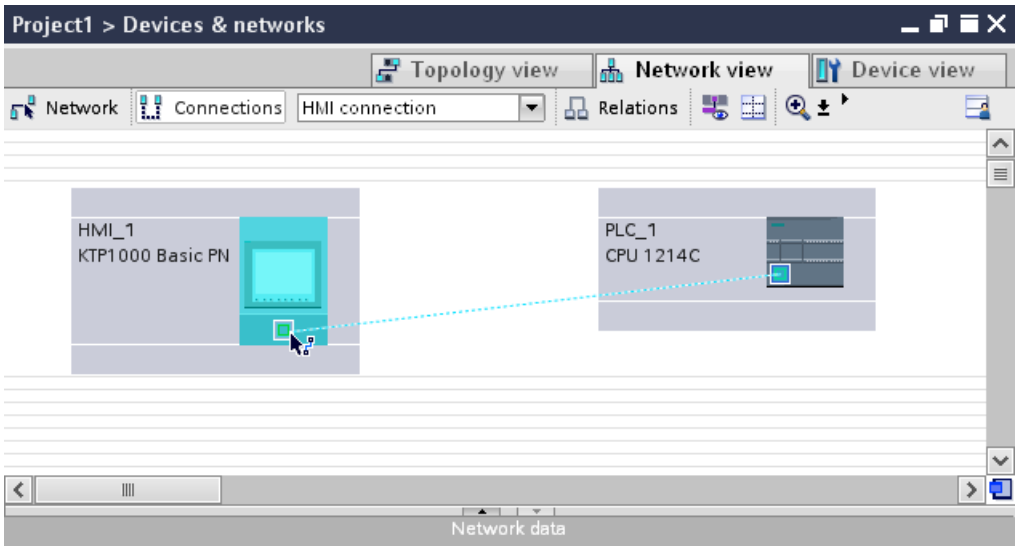
- Highlighting of communication partners
- Highlighting of HMI connections
- Automatic creation of subnets

Highlighting of communication partners

All communication partners for which an HMI connection is possible are highlighted in turquoise if you have selected the "HMI connection" type.

Starting from the interface of a device create an HMI connection to the device of another device using a drag-and-drop operation. During the drag-and-drop operation all potential communication partners are highlighted in turquoise.

Use the ESC key to stop connecting interfaces using a drag-and-drop operation.



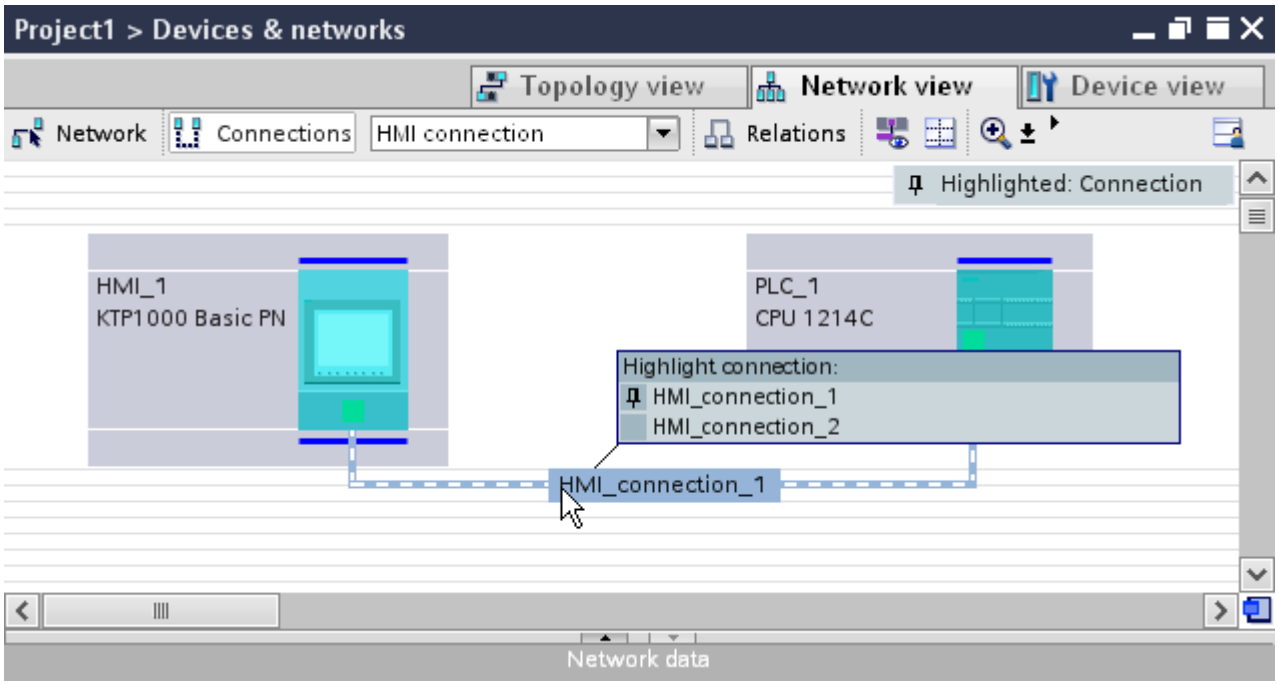
When the mouse pointer is moved over the interface of a device, the following icons indicate whether a connection is possible:

A connection is possible.

A connection is not possible.

Highlighting of HMI connections

A turquoise highlighting of the connection indicates that a HMI connection was created. If several HMI connections are created, you can select one of the already created HMI connections in a dialog.



Then you can configure the parameters of the selected HMI connection and the communication partners in the inspector window.

Subnets

Subnetworks are automatically created and used under the following conditions:

- If both communication partners are not already interconnected in different networks
- If a free interface is available to both communication partners.
- If a subnetwork already exists then that subnetwork is automatically used for the HMI connection.

Configuring a non-integrated connection in the "Connections" editor

Introduction

You use the "Connections" editor of the HMI device to configure a connection between an HMI device and a PLC that cannot be configured in the "Devices & Networks" editor.

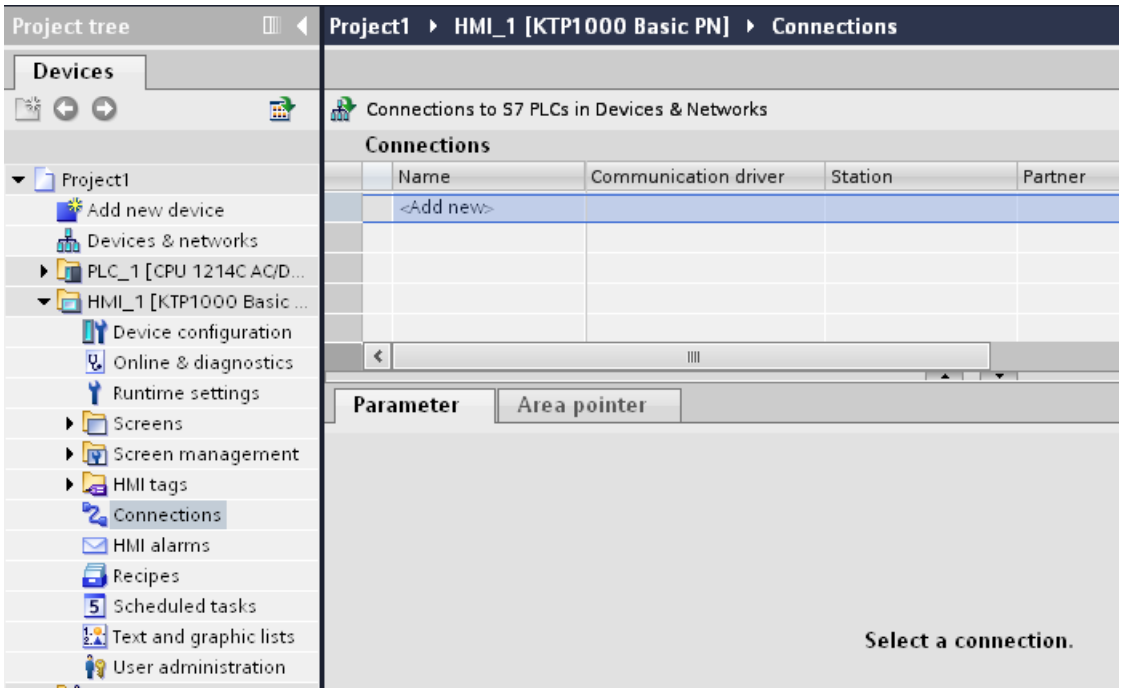
These connections are referred to as non-integrated connections.

Requirements

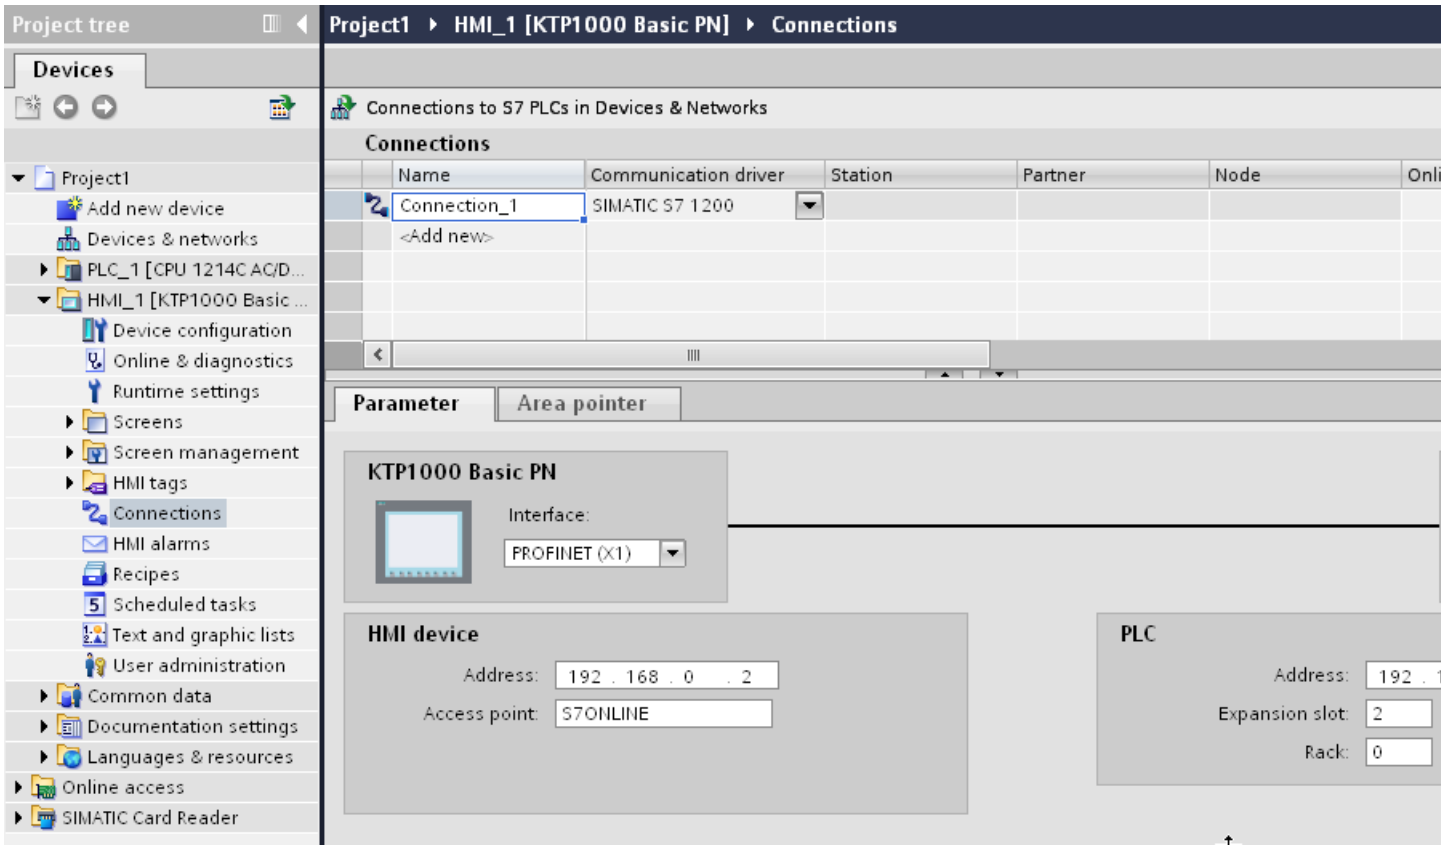
- A project is open.
- An HMI device has been created.

Configuring a connection in the "Connections" editor

1. Open the "Connections" editor of the HMI device.
2. Create a new connection.

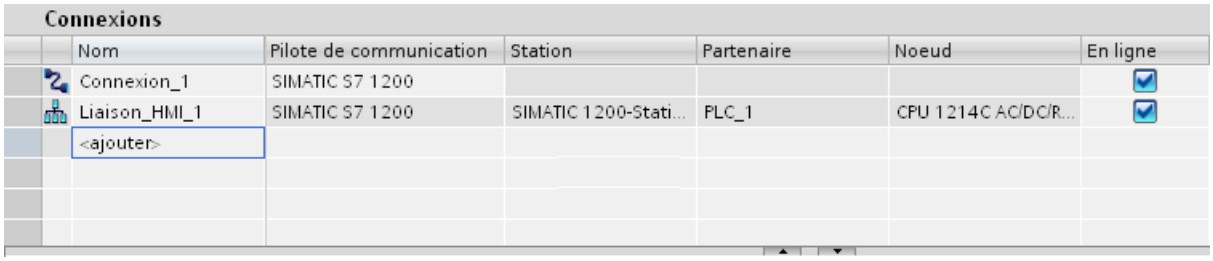


3. Select the communication driver.
4. Set the connection parameters.



Integrated connections in the "Connections" editor

If you have already configured the integrated connections of the HMI device in the "Devices & Networks" editor, they are also displayed in the "Connections" editor.



Meaning of the icons used:

- Integrated connection
- Non-integrated connection

10.11.4 Data exchange

10.11.4.1 Data exchange using tags

Basics of tags

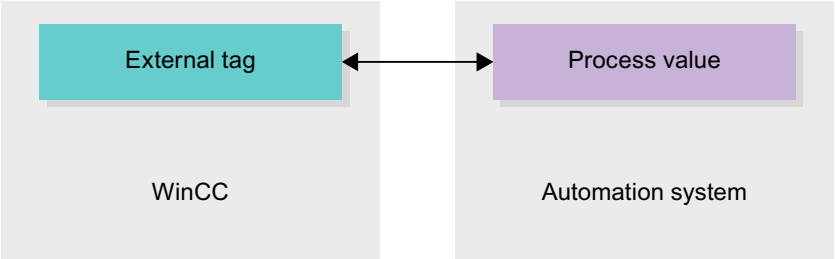
Introduction

Process values are forwarded in runtime using tags. Process values are data which is stored in the memory of one of the connected automation systems. They represent the status of a plant in the form of temperatures, fill levels or switching states, for example. Define external tags for processing the process values in WinCC.

WinCC works with two types of tag:

- External tags
- Internal tags

The external tags form the link between WinCC and the automation systems. The values of external tags correspond to the process values from the memory of an automation system. The value of an external tag is determined by reading the process value from the memory of the automation system. It is also possible to rewrite a process value in the memory of the automation system.



Internal tags do not have a process link and only convey values within the WinCC. The tag values are only available as long as runtime is running.

Tags in WinCC

For external tags, the properties of the tag are used to define the connection that the WinCC uses to communicate with the automation system and form of data exchange.

Tags that are not supplied with values by the process - the internal tags - are not connected to the automation system. In the tag's "Connection" property, this is identified by the "Internal tag" entry.

You can create tags in different tag tables for greater clarity. You then directly access the individual tag tables in the "HMI tags" node in the project tree. The tags from all tag tables can be displayed with the help of the table "Show all tags".

With structures you bundle a number of different tags that form one logical unit. Structures are project-associated data and are available for all HMI devices of the project. You use the "Types" editor in the project library to create and edit a structure.

Overview of HMI tag tables

Introduction

HMI tag tables contain the definitions of the HMI tags that apply across all devices. A tag table is created automatically for each HMI device created in the project.

In the project tree there is an "HMI tags" folder for each HMI device. The following tables can be contained in this folder:

- Default tag table
- User-defined tag tables
- Table of all tags

In the project tree you can create additional tag tables in the HMI tags folder and use these to sort and group tags and constants. You can move tags to a different tag table using a drag-and-drop operation or with the help of the "Tag table" field. Activate the "Tags table" field using the shortcut menu of the column headings.

Default tag table

There is one default tag table for each HMI device of the project. It cannot be deleted or moved. The default tag table contains HMI tags and, depending on the HMI device, also system tags. You can declare all HMI tags in the standard tags table or, as necessary, additional user-defined tables of tags.

User-defined tag tables

You can create multiple user-defined tag tables for each HMI device in order to group tags according to your requirements. You can rename, gather into groups, or delete user-defined tag tables. To group tag tables, create additional subfolders in the HMI tags folder.

All tags

The "All tags" table shows an overview of all HMI tags and system tags of the HMI device in question. This table cannot be deleted, renamed or moved. This table also contains the "Tags table" column, which indicates the tag table of where a tag is included. Using the "Tags table" field, the assignment of a tag to a tags table can be changed.

With devices for Runtime Professional, the table "All tags" contain an additional tab "System tags". The system tags are created by the system and used for internal management of the project. The names of the system tags begin with the "@" character. System tags cannot be deleted or renamed. You can evaluate the value of a system tag, but cannot modify it.

Additional tables

The following tables are also available in an HMI tag table:

- Discrete alarms
- Analog alarms
- Logging tags

With the help of these tables you configure alarms and logging tags for the currently selected HMI tag.

Discrete alarms table

In the "Discrete alarms" table, you configure discrete alarms to the HMI tag selected in the HMI tag table. When you configure a discrete alarm, multiple selection in the HMI tag table is not possible. You configure the discrete alarms for each HMI tag separately.

Analog alarms table

In the "Analog alarms" table, you configure analog alarms to the HMI tag selected in the HMI tag table. When you configure an analog alarm, multiple selection in the HMI tag table is not possible. You configure the analog alarms for each HMI tag separately.

Logging tags table

In the "Logging tags" table, you configure logging tags to the HMI tag selected in the HMI tag table. When you configure a logging tag, multiple selection in the HMI tag table is not possible. You configure the logging tags for each HMI tag separately. The "Logging tags" table is only available if the HMI device used supports logging.
If WinCC Runtime Professional is used, you can also assign several log tags to a tag. With the other HMI devices, you can only assign one log tag to a tag.

External tags

Introduction

External tags allow communication (exchange of data) between the components of an automation system, such as between the HMI device and the PLC.

Principle

An external tag is the image of a defined memory location in the PLC. You have read and write access to this storage location from both the HMI device and from the PLC.

Since external tags are the image of a storage location in the PLC, the applicable data types depend on the PLC which is connected to the HMI device.

In STEP 7, if you write a PLC control program, the PLC tags created in the control program will be added to the PLC tag table. If you want to connect an external tag to a PLC tag, access the PLC tags directly via the PLC tag table and connect them to the external tag.

Data types

All the data types which are available at the connected PLC are available at an external tag in WinCC. Information about data types which are available for connection to other PLCs can be found in the documentation about the respective communication drivers.

See "Communication between devices (Page 4909)" for additional information.

Note

As well as external tags, area pointers are also available for communication between the HMI device and PLC. You can set up and enable the area indicators in the "Connections" editor.

Update of tag values

For external tags, the current tag values are transmitted in runtime via the communication connection between WinCC and the connected automation systems and then saved in the runtime memory. Next, the tag value will be updated to the set cycle time. For use in the runtime project, WinCC accesses tag values in the runtime memory that were read from the PLC at the previous cycle time. As a result, the value in the PLC can already change whilst the value from the runtime memory is being processed.

See also

Communication between devices (Page 4909)

Addressing external tags

Introduction

The options for addressing external tags depend on the type of connection between WinCC and the PLC in question. A distinction must be made between the following connection types:

- Integrated connection
  Connections of devices which are within a project and were created with the "Devices & Networks" editor are referred to as integrated connections.
- Non-integrated connection
  Connections of devices which were created with the "Connections" editor are referred to as non-integrated connections. It is not necessary that all of the devices be within a single project.

The connection type can also be recognized by its icon.

	Integrated connection
	Non-integrated connection

You can find additional information in the section "Basics of communication (Page 4909)".

Addressing with integrated connections

An integrated connection offers the advantage that you can address a tag both symbolically and absolutely.

For symbolic addressing, you select the PLC tag via its name and connect it to the HMI tag. The valid data type for the HMI tag is automatically selected by the system. You have to distinguish between the following cases when you address elements in data blocks:

Symbolic addressing of data blocks with optimized access and standard access:

During the symbolic addressing of a data block with optimized access and standard access, the address of an element in the data block is dynamically assigned and is automatically adopted in the HMI tag in the event of a change. You do not need to compile the connected data block or the WinCC project for this step.
For data blocks with optimized access, only symbolic addressing is available.

For symbolic addressing of elements in a data block, you only need to recompile and reload the WinCC project in case of the following changes:

- If the name or the data type of the linked data block element or global PLC tag has changed.
- If the name or the data type of the higher level structure node of a linked element in the data block element or global PLC tag has changed.
- If the name of the connected data block has changed.

Symbolic addressing is currently available with the following PLCs:

- SIMATIC S7 1200
- SIMATIC S7 1500

Symbolic addressing is also available if you have an integrated link.

Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

You can also use absolute addressing with an integrated connection. You have to use absolute addressing for PLC tags from a SIMATIC S7 300/400 PLC. If you have connected an HMI tag with a PLC tag and the address of the PLC tag changes, you only have to recompile the control program to update the new address in WinCC. Then you recompile the WinCC project and load it onto the HMI device.

In WinCC, symbolic addressing is the default method. To change the default setting, select the menu command "Options > Settings". Select "Visualization > Tags" in the "Settings" dialog. If required, disable the "Symbolic access" option.

The availability of an integrated connection depends on the PLC used. The following table shows the availability:

PLC	Integrated connection	Comments
S7 300/400	Yes	The linking of tags is not checked in Runtime. If the tag address changes in the PLC and the HMI device is not compiled again and loaded, the change is not registered in runtime.
S7 1200	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.
S7 1500	Yes	A validity check of the tag connection is performed in runtime during symbolic addressing. If an address is changed in the PLC, the change is registered and an error message is issued. In the case of absolute addressing, the following behavior applies to the S7 300/400.

Create an integrated connection in the "Devices & Networks" editor. If the PLC is contained in the project and integrated connections are supported, you can then also have the connection created automatically. To do this, when configuring the HMI tag, simply select an existing PLC tag to which you want to connect the HMI tag. The integrated connection is then automatically created by the system.

Addressing with non-integrated connections

In the case of a project with a non-integrated connection, you always configure a tag connection with absolute addressing. Select the valid data type yourself. If the address of a PLC tag changes in a project with a non-integrated connection during the course of the project, you also have to make the change in WinCC. The tag connection cannot be checked for validity in Runtime, an error message is not issued.

A non-integrated connection is available for all supported PLCs.

Symbolic addressing is not available in a non-integrated connection.

With a non-integrated connection, the control program does not need to be part of the WinCC project. You can perform the configuration of the PLC and the WinCC project independently of each other. For configuration in WinCC, only the addresses used in the PLC and their function have to be known.

See also

Basics of communication (Page 4909)

Internal Tags

Introduction

Internal tags do not have any connection to the PLC. Internal tags transport values within the HMI device. The tag values are only available as long as runtime is running.

Principle

Internal tags are stored in the memory of the HMI device. Therefore, only this HMI device has read and write access to the internal tags. You can create internal tags to perform local calculations, for example.

You can use the HMI data types for internal tags. Availability depends on the HMI device being used.

The following HMI data types are available:

HMI data type	Data format
ARRAY	One-dimensional array
BOOL	Binary tag
DATETIME	Date/time format
DINT	Signed 32-bit value
INT	Signed 16-bit value
LREAL	Floating-point number 64-bit IEEE 754
REAL	Floating-point number 32-bit IEEE 754
SINT	Signed 8-bit value
UDINT	Unsigned 32-bit value
UINT	Unsigned 16-bit value
USINT	Unsigned 8-bit value
WSTRING	Text tag, 16-bit character set

10.11.4.2 Data exchange using area pointers

Basic information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

For example, area pointers are required for the following data:

- Recipes
- Job mailboxes
- Sign-of-life monitoring

Area pointers

The following area pointers are supported:

Area pointer

Area pointers can be configured for connections.

- Data record
- Date/time
- Coordination
- Job mailbox

Global area pointers of the HMI device

Global area pointers can be configured for separate connections.

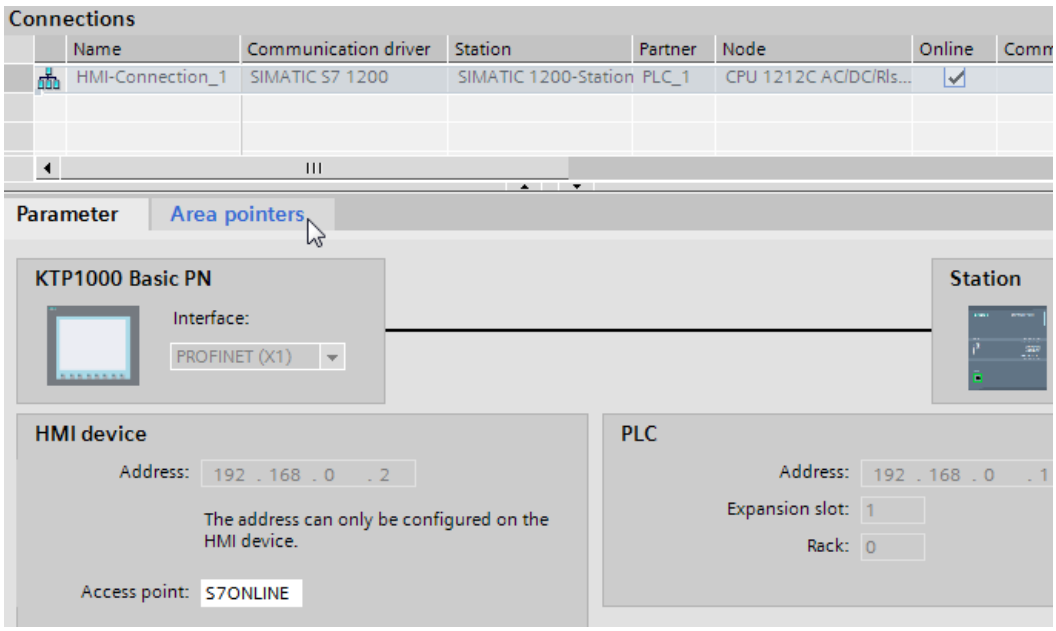
- Screen number
- Date/time PLC
- Project ID

Area pointers for connections

Introduction

Using the "Area pointer" tab of the "Connections" editor, you can configure the usage of the available area pointers.

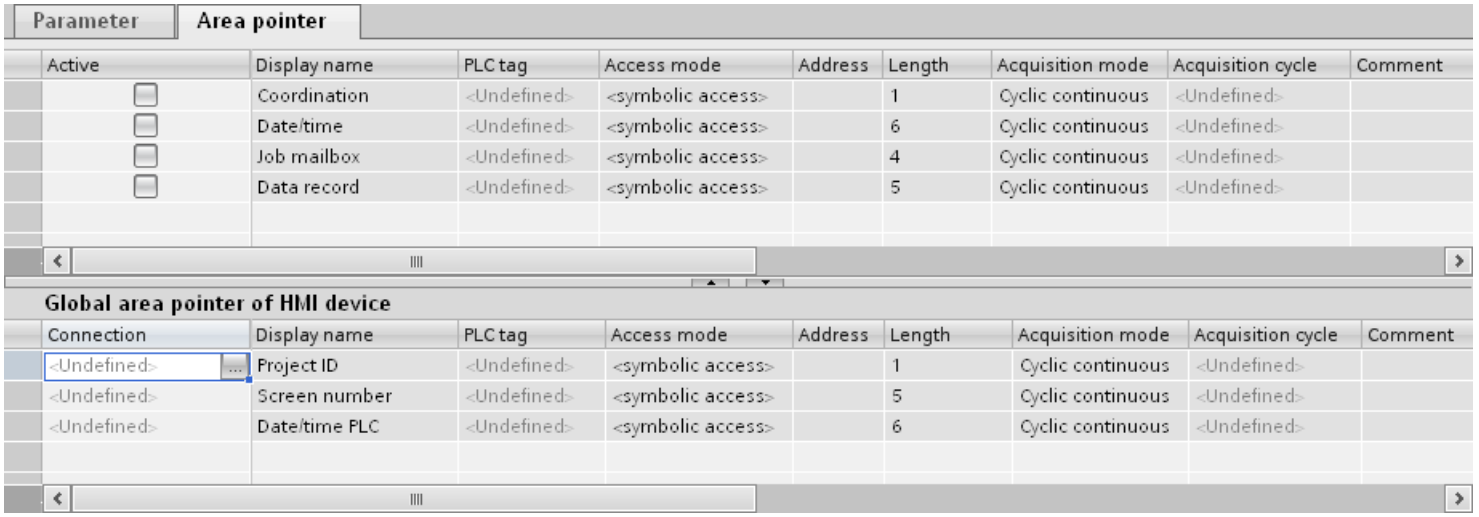
To configure the area pointers, open the "Connections" editor and open the "Area pointer" tab.



Structure

The "Area pointer" tab contains two tables of area pointers. The top part of the table contains the area pointers you can create and enable separately for each available connection.

The "Global area pointers of HMI device" table contains the area pointers which are created only once in the project and can be used for only one connection.

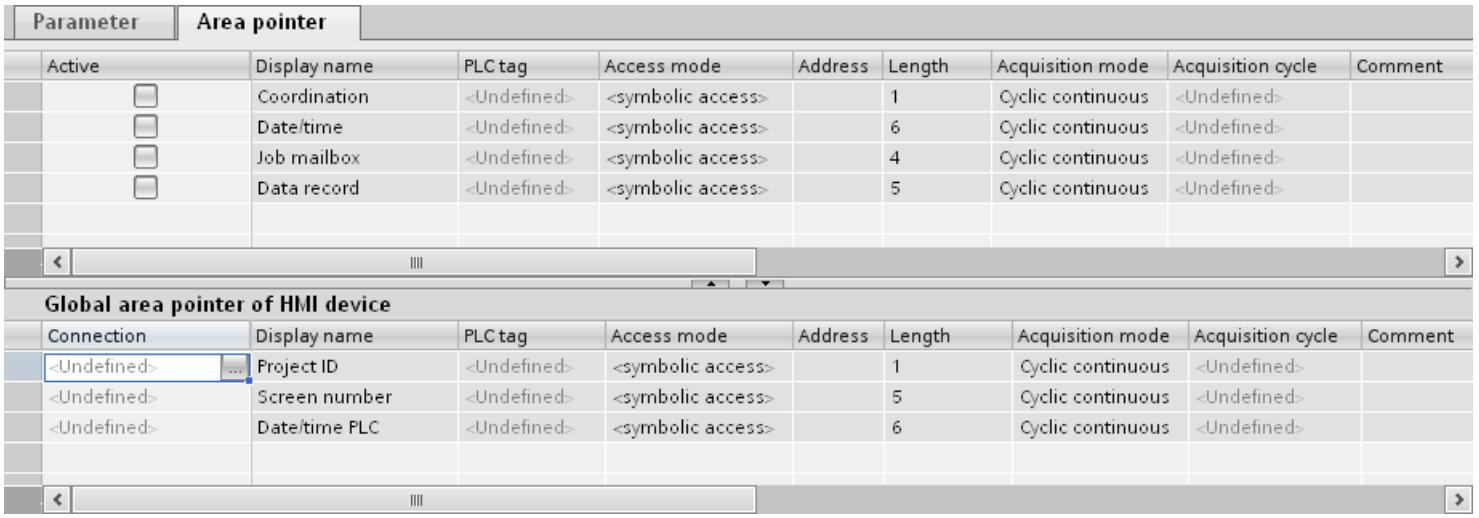


Use of area pointers

"Area pointer" tab

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You assign the following parameters in the "Area pointer" tab:



- Active
  Enables the area pointer.
- Pointer name
  Name of the area pointer specified by WinCC.
- PLC tag
  Here you select the PLC tag or the tag array that you have configured as the data area for the area pointer.
- Access mode
  Here you can select from the following access modes:
  - Symbolic access
  - Absolute access
- Address
  If you selected "Symbolic access", no address is entered in this field.
  If you selected "Absolute access", enter the address of a tag in the "Address" field.
- Length
  WinCC specifies the length of the area pointer.
- Acquisition cycle
  You specify the acquisition cycle in this field for area pointers that are read by the HMI device. Note that a very short acquisition time may have a negative impact on HMI device performance.
- Comment
  Enter a comment, for example, to describe the purpose of the area pointer.

Accessing data areas

Accessing data areas

The following table shows how HMI devices and PLCs access individual data areas for read (R) or write (W) operations.

Data area	Required for	HMI device	PLC
Screen number	Evaluation by the PLC in order to determine the active screen.	W	R
Data record	Transfer of data records with synchronization	R/W	R/W
Date/time	Transfer of the date and time from the HMI device to the PLC	W	R
Date/time PLC	Transfer of the date and time from the PLC to the HMI device	R	W
Coordination	Requesting the HMI device status in the PLC program	W	R
Project ID	Runtime checks for consistency between the WinCC project ID and the project in the PLC	R	W
Job mailbox	Triggering of HMI device functions by the PLC program	R/W	R/W

Configuring area pointers

Configuration of area pointers

Introduction

You use an area pointer to access a data area in the PLC. The data area is stored in the PLC.

Prior to configuring area pointers

Before you use the area pointer, you must enable and parameterize it under "Connections > Area Pointer".

Global data block

To access the data area in the PLC, you have to create a global data block in the PLC program. The following example shows the use of a data block.

Length of area pointers

For area pointers with a length >= 1, you set up the data area as a tag array in a global data block or instance data block.

You also have the option to use a PLC tag for area pointers with a length = 1.

The configuration of the tags in a data block is dependent on the length of the area pointer you want to use. The unit for the length of an area pointer is a 16-bit word.

If, for example, you want to use an area pointer with a length of "5", you must create an array with 5 array elements of the data type UINT in the data block.

Alternative procedure

Alternatively, you can also use the absolute access mode to access area pointers. Absolute access mode only works on standard PLC data blocks.

Parameterizing a global data block

Introduction

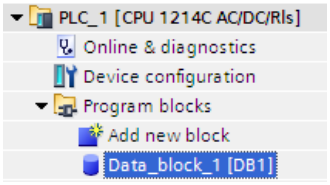
To access the data area in the PLC, a global data block for the area pointer must be parameterized in the PLC program.

Requirements

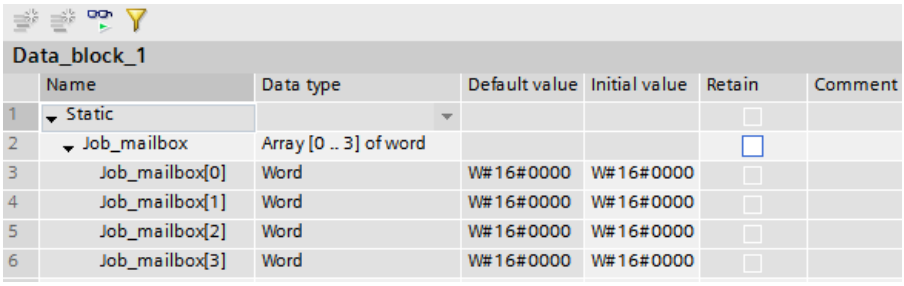
- A PLC is created in the project.
- A connection is configured between the PLC and the HMI device.
- The PLC program contains a global data block.

Procedure

1. Open "PLC > Program blocks" in the project tree.
2. Double-click the global data block you created previously.
   The data block opens.



3. Enter a tag name in the "Name" column.
4. Select "Array[lo .. hi] of type" as the data type in the "Data type" column.
5. Replace the "lo" entry by the low value for the dimension of the array.
6. Replace the "hi" entry by the high value for the dimension of the array.
   Example: If you configure an area pointer with the length "4", enter the value "0" for "lo" and the value "3" for "hi" inside the brackets.
7. Replace the "type" designation with the "word" data type.
   The full data type for an array of 4 tags appears as follows: "Array[0 .. 3] of word".
   The tag array is created after the entry is confirmed.
8. Click "Compile".
   The project is compiled.



Data_block_1

	Name	Data type	Default value	Initial value	Retain	Comment
1	Static					
2	Job_mailbox	Array [0 .. 3] of word				
3	Job_mailbox[0]	Word	W#16#0000	W#16#0000		
4	Job_mailbox[1]	Word	W#16#0000	W#16#0000		
5	Job_mailbox[2]	Word	W#16#0000	W#16#0000		
6	Job_mailbox[3]	Word	W#16#0000	W#16#0000		

Configuring an area pointer for a connection

Introduction

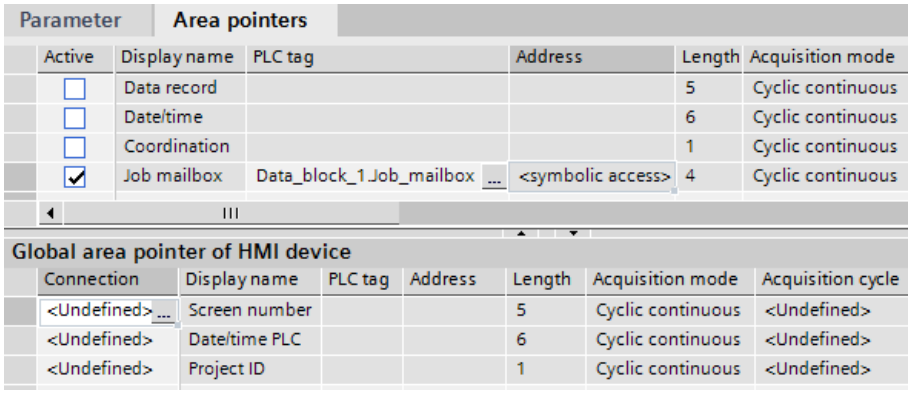
After you have parameterized the global data block, you now create the area pointer for the connection.

Requirements

- The global data block has been parameterized in the PLC program.

Procedure

1. Open "HMI >Connections" in the project tree.
2. Click the "Area pointer" tab.
3. Enable the required area pointer.
   You enable a global area pointer by selecting the connection in the "Connection" field.
4. Click the navigation button in the "PLC tag" field.
   The object list opens.
5. Navigate to the data block in the object list, and select the tag in the right window.
   You do not need an array tag to configure an area pointer with the length of "1".



6. Select the "Word" data type when creating the tag in the data block.

If required, set additional parameters, such as the acquisition cycle, during configuration.

Result

The area pointer is enabled and connected to the PLC tag in the global data block.

Area pointers for Basic Panels

Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device

alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Area pointer

Area pointers for Comfort Panel

Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Area pointer

Mitsubishi MC TCP/IP	ETHERNET	ETHERNET	ETHERNET
Mitsubishi FX	IF1B 3)5)	IF1B 3)5)	IF1B 3)5)
Modicon Modbus TCP	ETHERNET	ETHERNET	ETHERNET
Modicon Modbus RTU	IF1B 2) 3) 5)	IF1B 2) 3) 5)	IF1B 2) 3) 5)
Omron Host Link	IF1B 3)5)	IF1B 3)5)	IF1B 3)5)

1) For SIMATIC S7-200 only

2) only with RS 422-RS232 converter (option)
Order number: 6AV6 671-8XE00-0AX0

3) For serial communication, deselect "Remote Control" of "Channel 1" in the "File > Transfer >Options" menu.

4) Direct communication with PLC5 or KF2 module, otherwise only approved with RS422-RS232 converter (option).
Order number: 6AV6 671-8XE00-0AX0

5) "PROFINET IO Enabled" must be disabled.

Area pointers for Multi Panel

Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Area pointers

	MP 177	MP 277	MP 377
Screen number	Yes	Yes	Yes
Data record	Yes	Yes	Yes
Date/time	Yes	Yes	Yes
Date/time PLC	Yes	Yes	Yes
Coordination	Yes	Yes	Yes
Project ID	Yes	Yes	Yes
Job mailbox	Yes	Yes	Yes

10.11.5.5 Mobile Panel

Communication drivers for Mobile Panels

Device dependency of Mobile Panels

The following table shows which communication drivers you can configure with the various Mobile Panels.

Communication drivers

HMI devices	SIMATIC S7 1500	SIMATIC S7 1200	SIMATIC S7 300/400	SIMATIC S7 200	SIMATIC LOGO!	SIMATIC HTTP protocol	OPC	Allen-Bradley EtherNet/IP	Allen-Bradley DF1	Mitsubishi MC TCP/IP	Mitsubishi FX	Modicon Modbus TCP/IP	Modicon Modbus RTU	Omron Host Link
Mobile Panel 177 6" DP	Yes [2]	Yes	Yes	Yes	No	No	No	No	Yes [1]	No	Yes [1]	No	Yes [1]	Yes [1]
Mobile Panel 177 6" PN	Yes [2]	Yes	Yes	Yes	Yes	Yes	No	Yes	No	Yes	No	Yes	No	No
Mobile Panel 277 8"	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes [1]	Yes	Yes [1]	Yes	Yes [1]	Yes [1]
Mobile Panel 277 8" IWLAN V2	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No	Yes	No	Yes	No	No
Mobile Panel 277F 8" IWLAN V2	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No	No	No	No	No	No
Mobile Panel 277F 8" IWLAN V2 (RFID tag)	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No	No	No	No	No	No
Mobile Panel 277 10"	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes [1]	Yes	Yes [1]	Yes	Yes [1]	Yes [1]

[1] "PROFINET IO Enabled" must be disabled.

[2] You must activate "Access via PUT/GET communication" for communication with the SIMATIC S7 1500 PLC.

Activate PUT/GET communication in the PLC properties at:

"General > Security > Enable PUT/GET communication with remote partner (PLC, HMI, OPC, ...)"

Interfaces of Mobile Panels

Device dependency of Mobile Panels

The following table shows which HMI device interfaces are available for the communication driver protocols.

Table 10-153 Mobile Panels

	Mobile Panel 177 DP [3]	Mobile Panel 177 PN	Mobile Panel 277 [2][3]	Mobile Panel 277 IWLAN V2	Mobile Panel 277F V2 IWLAN	Mobile Panel 277F IWLAN V2 (RFID tag)
SIMATIC S7 - PPI [1]	IF1B	—	IF1B	—	—	—
SIMATIC S7 - MPI	IF1B	—	IF1B	—	—	—
SIMATIC S7 - PROFIBUS	IF1B	—	IF1B	—	—	—
SIMATIC S7 - PROFINET	—	ETHERNET	ETHERNET	ETHERNET	ETHERNET	ETHERNET
SIMATIC HMI HTTP protocol	—	ETHERNET	ETHERNET	ETHERNET	ETHERNET	ETHERNET
OPC	—	—	—	ETHERNET	ETHERNET	ETHERNET
Allen-Bradley DF1	IF1A [3], IF1B [3] [4] [6] (terminal box)	—	IF1A [3], IF1B [3] [4] [6] (terminal box)	—	—	—
Allen-Bradley EtherNet/IP	---	ETHERNET	ETHERNET	ETHERNET	ETHERNET	ETHERNET
Mitsubishi MC TCP/IP	--	ETHERNET	ETHERNET	ETHERNET	—	—
Mitsubishi FX	IF1A [3], IF1B [3] [6] (terminal box)	—	IF1A [3], IF1B [3] [6] (terminal box)	—	—	—
Modicon Modbus RTU	IF1A [3], IF1B [3] [5] [6] (terminal box)	—	IF1A [3], IF1B [3] [5] [6] (terminal box)	—	—	—
Modicon Modbus TCP/IP	—	ETHERNET	ETHERNET	ETHERNET	—	—
Omron Host Link	IF1A [3], IF1B [3] [6] (terminal box)	—	IF1A [3], IF1B [3][6] (terminal box)	—	—	—

[1] For SIMATIC S7-200 only

[2] Depending on the terminal box used

[3] For serial communication, deselect "Remote Control" of "Channel 1" in the "File > Transfer >Options" menu.

[4] With PLC5 and KF2 module only

[5] Can be selected and used, but not approved.

[6] "PROFINET IO Enabled" must be disabled.

Area pointers for Mobile Panel

Introduction

Area pointers are parameter fields from which the HMI device obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Area pointer

	Mobile Panel 177	Mobile Panel 277	Mobile Panel 277 IWLAN V2	Mobile Panel 277F IWLAN V2	Mobile Panel 277F IWLAN V2 (RFID tag)	Mobile Panel 277
Screen number	Yes	Yes	Yes	Yes	Yes	Yes
Data record	Yes	Yes	Yes	Yes	Yes	Yes
Date/time	Yes	Yes	Yes	Yes	Yes	Yes
Date/time PLC	Yes	Yes	Yes	Yes	Yes	Yes
Coordination	Yes	Yes	Yes	Yes	Yes	Yes
Project ID	Yes	Yes	Yes	Yes	Yes	Yes
Job mailbox	Yes	Yes	Yes	Yes	Yes	Yes

10.11.5.6 PC systems

Communication drivers for PC systems

Device dependency

The following table shows which communication drivers you can configure with the various Runtimes on a PC.

Communication drivers

HMI devices	SIMATIC S7 1500	SIMATIC S7 1200	SIMATIC S7 300/400	SIMATIC S7 200	SIMATIC LOGO!	SIMATIC HTTP protocol	OPC	Allen-Bradley EtherNet/IP	Allen-Bradley DF1	Mitsubishi MC TCP/IP	Mitsubishi FX	Modicon Modbus TCP/IP	Modicon Modbus RTU	Omron Host Link
WinCC RT Advanced	Yes	Yes	Yes	Yes	Yes	Yes	Yes [1]	Yes	Yes	Yes	Yes	Yes	Yes	Yes
WinCC RT Professional	Yes	Yes	Yes	No	No	No	Yes [2]	Yes	No	Yes	No	Yes	No	No

[1] OPC-DA-Client, OPC-XML-DA-Client, OPC-UA(DA only) Client and OPC-DA-Server

[2] OPC-DA-Client, OPC-XML-DA-Client and OPC-DA-Server, OPC-XML-DA-Server (optional),
OPC-HDA-Server (optional), OPC-AE-Server (optional) , OPC-UA(DA only)-Server

Interfaces for PC systems

Device dependency

The following table shows which HMI device interfaces are available for the communication driver protocols.

	WinCC RT Advanced	WinCC RT Professional
SIMATIC S7 - PPI	MPI/DP [2]	--
SIMATIC S7 - MPI	MPI/DP [2]	MPI/DP [2]
SIMATIC S7 - PROFIBUS	MPI/DP [2]	MPI/DP [2]
SIMATIC S7 - PROFINET	ETHERNET	ETHERNET
SIMATIC HMI HTTP protocol	ETHERNET	ETHERNET

	WinCC RT Advanced	WinCC RT Professional
OPC	ETHERNET	ETHERNET
Allen-Bradley EtherNet/IP	ETHERNET	ETHERNET
Allen-Bradley DF1	COM1 to COM4 [1]	--
Mitsubishi MC TCPI/IP	ETHERNET	ETHERNET
Mitsubishi FX	COM1 to COM4 [1]	--
Modicon Modbus TCP/IP	ETHERNET	ETHERNET
Modicon Modbus RTU	COM1 to COM4 [1]	--
Omron Host Link	COM1 to COM4 [1]	--

[1] COM2 is blocked for Panel PC 477

[2]
- in SIMATIC PC via integrated interface
- in Standard PC e.g. SIMATIC NET CP 5611 A2

Area pointers for PC systems

Introduction

Area pointers are parameter fields from which WinCC RT Advanced obtains information about the location and size of data areas in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations. Based on the evaluation of data stored in the data areas, the PLC and HMI device initiate mutually defined actions.

WinCC uses the following area pointers:

- Job mailbox
- Project ID
- Screen number
- Data record
- Date/time
- Date/time PLC
- Coordination

Availability of the area pointers

The following table shows the availability of the area pointers on the HMI devices. Note that the area pointers can be used only for available communication drivers.

Table 10-154 WinCC RT Advanced

	WinCC RT Advanced
Screen number	Yes
Data record	Yes

	WinCC RT Advanced
Date/time	Yes
Date/time PLC	Yes
Coordination	Yes
Project ID	Yes
Job mailbox	Yes

10.11.5.7 Parallel communication

Parallel communication of communication drivers

The following table shows an overview of which communication drivers you can use simultaneously on one HMI device.

Note

Parallel communication is not approved for Basic Panels.

Parallel communication over Ethernet interfaces

The approved combinations can be operated via the same Ethernet interface. Several Ethernet interfaces are not required.

Parallel communication only concerns the Ethernet-based communication drivers.

	Allen-Bradley EtherNet/IP	Mitsubishi MC TCP/IP	Modicon Modbus TCPIP	OPC (DA/ XML DA)	OPC UA (DA)	SIMATIC LOGO!	SIMATIC S7 200	SIMATIC S7 300/400	SIMATIC S7 1200	SIMATIC S7 1500	SIMATIC HTTP protocol	Sinumerik NC

Sinumerik NC	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--

Parallel communication over serial interfaces

The following applies for parallel communication over serial interfaces:

- One communication driver per interface.
- One interface per communication driver.

10.11.6 Communicating with SIMATIC S7 1500

10.11.6.1 Communication with SIMATIC S7 1500

Introduction

This section describes the communication between an HMI device and the SIMATIC S7 1500 PLC.

You can configure the following communication channels for the SIMATIC S7 1500 PLC:

- PROFINET
- PROFIBUS

HMI connection for communication

Configure connections between the HMI device and a SIMATIC S7 1500 in the "Devices & Networks" Editor.

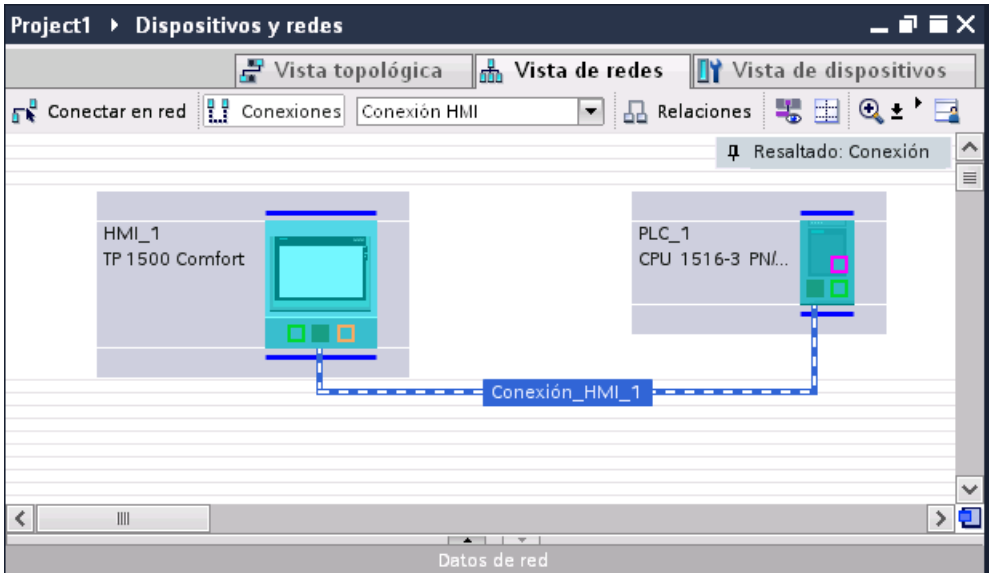
10.11.6.2 Communication via PROFINET

Configuring an HMI connection

Communication via PROFINET

HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 1500 into the project, interconnect the two PROFINET interfaces in the "Devices & Networks" editor.



You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1500 via PROFINET or Ethernet in the "Devices & Networks" editor.

CAUTION
Communication via Ethernet In Ethernet-based communication, the end user is responsible for the security of his data network. Targeted attacks can overload the device and interfere with proper functioning.

Requirements

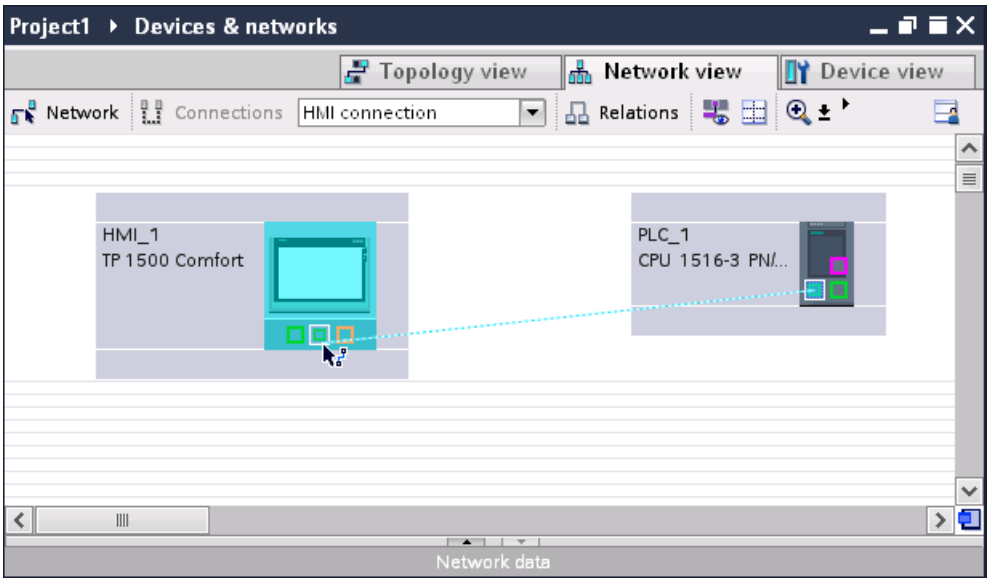
The following communication partners are created in the "Devices & Networks" editor:

- HMI device with PROFINET or Ethernet interface
- SIMATIC S7 1500 with PROFINET interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

3. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.



4. Click the connecting line.
5. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 4989)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection

Communication via PROFINET

Communication via PROFINET

This chapter describes communication over PROFINET between a WinCC Runtime and the SIMATIC S7 1500 PLC.

You can use the following WinCC Runtimes as an HMI device:

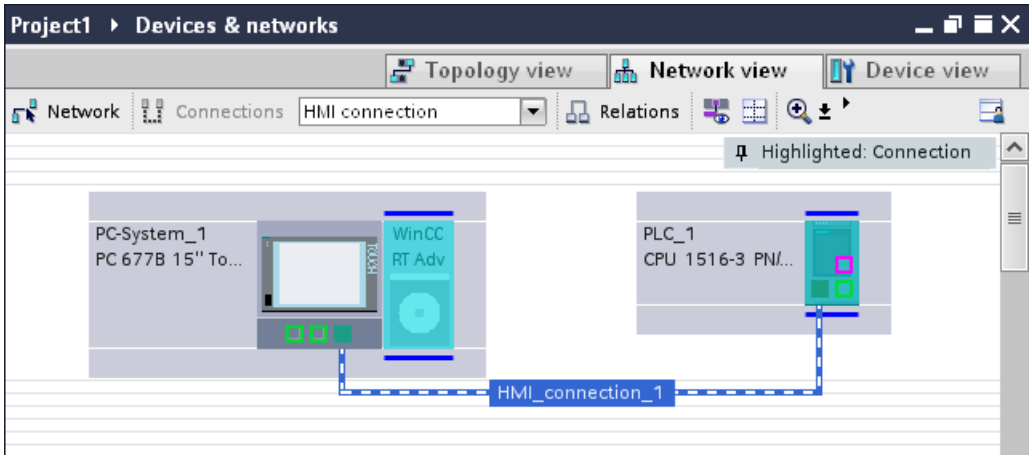
- WinCC RT Advanced

WinCC Runtime as HMI device

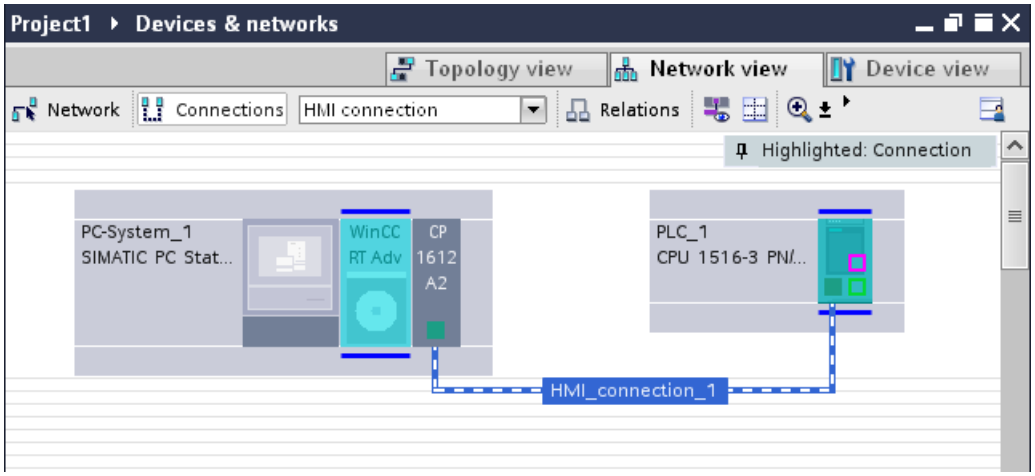
Configure the HMI connections between a WinCC Runtime and SIMATIC S7 1500 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device.

The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET with a PC

Introduction

You configure an HMI connection over PROFINET or Ethernet between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

⚠ CAUTION
Communication via Ethernet In Ethernet-based communication, the end user is responsible for the security of his data network. Targeted attacks can overload the device and interfere with proper functioning.

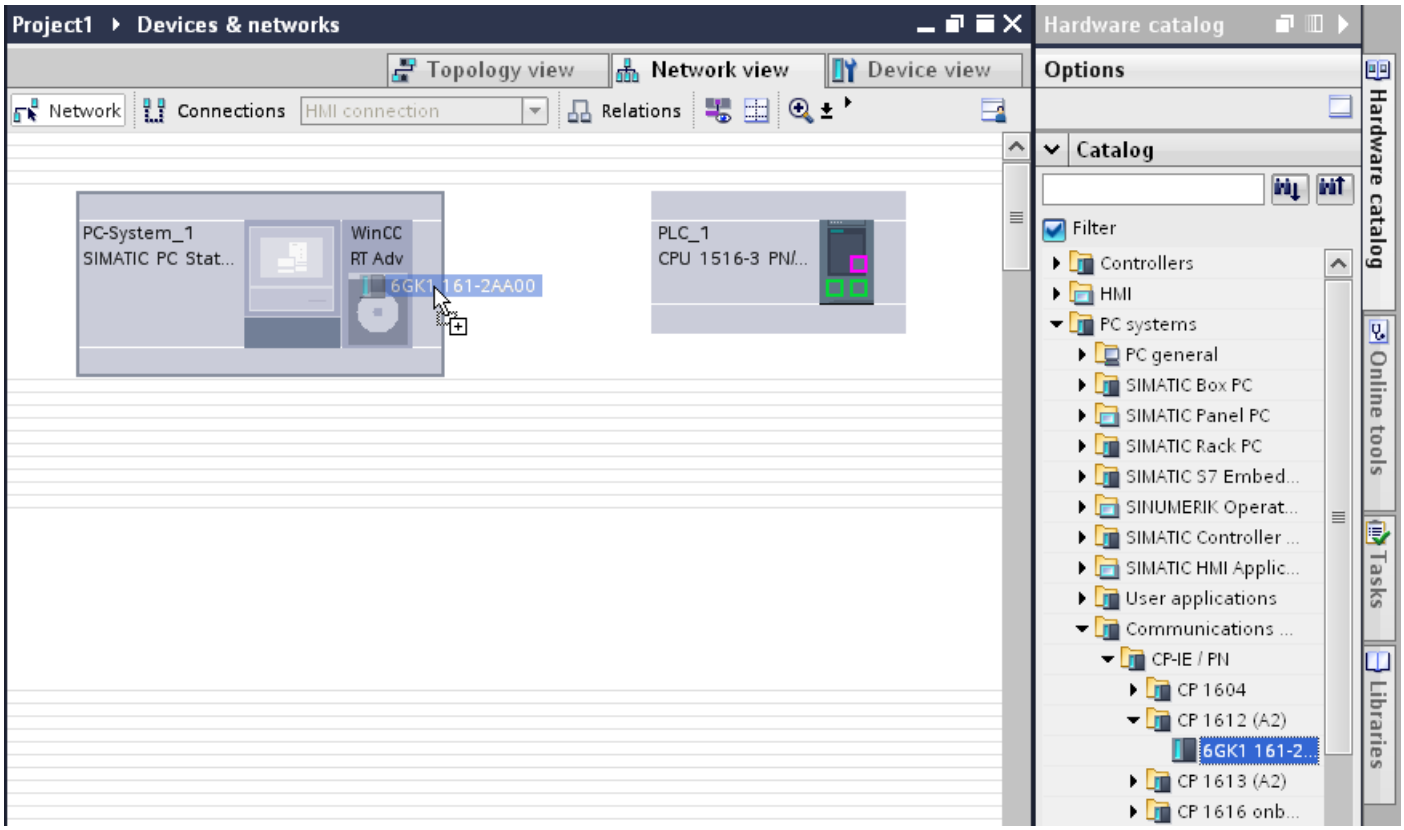
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1500 with PROFINET interface
- PC station with WinCC RT Advanced

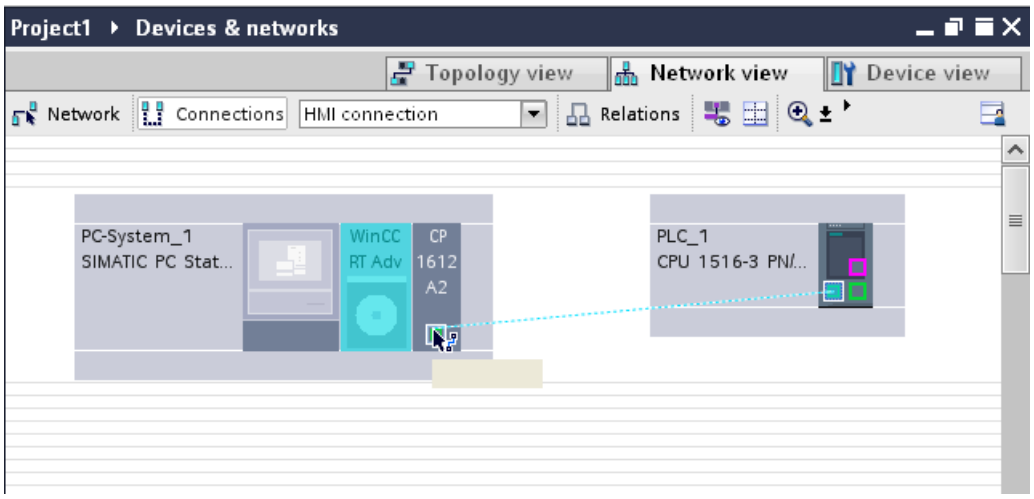
Procedure

1. Double-click the "Devices & Networks" item in the project navigation.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFINET-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.



5. Click the connecting line.
   The connection is displayed graphically in the Inspector window.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 4989)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection via PROFINET with a SIMATIC PC

Introduction

You configure an HMI connection over PROFINET or Ethernet between HMI devices and SIMATIC S7 1500 in the "Devices & Networks" editor.

CAUTION

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

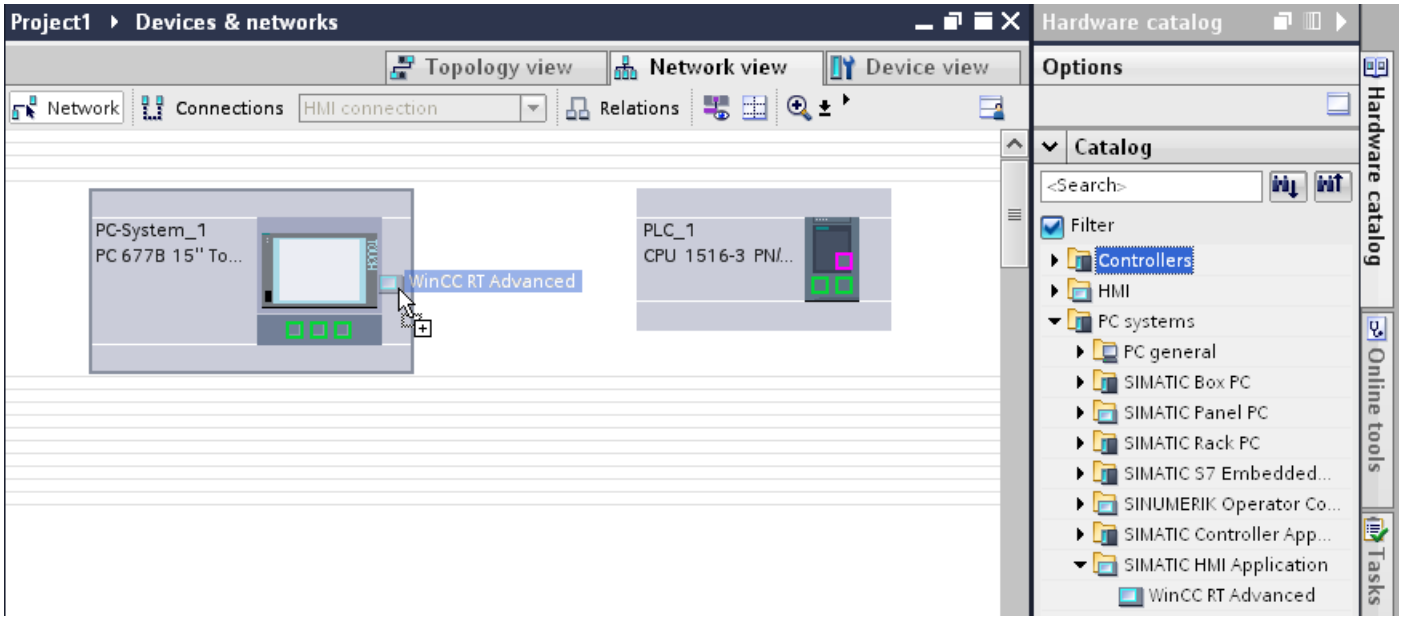
Requirements

The following communication partners are created in the "Devices & Networks" editor:

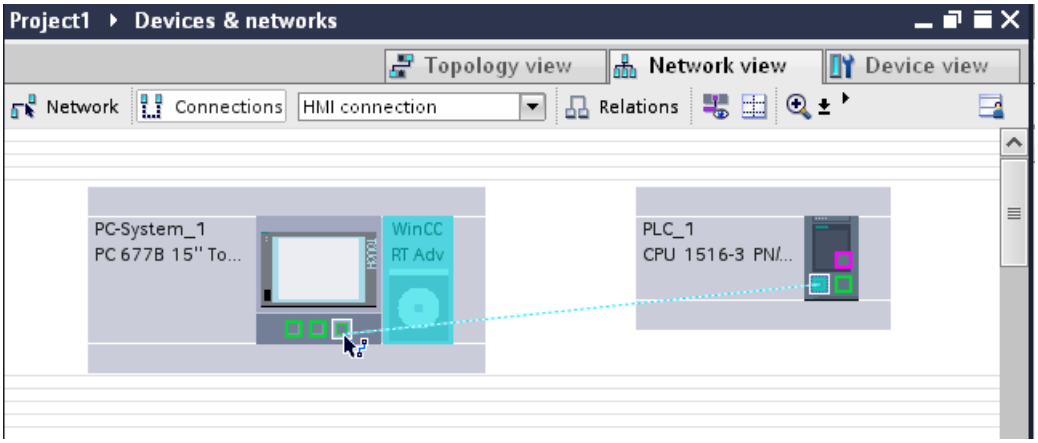
- SIMATIC S7 1500 with PROFINET interface
- SIMATIC PC with PROFINET interface

Procedure

1. Double-click the "Devices & Networks" item in the project navigation.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the PC.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 4989)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1500. The IP address and subnet mask connection parameters are configured.

PROFINET parameters

PROFINET parameters for the HMI connection

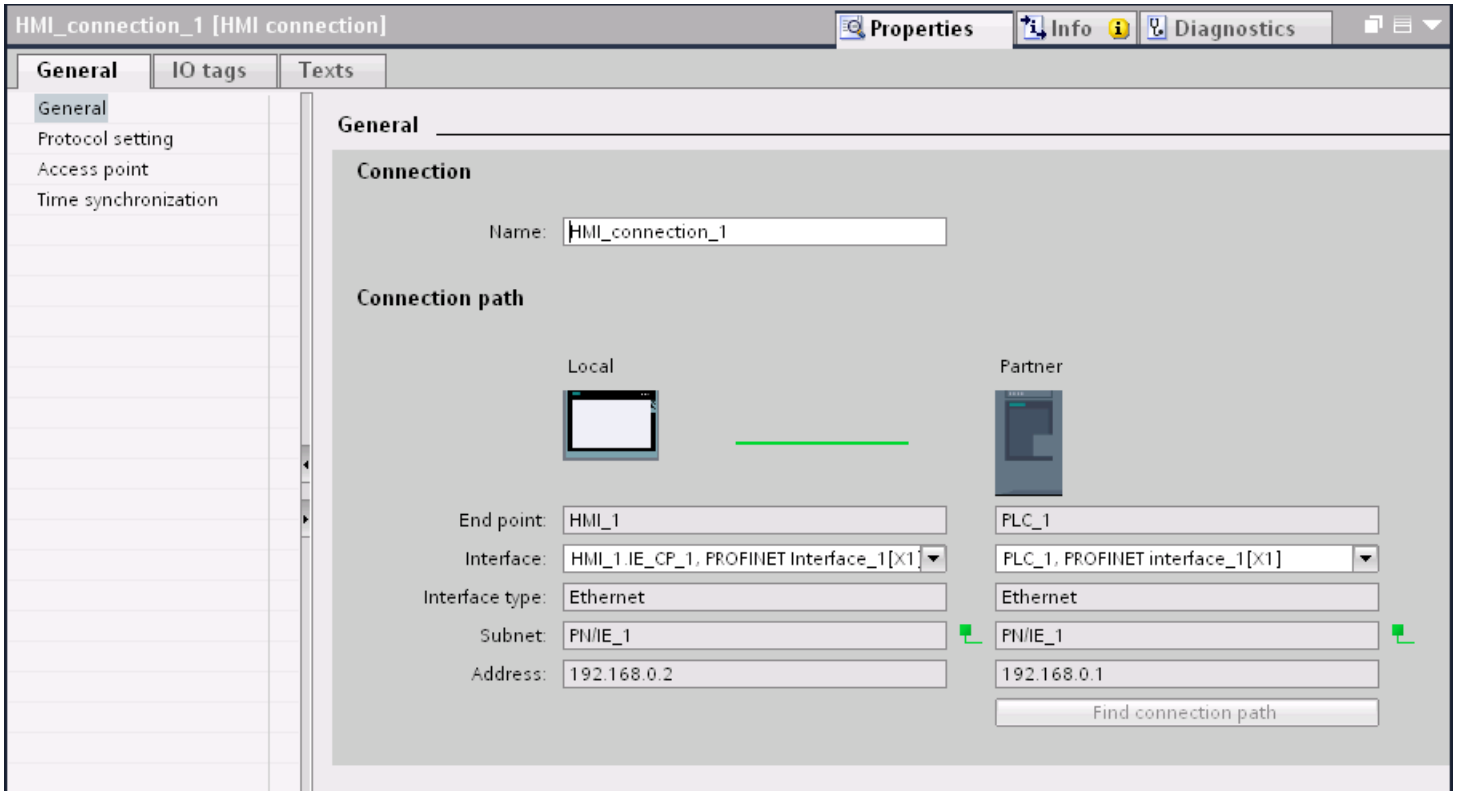
PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Shows the name of the HMI connection.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.

- "Address"
  Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

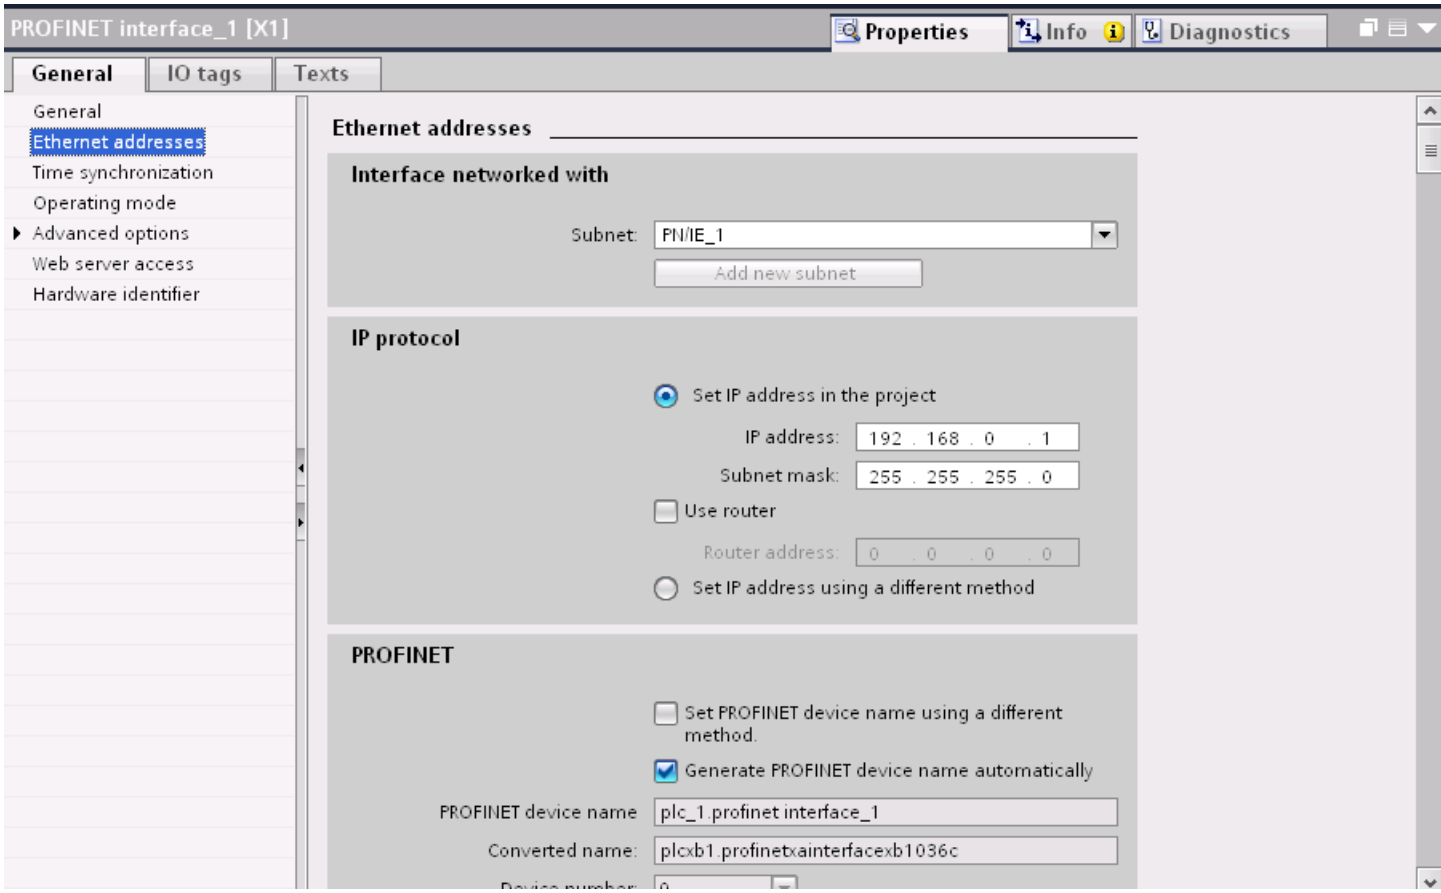
PROFINET parameters for the HMI device

PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Set IP address in the project"
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

  Note

  The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

  HMI devices with Windows CE 3.0:
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP

- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
- "Use IP router"
  If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
- "Set IP address using a different method"
  If the function "Set IP address using a different method" is activated, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

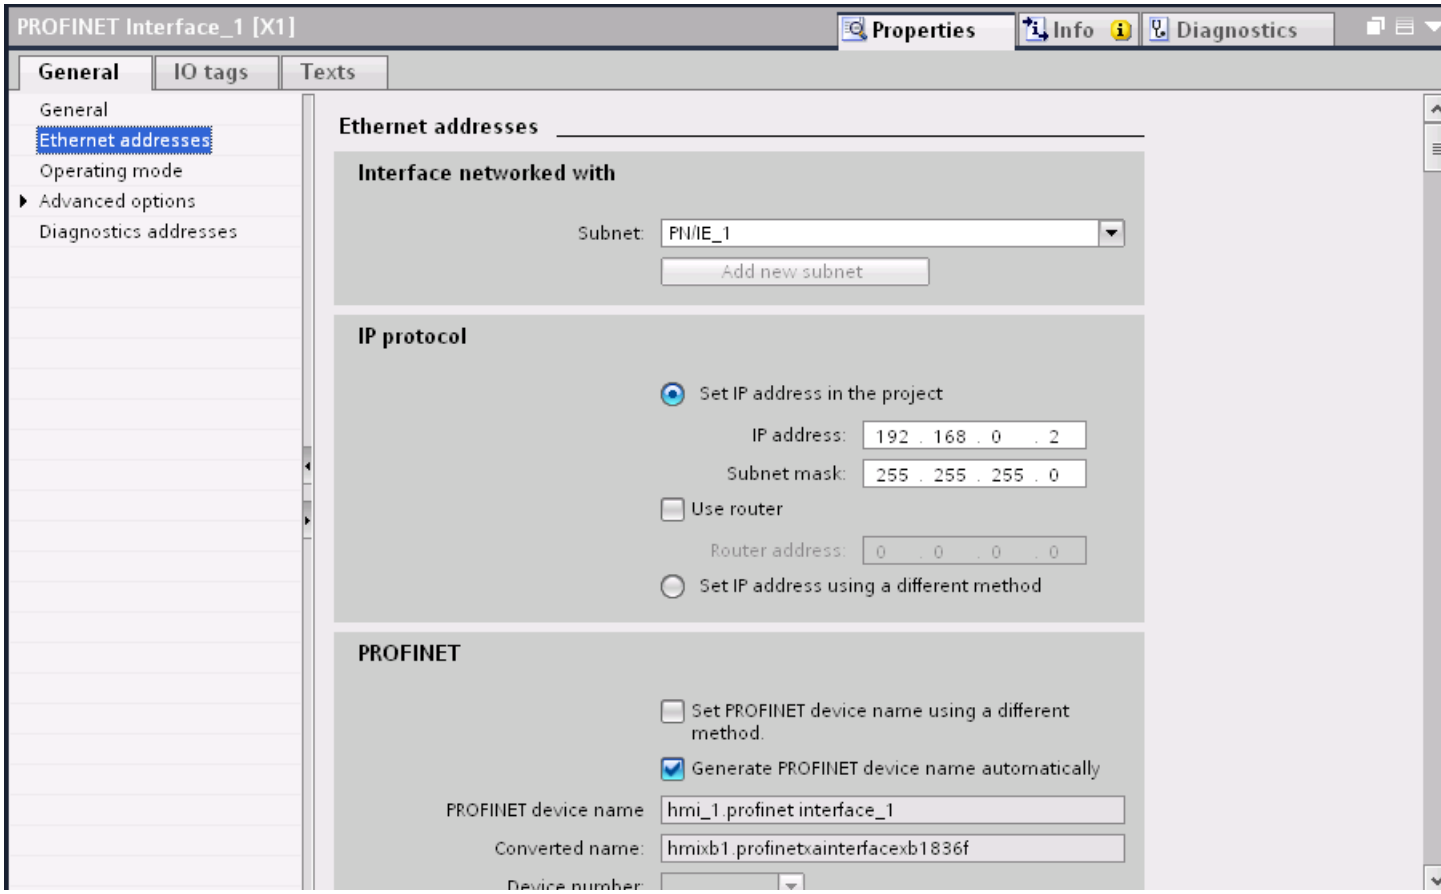
PROFINET parameters for the PLC

PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"
  You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
  If you are using an IP router, select "Use IP router" and enter the router address in the field.

Protection of communication

Security levels

You can assign communication security levels to protect PLC and HMI device communication.

For an S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that each password is assigned to exactly one protection level.

The effect of the password is given in the "Protection" column.

Example

Select the "Complete protection" security level for a standard CPU (in other words, not an F-CPU) and enter a separate password for each security level in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read/write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Access password for the HMI connection

Introduction

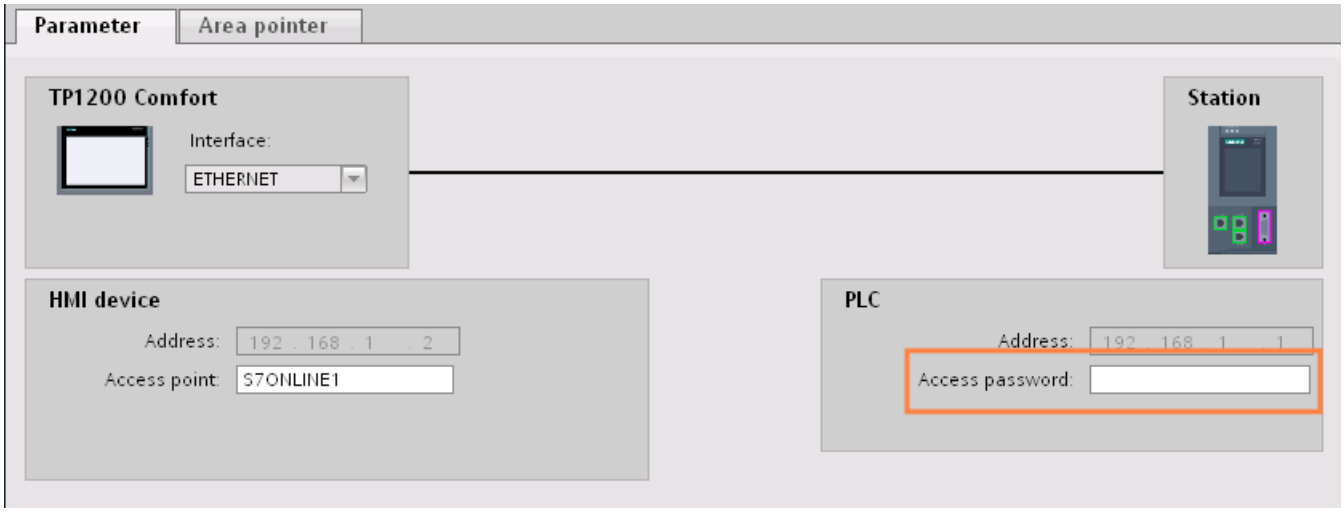
Communication with a PLC with the"Complete protection" protection level is protected by a password. The password is stored in the properties of the PLC.

Enter the password from the PLC in the "Access password" area.

Communication to the PLC is denied if an incorrect or no password is entered.

Entering the access password

Enter the access password for the HMI connection in the "Connections" editor.



Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- Automatic setting
  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- TP/ITP at x Mbps full duplex (half duplex)
  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled
    You can use both cross cable and patch cable.
  - Autonegotiation disabled
    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated
  Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

Wiring rules for disabled autonegotiation

Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

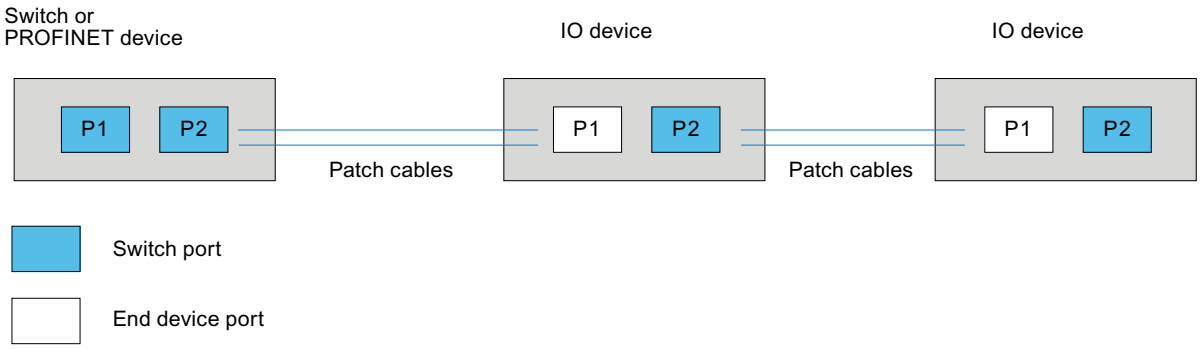
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"
  No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"
  LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"
  No forwarding of sync frames transmitted to synchronize nodes within a sync domain.
  If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).
  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

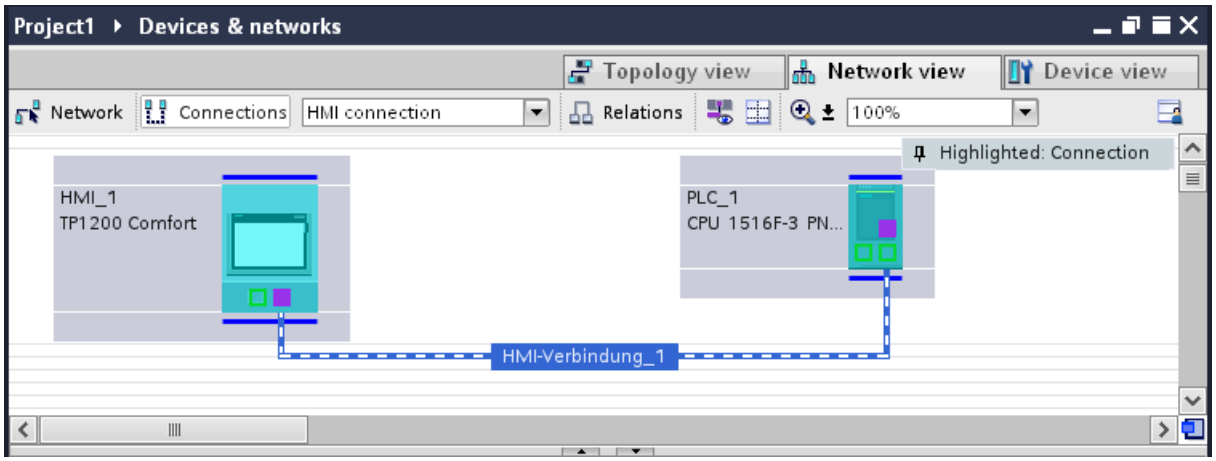
10.11.6.3 Communication via PROFIBUS

Configuring an HMI connection

Communication via PROFIBUS

HMI connections via PROFIBUS

If you have inserted an HMI device and a SIMATIC S7 1500 into the project, interconnect the two PROFIBUS interfaces in the "Devices & Networks" editor.



HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS

Introduction

You configure an HMI connection over PROFIBUS between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

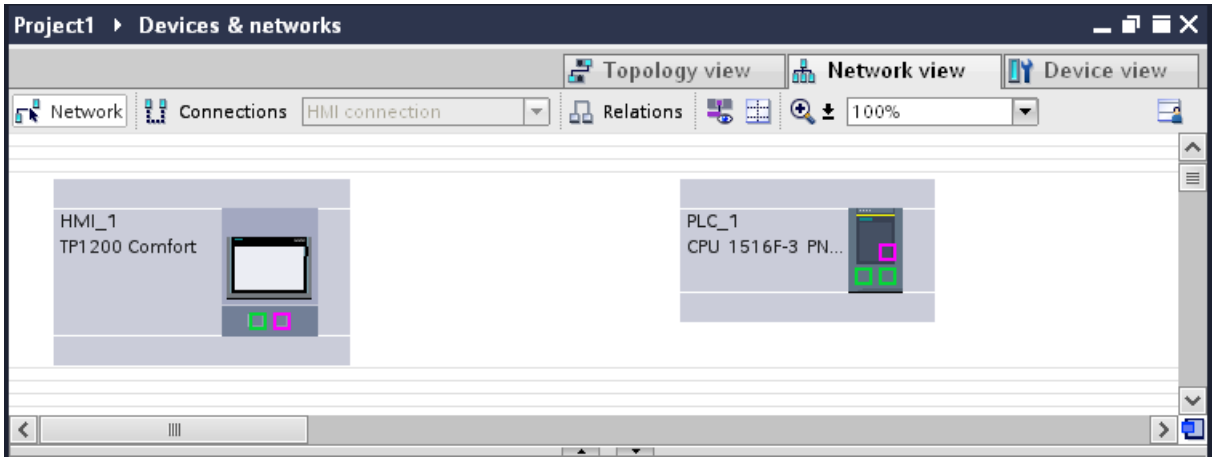
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7 1500 with PROFIBUS interface

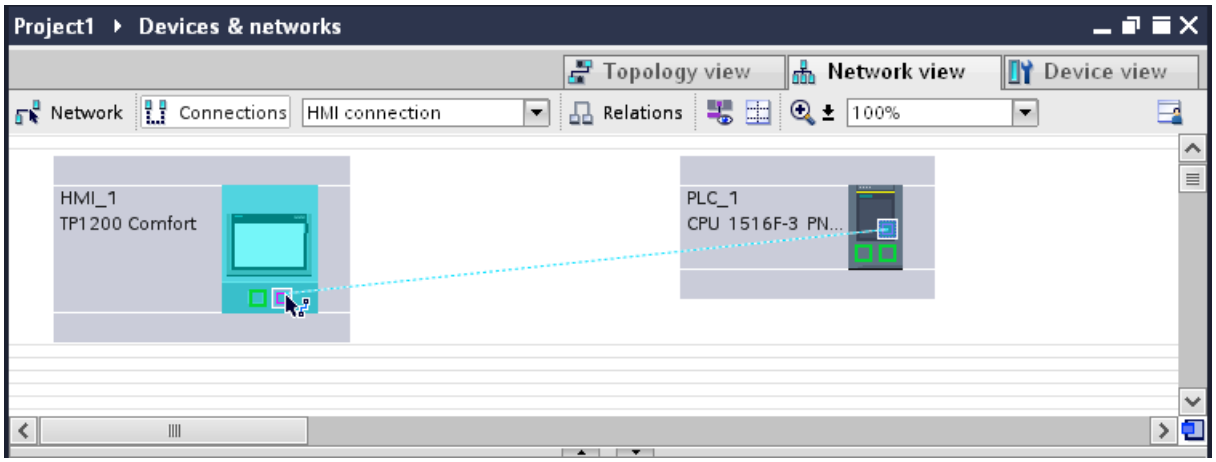
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.



2. Click the "Connections" button.
   The devices available for connection are highlighted in color.
3. Click the HMI device interface.
4. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > HMI MPIDP > Parameters".

5. Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 5006)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

Configuring an HMI connection

Communication via PROFIBUS

Communication via PROFIBUS

This chapter describes communication over PROFIBUS between a WinCC Runtime and the SIMATIC S7 1500 PLC.

You can use the following WinCC Runtimes as an HMI device:

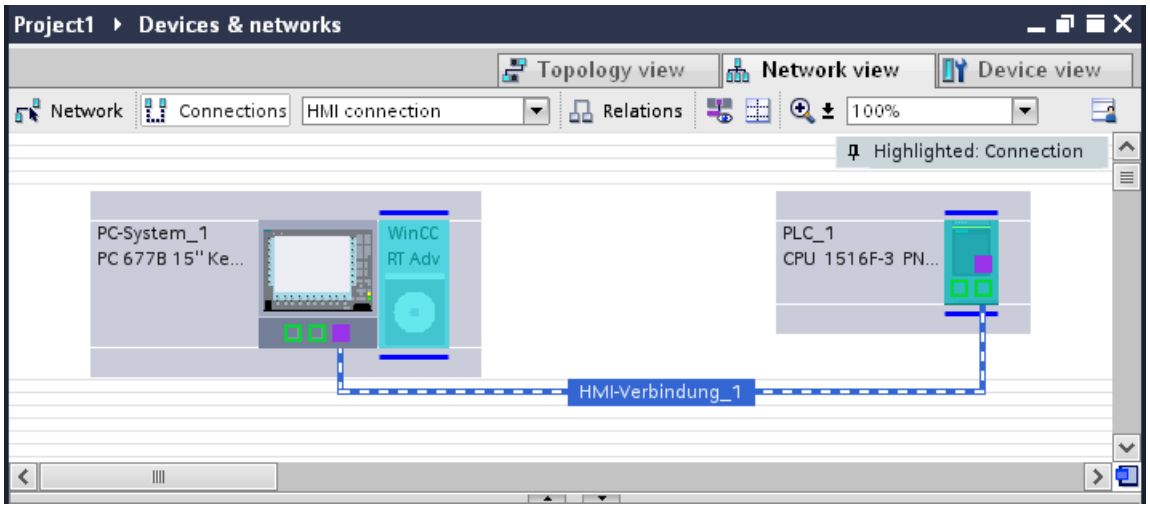
- WinCC RT Advanced
- WinCC RT Professional

WinCC Runtime as HMI device

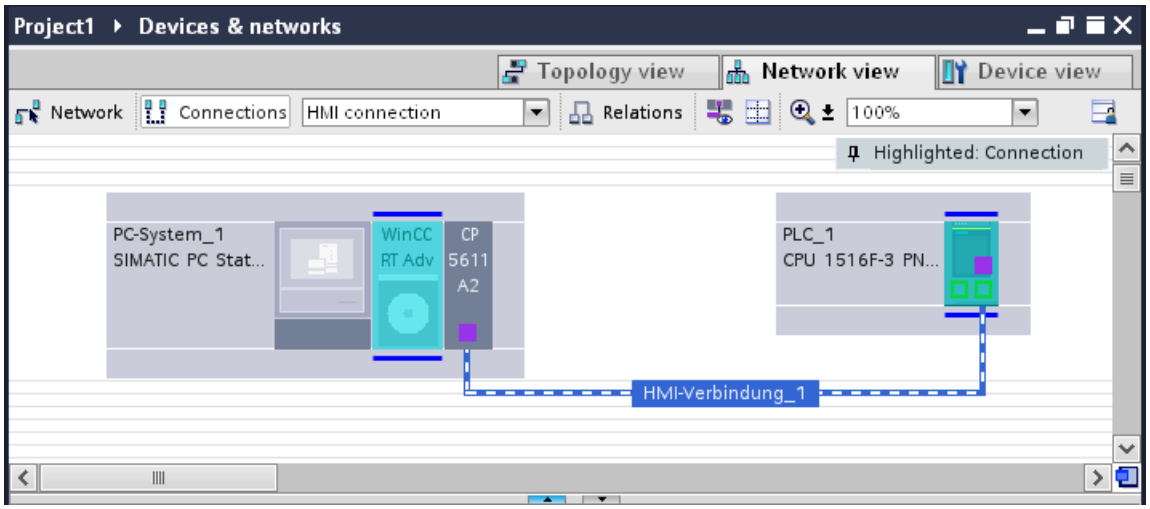
Configure the HMI connections between WinCC Runtime and SIMATIC S7 1500 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to a single SIMATIC S7 1500 and multiple SIMATIC S7 1500 to a single HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS with a PC

Introduction

You configure an HMI connection over PROFIBUS between the HMI device and SIMATIC S7 1500 in the "Devices & Networks" editor.

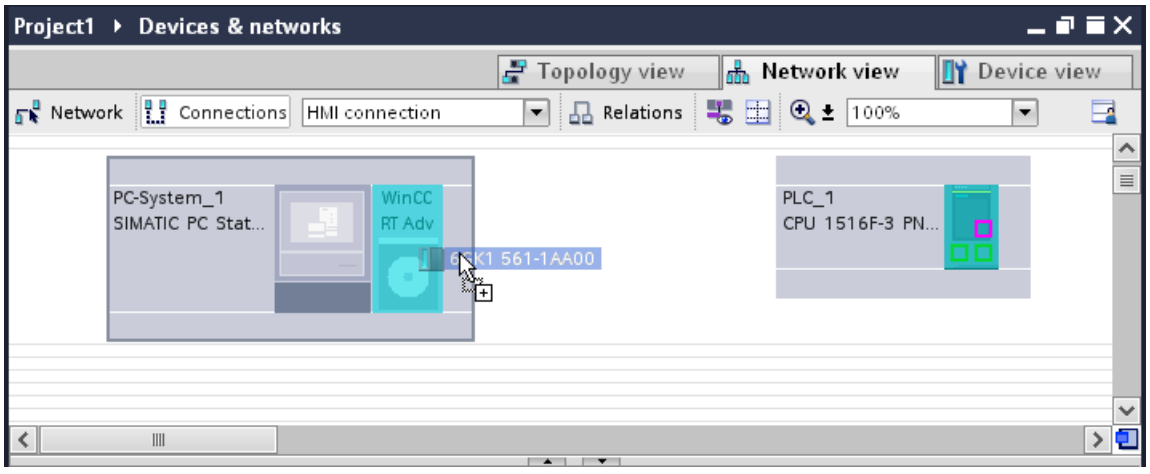
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1500 with PROFIBUS interface
- PC station with WinCC RT Advanced or WinCC RT Professional

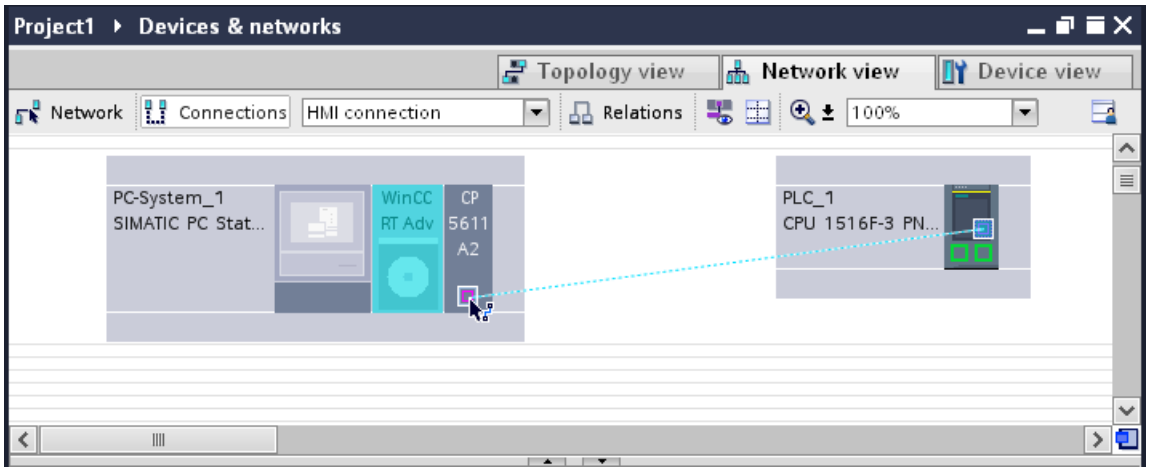
Procedure

1. Double-click the "Devices & Networks" item in the project navigation.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 5006)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

Configuring an HMI connection via PROFIBUS with a SIMATIC PC

Introduction

You configure an HMI connection over PROFIBUS between HMI devices and a SIMATIC S7 1500 in the "Devices & Networks" editor.

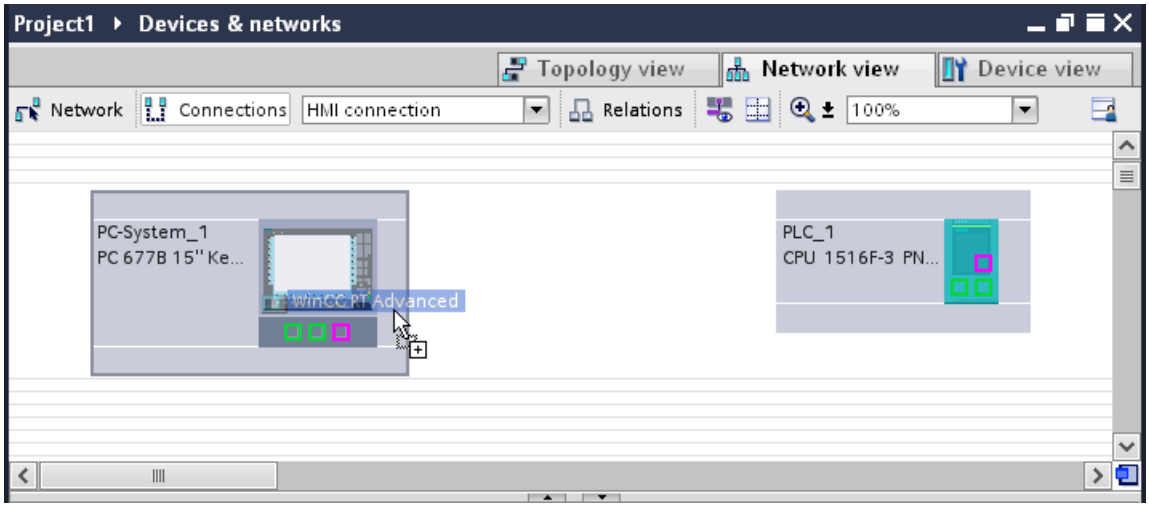
Requirements

The following communication partners are created in the "Devices & Networks" editor:

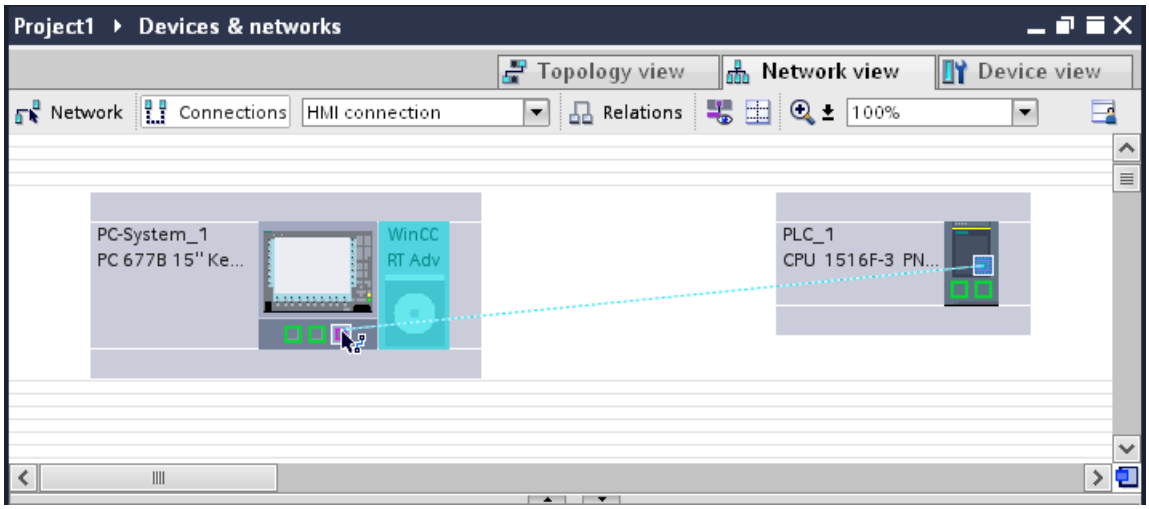
- SIMATIC S7 1500 with PROFIBUS interface
- SIMATIC PC with PROFIBUS interface

Procedure

1. Double-click the "Devices & Networks" item in the project navigation.
   The available communication partners in the project are displayed in the network view.
2. Click the MPI interface of the PC and select "PROFIBUS" for the interface type in the Inspector window.
3. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



4. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
5. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.



6. Click the connecting line.

7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 5006)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection over PROFIBUS between an HMI device and a SIMATIC S7 1500.

PROFIBUS parameters

PROFIBUS parameters for the HMI connection

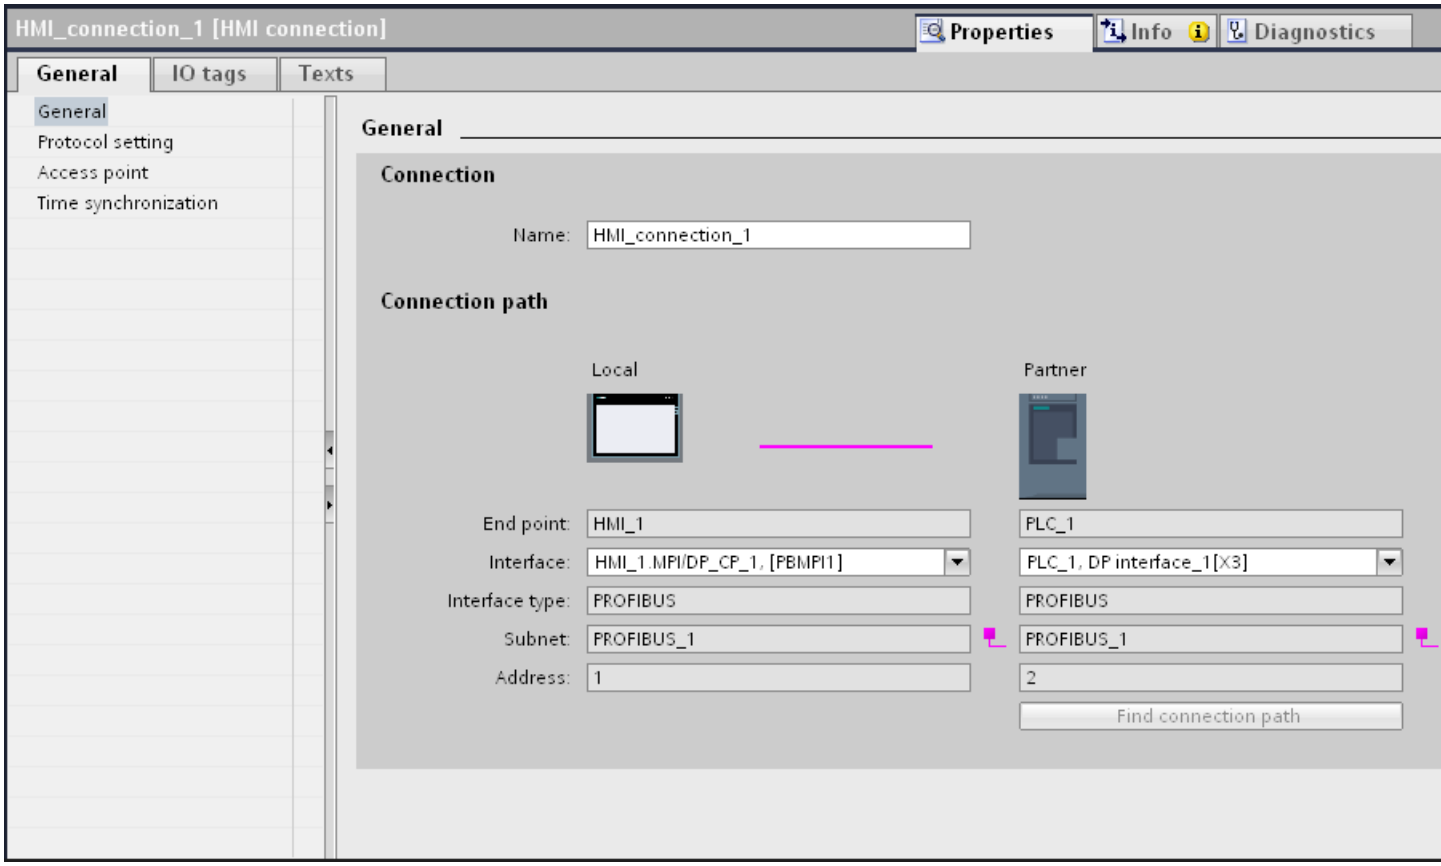
PROFIBUS parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Displays whether the devices are networked together.

- displayed if the devices are networked together.

- displayed if the devices are not networked together.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.

- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the PROFIBUS address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

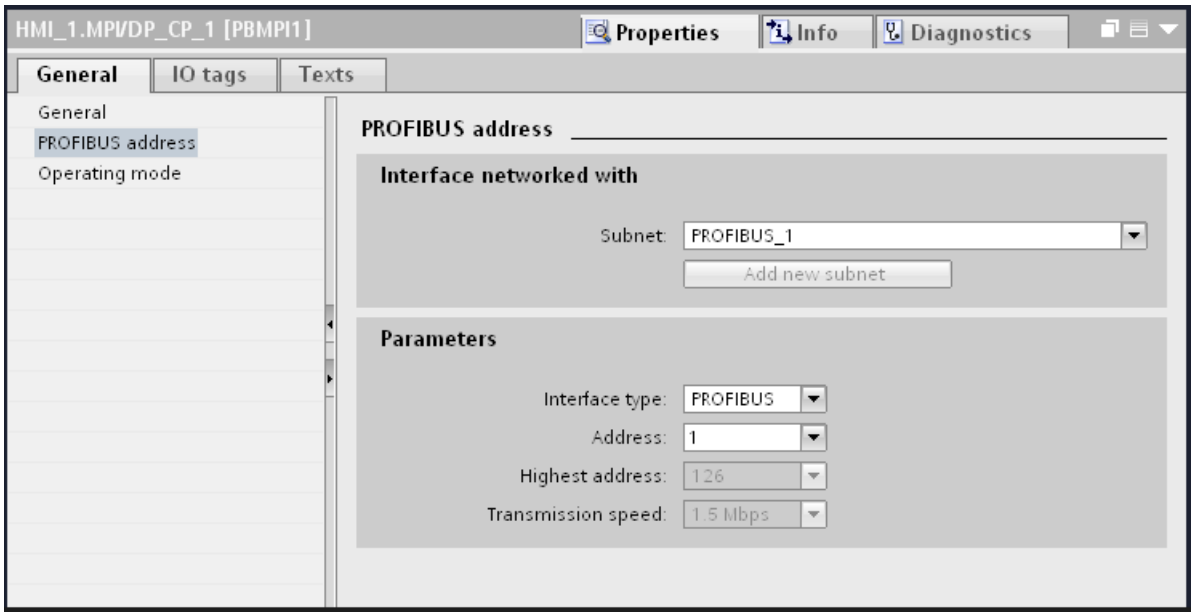
PROFIBUS parameters for the HMI device

PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  You assign the interface type in the "Interface type" area. Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

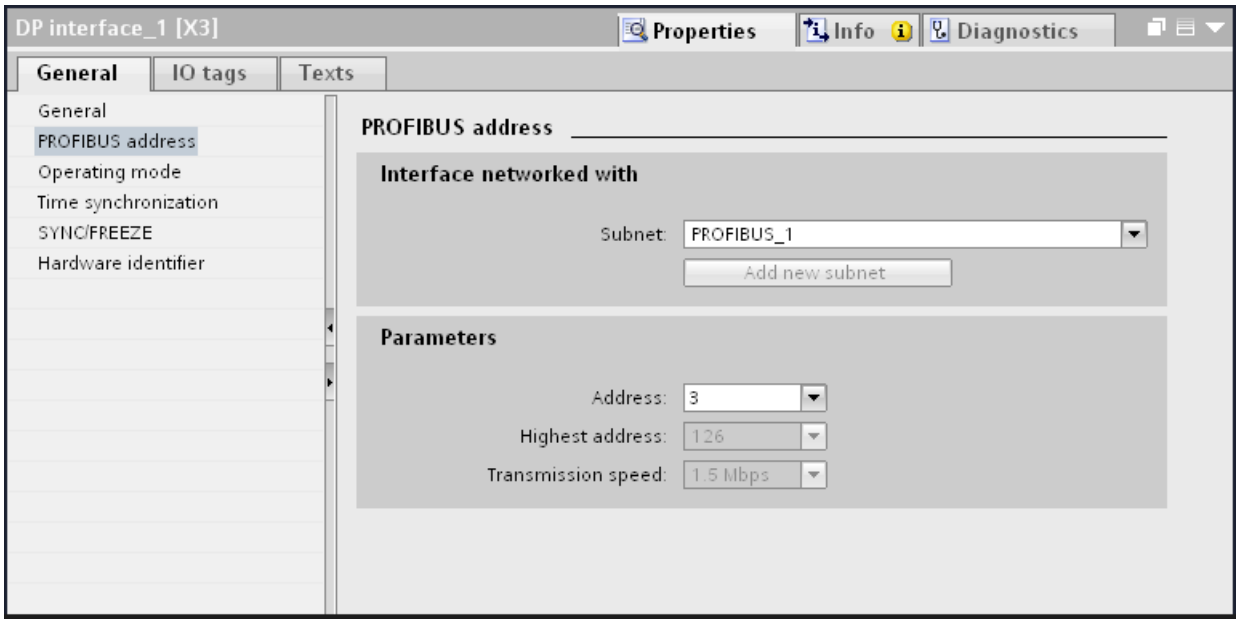
PROFIBUS parameters for the PLC

PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

Protection of communication

Security levels

You can assign communication security levels to protect PLC and HMI device communication.

For an S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that each password is assigned to exactly one protection level.

The effect of the password is given in the "Protection" column.

Example

Select the "Complete protection" security level for a standard CPU (in other words, not an F-CPU) and enter a separate password for each security level in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read/write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Access password for the HMI connection

Introduction

Secure access to a PLC by assigning a password.

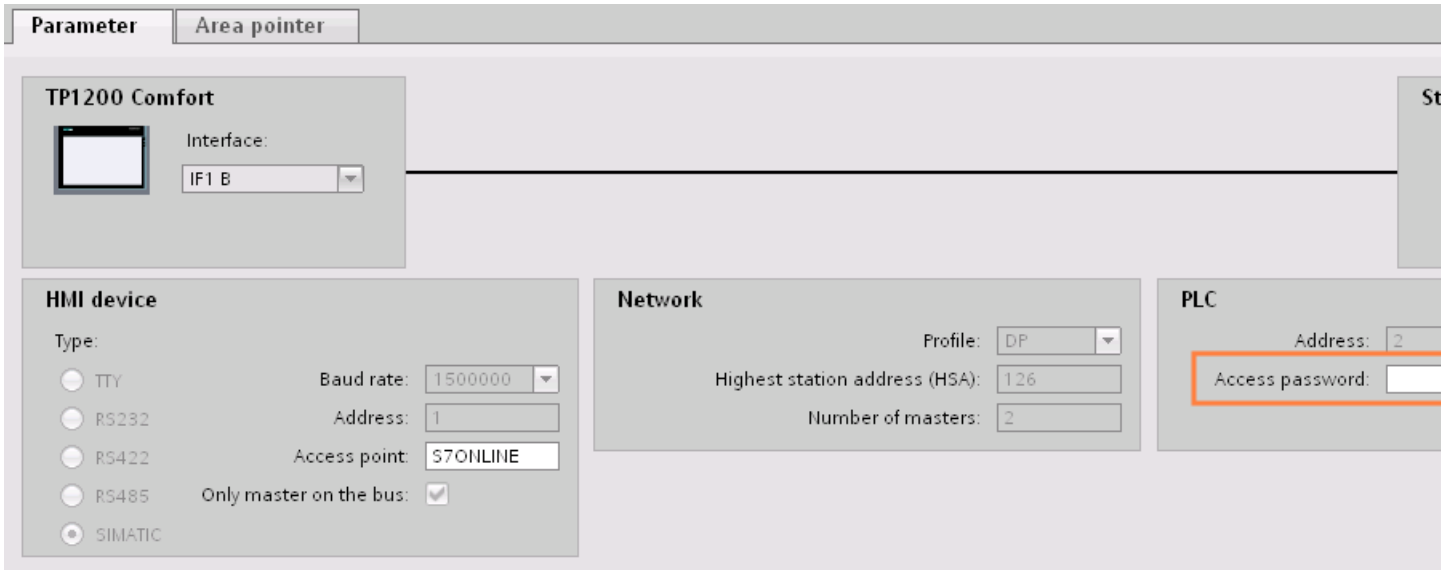
Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

Assigning password

Enter the access password for the HMI connection in the "Connections" editor.



10.11.6.4 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Data exchange using area pointers (Page 4916)

Restrictions

You can only configure the following data types for communication with SIMATIC S7 1500 for data exchange using area pointers:

- UInt and array of UInt
- Word and array of Word
- Int and array of Int
- "Array[0..15] of Bool" for area pointer "Coordination"
- Date_And_Time
- DTL and LDT

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" or "40" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Using data types

The data types "Date_And_Time, DTL" and "LDT" can only be used with the "Date/time" and "Date/time PLC" area pointers.

The data format of the "Date/time" area pointer depends on job mailbox 40/41.

If there are no control tags linked to the area pointer, or a control tag is linked with the data type "Array[0..5] of UInt/Word/Int", the following applies:

The configuration of the "Date/time" area pointer is only used for job mailbox 41.

If job mailbox 40 is used, the data format "DATE_AND_TIME (BCD-encoded)" is used (shown in the next section).

If the "Date/time" and "Date/time PLC" area pointers are linked to a control tag with the data type "DATE_AND_TIME", "DTL" or "LDT", the associated data format is used in the corresponding area pointer.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Using data types

The data types "Date_And_Time, DTL" and "LDT" can only be used with the "Date/time" and "Date/time PLC" area pointers.

The data format of the "Date/time" area pointer depends on job mailbox 40/41.

If there are no control tags linked to the area pointer, or a control tag is linked with the data type "Array[0..5] of UInt/Word/Int", the following applies:

The configuration of the "Date/time" area pointer is only used for job mailbox 41.

If job mailbox 40 is used, the data format "DATE_AND_TIME (BCD-encoded)" is used (shown in the next section).

If the "Date/time" and "Date/time PLC" area pointers are linked to a control tag with the data type "DATE_AND_TIME", "DTL" or "LDT", the associated data format is used in the corresponding area pointer.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

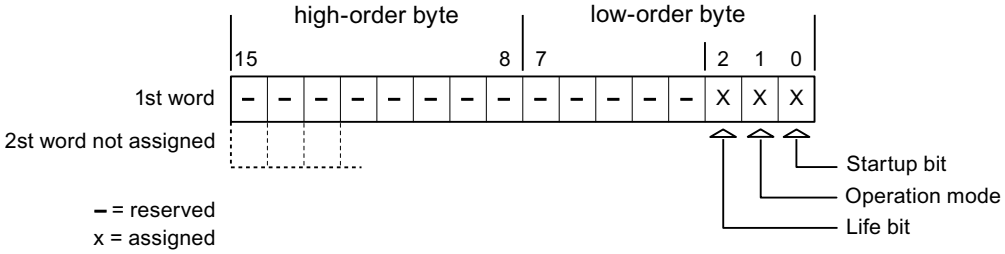
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Usage

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of the bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

"Project ID" area pointer

Function

When Runtime starts it can check to see if the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

Use

To use this area pointer, set up the following during the configuration:

- Define the version of configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections" under "Address".

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

"Job mailbox" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)** [3) 4)]	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	

No.	Function	
14	**Set time (BCD-coded)**	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [2]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1]	Only for devices supporting recipes.
[2]	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
[3]	The weekday is ignored on HMI device KTP 600 BASIC PN.
[4]	The weekday is ignored when you configure the "Date/Time PLC" area pointer.

"Data record" area pointer

"Data record" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization via the data mailbox

Data records are always transferred directly, which means that the tag values are read straight from an address or written straight to an address configured for this tag without being redirected via an interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system alarm.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then, for example, process, edit, or save these values in the HMI device.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data mailbox free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxs No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3237)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

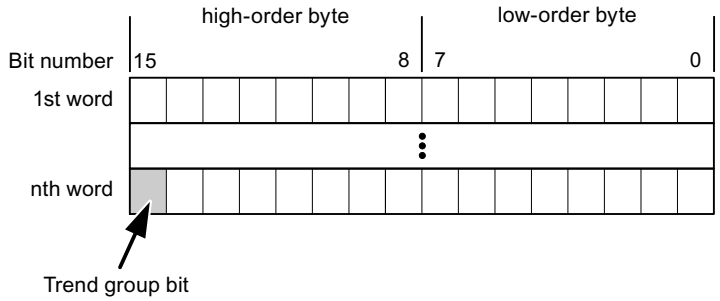
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Configuring Alarms (Page 3261)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

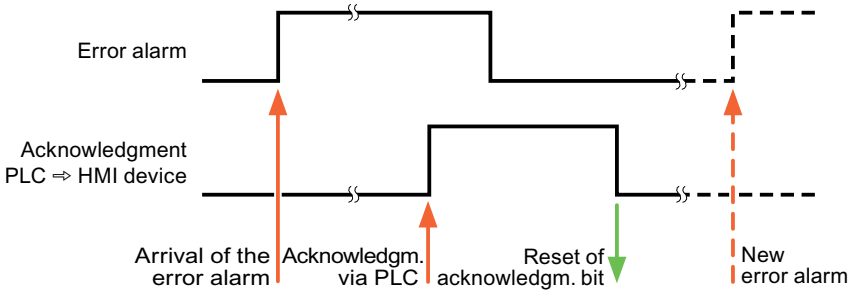
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

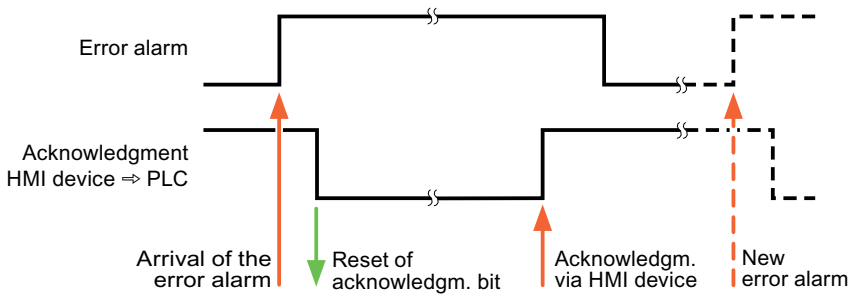
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels	Panel PCs:
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

10.11.6.5 Performance features of communication

S7-1500 device dependency

Device dependency

If you use devices from an earlier version of the TIA Portal with TIA Portal V12 SP1, it may not be possible to configure connections to certain HMI devices.

You can configure the SIMATIC S7-1500 controller with version V1.0 in the following scenarios:

TIA Portal	Basic Panels	Panels	Comfort Panels	RT Advanced
V11	No	No	Yes	No
V12	Yes	Yes	Yes	Yes

Valid data types for SIMATIC S7 1500

Valid data types for connections with SIMATIC S7 1500

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Length
BOOL	1 bit
BYTE	1 byte
WORD	2 bytes
DWORD	4 bytes
CHAR	1 byte
INT	2 bytes
DINT	4 bytes
REAL	4 bytes
TIME	4 bytes
DATE	2 bytes
TIME_OF_DAY	4 bytes
S5TIME	2 bytes
COUNTER	2 bytes
TIMER	2 bytes
DATE_AND_TIME	8 bytes
STRING	(2+n) bytes, n = 0 to 254
DTL	12 bytes
LDT	8 bytes
LINT	8 bytes
LREAL	8 bytes
LTIME	8 bytes

Data type	Length
LTIME_OF_DAY	8 bytes
SINT	1 byte
UDINT	4 bytes
UINT	2 bytes
ULINT	8 bytes
USINT	1 byte

10.11.6.6 Configuring connections in the "Connections" editor

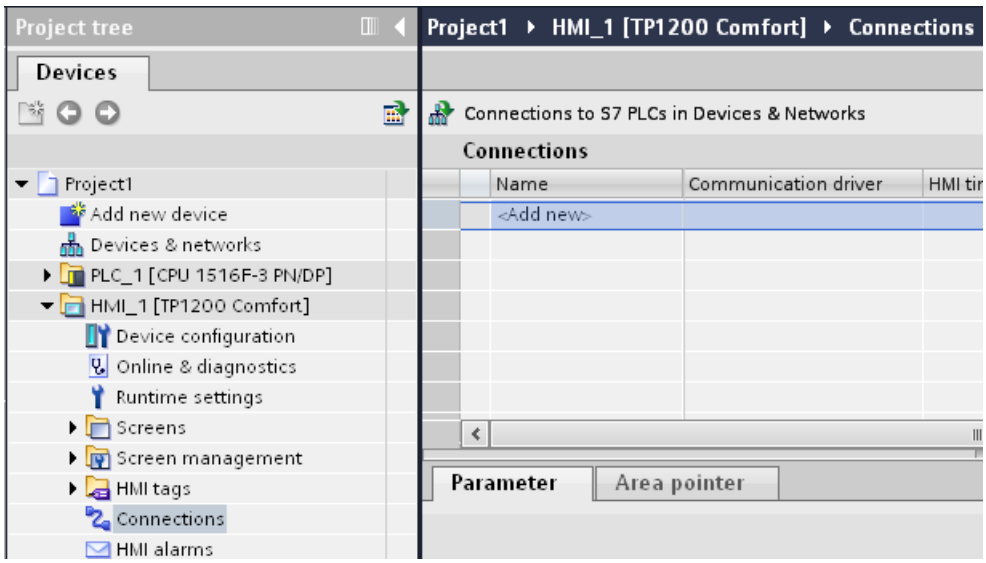
Creating a PROFINET connection

Requirements

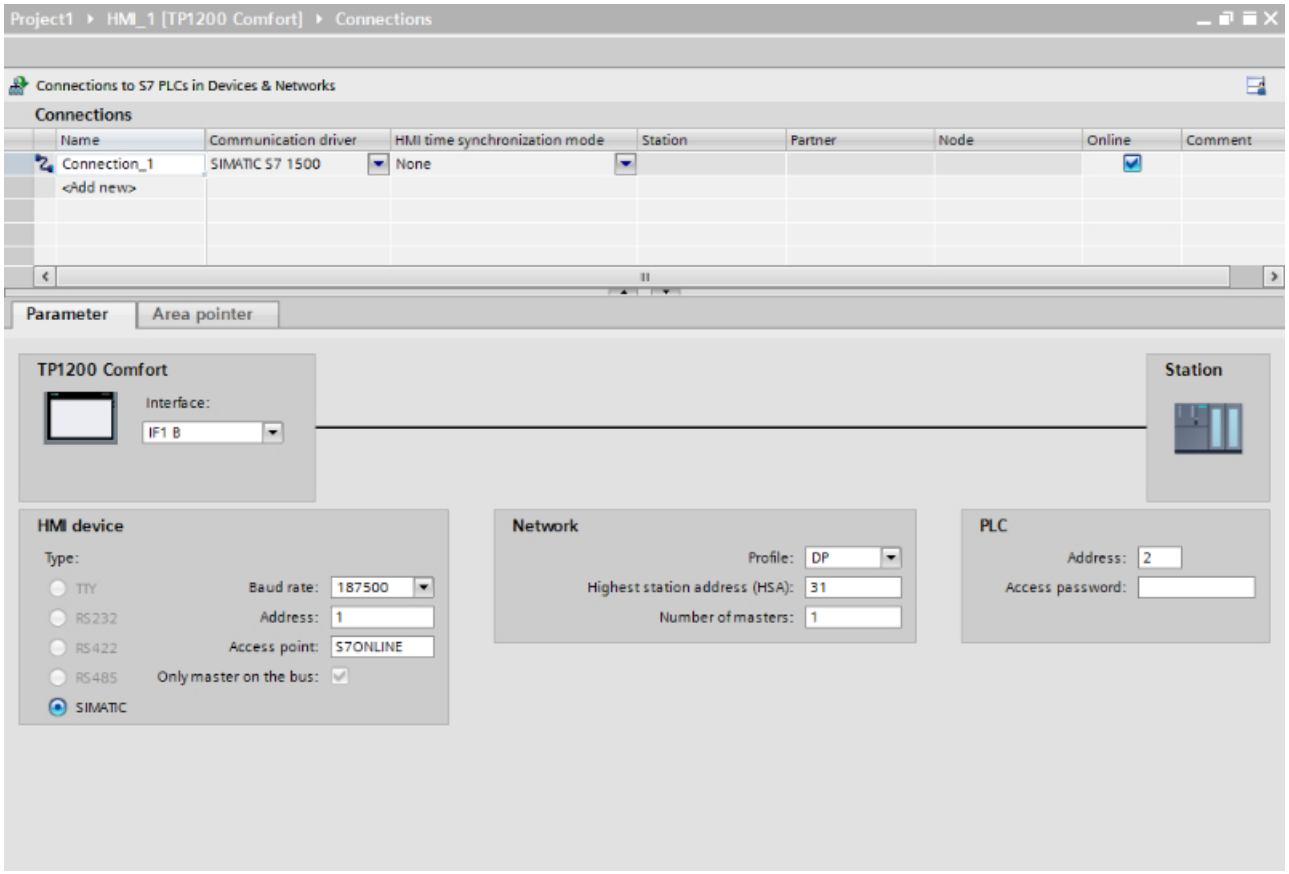
- A project is open.
- An HMI device with a PROFINET interface has been created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.



4. Click the name of the connection.
5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the IP addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

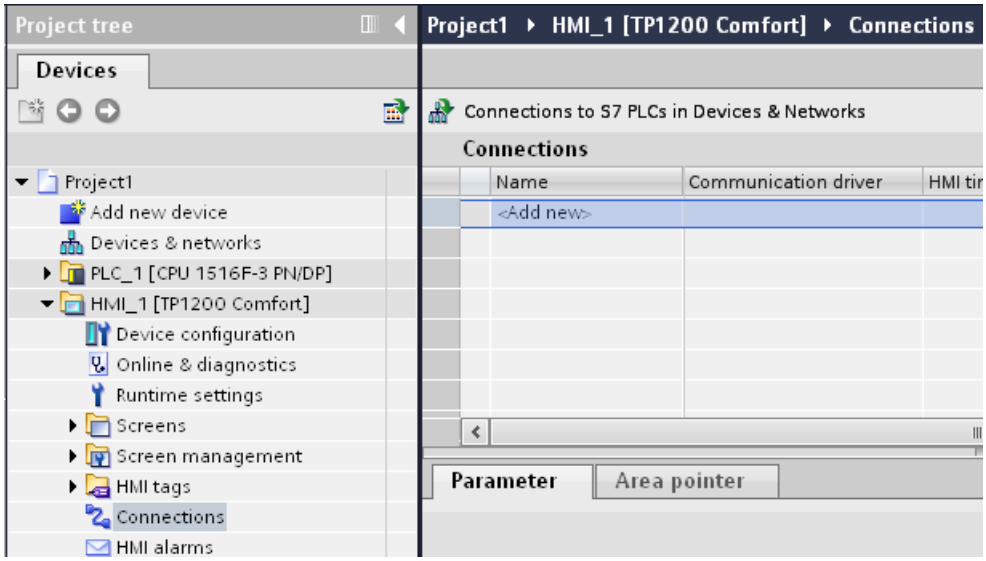
Creating a PROFIBUS connection

Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

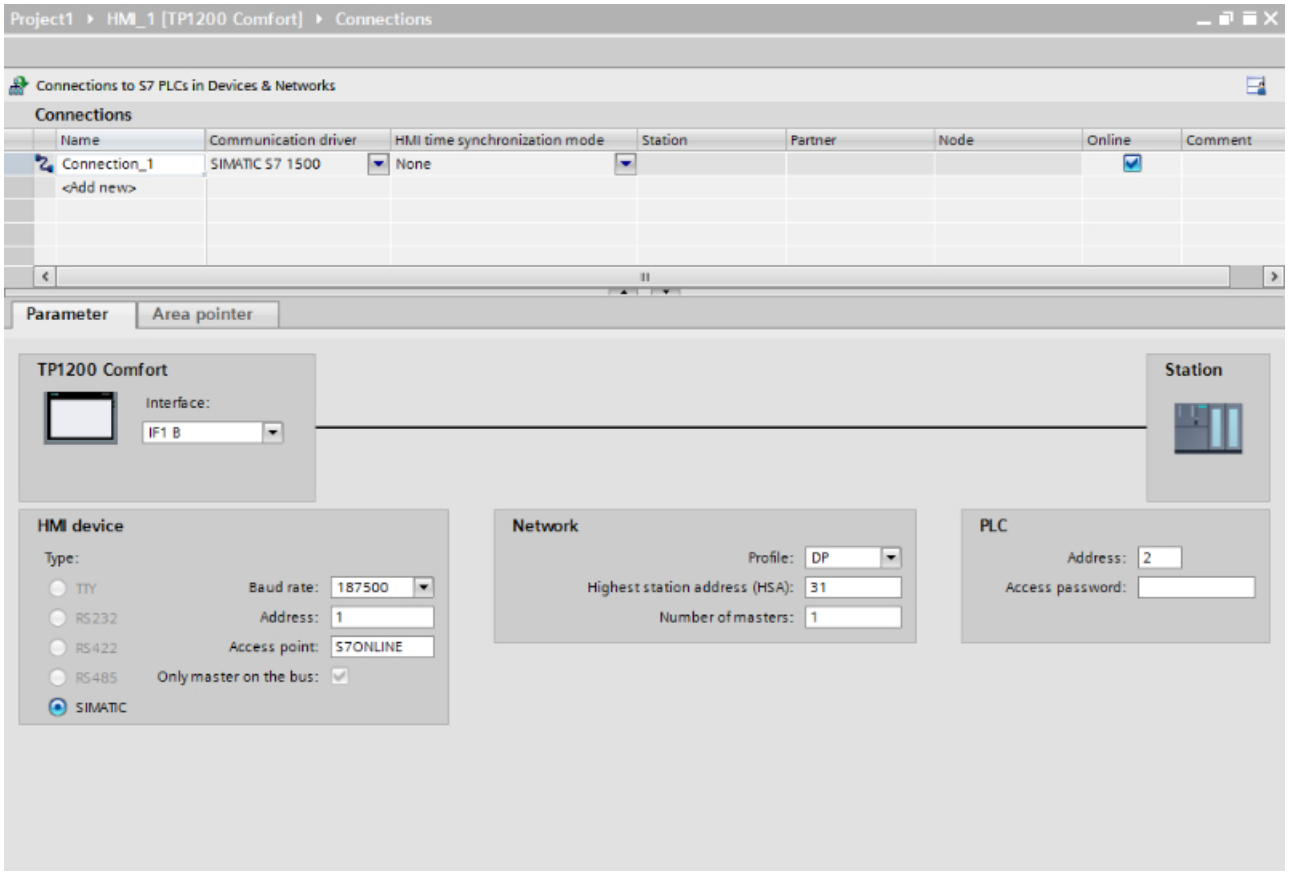
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "IF 1 B" interface from "Parameters > interface" in the Inspector window.

6. Select the "DP" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

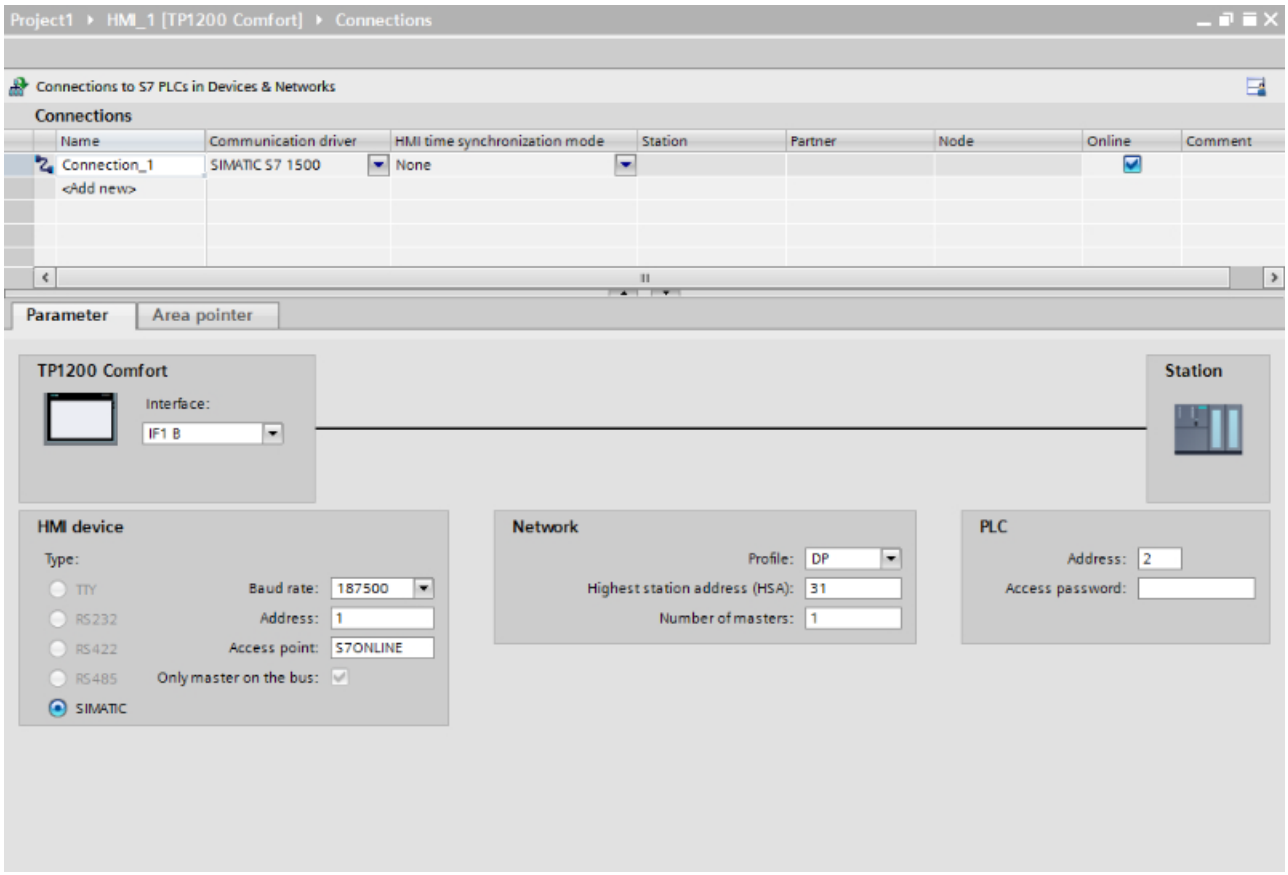
Connection parameters

Connection parameters

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.



PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

Note

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7 200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

Note

The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

The IP address is transferred to the HMI device during project transfer.
To set up the IP address of the HMI device:

– Click the HMI device.
– Open the "Device configuration" editor.
– Click the Ethernet interface.
– Assign the IP address in the inspector window under:

"General > PROFINET interface > Ethernet addresses"

- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

10.11.6.7 Configuring connections in the "Connections" editor

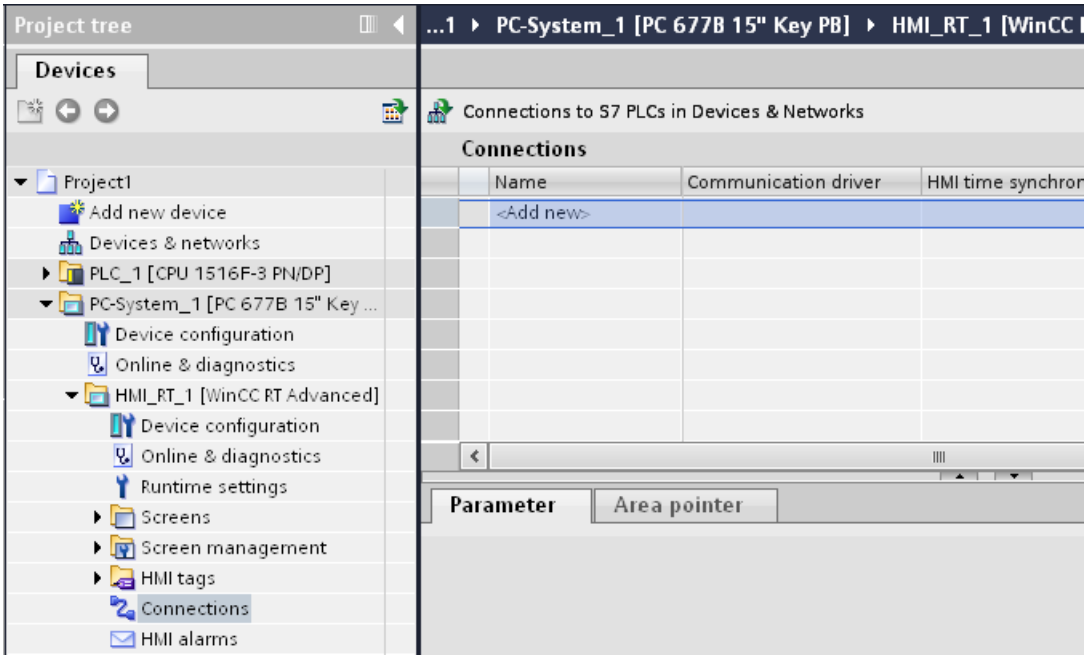
Creating a connection

Requirements

- A project is open.
- WinCC RT Advanced is created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select an interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the parameters for the connection in the Inspector window.

Interfaces

Select one of the following interfaces in the Inspector window under "Parameters > WinCC RT Advanced > Interfaces".:

- Industrial Ethernet
- MPI
- PROFIBUS
- PLC slot
- Soft PLC
- TCP/IP

For additional information on the parameters of the interfaces see:

Connection parameters (Page 5041)

Connection parameters

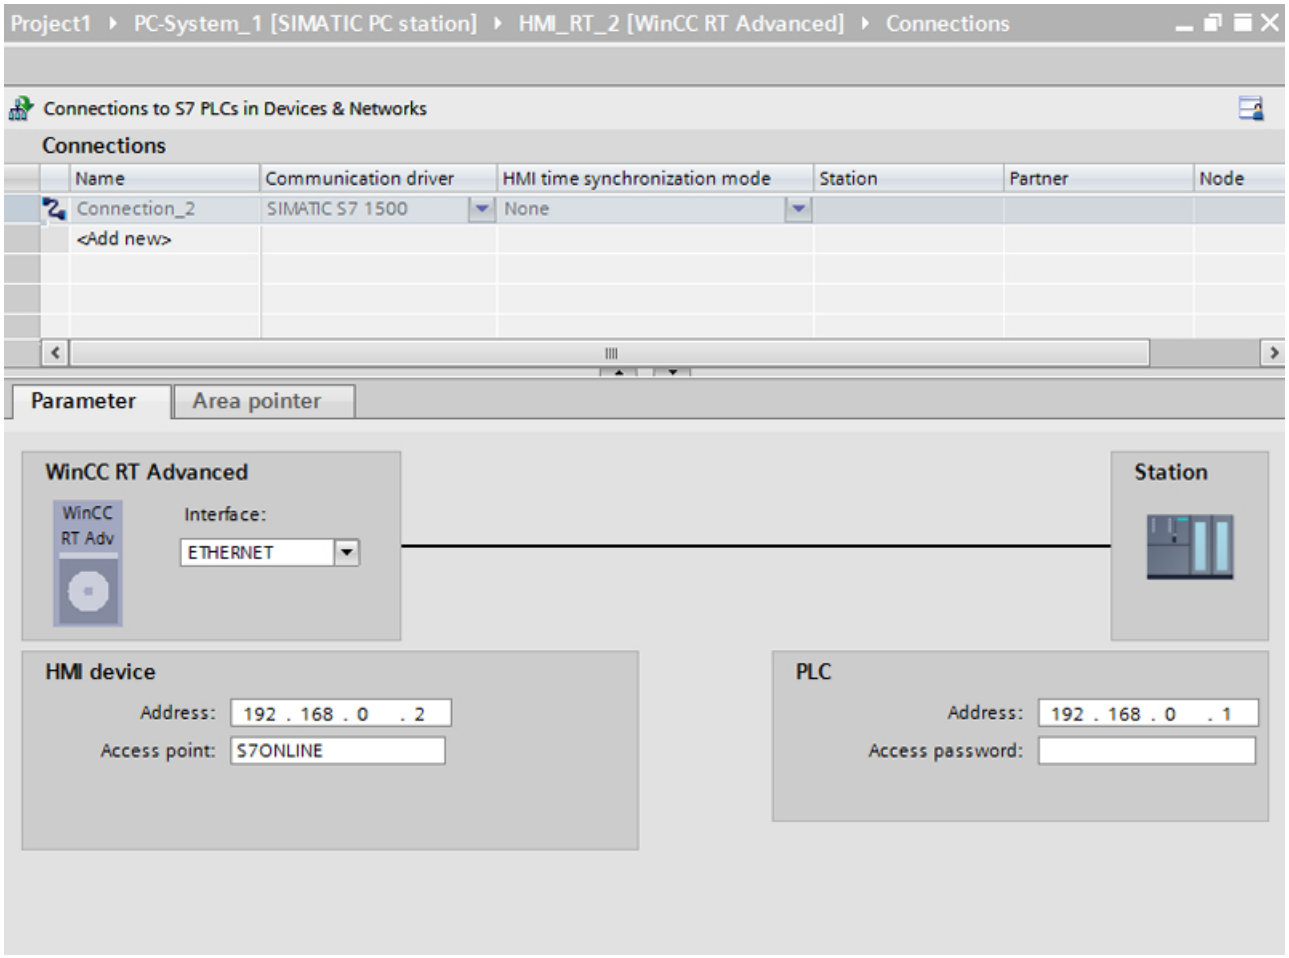
ETHERNET

Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- TCP/IP



HMI device

- "Address"
  Enter the IP address of the HMI device under "Address".
- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Controller

- "Address"
  Enter the IP address of the controller under "Address".
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the controller.

Note

You only need a password if you have set the "Complete protection" protection level at the controller.

No connection to the controller is established if the "Complete protection" protection level is stored on the controller and you do not enter a password.

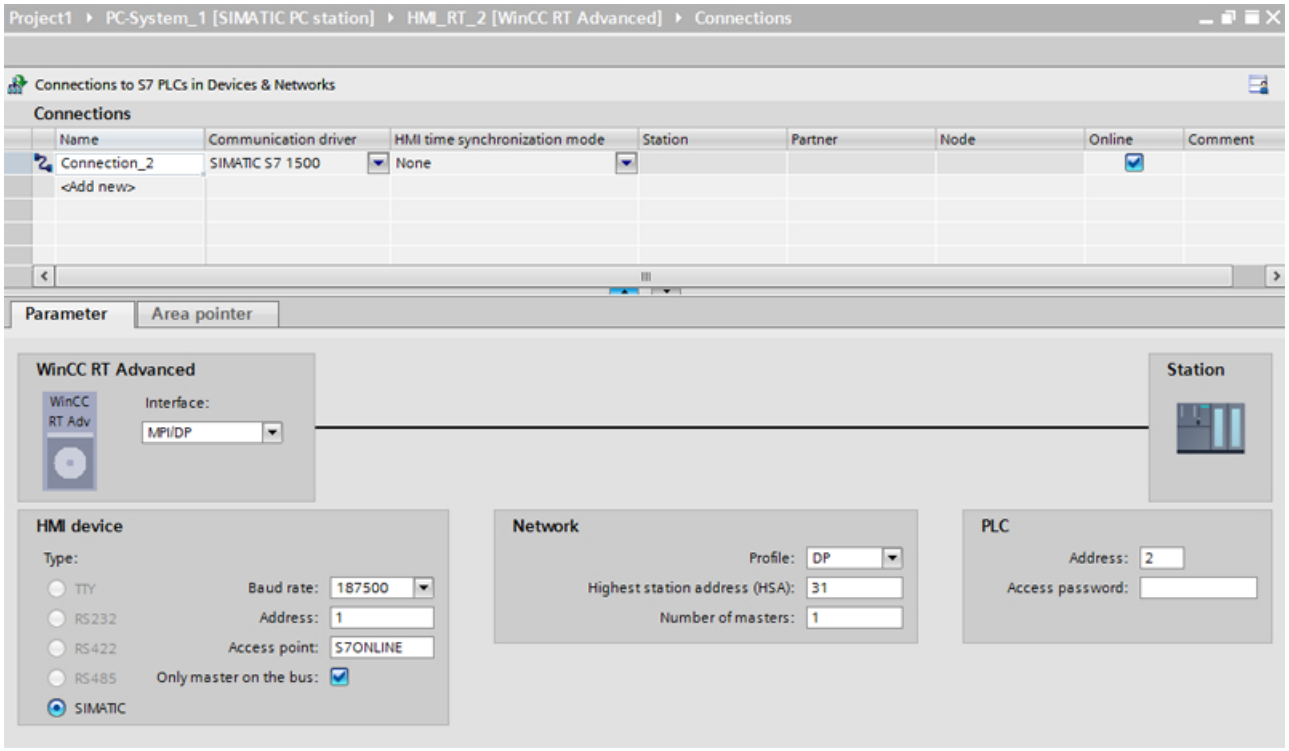
MPI/DP

Introduction

You assign the parameters for the HMI device and the controller in the network under "Parameters".

The parameters described in the following apply to the following interfaces:

- PROFIBUS



HMI device

- "Baud rate"
  Select the baud rate of the HMI device under "Baud rate".
- "Address"
  Enter the address of the HMI device under "Address".
- "Access point"
  Enter the logical device name under "Access point".

Controller

- "Address"
  Enter the address of the controller under "Address".
- "Access password"
  If you have configured the degree of protection "Complete protection" for the controller, enter the password for the controller under "Access password".

10.11.6.8 Configuring time synchronization

Time synchronization

Introduction

To have the same time of day throughout the plant, you can synchronize the time on various plant components using time synchronization. WinCC time synchronization is operated as a master-slave system.

One system component must be a clock for all components of a plant to work with identical time. The component functioning as the clock is referred to as the time master. The components that receive the time are time slaves.

Properties of time synchronization

- The HMI device can define the time as master or can accept the time of the PLC as slave.
- In "master mode", the time is synchronized at each connection setup.
- In "slave mode", the time is synchronized at each connection setup and than at cyclic intervals of 10 minutes.
- The first time synchronization is performed on the HMI device immediately after the start of runtime.
- Time synchronization is only performed on the HMI device during operation of runtime.

Time synchronization restrictions

Approved HMI devices

You can configure the time synchronization between a SIMATIC S7 1200 or SIMATIC S7 1500 and an HMI device with the following HMI devices:

Device	Operating system
Basic Panels	-
TP177 4"	Windows CE 5.0
Multi Panel 177	Windows CE 5.0
Multi Panel 277	Windows CE 5.0
Multi Panel 377	Windows CE 5.0
Mobile Panel 277	Windows CE 5.0
Mobile 277 IWLAN V2	Windows CE 5.0
Comfort Panels	Windows CE 6.0
PC systems with WinCC RT Advanced	Microsoft Windows XP Microsoft Windows 7

Configuration restrictions

- If an HMI device has several connections to SIMATIC S7 1200 or SIMATIC S7 1500, you can only configure one connection as "slave".
- If you have enabled time synchronization for the HMI device as "slave", you can no longer use the global area pointer "Date/time PLC".
- An HMI device can only request the time from a PLC with "Complete protection" security type configuration if the correct "Access password" is configured.
  Configure the "Access password" for communication with a PLC with "Complete protection" security type in the "Connections" editor of the HMI device.
  This "Access password" must match the password configured on the PLC. The PLC password is assigned in the PLC properties at: "General > Security"
- Basic Panels can only be configured as "Slave".
- If you use Basic Panels for the configuration, it is not possible to use time synchronization via NTP and the "Date/time PLC" area pointer simultaneously.

Configuring time synchronization for integrated connections

Introduction

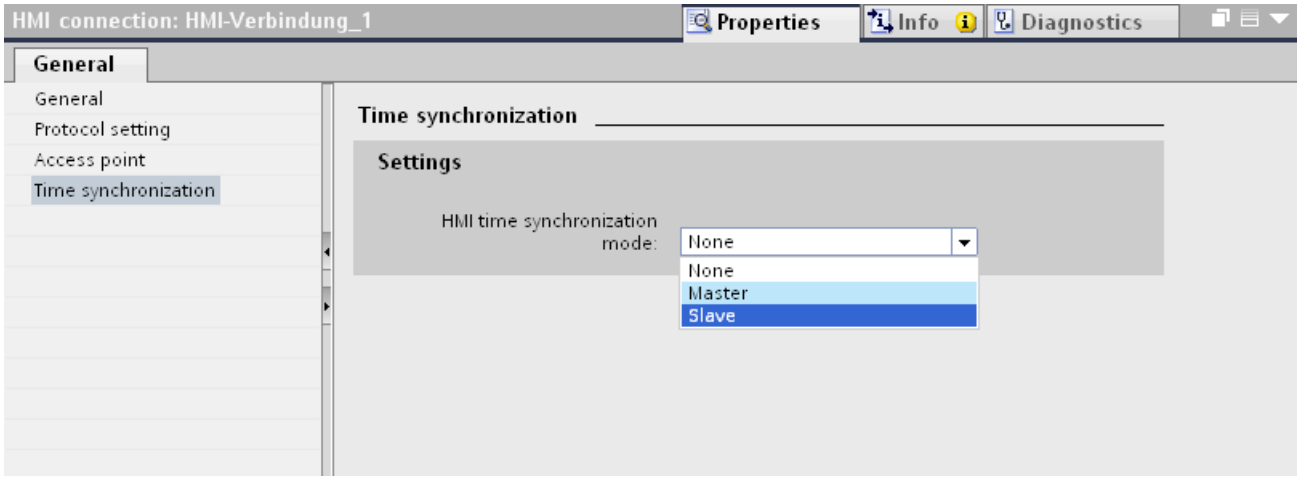
You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 or SIMATIC S7 1500 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



Configuring time synchronization for non-integrated connections

Introduction

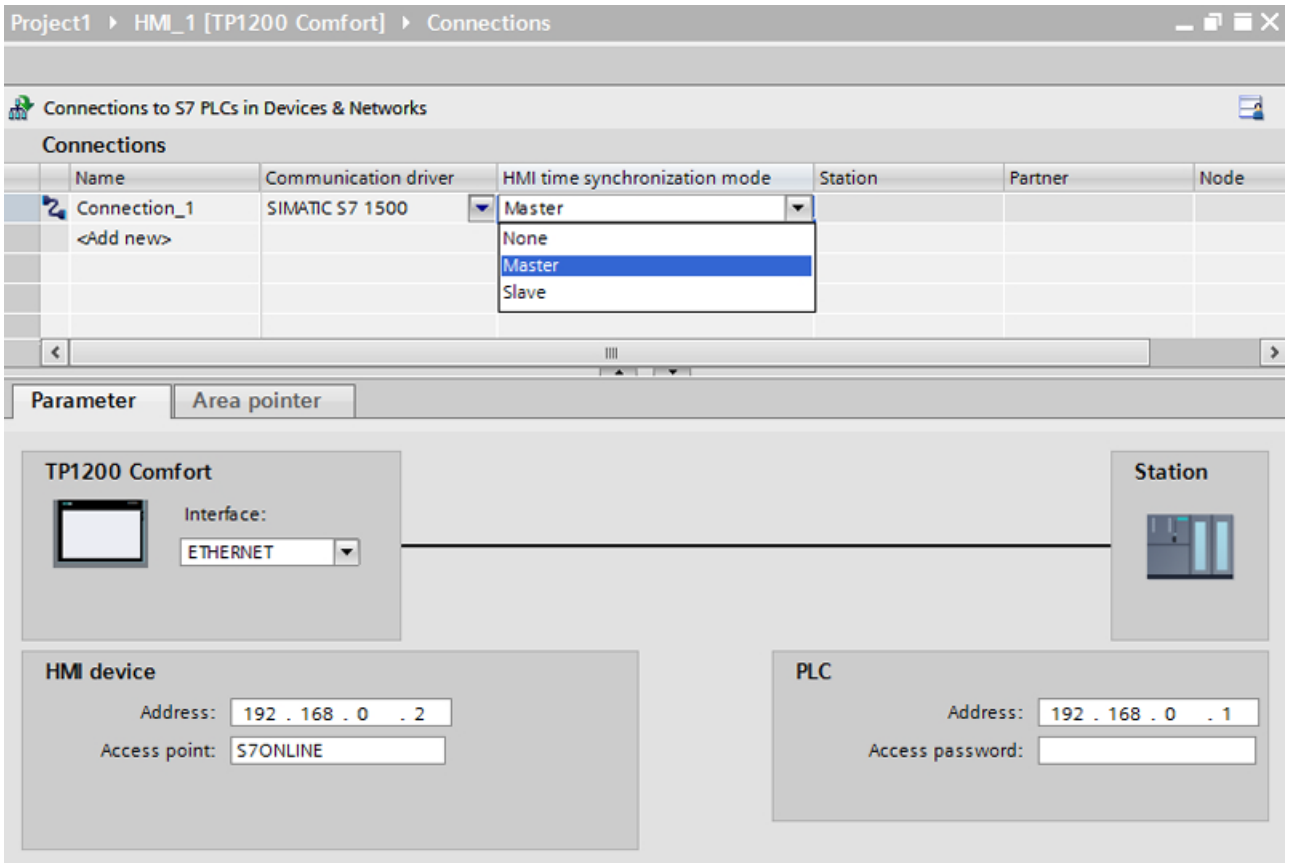
You configure time synchronization for a non-integrated connection in the "Connections" editor.

Requirements

- An HMI device which supports the "time synchronization" function has been created.
- "Connections" editor is open.

Procedure

1. Double-click "<Add>".
2. In the "Communication drivers" column, select the "SIMATIC S7 1200" PLC.
3. Select the following in the "HMI time synchronization mode" column:
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



10.11.7 Communicating with SIMATIC S7 1200

10.11.7.1 Communication with SIMATIC S7 1200

Introduction

This section describes the communication between an HMI device and the SIMATIC S7 1200 PLC.

You can configure the following communication channels for the SIMATIC S7 1200 PLC:

- PROFINET
- PROFIBUS

HMI connection for communication

You configure connections between the HMI device and a SIMATIC S7 1200 in the "Devices & Networks" editor. If you have configured a HMI device with a serial port, you must configure a PROFIBUS-capable communication module to the SIMATIC S7 1200.

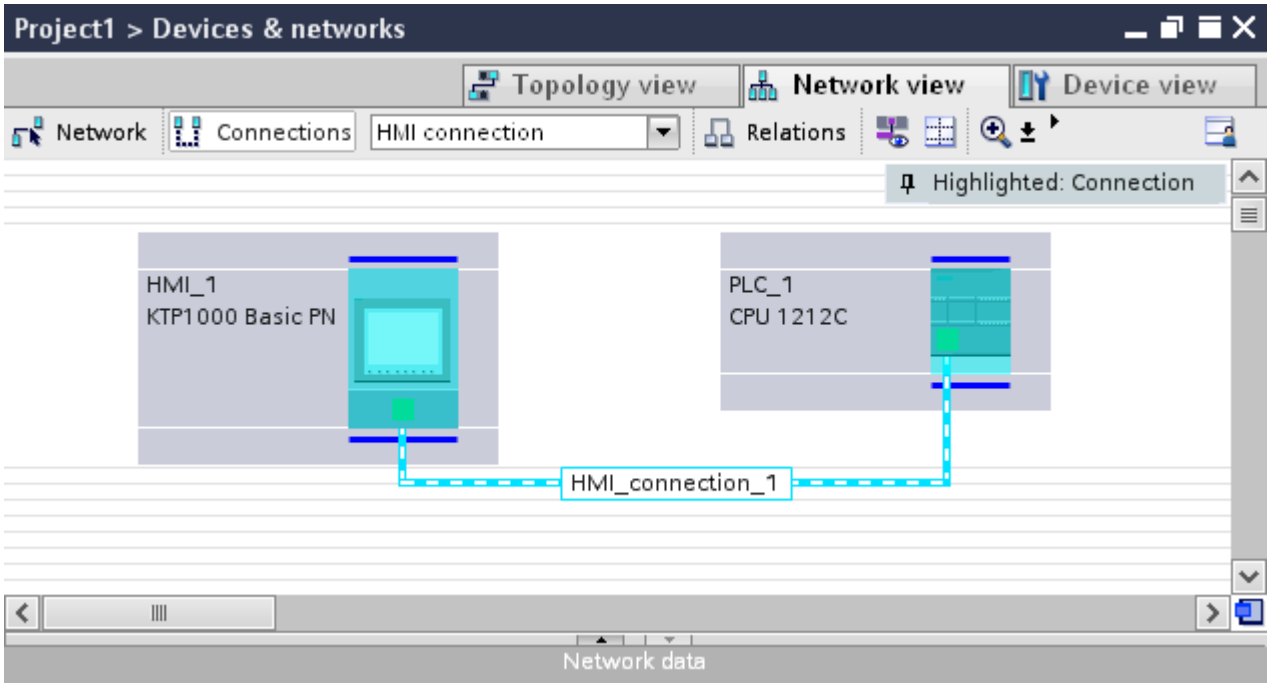
10.11.7.2 Communication via PROFINET

Configuring an HMI connection

Communication via PROFINET

HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 1200 into the project, you interconnect the two PROFINET interfaces in the "Devices & Networks" editor.



You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

⚠ CAUTION
Communication via Ethernet In Ethernet-based communication, the end user is responsible for the security of his data network. Targeted attacks can overload the device and interfere with proper functioning.

Requirements

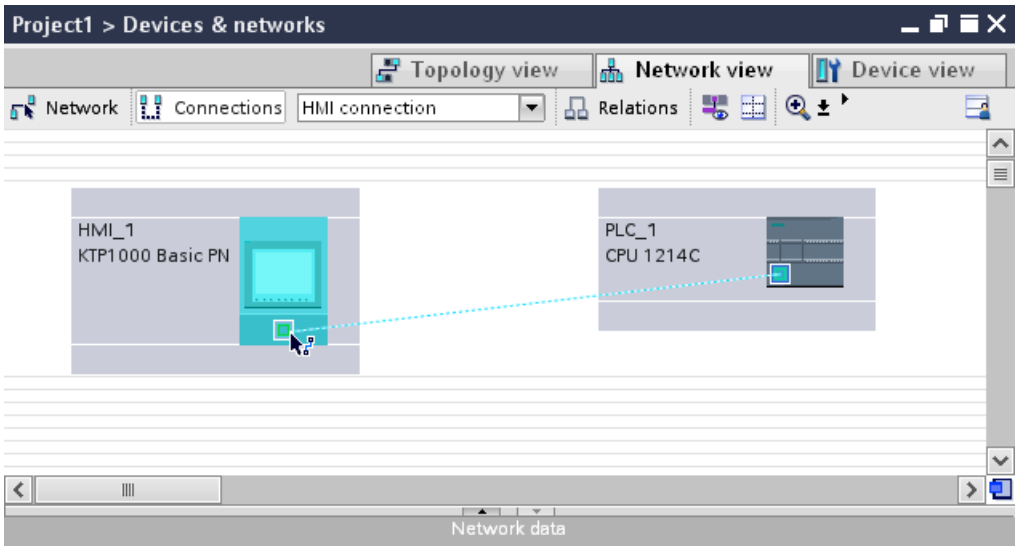
The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- HMI device with PROFINET or Ethernet interface

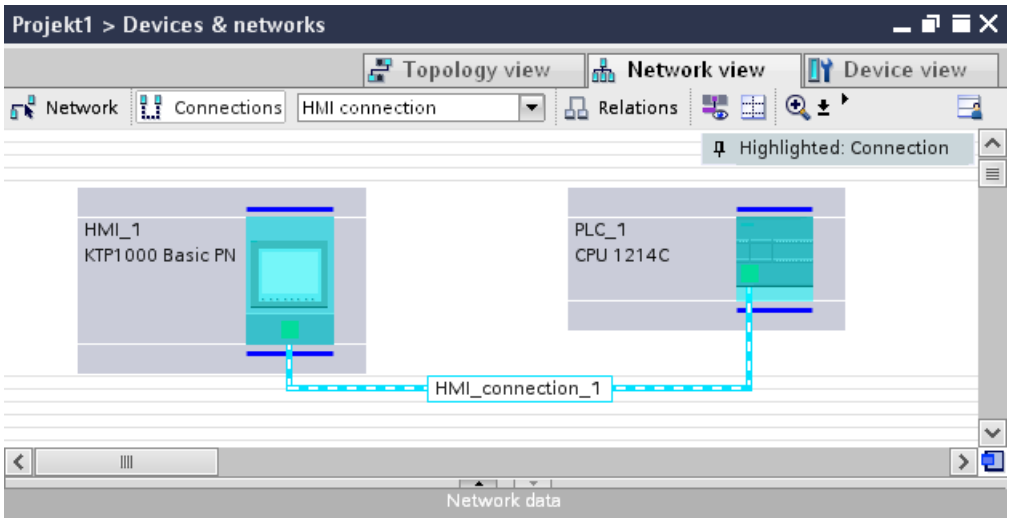
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

3. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.



4. Click the connecting line.
5. Click "Highlight HMI connection" and select the HMI connection.



The connection is displayed graphically in the Inspector window.

6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project. See the chapter "PROFINET parameters (Page 5057)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection

Communication via PROFINET

Communication via PROFINET

This section describes the communication between a WinCC Runtime and the SIMATIC S7 1200 PLC via PROFINET.

You can use the following WinCC Runtimes as an HMI device:

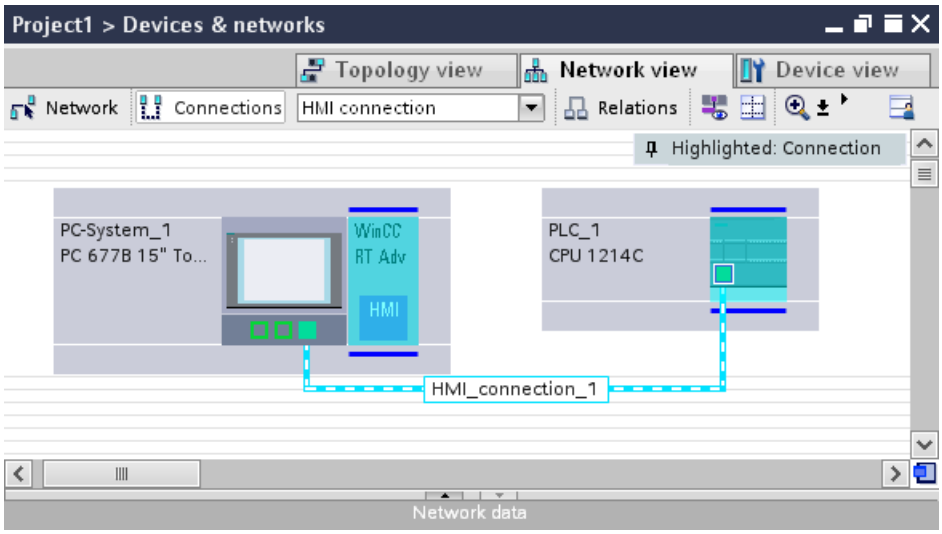
- WinCC RT Advanced

WinCC Runtime as HMI device

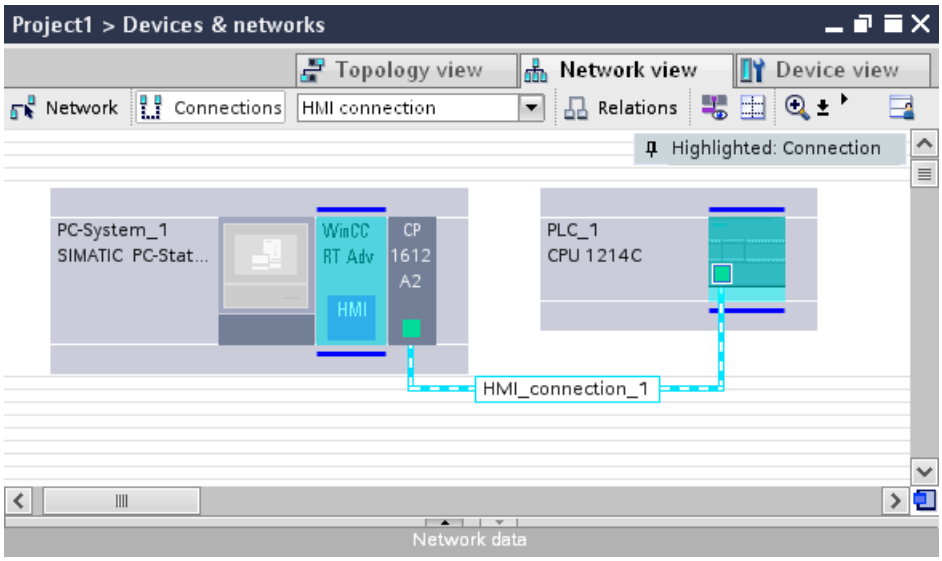
You configure the HMI connections between WinCC Runtime and SIMATIC S7 1200 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

CAUTION
Communication via Ethernet In Ethernet-based communication, the end user is responsible for the security of his data network. Targeted attacks can overload the device and interfere with proper functioning.

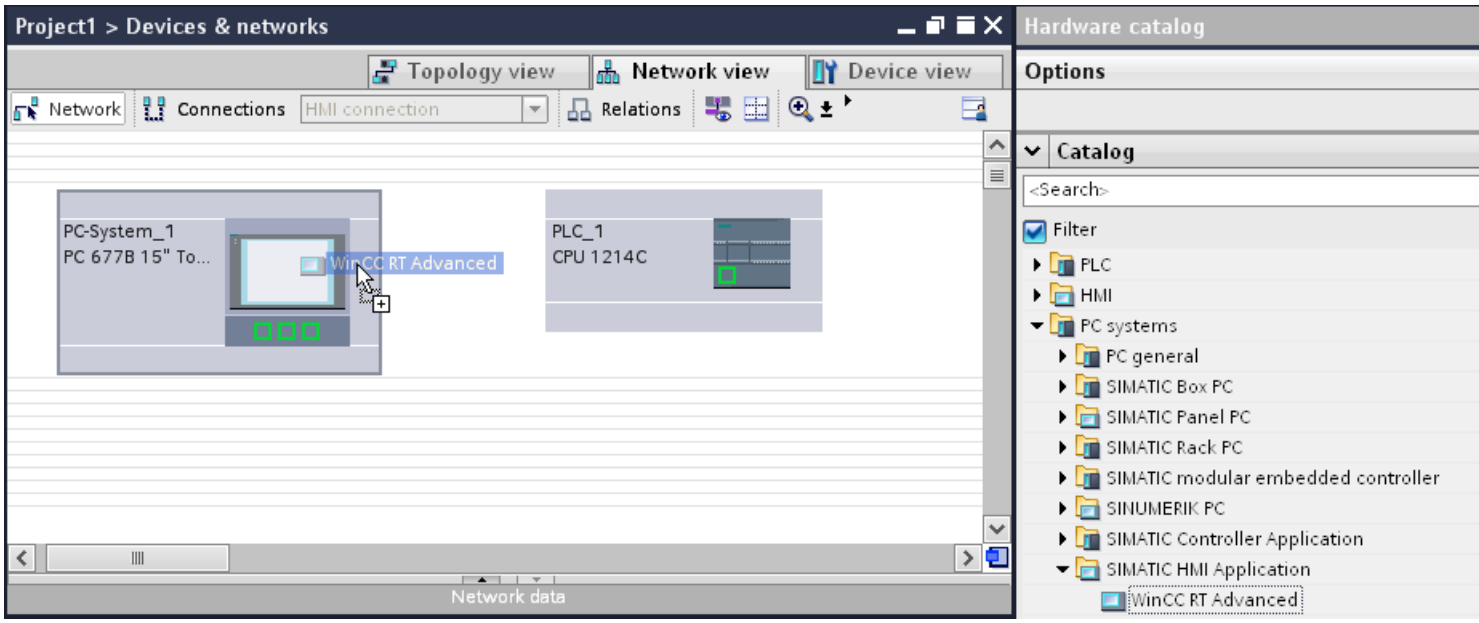
Requirements

The following communication partners are created in the "Devices & Networks" editor:

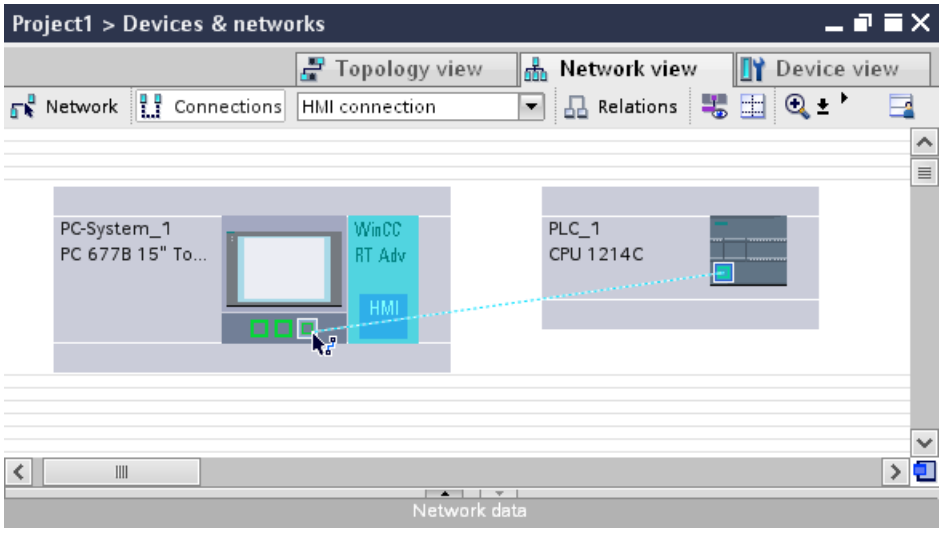
- SIMATIC S7 1200
- SIMATIC PC with PROFINET interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the PC.



5. Click the connecting line.

6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 5057)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection via PROFINET with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFINET or Ethernet in the "Devices & Networks" editor.

CAUTION

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

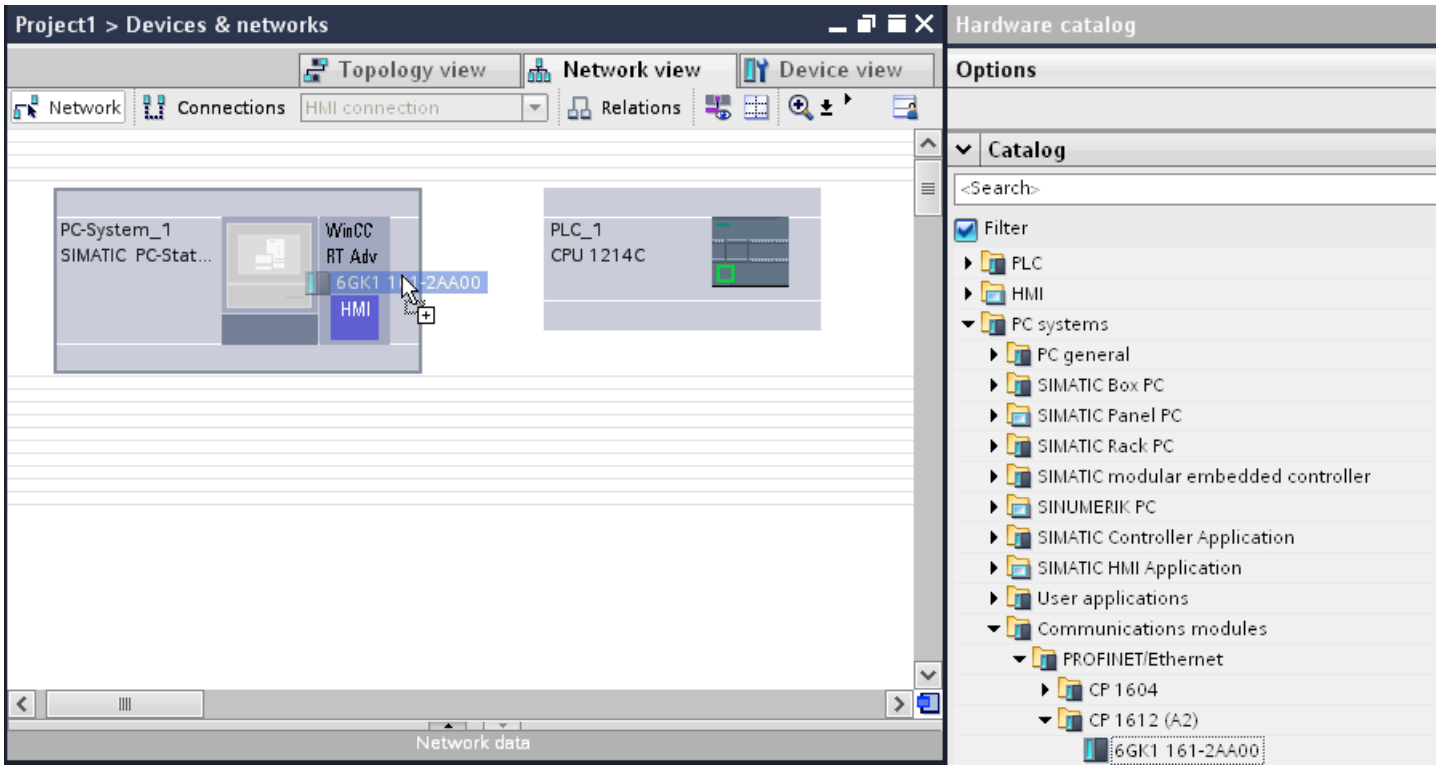
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- PC station with WinCC RT Advanced

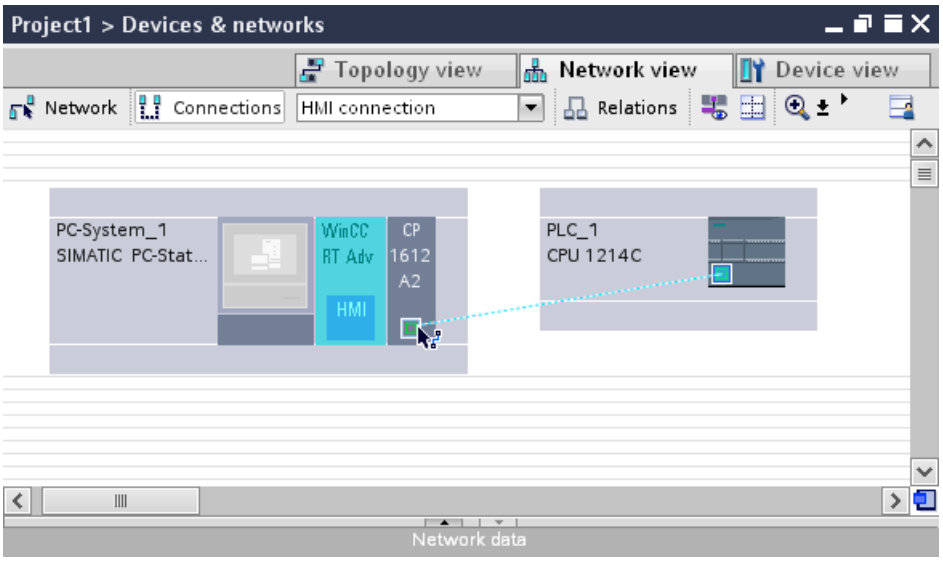
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 5057)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 1200. The IP address and subnet mask connection parameters are configured.

PROFINET parameters

PROFINET parameters for the HMI connection

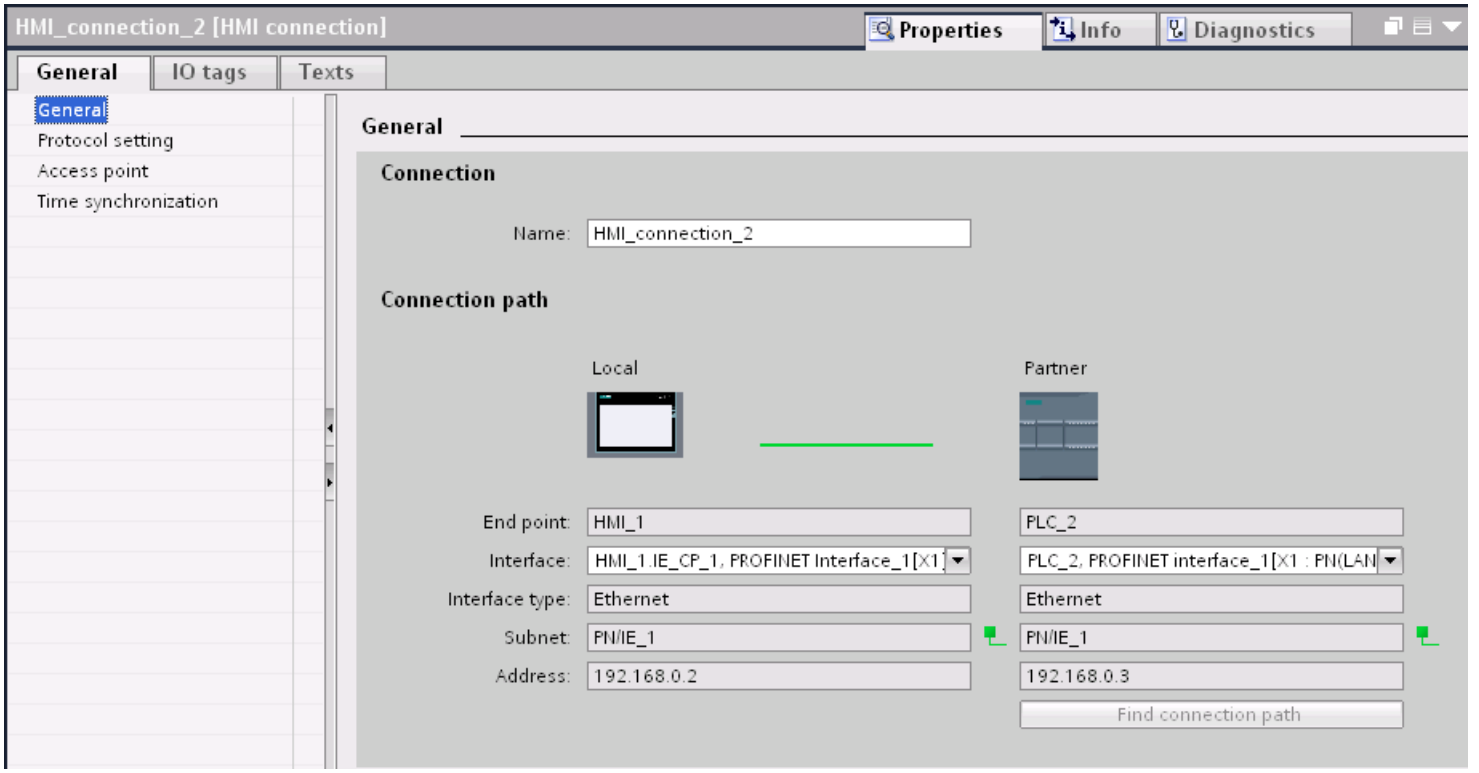
PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and editing HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



Connection

The "Connection" area displays the HMI connection created for communication between the devices.

You can edit the name of the HMI connection in this area.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.

- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

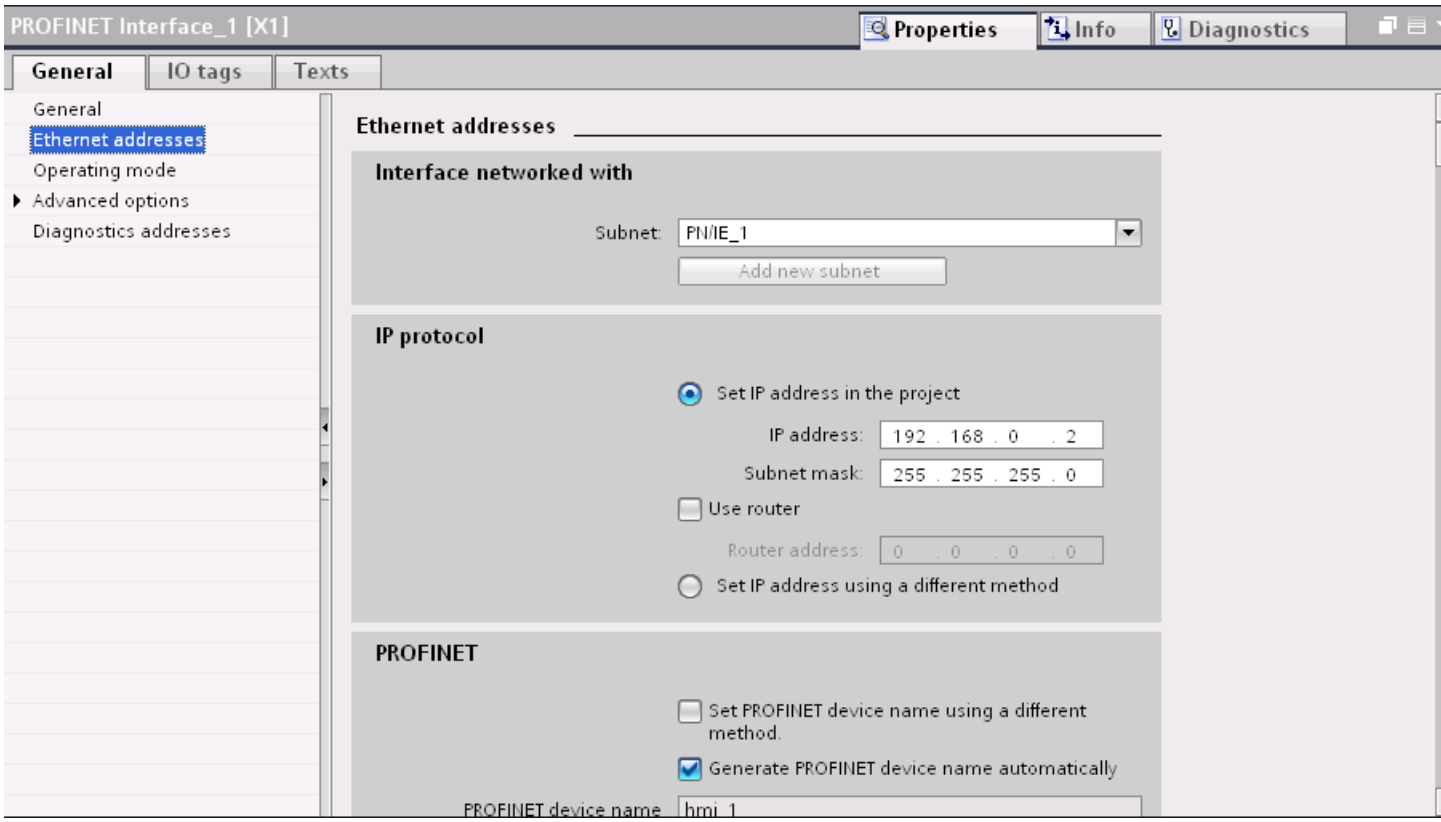
PROFINET parameters for the HMI device

PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Set IP address in the project"
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

  Note

  The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

  HMI devices with Windows CE 3.0:
  - OP 77B
  - TP 177B color PN/DP
  - TP 177B mono DP
  - OP 177B color PN/DP
  - OP 177B mono DP
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP
  - TP 277 6"
  - OP 277 6"

- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
- "Use IP router"
  If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
- "Set IP address using a different method"
  If the function "Set IP address using a different method" is activated, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

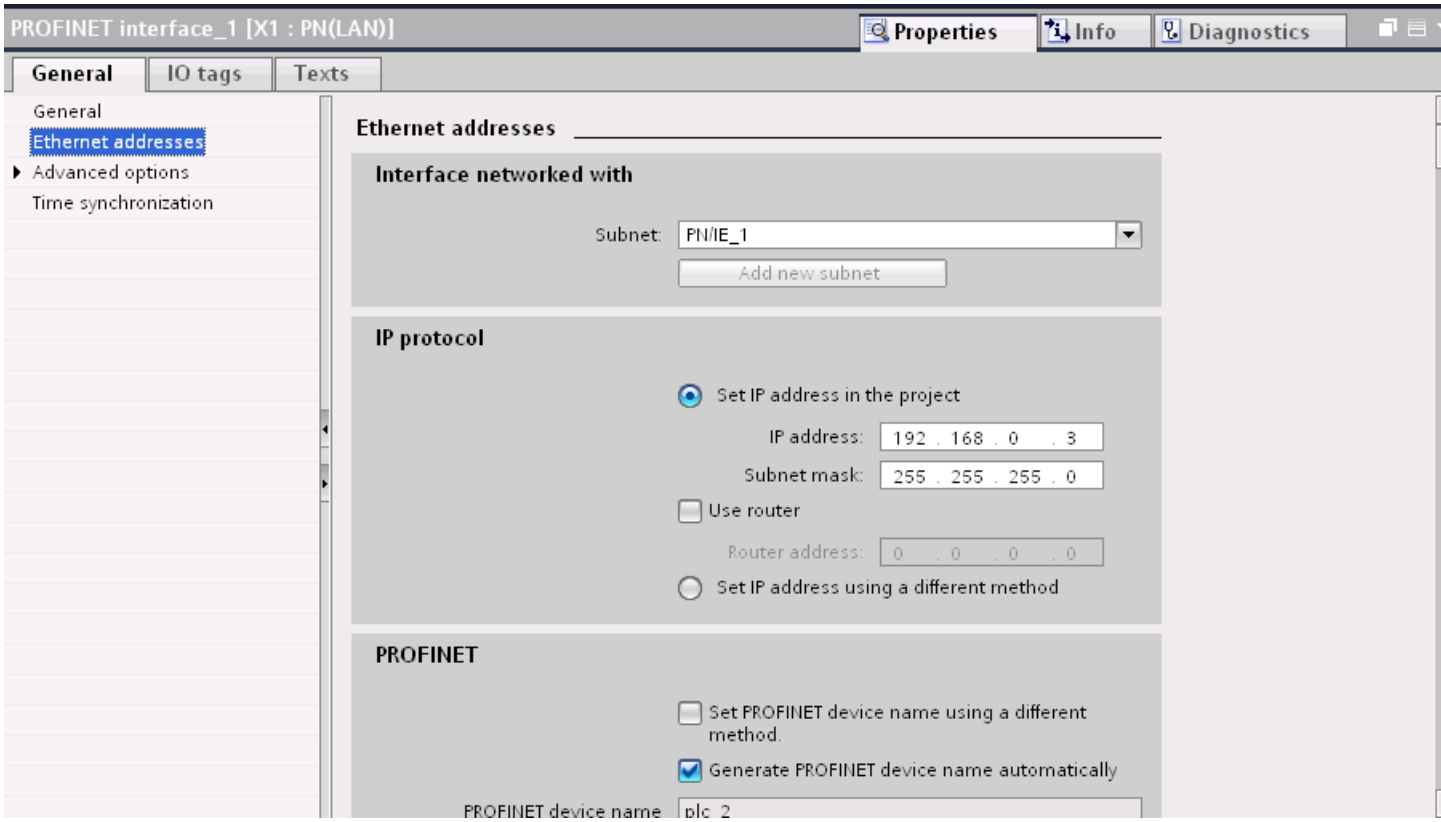
PROFINET parameters for the PLC

PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"
  You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
  If you are using an IP router, select "Use IP router" and enter the router address in the field.

Configuring Industrial Ethernet

Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

IP address

The IP parameters are visible if the communication-capable devices support the TCP/IP protocol.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of the following:

- The address of the (sub) net
- The address of the node (generally also called host or network node)

Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the node.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the node, thus 0.2.

It is generally true that:

- The network address results from AND linking the IP address and subnet mask.
- The node address results from AND NOT linking the IP address and subnet mask.

Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx....	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

Note

Range of values for the first decimal point

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D etc). This is, however, not recommended because there is no address check for these values.

Masking other subnets

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of nodes they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (e.g. IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All nodes with addresses between 129.80.001.xxx and 129.80.127.xxx are on one subnet, all nodes with addresses between 129.80.128.xxx and 129.80.255.xxx are on another subnet.

Router

The job of the routers is to connect the subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, in this case you have to enter the address of the router for each node in the subnet.

The IP address of a node in the subnet and the address of the router may only differ at the points at which there is a "0" in the subnet mask.

Configuring time synchronization for integrated connections

Introduction

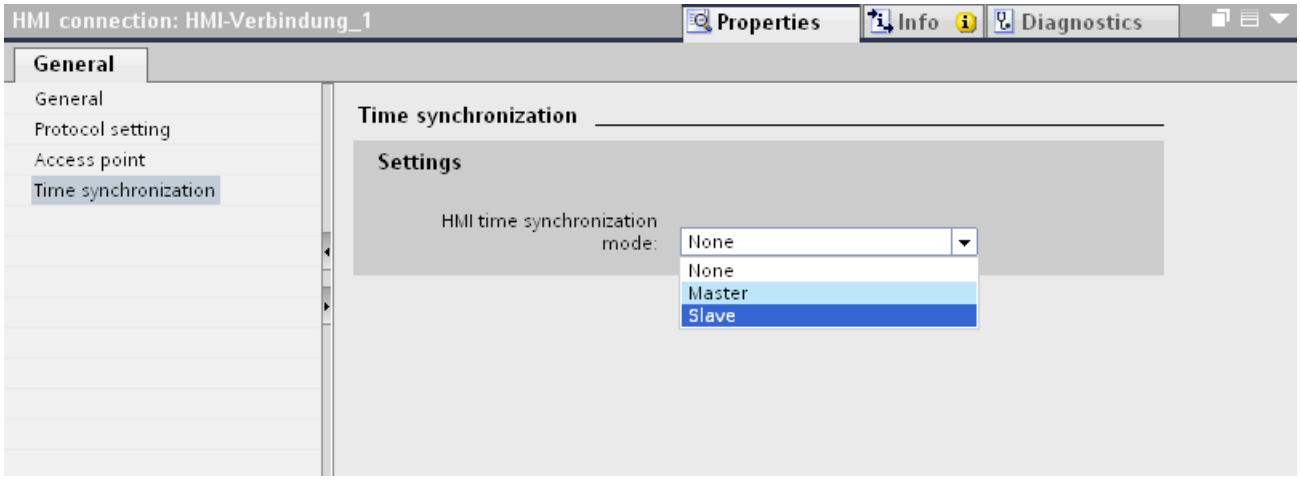
You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



Protection of communication

Security levels

You can assign communication security levels to protect PLC and HMI device communication.

For an S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that each password is assigned to exactly one protection level.

The effect of the password is given in the "Protection" column.

Example

Select the "Complete protection" security level for a standard CPU (in other words, not an F-CPU) and enter a separate password for each security level in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read/write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Access password for the HMI connection

Introduction

Secure access to a PLC by assigning a password.

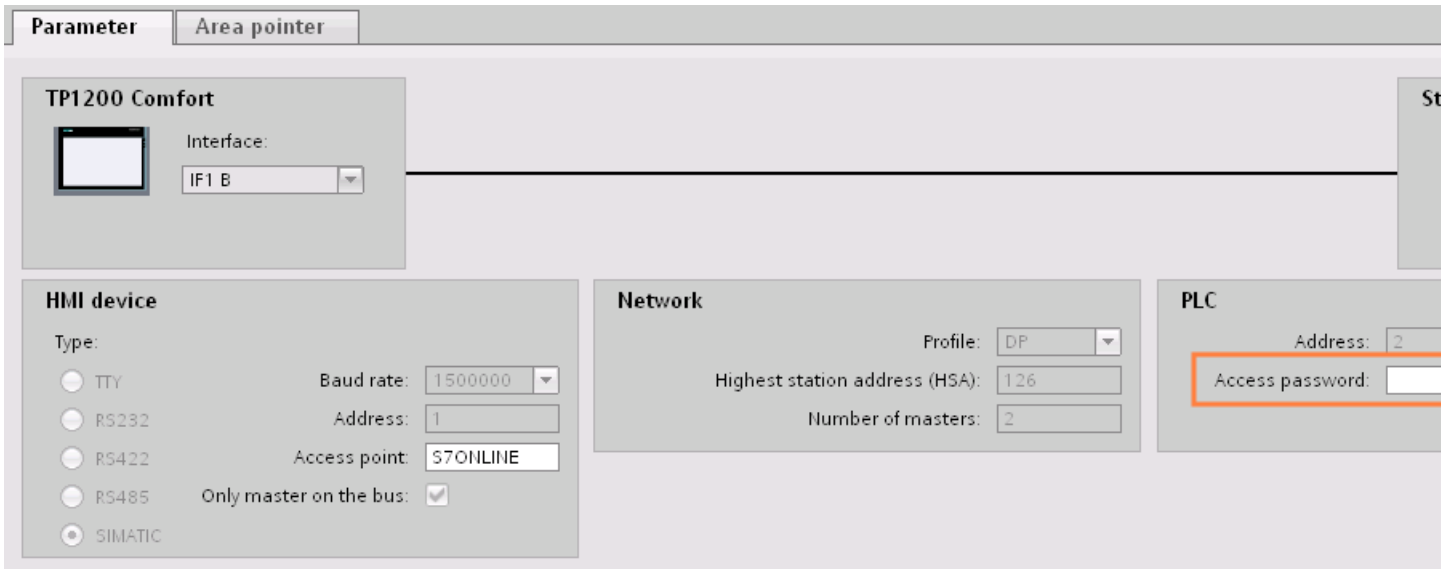
Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

Assigning password

Enter the access password for the HMI connection in the "Connections" editor.



Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- Automatic setting
  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- TP/ITP at x Mbps full duplex (half duplex)
  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled
    You can use both cross cable and patch cable.
  - Autonegotiation disabled
    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated
  Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

Wiring rules for disabled autonegotiation

Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

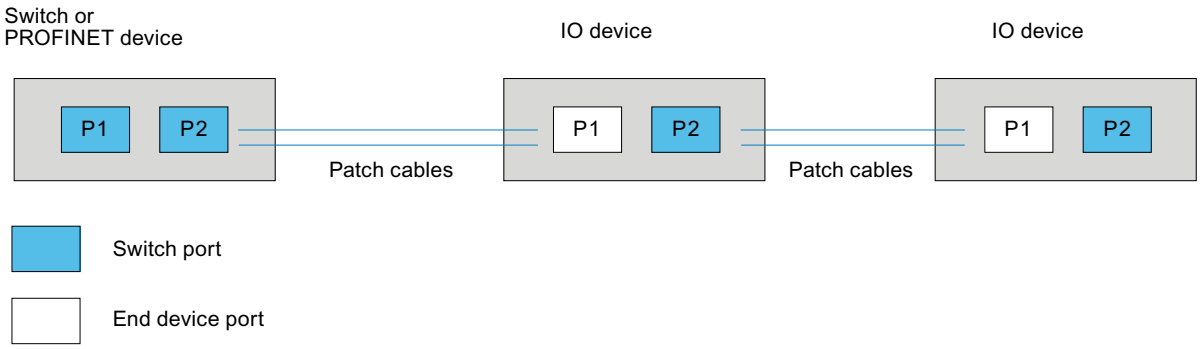
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"
  No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"
  LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"
  No forwarding of sync frames transmitted to synchronize nodes within a sync domain.
  If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).
  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

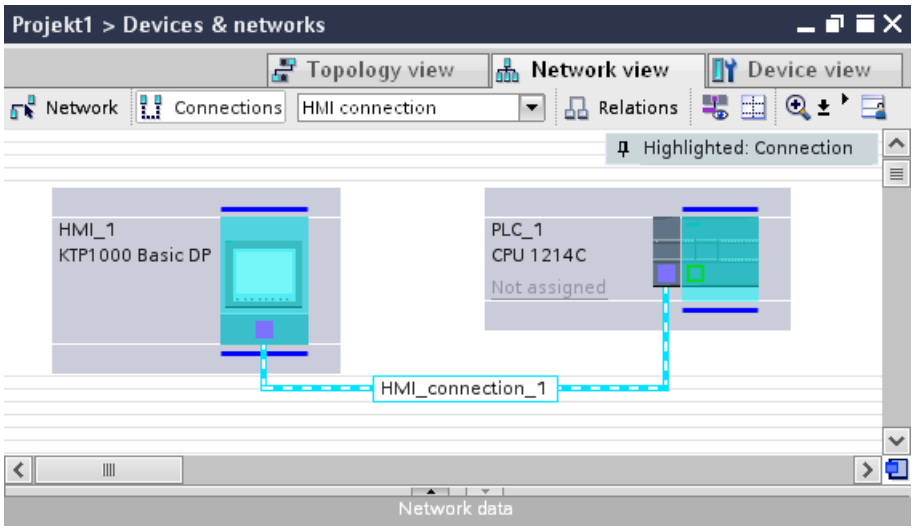
10.11.7.3 Communication via PROFIBUS

Configuring an HMI connection

Communication via PROFIBUS

HMI connections via PROFIBUS

If you want to connect a SIMATIC S7 1200 to a HMI device via PROFIBUS, you must configure a PROFIBUS-capable communication module to a slot of the controller first.



HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFIBUS in the "Devices & Networks" editor.

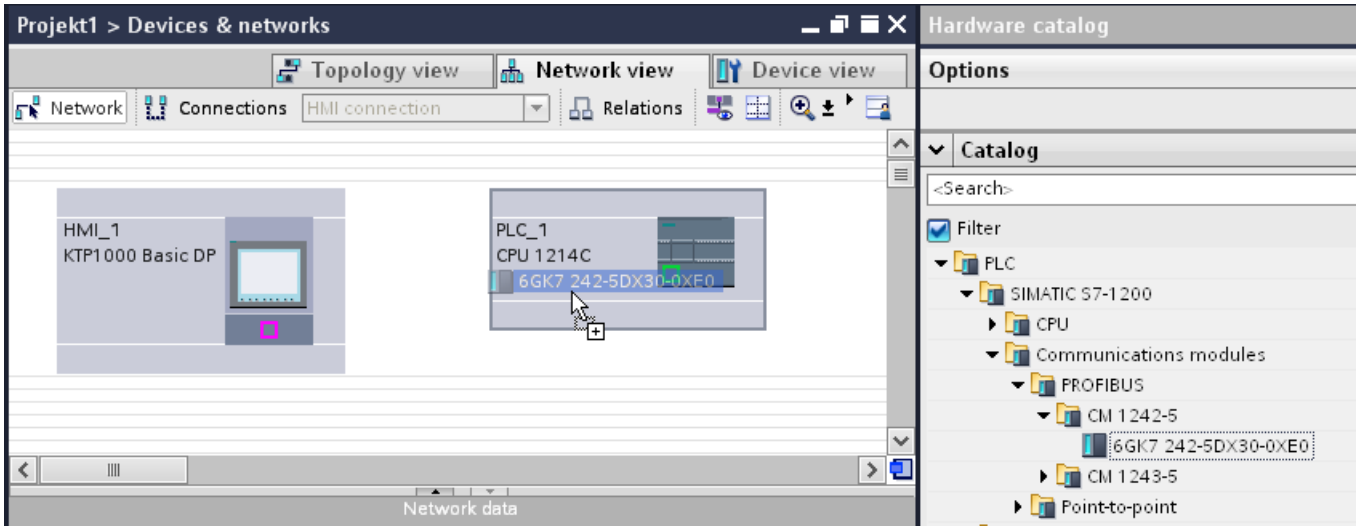
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7 1200

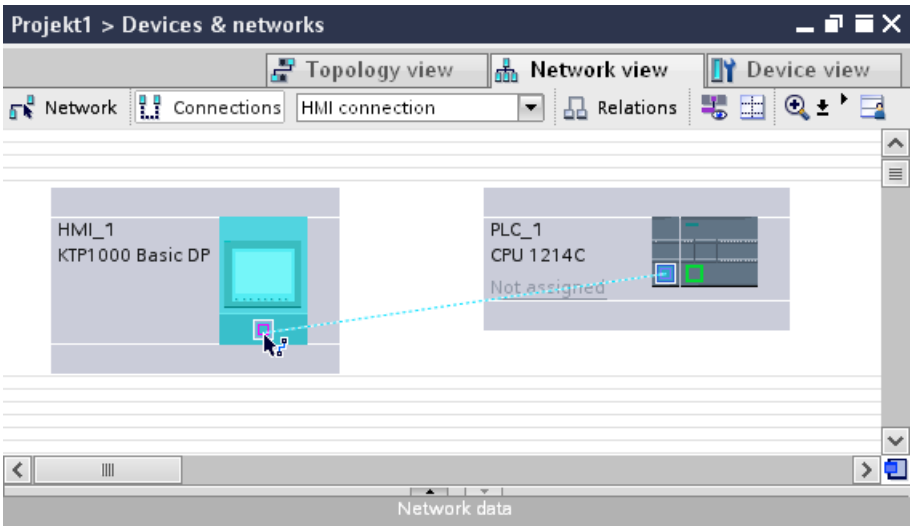
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button.
   The devices available for connection are highlighted in color.
3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.



4. Click the HMI device interface.
5. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > PROFIBUS address/ MPI address > Parameters".

6. Click the interface of the communication module and use a drag-and-drop operation to draw a connection to the HMI device.



7. Click the name of the connection.
   The connection is displayed graphically in the Inspector window.
8. Click "Highlight HMI connection" and select the HMI connection.
9. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 5077)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 1200 via PROFIBUS.

Configuring an HMI connection

Communication via PROFIBUS

Communication via PROFIBUS

This section describes the communication between a WinCC Runtime and the SIMATIC S7 1200 PLC via PROFIBUS.

You can use the following WinCC Runtimes as an HMI device:

- WinCC RT Advanced

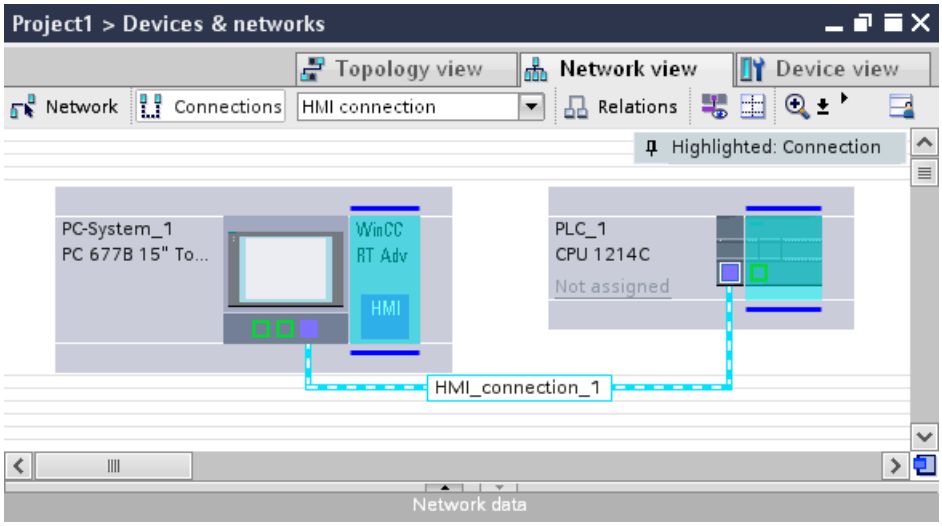
If you want to connect a SIMATIC S7 1200 to an HMI device via PROFIBUS, you must configure a PROFIBUS-capable communication module in a slot of the PLC.

WinCC Runtime as HMI device

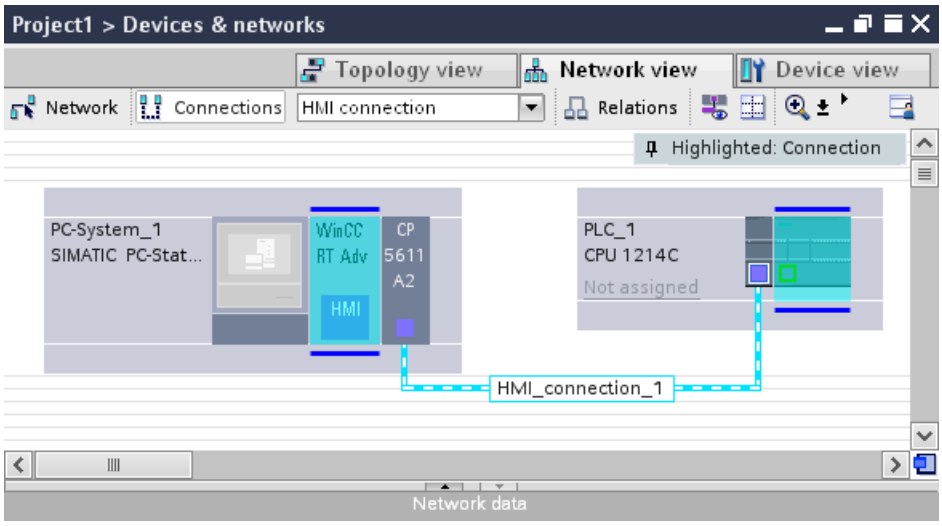
You configure the HMI connections between WinCC Runtime and SIMATIC S7 1200 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 1200 and multiple SIMATIC S7 1200s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFIBUS in the "Devices & Networks" editor.

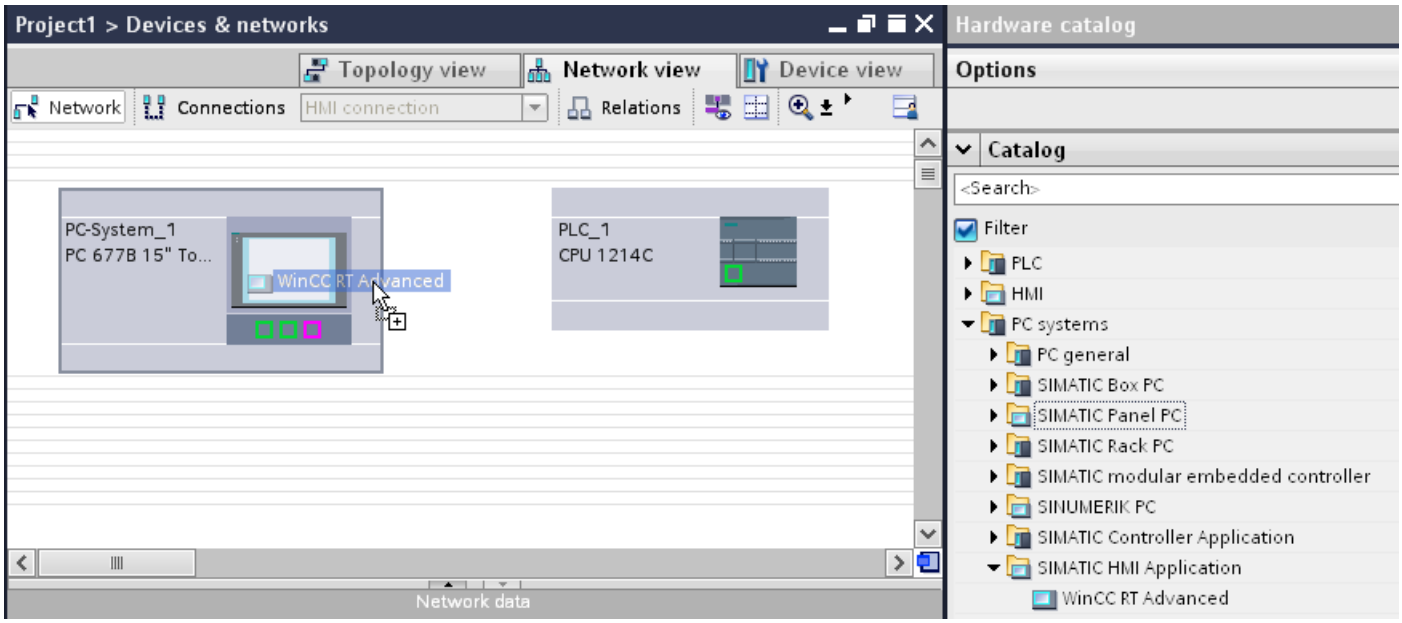
Requirements

The following communication partners are created in the "Devices & Networks" editor:

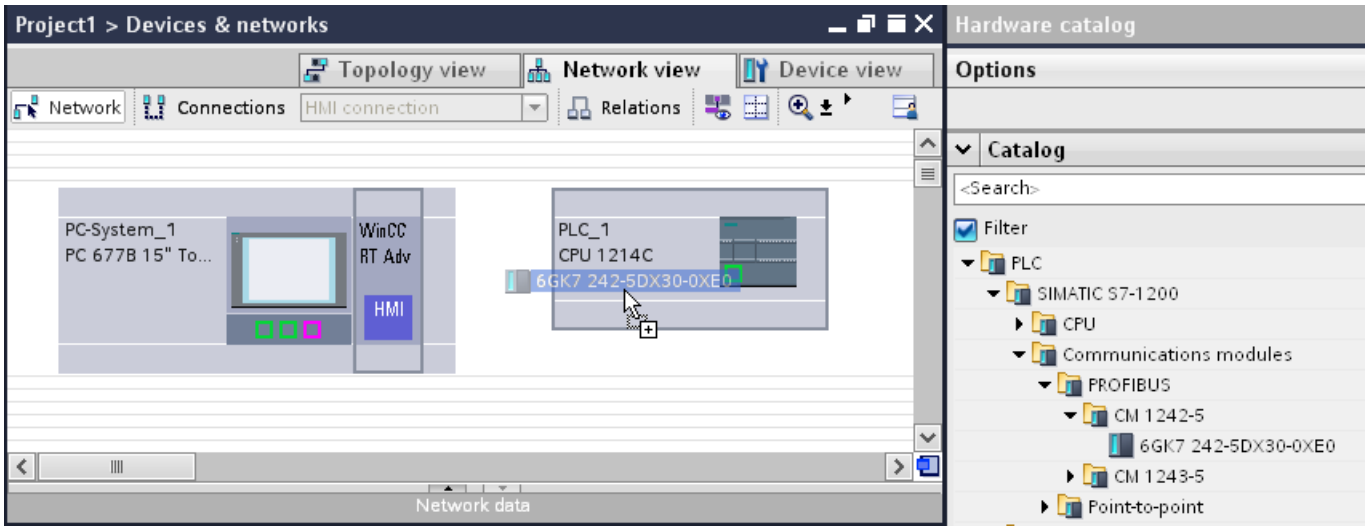
- SIMATIC S7 1200
- SIMATIC PC with PROFIBUS interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.

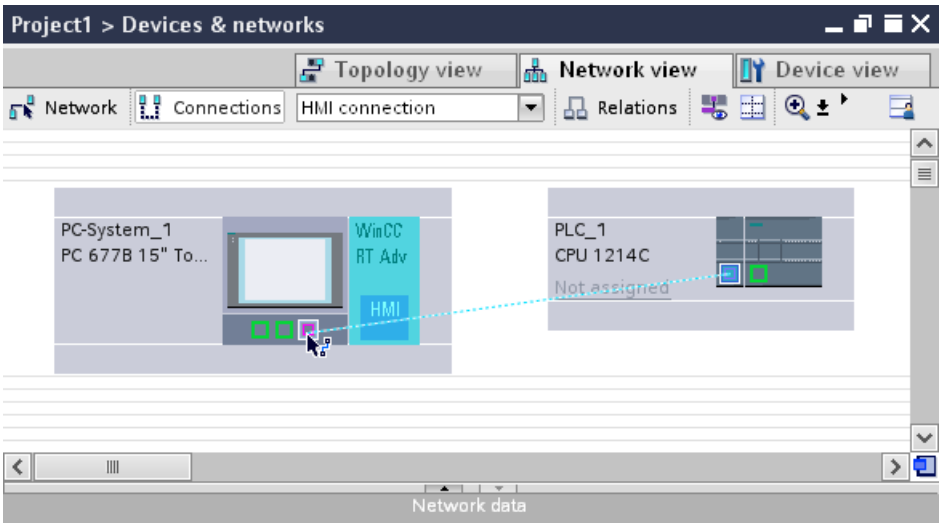


3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.



4. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

5. Click the PROFIBUS interface of the communication module and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 5077)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 1200 via PROFIBUS.

Configuring an HMI connection via PROFIBUS with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 1200 via PROFIBUS in the "Devices & Networks" editor.

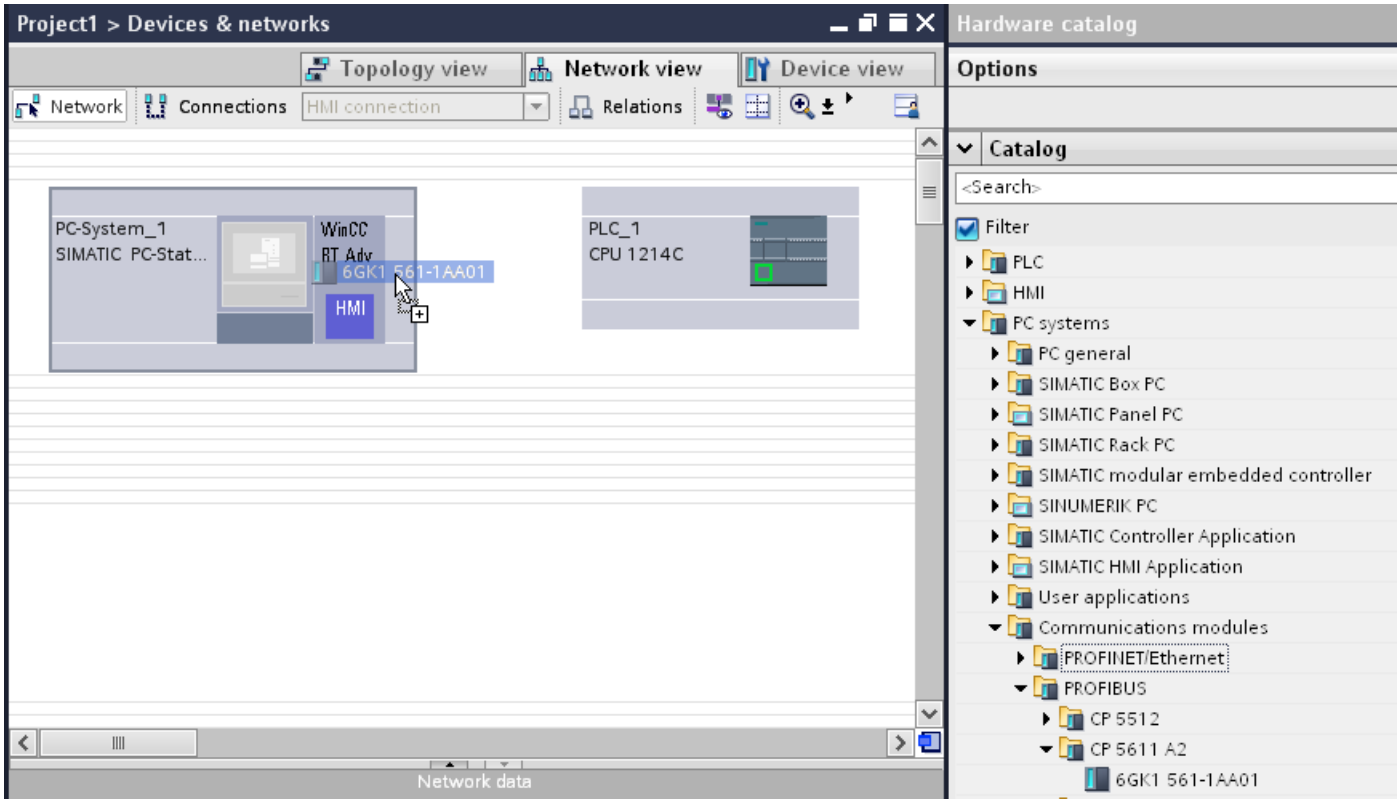
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 1200
- PC station with WinCC RT Advanced

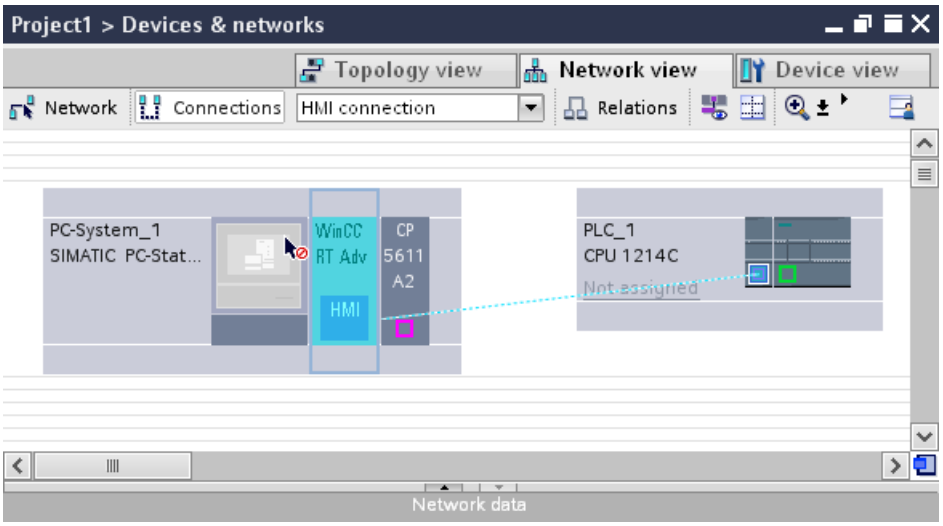
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.
3. Use a drag-and-drop operation to move a PROFIBUS-capable communication module from the hardware catalog to the PLC.



4. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

5. Click the PROFIBUS interface of the communication module and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.

  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the PROFIBUS address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

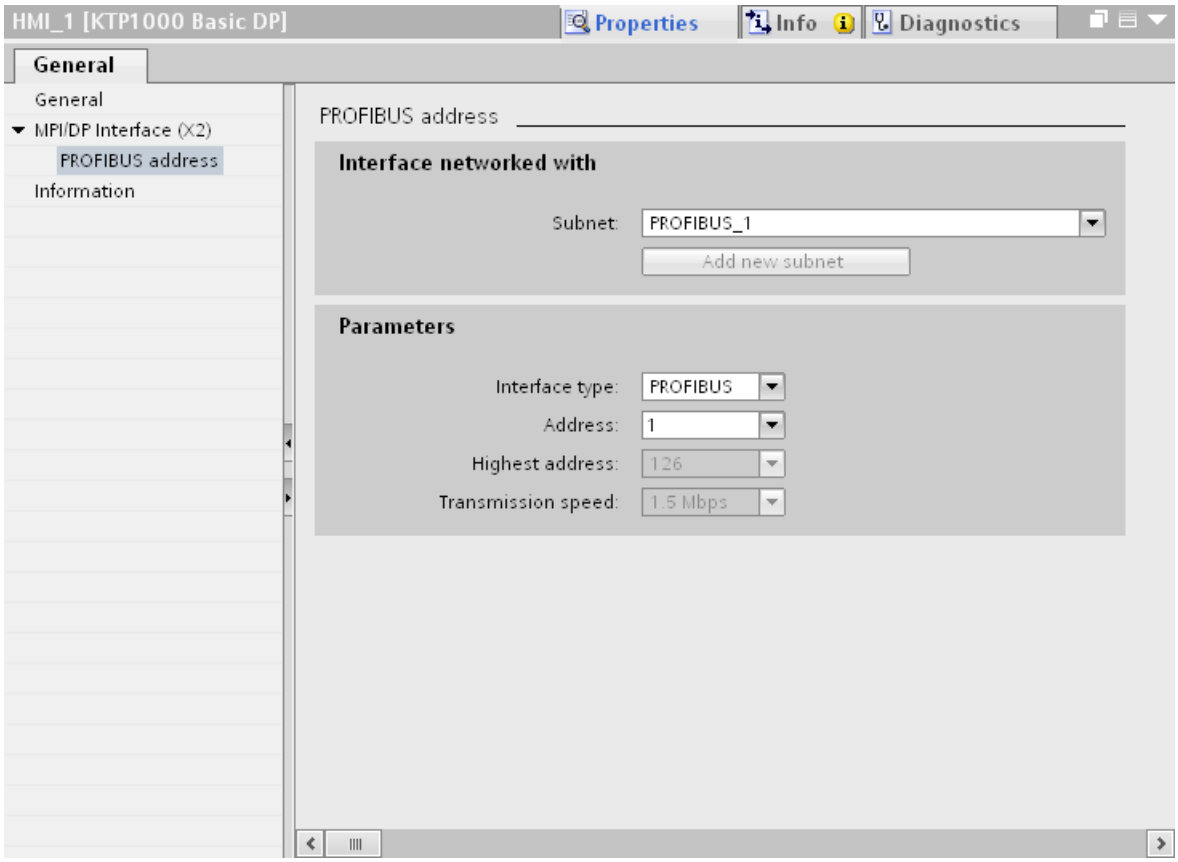
PROFIBUS parameters for the HMI device

PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFIBUS parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

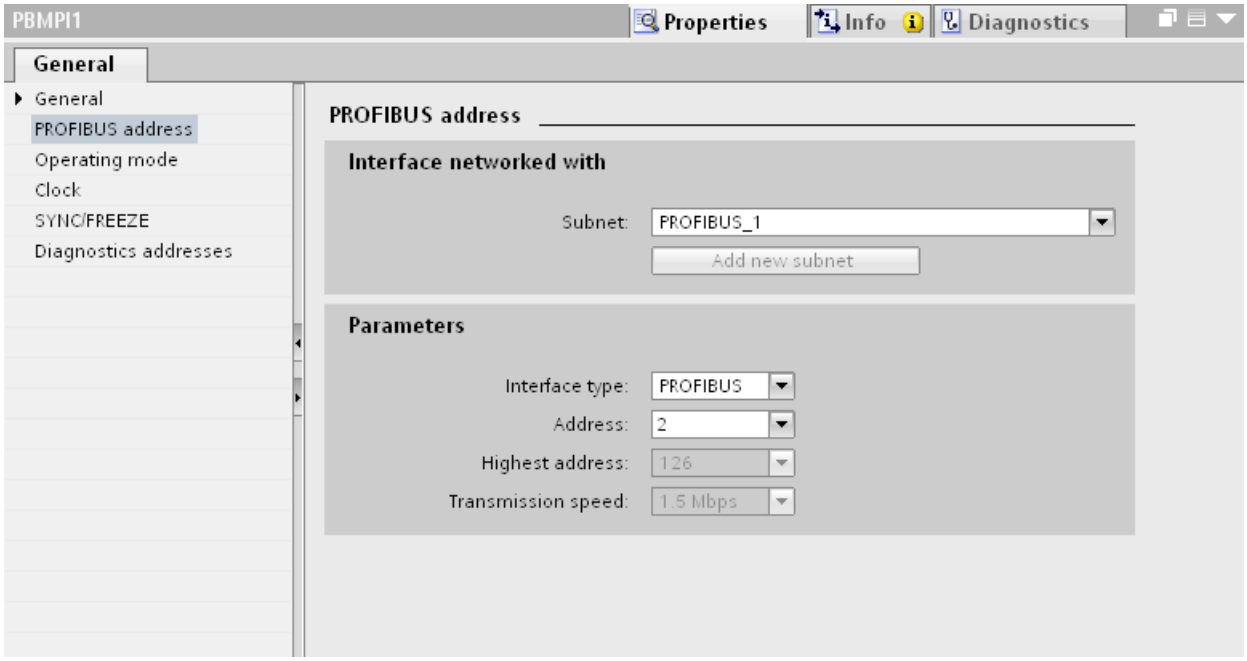
PROFIBUS parameters for the PLC

PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

Bus profiles with PROFIBUS

Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values.

Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Standard	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Universal	9,6 19,2 93,75 187,5 500 1500

Meaning of profiles

Profile	Meaning
DP	Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices. This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.
Standard	Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.
Universal	Select the "Universal" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service. This includes the following devices for example: • CP 343-5 • PROFIBUS-FMS devices of other manufacturers As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.

Protection of communication

Security levels

You can assign communication security levels to protect PLC and HMI device communication.

For an S7-1500 CPU, you can enter multiple passwords and thereby set up different access rights for various user groups.

The passwords are entered in a table, so that each password is assigned to exactly one protection level.

The effect of the password is given in the "Protection" column.

Example

Select the "Complete protection" security level for a standard CPU (in other words, not an F-CPU) and enter a separate password for each security level in the table.

For users who do not know any of the passwords, the CPU is completely protected. Not even HMI access is possible.

For users who know one of the assigned passwords, the effect depends on the table row in which the password occurs:

- The password in row 1 (no protection) allows access as if the CPU were completely unprotected. Users who know this password have unrestricted access to the CPU.
- The password in row 2 (write protection) allows access as if the CPU were write-protected. Despite knowing the password, users who know this password only have read access to the CPU.
- The password in row 3 (read/write protection) allows access as if the CPU were read-protected and write-protected, so that only HMI access is possible for users who know this password.

Access password for the HMI connection

Introduction

Secure access to a PLC by assigning a password.

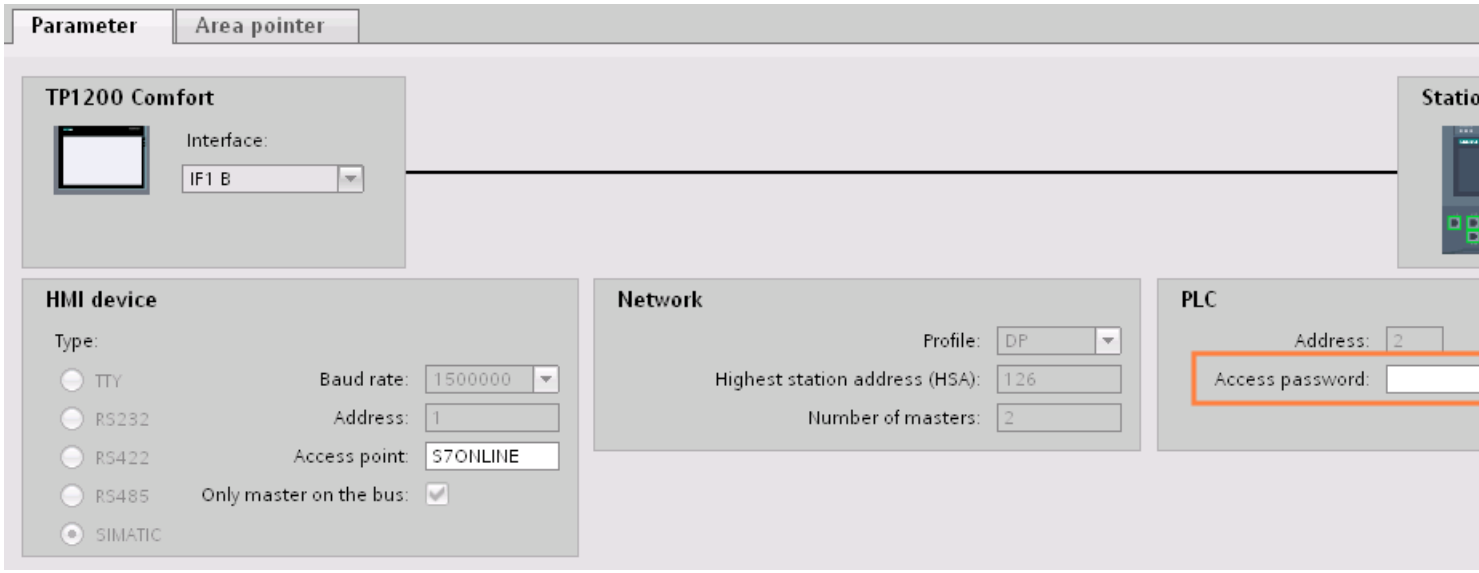
Assign the password when configuring the connection.

Input of the password of the PLC is mandatory as of "Complete protection" security level.

Communication to the PLC is denied if an incorrect password or no password is entered.

Assigning password

Enter the access password for the HMI connection in the "Connections" editor.



10.11.7.4 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 4956)

Area pointer "Date/time"

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Permitted data types

You can use the following data types when you configure the "Date/Time" area pointer.

- Word
- UInt
- DTL

Use of the "DTL" data type

Use data type "DTL" with communication driver S7 1200. A tag of the "DTL" data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The "DTL" data type has the following structure:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2554
1			
2	Month	USINT	0 to 12
3	Day	USINT	1 to 31
4	Day of week	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999 999 999
9			
10			
11			

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the date/time area pointer PLC to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

Permitted data types

You can use the following data types when you configure the "Date/Time PLC" area pointer:

- Word
- UInt
- DTL

Use of the "DTL" data type

Use data type "DTL" with communication driver S7 1200. A tag of the "DTL" data type has a length of 12 bytes and saves information on date and time in a predefined structure.

The "DTL" data type has the following structure:

Byte	Component	Data type	Value range
0	Year	UINT	1970 to 2554
1			
2	Month	USINT	0 to 12
3	Day	USINT	1 to 31
4	Day of week	USINT	1(Sunday) to 7(Saturday) The weekday is not considered in the value entry.
5	Hour	USINT	0 to 23
6	Minute	USINT	0 to 59
7	Second	USINT	0 to 59
8	Nanoseconds	UDINT	0 to 999 999 999
9			
10			
11			

The HMI devices do not support the use of nanoseconds. Values in the nanosecond range will be ignored during processing in Runtime.

Area pointer "Coordination"

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

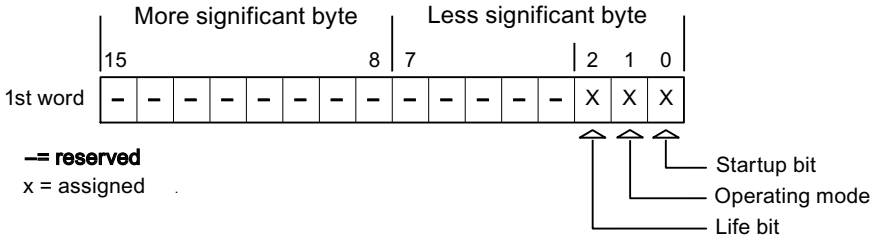
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Usage

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of the bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

Processing in the PLC

For a simpler evaluation in the PLC program, use a Bool array for this area pointer when using the SIMATIC S7 1200 communication driver. You will have to map the complete 16-bit word of the area pointer. Configure a tag of the data type "Array [0 .. 15] of bool" for this purpose.

Permitted data types

You can use the following data types when you configure the "Coordination" area pointer.

- Word
- UInt
- Bool

Area pointer "Screen number"

Function

The HMI devices store information about the screen called up on the HMI device in the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. Certain reactions can be triggered in the PLC, such as the call of a different screen.

Use

Before the "Screen number" area pointer can be used, it must be set up and activated by selecting "Communication ▸ Area pointer". You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1. Word	Current screen type															
2. Word	Current screen number															
3. Word	Reserved															
4th word	Current field number															
5. Word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

Note

Device dependency

Permanent windows are not available on Basic Panels.

Permitted data types

You can use the following data types when you configure the "Screen number" area pointer.

- Word
- UInt

Area pointer "Project ID"

Function

When Runtime starts it can check to see if the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program.

A missing compatibility results in a corresponding alarm and Runtime will not be started.

Use

To use this area pointer, set up the following during the configuration:

- Define the version of configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- This is where you select the PLC tag or the tag array that you have configured as the data area for the area pointer.

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

Permitted data types

You can use the following data types when you configure the "Project ID" area pointer.

- Word
- UInt

Area pointer "Job mailbox"

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Set date (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year

No.	Function	
14	**Set time (BCD-coded)**	
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Clear event buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Clear error alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Display selection**	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1)]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1)]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

1)	Only devices supporting recipes
2)	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
3)	The weekday is ignored on HMI device KTP 600 BASIC PN.

Permitted data types

You can use the following data types when you configure the "Screen number" area pointer:

- Word
- UInt

"Data record" area pointer

"Data mailbox" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data mailbox

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a job mailbox, the data in the recipe view will be updated as well. Avoid operating the recipe view while job mailboxes for transfer of data records are being triggered. If you have already started editing a data record and a job mailbox is triggered for transfer of data records, then this job mailbox will be rejected.

Permitted data types

You can use the following data types when you configure the "Data record" area pointer.

- Word
- UInt

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. Use this mechanism to prevent uncontrolled overwriting of data in either direction of your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Connections ▸ Area pointer" editor.
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transfer is busy
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer started by the operator in the recipe display

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data mailbox and sets the data record number to 0.	Abort with system alarm.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data mailbox.	Abort with system alarm.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data mailboxes from the PLC to the HMI device. The job mailbox is structured as follows:

	Most significant byte	Least significant byte
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox no. 70 transfers data mailboxes from the HMI device to the PLC. The job mailbox is structured as follows:

	Most significant byte	Least significant byte
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.

Step	Action	
3	The HMI device reads the values and stores the values in the data record specified in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed". • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the job from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The PLC program can now evaluate the transferred data. To allow further transfers, the PLC program must set the status word to 0 again.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system alarm.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible
- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data mailbox.

Note

Availability for specific devices

Notes in the status bar of the recipe view are not available in Basic Panels.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3237)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

See also

Trends (Page 3237)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

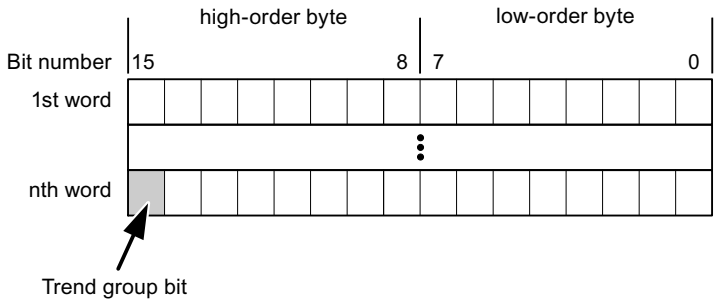
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3260)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

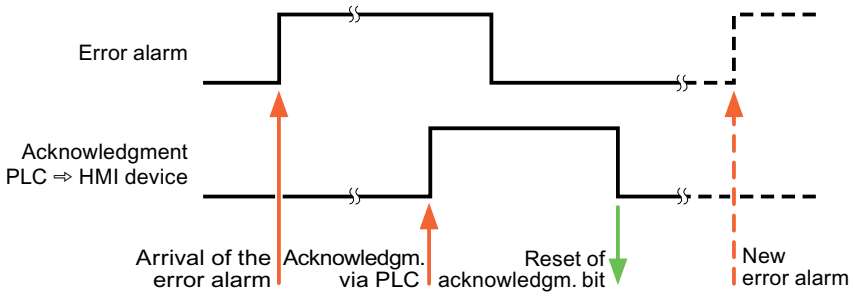
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

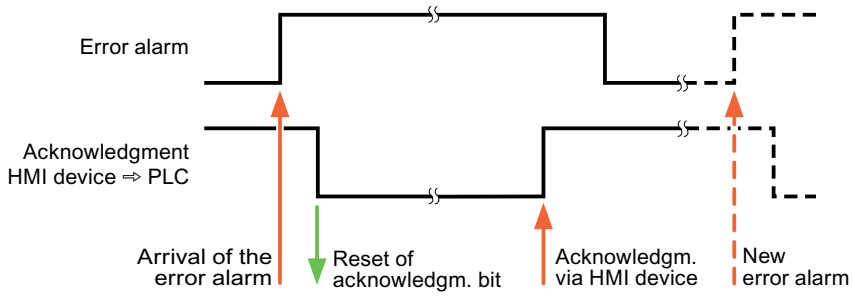
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels	Panel PCs:
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

10.11.7.5 Performance features of communication

S7-1200 device dependency

Communication with the SIMATIC S7-1200 controller

If you use devices from an earlier version of the TIA Portal with TIA Portal V12 SP1, it may not be possible to configure integrated connections to certain HMI devices.

Version V1.0

You can configure the SIMATIC S7-1200 controller with version V1.0 in the following scenarios:

TIA Portal	Basic Panels	Panels	Comfort Panels	RT Advanced
V11	Yes	Yes	No	No
V12	No	No	No	No

Version V2.0

You can configure the SIMATIC S7-1200 controller with version V2.0 in the following scenarios:

TIA Portal	Basic Panels	Panels	Comfort Panels	RT Advanced
V11	Yes	Yes	Yes	Yes
V12	Yes	Yes	Yes	Yes

Version V3.0

You can configure the SIMATIC S7-1200 controller with version V3.0 in the following scenarios:

TIA Portal	Basic Panels	Panels	Comfort Panels	RT Advanced
V11	Yes	Yes	Yes	Yes
V12	Yes	Yes	Yes	Yes

Version V4.0

You can configure the SIMATIC S7-1200 controller with version V4.0 in the following scenarios:

TIA Portal	Basic Panels	Panels	Comfort Panels	RT Advanced
V11	No	No	No	No
V12	Yes	Yes	Yes	Yes

Permitted data types for SIMATIC S7 1200 - V2

Permitted data types for connections with SIMATIC S7 1200 (V2)

The table lists the user data types that can be used when configuring tags and area pointers.

Data type	Length
BOOL	1-bit
SINT	1 byte
INT	2 bytes
DINT	4 bytes

Data type	Length
USINT	1 byte
UINT	2 bytes
UDINT	4 bytes
REAL	4 bytes
LREAL	8 bytes
TIME	4 bytes
DATE	2 bytes
DTL	12 bytes
TIME_OF_DAY, TOD	4 bytes
STRING	(2+n) bytes, n = 0 to 254
CHAR	1 byte
BYTE	1 byte
WORD	2 bytes
DWORD	4 bytes

10.11.7.6 Creating connections in the "Connections" editor

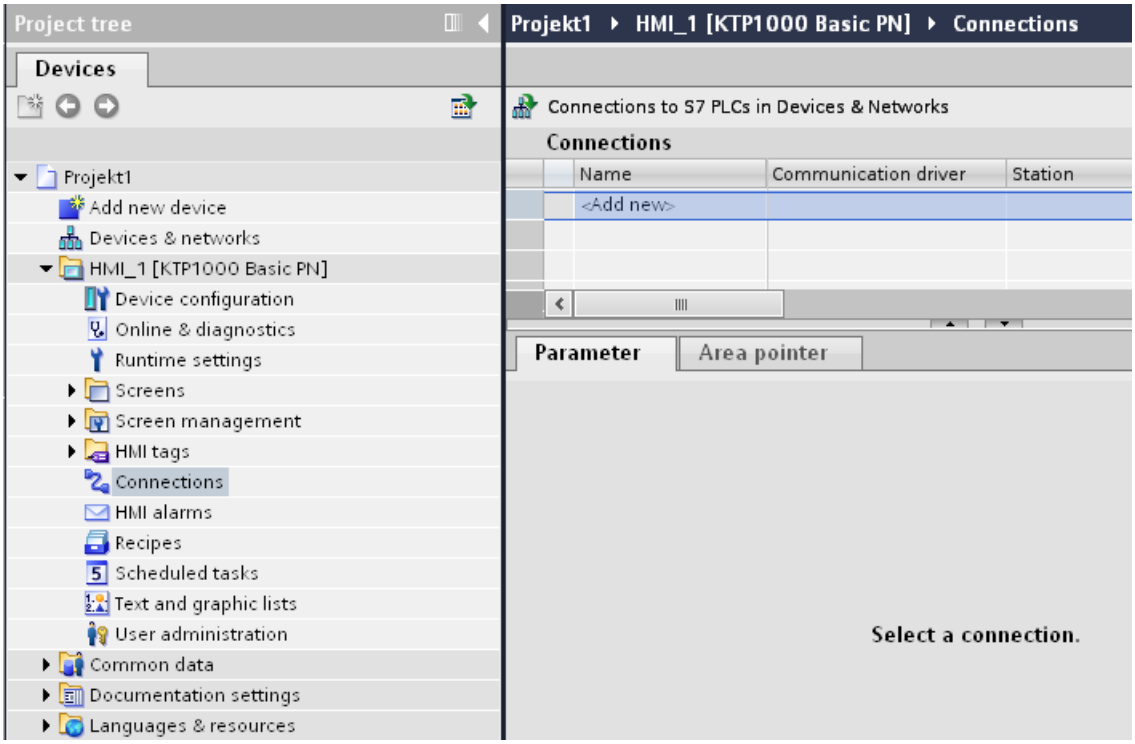
Creating a PROFINET connection

Requirements

- A project is open.
- An HMI device with a PROFINET interface has been created.

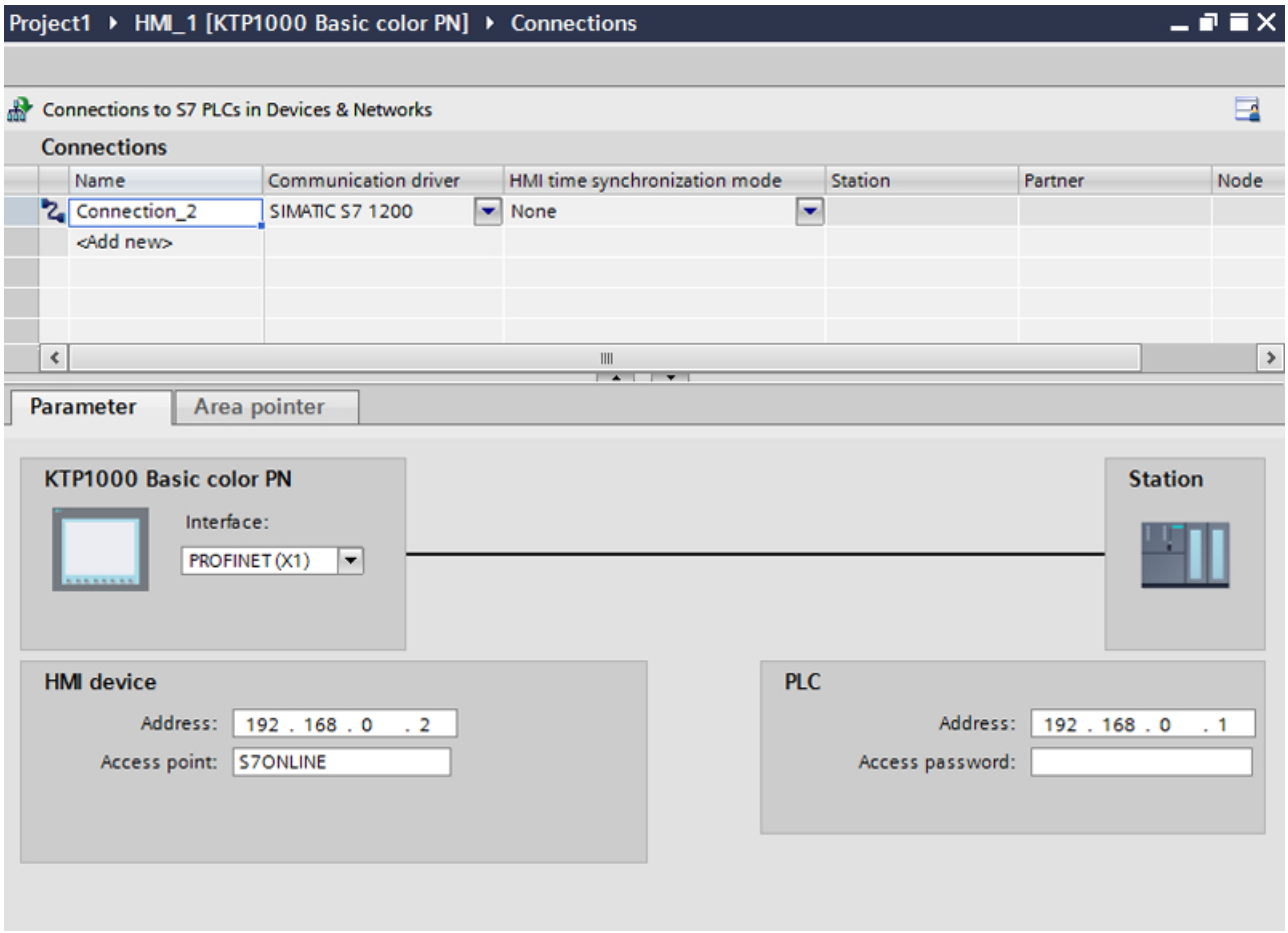
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. In the "Communication drivers" column, select the "SIMATIC S7 1200" driver.
4. Click the name of the connection.

5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".



6. Set the IP addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

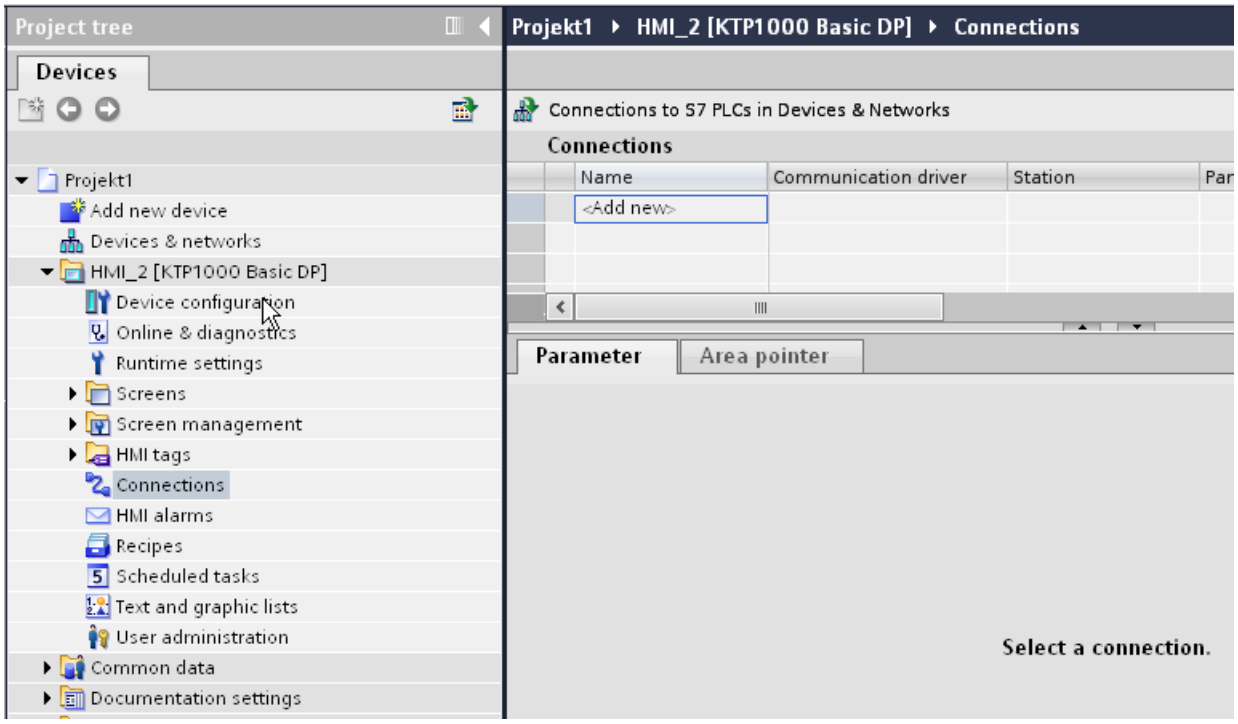
Creating a PROFIBUS DP connection

Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

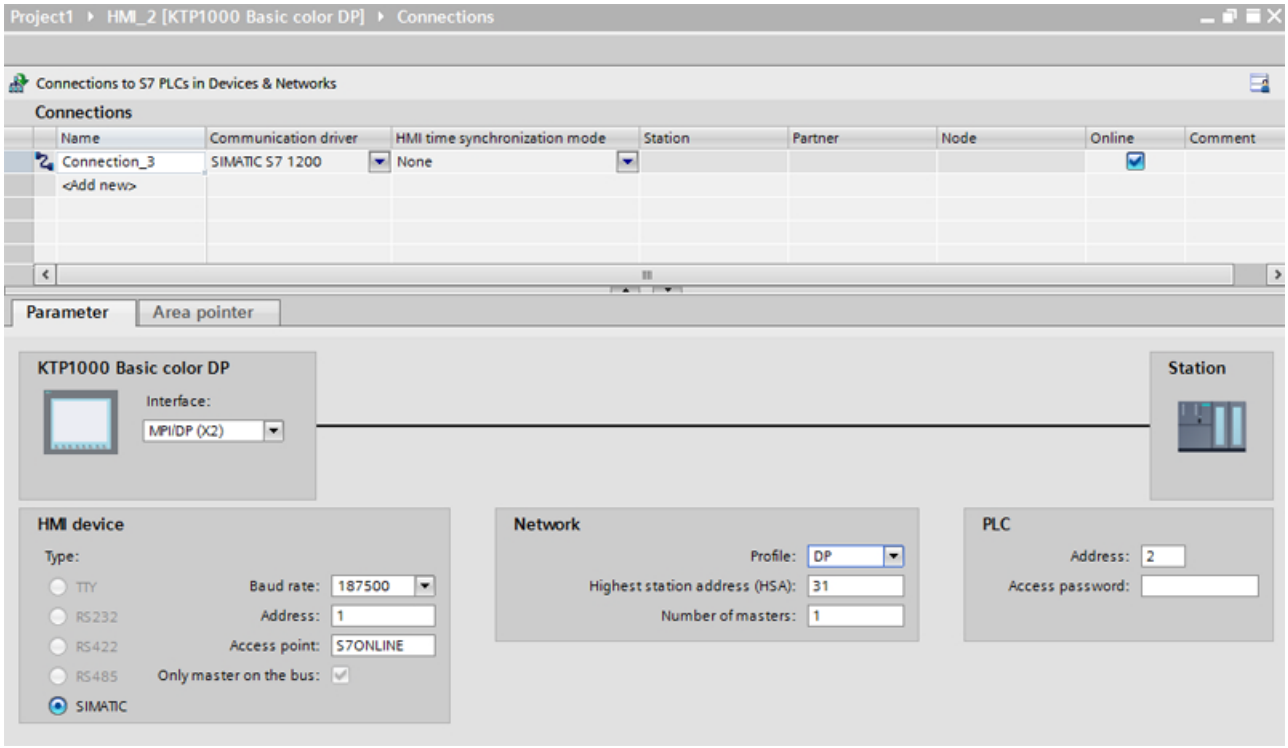
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. In the "Communication drivers" column, select the "SIMATIC S7 1200" driver.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters".

6. Select the "DP" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

Parameters for the connection

Parameters for the connection (SIMATIC S7 1200)

Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.

Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"

- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

- "Access point"
  Specifies the access point for the PG/PC interface that can be used to reach the communication partner.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

Note

If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.

- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7 200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Access password"
  Enter a password in the "Access password" field. This password must match the one you saved to the PLC.

Note

You only need a password if you have set "Complete protection" at the PLC.

No connection is set up to the PLC if the "Complete protection" security level is stored on the PLC and you do not enter a password.

10.11.7.7 Time synchronization

Time synchronization

Introduction

To have the same time of day throughout the plant, you can synchronize the time on various plant components using time synchronization. WinCC time synchronization is operated as a master-slave system.

One system component must be a clock for all components of a plant to work with identical time. The component functioning as the clock is referred to as the time master. The components that receive the time are time slaves.

Properties of time synchronization

- The HMI device can define the time as master or can accept the time of the PLC as slave.
- In "master mode", the time is synchronized at each connection setup.
- In "slave mode", the time is synchronized at each connection setup and than at cyclic intervals of 10 minutes.
- The first time synchronization is performed on the HMI device immediately after the start of runtime.
- Time synchronization is only performed on the HMI device during operation of runtime.

Time synchronization restrictions

Approved HMI devices

You can configure the time synchronization between a SIMATIC S7 1200 or SIMATIC S7 1500 and an HMI device with the following HMI devices:

Device	Operating system
Basic Panels	-
TP177 4"	Windows CE 5.0
Multi Panel 177	Windows CE 5.0
Multi Panel 277	Windows CE 5.0
Multi Panel 377	Windows CE 5.0
Mobile Panel 277	Windows CE 5.0
Mobile 277 IWLAN V2	Windows CE 5.0
Comfort Panels	Windows CE 6.0
PC systems with WinCC RT Advanced	Microsoft Windows XP Microsoft Windows 7

Configuration restrictions

- If an HMI device has several connections to SIMATIC S7 1200 or SIMATIC S7 1500, you can only configure one connection as "slave".
- If you have enabled time synchronization for the HMI device as "slave", you can no longer use the global area pointer "Date/time PLC".
- An HMI device can only request the time from a PLC with "Complete protection" security type configuration if the correct "Access password" is configured.
  Configure the "Access password" for communication with a PLC with "Complete protection" security type in the "Connections" editor of the HMI device.
  This "Access password" must match the password configured on the PLC. The PLC password is assigned in the PLC properties at: "General > Security"
- Basic Panels can only be configured as "Slave".
- If you use Basic Panels for the configuration, it is not possible to use time synchronization via NTP and the "Date/time PLC" area pointer simultaneously.

Configuring time synchronization for integrated connections

Introduction

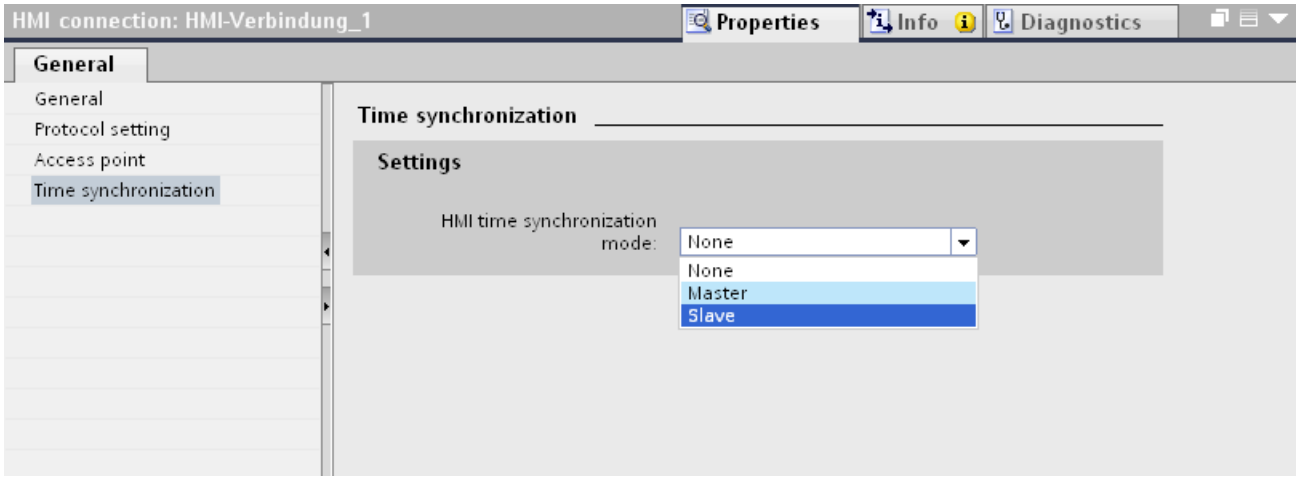
You configure time synchronization for an integrated connection in the "Devices & Networks" editor.

Requirements

- An HMI connection between an HMI device and a SIMATIC S7 1200 has been configured.
- The HMI device must support the "time synchronization" function.
- The "Devices & Networks" editor is open.

Procedure

1. Click the line of the HMI connection in the "Devices & networks" editor.
2. Select the following in the inspector window under "General > Time synchronization > Settings":
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



Configuring time synchronization for non-integrated connections

Introduction

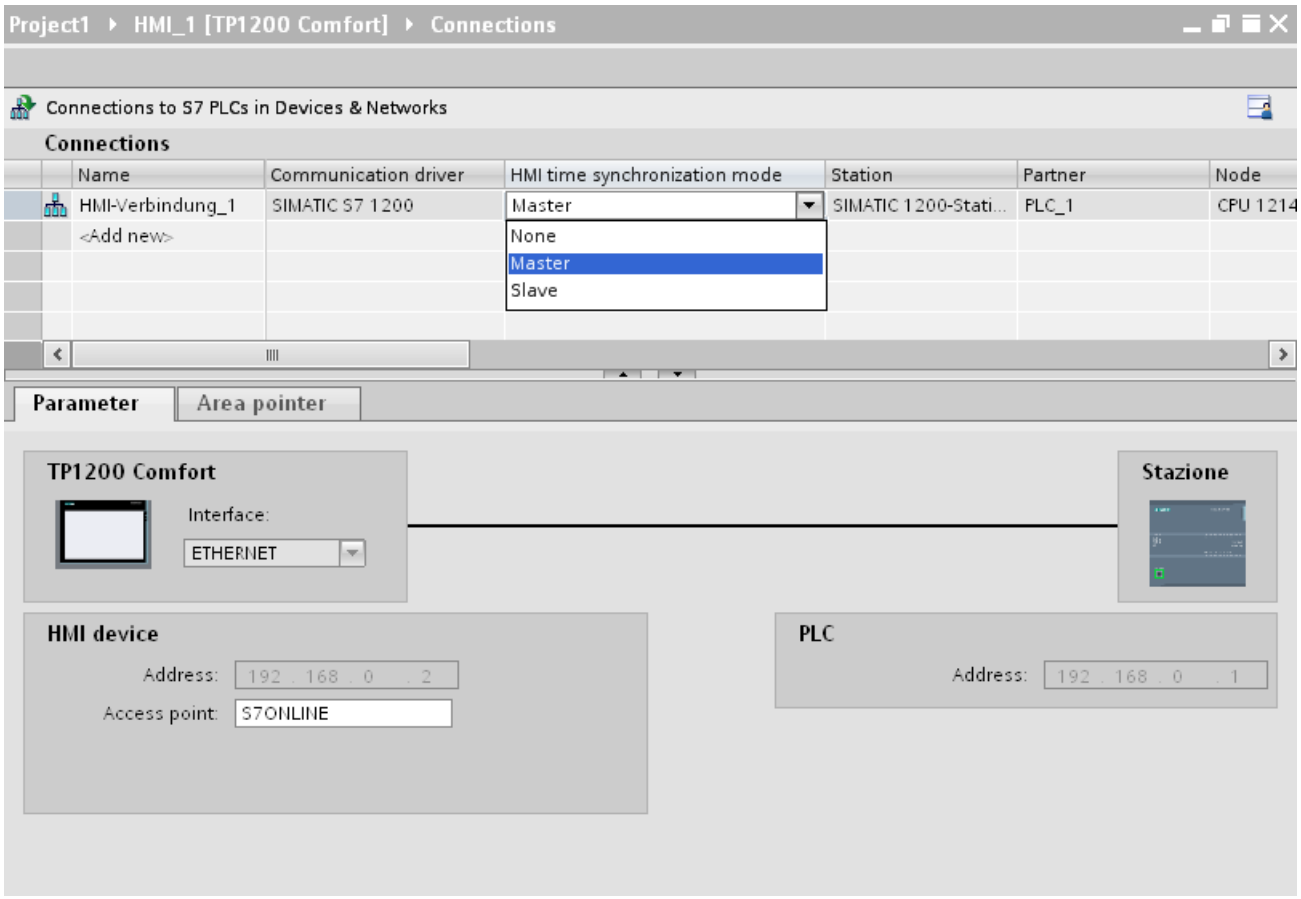
You configure time synchronization for a non-integrated connection in the "Connections" editor.

Requirements

- An HMI device which supports the "time synchronization" function has been created.
- "Connections" editor is open.

Procedure

1. Double-click "<Add>".
2. In the "Communication drivers" column, select the "SIMATIC S7 1200" PLC.
3. Select the following in the "HMI time synchronization mode" column:
   - None: No time synchronization is used.
   - Master: The HMI device sets the time.
   - Slave: The PLC sets the time.



10.11.8 Communicating with SIMATIC S7 300/400

10.11.8.1 Communication with SIMATIC S7 300/400

Introduction

This section describes the communication between an HMI device and the SIMATIC S7 300 and S7 400 PLCs. These two PLCs will be referred to jointly as SIMATIC S7 300/400.

You can configure the following communication channels for the SIMATIC S7 300/400 PLC:

- PROFINET
- PROFIBUS
- MPI

HMI connection for communication

You configure connections between the HMI device and a SIMATIC S7 300/400 in the "Devices & Networks" editor.

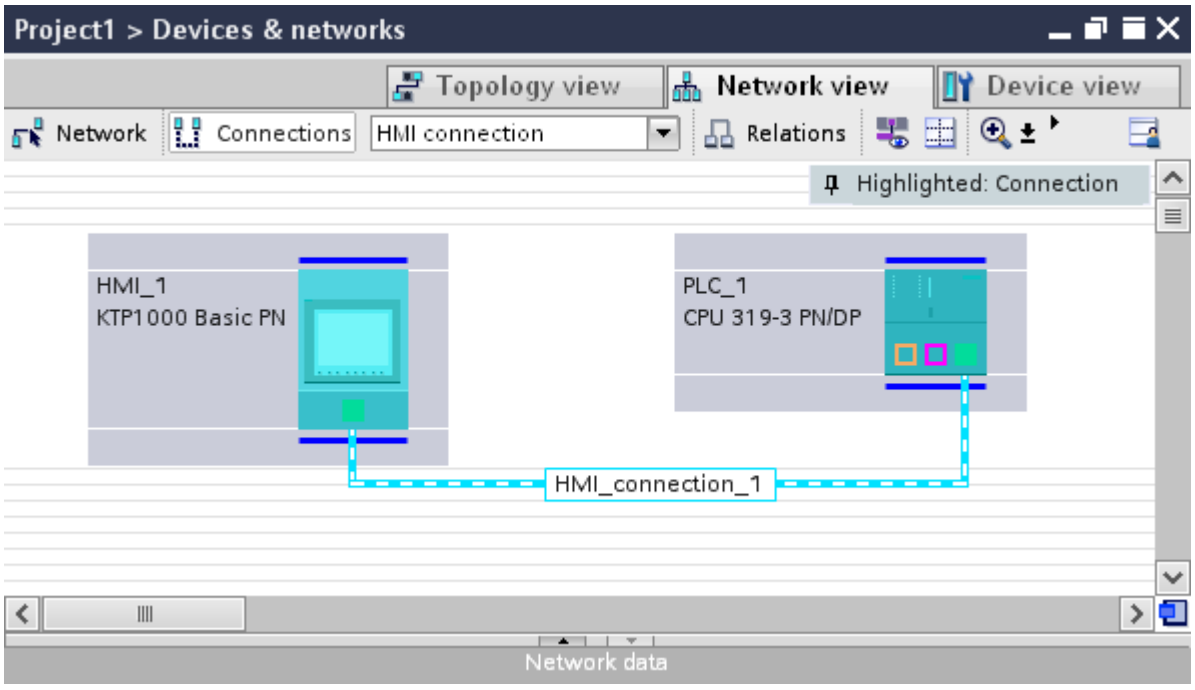
10.11.8.2 Communication via PROFINET

Configuring an HMI connection

Communication via PROFINET

HMI connections via PROFINET

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two PROFINET interfaces in the "Devices & Networks" editor.



You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

CAUTION
Communication via Ethernet In Ethernet-based communication, the end user is responsible for the security of his data network. Targeted attacks can overload the device and interfere with proper functioning.

Requirements

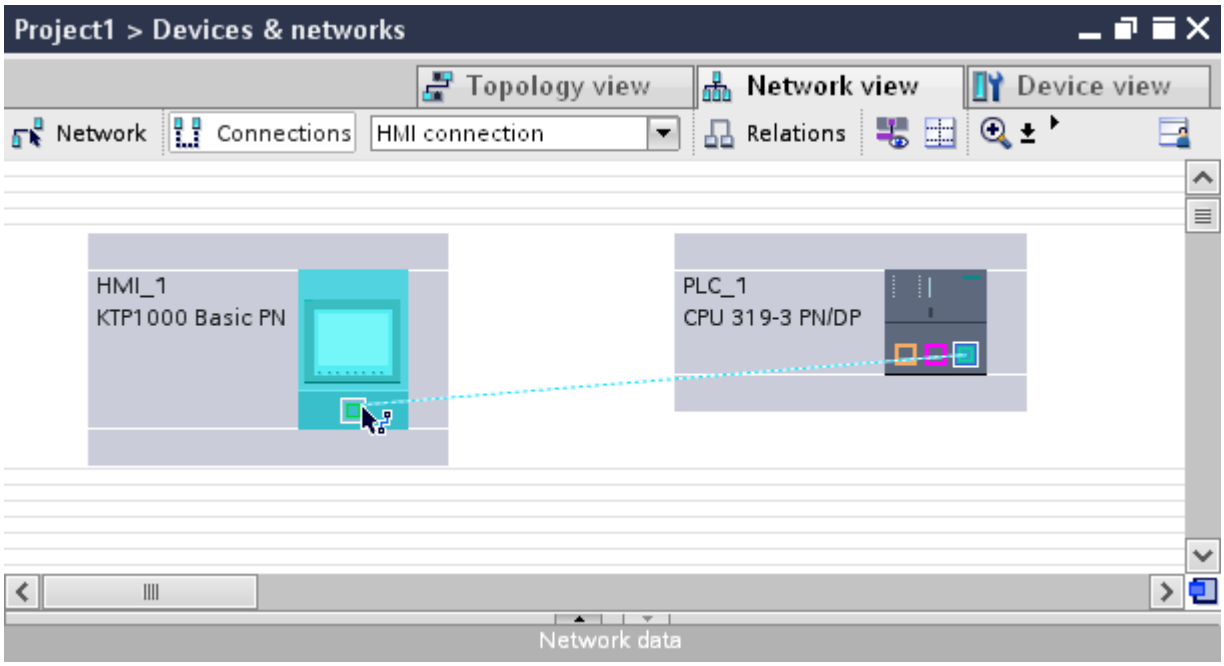
The following communication partners are created in the "Devices & Networks" editor:

- HMI device with PROFINET or Ethernet interface
- SIMATIC S7 300/400 with PROFINET interface.

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.

3. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the HMI device.



4. Click the connecting line.
5. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
6. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 5130)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection

Communication via PROFINET

Communication via PROFINET

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via PROFINET.

You can use the following WinCC Runtimes as an HMI device:

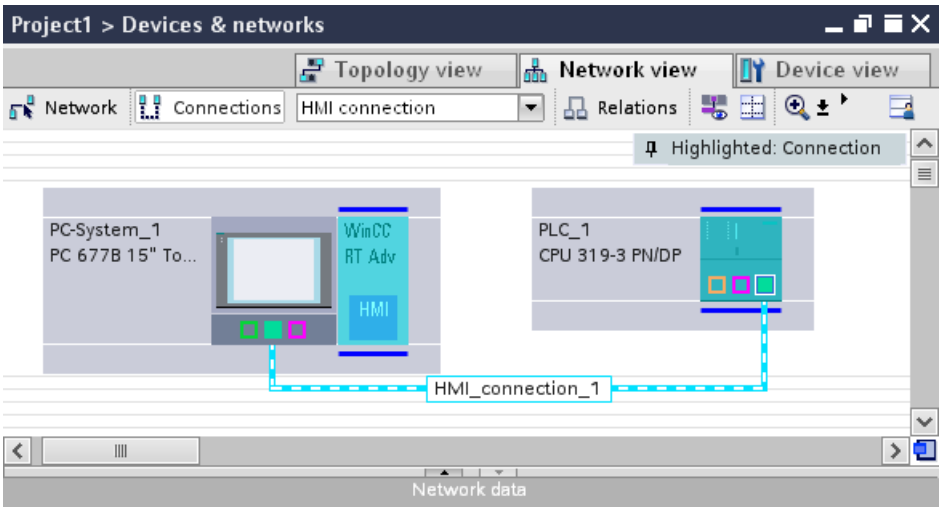
- WinCC RT Advanced

WinCC Runtime as HMI device

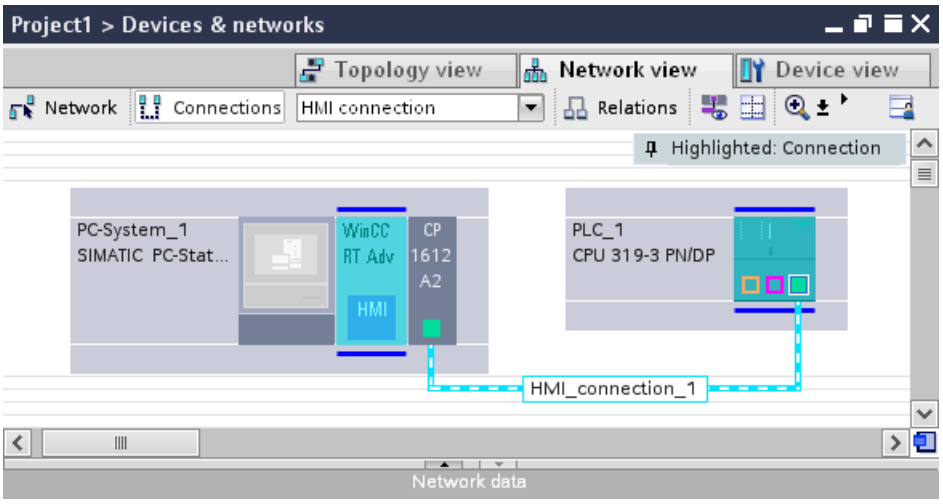
You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC. In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime. In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFINET in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFINET in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFINET with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

> **CAUTION**
>
> **Communication via Ethernet**
>
> In Ethernet-based communication, the end user is responsible for the security of his data network.
>
> Targeted attacks can overload the device and interfere with proper functioning.

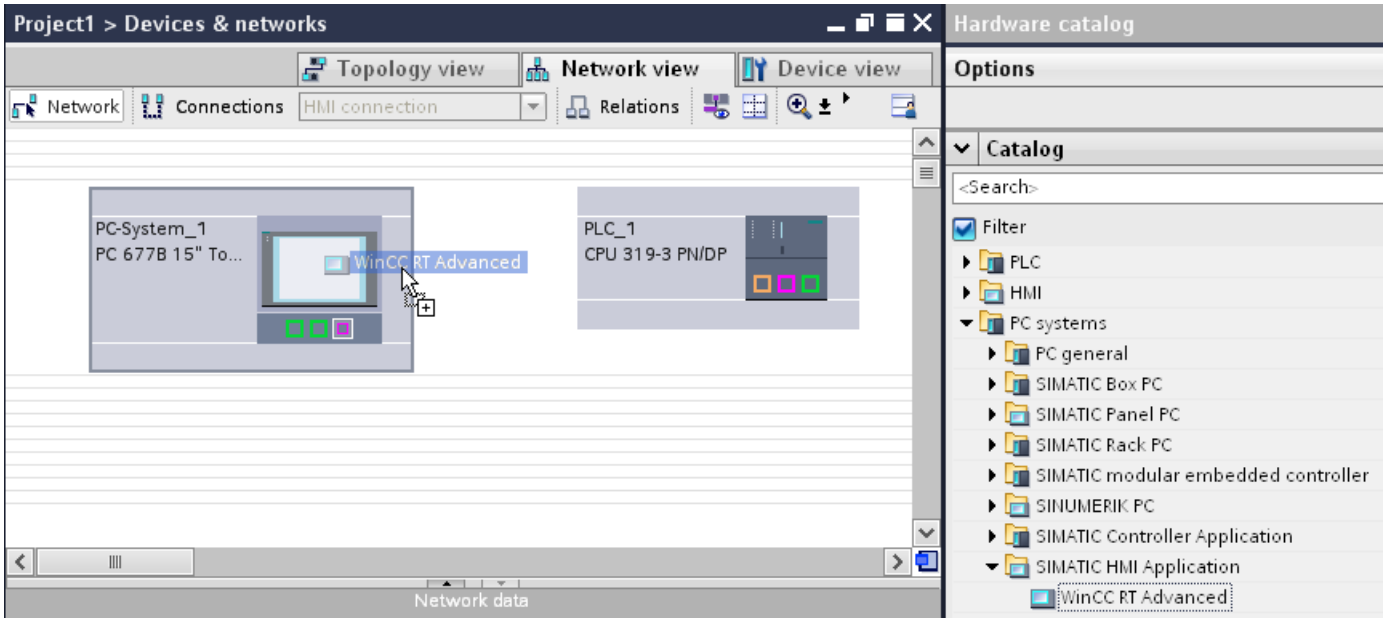
Requirements

The following communication partners are created in the "Devices & Networks" editor:

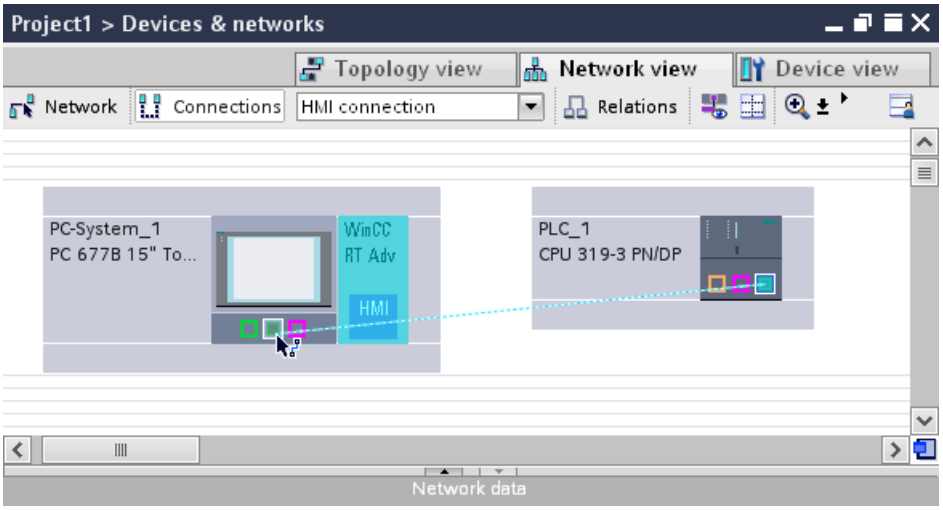
- SIMATIC S7 300/400 with PROFINET interface
- SIMATIC PC with PROFINET interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET or Ethernet interface of the PC.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 5130)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

Configuring an HMI connection via PROFINET with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFINET or Ethernet in the "Devices & Networks" editor.

CAUTION

Communication via Ethernet

In Ethernet-based communication, the end user is responsible for the security of his data network.

Targeted attacks can overload the device and interfere with proper functioning.

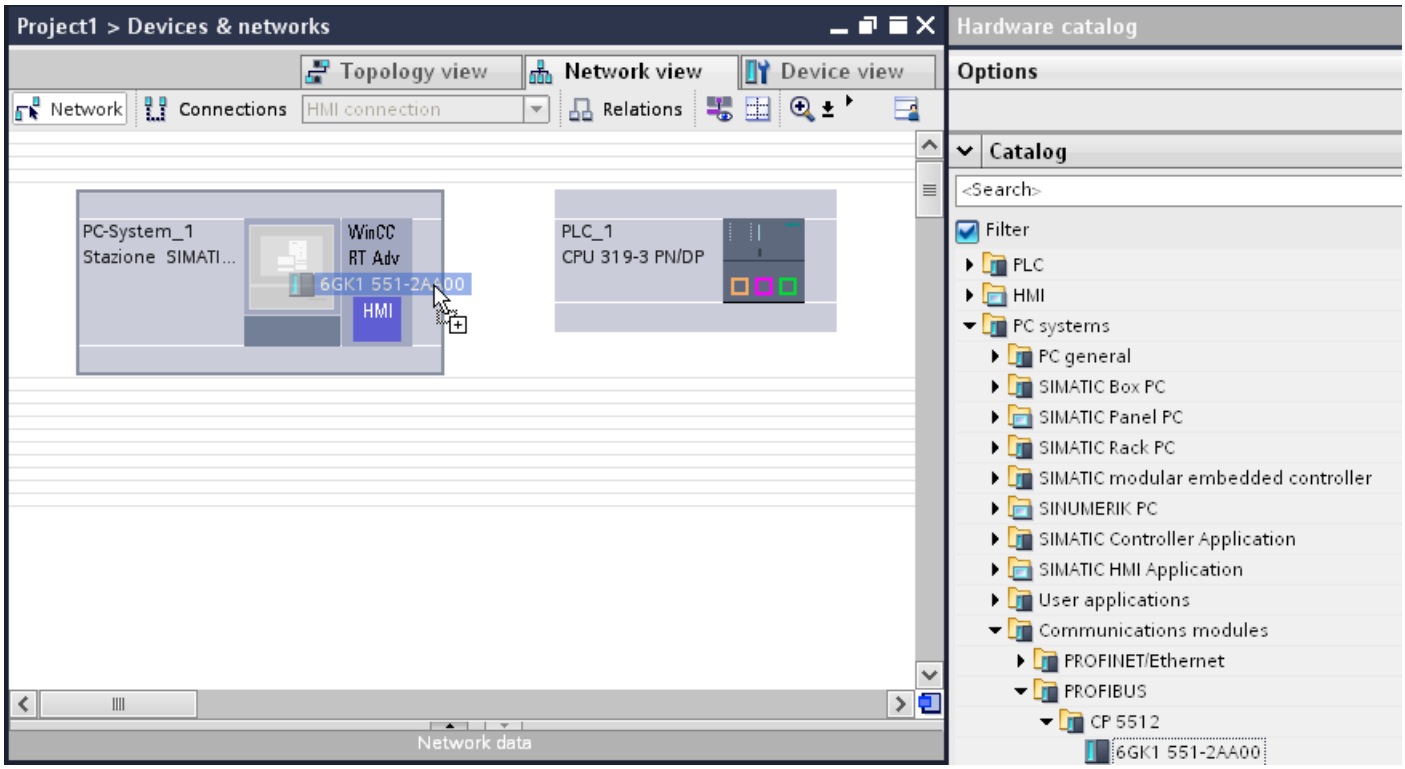
Requirements

The following communication partners are created in the "Devices & Networks" editor:

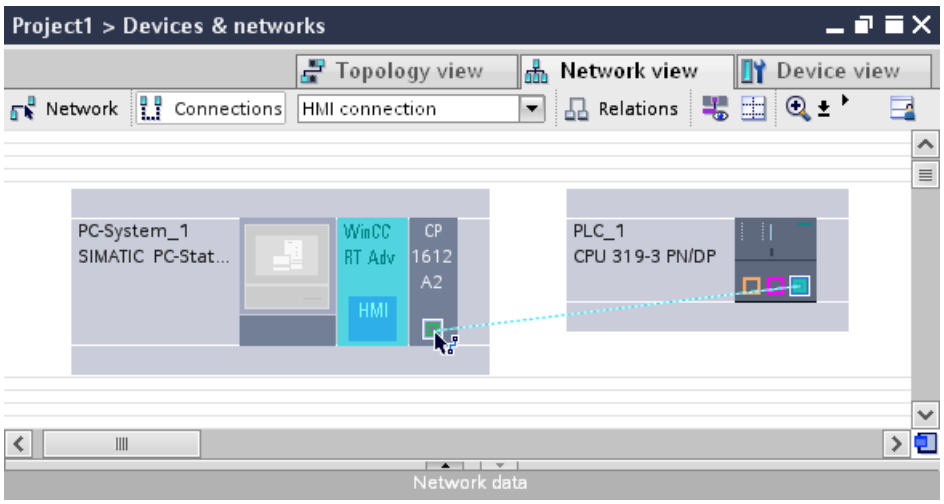
- SIMATIC S7 300/400 with PROFINET interface
- PC station with WinCC RT Advanced

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.
2. Use a drag-and-drop operation to move a PROFINET-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
4. Click the PROFINET interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFINET interface of the communication processor.



5. Click the connecting line.
   The connection is displayed graphically in the Inspector window.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFINET parameters (Page 5130)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created a connection between an HMI device and a SIMATIC S7 300/400. The IP address and subnet mask connection parameters are configured.

PROFINET parameters

PROFINET parameters for the HMI connection

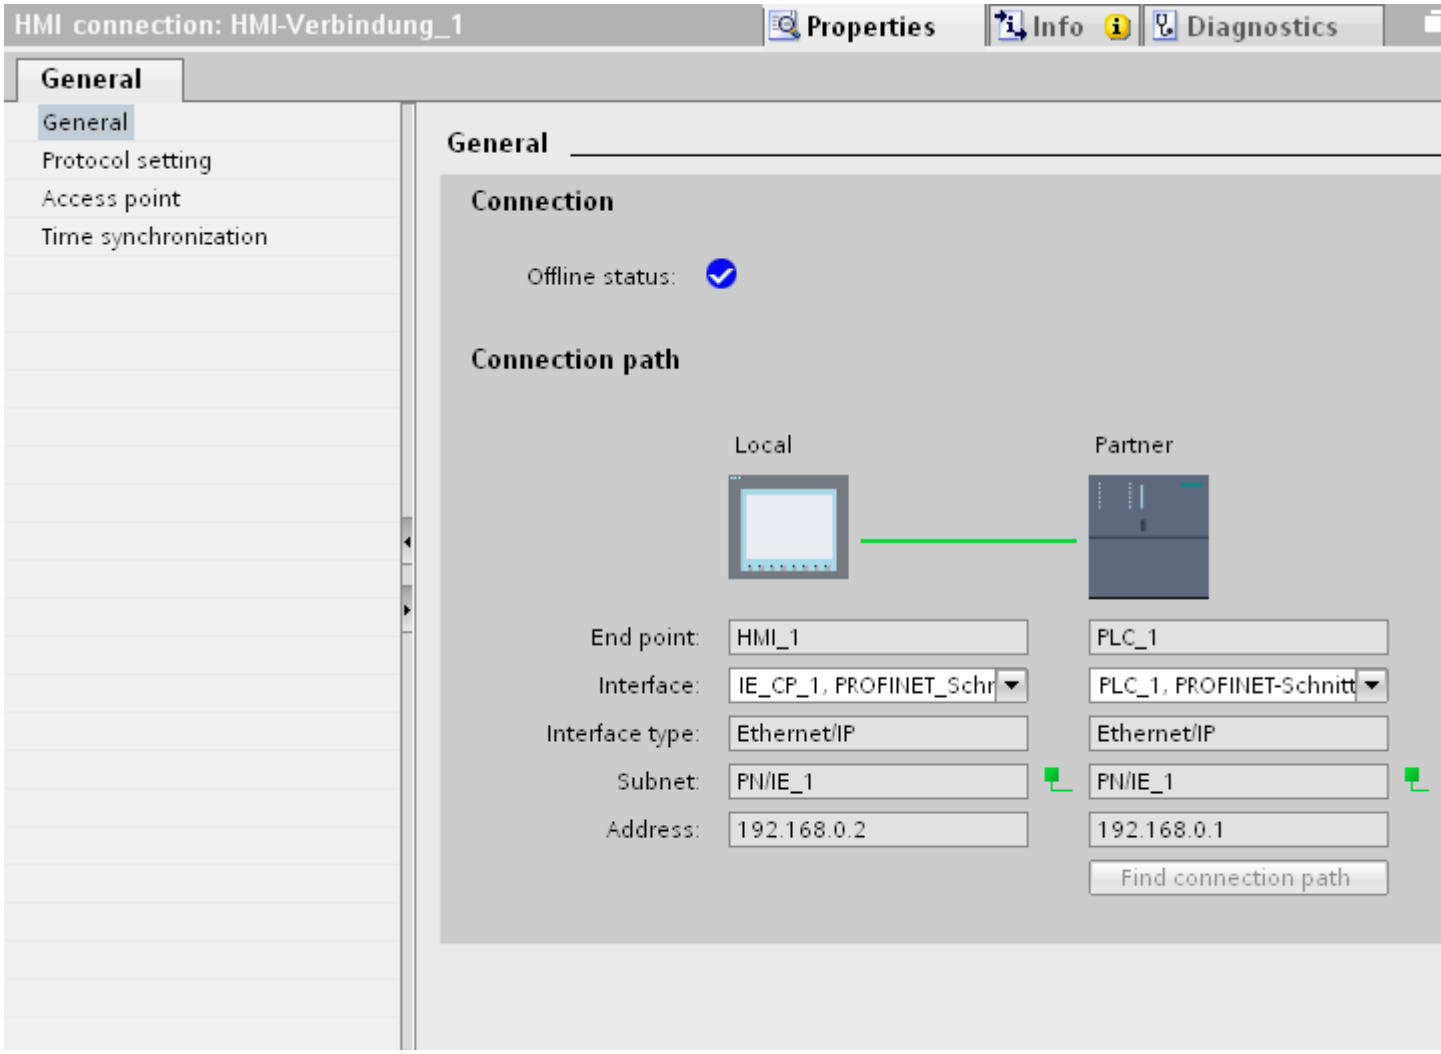
PROFINET parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Displays whether the devices are networked together.

- displayed if the devices are networked together.

- displayed if the devices are not networked together.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFINET parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area cannot be edited.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.
- "Interface type"
  Displays the selected interface type. This area cannot be edited.
- "Subnet"
  Displays the selected subnet. This area cannot be edited.
- "Address"
  Displays the selected IP address of the device. This area cannot be edited.
- "Find connection path" button
  Enables the subsequent specification of connections.

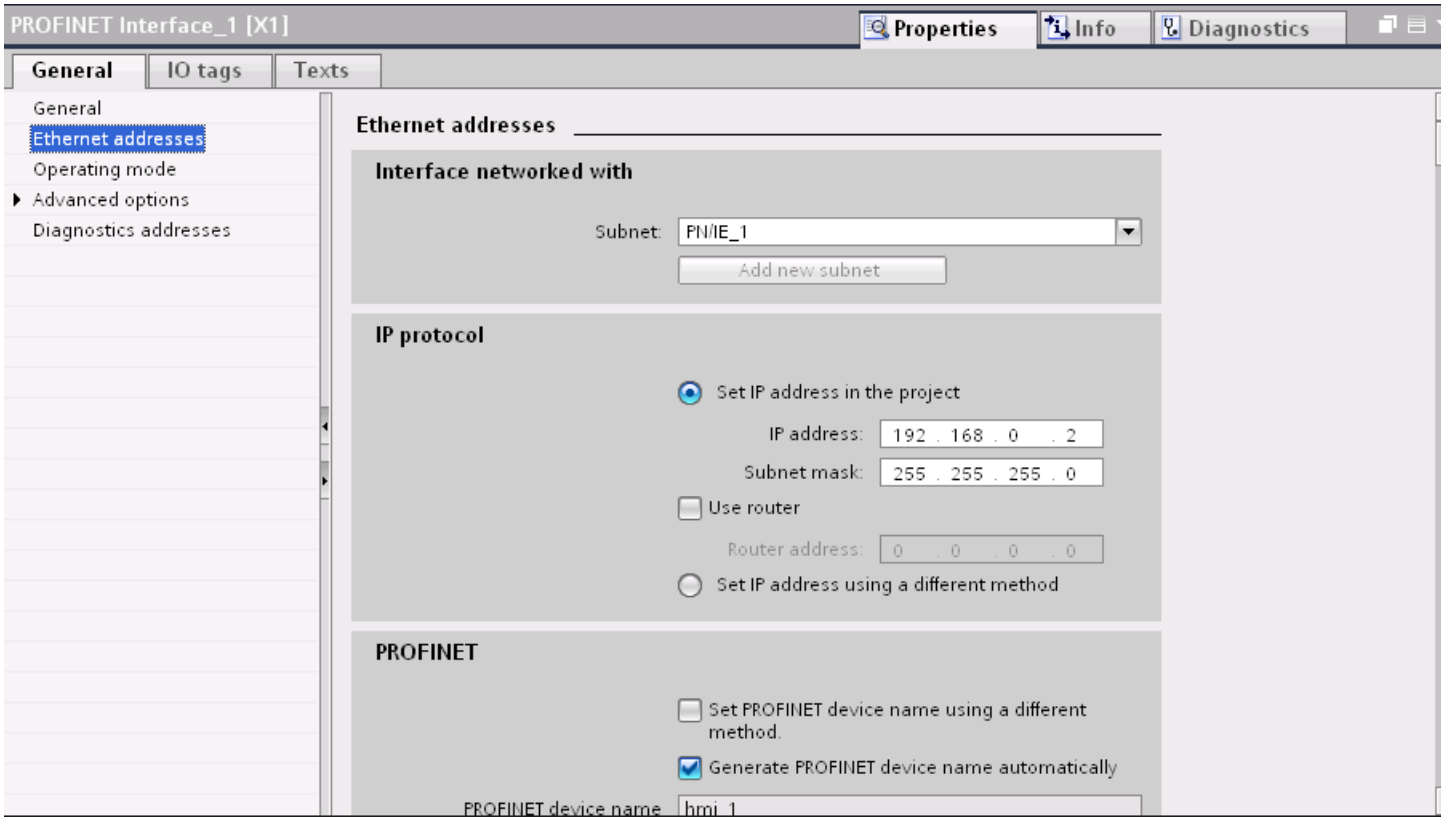
PROFINET parameters for the HMI device

PROFINET parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Set IP address in the project"
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

  Note

  The device is automatically restarted in the case of HMI devices with the Windows CE 3.0 operating system.

  HMI devices with Windows CE 3.0:
  - OP 77B
  - TP 177B color PN/DP
  - TP 177B mono DP
  - OP 177B color PN/DP
  - OP 177B mono DP
  - Mobile Panel 177 PN
  - Mobile Panel 177 DP
  - TP 277 6"
  - OP 277 6"

- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
- "Use IP router"
  If you are using an IP router, select "Use IP router" and enter the router address in the "Router address" field.
- "Set IP address using a different method"
  If the function "Set IP address using a different method" is activated, the IP address is not taken from the project. You have to enter the IP address directly in the Control Panel of the HMI device.

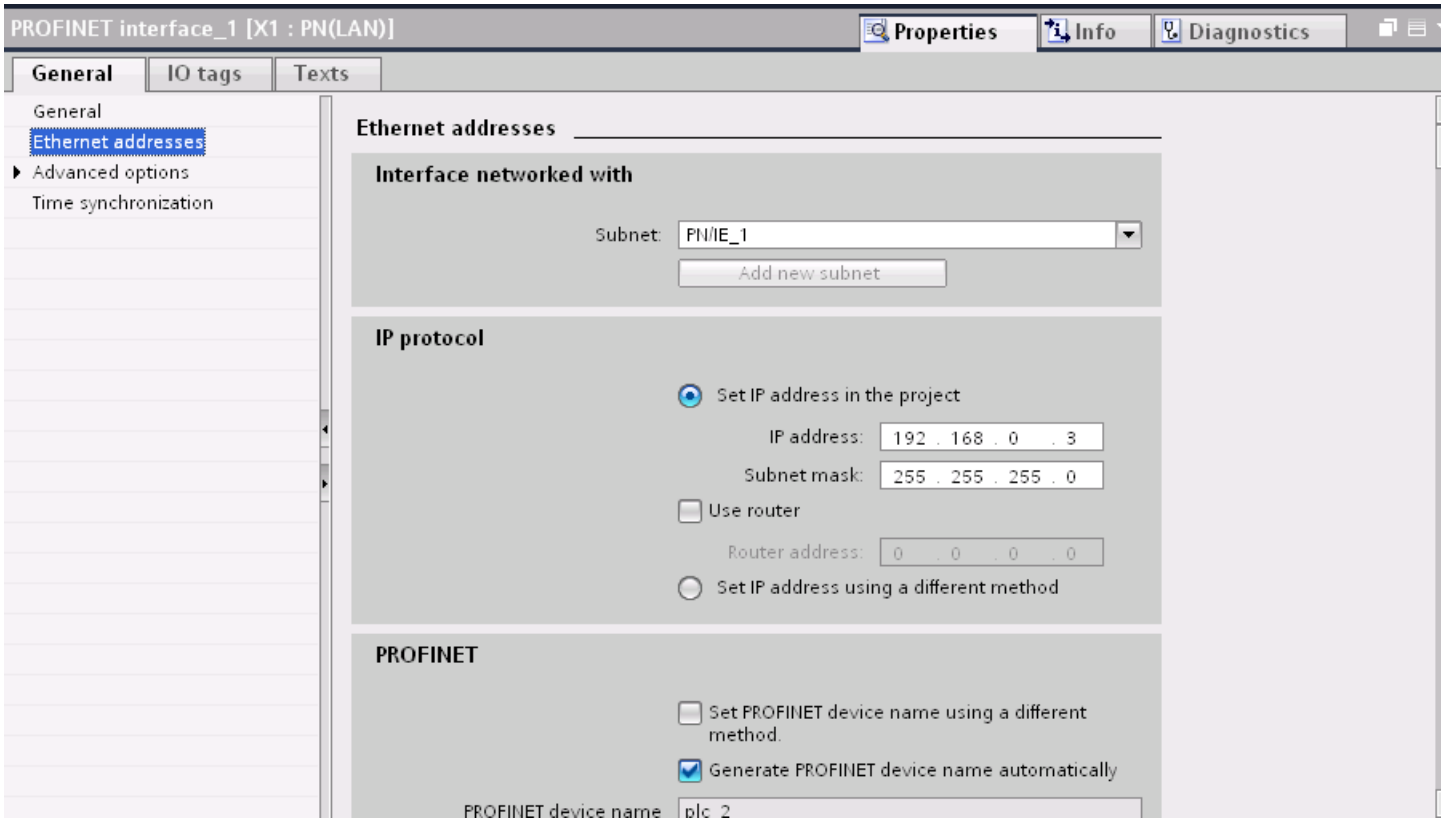
PROFINET parameters for the PLC

PROFINET parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFINET parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"IP protocol"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "IP address"
  You assign the IP address of the HMI device in the "IP address" area.
- "Subnet mask"
  You assign data of the subnet mask in the "Subnet mask" area.
  If you are using an IP router, select "Use IP router" and enter the router address in the field.

Configuring Industrial Ethernet

Rules for the network configuration

The Ethernet interfaces of the devices have a default IP address that you can change.

IP address

The IP parameters are visible if the communication-capable devices support the TCP/IP protocol.

The IP address consists of 4 decimal figures in the range of 0 to 255. The decimal figures are separated from one another by a dot.

Example: 140.80.0.2

The IP address consists of the following:

- The address of the (sub) net
- The address of the node (generally also called host or network node)

Subnet mask

The subnet mask splits these two addresses. It determines which part of the IP address addresses the network and which part of the IP address addresses the node.

The set bits of the subnet mask determine the network part of the IP address.

Example:

Subnet mask: 255.255.0.0 = 11111111.11111111.00000000.00000000

In the example given for the above IP address, the subnet mask shown here has the following meaning:

The first 2 bytes of the IP address identify the subnet - i.e. 140.80. The last two bytes address the node, thus 0.2.

It is generally true that:

- The network address results from AND linking the IP address and subnet mask.
- The node address results from AND NOT linking the IP address and subnet mask.

Relation between IP address and default subnet mask

An agreement exists relating to the assignment of IP address ranges and so-called "Default subnet masks". The first decimal number (from the left) in the IP address determines the structure of the default subnet mask. It determines the number of "1" values (binary) as follows:

IP address (decimal)	IP address (binary)	Address class	Default subnet mask
0 to 126	0xxxxxxx.xxxxxxxx....	A	255.0.0.0
128 to 191	10xxxxxx.xxxxxxxx...	B	255.255.0.0
192 to 223	110xxxxx.xxxxxxxx...	C	255.255.255.0

Note

Range of values for the first decimal point

A value of between 224 and 255 is also possible for the first decimal number of the IP address (address class D etc). This is, however, not recommended because there is no address check for these values.

Masking other subnets

You can use the subnet mask to add further structures and form "private" subnets for a subnet that is assigned one of the address classes A, B or C. This is done by setting other lower points of the subnet mask to "1". For each bit set to "1", the number of "private" networks doubles and the number of nodes they contain is halved. Externally, the network functions like an individual network as it did previously.

Example:

You have a subnet of address class B (e.g. IP address 129.80.xxx.xxx) and change the default subnet mask as follows:

Masks	Decimal	Binary
Default subnet mask	255.255.0.0	11111111.11111111.00000000.00000000
Subnet mask	255.255.128.0	11111111.11111111.10000000.00000000

Result:

All nodes with addresses between 129.80.001.xxx and 129.80.127.xxx are on one subnet, all nodes with addresses between 129.80.128.xxx and 129.80.255.xxx are on another subnet.

Router

The job of the routers is to connect the subnets. If an IP datagram is to be sent to another network, it first has to be conveyed to a router. To make this possible, in this case you have to enter the address of the router for each node in the subnet.

The IP address of a node in the subnet and the address of the router may only differ at the points at which there is a "0" in the subnet mask.

Setting port options

Setting the port options

Changing connection settings for the PROFINET IO port

You can change the network settings for the PROFINET IO port as required. By default, the settings are made automatically. In normal situations, this guarantees problem-free communication.

Possible settings for transmission rate / duplex

Depending on the selected device, you can make the following settings for "Transmission rate / duplex":

- Automatic setting
  Recommended default setting of the port. The transmission settings are automatically "negotiated" with the peer port. The "Enable autonegotiation" option is also enabled as a default, in other words, you can use cross cables or patch cables for the connection.
- TP/ITP at x Mbps full duplex (half duplex)
  Setting of the transmission rate and the full duplex/half duplex mode. The effectiveness depends on the "Enable autonegotiation" setting:
  - Autonegotiation enabled
    You can use both cross cable and patch cable.
  - Autonegotiation disabled
    Make sure that you use the correct cable (patch cable or cross cable)! The port is also monitored with this setting.
- Deactivated
  Depending on the module type, the drop down list box can contain the "- Disabled -" option. This option, for example, allows you to prevent access to an unused port for security reasons. With this setting, diagnostic events are not generated.

"Monitor" option

This option enables or disables port diagnostics. Examples of port diagnostics: The link status is monitored, in other words, the diagnostics are generated during link-down and the system reserve is monitored in the case of fiber optic ports.

Option "Enable autonegotiation "

The autonegotiation setting can only be changed if a concrete medium (for example, TP 100 Mbps full duplex) is selected. Whether or not a concrete medium can be set depends on the properties of the module.

If autonegotiation is disabled, this causes the port to be permanently specified, as for example, is necessary for a prioritized startup of the IO device.

You must make sure the partner port has the same settings because with this option the operating parameters of the connected network are not detected and the data transmission rate and transmission mode can accordingly not be optimally set.

Note

When a local port is connected, STEP 7 makes the setting for the partner port if the partner port supports the setting. If the partner port does not accept the setting, an error message is generated.

Wiring rules for disabled autonegotiation

Requirements

You have made the following settings for the port in question, for example, to accelerate the startup time of the IO device:

- Fixed transmission rate
- Autonegotiation incl. autocrossing disabled

The time for negotiating the transmission rate during startup has been saved.

If you have disabled autonegotiation, you must observe the wiring rules.

Wiring rules for disabled autonegotiation

PROFINET devices have the following two types of ports:

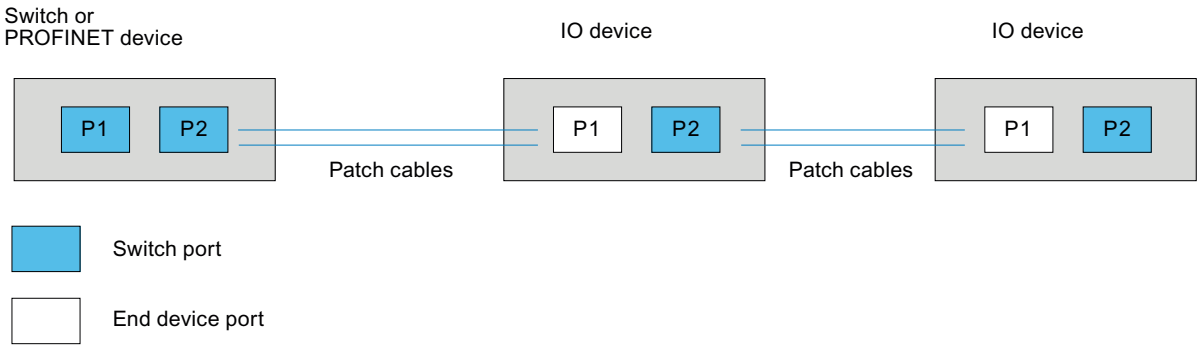
Type of port	PROFINET devices	Note
Switch port with crossed pin assignment	For IO devices: Port 2 For S7 CPUs with 2 ports: Ports 1 and 2	Crossed pin assignment means that the pin assignment for the ports for sending and receiving between the respective PROFINET devices is exchanged internally.
End device port with uncrossed pin assignment	For IO devices: Port 1 For S7 CPUs with one port: Port 1	-

Validity of the wiring rules

The cabling rules described in the following paragraph apply exclusively for the situation in which you have specified a fixed port setting.

Rules for cabling

You can connect several IO devices in line using a single cable type (patch cable). To do this, you connect port 2 of the IO device (distributed I/O) with port 1 of the next IO device. The following graphic gives an example with two IO devices.



Boundaries at the port

Requirements

To use boundaries, the respective device must have more than one port. If the PROFINET does not support boundary settings, they are not shown.

Enable boundaries

"Boundaries" are limits for transmission of certain Ethernet frames. The following boundaries can be set at a port:

- "End of discovery of accessible devices"
  No forwarding of DCP frames to identify accessible devices. Devices downstream from this port cannot be reached by the project tree under "Accessible devices". Devices downstream from this port cannot be reached by the CPU.
- "End of topology discovery"
  LLDP frames (Link Layer Discovery Protocol) are not forwarded for topology detection.
- "End of sync domain"
  No forwarding of sync frames transmitted to synchronize nodes within a sync domain.
  If you operate, for example, a PROFINET device with more than two ports in a ring, you should prevent the sync frame from being fed into the ring by setting a sync boundary (at the ports not inside the ring).
  Additional example: If you want to use several sync domains, configure a sync domain boundary for the port connected to a PROFINET device from the other sync domain.

Restrictions

The following restrictions must be observed:

- The individual check boxes can only be used if the port supports the function in question.
- If a partner port has been determined for the port, the following check boxes cannot be used:
  - "End of discovery of accessible devices"
  - "End of topology discovery"
- If autonegotiation is disabled, none of the check boxes can be used.

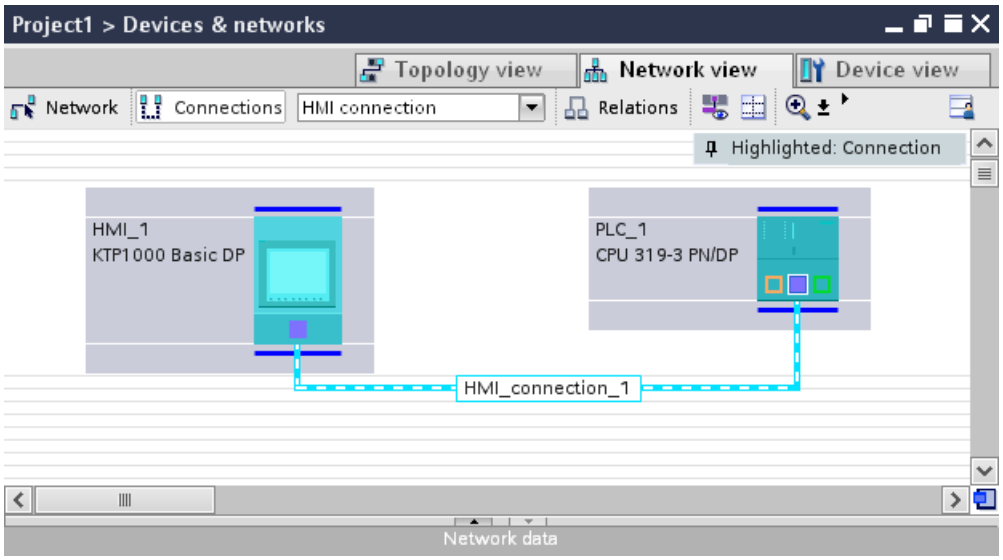
10.11.8.3 Communication via PROFIBUS

Configuring an HMI connection

Communication via PROFIBUS

HMI connections via PROFIBUS

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two PROFIBUS interfaces in the "Devices & Networks" editor.



HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

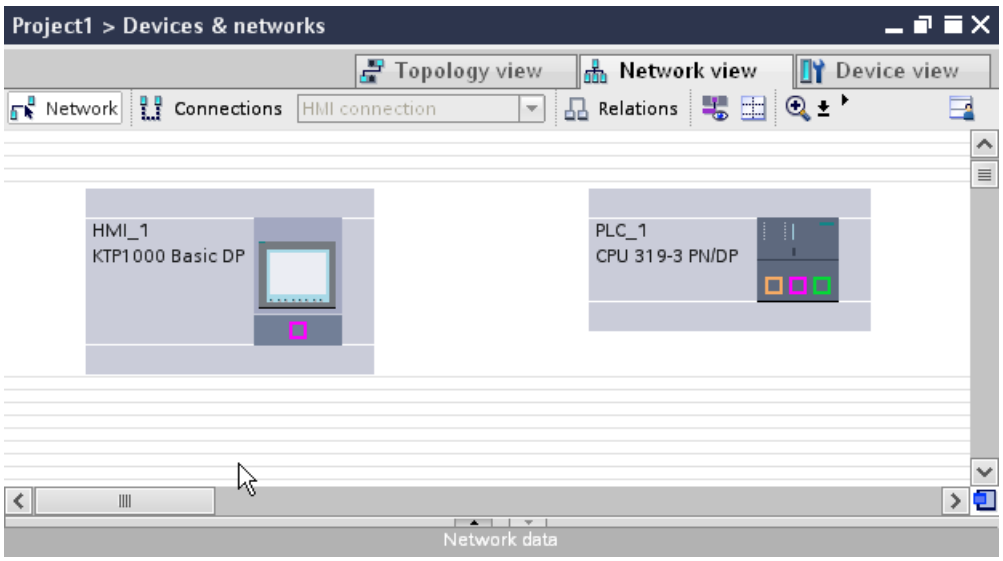
Requirements

The following communication partners are created in the "Devices & Networks" editor:

- HMI device with MPI/DP interface
- SIMATIC S7 300/400 with PROFIBUS interface

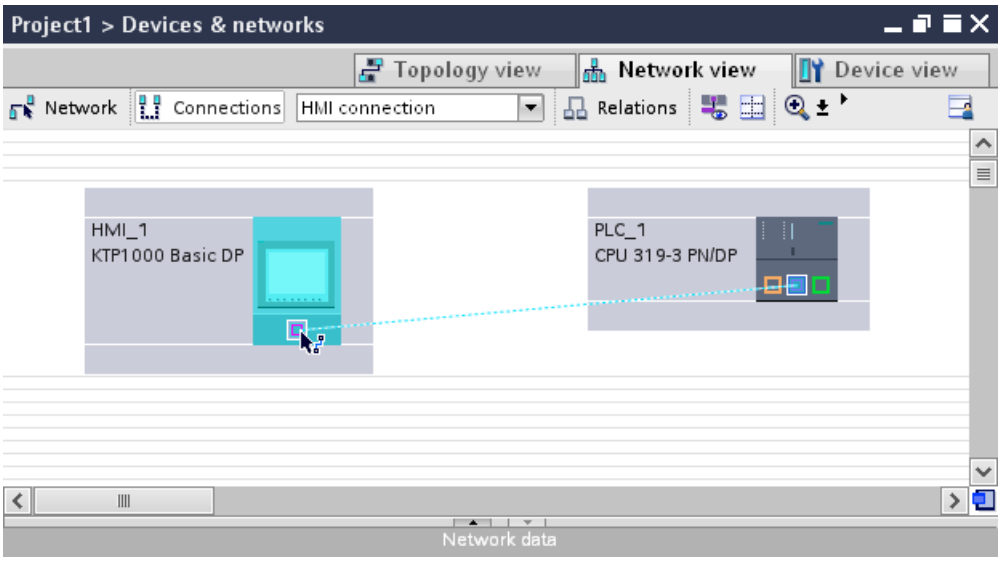
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.



2. Click the "Connections" button.
   The devices available for connection are highlighted in color.
3. Click the HMI device interface.
4. Select the "PROFIBUS" interface type in the Inspector window under "Properties > General > HMI MPIDP > Parameters".

5. Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.



6. Click the connecting line.
7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFINET parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 5149)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via PROFIBUS.

Configuring an HMI connection

Communication via PROFIBUS

Communication via PROFIBUS

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via PROFIBUS.

You can use the following WinCC Runtimes as an HMI device:

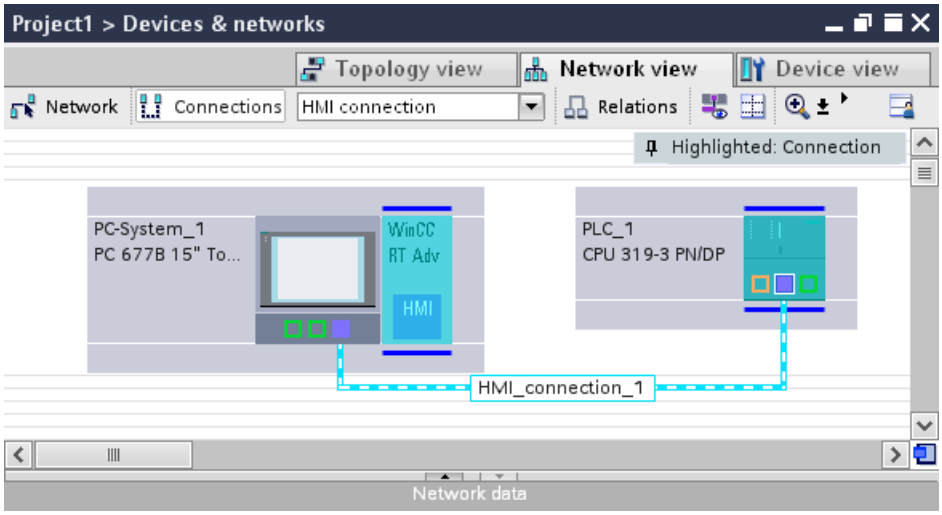
- WinCC RT Advanced
- WinCC RT Professional

WinCC Runtime as HMI device

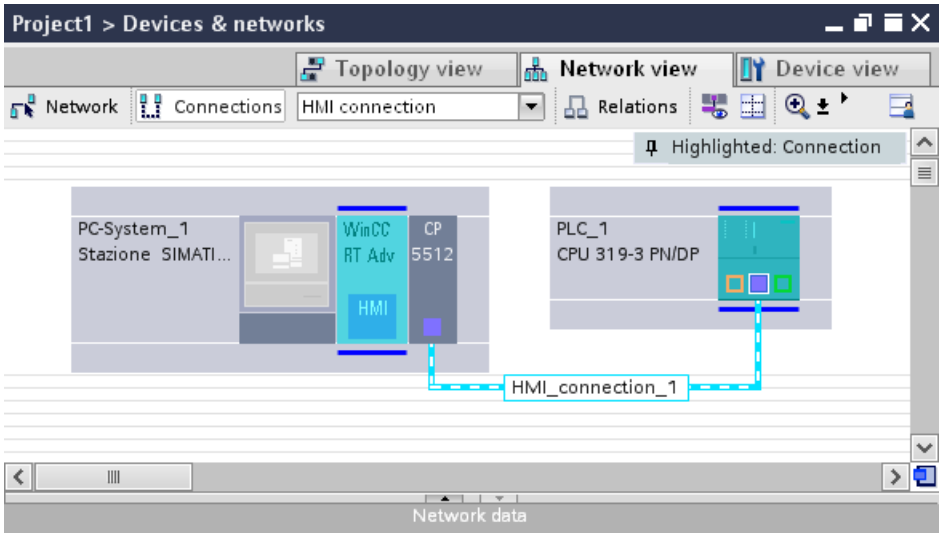
You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.

Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device via PROFIBUS in the "Connections" editor of the HMI device.

Configuring an HMI connection via PROFIBUS with a SIMATIC PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

Requirements

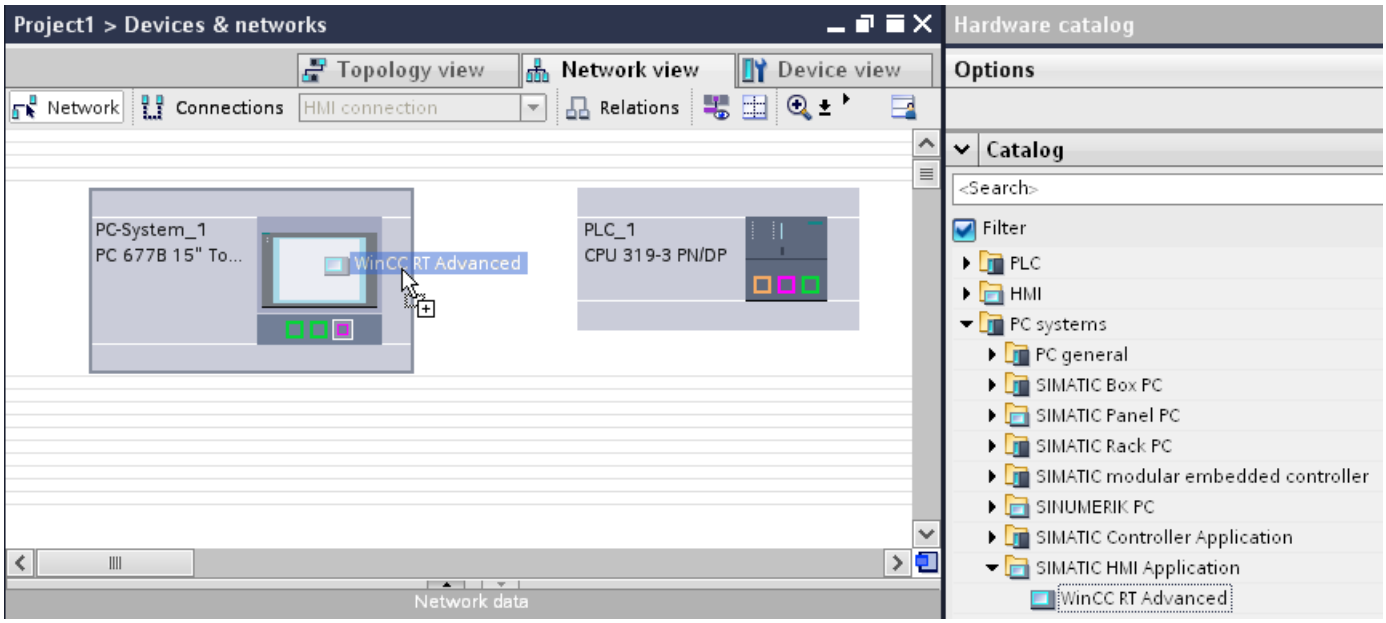
The following communication partners are created in the "Devices & Networks" editor:

- SIMATIC S7 300/400 with PROFIBUS interface
- SIMATIC PC with PROFIBUS interface

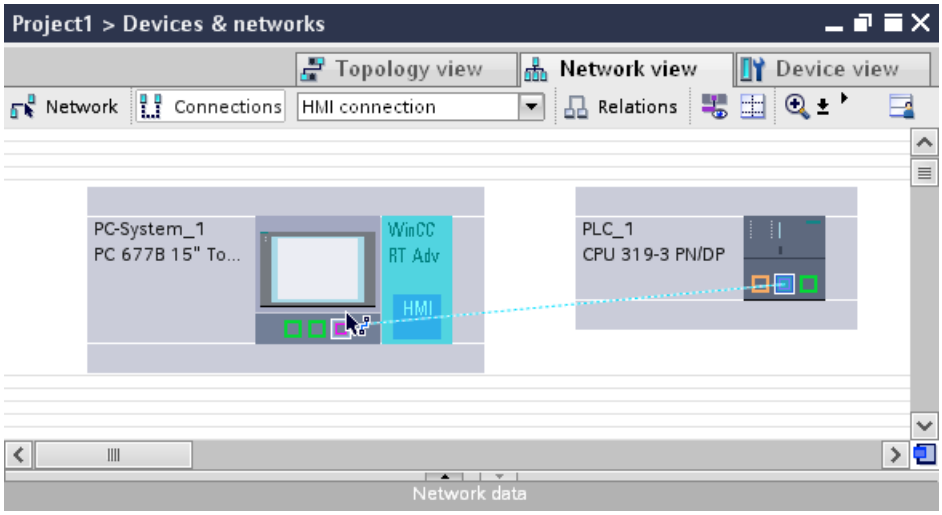
Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Click the MPI interface of the PC and select "PROFIBUS" for the interface type in the Inspector window.

3. Use a drag-and-drop operation to move a WinCC Runtime from the hardware catalog to the PC.



4. Click the "Connections" button and select "HMI connection" for the connection type. The devices available for connection are highlighted in color.
5. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the PC.



6. Click the connecting line.

7. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
8. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 5149)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via PROFIBUS.

Configuring an HMI connection via PROFIBUS with a PC

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via PROFIBUS in the "Devices & Networks" editor.

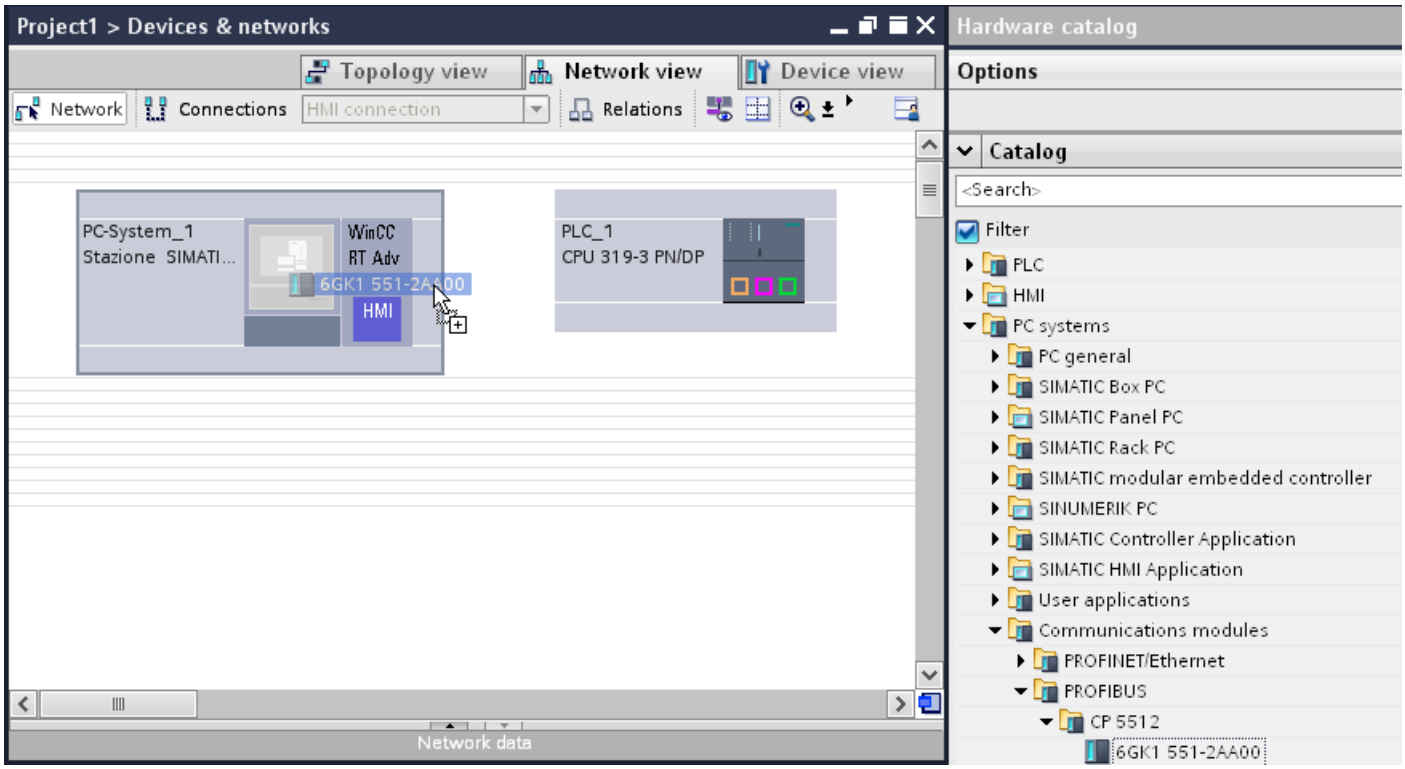
Requirements

The following communication partners are created in the "Devices & Networks" editor:

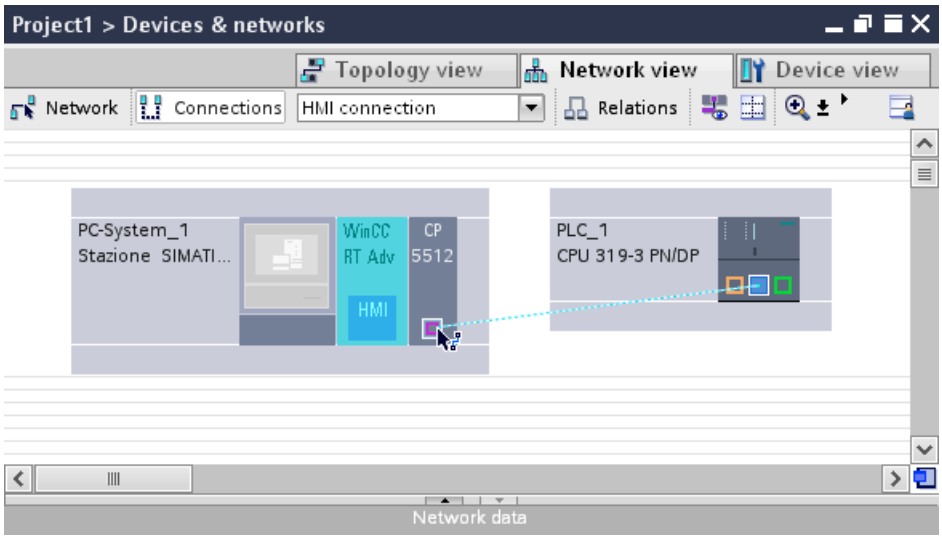
- SIMATIC S7 300/400
- PC station with WinCC RT Advanced

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed in the network view.
2. Use a drag-and-drop operation to move a PROFIBUS-capable communication processor from the hardware catalog to the WinCC Runtime.



3. Click the "Connections" button and select "HMI connection" for the connection type.
   The devices available for connection are highlighted in color.
4. Click the PROFIBUS interface of the PLC and use a drag-and-drop operation to draw a connection to the PROFIBUS interface of the communication processor.



5. Click the connecting line.
6. Click "Highlight HMI connection" and select the HMI connection.
   The connection is displayed graphically in the Inspector window.
7. Click the communication partners in the "Network view" and change the PROFIBUS parameters in the Inspector window according to the requirements of your project.
   See the chapter "PROFIBUS parameters (Page 5149)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. You check the connection parameters in the table.

You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 1200 via PROFIBUS.

PROFIBUS parameters

PROFIBUS parameters for the HMI connection

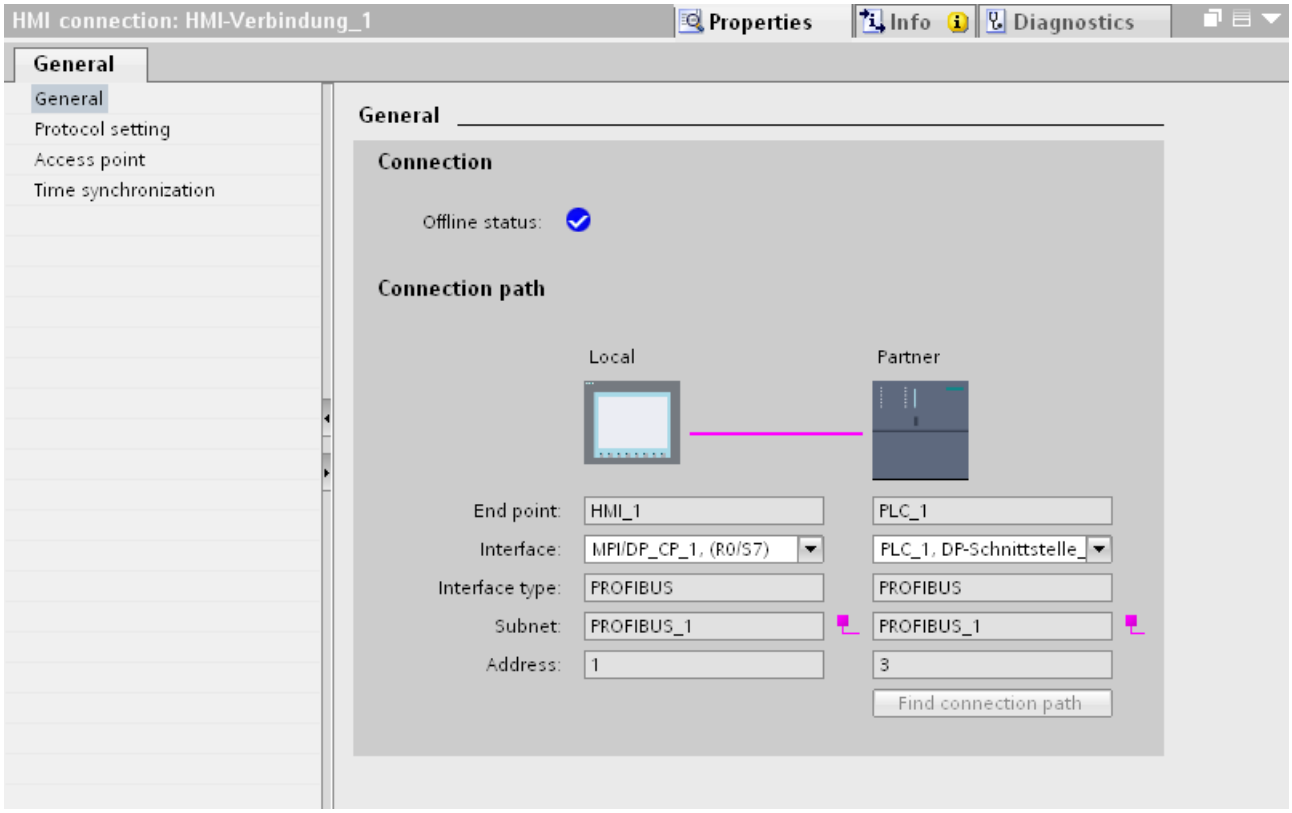
PROFIBUS parameters for the HMI connection

An overview of the configured HMI connection parameters can be found in the properties for the HMI connection.

Only limited changes are possible in this Inspector window.

Displaying and changing the HMI connection parameters

1. Click the HMI connection in the "Devices & Networks" editor.
2. Change the parameters of the HMI connection in the Inspector window under "Properties > General > General".



"Connection"

Displays whether the devices are networked together.

- displayed if the devices are networked together.

- displayed if the devices are not networked together.

"Connection path"

The communication partners of the selected HMI connection and the associated PROFIBUS parameters are displayed in the "Connection path" area. Some of the areas displayed cannot be edited in this dialog.

- "End point"
  Displays the device name. This area is not editable.
- "Interface"
  Displays the selected interface of the device. You can choose between several interfaces, depending on the device.

- "Interface type"
  Displays the selected interface type. This area is not editable.
- "Subnet"
  Displays the selected subnet. This area is not editable.
- "Address"
  Displays the PROFIBUS address of the device. This area is not editable.
- "Find connection path" button
  Enables the subsequent specification of connections.

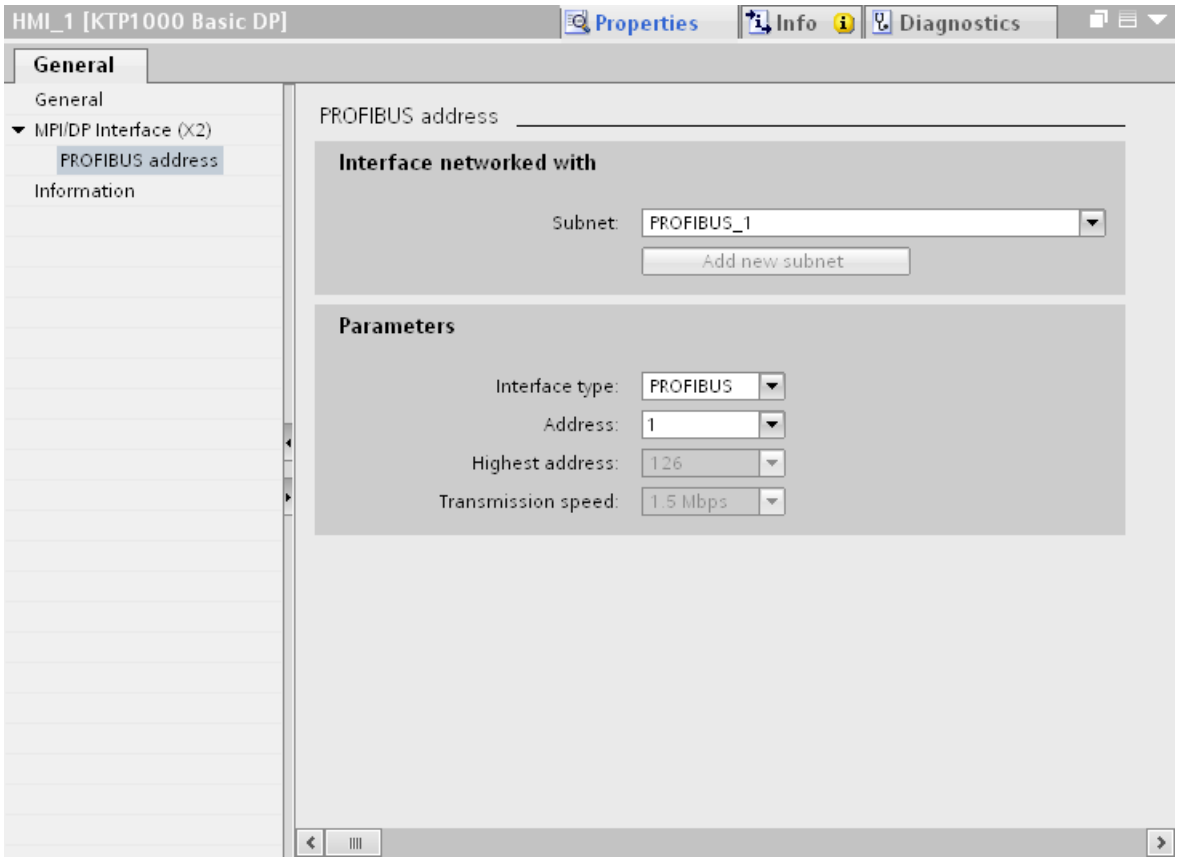
PROFIBUS parameters for the HMI device

PROFIBUS parameters for the HMI device

An overview of the configured HMI device parameters can be found in the properties for the HMI device.

Displaying and changing PROFINET parameters of the HMI device

1. Click the HMI device in the "Devices & Networks" editor.
2. Change the parameters of the HMI device in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Interface networked with" area, select the subnet of the HMI connection via which the HMI device is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  You assign the interface type in the "Interface type" area. Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

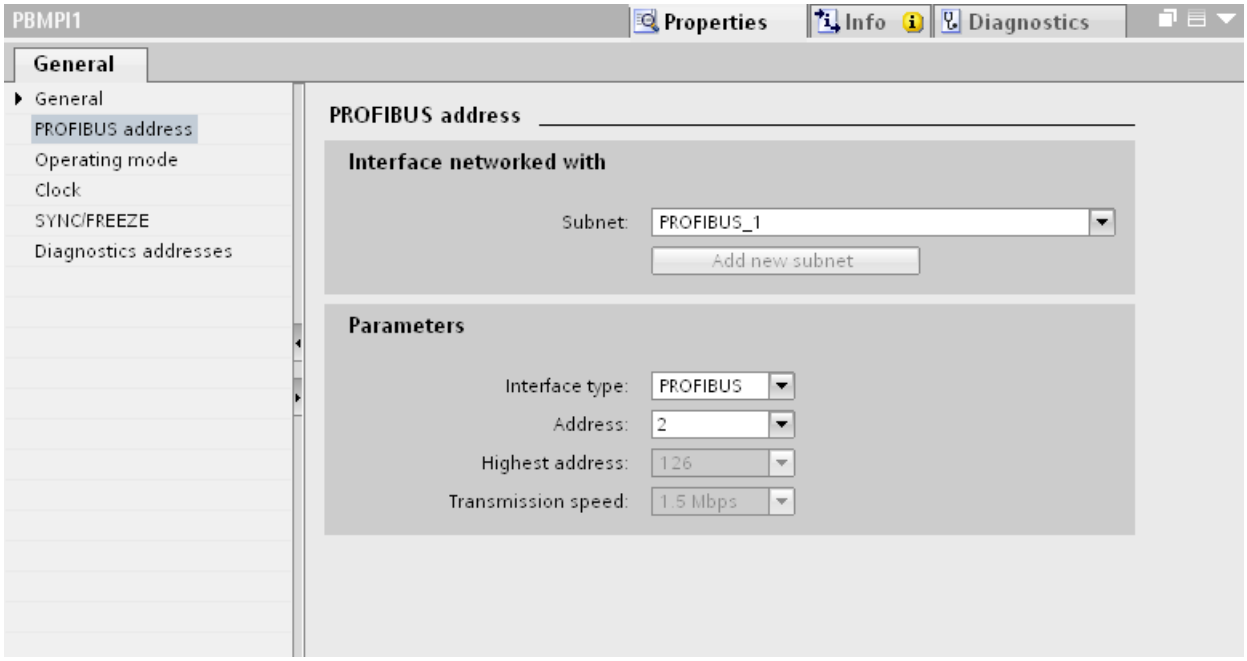
PROFIBUS parameters for the PLC

PROFIBUS parameters for the PLC

An overview of the configured parameters can be found in the properties for the PLC.

Displaying and changing PROFIBUS parameters of the PLC

1. Click the PLC in the "Devices & Networks" editor.
2. Change the parameters of the PLC in the Inspector window under "Properties > General > General".



"Interface networked with"

In the "Subnet" area, select the subnet of the HMI connection via which the PLC is connected to the network. You use the "Add new subnet" button to create a new subnet.

"Parameters"

- "Interface type"
  Depending on the HMI device type, you have various interfaces to choose from.
- "Address"
  You assign the PROFIBUS address of the HMI device in the "Address" area. The PROFIBUS address must be unique throughout the PROFIBUS network.
- "Highest address"
  The "Highest address" area displays the highest address of the PROFIBUS network.
- "Transmission speed"
  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

Bus profiles with PROFIBUS

Introduction

Depending on the device types connected and protocols used on the PROFIBUS, different profiles are available. The profiles differ in terms of the setting options and calculation of bus parameters. The profiles are explained below.

Devices with different profiles on the same PROFIBUS subnet

The PROFIBUS subnet only functions without problem if the bus parameters of all devices have the same values.

Profiles and transmission rates

Profiles	Supported transmission speeds in Kbits/s
DP	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Standard	9,6 19,2 45,45 93,75 187,5 500 1500 3000 6000 12000
Universal	9,6 19,2 93,75 187,5 500 1500

Meaning of profiles

Profile	Meaning
DP	Select the "DP" bus profile when the only devices connected to the PROFIBUS subnet are those which satisfy the requirements of standard EN 50170 Volume 2/3, Part 8-2 PROFIBUS. The bus parameter setting is optimized on these devices. This includes devices with DP master and DP slave interfaces of the SIMATIC S7 and distributed I/Os of other manufacturers.
Standard	Compared to the "DP" profile, the "Standard" profile also offers scope for devices of another project or devices which have not been configured here to be taken into account when calculating the bus parameters. The bus parameters are then calculated following a simple, non-optimized algorithm.
Universal	Select the "Universal" bus profile when individual devices on the PROFIBUS subnet use the PROFIBUS-FMS service. This includes the following devices for example: • CP 343-5 • PROFIBUS-FMS devices of other manufacturers As with the "Standard" profile, this profile allows you to take other devices into account when calculating the bus parameters.

10.11.8.4 Communication via MPI

Configuring an HMI connection

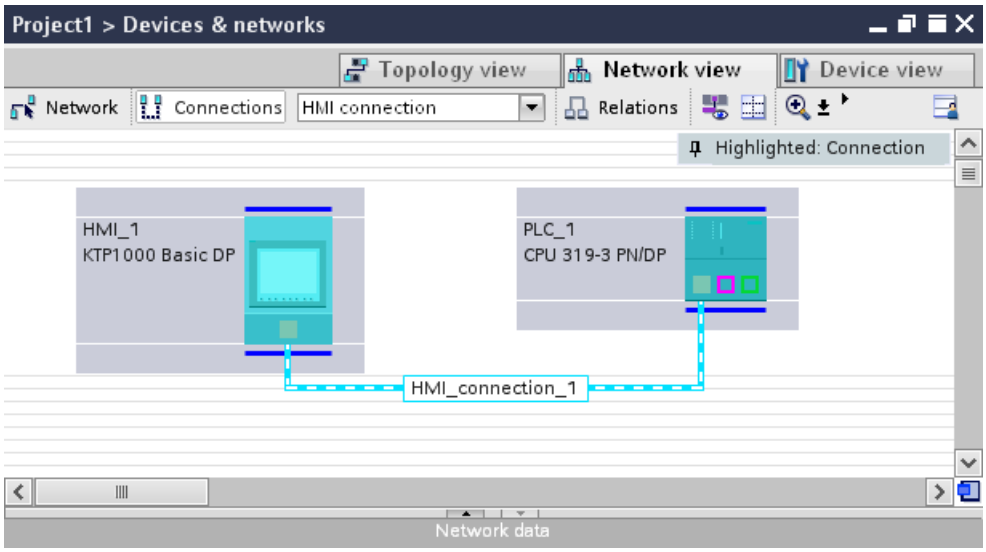
Communication via MPI

HMI connections via MPI

If you have inserted an HMI device and a SIMATIC S7 300/400 into the project, you interconnect the two MPI interfaces in the "Devices & Networks" editor.

HMI connection in the "Devices & Networks" editor

You configure the HMI connection between the PLC and the HMI device via PROFIBUS in the "Devices & Networks" editor.



Connection in the "Connections" editor

Alternatively, you configure the connection between the PLC and HMI device in the "Connections" editor of the HMI device.

Configuring an HMI connection via MPI

Introduction

You configure an HMI connection between HMI devices and a SIMATIC S7 300/400 via MPI in the "Devices & Networks" editor.

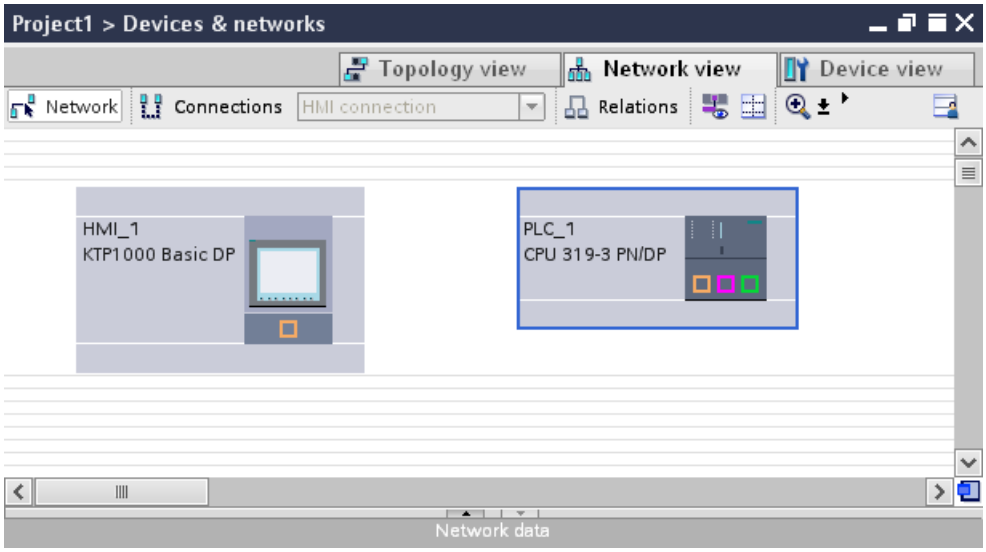
Requirements

The following communication partners are created in the "Devices & Networks" editor:

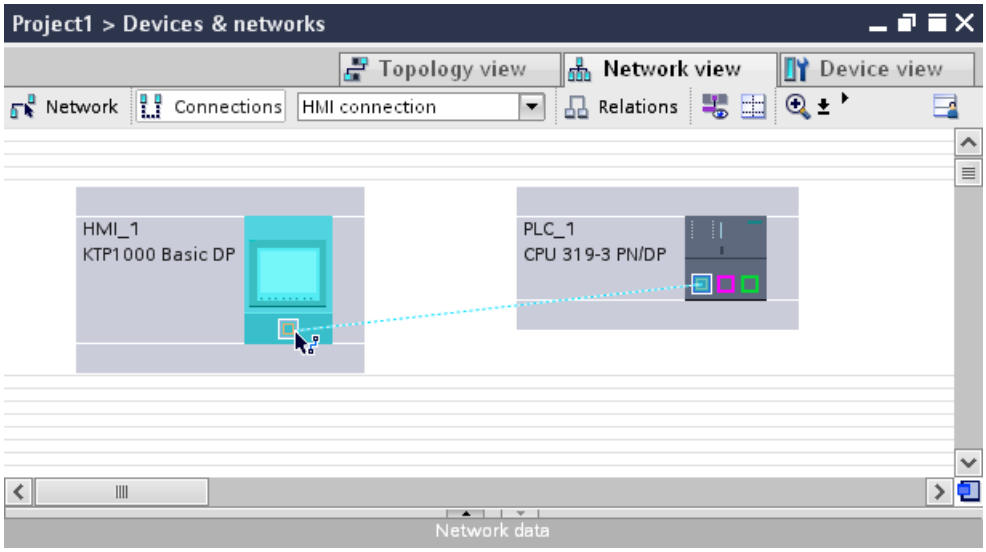
- HMI device with MPI/DP interface
- SIMATIC S7 300/400 with MPI/DP interface

Procedure

1. Double-click the "Devices & Networks" item in the project tree.
   The available communication partners in the project are displayed graphically in the network view.



2. Click the "Connections" button.
   The devices available for connection are highlighted in color.
3. Click the interface of the PLC and use a drag-and-drop operation to draw a connection to the HMI device.



4. Click the connecting line.
   The connection is displayed graphically in the Inspector window.
5. Click "Highlight HMI connection" and select the HMI connection.
6. Click the communication partners in the "Network view" and change the MPI parameters in the Inspector window according to the requirements of your project.
   See the chapter "MPI parameters (Page 5162)" for additional details.

Note

The created HMI connection is also shown in the tabular area of the editor on the "Connections" tab. Use the table to monitor the connection parameters and change the connection partner. You can change the local name for the connection only in the table.

Result

You have created an HMI connection between an HMI device and a SIMATIC S7 300/400 via MPI.

Configuring an HMI connection

Communication via MPI

Communication via MPI

This section describes the communication between a WinCC Runtime and the SIMATIC S7 300/400 PLC via MPI.

You can use the following WinCC Runtimes as an HMI device:

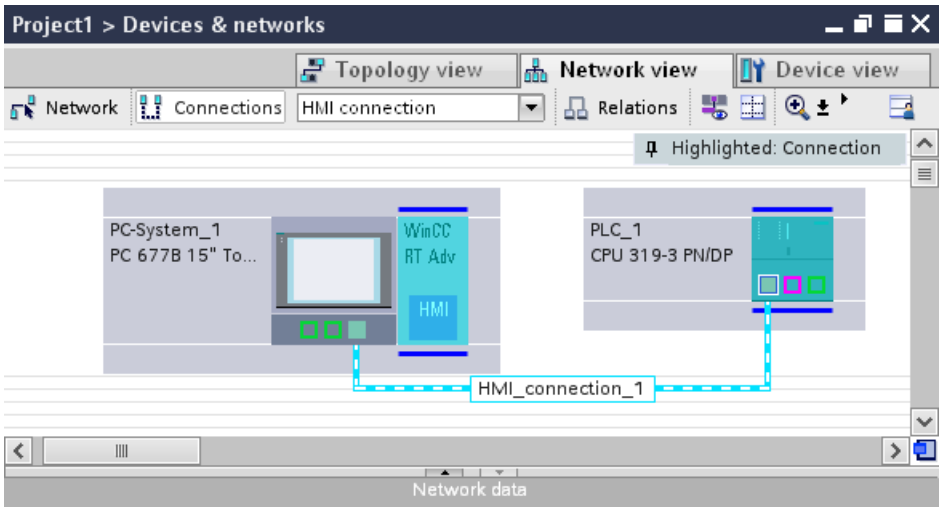
- WinCC RT Advanced

WinCC Runtime as HMI device

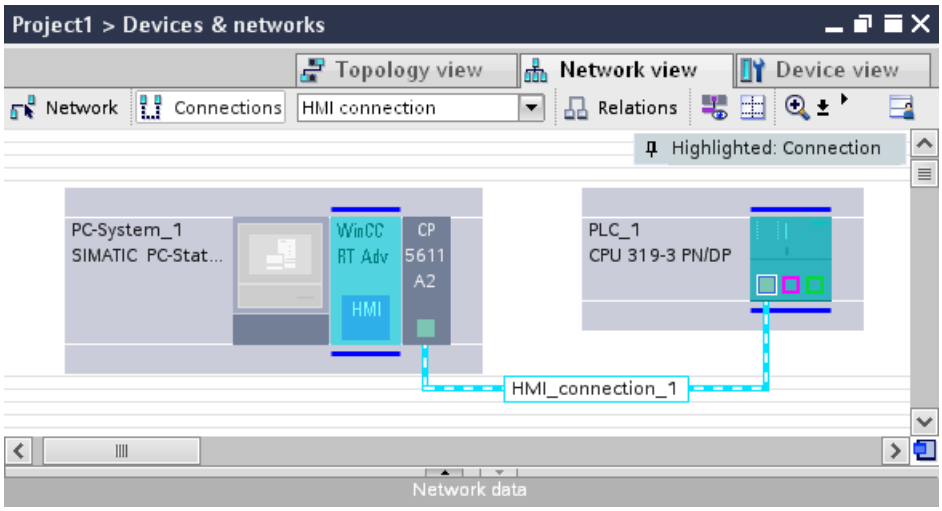
You configure the HMI connections between WinCC Runtime and SIMATIC S7 300/400 in the "Devices & Networks" editor.

If you want to use a WinCC Runtime as an HMI device, you have the following options:

1. You create a SIMATIC PC and configure a WinCC Runtime on this SIMATIC PC.
   In this way you use the SIMATIC PC with a WinCC Runtime as an HMI device.



2. You create a WinCC Runtime and configure a communication processor to the Runtime.
   In this way you use your configuration PC with a WinCC Runtime as an HMI device.



You can also connect multiple HMI devices to one SIMATIC S7 300/400 and multiple SIMATIC S7 300/400s to one HMI device. The maximum number of communication partners that you can connect to an HMI device is dependent on the HMI device used.

Additional information is available in the documentation for the respective HMI device.

  The "Transmission speed" is determined by the slowest device connected to the network. The setting is identical throughout the network.

Addressing of the PLC via MPI

Introduction

Each communication partner must be assigned an MPI network address.

Each S7 module which supports communication functions and is operated the SIMATIC S7-300/400 PLC is assigned a unique MPI address. Only one CPU may be used per rack.

Note

HMI devices cannot be operated with incorrect addressing

Always avoid redundant addressing on the MPI bus.

MPI address of the communication partner of a SIMATIC S7-300

When assigning addresses, you have to distinguish between communication partners with and without separate MPI address.

- If the communications partner has its own MPI address, you only need to define the MPI address.
- If the communication partners do not have a separate MPI address, specify the MPI address of the communications partner used for the connection. In addition, define the slot and rack of a communication partner without its own MPI address.

MPI address of the communication partner of a SIMATIC S7-400

Only S7 modules with an MPI connector are assigned an MPI address. Modules without an MPI connector are addressed indirectly:

- MPI address of the module to which the HMI is connected.
- The slot and the rack of the module with which the HMI device communicates.

10.11.8.5 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 4956)

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" or "40" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+4 [1]	Reserved			Reserved		
n+5 [1]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

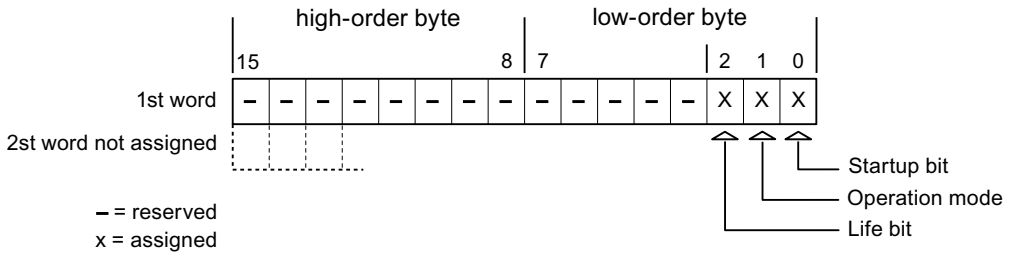
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Application

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

"Project ID" area pointer

Function

When Runtime starts it can check to see if the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

Use

To use this area pointer, set up the following during the configuration:

- Define the version of configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections" under "Address".

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

"Job mailbox" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)** [3) 4)]	

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [2]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1]	Only for devices supporting recipes.
[2]	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
[3]	The weekday is ignored on HMI device KTP 600 BASIC PN.
[4]	The weekday is ignored when you configure the "Date/Time PLC" area pointer.

"Data record" area pointer

"Data record" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization via the data mailbox

Data records are always transferred directly, which means that the tag values are read straight from an address or written straight to an address configured for this tag without being redirected via an interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system alarm.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then, for example, process, edit, or save these values in the HMI device.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data mailbox free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer started by the operator in the recipe view

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data record.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxs No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.

Step	Action	
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible
- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3237)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

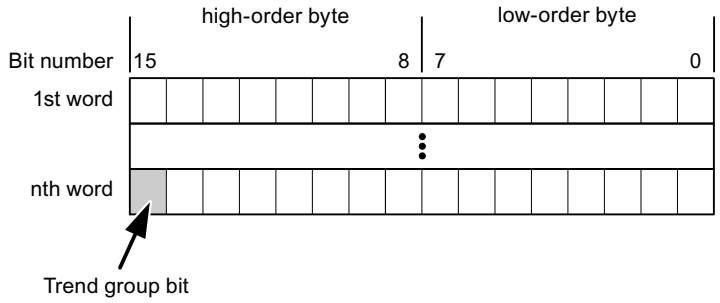
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3260)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 300/400	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, COUNTER, TIME

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

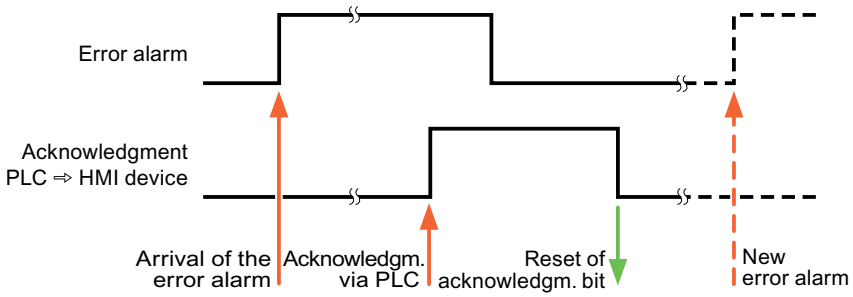
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

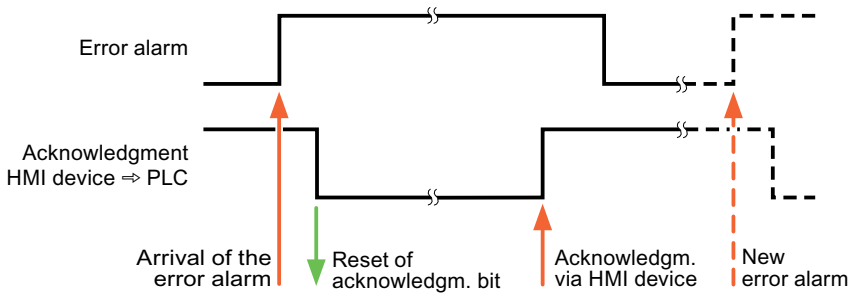
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels	Panel PCs:
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

10.11.8.6 Performance features of communication

Permitted data types for SIMATIC S7 300/400

Permitted data types for connections with SIMATIC S7 300/400

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Length
BOOL	1-bit
BYTE	1 byte
WORD	2 bytes
DWORD	4 bytes
CHAR	1 byte
INT	2 byte
DINT	4 bytes
REAL	4 bytes
TIME	4 bytes
DATE	2 bytes
TIME_OF_DAY, TOD	4 bytes
S5TIME	2 bytes
COUNTER	2 bytes

Data type	Length
TIMER	2 bytes
DATE_AND_TIME	8 bytes
STRING	(2+n) bytes, n = 0 to 254

10.11.8.7 Creating connections in the "Connections" editor

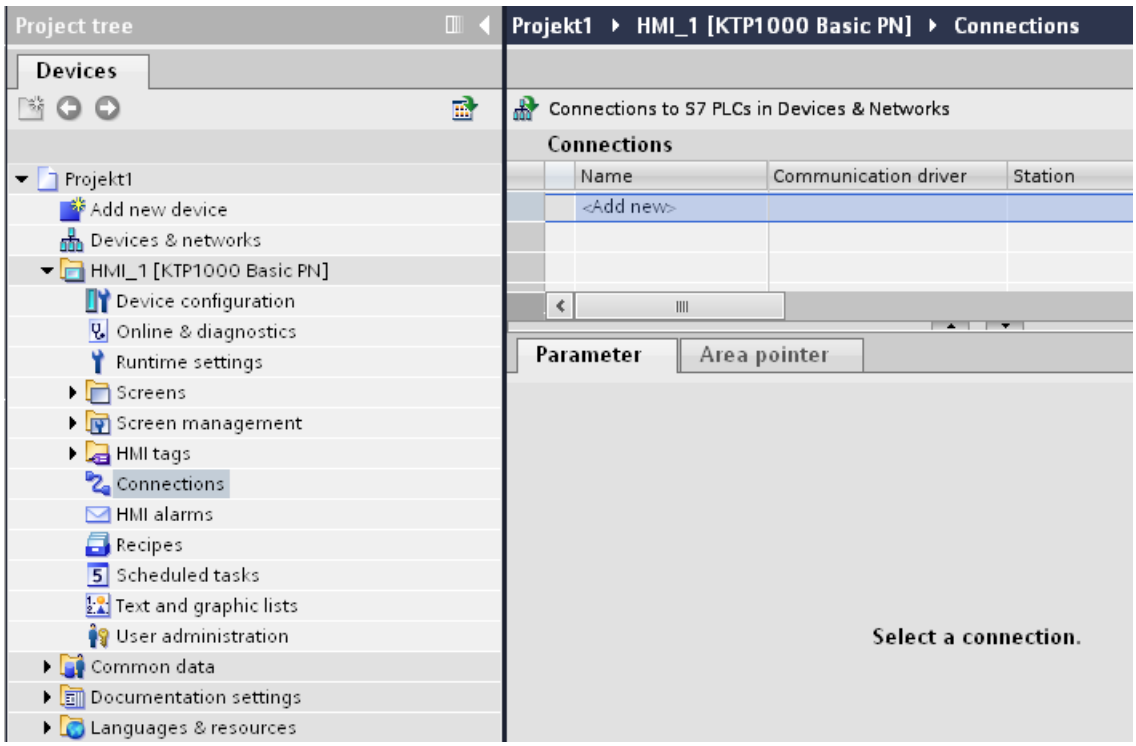
Creating a PROFINET connection

Requirements

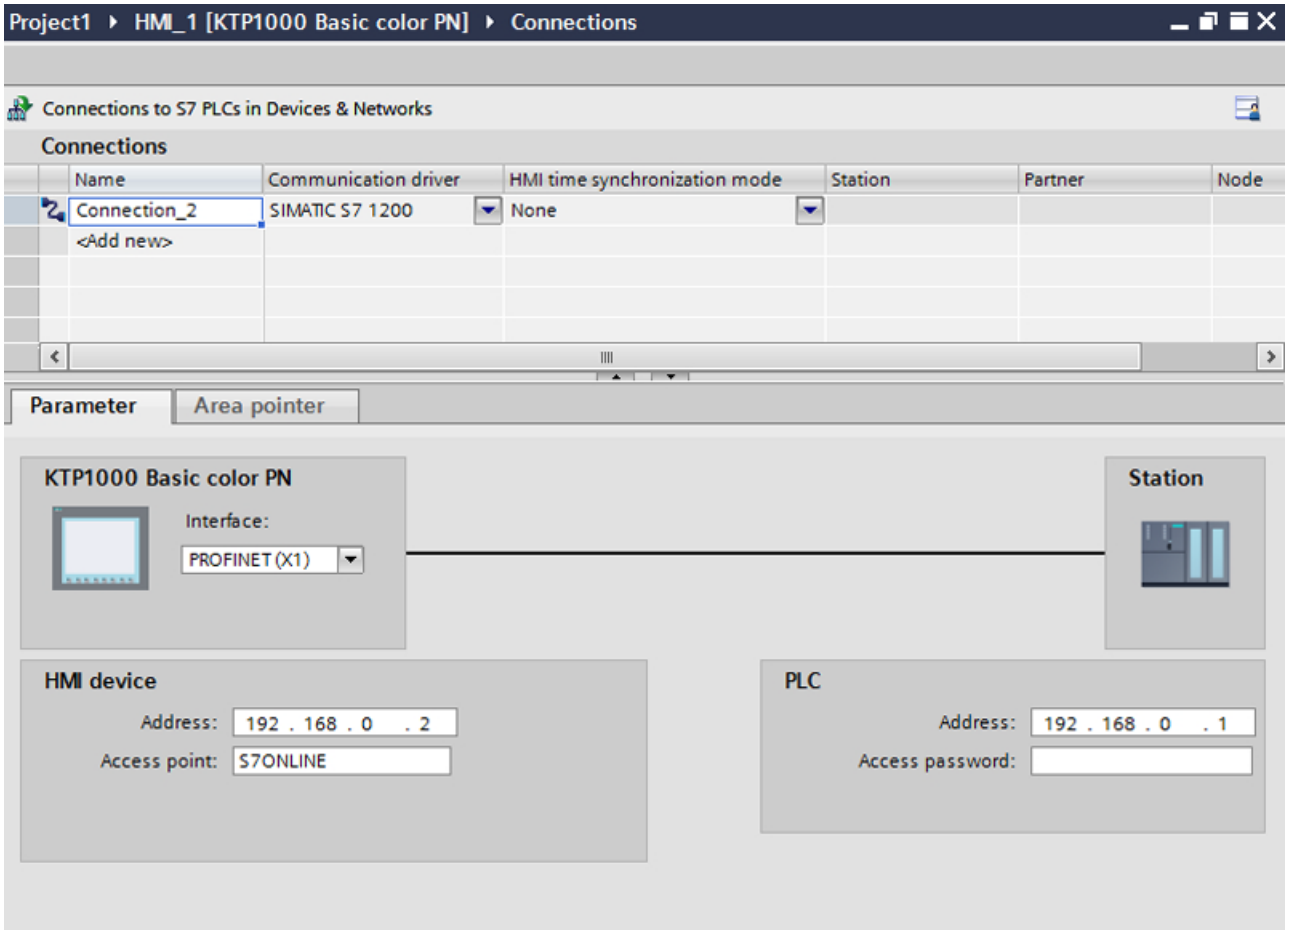
- A project is open.
- An HMI device with a PROFINET interface has been created.

Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.



4. Click the name of the connection.
5. Select a PROFINET interface of the HMI device in the Inspector window under "Parameters > Interface".
6. Set the IP addresses of the communication partners in the Inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

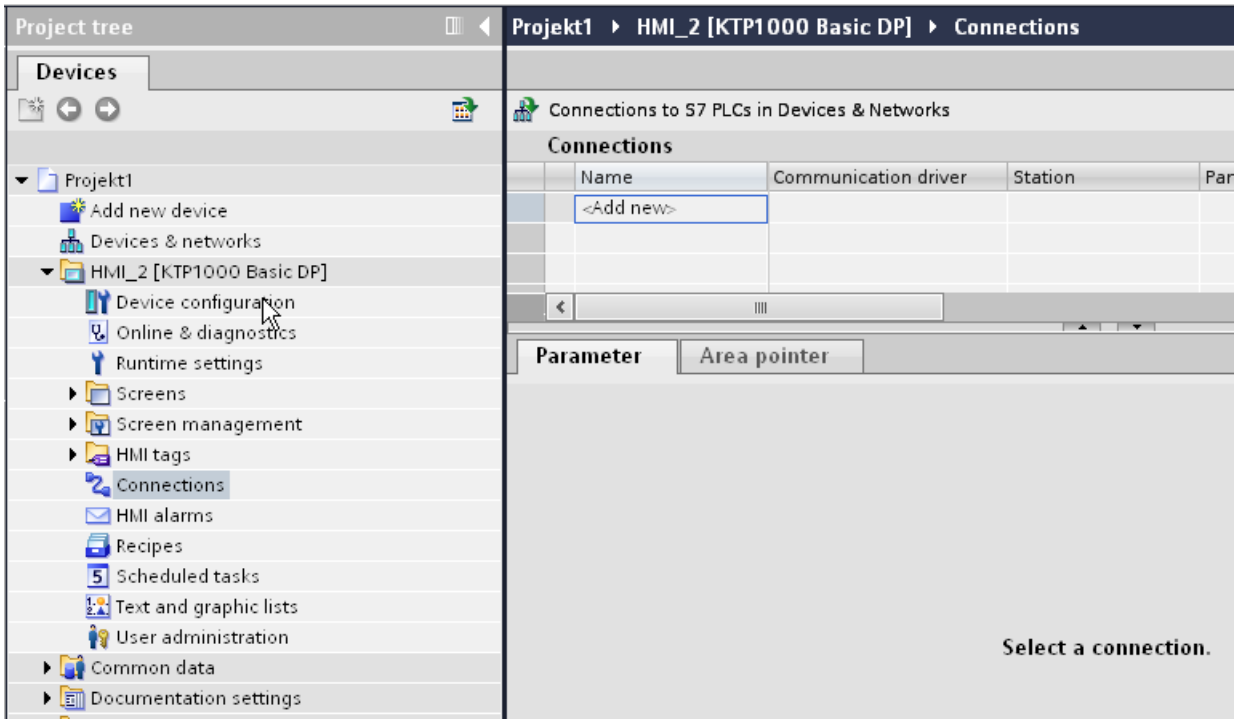
Creating a PROFIBUS connection

Requirements

- A project is open.
- An HMI device with a PROFIBUS interface has been created.

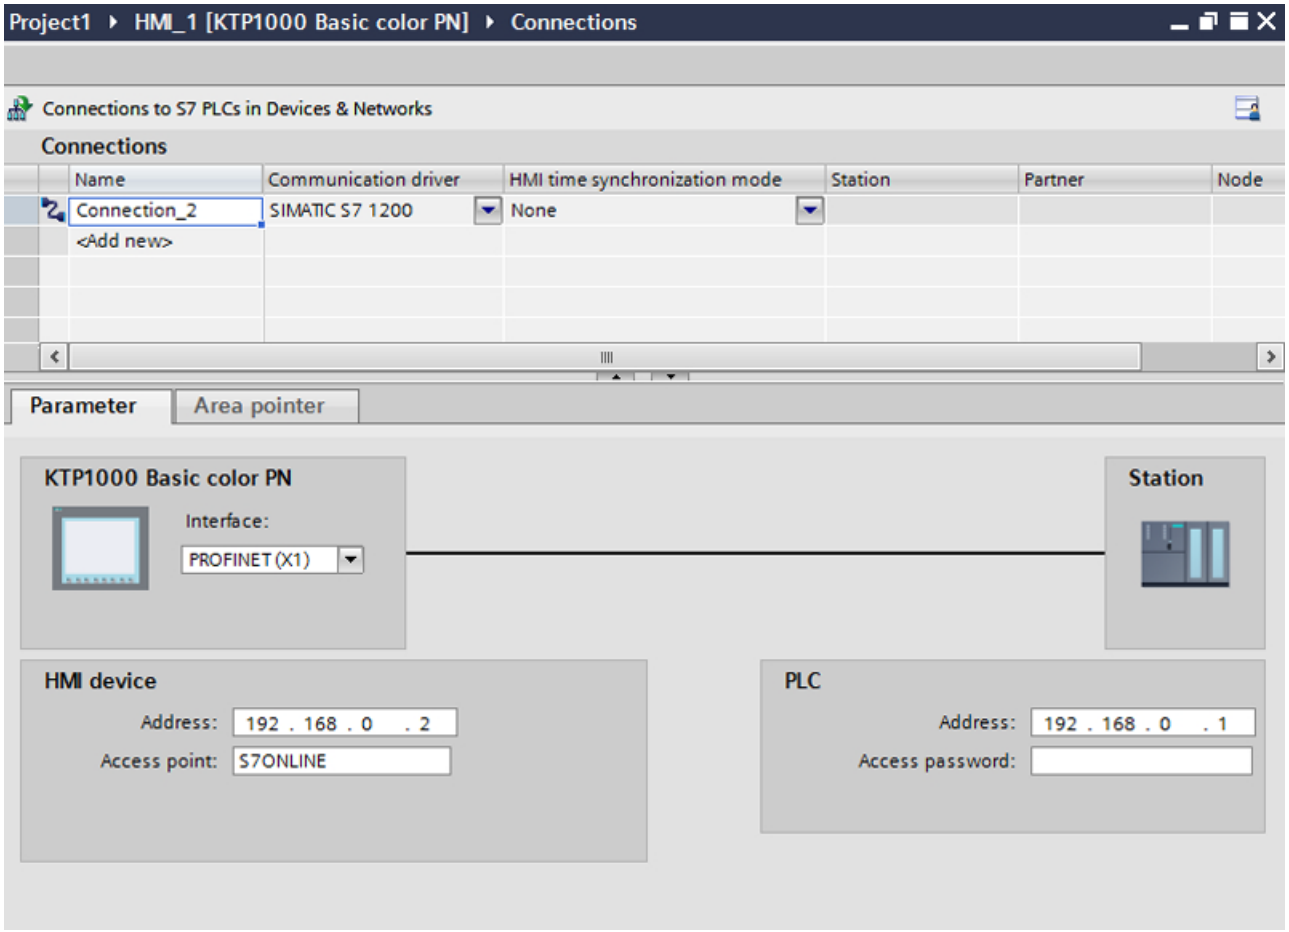
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters > Interface".

6. Select the "DP" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

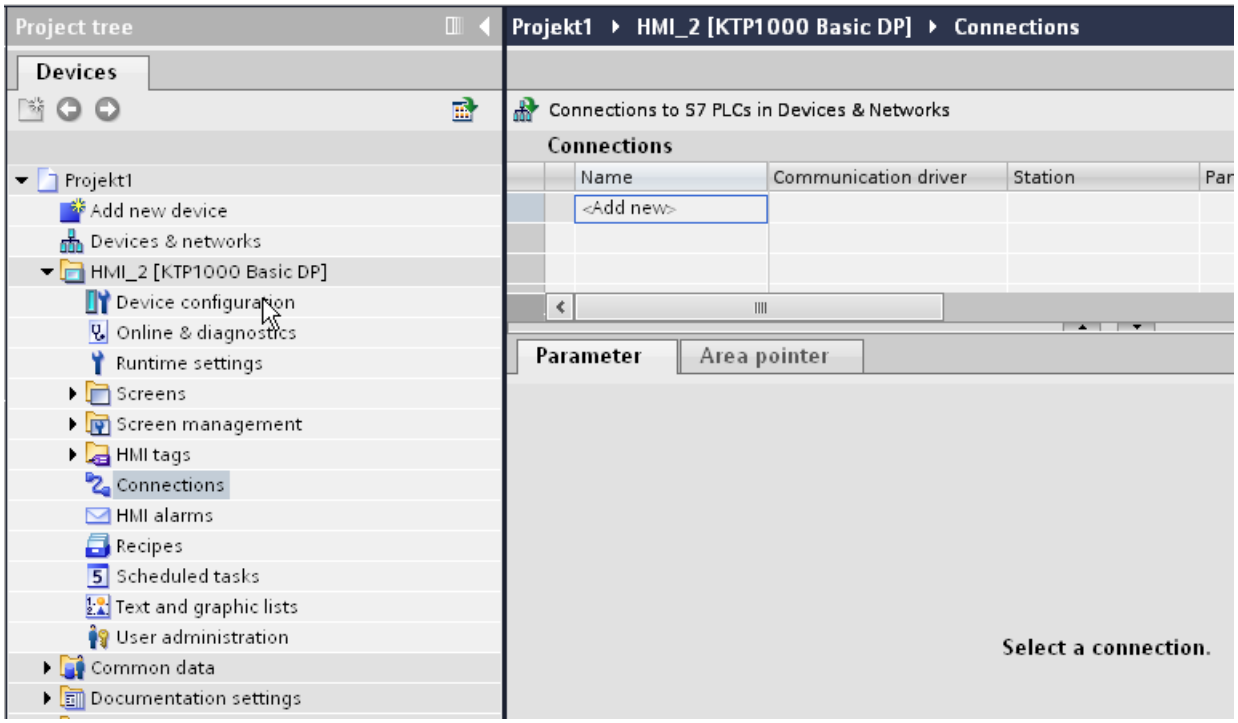
Creating an MPI connection

Requirements

- A project is open.
- An HMI device with an MPI interface has been created.

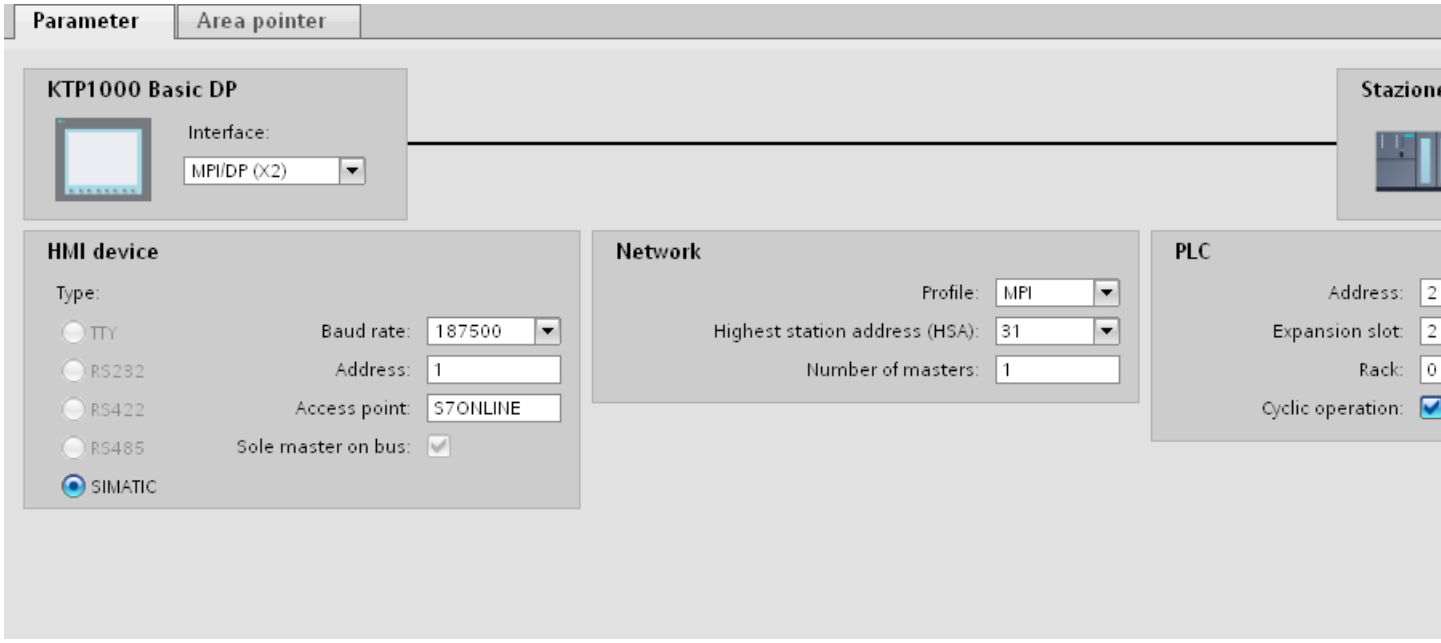
Procedure

1. Open the "Connections" editor of the HMI device.
2. Double-click "<Add>".



3. Select the driver in the "Communication driver" column.
4. Click the name of the connection.
5. Select the "MPI/DP" interface in the Inspector window under "Parameters > Interface".

6. Select the "MPI" profile in the Inspector window under "Parameters > Network".



7. Set the addresses of the communication partners in the inspector window:
   - HMI device: "Parameters > HMI device > Address"
   - PLC: "Parameters > PLC > Address"

Parameters for the connection

Parameters for the connection (SIMATIC S7 300/400)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.

Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"

- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.

- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.

- "Expansion slot"
  Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"
  Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.
  Disable cyclic mode if you are operating several HMI devices in parallel.

PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7 200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200 PLCs.

MPI parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the MPI network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  For "Address", you set the MPI address of the HMI device. The MPI address must be unique throughout the MPI network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.
  In S7 200, you must set an HMI device as the master.

Parameters for the network

Under "Network", you set the parameters for the MPI network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "MPI". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"
  This setting is not required for MPI.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the MPI address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic mode"
  When cyclic mode is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This improves system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200.

Cyclic operation

Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

10.11.9 Communicating with SIMATIC S7 200

10.11.9.1 Communication with SIMATIC S7 200

Introduction

This section describes the communication between an HMI device and the SIMATIC S7 200 PLC.

You can configure the following communication channels for the SIMATIC S7 200 PLC:

- PROFINET and Ethernet
- PROFIBUS
- MPI
- PPI

HMI connection for communication

You configure connections between the HMI device and a SIMATIC S7 200 in the "Connections" editor of the HMI device.

10.11.9.2 Creating a connection to SIMATIC S7 200

Introduction

You configure a connection to the SIMATIC S7 200 PLC in the "Connections" editor of the HMI device. The interfaces are named differently depending on the HMI device.

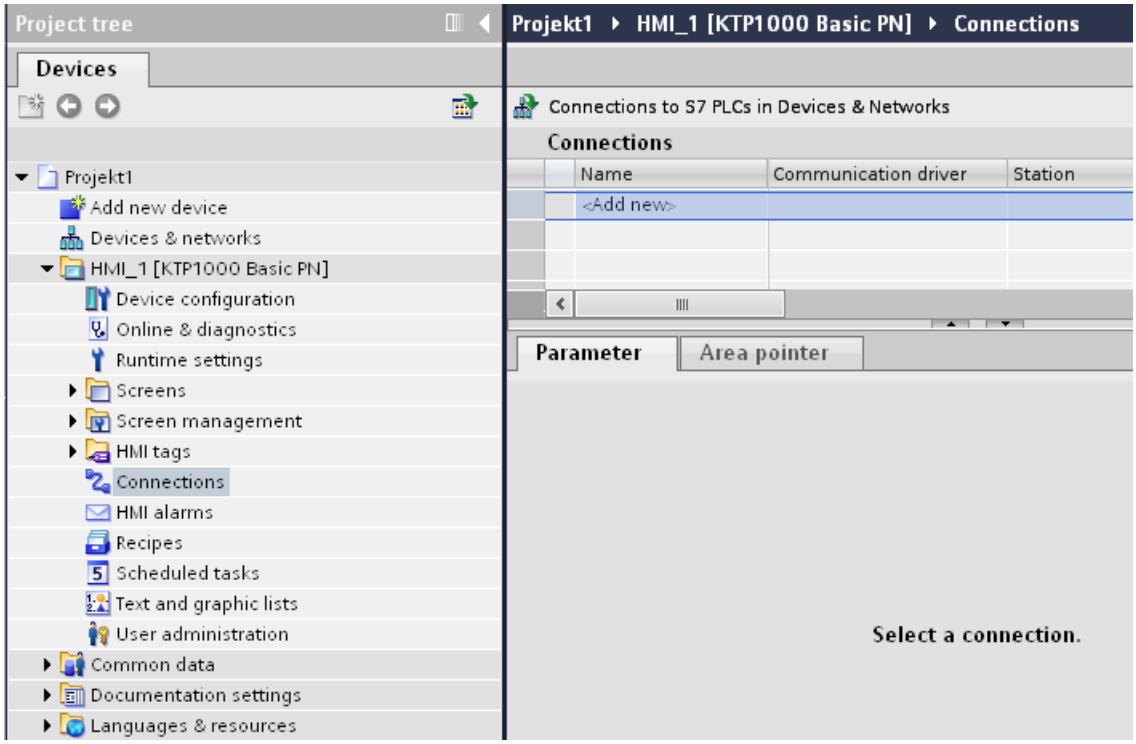
Requirements

- A project is open.
- An HMI device has been created.

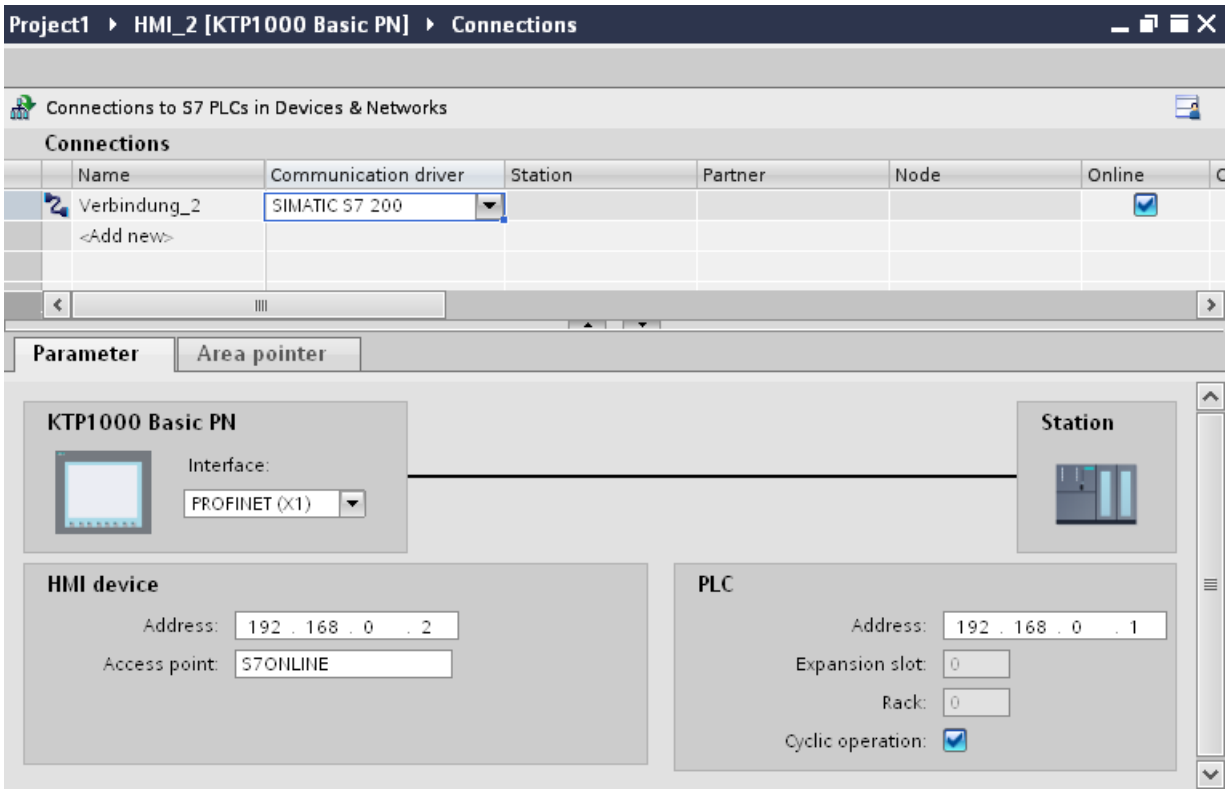
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "SIMATIC S7 200" driver.
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".



See the chapter "Parameters for the connection (Page 5202)" for additional details.

10.11.9.3 Parameters for the connection

Parameters for the connection (SIMATIC S7 200)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.

Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"

- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Expansion slot"
  Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"
  Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.
  Disable cyclic mode if you are operating several HMI devices in parallel.

PROFIBUS parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PROFIBUS network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  You set the PROFIBUS address of the HMI device under "Address". The PROFIBUS address must be unique in the PROFIBUS network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master).
  In S7 200, you must set an HMI device as the master.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the network

Under "Network", you set the parameters for the PROFIBUS network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "DP", "Universal", or "Standard". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual PROFIBUS address. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud in the OP 73 or the OP 77A, the highest station address must be less than or equal 63.

- "Number of masters"
  For "Number of masters", set the number of masters in the PROFIBUS network. This information is necessary to correctly calculate the bus parameters.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PROFIBUS address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200 PLCs.

MPI parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the MPI network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  For "Address", you set the MPI address of the HMI device. The MPI address must be unique throughout the MPI network.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.
  In S7 200, you must set an HMI device as the master.

Parameters for the network

Under "Network", you set the parameters for the MPI network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "MPI". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"
  This setting is not required for MPI.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the MPI address of the S7 module (CPU, FM, or CP) to which the HMI device is connected.
- "Cyclic mode"
  When cyclic mode is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This improves system performance. Disable cyclic mode if you are operating several HMI devices in parallel. This setting is not required for SIMATIC S7-200.

PPI parameters

Parameters for the HMI device

You assign the parameters for the HMI device in the network once under "HMI device". The change applies to each communication partner.

- "Type"
  Specifies the physical connection used.
- "Interface"
  For "Interface", you select the HMI device interface via which the HMI device is connected to the PP network.
- "Baud rate"
  For "Baud rate", you set the transmission speed of the data in the network. The baud rate is determined by the slowest HMI device connected to the network. The setting must be identical throughout the network.

  Note

  If you set a baud rate of 1.5 Mbaud for OP 73 or OP 77A, the highest station address must be less than or equal to 63.

- "Address"
  For "Address", you set the PPI address of the HMI device. The PPI address must be unique throughout the PPI network.
- "Access point"
  For "Access point", you set the access point via which the communication partner is reached.
- "Sole master on bus"
  Disables an additional safety feature against bus faults when the HMI device is connected to the network. A passive station (slave) can only send data if it is requested to do so by an active station (master). If you have connected only slaves to the HMI device, you must therefore disable the "Sole master on bus" safety feature.
  In S7 200, you must set an HMI device as the master.

Parameters for the network

Under "Network", you set the parameters for the network to which the HMI device is linked.

- "Profile"
  For "Profile", you select the network profile that is used in the network. In "Profile", set "PPI". The setting must be identical throughout the network.
- "Highest address"
  For "Highest station address", set the highest station address. The highest station address must be greater than or equal to the highest actual MPI address. The setting must be identical throughout the network.
- "Number of masters"
  Set the number of the master on the network to "1".

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  For "Address", set the PPI address of the S7 module to which the HMI device is connected.
- "Cyclic operation"
  This parameter is not required for communication via PPI.

Cyclic operation

Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

10.11.9.4 Data exchange

Data exchange using area pointers

General information on area pointers

Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use an area pointer, you enable it under "Connections > Area pointer". You then assign the area pointer parameters.

You can find more detailed information on configuring area pointers in:

Configuring area pointers (Page 4956)

See also

Data exchange using area pointers (Page 4952)

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Application

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1st word	Current screen type															
2nd word	Current screen number															
3rd word	Reserved															
4th word	Current field number															
5th word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

Note

Symbolic addressing is not possible if you are using the "Date/Time" area pointer.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

The date/time data area has the following structure:

Data word	Most significant byte								Least significant byte								
	7							0	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute, if the process allows this.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The date/time data area has the following structure:

DATE_AND_TIME format (in BCD code)

Data word	Most significant byte			Least significant byte		
	7	. . . . .	0	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC flexible and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functions:

- Detecting the startup of the HMI device in the control program
- Detecting the current operating mode of the HMI device in the control program
- Detecting whether the HMI device is ready to communicate in the control program

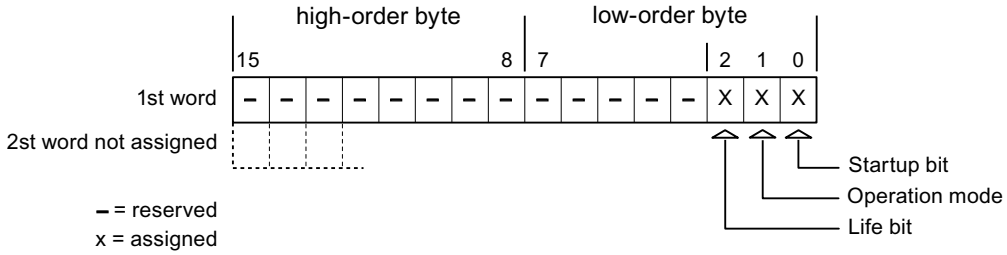
By default, the "Coordination" area pointer has the length of one word and cannot be changed.

Usage

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program can for this reason not make changes to the coordination area.

Assignment of the bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The status of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit in the control program.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not there is still a connection to the HMI device by querying this bit in the control program.

"Project ID" area pointer

Function

When Runtime starts it can check to see if the HMI device is connected to the correct PLC. This check is important when operating with several HMI devices.

For this, the HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of the configuration data with the PLC program. If there is no concordance, a system event is given on the HMI device and Runtime is stopped.

Use

To use this area pointer, set up the following during the configuration:

- Define the version of configuration. Values between 1 and 255 are possible.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections" under "Address".

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections of the device being switched to "offline".

This behavior has the following requirements:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

"Job mailbox" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Most significant byte	Least significant byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

Note

Please note that not all HMI devices support job mailboxes. TP 170A and Micro Panel do not support job mailboxes, for example.

No.	Function	
14	**Set time (BCD-coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)** [3)]	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tag**	

No.	Function	
14	**Set time (BCD-coded)**	
	Causes the HMI device to read the current value of the tags from the PLC whose update ID matches the value transferred in Parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [2]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Reading data record from PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Writing data record to PLC** [1]	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1]	Only devices supporting recipes
[2]	OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.
[3]	The weekday is ignored on HMI device KTP 600 BASIC PN.

"Data record" area pointer

"Data record" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data record

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system event.

Sequence of a transfer started by the operator in the recipe view

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data mailbox.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized in the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a job mailbox

The transfer of data records between the HMI device and the PLC can be initiated by the HMI device or by the PLC.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1-65,535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC using job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data mailbox.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the job from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data mailbox.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data mailbox.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of faults

The section below shows possible causes of errors which lead to a data record transfer being terminated with errors:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system events
- Triggered by function
  Output of system events
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data mailbox.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the Inspector window the "Coordinated transfer of data records" option under "General > Synchronization > Settings".

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transferring
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3237)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

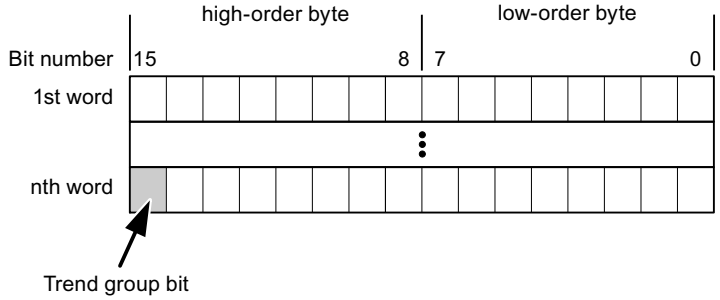
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3260)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

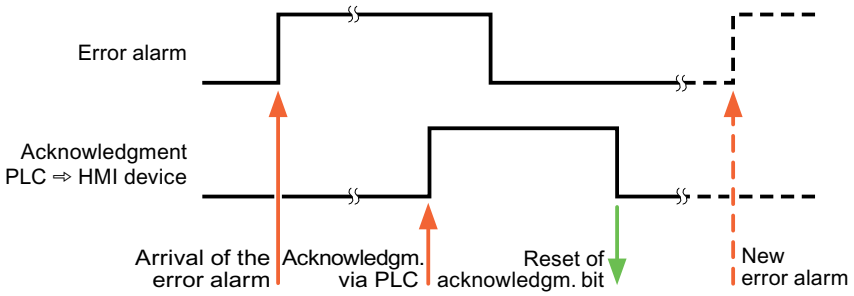
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

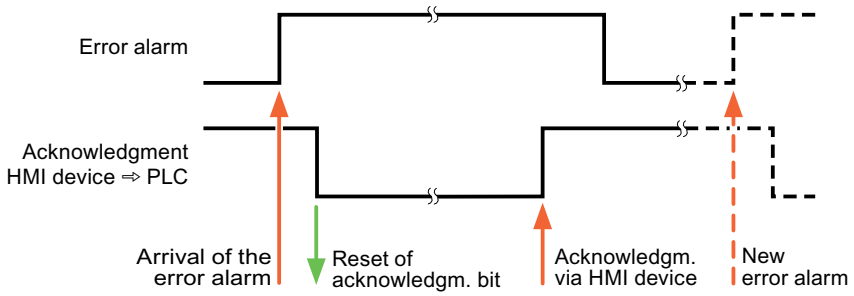
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels	Panel PCs:
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

10.11.9.5 Performance features of communication

Permitted data types for SIMATIC S7 200

Permitted data types for connections with SIMATIC S7 200

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Length
Bool	1 bit
Byte	1 byte

Data type	Length
Char	1 byte
Word	2 bytes
Int	2 bytes
DWord	4 bytes
DInt	4 bytes
Real	4 bytes
StringChar	--
Timer	2 bytes
Array	--

Note

Disconnection with a PPI network

If you are using arrays in the configuration, an array size of approximately 1000 bytes may cause an interruption of the connection.

Use smaller arrays in your configuration.

10.11.10 Communicating with SIMATIC LOGO!

10.11.10. Communication with SIMATIC LOGO! 1

Introduction

This section describes the communication between an HMI device and the SIMATIC SIMATIC LOGO! controller.

You can configure the following communication channels for the SIMATIC LOGO! controller:

- PROFINET
- Ethernet

HMI connection for communication

You configure connections between the HMI device and SIMATIC LOGO! in the "Connections" editor of the HMI device.

Data exchange

Data exchange with the SIMATIC LOGO! control system is possible by means of tags.

Data cannot be exchanged using area pointers.

10.11.10. Creating a connection to SIMATIC LOGO! 2

Introduction

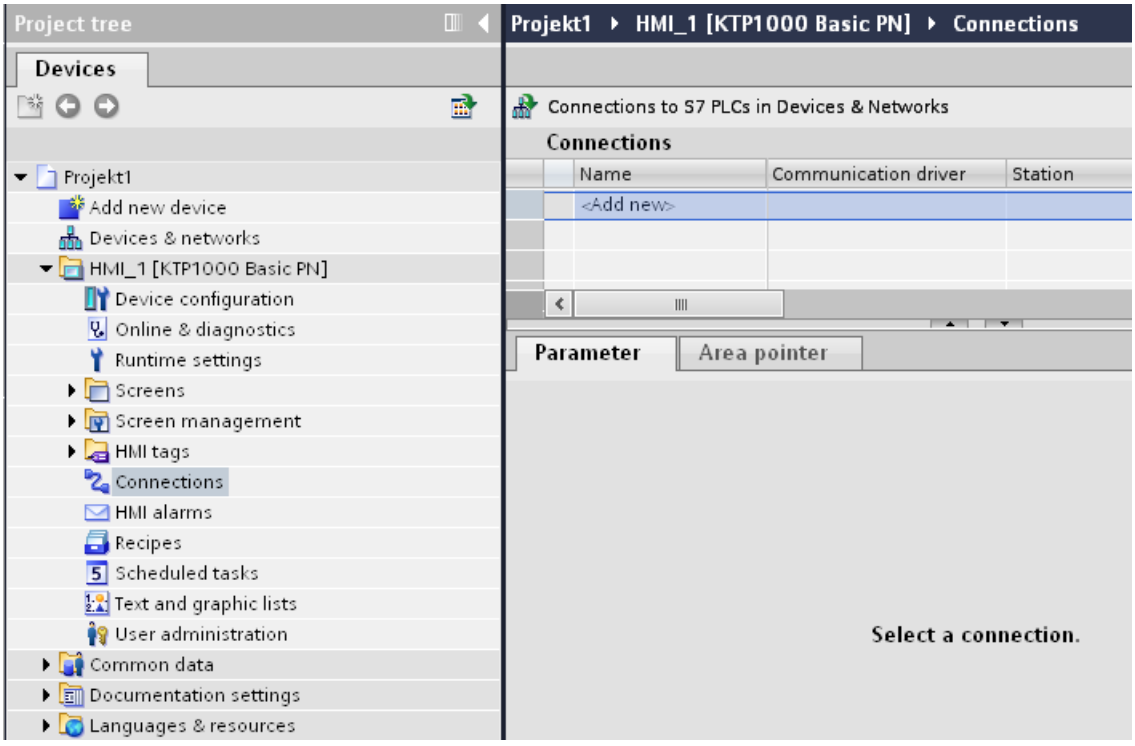
You configure a connection to the SIMATIC LOGO! controller in the "Connections" editor of the HMI device. The interfaces are named differently depending on the HMI device.

Requirements

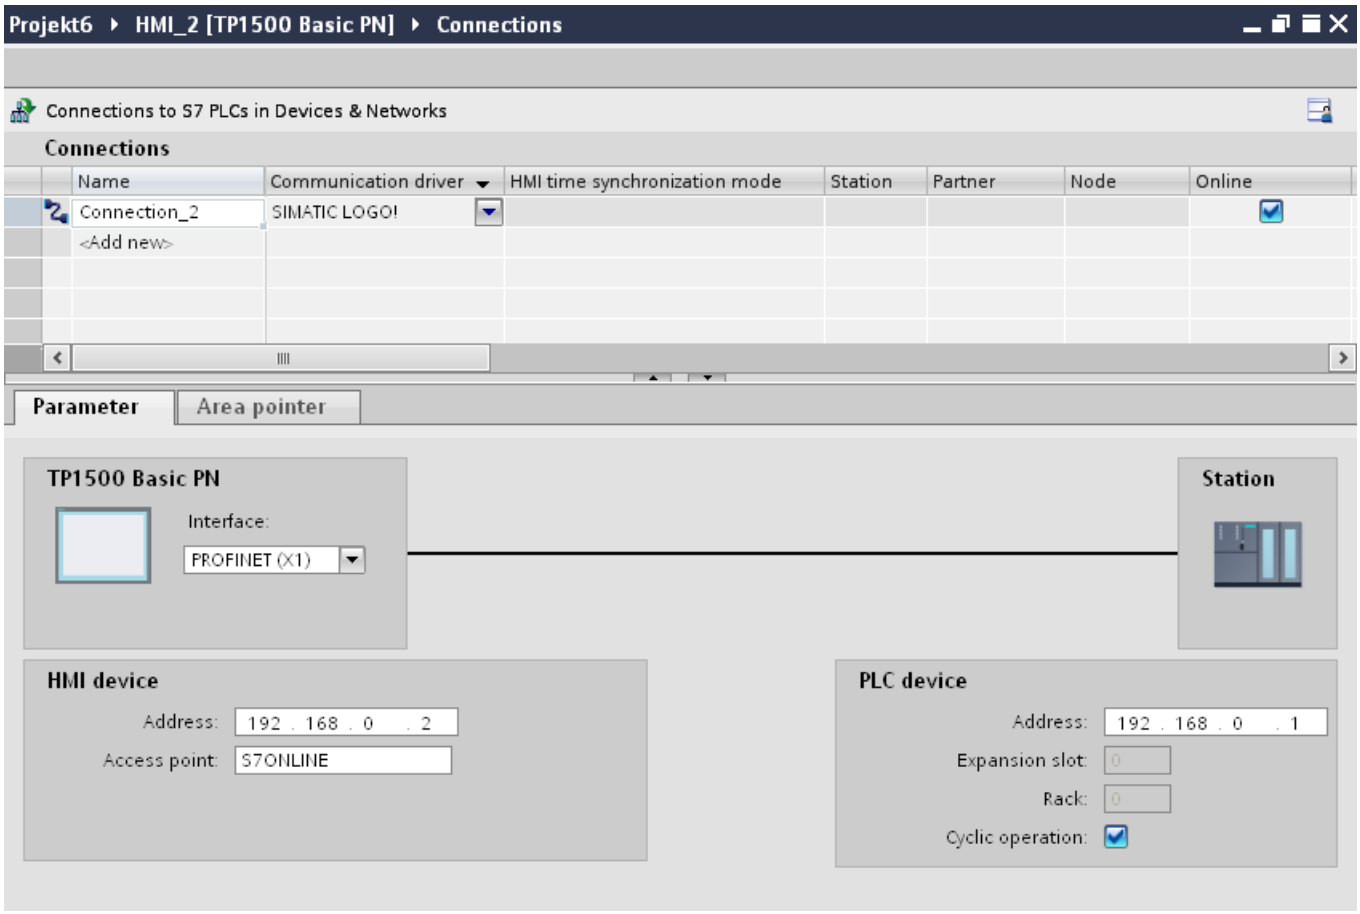
- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "SIMATIC LOGO!" driver.
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".



See the chapter "Connection parameters (Page 5232)" for additional details.

10.11.10. Connection parameters
3

Connection parameters

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.

Ethernet parameters

Parameters for the HMI device

You set the parameters for the HMI device in the network under "HMI device".. The changes are not transferred automatically to the HMI device. You must change the settings in the Control Panel of the HMI device.

- "Interface"
  If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC.

  Note

  The IP address in the Control Panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

  The IP address already set up in the Control Panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

  The IP address is transferred to the HMI device during project transfer.
  To set up the IP address of the HMI device:

  – Click the HMI device.
  – Open the "Device configuration" editor.
  – Click the Ethernet interface.
  – Assign the IP address in the inspector window under:
    "General > PROFINET interface > Ethernet addresses"

- "Address"
  You assign the IP address of the HMI device in the "Address" area.
  When you transfer the WinCC project to the HMI device, this IP address is set up directly in the HMI device.
- "Access point"
  The access point defines a logical device name through which the communication partner can be reached.

Parameters for the PLC

Under "PLC", you address the S7 module with which the HMI device will exchange data. Assign a name for the connection for each communication partner.

- "Address"
  Under "Address", set the IP address of the S7 module to which the HMI device is connected.
- "Expansion slot"
  Defines the number of the expansion slot of the CPU to be addressed.

- "Rack"
  Defines the rack number of the CPU to be addressed.
- "Cyclic operation"

  Note

  The setting "Cyclic operation" cannot be configured for the SIMATIC S7 1200 PLC.

  When cyclic operation is enabled, the PLC optimizes the data exchange between the HMI device and the PLC. This increases system performance.
  Disable cyclic mode if you are operating several HMI devices in parallel.

Cyclic operation

Handling the "Cyclic operation" selection

If "Cyclic operation" is enabled, the HMI device sends a message frame to the CPU at the beginning of communication indicating that certain tags are required on a recurring basis.

The CPU then always transmits the data at the same cyclic interval. This saves the HMI device from having to output new requests for the data.

If cyclic operation is disabled, the HMI device sends a request whenever information is required.

Additional properties:

- Cyclic operation reduces data transmission load at the HMI device. The PLC resources are used to relieve load on the HMI device.
- The PLC only supports a certain number of cyclic services. The HMI device handles the operation if the PLC cannot provide any further resources for cyclic services.
- The HMI device generates the cycle if the PLC does not support the cyclic mode.
- Screen tags are not integrated in cyclic operation.
- Cyclic mode is only set up at the restart of Runtime.
- The HMI device transfers several jobs to the PLC if cyclic mode is enabled, depending on the PLC.
- The HMI device only transfers one job to the PLC if cyclic mode is disabled.

10.11.10. Data exchange
4

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Auto-Hotspot

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

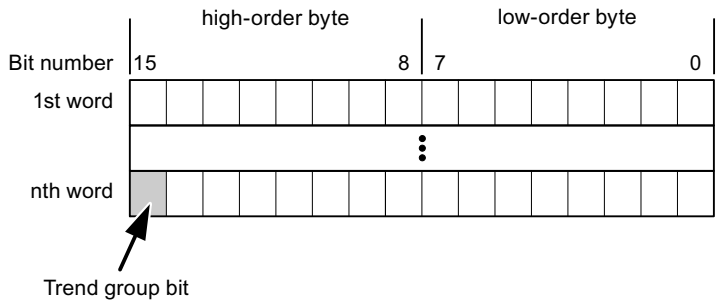
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trends

For SIMATIC S7

You assign one bit to each trend during configuration. Tags and array tags of the "Word" or "Int" data type are permitted.

Alarms

Configuring alarms

Configure alarms

Several steps are needed to configure alarms, such as operational messages, error alarms, and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Auto-Hotspot

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a SIMATIC communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
SIMATIC S7 PLCs	WORD, INT	BYTE, CHAR, WORD, INT, DWORD, DINT, REAL, TIMER

How the bit positions are counted

For connections with a SIMATIC communication driver, the following counting method applies:

How the bit positions are counted	Byte 0								Byte 1							
	Most significant byte								Least significant byte							
In SIMATIC S7 PLCs	7							0	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

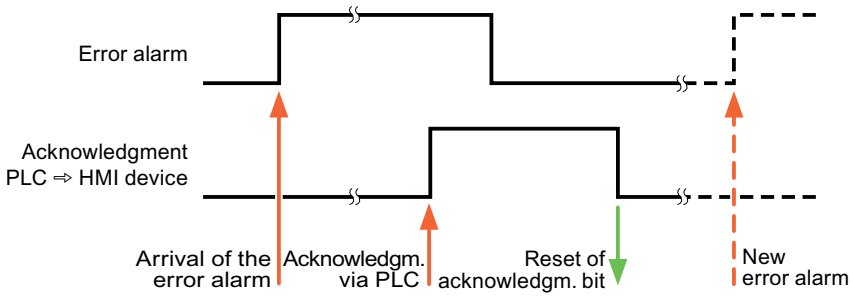
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

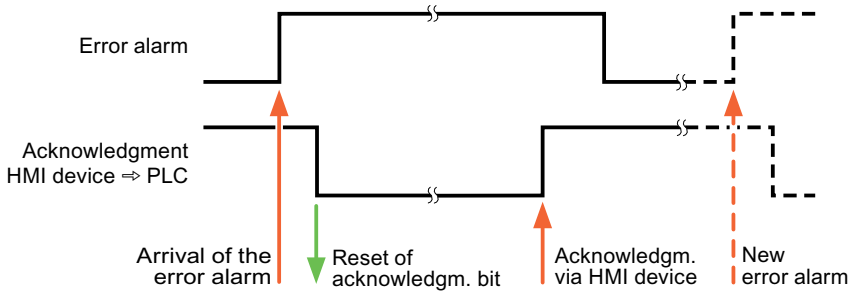
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



10.11.10. Performance features of communication 5

Valid data types for SIMATIC LOGO!

Valid data types for connections with SIMATIC LOGO!

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Length
Bool	1 bit
Byte	1 byte
Int	2 bytes
DInt	4 bytes
Word	2 bytes
DWord	4 bytes
Array	--

10.11.11 Configuring direct keys

10.11.11. Direct keys 1

Introduction

In addition to their standard use, the F, K and S keys of an HMI device with key operation can be used as direct keys.

With HMI devices with touch operation, you configure the system function "Direct key" to a button

You can configure the following direct keys:

- PROFINET connection: PROFINET IO direct keys
- PROFIBUS connection: PROFIBUS DP direct keys

Operating mode of HMI devices with direct keys

Before accessing the PLC from the HMI device using the direct keys you have to change the operating mode of the HMI device.

10.11.11. Changing the operating mode of the HMI device 2

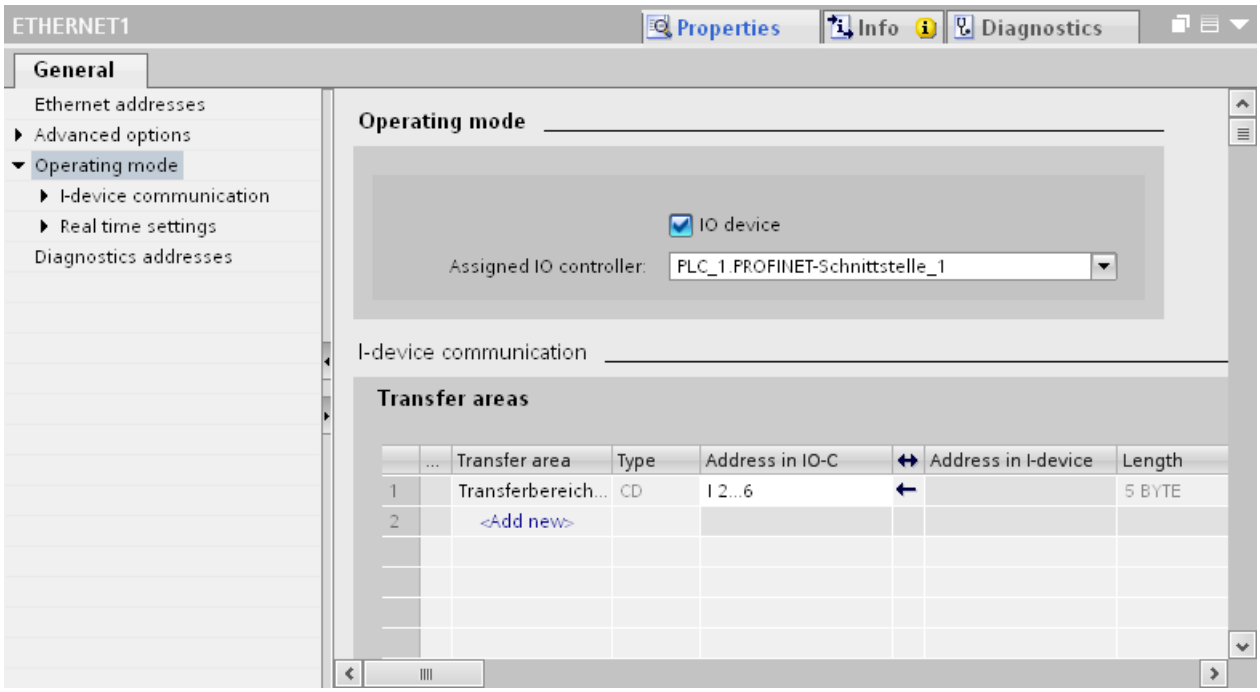
Changing the operating mode for a PROFINET connection

Requirements

The HMI device is networked with a PLC via PROFINET.

Procedure

1. Click the PROFINET interface of the HMI device in the "Devices & Networks" editor.
2. Click "Operating mode" under "Properties > General" in the Inspector window.
3. Select the function "IO device" in the "Operating mode" area.
4. Select the PLC which is networked with the HMI device under "Assigned IO controller".



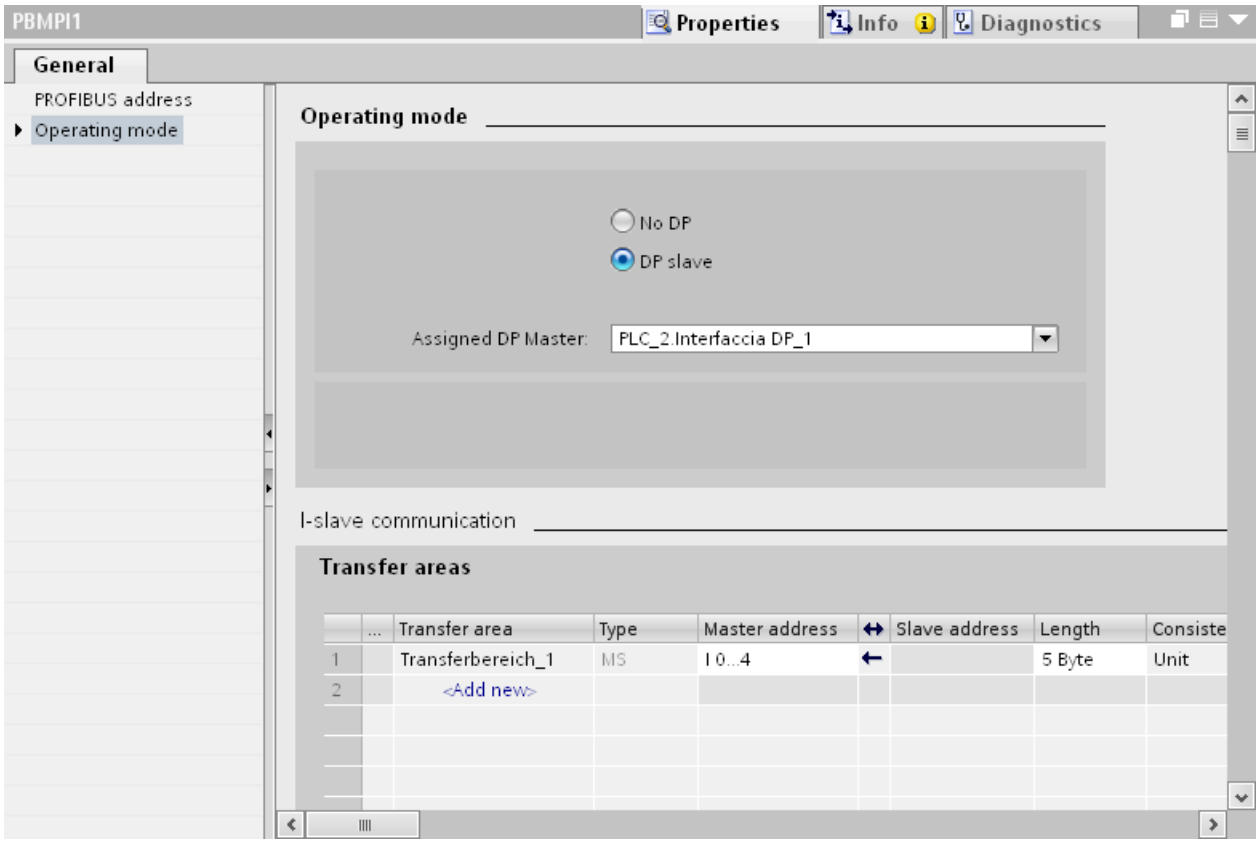
Changing the operating mode for a PROFIBUS connection

Requirements

The HMI device is networked with a PLC via PROFIBUS.

Procedure

1. Click the PROFIBUS interface of the HMI device in the "Devices & Networks" editor.
2. Click "Operating mode" under "Properties > General" in the Inspector window.
3. Select the function "DP slave" in the "Operating mode" area.
4. Select the PLC which is networked with the HMI device under "Assigned DP master".



10.11.11. Configuring direct keys
3

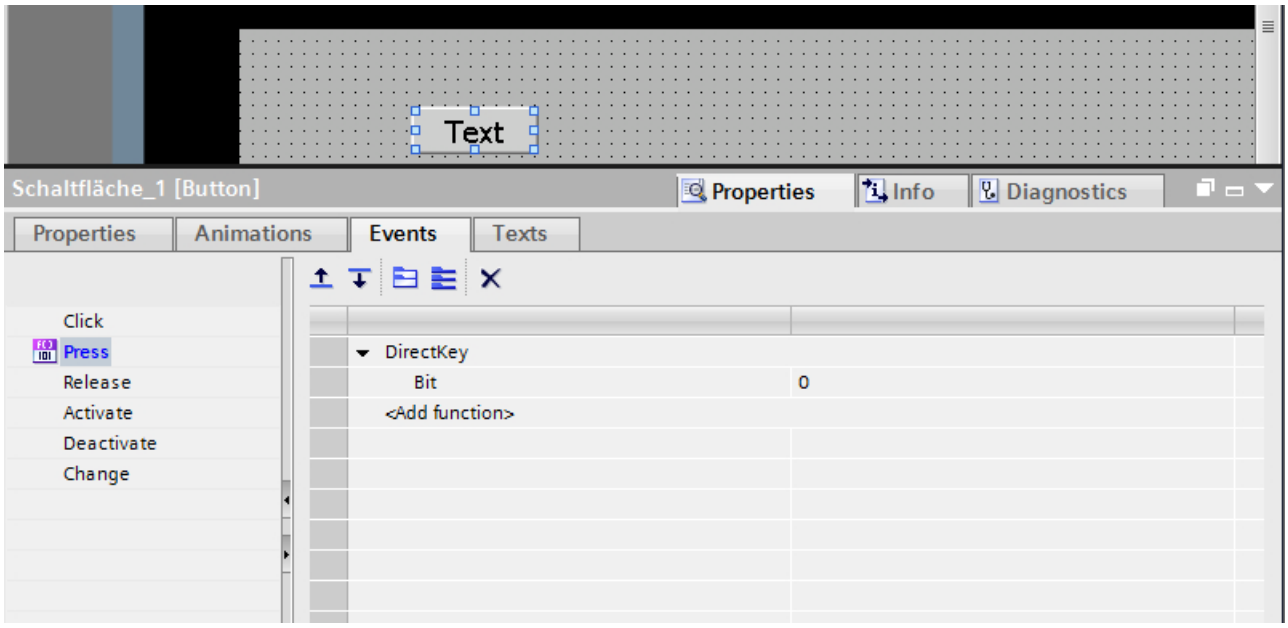
Configuring direct keys for an HMI device with touch operation

Requirements

- An HMI device with key operation has been created.
- You have created an LED tag.

Procedure

1. Create a new screen.
2. Drag-and-drop a button from the "Tools" task card into the screen.
3. Click the button.
4. In the Inspector window, click "Properties > Events > Press".
5. Click "<Add function>".
6. Select the "Direct key" system function.



7. Under "Bit" enter the correct bit number.
   The correct bit number depends on the HMI device and the input and output assignments on the HMI device.

Assignment of inputs and outputs

The exact assignment of inputs and outputs can be found under:

- PROFINET IO direct keys: Assignment of inputs and outputs (Page 5248)
- PROFIBUS DP direct keys: Assignment of inputs and outputs (Page 5265)

10.11.11. PROFINET IO direct keys
4

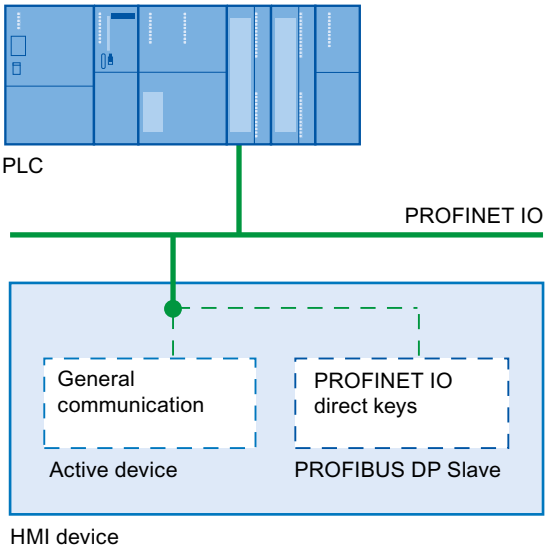
PROFINET IO direct keys

PROFINET IO direct keys

You configure the HMI device created in WinCC as an active communication partner in the automation network.

For the PROFINET IO direct keys, the HMI device can also be configured as a slave in the PROFINET IO network.

The following figure shows the basic configuration based on an automation network with an HMI device and a PLC.



Mode of operation of the PROFINET IO direct keys

The cycle time of the Ethernet bus can be set between 8 ms and 512 ms.

Thus, the reaction time of the PROFINET IO direct keys can also be determined. For a typical configuration with a cycle time of 64 ms, the response time of the PROFINET IO direct keys is < 100 ms.

A response time of < 100 ms to the CPU is usually ensured when using the PROFINET IO direct keys. This time can be exceeded significantly in the following cases:

- Complex functions run in the background, e.g. transmitting recipes, printing reports.
- At the same time, multiple connections can be maintained to the CPU.

HMI devices for the configuration of PROFINET IO direct keys

HMI devices

You can configure PROFINET IO direct keys with the following HMI devices:

HMI device class	HMI device
Panel	OP 177B PN/DP

Restrictions for PROFINET IO direct keys

Note

Direct keys are still active when the HMI device is in "offline" mode.

Note

If an external application such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the function "DirectKeyScreenNumber" is no longer set and the keys or buttons with the configured function "DirectKey" no longer trigger the associated bit in the PLC.

Restrictions

- It is not permitted to operate PROFIBUS IO direct keys and PROFINET DP direct keys simultaneously.
- Establish the following via the "PROFINET IO enabled" option in the control panel of the HMI device:
  - Option disabled = PROFIBUS DP direct keys enabled
  - Option enabled = PROFINET IO direct keys enabled
- If communication is enabled with PROFINET IO, you are not permitted to use the serial interface.
- You can operate direct keys only on local HMI devices. On the Sm@rtClient it is possible to operate the key / button for the direct key. However, No bit is set in the I/O area of the CPU.
- Direct keys which are assigned to a button are only triggered through touch operation. Triggering with a mouse click, for example with a connected USB mouse, is not possible.
- With touch operation, direct keys are triggered independent of any configured password protection.
- The buttons used as direct keys on HMI devices with touch screen functionality may not be modified as follows by means of scripting:
  - Moving
  - Resizing
  - Hiding
  - Disabling for operation
- The LEDs are addressed either via the PROFINET IO direct keys or the HMI Runtime application. Avoid concurrent addressing via the PROFINET IO direct keys and the HMI Runtime application. The LEDs "ACK", "A-Z l", "A-Z r" and "HELP" are reserved for system functions and cannot be configured. It is not advisable to control the "ACK", "A-Z l", "A-Z r" and "HELP" LEDs by means of PROFINET IO direct key functionality.

Inputs and outputs of HMI devices

Assignment of inputs and outputs

Assigning the inputs/outputs

The keys or buttons of the device are assigning bytes in the input area. The LEDs are assigning bytes in the output area. The number of bytes used depends on the HMI device.

The touch panels do not have any permanently assigned keys. They only have user-configurable buttons. Via the "DirectKey system function you can assign a bit to a button in the input area. The counting direction of the bit in the input direction is from right to left. In contrast to the operator panels which have permanently assigned keys, the touch panel buttons can be assigned freely.

Assigning direct keys to screen numbers (only for touch devices)

If a PROFINET IO direct key is using the same bit for different functions in different screens, the SIMATIC PLC must differentiate between the respective functionality by means of the screen number. You can use the "DirectKeyScreenNumber" system function to avoid the delayed updating of the screen number following a screen change.

Using the "DirectKeyScreenNumber"system function you can set within the input area any number of bits in order to identify the screen and simultaneously transfer the direct key bits to the PLC. This ensures unambiguous allocation of a control bit to screen number at all times.

10.11.11. PROFIBUS DP direct keys 5

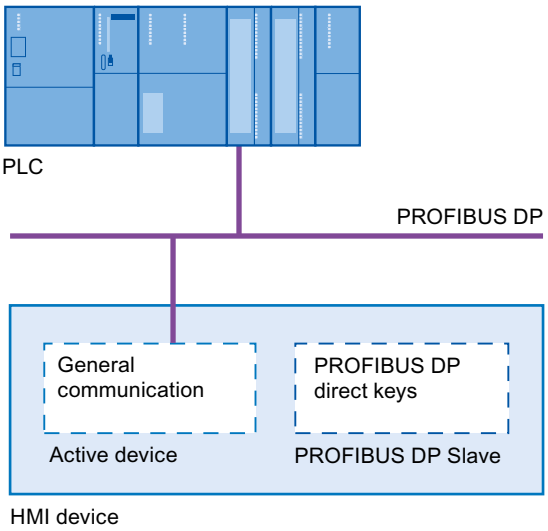
PROFIBUS DP direct keys

PROFIBUS DP direct keys

You configure the HMI device created in WinCC as an active communication partner in the automation network.

For the PROFIBUS DP direct keys, also configure the HMI device as a slave in the PROFIBUS DP network.

The following figure shows the basic configuration based on an automation network with an HMI device and a PLC.



Mode of operation of the PROFIBUS DP direct keys

With PROFIBUS DP direct keys, when the key or button is pressed, a bit is set in the I/O area of the CPU.

The cycle time of the PROFIBUS DP bus is calculated from the total of all configured inputs and outputs.

The number of configured inputs and outputs can influence the reaction time of the PROFIBUS DP direct key. For a typical configuration the response time of the PROFIBUS DP direct key is < 100 ms.

HMI devices for the configuration of PROFIBUS DP direct keys

HMI devices

You can configure PROFIBUS DP direct keys with the following HMI devices:

HMI device class	HMI device
Panel	OP 77B

Restrictions for PROFIBUS DP direct keys

Note

If an external application such as Pocket Internet Explorer or Control Panel is started, it will run in the foreground and Runtime is placed in the background. The bit for the function "DirectKeyScreenNumber" is no longer set and the keys or buttons with the configured function "DirectKey" no longer trigger the associated bit in the PLC.

Restrictions

- It is not possible to operate PROFIBUS DP direct keys and PROFINET IO direct keys simultaneously.
  Establish the following via the "PROFINET IO enabled" option in the control panel of the HMI device:
  - Option disabled = PROFIBUS DP direct keys enabled
  - Option enabled = PROFINET IO direct keys enabled
- You can operate direct keys only on local HMI devices. On the Sm@rtClient it is possible to operate the key / button for the direct key. However, No bit is set in the I/O area of the CPU.

- The buttons used as direct keys on HMI devices with touch screen functionality may not be modified as follows by means of scripting:
  - Moving
  - Resizing
  - Hiding
  - Disabling for operation
- The LEDs are addressed either via the PROFIBUS DP direct keys or the HMI Runtime application. Avoid concurrent addressing via the PROFIBUS DP direct keys and the HMI Runtime application. The LEDs "ACK", "A-Z l", "A-Z r" and "HELP" are reserved for system functions and cannot be configured. We do not recommend addressing the LEDs "ACK", "A-Z l", "A-Z r" and "HELP" with the PROFIBUS DP direct keys.
- The PROFIBUS direct keys on an HMI device are triggered independent of any configured password protection.

Inputs and outputs of HMI devices

Assignment of inputs and outputs

Assigning the inputs/outputs

The keys or buttons of the device are assigning bytes in the input area. The LEDs occupy bytes in the DP output area. The following table shows the number of bytes used in the various HMI devices. The precise assignment is shown in the following screens.

The touch panels do not have any permanently assigned keys. They only have user-configurable buttons. Via the direct keys function you can assign to a button a bit in the input area. The counting direction of the bit in the input direction is from right to left. In contrast to the operator panels which have permanently assigned keys, the touch panel buttons can be assigned freely. For more detailed information, refer to the "WinCC flexible - Configuring WinCC Windows-based Systems" user manual.

Assigning direct keys to screen numbers (only for touch devices)

If a PROFIBUS DP direct key is using the same bit for different functions in different screens, the S7 must differentiate between the respective functionality by means of the screen number. To combat the delayed updating of the screen number in the PLC after a change of screen you use the "DirectKeyScreenNumber" screen function.

Using the "DirectKeyScreenNumber" you can set within the input area any number of bits in order to identify the screen and simultaneously transfer the direct key bits to the PLC. This ensures unambiguous allocation of a control bit to screen number at all times.

10.11.12 Communication via SIMATIC HMI HTTP

10.11.12. Basic information on SIMATIC HMI HTTP 1

Introduction

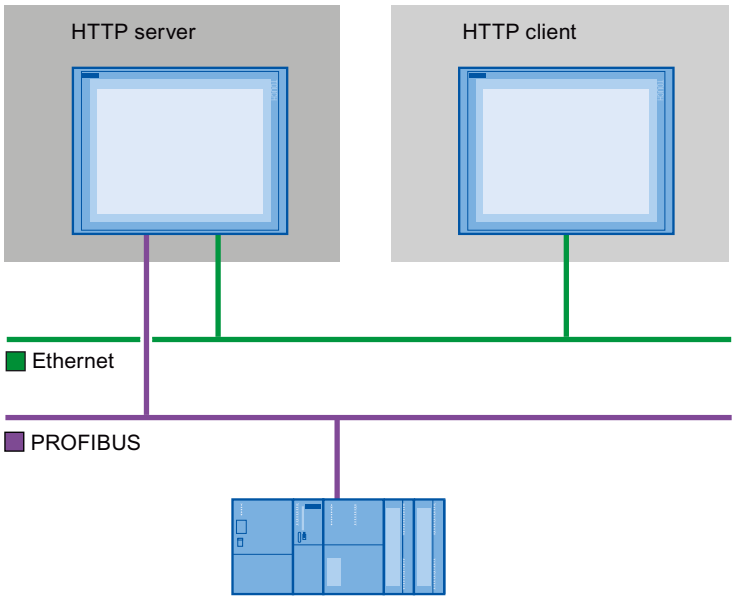
You use the SIMATIC HMI HTTP Protocol for data exchange between HMI devices.

The SIMATIC HMI HTTP Protocol is not suited for exchange of bulk data.

Data exchange occurs according to the Request-Response method. The HTTP client sends its request to the HTTP server, which processes it and returns a response.

A device can be configured as an HTTP client and HTTP server simultaneously.

The client and server establish a connection via the Ethernet interface for data exchange.



HTTP components

The components of the SIMATIC HMI HTTP Protocol are transferred to the HMI device in "Load to device".

HTTP components are:

- HTTP server
- HTTP client

If you use a Standard-PC or SIMATIC IPC, you must install WinCC RT Advanced or WinCC RT Professional first.

SMTP protocol

The SMTP protocol is not a requirement for communication via SIMATIC HMI HTTP Protocol .

HTTP / HTTPS

TheSIMATIC HMI HTTP Protocol offers two standards:

- HTTP
  Is implemented in local networks for a fast, uncoded transfer of uncritical data.
- HTTPS
  Enables a reliable HTTP connection between devices. Initially there is an exchange of secret keys. Then, in a further step, the respective public keys can be securely exchanged in the form of digital certificates. The public keys are used to encode the utility data in order to guarantee a bug-proof communication.

Note

Due to the encryption, the HTTPS protocol has a lower transmission performance than the HTTP protocol.

CAUTION

End users are responsible for the security of their own networks.

10.11.12. Configuring a connection via SIMATIC HMI HTTP 2

Configuring a connection via SIMATIC HMI HTTP

Communication between HMI devices via SIMATIC HMI HTTP protocol

Several steps are needed to configure communication between HMI devices via the SIMATIC HMI HTTP protocol:

1. Configure HMI device as a server.
2. Configure HMI device as a client.
3. Assign tag parameters in the client.
4. Commission connection.

Access to tags via SIMATIC HMI HTTP protocol

If access to tags via the SIMATIC HMI HTTP protocol is to be enabled, these tags must be defined for the relevant HMI devices and interconnected.

Configuring an HMI device as a server

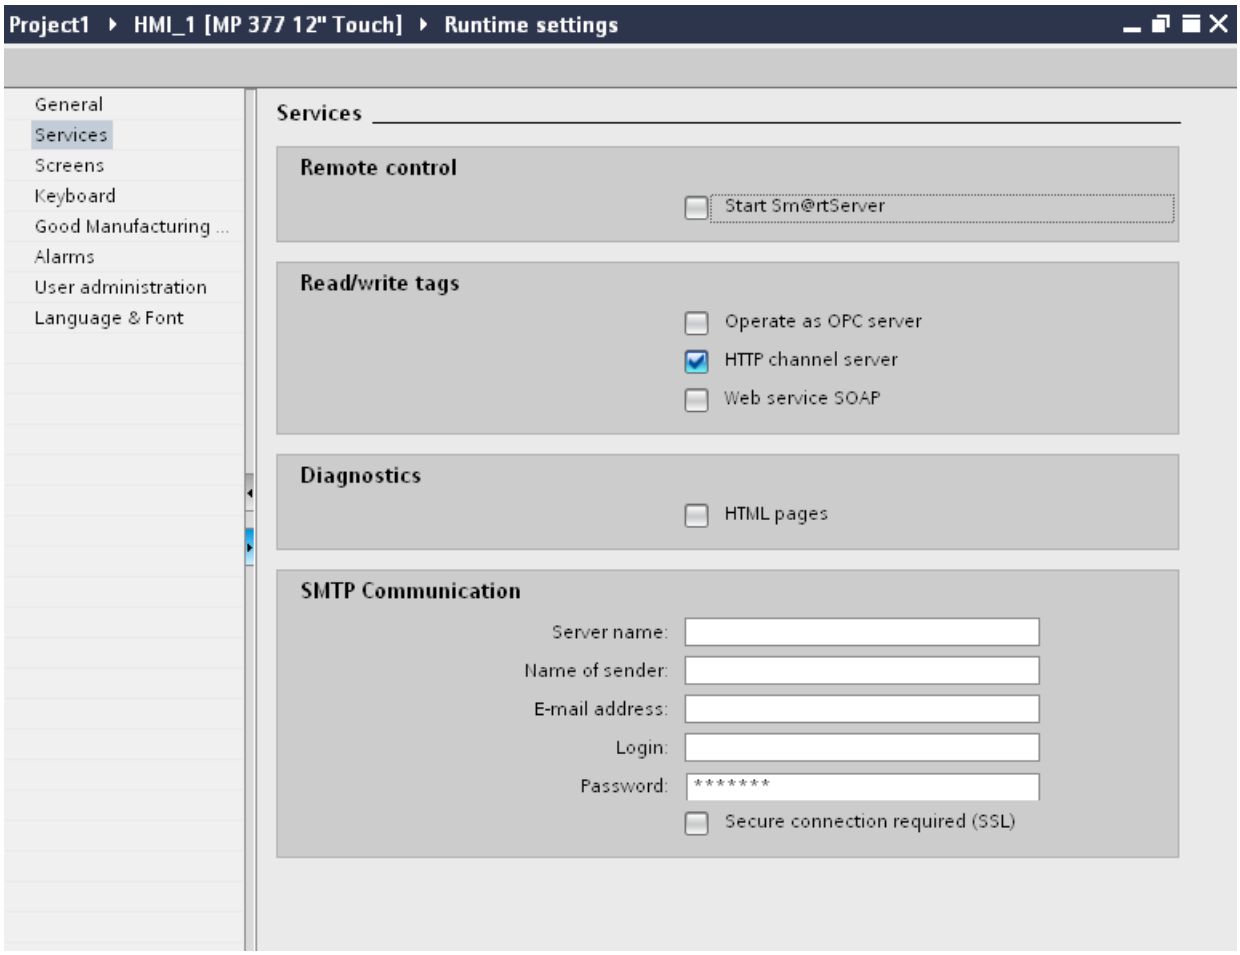
Configuring a server

Requirements

- The HTTP communication channel must be set in the Control Panel of the HMI device.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click "Runtime settings".
   The "Runtime settings" editor opens.
3. Click "Services".
4. Select the "HTTP channel server" option.



If you use the SMTP protocol, you assign the following values under "SMTP settings" according to your project specifications:

- Server name
- Login
- Password

Result

The HMI device has been configured as a server.

Tags in the server

Tags used

The client can use the HTTP protocol for read and write access to tags configured on the server in runtime. This means that it is not necessary to configure additional tags for an HTTP communication.

However, the following aspects must be taken into account to ensure correct data exchange:

- The data type of the server tags must match the data type in the client.
- The tag name configured in the HTTP server must be identical to the name of the address tag of the HTTP client.

Configuring an HMI device as a client

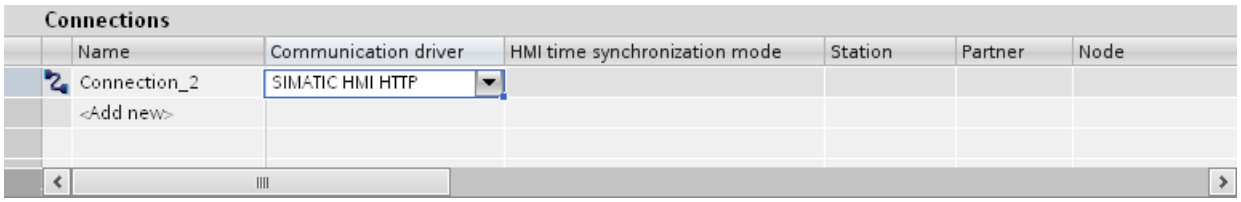
Configuring a client

Requirements

- The HTTP communication channel must be set in the Control Panel of the HMI device.
- An HMI device has been configured as a server.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.
4. In the "Communication drivers" column, select the "SIMATIC HMI HTTP Protocol" driver.



5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".
6. Set the parameters in the Property window.
   See "Setting parameters for the client" for more information about the parameters.

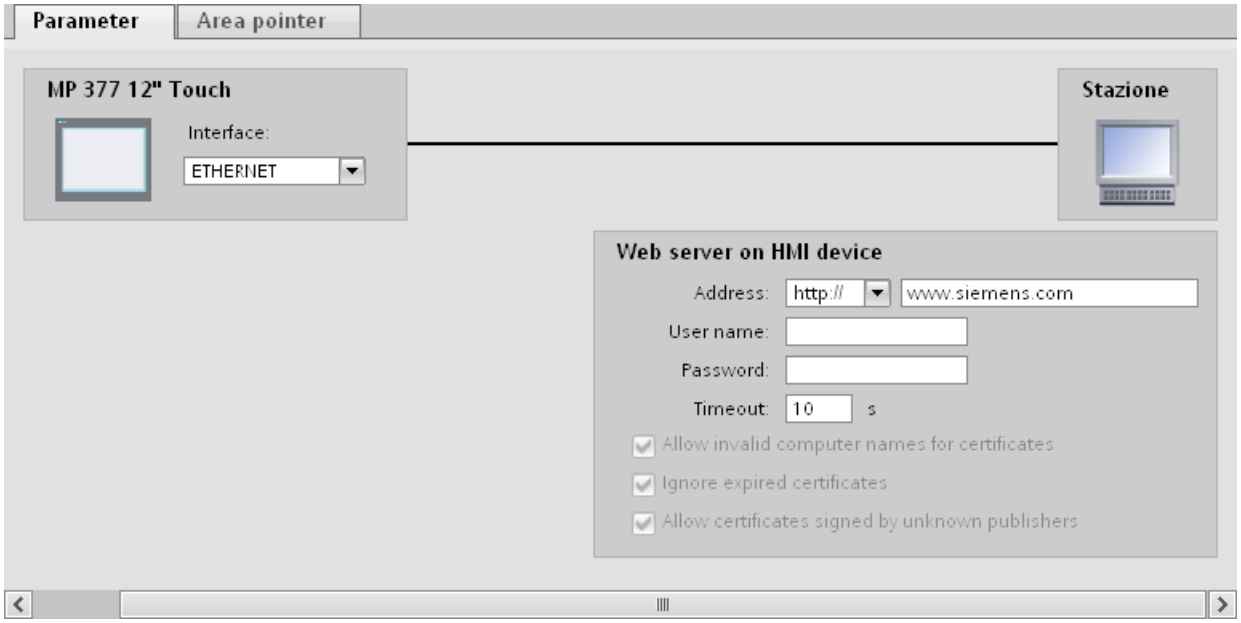
Setting parameters for the client

Requirements

- Connection has been created via SIMATIC HMI HTTP protocol.
- "Connections" editor is open.

Procedure

1. Select "Ethernet" in the Inspector window under "Parameters > Interface".
2. Select protocol http:// or https://.
3. Enter the name of the server or its IP address.



User name and password

If the "Authentication required" check box was selected in the server in the "Control Panel > WinCC Internet Settings > Web Server" dialog, a user name and password must be entered here in the client.

Timeout

Assign a time after which a connection break is recognized.

HTTPS protocol

If the HTTPS protocol is selected, with the following settings you can establish how the HTTPS client should check the properties of the server certificate and how it should react in the event of error:

- "Allow invalid computer names for certificates"
- "Allow expired certificates"
- "Allow certificates signed by unknown publishers"

Reading out an IP address

If the server has already been commissioned, you can read out the IP address on the server as well:

- For Panel
  Click "Start > Programs > Command Prompt" on the server and enter the "ipconfig" command using the screen keyboard. The IP address is displayed after pressing <Ret>.
- For PC / Panel PC
  Click "Start > Run" on the server, enter "Cmd", and press <Ret>: The command interpreter is displayed. Enter the "ipconfig" command. The IP address is displayed after pressing <Ret>.

Assigning tag parameters in the client

Assigning tag parameters in the client

Introduction

In order to be able to access tags on the server, they must be configured in the client as tag addresses.

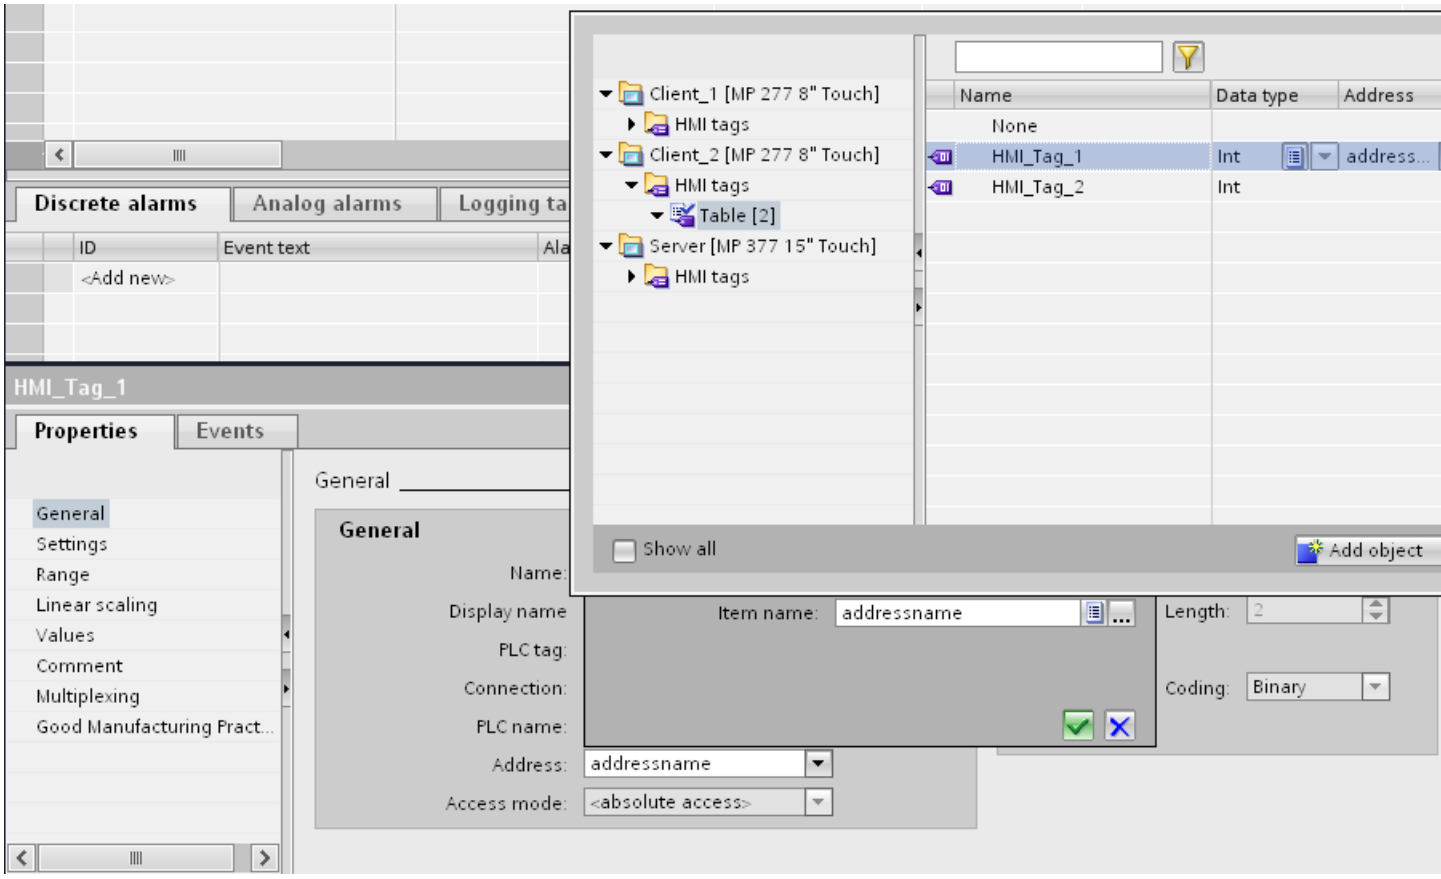
Requirements

- Tags have been created in the "HMI tags" editor of the server.

Procedure

1. Double-click the client under "Devices" in the project tree.
2. Double-click "HMI tags".
3. Create a new tag.
4. Select a data type.

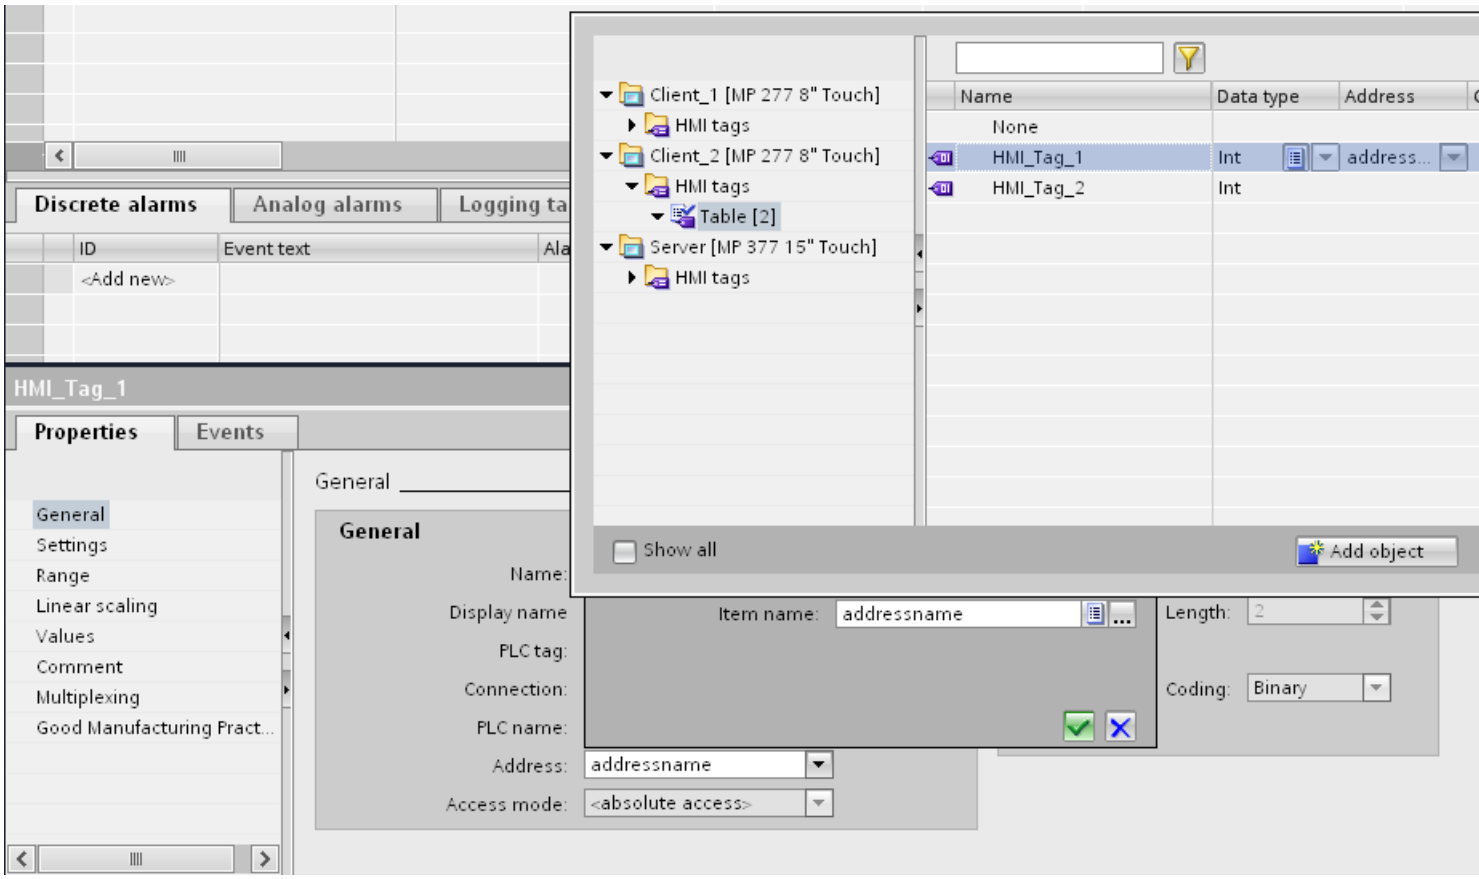
5. Open the selection dialog in the "Addresses" column.



6. Define the parameters in the working area:
   See "Parameters for the client tags" for more information about the parameters.

Parameters for the tags of the client

Parameters for the tags



Data type

- The client does not check the data type. Therefore, pay attention that the data type selected here matches the data type of the tags on the server.
- Array tags are not permitted.

Addressing

If the server and client are not within the same project, note the following:

- Enter the exact name of the tag that is to be communicated with on the server.

Commissioning a connection

Setting the server's Internet Settings

Introduction

To commission an HTTP/HTTPS connection, the WinCC Internet Settings must be set up in the Control Panel of both the server and client, in addition to the configuration in WinCC.

The name and number of tabs contained in the "WinCC Internet Settings" dialog depend on the software installed.

Only the required tabs with the MP 277 HMI device as an example are shown below.

WinCC Internet Settings, Proxy tab

The valid network settings are specified by the network administrator.

Make the following settings:

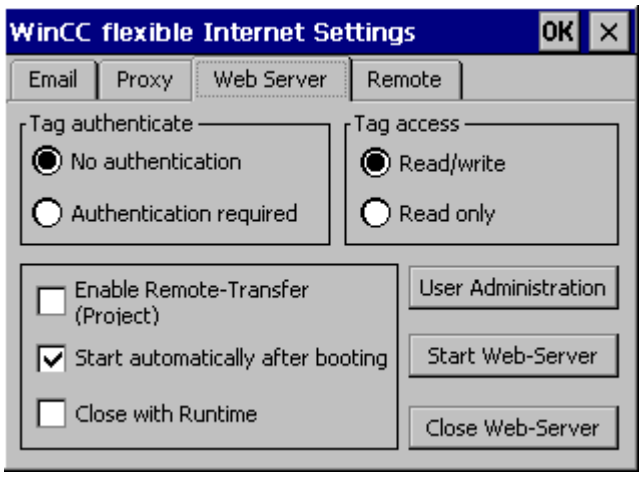
- Internet settings for HMI devices with Windows CE
  In this case, there are several options for calling the Control Panel:
  - In the startup phase, click on the "Control Panel" button in the Windows CE Loader menu.
  - Select "Start > Settings > Control Panel" in the toolbar.
  - During normal operation, pressing the key combination <CTRL + ESC> opens the toolbar. Start the Control Panel by selecting "Start > Settings > Control Panel".
  - Using the RT function "OpenControlPanel"

  The language in the Windows CE based devices is always English.

WinCC Internet Settings, Web Server tab

Settings for using the integrated Web Server are made in this tab.

The "Web Server" tab is only available in the WinCC Internet Settings if the Web Server is installed on the HMI device.



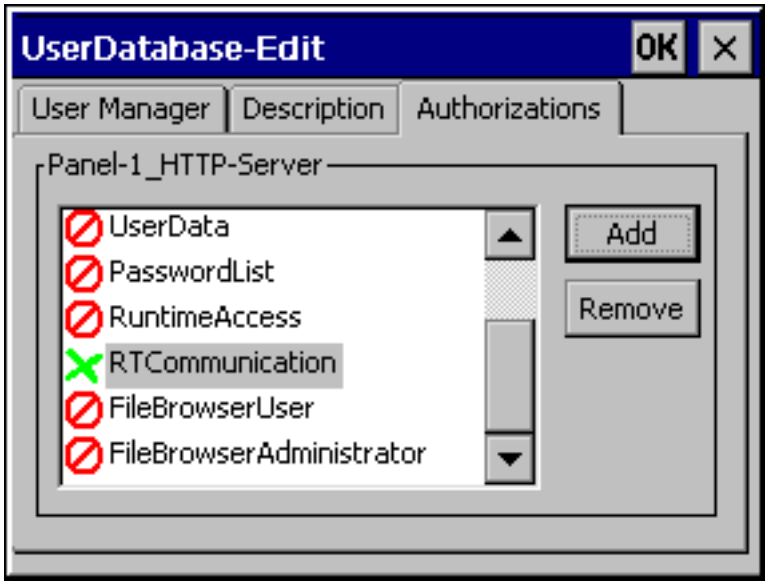
- Tag authenticate
  Controls authentication for tag access:
  - "No authentication": Authentication (user name password) is not required for access.
  - "Authentication required": Authentication (user name password) is required for access. The user name and password for the client are specified during configuration.
- Tag access
  Controls access to tags:
  - "Read/write": Tags can be read and rewritten.
  - "Read only": Tags can only be read.
- Group for defining operational performance
  The following check boxes are not selected in conjunction with tag exchange via the HTTP/ HTTPS protocol:
  - Enable remote transfer (project)
    Select this check box to enable an HTTP transfer from the configuration computer to the HMI device.
  - Start automatically after booting
    Specifies when the HTTP server should be started:
    Enabled: The HTTP server starts immediately after the HMI device is booted, irrespective of the runtime software
    Disabled: The HTTP server starts at the same time as the runtime software.
  - Close with Runtime
    Enabling this check box causes the HTTP server to be closed at the same time as the runtime software.

- User Administration
  This button opens the "UserDatabase-Edit" dialog box.

  In the "User Manager" tab of this dialog box, you can select, delete, or create a new user. The "Description" and "Authorizations" tabs always apply to the user currently selected. (This example dialog box shows a user with the name 'Panel-1_HTTP-Server'.)

- User Manager
  "Administrator" is the default user name, and "100" is the default password setting. If a user name and password have been entered for the HTTP server under "Connections" in your WinCC project, the same user name and password must be specified on the server.

- Description
  Enables input of a user description.
- Authorizations
  The newly set up user must be assigned the authorizations for "RT Communication on the "Authorizations" tab control.



Establishing an HTTP connection

Introduction

To establish an HTTP connection, you must perform the following actions:

- In the "Connections" editor of WinCC, configure the connection as an "https://" protocol type and define how the HTTPS client should verify the properties of the server certificate and respond to errors.
- Install a valid certificate on the HTTPS client.
  Certificates are necessary for server authentication. Using certificates you can ensure that the server with which the connection is to be developed is actually the server for which it is outputting.

Principle of an HTTPS connection

After runtime start, the HTTPS client establishes a connection to the HTTPS server. The HTTPS server presents its certificate, which the client verifies for authenticity. The session

code that can only be read by the HTTPS server is then transmitted. The session code is now available on both sides and enables a symmetrical data encryption.

Note

The certificate contains the current time. The current time can lead to problems if the time zones of the server and client are different. For example, a certificate generated on a server with an Asian time zone only becomes valid on a client with European time zone in the future (8 hours).

Preparation for installing a certificate on the client

With the first HTTPS client access, the HTTPS server generates the certificate itself and then saves it in the "Cert.cer" memory. The file is stored in the following directory:

- On a PC/panel PC (with Windows XP) in the directory "..\\Siemens\Automation\WinCC Runtime Advanced\SystemRoot\SSL"
- On Windows CE-based devices in the directory "Flash\Simatic\SystemRoot\SSL"
  The certificate must be stored on the HTTPS client on a storage medium from which it can be launched with a double click.

Server	Client	Possible file transfer
with Windows XP (PC, Panel PC)	with Windows XP (PC, Panel PC)	• Disk • USB stick • LAN (Ethernet) • Internet Explorer (via TCP/IP, if Service is already running)
With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	with Windows XP (PC, Panel PC)	• Memory card • ActiveSync (serial)
with Windows XP (PC, Panel PC)	With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	
With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	With Windows CE (xP 270, xP 277, MP 370, MP 377, xP 177B, Mobile Panel 177 PN, Mobile Panel 277, Comfort Panels)	• Memory card

Installing a certificate on a client with Windows XP

Insert the storage medium on which you have saved the "Cert.cer" file into the HTTPS client or open the directory in which the file is located. Double click on the file and follow the instructions in the Windows dialog.

Tip: The Internet Explorer provides an easy way to install a certificate. Connect to this device via HTTPS (e.g.: https://<my device>). The browser establishes if a certificate has not yet been imported. In this case, the browser asks if you want to install the certificate. Any errors in the certificate will be displayed.

Installing a certificate on a client with Windows CE

Insert the memory card on which you have saved the converted "Cert.cer" file into the HTTPS client. WinCC provides the "InstallCert.exe" tool for importing certificates with Windows CE.

You can implement the installation as follows:

- In Explorer:
  Double click the "Cert.cer" file to install the certificate.
- At the command prompt:
  Enter "InstallCert /[command parameter] [filename]".
  - command parameters:
    /r parameter must be specified because the certificate used in WinCC Runtime is a root certificate.
    A root certificate is the main certificate and is used to verify the authenticity of all other certificates transferred.
  - filename
    You must specify the certificate file with its complete path (e.g. "\Storage Card\Cert.cer")

A status alarm is output when you completed the installation. Runtime has to be restarted after the installation of a certificate on Windows CE- HMI devices with HTTPS clients. It is necessary to restart Runtime so that an HTTPS connection can be established.

The file "Cert.cer" cannot be opened.

The "Cert.cer" file generated at the HTTPS server cannot be opened on HMI devices based on Windows CE 5.0 by double-clicking the client.

1. Open the Control Panel.
2. Select "Certificates > My Certificates."
3. Click the "Import" button.
   A dialog box opens.
4. Select the "From a File" menu in the file browser and select the "Cert.cer" file.

10.11.12. Performance features of communication 3

Permitted data types

Permitted data types

When configuring tags, the data types listed below can be used.

Data type in the SIMATIC HMI HTTP protocol	Length	Sign	Range of values
Bool	0	No	true (-1) or false (0)
SInt	1 Byte	Yes	-128 to 127
USint	1 Byte	No	0 to 255
Int	2 Byte	Yes	-32768 to 32767
UInt	2 Byte	No	0 to 65535
DInt	4 Byte	Yes	-2,147,483,648 to 2,147,483,647
UDInt	4 Byte	No	0 to 4,294,967,295
Real	4 Byte	Yes	-3.402823E38 to -1.401298E-45 for negative values and 1.401298E-45 to 3.402823E38 for positive values
LReal	8 Byte	Yes	-1.79769313486231E308 to -4.94065645841247E-324 for negative values and 4.94065645841247E-324 to 1.79769313486232E308 for positive values
String	1 to 255 byte	——	
DateTime	8 Byte	——	1.1.1970 00:00:00 up to 31.12.2037 23:59:59

Note

Data types for third-party PLCs

Data types in third-party PLCs may differ from those in WinCC.

Note the the tag definition of the third-party PLC for the correct assignment.

Note

It is not possible to access array tags from an HTTP client.

Multiplex tags are not supported by the HTTP protocol. If you need a multiplex tag, you must configure it on the HTTP client. You will have to create the tags for the multiplex list on the server and the client and then connect them. You will then add these tags to the multiplex list on the client.

Address multiplex tags are not supported by the HTTP protocol.

10.11.13 Communication via OPC

10.11.13. Communication via OPC 1

Introduction

This section describes the communication between an HMI device and a device via OPC.

In this case, the HMI device is the OPC client and the device is the OPC server.

For more detailed information on OPC and on configuring OPC servers, refer to Section "OPC (Page 5892)".

10.11.13. Configuring a connection via OPC 2

Introduction

You configure a connection to a device via OPC in the "Connections" editor of the HMI device.

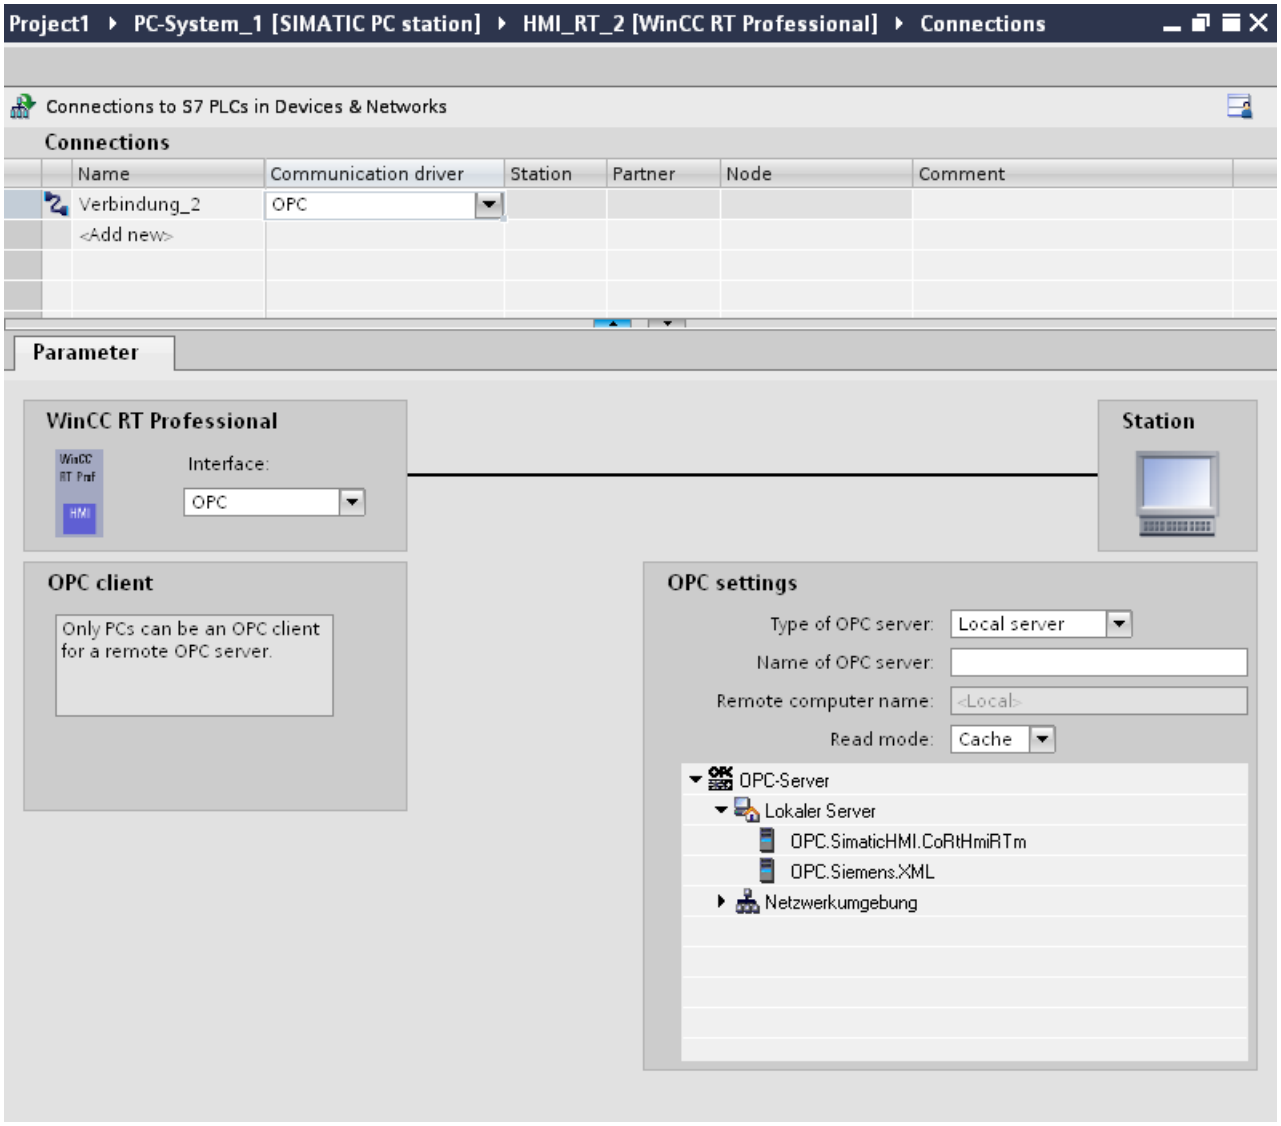
Requirements

- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.
4. In the "Communication drivers" column, select the "OPC" driver.

5. Select the "OPC" interface for the HMI device under "Parameters > Interface".



6. Select an OPC server from the tree view under "Parameters > OPC servers".
   The OPC server is entered in the "Name of OPC server" field.

10.11.13. Performance features of communication 3

Permitted data types for OPC DA

Permitted data types for connections with OPC DA

10.11.14 Communication via routing

10.11.14. Communication via routing 1

Introduction

If all stations in an automation system are not connected to the same subnet, these stations cannot be accessed directly online.

A connection between partners in different subnets is only possible via routing.

You configure the routing settings with the properties of the interfaces.

Communication from connection partners in various different subnets can be routed via the following links:

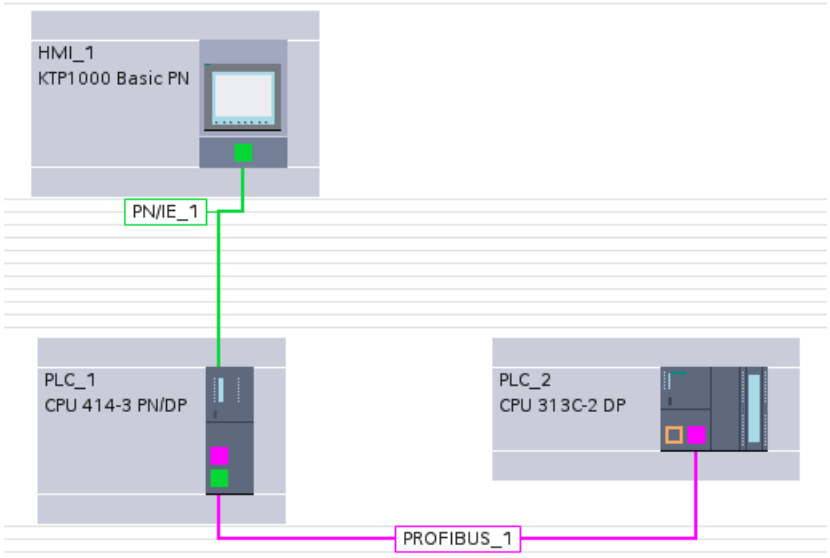
- PROFINET
- PROFIBUS
- MPI

Requirements for routing

To establish a connection to these devices, a router must be interposed. In this case, a SIMATIC station can also act as a router if it has appropriate interfaces with the different subnets.

Modules with communication capability (CPUs or CPs) used to establish gateways between the subnetworks must have routing capability.

A connection between partners in different subnets is only possible with IP routing. The routing settings can be edited in the corresponding interface properties.



Routing path

The routing path is determined in Runtime by the system and cannot be influenced by the user. During configuration, it is not possible to generate information about a faulty connection.

HMI devices as routers

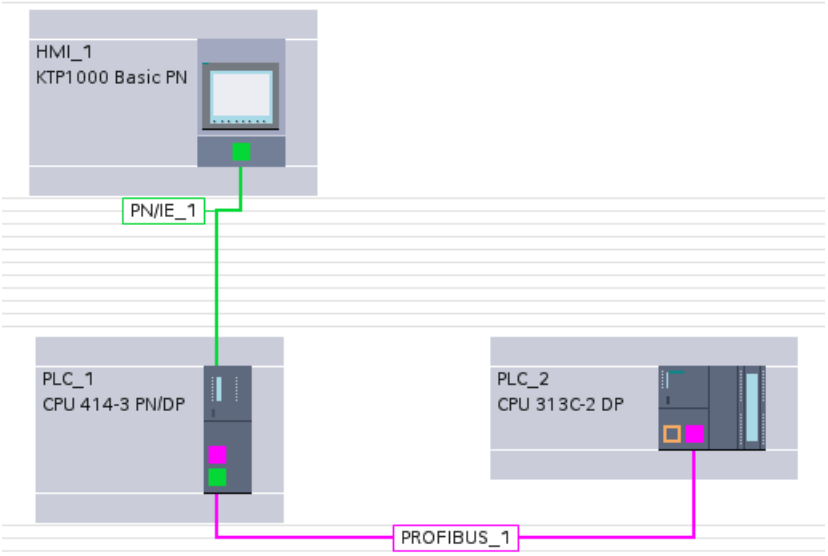
Only SIMATIC PCs or PC stations can be used as a router.

All other HMI devices from the "HMI" area cannot be used as a router.

10.11.14. Example for communication via routing 2

Communication via routing

Illustration of a hardware configuration with a routing connection



In the figure above, a routing connection has been established between an HMI device and the SIMATIC S7-300 controller.

The SIMATIC S7-400 automation device serves as a router.

A routing connection can be made directly in integrated projects. The communication partners are connected in the "Devices and Networks" editor.

You configure the parameters of the connection and interface in the Inspector window.

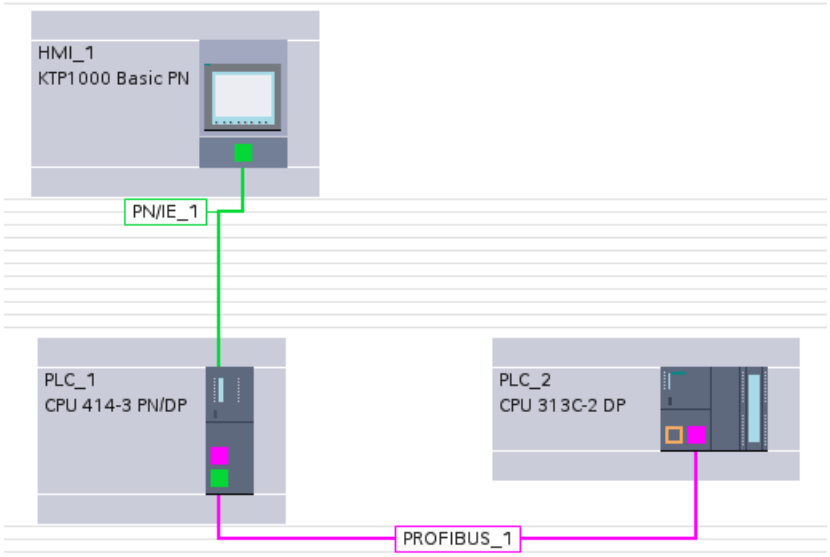
10.11.14. Configuring communication via routing 3

Introduction

The following configuration describes a network for the following communication partners:

- KTP1000 Basic PN
- SIMATIC S7-400 with PROFINET and PROFIBUS interface
- SIMATIC S7-300 with PROFIBUS interface



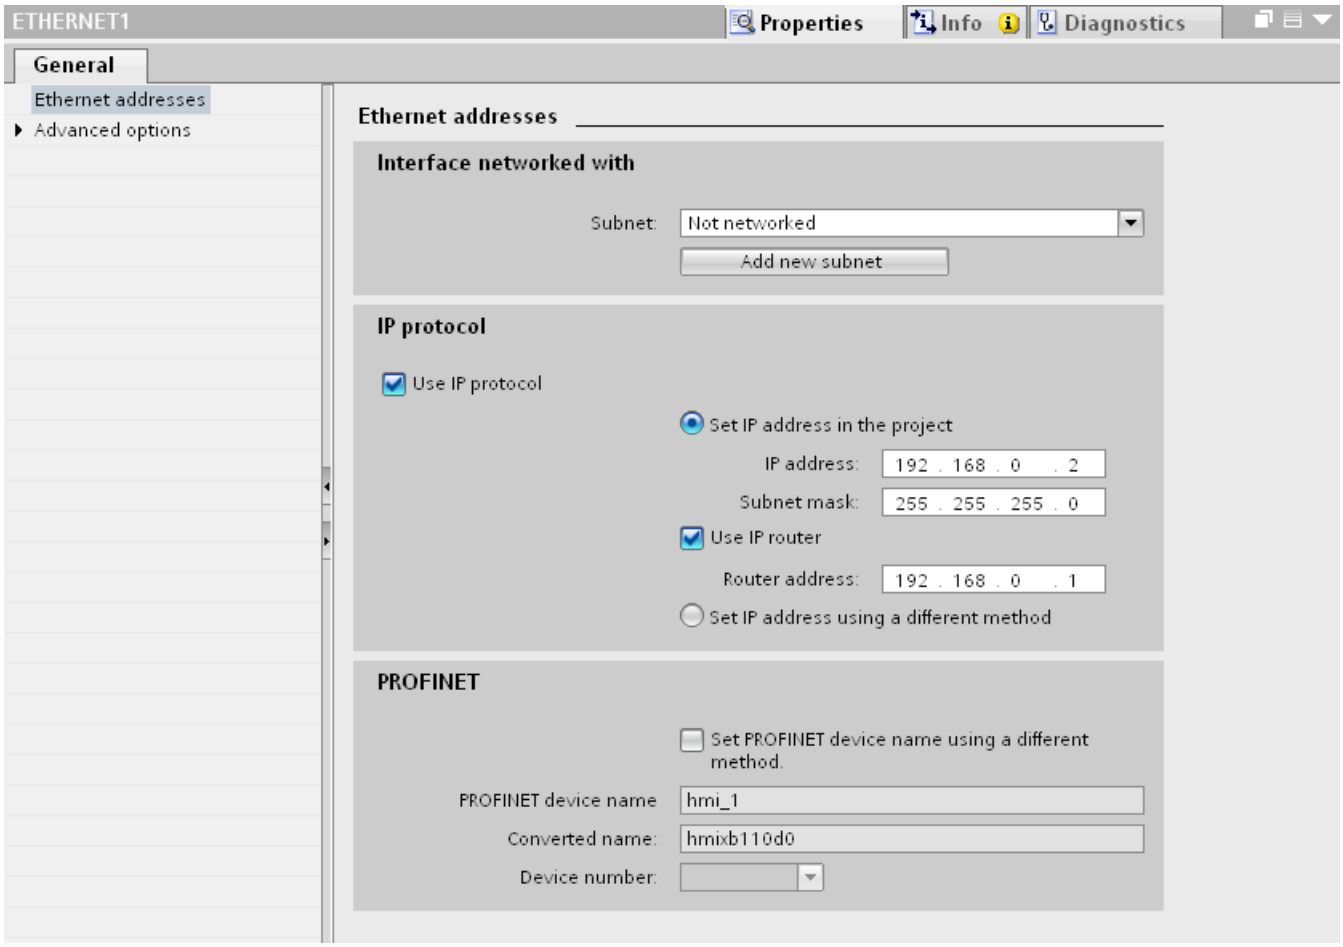
Requirements

- KTP1000 Basic PN is connected via PROFINET to the SIMATIC S7-400.
- SIMATIC S7-400 is connected via PROFIBUS to the SIMATIC S7-300.

Procedure

1. Click on the PROFINET interface of the HMI device.
2. In the Inspector window, click "Properties > General > Ethernet addresses".

3. Click "Use router" in the "IP protocol" area.
4. Enter the IP address of the router in the "Router address" field.



10.11.15 PROFINET IO and IRT

10.11.15. PROFINET IO
1

What is PROFINET IO?

PROFINET IO

PROFINET is an Ethernet-based automation standard of PROFIBUS Nutzerorganisation e.V. (PNO) which defines a manufacturer-neutral communication, automation and engineering model.

Objective

The objective of PROFINET is:

- Integrated communication via field bus and Ethernet
- Open, distributed automation
- Use of open standards

Architecture

The PROFIBUS User Organisation e.V. (PNO) has designated the following aspects for PROFINET architecture:

- Communication between controllers as components within distributed systems.
- Communication between field devices, such as I/O devices and drives.

Implementation by Siemens

The demand for "Communication between controllers as components within distributed systems" is implemented by "Component Based Automation" (CBA). Component Based Automation is used to create a distributed automation solution based on prefabricated components and partial solutions.

The demand for "Communication between field devices" is implemented by Siemens with "PROFINET IO". Just as with PROFIBUS DP, the complete configuration and programming of the components involved is possible using the Totally Integrated Automation Portal.

The following sections deal with the configuration of communication between field devices using PROFINET IO.

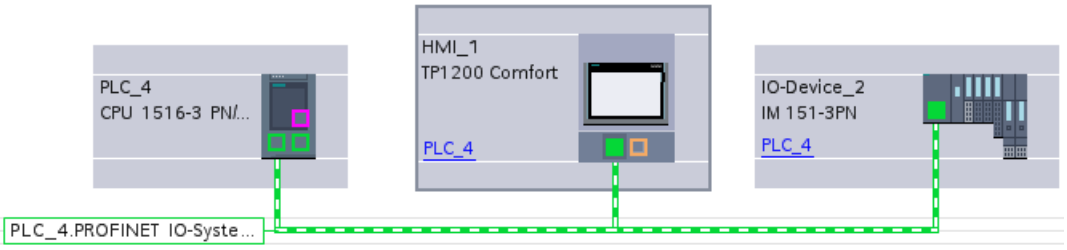
PROFINET IO systems

PROFINET IO system

A PROFINET IO system is comprised of a PROFINET IO controller and its assigned PROFINET IO devices.

- A PROFINET IO controller is a PLC that controls the automation task.
  Example: SIMATIC S7 1500 PLC
- A PROFINET IO device is a device that is controlled by an IO controller.
  Examples: HMI device TP 1200 Comfort, a head module of the distributed IO family ET 200S

As soon as you connect an IO controller to an IO device, a controller-device link is established.



10.11.15. IRT communication 2

Overview of RT classes

RT classes in PROFINET IO

PROFINET IO is a scalable, real-time communication system based on Ethernet technology. The scalable approach is reflected in several real-time classes:

- **RT:** Transmission of data in prioritized, non-isochronous Ethernet frames. The required bandwidth is within the free bandwidth area for TCP/IP communication.
- **IRT:** Isochronous transmission of data with high stability for time-critical applications (for example, motion control). The required bandwidth is from the area of bandwidth reserved for cyclic data.

Device dependency

Depending on the device, not all real-time classes are supported.

You can find further information on device dependency here: Performance characteristics of PROFINET IO and IRT (Page 5313)

Introduction: Isochronous Realtime Ethernet

Introduction: Isochronous Realtime Ethernet

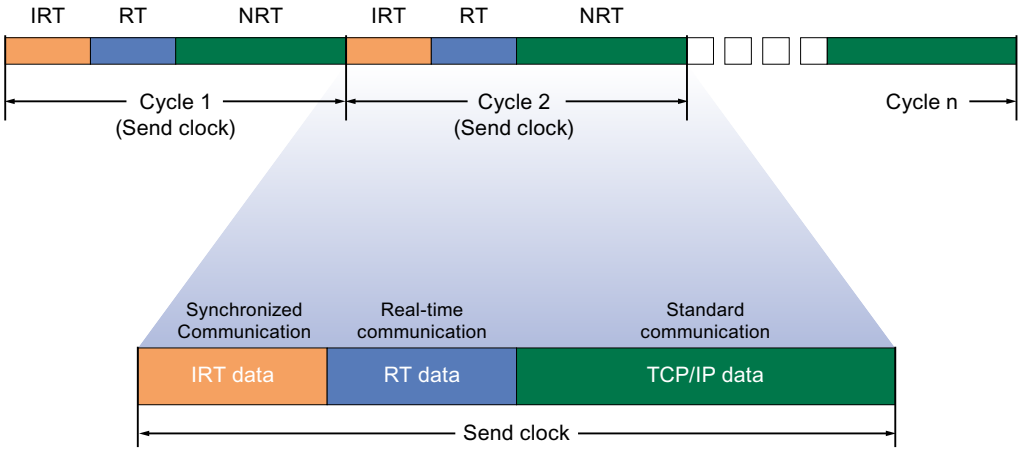
IRT is a transmission method by which PROFINET devices are synchronized with very high accuracy.

A sync master specifies the clock to which sync slaves are synchronized. An IO controller or an IO device can have the role of sync master.

Sync master and sync slaves are always devices in a sync domain. Bandwidth is reserved within the sync domain for IRT communication. Real-time and non-real-time communication (TCP/IP communication) is possible outside of the reserved bandwidth.

Time ranges of communication cycles

The communication cycle is divided into three time ranges, which are represented in the following chart:



- IRT data (synchronized communication)
  This area can be reserved in specific steps, depending on the send clock. Within this time range the IRT data is transmitted.
- RT data (real-time communication)
  In this time range the cyclic RT date is transmitted. RT data has a higher priority than "normal" TCP/IP data. TCP/IP data or Ethernet frames can have a priority between 1 and 7. RT data has a priority of 6.
- TCP/IP data (standard communication)
  Standard communication (TCP/IP, etc.) is transmitted in the remaining interval of the communication cycle.

Applications of IRT

PROFINET with IRT is especially suited for:

- High performance and deterministics for large quantity structures with regard to user data communications (productive data)
- High performance even with many devices in the line topology with regard to user data communications (productive data).
- Parallel transmission of production and TCP/IP data over wire, and securing the forwarding of production data when data volume is high by reserving transmission bandwidth.

Basic procedures for configuring IRT

Basic procedures for configuring IRT

If you want to upgrade equipment with PROFINET IO to IRT, follow these three steps:

1. Configure the PROFINET IO device. The PROFINET device must support IRT.
2. Set which device acts as the sync master and synchronizes the other devices. For this you must configure a sync domain with a sync master and at least one sync slave.
3. Download the configuration to all involved devices.

You can find further information on IRT configuration here: Auto-Hotspot

Creating PROFINET IO configuration for IRT

As a prerequisite for IRT configuration, there must be an existing PROFINET IO configuration, i.e., one or more stations must be configured with an IO controller and IO devices.

You can read which components are suitable for IRT communication in the task card "Information", once you have selected the corresponding components in the hardware catalog.

The requirements for functioning IRT communication are met simply by configuring a PROFINET IO system with components that support IRT.

Sync domain

Sync domain

A sync domain is required for synchronization of PROFINET IO devices. The sync domain assures that all devices belonging to it communicate synchronously.

Prerequisite for IRT communication is a synchronization cycle to distribute a common time base for all PROFINET devices in a sync domain. With this base synchronization, a synchronous transmission cycle of PROFINET devices within a sync domain is achieved. The sync master (usually an IO controller) generates the common synchronization clock and specifies the time basis on which all other sync slaves (usually IO devices) are synchronized.

If the sync master fails, the communication between the IRT devices reverts to RT communication.

Background processes during configuration of an IO system

If you configure an IO controller and network it with an Ethernet subnet, it will automatically be added to the default sync domain of the Ethernet subnet. The default sync domain is always available. The IO controller operates unsynchronized.

If you assign an additional IO device to the IO system of the IO controller, the IO device automatically assigns the IO controller's sync domain.

10.11.15. Configuring the HMI device as IO device 3

Introduction

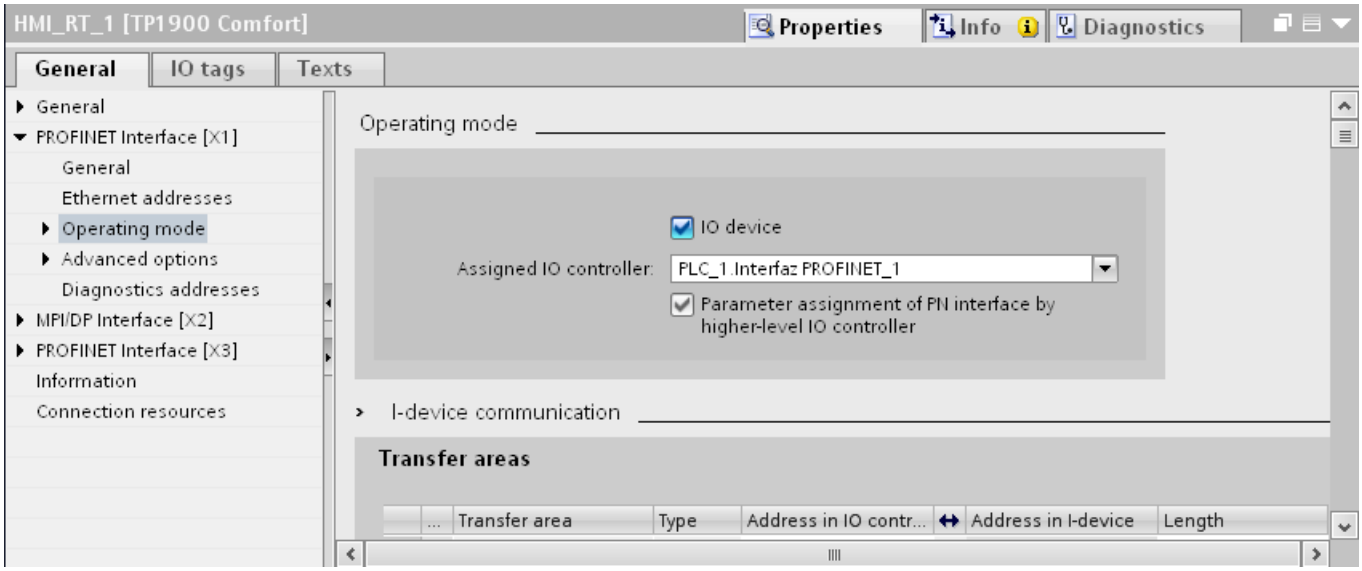
An IO controller and at least one PROFINET IO device are necessary for a PROFINET IO system.

Requirements

- A SIMATIC S7 1200 or SIMATIC S7 1500 PLC has been created.
- An HMI device from the Comfort Panels device family has been created.
- The "Devices & Networks" editor is open.

Procedure

1. You network the PLC with the HMI device:
2. Click the HMI device in the "Devices & Networks" editor.
3. In the inspector window, you select the following:
   "General > PROFINET Interface (X1) > Operating mode"
4. Select the "IO device".



5. You assign the parameters required for your PROFINET IO system
   You can find further information on the parameters for PROFINET IO systems here:
   Parameters for PROFINET IO and IRT (Page 5311)

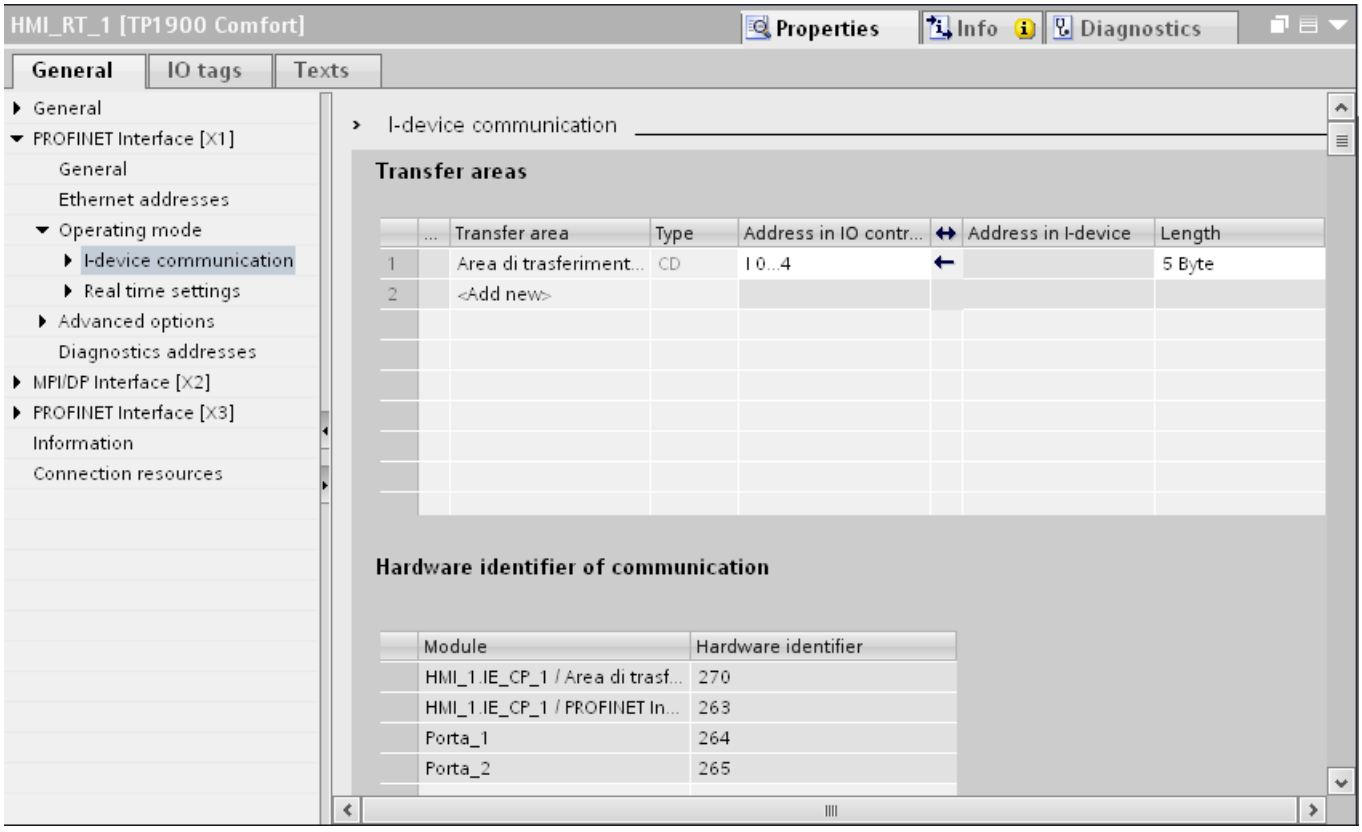
10.11.15. Parameters for PROFINET IO and IRT 4

I-device communication

I-device

The "I-device" functionality (intelligent IO device) of a CPU allows data to be exchanged with an IO controller and therefore to use the CPU, for example, as an intelligent preprocessing unit of subprocesses. The I-device is linked as an IO device to a "higher-level" IO controller.

Parameters for I-device communication



- Transfer areas
  Display transfer areas of the I-device communication
- Diagnostics address of communication
  Display of diagnostic data of the IO device

Configuring an I-device with a GSD file

If you use an I-device in another project, or if the I-device is used in another engineering system, then configure the higher-level IO controller and the I-device as described above.

However, click on the "Export" button after configuring the transfer areas in order to create a GSD file from the I-device. This GSD file represents the configured I-device in other projects.

The "Export" button is found in the "I-device communication" section of the inspector window.

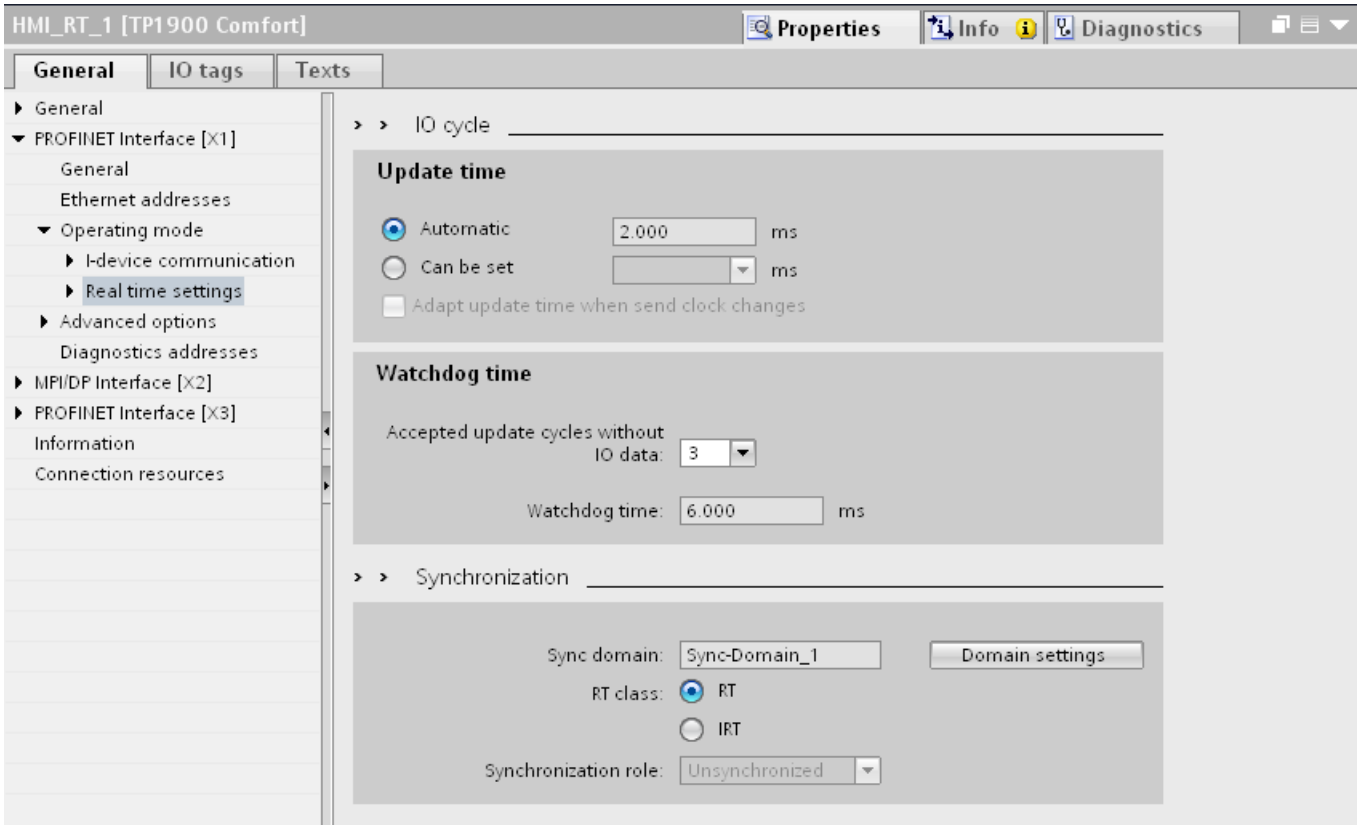
The hardware configuration is compiled and the export dialog opened.

Assign a name for the I-device proxy as well as a description in the fields provided. Click the "Export" button to complete your process.

Finally, import the GSD file, for example, into another project.

Real-time settings

Parameters for real-time settings



- Update time
  - Display of update time used in network.
  - Selection of update times available in network.
- Watchdog time
  - Selection of available update cycles.
  - Display of watchdog time used in network.
- Synchronization
  - Display of sync domain used
  - Selection of RT class.
  - Selection of role in the sync domain.

10.11.15. Performance characteristics of PROFINET IO and IRT 5

Configuration of PROFINET and IRT

Setting up PROFINET with IRT

Keep in mind the following rules for the set up and operation of a PROFINET IO system in IRT operation. They serve to insure an optimal operation of your PROFINET IO system.

- When using IRT, you must configure the topology. This will enable exact calculation of the update time, bandwidth, and additional parameters.
- If you would like to use multiple sync domains, configure a sync domain boundary for the port which is currently connected to the PROFINET device of another sync domain.
- In a sync domain you can only configure one sync master at a time.
- A PROFINET IO system may only be part of a single sync domain.
- If you configure a PROFINET device in a sync domain and want to synchronize with IRT, the PROFINET devices concerned must support IRT communication.
- Wherever possible, use the same PROFINET device as the PROFINET IO controller and sync master.
- If only some of the PROFINET devices in a PROFINET IO system are synchronized, please keep in mind the following: PROFINET devices which are not part of IRT communication are placed outside of the sync domain.

Device dependency

IRT communication

The following HMI devices support IRT communication:

- TP700 Comfort and KP700 Comfort
- TP900 Comfort and KP900 Comfort
- TP1200 Comfort and KP1200 Comfort
- TP1500 Comfort and KP1500 Comfort
- TP1900 Comfort
- TP2200 Comfort

Communication options

The following configuration options are available for Comfort Panels:

- Comfort Panel with PROFINET Basis functionality without PROFINET IO
- Comfort Panel with PROFINET RT in an RT network networked with an RT controller
- Comfort Panel with PROFINET RT as end point in an IRT network networked with an RT controller
- Comfort Panel with PROFINET IRT in an IRT network networked with an IRT controller

10.11.16 Media redundancy

10.11.16. Restrictions with media redundancy 1

Diagnostic interrupts

If you have activated "Diagnostic interrupts", diagnostic interrupts pertaining to "Media redundancy" are only processed by PROFINET-compatible devices and displayed on the "IO Controller".

If you do not use a PROFINET-compatible device, the "Diagnostic interrupts" selection does not have any function.

Diagnostic interrupts are only detected by the IO controller. There is no separate diagnostic interrupts for HMI devices that are detected and displayed by HMI devices.

10.11.16. Media redundancy 2

Media redundancy options

To increase the network availability of an industrial Ethernet network with optical or electrical line topology, the following options are available:

- Meshing networks
- Parallel switching of transmission modes
- Consolidation of a line topology to a ring topology

Media redundancy in ring topologies

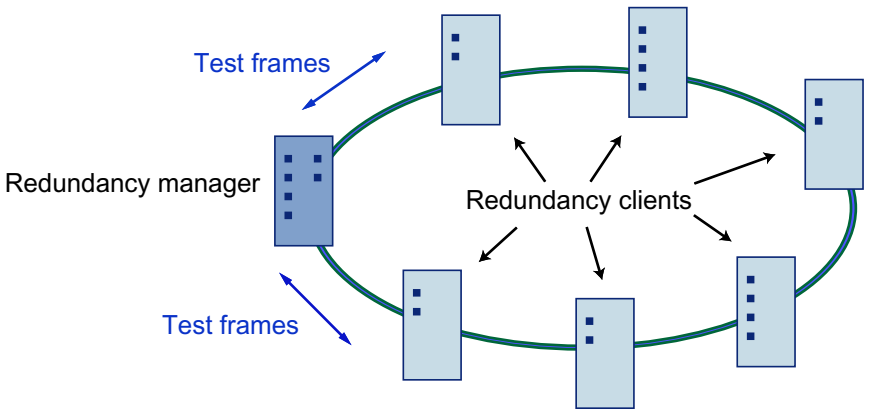
Devices in ring topologies can be the external switches and/or integrated switches of communication modules.

To set up a ring topology with media redundancy you must join both free ends of a line-shaped network topology to one device.

Consolidation of a line topology to a ring takes place over 2 ports (ring ports) in a device in the ring.

This device is the redundancy manager. All other devices in the ring are the redundancy clients.

The following figure shows the ring type interconnection:



The two ring ports in a device are the ports which create the connection to both of its neighboring devices in a ring topology.

The selection and set up of the ring ports takes place during configuration of the respective device.

Download the configuration in the individual devices before physically connecting the ring.

Functions of media redundancy in a ring topology

If a part of the ring is disconnected, then the data paths between the individual devices is automatically reconfigured. After the reconfiguration the devices are once again accessible in the newly created topology.

In the redundancy manager, 2 ring ports will be separated from each other during interruption-free network operation, so that no data frames circulate.

The ring topology is a line when viewed from the standpoint of data transfer. The redundancy manager monitors the ring topology. To do so it sends a test frame not only from ring port 1 but also from ring port 2. The test frame passes through the ring in both directions until it arrives at the other ring port on the redundancy manager.

An interruption in the ring can occur from connection failure between two devices or device failure in the ring.

If the redundancy manager's test telegram does not reach the other ring port because of interruption in the ring, the redundancy manager connects via both ports.

With this alternate route a functioning connection is again created among all remaining devices in a line-shaped topology.

The time between ring interruption and re-establishment of a functional line topology is called the reconfiguration time.

As soon as the interruption is eliminated, the original transmission route is again created, both ring ports in the redundancy manager are separated from each other, and the redundancy clients are notified of the change.

The redundancy clients then use the new route to the other devices.

If the redundancy manager fails, then the ring is changed to a functional line.

10.11.16. Media Redundancy Protocol (MRP)
3

Media Redundancy Protocol (MRP)

The MRP process works in conformity with Media Redundancy Protocol (MRP), which is specified in IEC 61158 Type 10 "PROFINET".

The reconfiguration time following an interruption of the ring amounts to a maximum of 0.2 seconds.

Requirements for trouble-free operation

Requirements for trouble-free operation with media redundancy process MRP are:

- MRP is supported in ring topologies of up to 50 devices. Exceeding the device limit can lead to data traffic failure.
- All devices must be connected to each other via their ring ports.
- "MRP" must be activated on all devices in the ring.
- The connection settings (transfer medium / duplex) must be set to full duplex and for at least 100 Mbit/s for all ring ports. Otherwise data traffic failure can occur.
- In STEP 7 configuration in the properties dialog for all ports in the ring, set the connection in the register "Options" to "Automatic settings".

HMI devices for media redundancy

The following HMI devices support "Media Redundancy":

- KP700 Comfort
- TP700 Comfort
- KP900 Comfort
- TP900 Comfort
- KP1200 Comfort
- TP1200 Comfort
- KP1500 Comfort
- TP1500 Comfort
- TP1900 Comfort
- TP2200 Comfort

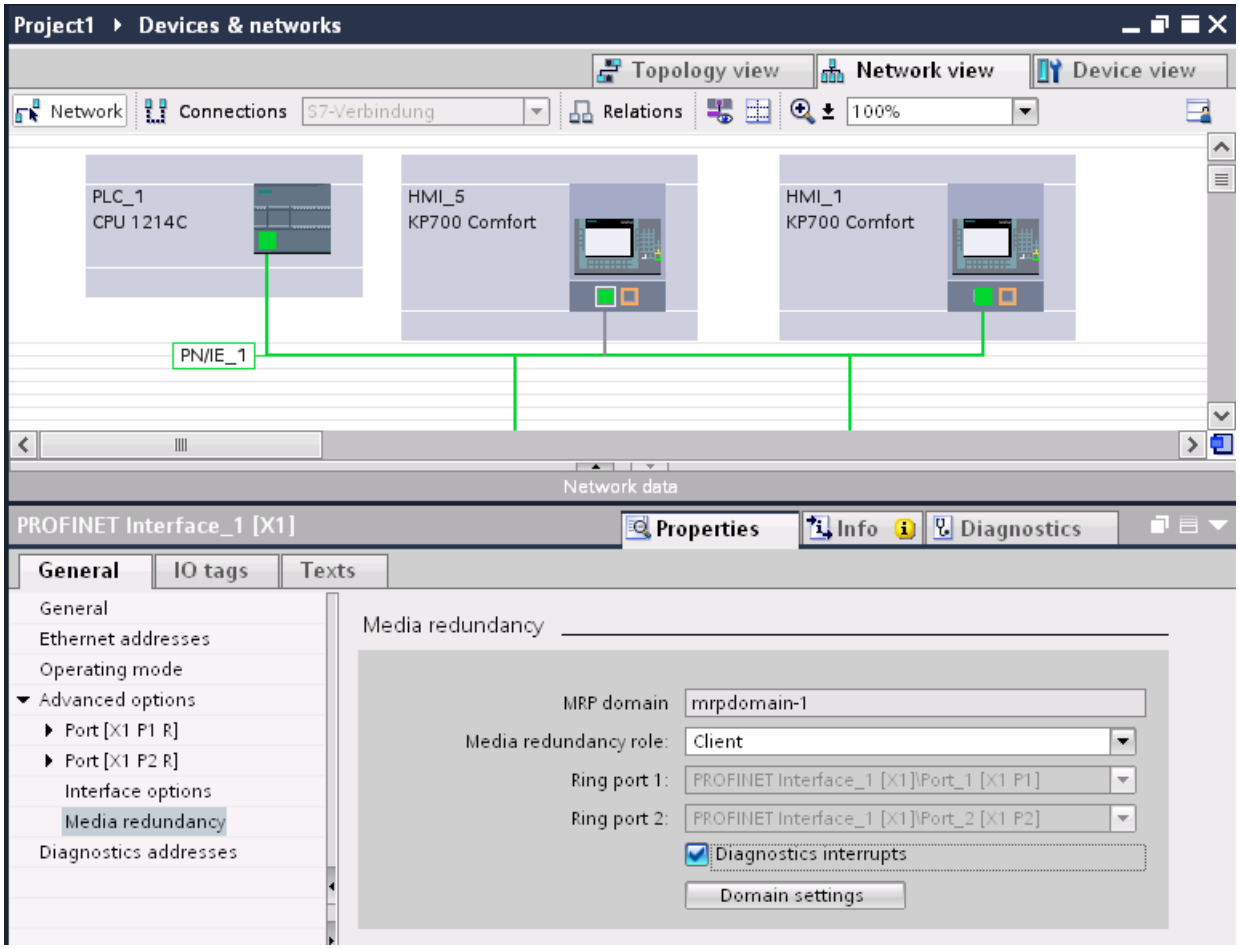
10.11.16. Configuring media redundancy for HMI devices 4

Requirements

- The participating components must support "media redundancy".
- IRT communication is not configured
- One device on the network must be configured as "Redundancy manager".
- A ring topology is set up by means of port interconnections.

Procedure

1. Click on the PROFINET interface of an HMI device.
2. Select "General > Advanced settings > Media redundancy" in the properties.
3. Select "Client" in the "Media redundancy role" area.

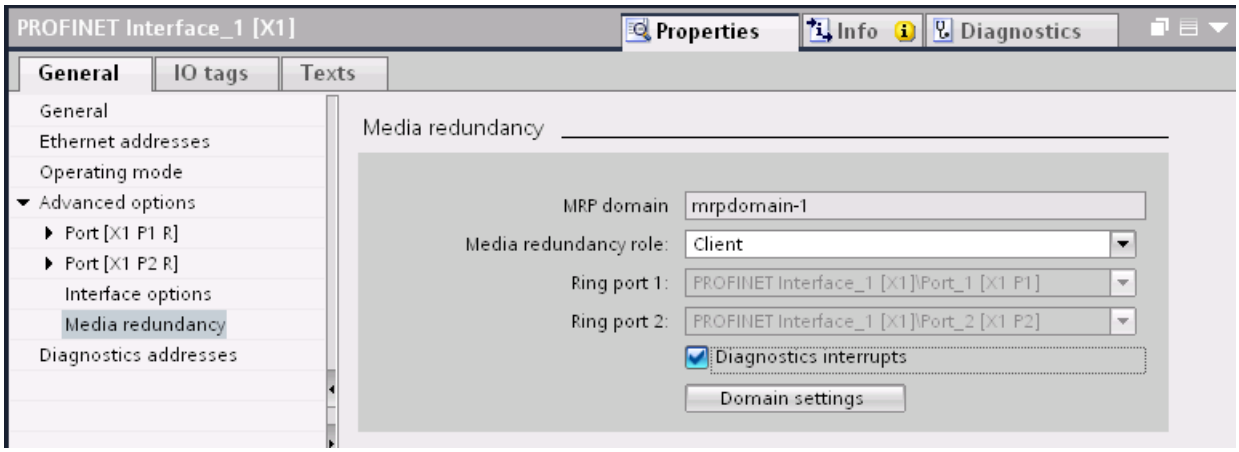


Result

The HMI device is now operating as client on the MRP network.

The default ring ports will automatically be displayed in the subjacent fields.

10.11.16. Parameters for media redundancy
5



MRP domain

This area displays the MRP domain.

You can rename the MRP domain in the "Domain settings" dialog.

Domain settings

Click "Domain settings" to open the "Domain settings" editor.

You also manage the MRP domains in the MRP domain area of the "Domain settings" editor.

Media redundancy role

Assign the role of the HMI device in the "Media redundancy role" area.

You have the following options:

- Client
  The HIM device is operated as "Client" in an MRP domain.
- Not a node of the ring
  The HIM device is not operated within an MRP domain.

Ring port 1 and Ring port 2

Display of available ring ports

Diagnostic interrupts

The following diagnostic interrupts can be generated if "Diagnostic interrupts" is activated:

- Wiring or port error
  Diagnostics interrupts will be generated for the following errors in the ring ports:
  - A neighbor of the ring port does not support MRP
  - A ring port is connected to a non-ring port

10.11.16. Managing MRP domains
6

You can monitor and adjust the media redundancy settings centrally.

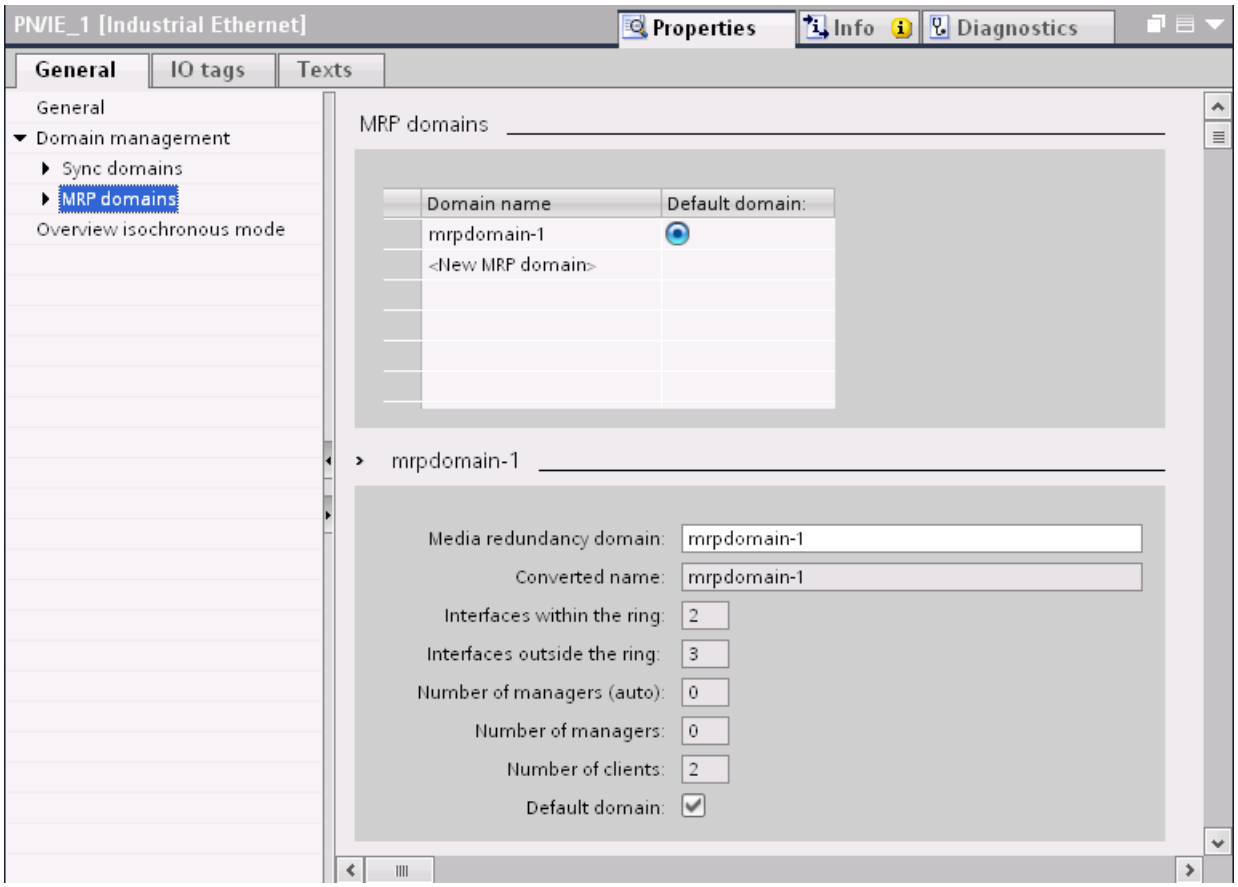
Requirements

The devices are configured and networked.

Procedure

1. Select the PROFINET interface of the HMI device.
2. Select the "Advanced options > Media redundancy" area in the Inspector window.

3. Click the "Domain settings" button.
4. Navigate to the "Domain management > MRP domains" area in the Inspector window.



MRP domains

You can specify the default MRP domain in the "MRP domains" area.

You can rename all domains and check the redundancy roles and ring ports.

For each MRP domain, you receive an overview of how many PROFINET interfaces are interconnected in the ring, how many PROFINET interfaces are located outside the ring, and the number of redundancy managers and redundancy clients.

You can have the devices in the ring, including device name, associated MRP domain, media redundancy role, and utilized ring ports, displayed in groups:

- IO systems
  The list shows you all configured devices of the selected IO system.
- Rings
  The list shows you all ring interconnections of the selected IO system. The identified rings are numbered consecutively. If all devices of this ring belong to one MRP domain, this is also displayed.
- MRP domain
  The list shows you the existing MRP domains of the selected IO system.

10.11.17 Communication with other PLCs

10.11.17. Communication with other PLCs 1

Introduction

Communication with other PLCs is communication with PLCs that are not in the SIMATIC family.

These PLCs have proprietary protocols for data exchange. The protocols are configured as communication drivers in WinCC.

Communication drivers

The following communication drivers are supported in WinCC and are already installed:

- Allen-Bradley
  - Allen-Bradley EtherNet/IP
  - Allen-Bradley DF1
- Mitsubishi
  - Mitsubishi MC TCP/IP
  - Mitsubishi FX
- Modicon Modbus
  - Modicon Modbus TCP/IP
  - Modicon Modbus RTU
- Omron
  - Omron Host Link

Communication drivers in WinCC RT Professional

The following communication drivers are supported for RT Professional:

- Allen-Bradley
  - Allen-Bradley EtherNet/IP
- Mitsubishi
  - Mitsubishi MC TCP/IP
- Modicon Modbus
  - Modicon Modbus TCP

Connections between HMI devices and other PLCs

You configure the connections between HMI devices and other PLCs in the "Connections" editor of the HMI device. These connections are non-integrated connections.

10.11.17. Distinctive features when configuring 2

Distinctive features for data exchange

Distinctive features apply when configuring connections to other PLCs, compared to configuring integrated connections.

Note the following distinctive features when configuring:

- Addressing of tags
- Permitted data types
- Distinctive features when configuring area pointers
- Distinctive features when configuring alarms
- Distinctive features when configuring trends

For more detailed information on distinctive features when configuring, refer to Section "Data exchange" of the respective communication driver.

10.11.17. Parallel communication 3

Parallel communication of communication drivers

The following table shows an overview of which communication drivers you can use simultaneously on one HMI device.

Note

Parallel communication is not approved for Basic Panels.

Parallel communication over Ethernet interfaces

The approved combinations can be operated via the same Ethernet interface. Several Ethernet interfaces are not required.

Parallel communication only concerns the Ethernet-based communication drivers.

	Allen-Bradley EtherNet/IP	Mitsubishi MC TCP/IP	Modicon Modbus TCPIP	OPC (DA/ XML DA)	OPC UA (DA)	SIMATIC LOGO!	SIMATIC S7 200	SIMATIC S7 300/400	SIMATIC S7 1200	SIMATIC S7 1500	SIMATIC HTTP protocol	Sinumerik NC
Allen-Bradley EtherNet/IP	--	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Mitsubishi MC TCP/IP	No	--	No	Yes	Yes	No	No	No	No	No	Yes	No
Modicon Modbus TCPIP	No	No	--	Yes	Yes	No	No	No	No	No	Yes	No
OPC (DA/ XML DA)	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
OPC UA (DA)	Yes	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes	Yes	Yes
SIMATIC LOGO!	Yes	No	No	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes	Yes
SIMATIC S7 200	Yes	No	No	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes	Yes
SIMATIC S7 300/400	Yes	No	No	Yes	Yes	Yes	Yes	--	Yes	Yes	Yes	Yes
SIMATIC S7 1200	Yes	No	No	Yes	Yes	Yes	Yes	Yes	--	Yes	Yes	Yes
SIMATIC S7 1500	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	--	Yes	Yes
SIMATIC HTTP protocol	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--	Yes
Sinumerik NC	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	--

Parallel communication over serial interfaces

The following applies for parallel communication over serial interfaces:

- One communication driver per interface.
- One interface per communication driver.

10.11.17. Communication drivers
4

Allen-Bradley

Allen-Bradley communication drivers

Introduction

This section describes the communication between an HMI device and PLCs that use Allen-Bradley communication drivers.

The following communication drivers are supported:

- Allen-Bradley EtherNet/IP
- Allen-Bradley DF1

Data exchange

Data is exchanged by means of tags or area pointers.

- Tags
  The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers
  Area pointers are used to exchange specific data and are only set up when these data are used.

Allen-Bradley EtherNet/IP

Configuring a connection via Allen-Bradley EtherNet/IP

Introduction

You configure a connection to a PLC with an Allen-Bradley EtherNet/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

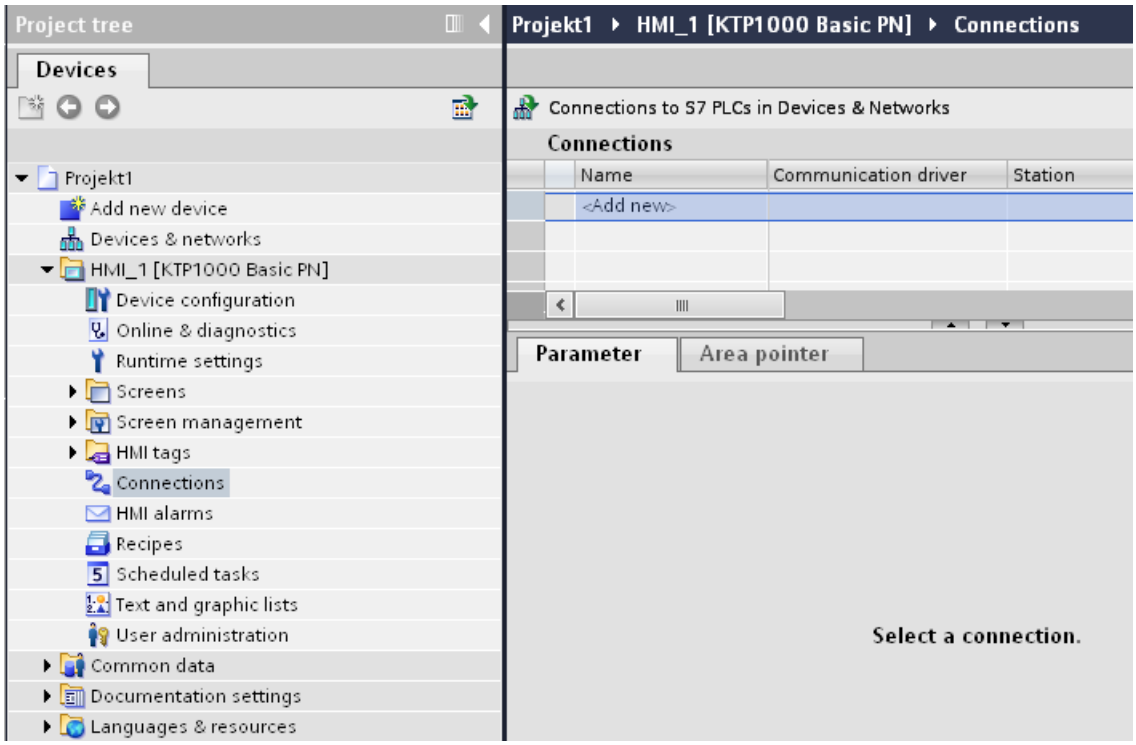
Example: PROFINET interface corresponds to the Ethernet interface

Requirements

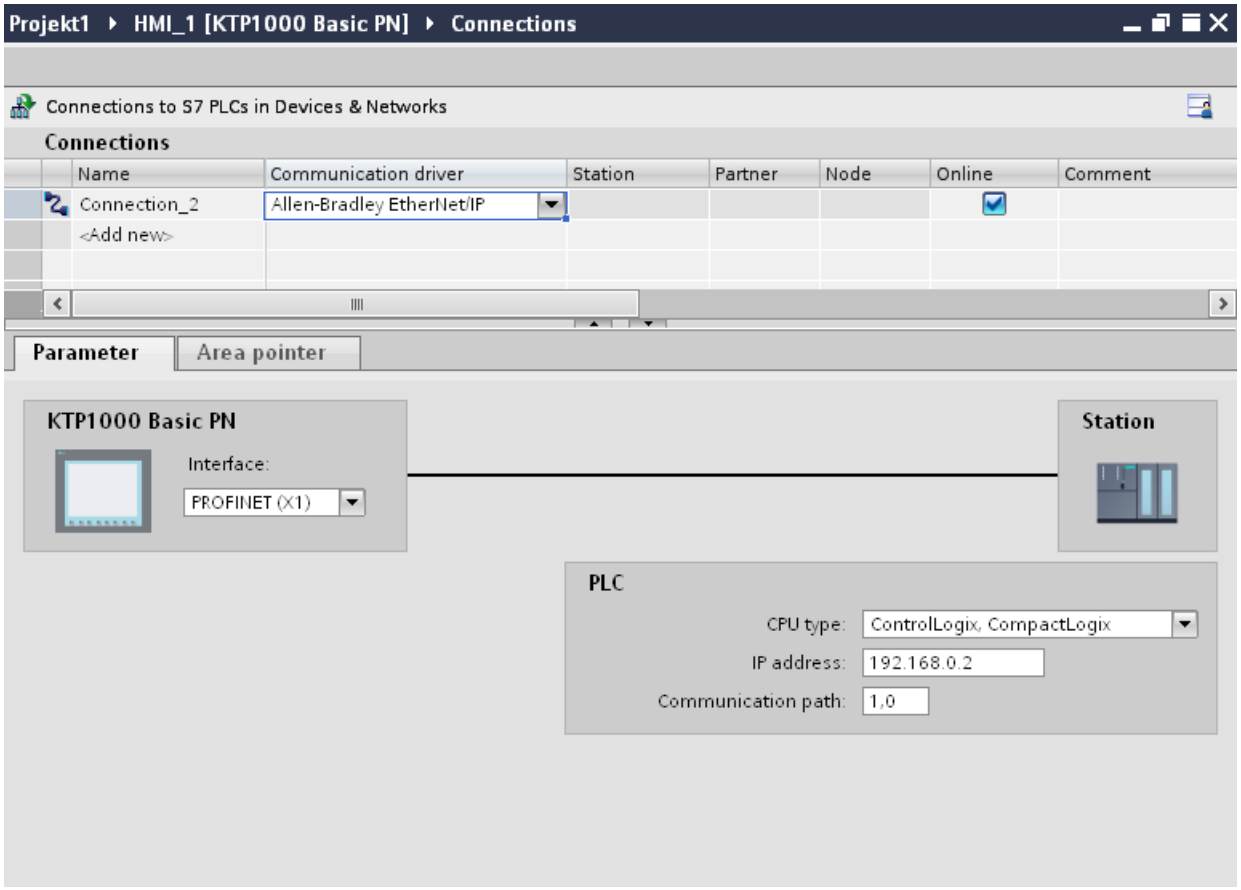
- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Allen-Bradley EtherNet/IP" driver.



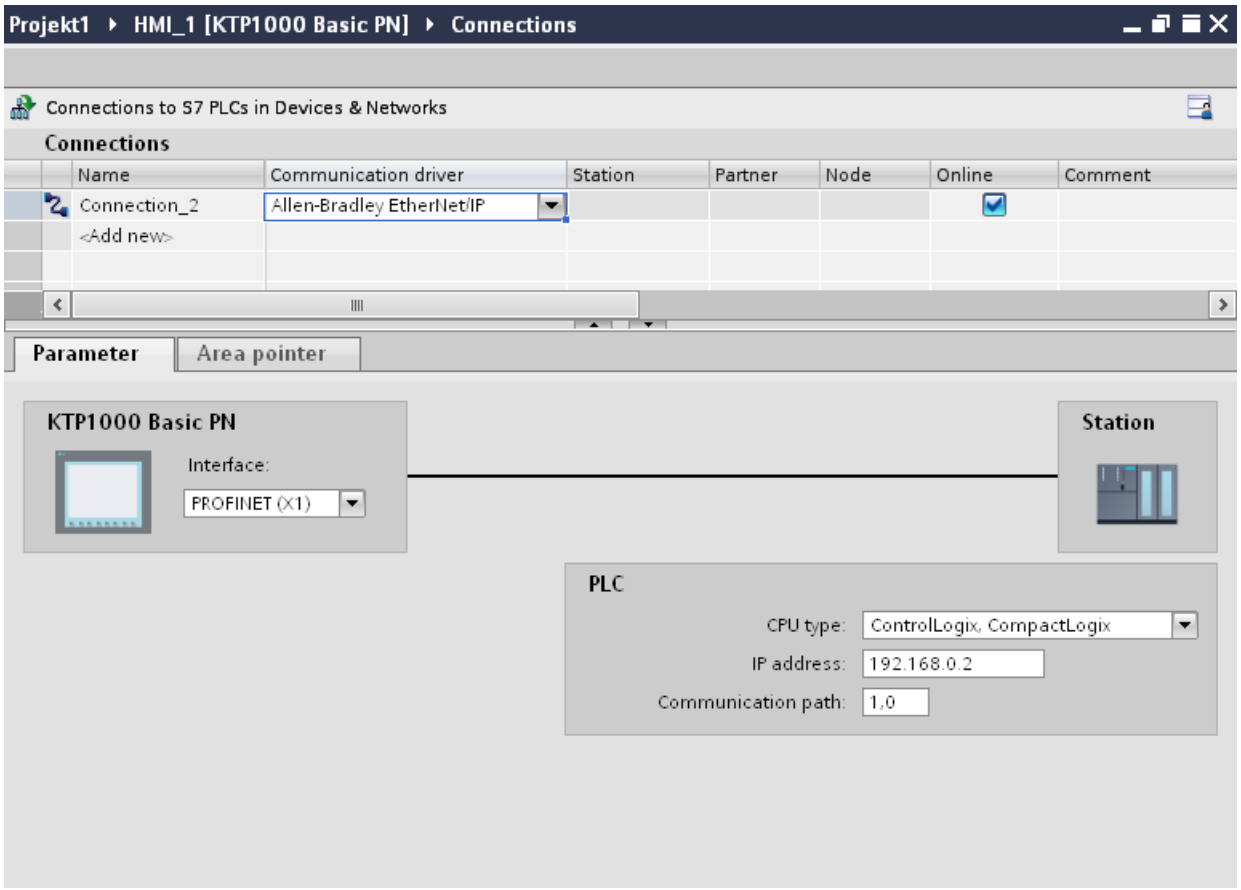
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Allen-Bradley EtherNet/IP)

Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "PLC" area is available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device upon subsequent loading.

Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

To set up the IP address of the HMI device:

1. Click on the HMI device.
2. Open the "Device configuration" editor.

3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:
   "General > PROFINET interface > Ethernet addresses"

Parameters for the PLC

- CPU type
  For "CPU type", set the CPU type of the PLC used.
- IP address
  Set the IP address or host name of the Ethernet/IP module of the PLC. Only the IP address can be used on a Basic Panel.
- Communication path
  Set the CIP path from the Ethernet module to the PLC. This establishes a logical connection between the Ethernet module and PLC, even if both devices are located in different CIP networks.
  For additional information see: Examples: Communication path

Connecting HMI device to PLC

Connections via Allen-Bradley EtherNet/IP

Connection

The HMI device can be connected to the Allen-Bradley PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to an Allen-Bradley PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Communication types

Approved communication types with Allen-Bradley EtherNet/IP

The following communication types are system-tested and approved:

- Point-to-point connection to the approved PLCs
- Multipoint connection from a HMI device (Allen-Bradley Ethernet/IP-Client) with up to 4 PLCs with the respectively approved PLCs. CPU types can be mixed.

Connection

Connection with the following PLCs is approved with Allen-Bradley EtherNet/IP:

- CPU type: "ControlLogix, Compact Logix"
  - ControlLogix
    556x(1756-L6x) with Ethernet module 1756-ENBT
  - Guard Logix-System ControlLogix
    556xS(1756-L6xS) with Ethernet module 1756-ENBT
  - CompactLogix
  - 533xE(1769-L3xE) with Ethernet interface onboard
  - 532xE(1769-L2xE) with Ethernet interface onboard
  - 534x (1768-L4x) with Ethernet module 1768-ENBT
- CPU type: "SLC, MicroLogix"
  - MicroLogix 1100 (with Ethernet interface onboard)
  - MicroLogix 1400 (with Ethernet interface onboard)
  - SLC 5/05 (with Ethernet interface onboard)

Performance features of communication

Permitted data types for Allen-Bradley EtherNet/IP

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

CPU type: ControlLogix, CompactLogix

Data type	Length
Bool	1 bit
DInt	4 bytes
Int	2 bytes
Real	4 bytes
SInt	1 byte
String	1 to 80 characters
UDInt	4 bytes
UInt	2 bytes
USInt	1 byte

Permitted data types arrays

Address	Permitted data types
Array	SInt, USInt, Int, UInt, DInt, UDInt, Real
Individual bits from the basic data types of the PLC SInt, USInt, Int, UInt, DInt, UDInt	Bool*

* Any changed value of certain defined bits is written back to the PLC. There is no check to determine whether any other bits have changed. The PLC (or other PLCs) may only read access the value.

CPU type: SLC, MicroLogix

Data type	Operand type	Length
ASCII	A	0 to 80 characters
Bool	N, R, C, T, B, S, I, O	1 bit
DInt	N	4 bytes
Int	N, R, C, T, S	2 bytes
Real	N, F	4 bytes
String	ST	1 to 80 characters
UDInt	N	4 bytes
UInt	N, R, C, T, B, I, O	2 bytes

Note

Strings in RSLogix 5000 have a default length of 82 characters. A maximum of 80 characters can be displayed in WinCC. Always use strings which do not exceed the maximum length of 80 characters.

Permitted data types arrays

Address	Permitted data types
Array	Int, UInt, DInt, UDInt, Real

Distinctive features for connections with Allen-Bradley Ethernet/IP

With the communication driver Allen Bradley Ethernet/IP and the CPU type SLC, MicroLogix, you can only use array tags for discrete alarms and trends.

Note

I/O modules with 8 or 16 ports occupy one data word on the PLC.

I/O modules with 24 or 32 ports occupy two data words.

The HMI device does not output an error message if using non-existent bits.

You should always make sure that I/O modules with 8 or 24 ports only occupy the bits that are actually assigned to a port.

Supported CPU types for Allen-Bradley EtherNet/IP

CPU types

The following CPU types are supported for configuring the Allen-Bradley EtherNet/IP communication driver.

- CompactLogix
  - 1769-L2xE with Ethernet interface onboard
  - 1769-L3xE with Ethernet interface onboard
  - 1768-L4x with Ethernet module 1768-ENBT
- ControlLogix
  - 1756-L6x with Ethernet module 1756-ENBT
- GuardLogix
  - 1756-L61S with Ethernet module 1756-ENBT
  - 1756-L62S with Ethernet module 1756-ENBT
  - 1756-L63S with Ethernet module 1756-ENBT
- MicroLogix
  - MicroLogix 1100 / 1400
- SLC50x
  - SLC5/05

Addressing in the C.Logix CPU type

Addressing

Addressing

A tag is uniquely referenced in WinCC by means of an address in the PLC. The address must correspond with the tag name in the PLC. The tag address is defined by a string with a length of up to 128 characters.

Using characters for addressing

Valid characters for tag addressing:

- Letters (a to z, A to Z)
- Numbers (0 to 9)
- Underscore (_)

The tag address consists of tag name and other character strings used to specify the tag in the PLC.

Tag name properties:

- The tag name may begin but not end with an underscore character.
- Strings with successive underscore and space characters are invalid.
- The address may not exceed a length of 128 characters.

Note

The characters reserved for tag addressing may not be used in program/tag names or at any other address instance.

The reserved characters are listed below:

Reserved character	Function
.	Element delimiter
:	Definition of a program tag
,	Delimiter for addressing multi-dimensional arrays
/	Reserved for bit addressing.
[ ]	Addressing of array elements or arrays

PLC and program tags

The Allen-Bradley EtherNet/IP communication driver supports addressing of PLC tags (global project tags) and/or program tags (global program tags).

A program tag is declared based on the program name in the PLC and actual tag name which are delimited by colon. PLC tags are simply addressed by their name.

Note

Addressing errors

Addressing errors occur when the tag name and data type are inconsistent.

Note that the tag name defined in the address field in WinCC must match the tag name in the PLC. Make sure that the data types of tags in WinCC match the data types in the PLC.

Note

Module-specific tags, e.g. for data on input and output modules, cannot be addressed directly. Instead, use an alias tag in the PLC.

Example: Local:3:O. Data cannot be addressed in WinCC.

If the alias "MyOut" is defined for Local:3:O in the PLC, you can address with WinCC via MyOut.Data.

Addressing syntax

Notation of addresses

The tables below define the notation for the individual addressing options for Allen-Bradley EtherNet/IP.

Table 10-155 Access to arrays, basic data types and structure elements

Data types	Type	Address
Basic data types	PLC tag	Tag name
	Program tag	Programname:tagname
Arrays	PLC tag	Array tag
	Program tag	Program name: array tag
Bits	PLC tag	Tagname/bitnumber
	Program tag	Programname:tagname/bitnumber
Structure elements	PLC tag	Structure tag. Structure element
	Program tag	Program name: structure tag. structure element

Note

Bit addressing with the data types Bool, Real and String is not permitted and will cause an addressing fault.

Description of the syntax

Syntax description:

```
 (Programname:)tagname([x(,y)(,z)]){.tagname([x(,y)(,z)])}(/
bitnumber)
```

- The "( )" defines an optional, single instance of an expression.
- The "{ }" defines an optional expression with multiple single instances.

The address string length may not exceed 128 characters.

Addressing types

Arrays

An array is a data structure that includes a number of data of the same type. WinCC only supports one-dimensional arrays.

In the address column of the tag editor, enter the array name possibly by specifying a start element. The length is defined in the Array Elements input box of the tag editor. If array limits in the PLC are exceeded (due to faulty indexing), addressing errors result.

These arrays must be declared in the PLC as controller or program tags.

Two- or three-dimensional arrays in the PLC can only be addressed in WinCC if these can be mapped area-wise onto one-dimensional arrays .

Note

During all read accesses and all write accesses, all array elements of a tag are always read or written, respectively. The contents of an array tag which is interconnected with a PLC are always transferred whenever there is a change. The HMI device and the PLC cannot concurrently write data to the same array tag for this reason. Instead of writing data only to a single element, the program writes the entire array to the PLC.

Array elements

Elements of one-dimensional, two-dimensional and three-dimensional arrays in the PLC are indexed by setting an index and the corresponding notation in the tag editor. Array addressing starts at element "0", with arrays of all basic types being valid for element addressing. Read/ write operations are only carried out at the addressed element, and not for the entire array.

Bits and bit tags

Bit access is allowed to all basic data types with the exception of Bool, Real and String. Bit addressing is also allowed at array/structure elements. The Bool data type is set in WinCC when bits and bit tags in the basic data types are addressed.

Single-digit bit numbers are addressed with "/x" or "/0x" (x = bit number). Bit numbers are defined by up to two digits.

Note

With the "Bool" data type in the data types SInt, Int and DInt, after changing the specified bit the complete tag is then written in the PLC again. In the meantime, no check is made as to whether other bits in the tag have since changed. Therefore, the PLC may have only read access to the specified tag.

Structures

User-defined data types are created by means of structures. These structures group tags of different data types. Structures may consist of basic types, arrays and of other structures. In WinCC, only structure elements are addressed and not entire structures.

Structure elements

Structure elements are addressed by means of the name of the structure and of the required structure element. This addressing is separated by point. In addition to basic data types, the

structure elements may represent arrays or other structures. Only one-dimensional arrays may be used as a structure element.

Note

The nesting depth of structures is only limited by the maximum length of 128 characters for the address.

Address multiplexing

Address multiplexing

Address multiplexing is possible with the CompactLogix, ControlLogix CPU type.

Address multiplexing requires two tags:

- "Tag_1" of data type "String"; contains a logical address such as "HMI:Robot5.Block5" as value.
  The value may change to a second valid address, for example, "HMI:Robot4.Block3".
- "Tag_2" is a tag in which the "Allen-Bradley EtherNet/IP" communication driver is set up as a connection.
  Enter a valid name of an HMI_tag in square brackets as the address.
  - e.g.: "[Tag_1]"
  - The tag must be of the String data type.
  - The square brackets indicate address multiplexing.
  - The address is derived from the actual value in "Tag_1".

  Note

  You can only multiplex entire Allen-Bradley EtherNet/IP addresses. Multiplexing of address elements is not possible. "HMI:Robot[Tag_1].Block5" is an invalid address.

  You can optionally click the arrow right icon in the "Address" column. Replace the "Constant" with the "Multiplex" entry by clicking the arrow on the left edge of the next address dialog box. Now the tag selection list only returns tags of data type "String".

  You can also configure a function triggered by a "change of value" event for multiplexed tags.

Examples for addressing

Example of a table for addressing

The table below defines the basic variants for addressing PLC tags. Other addressing variants are possible by means of combination.

Type	Type	Address
General	PLC tag	Tag name
	Program tag	Program:tagname
Array	Access to an element of a 2-dimensional array	Arraytag[Dim1,Dim2]
	Element of structure array (1-dimensional)	Arraytag[Dim1].structureelement
	Bit in element basic type array (2-dimensional)	Arraytag[Dim1,Dim2]/Bit
Structure	Array in structure	Structuretag.arraytag
	Bit in the element of an array in the substructure	Structuretag.structure2.arraytag [element]/ bit

Note

Program tags are addressed by leading the address with the program name derived from the PLC with colon delimiter.

Example: Programname:arraytag[Dim1,Dim2]

Access to array elements

Type	Address
PLC tag	Arraytag[Dim1]
	Arraytag[Dim1,Dim2]
	Arraytag[Dim1,Dim2,Dim3]
Program tag	Programname:arraytag[Dim1]
	Programname:arraytag[Dim1,Dim2]
	Programname:arraytag[Dim1,Dim2,Dim3]

Examples: Communication path

Example 1:

Connection with a PLC in the same Allen-Bradley rack.

1,0

Number	Meaning
1	Stands for a backplane connection.
0	Stands for a CPU slot number.

Example 2:

Connection with a PLC in remote Allen-Bradley racks. Two Allen-Bradley racks are networked on Ethernet.

1,2,2,190.130.3.101,1,5

Number	Meaning
1	Backplane connection
2	Stands for the CPU slot number of the second Ethernet module.
2	Stands for an Ethernet connection.
190.130.3.101	IP address of a remote AB rack on the network – in particular the third Ethernet module
1	Backplane connection
5	Slot number of the CPU

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Note

If running the CompactLogix PLC with firmware earlier than version 18, you will possibly have to restart the HMI device following the transfer of the PLC program.

You could also terminate the connection before transferring the PLC program and set up the connection again after having completed the transfer of the PLC program.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Allen-Bradley DF1

Configuring a connection via Allen-Bradley DF1

Introduction

You configure a connection to a PLC with an Allen-Bradley DF1 communication driver in the "Connections" editor of the HMI device.

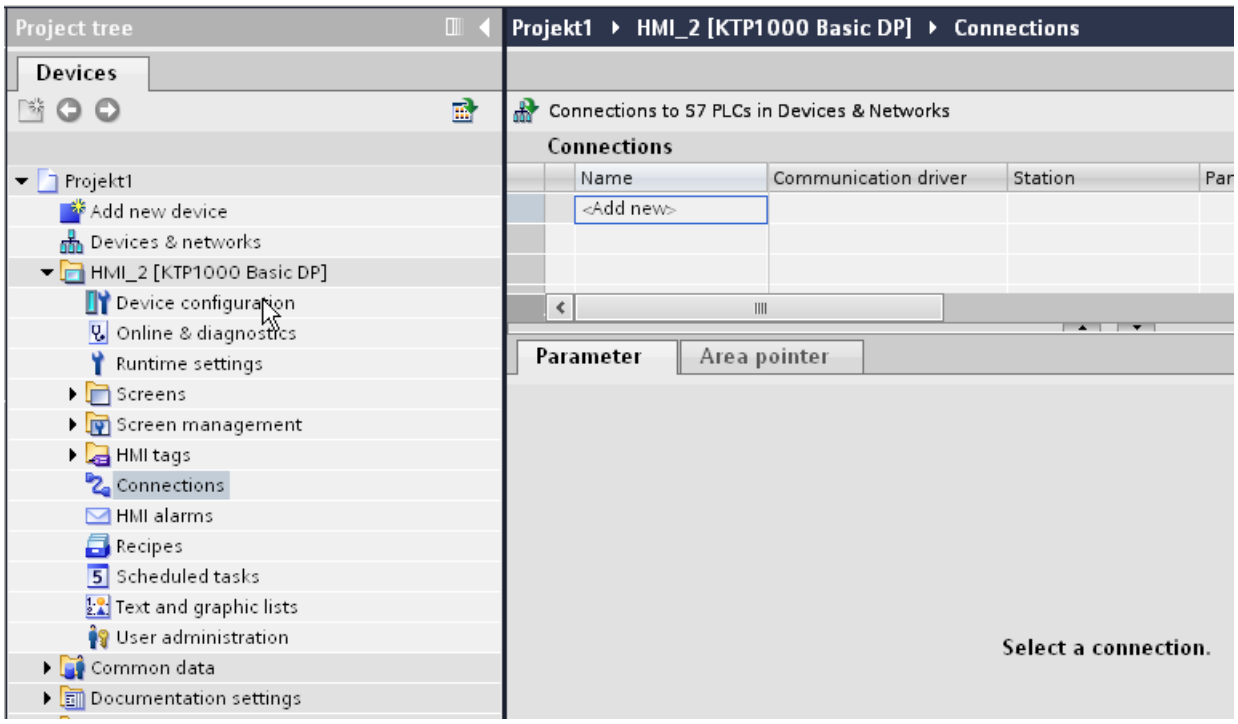
The interfaces are named differently depending on the HMI device.

Requirements

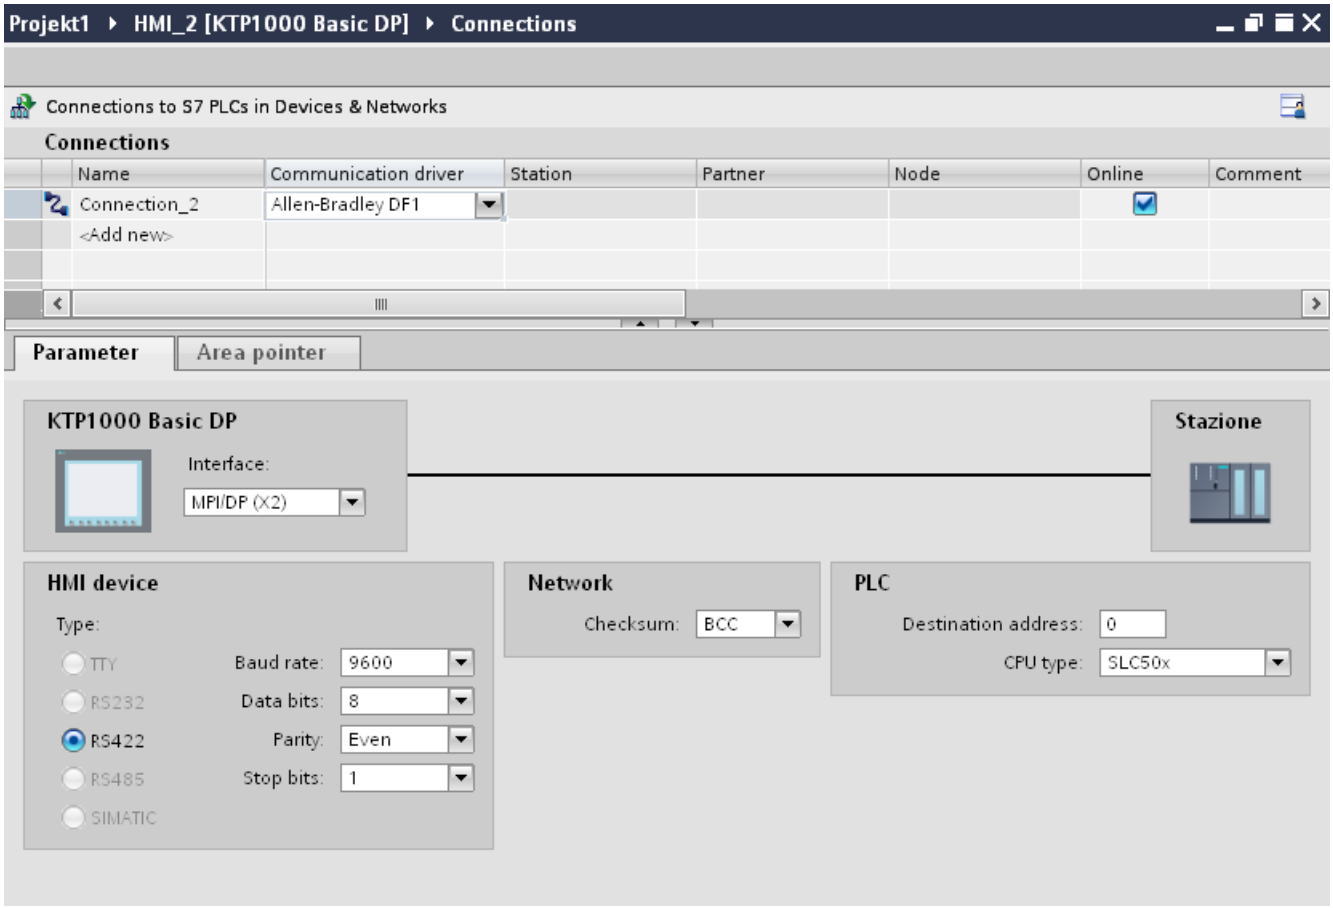
- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Allen-Bradley DF1" driver.



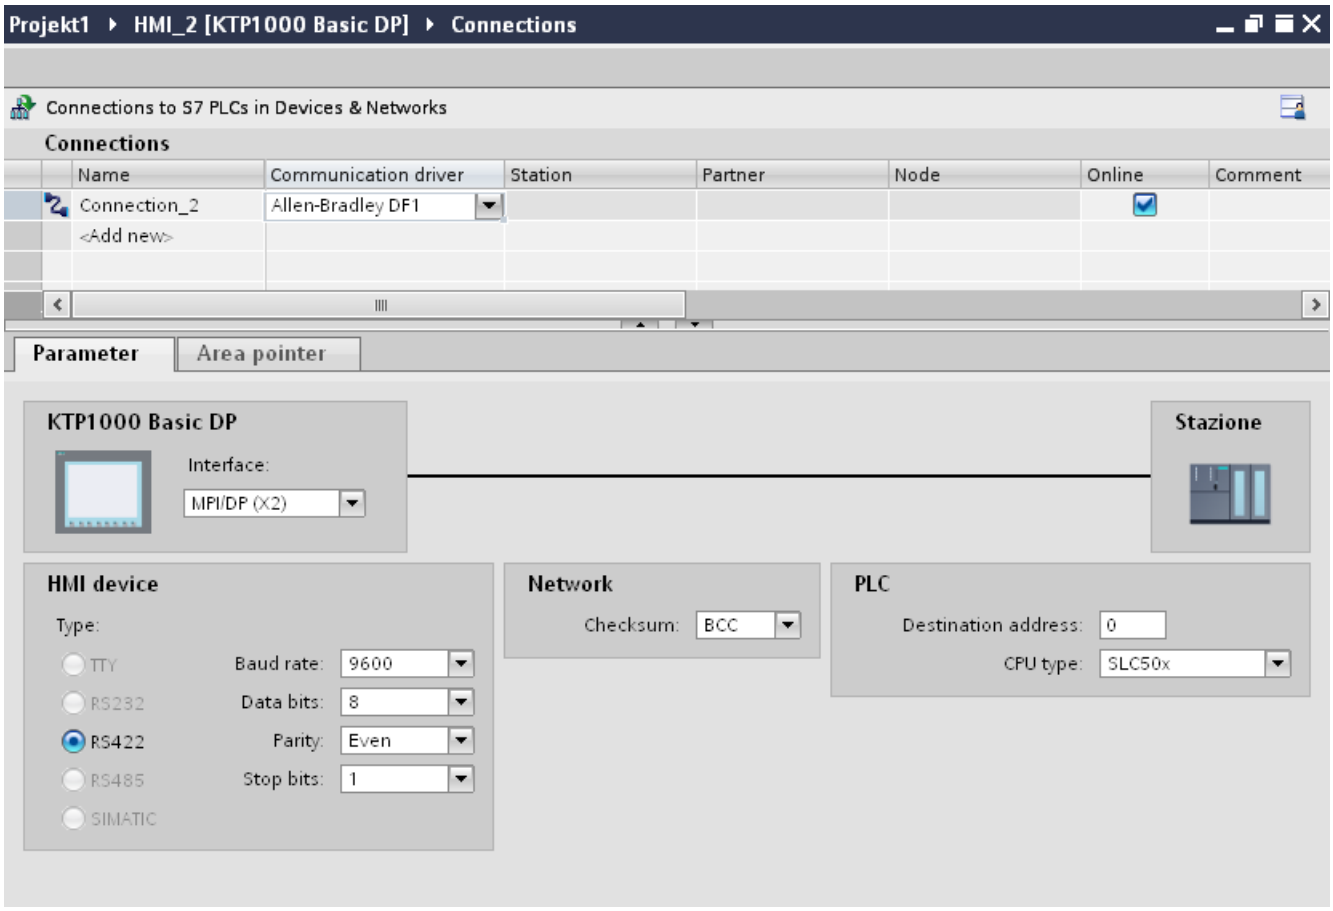
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Allen-Bradley DF1)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

- Interface
  Under "Interface", you select the interface of the HMI device to which the PLC is connected. For additional information, refer to the device manual for the HMI device.
- Type
  Specifies the physical connection used.

  Note

  If you are using the IF1B interface, you must also reconnect the RS-485 receive data and the RTS signal to the rear of the HMI devices via 4 DIP switches.

- Baud rate
  For "Baud rate", select the transmission speed between the HMI device and PLC.
- Data bits
  For "Data bits", you can choose between "7 bits" and "8 bits".
- Parity
  For "Parity", you can choose from "None", "Even", and "Odd".
- Stop bits
  For "Stop bits", you can choose between 1 and 2 bits.

Parameters for the network

- Checksum
  For "Checksum", choose the method for determining the error code: "BCC" or "CRC".

Parameters for the PLC

- Destination address
  For "Destination address", choose the PLC address. If there is a point-to-point DF1 connection, you set the address "0".
- CPU type
  For "CPU type", set the CPU type of the PLC used.

Note

Assign the DF1 FULL-DUPLEX driver in the CPU as follows: "NO HANDSHAKING" for "Control Line" and "AUTO-DETECT" for "Embedded Responses".

Connecting HMI device to PLC

Connections via Allen-Bradley DF1

Connection

The connection is established when you have matched the parameters of the PLC and the HMI device. Special blocks for the connection are not required in the PLC.

Note

Rockwell offers a variety of communication adapters for integrating "DF1 devices" for the DH485, DH, and DH+ networks. Of these connections, the direct connection and the connection via KF2 and KF3 module are approved. None of the other connections have been system-tested by SIEMENS AG and are therefore not approved.

Communication partners for Allen-Bradley DF1

Connectable PLCs

The communication drivers listed below support Allen-Bradley PLCs: :

PLC	DF1 (point-to-point) RS-232	DF1 (point-to-point) RS-422	DF1 (multipoint) over KF2 module to DH+ LAN RS-232/RS-422	DF1 (multipoint) over KF3 module to DH485 LAN RS-232
SLC500	–	–	–	X
SLC501	–	–	–	X
SLC502	–	–	–	X
SLC503	X	–	–	X
SLC504	X	–	X	X
SLC505	X	–	–	X
MicroLogix	X	–	–	X
PLC-5 [1)]	X	X	X	–

[1)] Processors released for PLC-5: PLC-5/11, PLC-5/20, PLC-5/30, PLC-5/40, PLC-5/60, and PLC-5/80.

Communication types

PLCs with Allen-Bradley DF1 communication driver

The communication between the HMI device and the following Allen Bradley PLCs is described in this section:

- SLC500
- SLC501
- SLC502
- SLC503
- SLC504
- SLC505
- PLC5
- MicroLogix

In these PLCs the connection is made by the PLC-internal protocols Allen Bradley DF1, Allen Bradley DH485 and Allen Bradley DH+.

The Allen-Bradley DF1 communication driver is used here, the protocol of which is converted into one of the other two PLC-internal protocols in multipoint communication with the communication modules KF2 (Allen Bradley DH+) and KF3(Allen Bradley DH485).

Enabled types of communication with Allen-Bradley DF1

The following communication types are system-tested and enabled:

- HMI (Allen Bradley DF1)
  Point-to-point connection
- HMI (Allen Bradley DF1)
  Via KF2 module to Allen Bradley DH+ (communication with up to 4 PLCs)
- HMI (Allen Bradley DF1)
  Via KF3 module to Allen Bradley DH485 (communication with up to 4 PLCs)

Connectable PLCs

The Allen Bradley DF1 communication driver is available for the following Allen-Bradley PLCs:

PLC	DF1 (point-to-point) RS 232	DF1 (point-to-point) RS 422	DF1 (multipoint) via KF2 module to DH+ LAN RS 232/RS 422	DF1 (multipoint) via KF3 module to DH485 LAN RS 232 [2]
SLC500	–	–	–	X
SLC501	–	–	–	X
SLC502	–	–	–	X
SLC503	X [2]	–	–	X
SLC504	X [2]	–	X	X
SLC505	X [2]	–	–	X
MicroLogix	X [2]	–	–	X
PLC-5 [1]	X	X	X	–

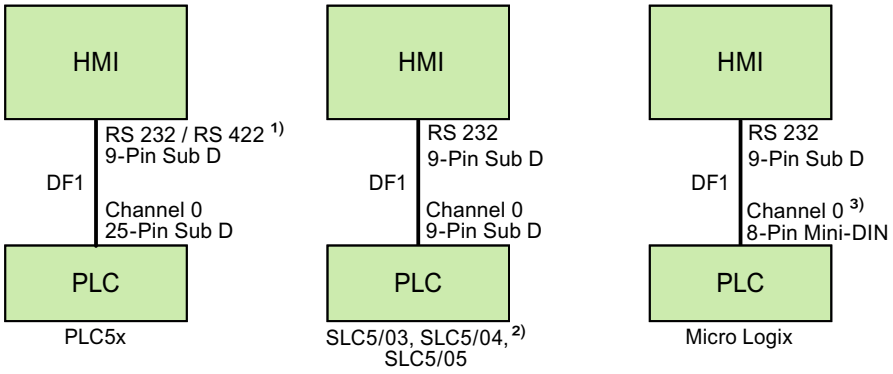
[1] Only the following processors are approved for PLC-5: PLC-5/11, PLC-5/20, PLC-5/30, PLC-5/40, PLC-5/60 und PLC-5/80.

[2] For HMI devices which only have an RS 422/485 interface and the communication partner is an RS 232 interface, the RS 422/232 converter is tested and approved.
Order number: 6AV6 671-8XE00-0AX0

DF1 protocol with multi-point connection

Point-to-point connection with DF1 protocol

Only point-to-point connections can be established with the DF1 protocol.



1) Only RS 232 is possible for Panel PC and PC.

2) A point-to-point connection to the SLC500, SLC501, and SLC502 PLCs via DF1 is not possible.

3) For MicroLogix ML1500 LRP, Channel 1 (9-pin Sub D) is also possible.

Connecting cable

HMI panel interface used	For connection to PLC5x	For connection to SLC5/03, SLC5/04, SLC5/05	For connection to MicroLogix
RS 232 9-pin	Allen-Bradley cable 1784-CP10	Allen-Bradley cable 1747-CP3	Allen-Bradley cable 1761-CBL-PM02
RS 422 9-pin	Connecting cable 9-pin Sub D RS 422	—	—

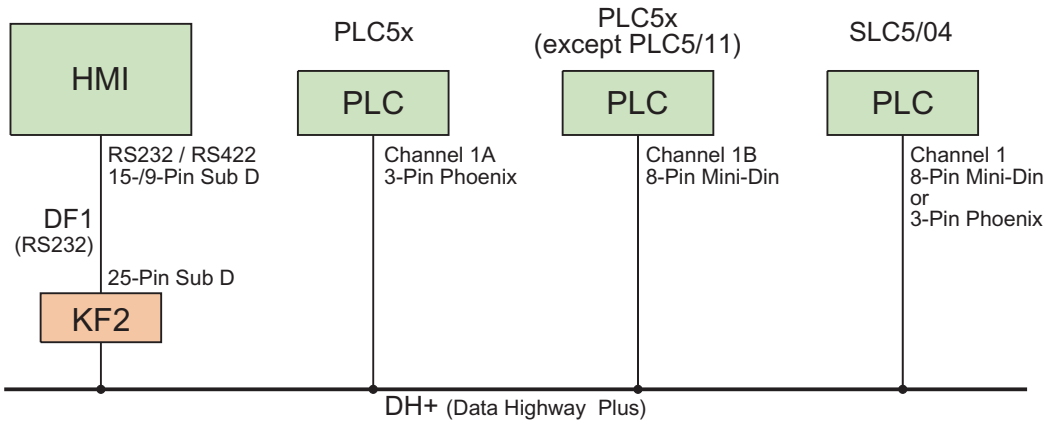
Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

DF1 protocol with multi-point connection via KF2 module

DF1 protocol with multi-point connection via KF2 module to DH+ LAN

The use of a KF2 protocol interface module enables a connection to be made to PLCs in the DH+ LAN (Data Highway Plus Local Area Network).



Connecting cable

HMI panel interface used	For connection to KF2 interface module
RS 232 9-pin	Allen-Bradley cable 1784-CP10 and 25-pin socket/socket adapter
RS 422 9-pin	9-pin Sub D RS 422 connecting cable and 25-pin female/female adapter

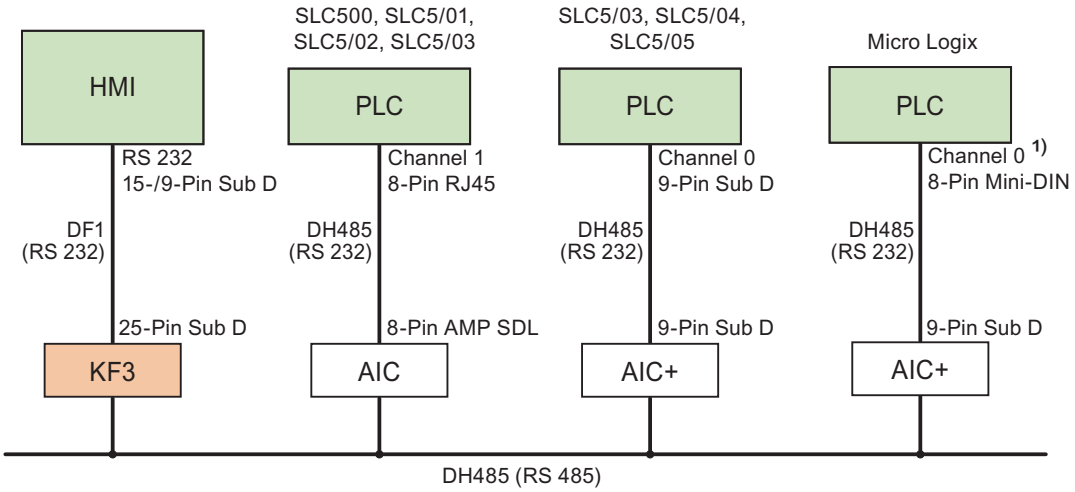
Refer to the Allen-Bradley documentation for the cable connection from the PLCs to the DH+ data bus.

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

DF1 protocol with multi-point connection via KF3 module

DF1 protocol with multi-point connection via KF3 module to DH485 LAN



1) For MicroLogix ML1500 LRP, Channel 1 (9-pin Sub D) is also possible.

Connecting cable

HMI panel interface used	For connection to KF3 interface module
RS 232 9-pin	Allen-Bradley cable 1784-CP10 and 25-pin socket/socket adapter

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Allen-Bradley".

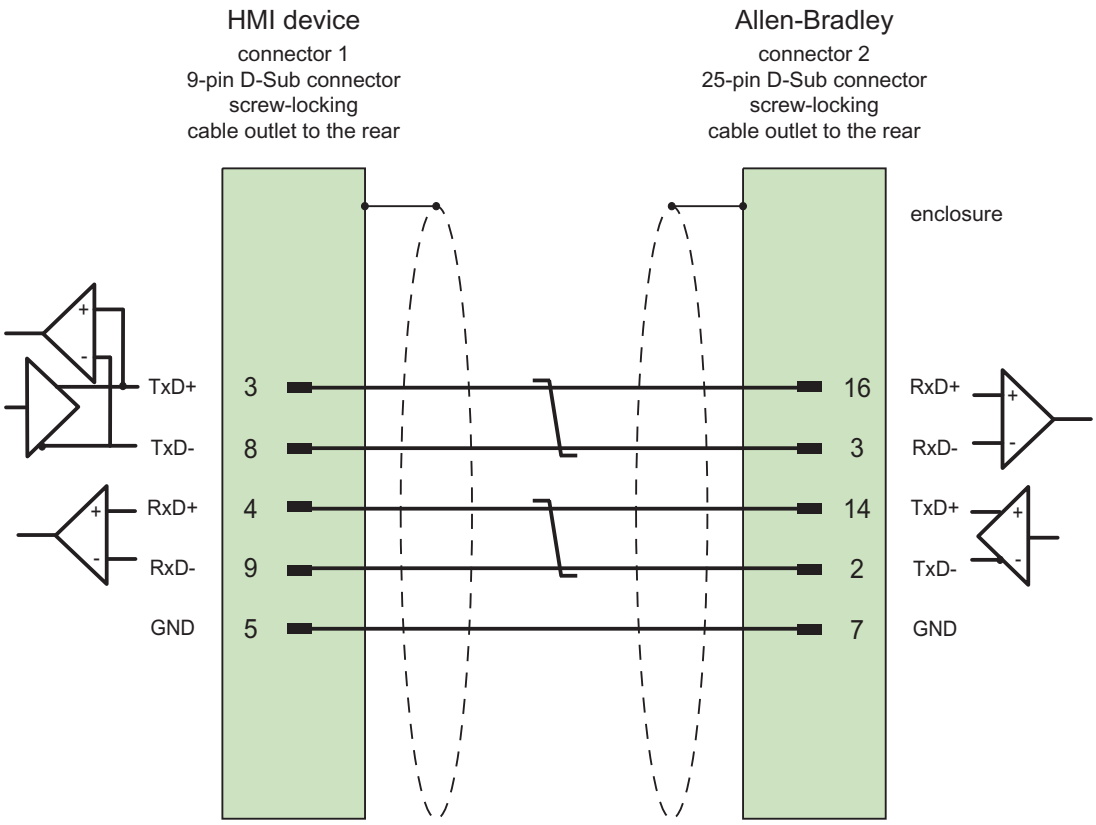
Connecting cables for Allen-Bradley DF1

Connecting cable 9-pin Sub D RS 422 for Allen-Bradley

Connecting cable 9-pin Sub D RS 422

For interconnecting the HMI device (RS 422, 9-pin sub D) - PLC5x, KF2, KF3

You require an additional 25-pin, female / female adapter (gender changer) for interconnections with KF2 and KF3.



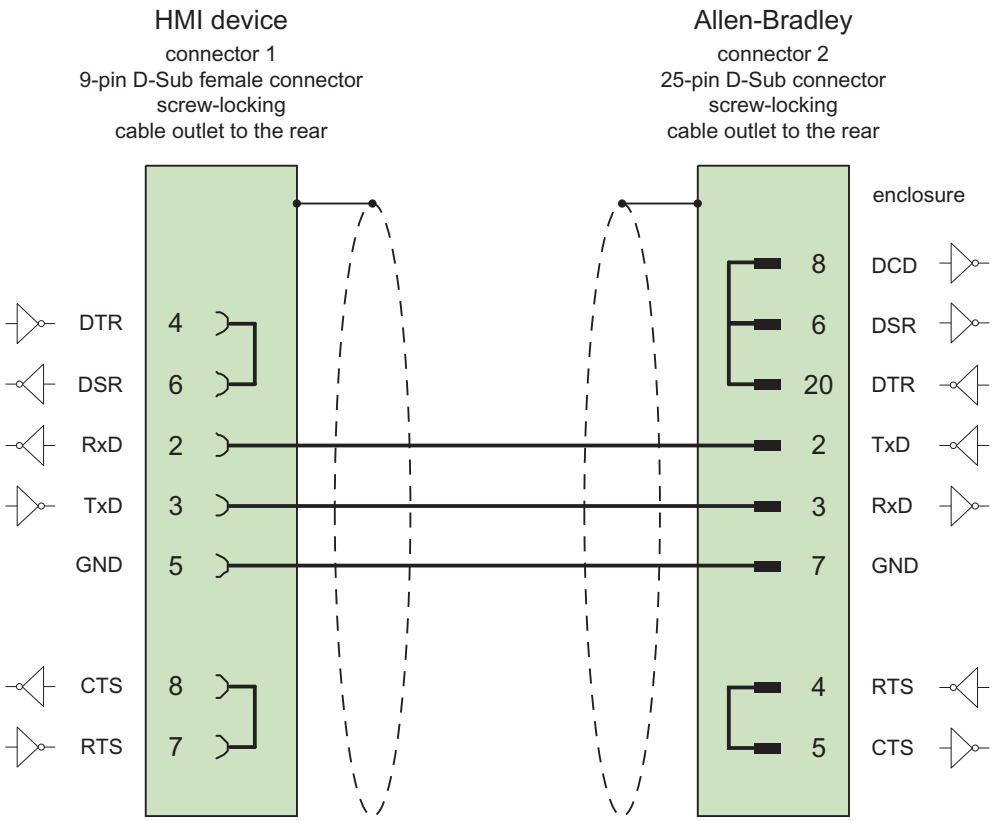
Shield with large-area contact to housing at both ends, interconnected shield contacts
Cable: 3 x 2 x 0.14 mm^2, shielded,
max. length 60 m

Connecting cable 1784-CP10, RS 232, for Allen-Bradley

Allen-Bradley cable 1784-CP10

For interconnecting the HMI device (RS 232, 9-pin sub D) - PLC5x, KF2, KF3

You require an additional 25-pin, female / female adapter (gender changer) for interconnections with KF2 and KF3.



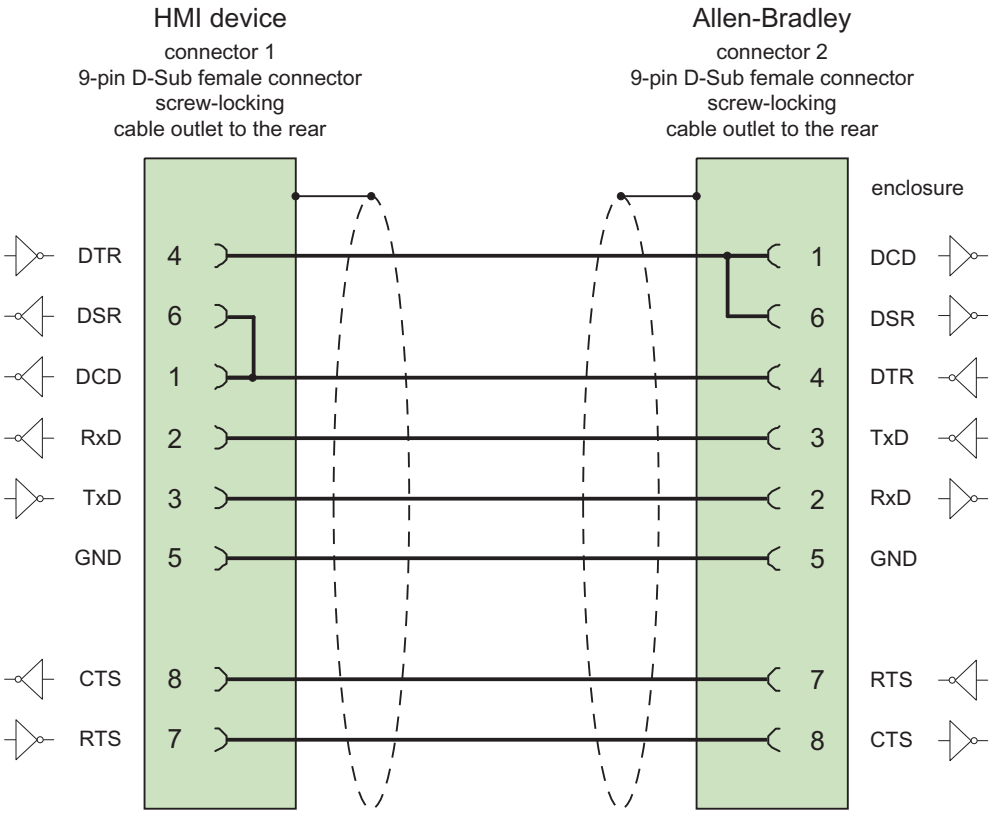
Screen connected with housing over large area on both sides

max. length 15 m

Connecting cable 1747-CP3, RS-232, for Allen-Bradley

Allen-Bradley cable 1747-CP3

For interconnecting the HMI device (RS 232, 9-pin sub D) - SLC503, SLC504, SLC505 (Channel 0), AIC+



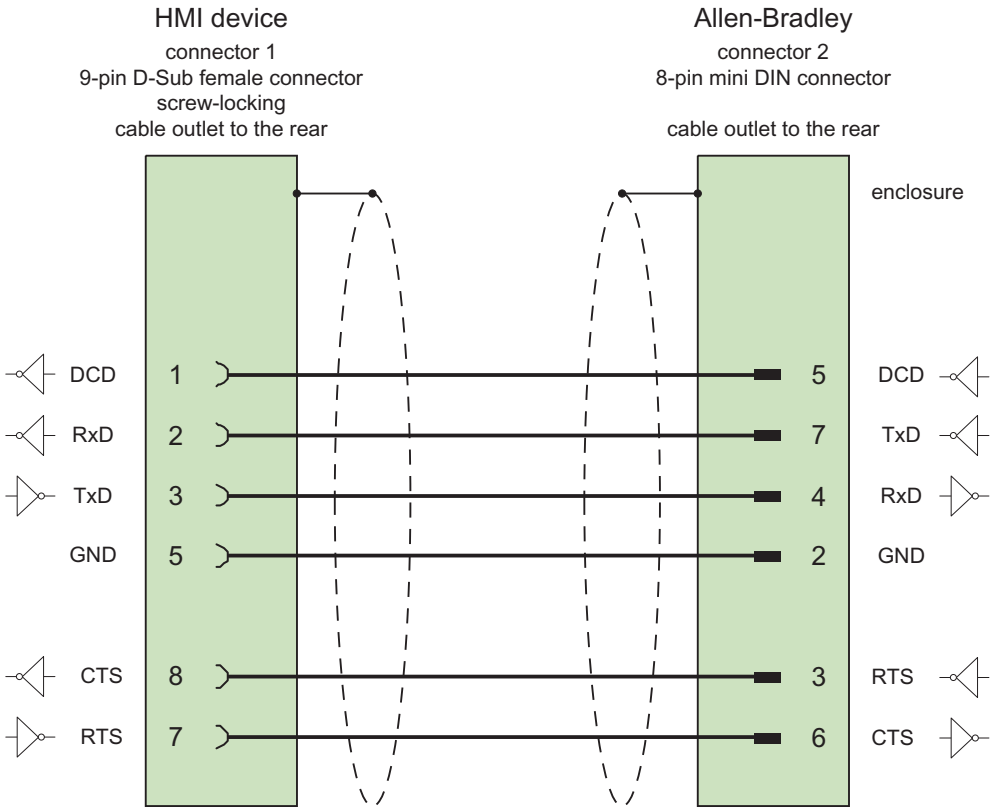
Screen connected with housing over large area on both sides

max. length 3 m

Connecting cable 1761-CBL-PM02, RS-232, for Allen-Bradley

Allen-Bradley cable 1761-CBL-PM02

For interconnecting the HMI device (RS 232, 9-pin sub D) - Micro Logix, AIC+



Screen connected with housing over large area on both sides

max. length 15 m

Performance features of communication

Permitted data types for Allen-Bradley DF1

Permitted data types for Allen-Bradley DF1

The table lists the user data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
ASCII	A [1)]	1 to 80 characters
Bool	N, R, C, T, B, S, I, O	1 bit
Int	N, R, C, T, S	2 bytes
DInt	N, D [2)]	4 bytes
UInt	N, R, C, T, B, I, O, D [2)]	2 bytes
UDInt	N, D [2)]	4 bytes
Real	N, F [1)]	4 bytes

1) Selectable depending on the selected CPU type.
2) Only for PLC5 CPU type

Abbreviations

In WinCC, formats of the data types are abbreviated as follows:

- UNSIGNED INT = UInt
- UNSIGNED LONG = UDInt
- SIGNED INT = Int
- SIGNED LONG = DInt

Distinctive features for connections with Allen-Bradley DF1

With Allen Bradley DF1, array tags may only be used for discrete alarms and trends.

Note

I/O modules with 8 or 16 ports occupy one data word on the PLC.

I/O modules with 24 or 32 ports occupy two data words.

The HMI device does not output an error message if using non-existent bits.

You should always make sure that I/O modules with 8 or 24 ports only occupy the bits that are actually assigned to a port.

Supported CPU types for Allen-Bradley DF1

CPU types

The following CPU types are supported for configuring the Allen-Bradley DF1 communication driver.

- SLC
  - SLC500
  - SLC501
  - SLC502
  - SLC503
  - SLC504
  - SLC505
- MicroLogix
  - MicroLogix 1x00
  - MicroLogix 1100 / 1400
- PLC 5
  - PLC-5/11
  - PLC-5/20
  - PLC-5/40
  - PLC-5/60
  - PLC-5/80

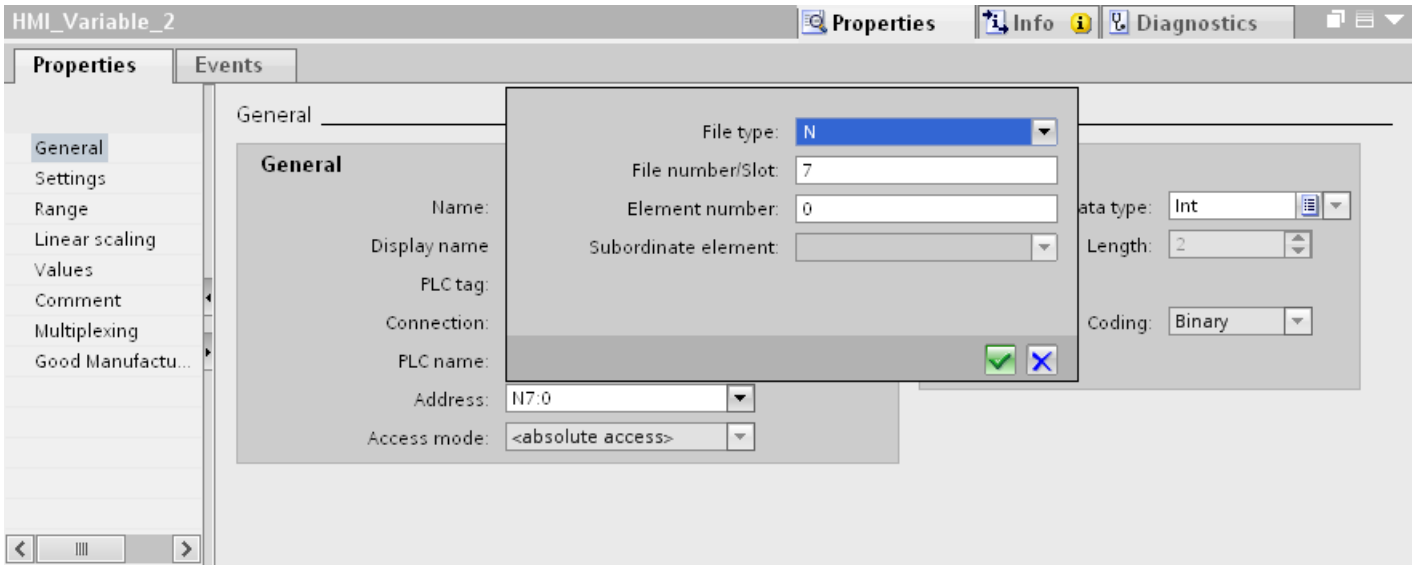
Addressing

Addressing

The addressing is entered in the following order in the Allen-Bradley DF1 communication driver:

- Operand type
- File number
- Element number

- Child element
- Bit number



The address then appears in the following format without spaces:

- File type file number : Element number . Child element
- e.g. T8:2.ACC

Operand type

You have the following options under operand type:

- I
- O
- S
- B
- T
- C
- R
- N
- A
- D only for PLC5 CPU type

File number

Select the number between two limits under file number:

- Low limit
- High limit

The limit values depend on the selected file type.

Child element

You can select a child element when you have selected one of the following data types:

- R
- C
- T

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.

- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Data exchange

Area pointers for Allen-Bradley

Area pointers for connections using an Allen-Bradley communication driver

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

Distinctive features for connections via Allen-Bradley EtherNet/IP

You can configure the following area pointers

Area pointer	Allen-Bradley EtherNet/IP	Allen-Bradley DF1
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes

Area pointer	Allen-Bradley EtherNet/IP	Allen-Bradley DF1
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

Restrictions Allen-Bradley Ethernet/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
ControlLogix,CompactLogix	Int, UInt	--
SLC, MicroLogix	Int, UInt	N, B

Restrictions Allen-Bradley DF1

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
MicroLogix	--	N, O, I, B
SLC50x	--	N, O, I, B
PLC5	--	N, O, I, B

Data exchange using area pointers (Page 5446)

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3237)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

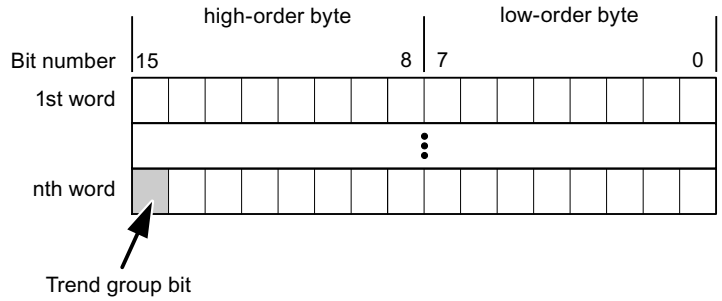
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Restrictions to the trend control

For Allen-Bradley DF1 communication drivers

Tags of the following operand types are permitted:

- "N"
- "O"
- "I"
- "S"
- "B"

Permitted data types:

- "UInt"
- "Int"
- Array tag of "UInt"
- Array tag of "Int"

You assign a bit to a trend during configuration. This sets a defined bit assignment for all trend areas.

For Allen-Bradley EtherNet/IP communication drivers

Tags of data type "Int" or an array tag of data type "Int" are permitted. You assign a bit to a trend during configuration. This sets a defined bit assignment for all trend areas.

ControlLogix and CompactLogix

The following data types are possible for tags for the ControlLogix and CompactLogix CPU types:

- "UInt"
- "Int"
- Array tag of "UInt"
- Array tag of "Int"

SLC and MicroLogix

The following operand types are permitted for tags of the SLC and MicroLogix CPU types:

- "N"
- "O"
- "I"
- "S"
- "B"

Permitted data types:

- "UInt"
- "Int"
- Array tag of "UInt"
- Array tag of "Int"

Alarms

Configuring alarms

Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3260)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Restrictions

Only tags whose "File type" is "N", "O", "I", "S" and "B" are allowed for use as a "trigger tag" for discrete alarms. These tags are only valid for the data types "Int" and "UInt".

Data types

For connections with an Allen-Bradley communication driver, the following data types are supported:

Communication drivers	PLC	Permitted data types	
		Discrete alarms	Analog alarms
Allen-Bradley DF1	SLC500, SLC501, SLC502, SLC503, SLC504, SLC505, PLC5, MicroLogix	Int, UInt	Int, UInt, Long, ULong, Real
Allen-Bradley EtherNet/IP	ControlLogix, CompactLogix, SLC, Micrologix	Int, UInt	SInt, USInt, Int, UInt, DInt, UDInt, Real

How the bit positions are counted

For connections with an Allen-Bradley communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In Allen-Bradley PLCs	15							8	7							0
In WinCC you configure:	15							8	7							0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

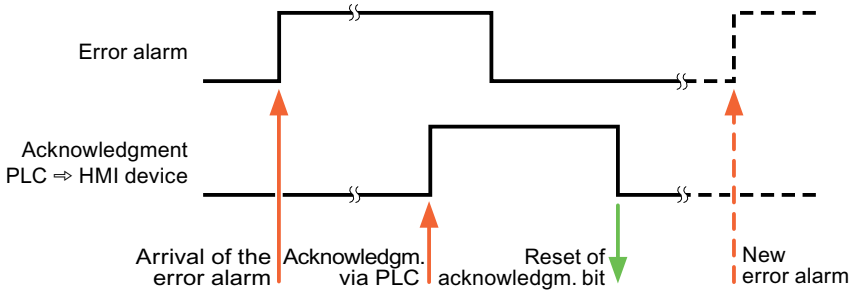
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

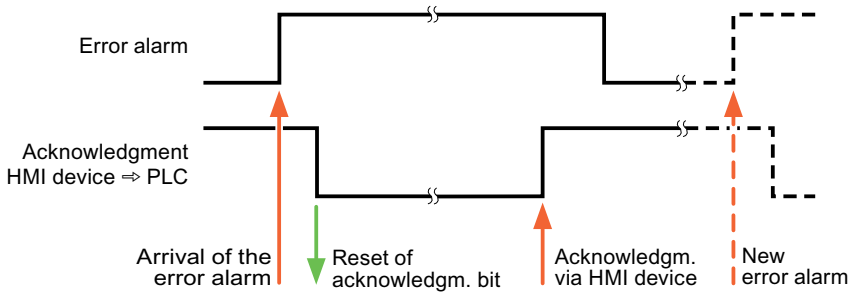
tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels	Panel PCs:
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

Mitsubishi

Mitsubishi communication drivers

Introduction

This section describes the communication between an HMI device and PLCs that use Mitsubishi communication drivers.

The following communication drivers are supported:

- Mitsubishi MC TCP/IP
- Mitsubishi FX

Data exchange

Data is exchanged by means of tags or area pointers.

- Tags
  The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers
  Area pointers are used to exchange specific data and are only set up when these data are used.

Mitsubishi MC TCP/IP

Configuring a connection via Mitsubishi MC TCP/IP

Introduction

You configure a connection to a PLC with a Mitsubishi MC TCPI/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

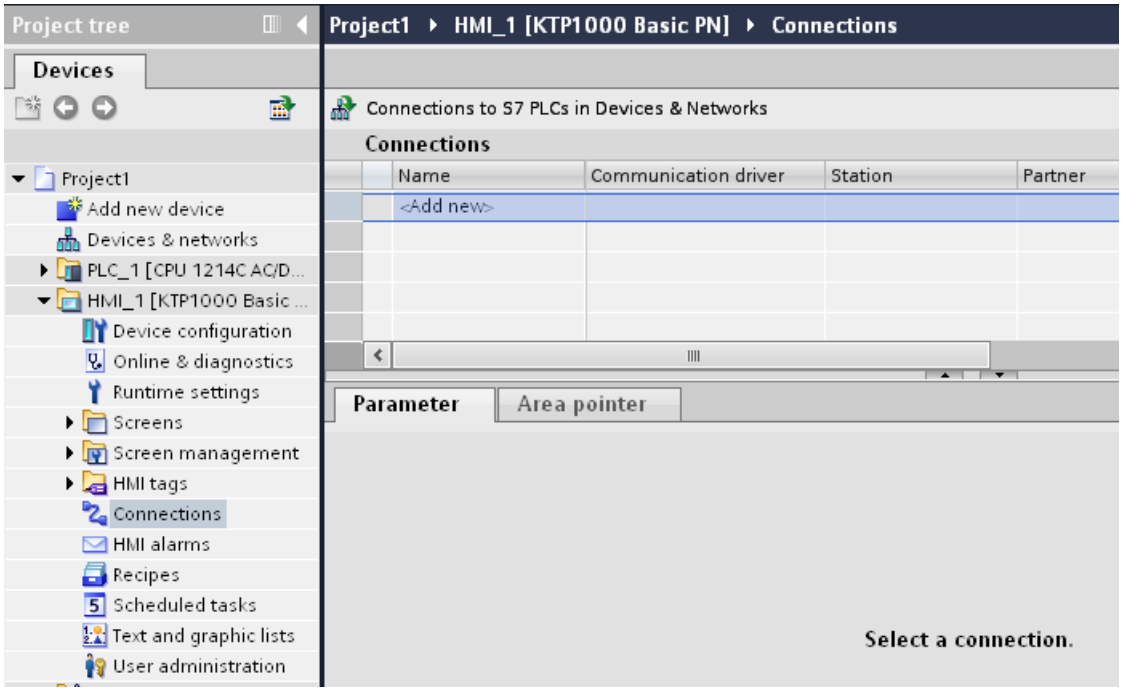
Example: PROFINET interface corresponds to the Ethernet interface

Requirements

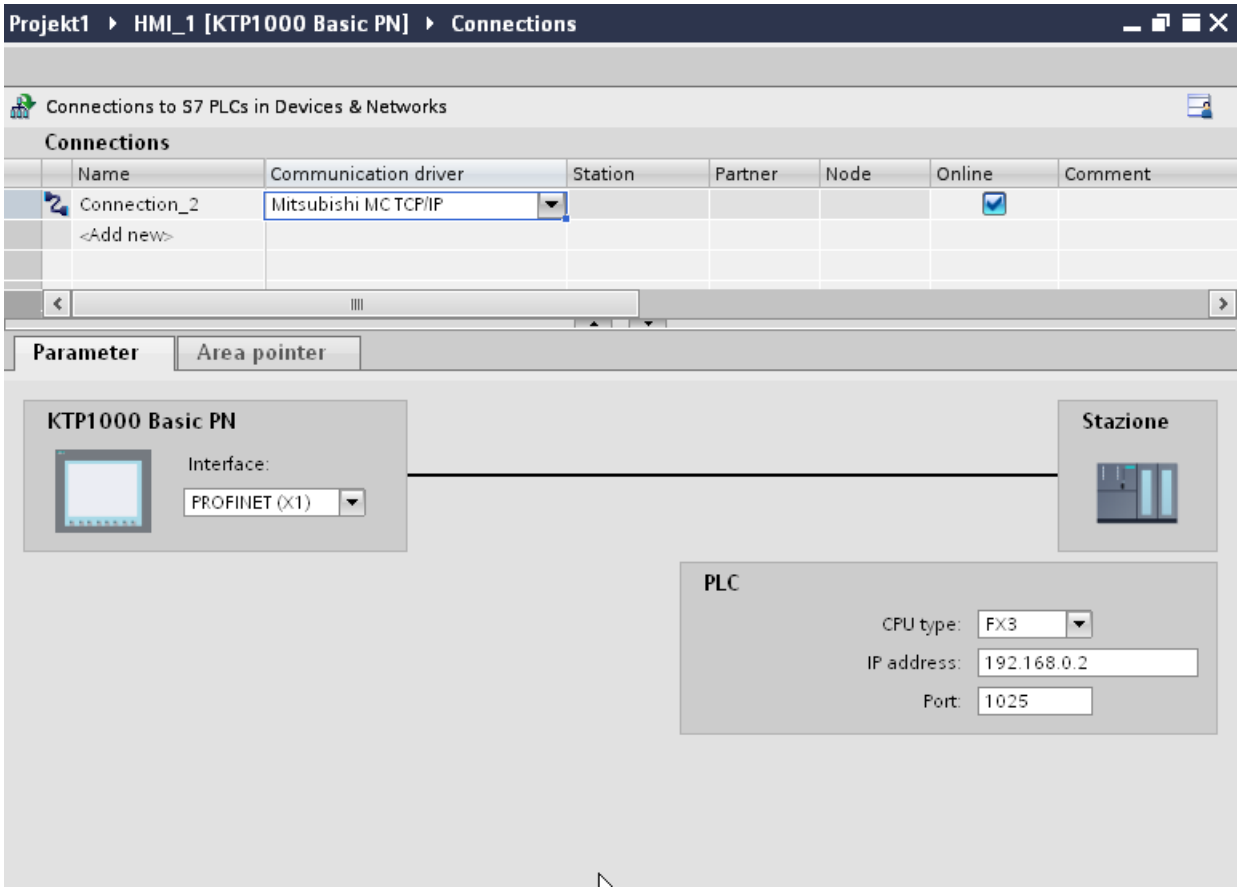
- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Mitsubishi MC TCPI/IP" driver.



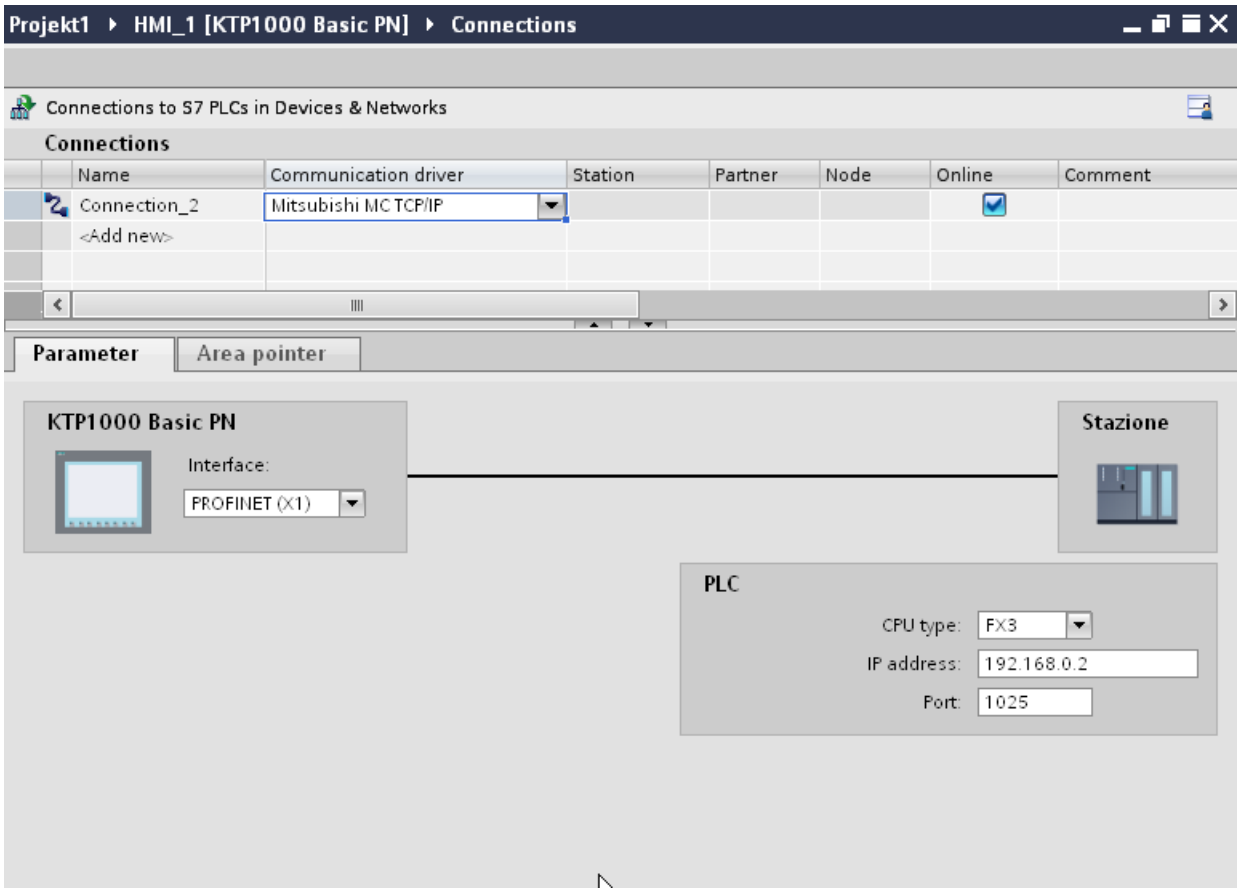
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Mitsubishi MC TCP/IP)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device during project transfer.

Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

To set up the IP address of the HMI device:

1. Click on the HMI device.
2. Open the "Device configuration" editor.

3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:
"General > PROFINET interface > Ethernet addresses"

Parameters for the PLC

- CPU type
For "CPU type", you set the type of PLC to which the HMI device is connected.
The following settings are possible:
–FX3
–Q
If you select the FX3 CPU type, the Mitsubishi MC protocol "1E" is used and "3E" for the "Q" CPU type.
The "Binary code" protocol variant is always used.

Note

If the CPU type is changed for a configured connection, tags with the following properties must be revised:

- Operands that do not exist for the new CPU type, such as "W", "B", "F".
- Inputs and outputs with different addressing (hexadecimal/octal)
- Addresses greater than the valid address area of the new CPU type

- IP address
Set the IP address or host name of the Ethernet/IP module of the PLC. Only the IP address can be used on a Basic Panel.
- Port
Set the port number of the module of the PLC.

Connecting HMI device to PLC

Connections via Mitsubishi MC TCP/IP

Connection

The HMI device can be connected to the Mitsubishi PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to a Mitsubishi PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Connect the HMI device to one or several Q-series and/or FX3 PLCs. Connect the HMI device via the following interfaces:

- Communication interface OnBoard
- Approved communication module suitable for the PLC

Note

Timeout response with TCP/IP (Ethernet)

Due to the use of the TCP/IP protocol, the breakdown of a connection is detected at the earliest after approximately one minute. Communication failure cannot be reliably detected if no tags are requested, for example, no output tags in the current screen.

Configure area pointer coordination for each PLC. This setting ensures that a communication failure is recognized after approximately two minutes, even in the aforementioned scenario.

Communication types

Approved communication types

- Only applies for Mitsubishi FX(PG protocol):
  The point-to-point connection from a HMI device to an approved Mitsubishi FX–CPU via Mitsubishi FX is system-tested and approved by Siemens AG.
- Only applies for Mitsubishi MC TCP/IP:
  The following communication types are system-tested and approved:
  - Point-to-point connection to the approved PLCs
  - Multipoint connection from a HMI device with up to 4 PLCs with the respectively approved PLCs. CPU types (FX3 and Q) can be mixed.

Note

The HMI device is a client and the PLC must operate as a server.

Connectable PLCs

Connections can be implemented for the following Mitsubishi PLCs:

PLC	Mitsubishi FX (PG protocol)	Mitsubishi MC TCP/IP
MELSEC FX1n, FX2n	Yes	No
MELSEC FX3U, FX3UC, FX3G with communication module FX3U-ENET	No	Yes
MELSEC System Q • Q-series with the communication module QJ71E71-100 • QnUDEH CPU with Ethernet interface onboard	No	Yes

Parameterization of the communications modules

FX3 PLCs

Procedure

1. Start the FX-Configurator.
2. Select the module.
3. Assign the following settings in the "Operational settings" dialog:
   - Communication data code:
     Binary code
   - Initial timing:
     Always wait for OPEN
   - IP address:
     IP address
   - Send frame setting:
     Ethernet(V2.0)
   - TCP Existence confirmation setting:
     Use the Ping

4. Assign the following settings in the "Open Settings" dialog:
   - Protocol:
     TCP
   - Open system:
     Unpassive
   - Fixed buffer:
     Receive
   - Fixed buffer communication procedure:
     Procedure exist(MC)
   - Pairing open
     Disable
   - Existence confirmation
     No confirm
   - Host station Port No. (DEC)
     Port number

   Note

   The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

   You must specify port numbers in decimal values.

5. Confirm the default settings of the other dialog boxes.

The network no. and station no. parameters are not relevant for the connection and can be chosen as required.

Q PLCs

Procedure

1. Click "Edit network parameters".
2. Select the network type:
   - Ethernet
     The network number and the group / station number are not evaluated and can be freely assigned

3. Assign the following settings in the "Operational settings" dialog:
   - Communication data code:
     Binary code
   - Initial timing:
     Always wait for OPEN
   - IP address:
     IP address
   - Send frame setting:
     Ethernet(V2.0)
   - Enable write operations during RUN
4. Assign the following settings in the "Open settings" dialog:
   - Protocol:
     TCP
   - Open system:
     Unpassive
   - Pairing open
     Disable
   - Existence confirmation
     No confirm
   - Host station Port No. (HEX)
     Port-Nummer

   Note

   The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

   You must specify port numbers in hexadecimal values.

Internal Ethernet port of the Q0xUDEH CPU

Procedure

1. Assign the following settings in the "Internal Ethernet Port" dialog:
   - IP address:
     IP address
   - Communication data code:
     Binary code
   - Enable online changes
2. Assign the following settings in the "Open settings" dialog:
   - Protocol:
     TCP
   - Open system:
     MC-Protocol
   - Host station Port No. (HEX)
     Port number

Note

The port number chosen in the communication module must match the port number in WinCC. A connection with a port number must be assigned for each connected HMI device.

Performance features of communication

Permitted data types for Mitsubishi MC TCPI/IP

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
4-bit block	M, X, Y, B, F	1 byte
8-bit block	M, X, Y B, F	1 byte
12-bit block	M, X, Y B, F	2 bytes
16-bit block	M, X, Y B, F	2 bytes
20-bit block	M, X, Y B, F	4 bytes
24-bit block	M, X, Y B, F	4 bytes
28-bit block	M, X, Y B, F	4 bytes
32-bit block	M, X, Y B, F	4 bytes
Bool	M, D, X, Y B, F	1-bit

Data type	Operand type	Length
DInt	D, W	4 bytes
DWord	D, C, W	4 bytes
Int	D, W	2 bytes
Real 1)	D, W	4 bytes
String 1)	D	1 to 80 characters
Word	D, T, C, W	2 bytes

1) The "String" and "Real" data types are not available for all CPUs.
2) Operand types B, F and W are only available for CPU type "Q".

Note

Note the following for write accesses:

Tags can only be written if "Enable online changes" or "Enable write operations during RUN" was selected when parameterizing the Mitsubishi communication modules.

For data type "Bool" in operand type "D", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

Note

Array elements in I/O fields cannot be used in communication with a Mitsubishi PLC.

Supported CPU types for Mitsubishi MC TCP/IP

CPU types

The following CPU types are supported for configuring the Mitsubishi MC TCP/IP communication driver.

- FX3 series
  - FX 3G / FX 3G with communication modul FX3U-ENET
  - FX 3U / FX 3U with communication modul FX3U-ENET
  - FX 3UC / FX 3UC with communication modul FX3U-ENET
- Q series
  - Q-Series with QJ71E71-100 communication module
- iQ series / QnUD
  - QnUDEHCPU with built in ethernet module

Addresses for Mitsubishi MC TCP/IP

Address areas for connections via Mitsubishi MC TCP/IP

The address area boundaries differ for the different series; refer to the Mitsubishi Computerlink manuals for this information.

Examples of address area boundaries dependent on the CPU and communication format:

Name	Operand type	Max. address FX3	Max. address Q-Series
Output/Input	Y/X	Octal X/Y 0 - 777	HEX X/Y 0 - 7FF
Bit memory	M	M0 - M3071 and M8000 - M8255	M/L/S 0 - 8191
Data register	D	D0 - 7999 D8000 - D8255	D0 - 8191 D9000 - D9255 becomes SD1000 - SD1255
Counter	C	C0 - 255	C0 - 1023
Timer	T	T0 - 255	T0 - 2047
Link register	W	--	Hex: W0 - FFF
Link flag	B	--	Hex: B0 - FFF
Error flag	F	--	F0 - 2047

Address areas for Mitsubishi MC TCP/IP

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Mitsubishi FX

Configuring a connection via Mitsubishi FX

Introduction

You configure a connection to a PLC with a Mitsubishi FX communication driver in the "Connections" editor of the HMI device.

The Mitsubishi FX protocol is also referred to as the Mitsubishi PG protocol.

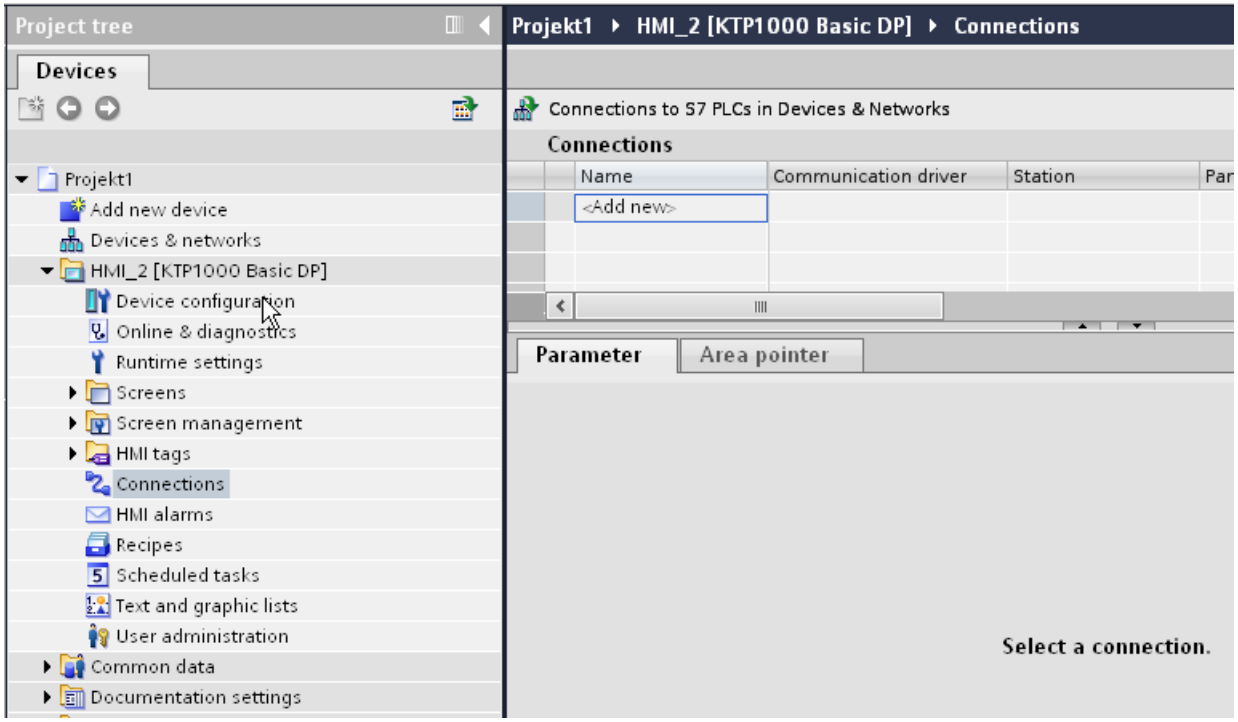
The interfaces are named differently depending on the HMI device.

Requirements

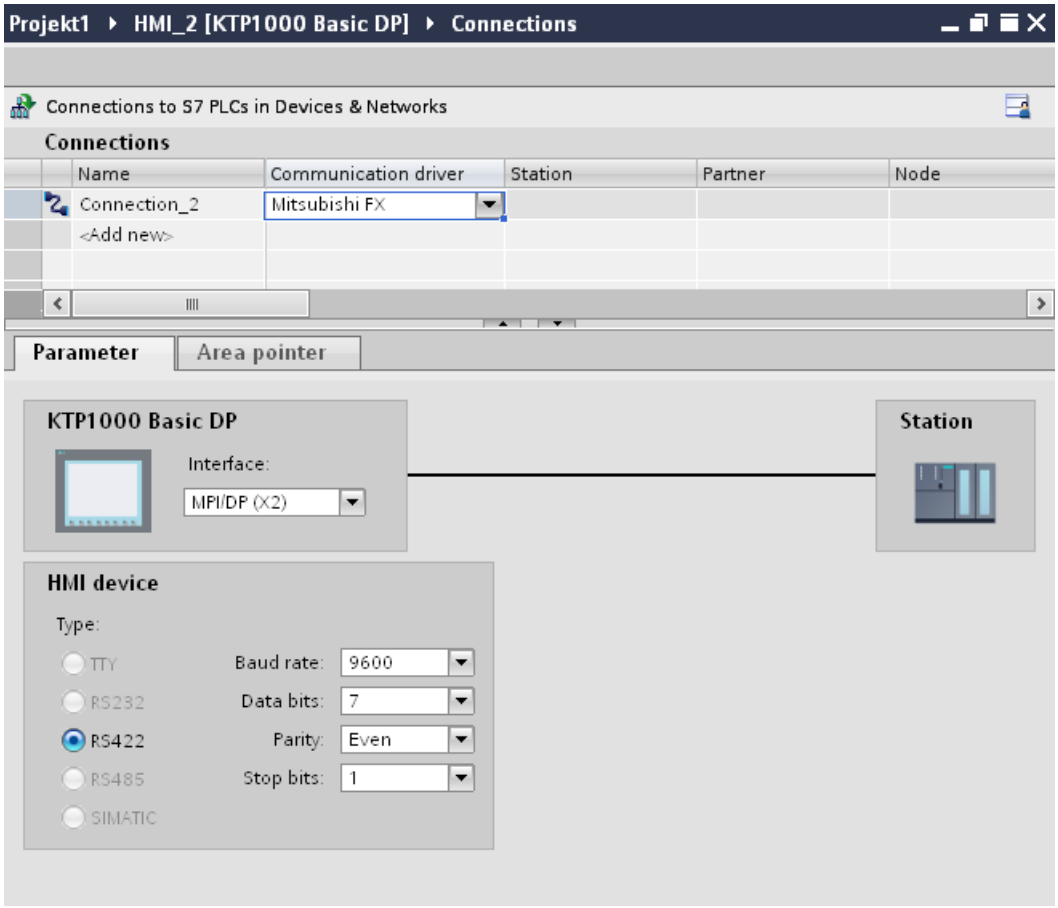
- A project is open.
- An HMI device has been created.

Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.
3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Mitsubishi FX" driver.



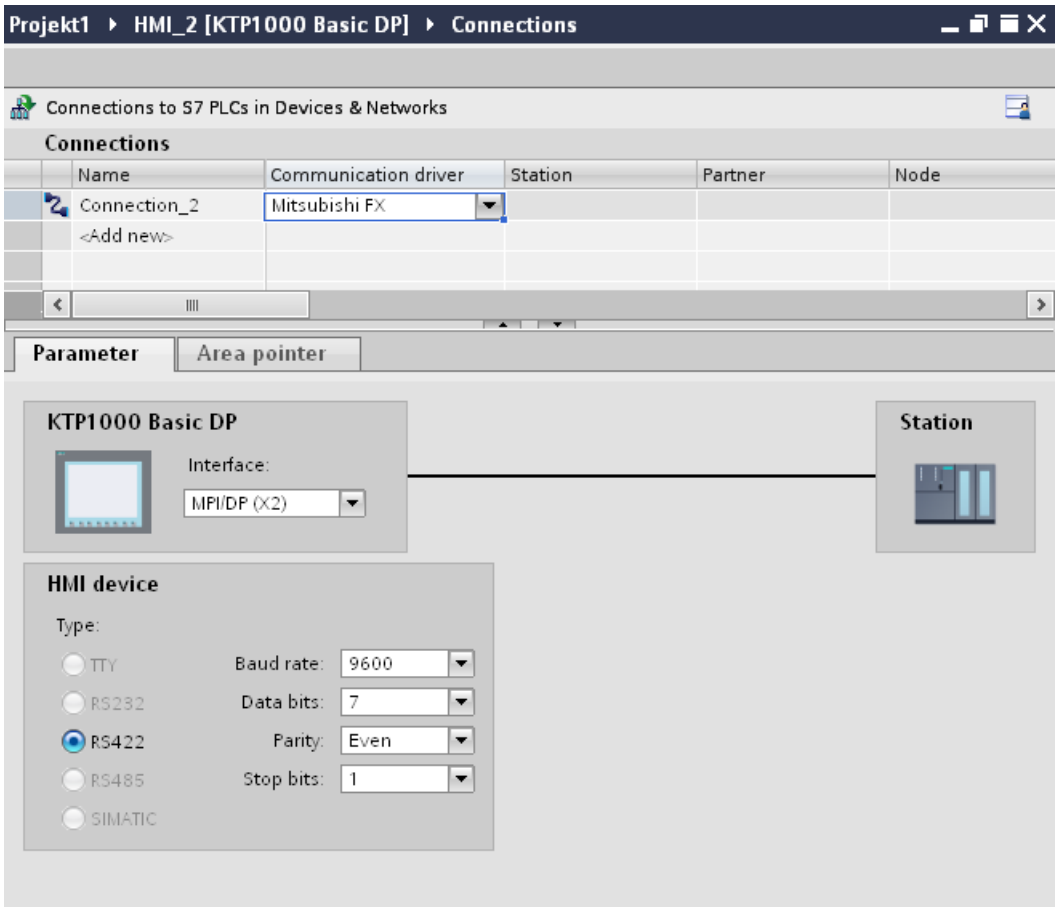
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Mitsubishi FX)

Parameters to be set

To assign the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device", "Network", and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- "Type"
  Specifies the physical connection used.

Note

If you use the IF1B interface, you must switch over the RS422 receive data and the RTS signal additionally by 4 DIL-switches on the back of the HMI device.

Parameters for the PLC

- Baud rate: For "Baud rate", select the transmission speed between the HMI device and PLC. Select the baud rate "9600".
- Data bits: Under "Data bits", select "7 bits".
- Parity: Under "Parity", select "Even".
- Stop bits: Under "Stop bits", select "1 bit".

Connecting HMI device to PLC

Connections via Mitsubishi FX

Connection

Connect the HMI device to the programming interface of the CPU (RS 422) (see documentation of the PLC).

The connection between the HMI device and the Mitsubishi PLC is basically restricted to setting the interface parameters. Special blocks for the connection are not required in the PLC.

Connecting cable

The following connecting cables are available to connect the HMI device to the PLC.

Interface to HMI device or adapter	Mitsubishi Electric PLC via FX protocol
	FX1n, Fx2n, Mini DIN, 8–pin
RS 232, 9-pin	Mitsubishi SC-09 [1]
RS 422, 9-pin	Connecting cable RS422-2P
[1] Since the Mitsubishi PLCs communicate via RS 422 as a standard, the Mitsubishi programming cable SC–09 with integrated RS 422/RS 232 adaptor is necessary for connecting a HMI device via RS 232.	

Note

Applies only to RS 232:

Cable length is restricted to 0.32 m.

Refer to the relevant device manual to determine which HMI device interface is to be used.

The cable pin assignments can be found in Section "Connecting cables for Mitsubishi FX".

Communication types

Approved communication types

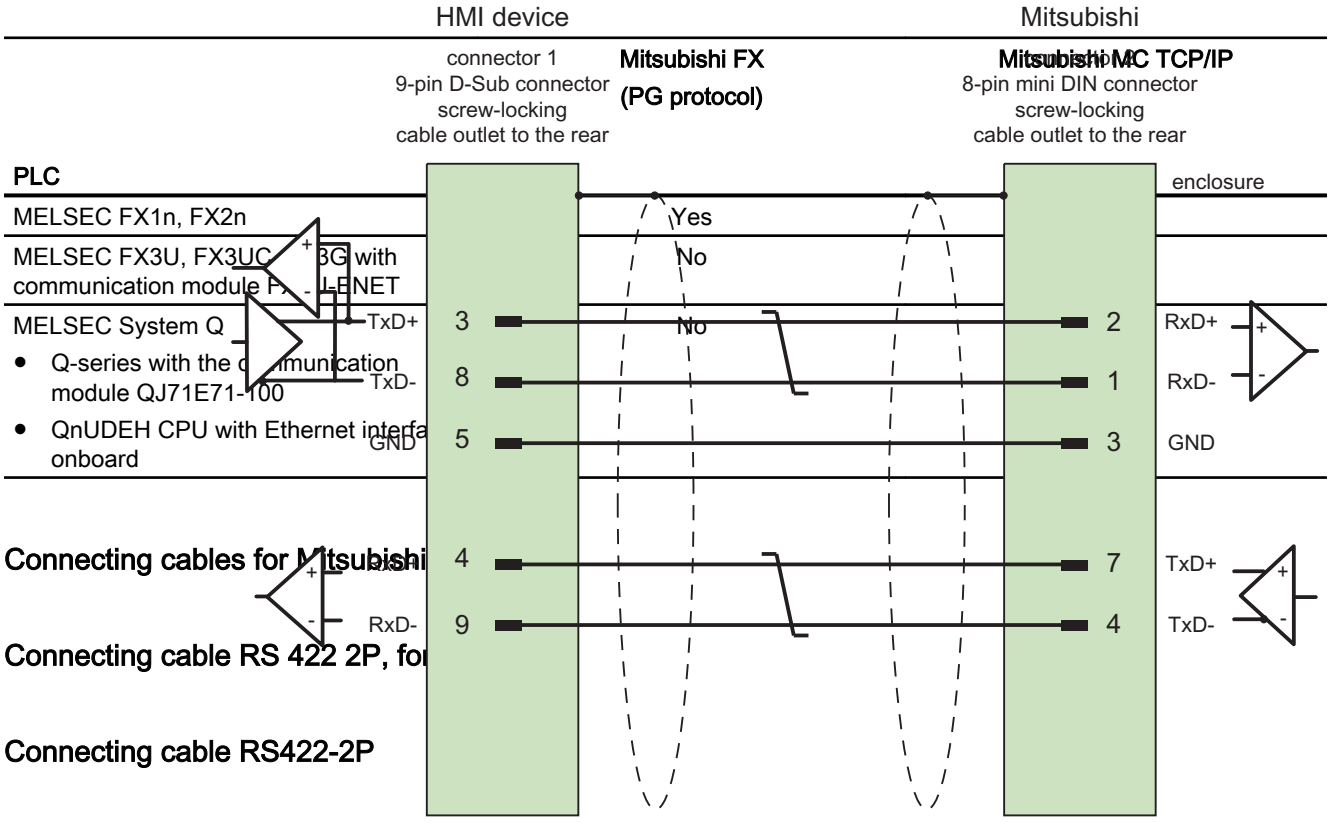
- Only applies for Mitsubishi FX(PG protocol):
  The point-to-point connection from a HMI device to an approved Mitsubishi FX–CPU via Mitsubishi FX (PG protocol := protocol for access to the program and memory elements of the FX series PC CPU version V1.21 and after) is system-tested and approved by Siemens AG.
- Only applies for Mitsubishi MC TCP/IP:
  The following communication types are system-tested and approved:
  - Point-to-point connection to the approved PLCs
  - Multipoint connection from a HMI device with up to 4 PLCs with the respectively approved PLCs. CPU types (FX3 and Q) can be mixed.

Note

The HMI device is a client and the PLC must operate as a server.

Connectable PLCs

Connections can be implemented for the following Mitsubishi PLCs:



Connecting cables for Mitsubishi

Connecting cable RS 422 2P, fo

Connecting cable RS422-2P

Shield with large-area contact to housing at both ends
Cable: 3 x 2 x 0.14 mm^2, shielded,
max. length 500 m

Performance features of communication

Permitted data types for Mitsubishi FX

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
4-bit block	M, X, Y	1 byte
8-bit block	M, X, Y	1 byte
12-bit block	M, X, Y	2 bytes
16-bit block	M, X, Y	2 bytes
20-bit block	M, X, Y	4 bytes
24-bit block	M, X, Y	4 bytes
28-bit block	M, X, Y	4 bytes
32-bit block	M, X, Y	4 bytes
Bool	D, M, X, Y	1-bit
DWord	D, C-32 bit	4 bytes
Real	D	4 bytes
String	D	1 to 50 characters
Word	D, T, C-16 bit	2 bytes

Note

Note the following for write accesses:

For data type "Bool" in operand type "D", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

Note

Array elements in I/O fields cannot be used in communication with a Mitsubishi PLC.

Supported CPU types for Mitsubishi FX

CPU types

The following CPU types are supported for configuring the Mitsubishi FX communication driver.

- FX1 series
  - FX1n
- FX2 series
  - FX2n

Configurable address areas for Mitsubishi FX

Permitted address areas

The following address areas can be configured for the "Mitsubishi FX" communication driver

X	Input	Octal 0- 377
Y	Output	Octal 0- 377
M	Bit memory	0...9999
D	Data register	0...999
C	Counter	0...199
T	Timer	0...25

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Data exchange

Area pointers for Mitsubishi

Area pointers for connections via Mitsubishi communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

Special considerations for connections via Mitsubishi communication drivers

You can configure the following area pointers

Area pointers	Mitsubishi MC TCP/IP	Mitsubishi FX
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

Restrictions Mitsubishi MC TCP/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	Operand type
FX3	Int, Word	D
Q	Int, Word	D

Mitsubishi FX restrictions

You cannot use the D operand type for configuring area pointers.

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Auto-Hotspot

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Displaying tags with Runtime Advanced and Panels (Page 3237)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

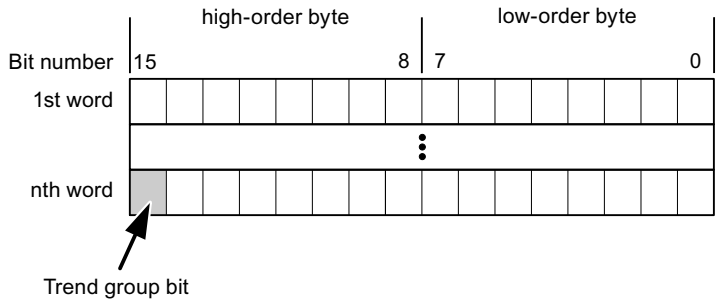
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Restrictions to the trend control

Data types for Mitsubishi MC TCPI/IP

For trend control you can create tags and array tags of the operand type "D" with the data type "Word" or "Int".

Data types for Mitsubishi FX

For trend control you can create tags and array tags of the operand type "D" with the data type "Word".

Alarms

Configuring alarms

Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3260)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a Mitsubishi communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
FX1n, FX2n, FX3 series, Q-Series, iQ-Series	Word, Int [1)]	4-bit block, 8-bit block, 12-bit block, 16-bit block, 20-bit block, 24-bit block, 28-bit block, 32-bit block, Word, DWord, Int [1)], DInt [1)], Real,
[1)] Not for Mitsubishi FX communication driver		

How the bit positions are counted

For connections with a Mitsubishi communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In Mitsubishi PLCs	15							8	7							0
In WinCC you configure:	15							8	7							0

Restrictions on alarms

- Mitsubishi MC TCP/IP
  Only tags of operand type "D" and data types "Word" and "Int" are permitted as trigger tags for discrete alarms. You can use array tags (operand type: "D"; data types: "ARRAY [x..y] of Word" or "ARRAY [x..y] of Int") for discrete alarms.
- Mitsubishi FX
  Only tags of operand type "D" and data type "Word" are permitted as trigger tags for discrete alarms. You can use array tags (operand type "D"; data type "ARRAY [x..y] of Word") for discrete alarms."

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

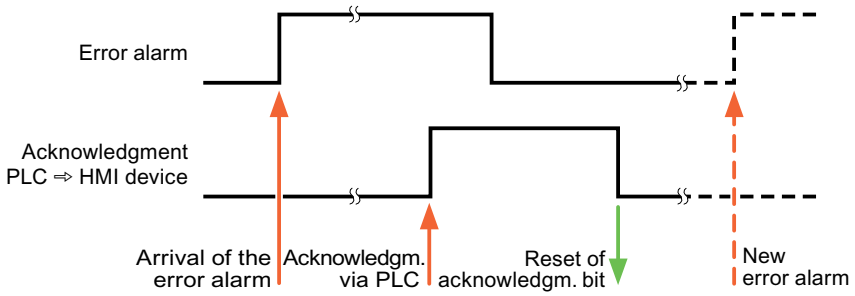
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

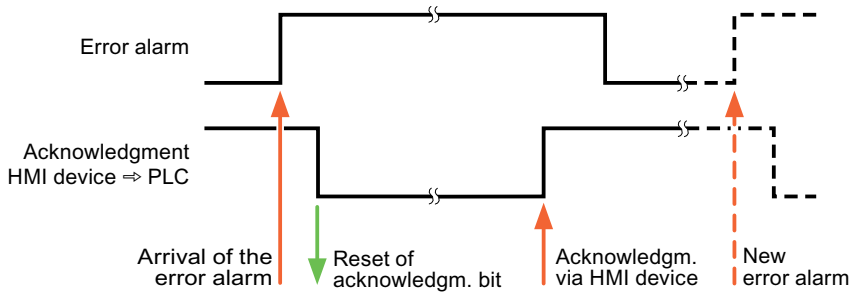
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels	Panel PCs:
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

Modicon Modbus

Modicon Modbus communication drivers

Introduction

This section describes the communication between an HMI device and PLCs that use Modicon Modbus communication drivers.

The following communication drivers are supported:

- Modicon Modbus TCP/IP
- Modicon Modbus RTU

Data exchange

Data is exchanged by means of tags or area pointers.

- Tags
  The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers
  Area pointers are used to exchange specific data and are only set up when these data are used.

Modicon Modbus TCP/IP

Configuring a connection via Modicon Modbus TCP/IP

Introduction

You configure a connection to one of the PLCs with Modicon Modbus TCP/IP communication driver in the "Connections" editor of the HMI device.

The Ethernet interfaces are named differently depending on the HMI device.

Example: PROFINET interface corresponds to the Ethernet interface

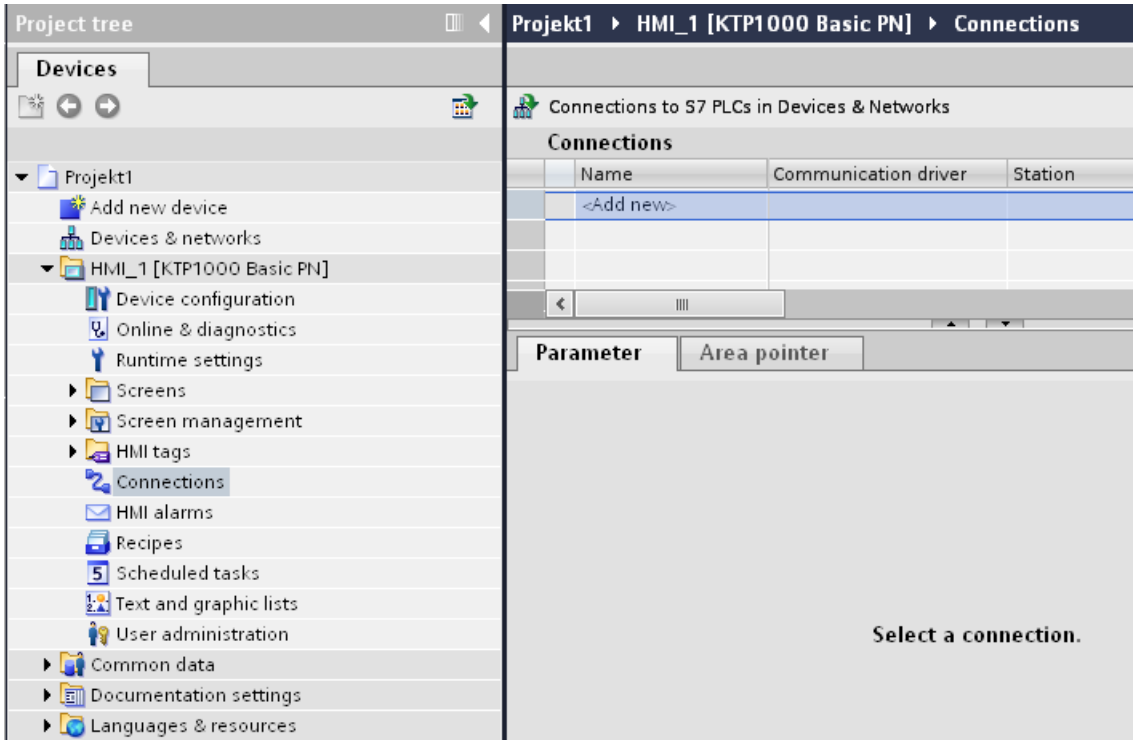
Requirements

- A project is open.
- An HMI device has been created.

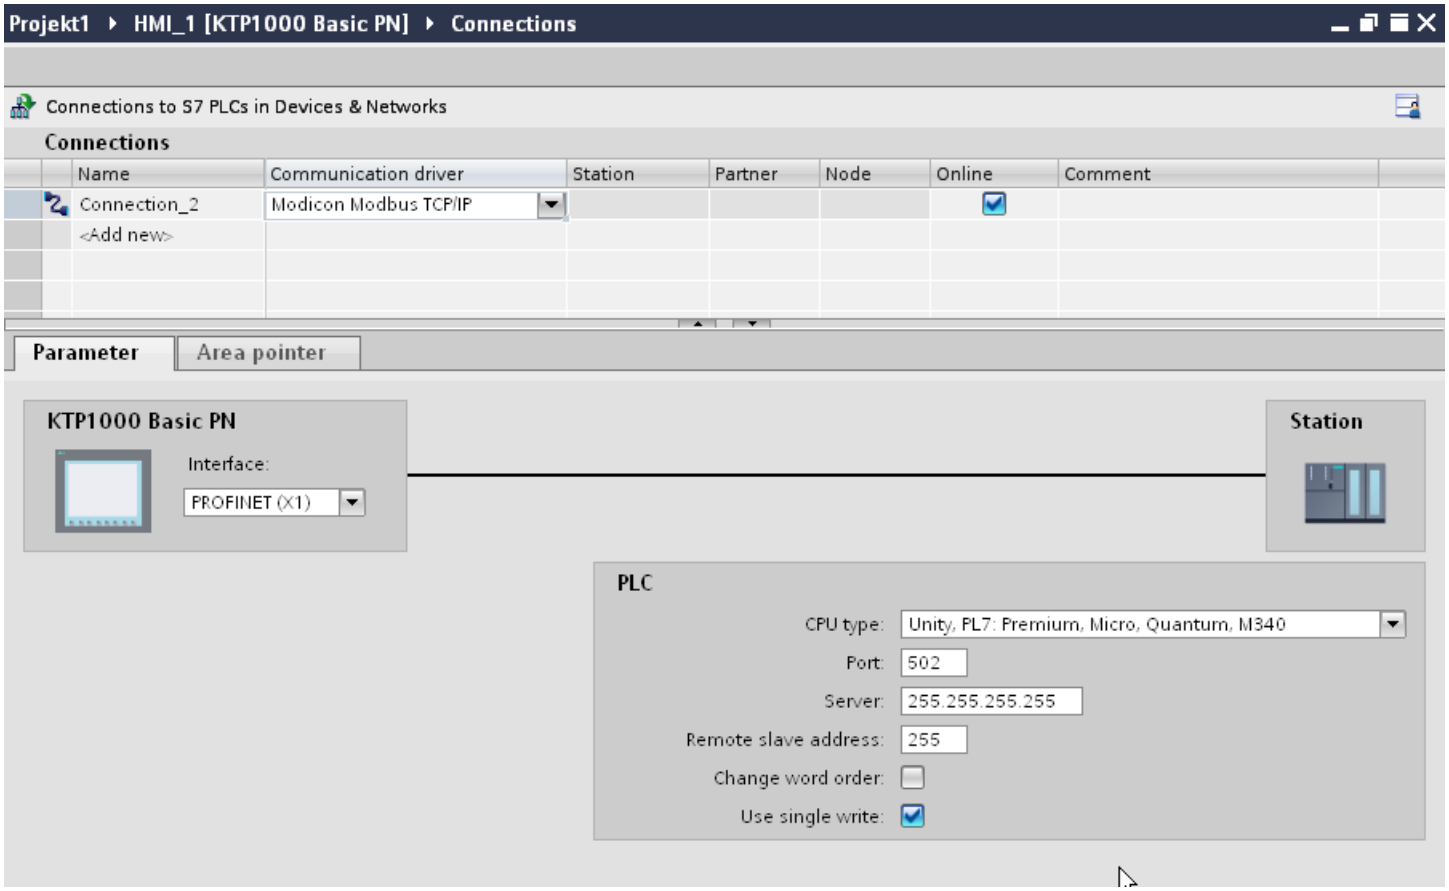
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. Select the "Modicon Modbus TCP" driver in the "Communication driver" column.



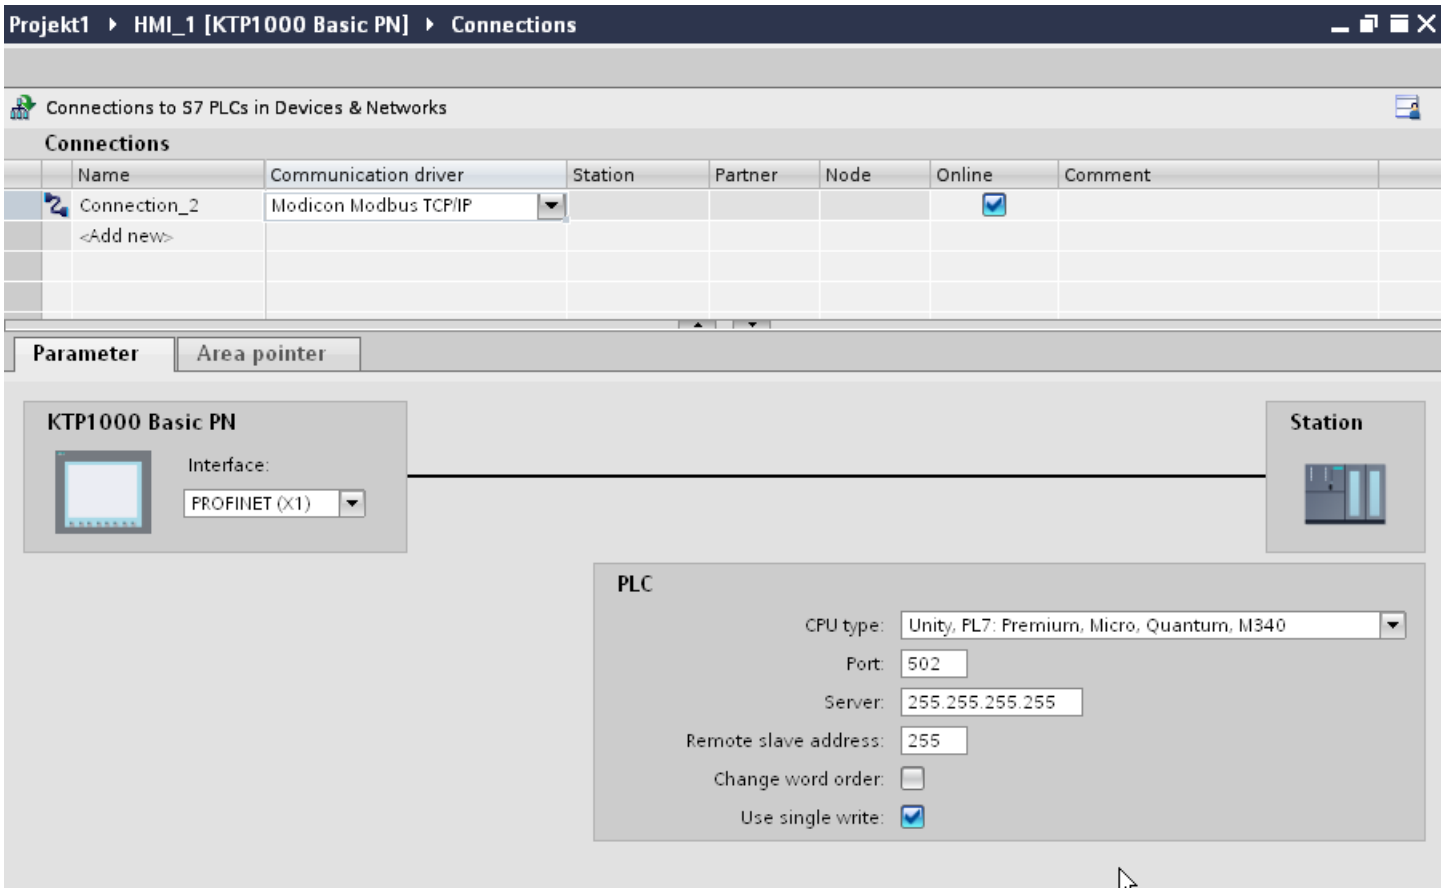
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Modicon Modbus TCP/IP)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select only one interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

If you are directly connected to the HMI device during configuration, you can set up the IP address of the HMI device in WinCC. The IP address is transferred to the HMI device during project transfer.

Note

The IP address in the control panel will be overwritten upon subsequent loading if you have already set up the IP address in the HMI device control panel.

The IP address already set up in the control panel will be retained upon subsequent loading if you activate "Set IP address using a different method".

To set up the IP address of the HMI device:

1. Click the HMI device.
2. Open the "Device configuration" editor.

3. Click the Ethernet interface.
4. Assign the IP address in the inspector window under:
   "General > PROFINET interface > Ethernet addresses"

Parameters for the PLC

- "CPU type"
  For "CPU type", you set the Modicon PLC to which the HMI device is connected.
- "Port"
  For "Port", you set the port that is used for the TCP/IP connection. The port used by the Modicon PLCs is 502.
- "Server"
  You set the IP address or host name of the PLC under "Server". Only the IP address can be used on a Basic Panel.
- "Remote Slave address"
  Under "Remote Slave address" you only set which slave address the remote PLC has when using a bridge.
  If no bridge is used, the default value 255 (or 0) must be retained.
- "Change word order"
  The "Change word order " parameter only affects the word order of the 32-bit values display. The setting pertains to the data types Double, Double+/-, and Float. The byte order cannot be changed.
  - "Change word order" not activated
    The most significant byte is sent first.
    For double words, the least significant word is sent before the most significant word.
    This setting has been system-tested for all approved PLCs.
  - "Change word order" activated
    The most significant byte is sent first.
    For double words, the most significant word is sent before the least significant word.

    Note

    This setting must be used for the SIEMENS SENTRON PAC3200 and PAC4200 multi-function meters and can be used for PLCs of other manufacturers.

- "Use single write"
  If you deselect this function, only function codes 15H and 16H are used for writing into the PLC.
  If this function remains selected, the function codes 05H, 06H 16H and 16H are used.

Connecting HMI device to PLC

Connections via Modicon Modbus TCP/IP

Connection

The HMI device can be connected to the Modicon Modbus PLC using the following components:

- Existing Ethernet network that also contains the PLCs
- Cross-over Ethernet cable connected directly to the Ethernet interface of the CPU or the communication module

The connection of the HMI device to a Modicon Modbus PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Note

Timeout response with TCP/IP (Ethernet)

Due to the use of the TCP/IP protocol, the breakdown of a connection is detected at the earliest after approximately one minute. Communication failure cannot be reliably detected if no tags are requested, for example, no output tags in the current screen.

Configure area pointer coordination for each PLC. This setting ensures that a communication failure is recognized after approximately two minutes, even in the aforementioned scenario.

Communication types

Approved communication types

The following communication types are system-tested and approved:

- Point-to-point coupling:
- Multiple point coupling of a HMI device (Modbus TCP/IP Client) with up to 4 PLCs, each with different couplings. CPU types can be mixed.
  The following couplings are possible:
  - Coupling the Ethernet CPU interface of the TSX Unity Quantum.
  - Coupling via the communication modules for Ethernet 140 NOE 771 01 for the TSX Quantum and TSX Unity Quantum series
  - Coupling via the Ethernet interface of the 171 CCC 980 30 CPU adapter of the Momentum series
  - Coupling the Ethernet CPU interface of the TSX Unity Premium.
  - Coupling via the Ethernet TCP/IP connect module TSX ETY 110 for the TSX Premium and TSX Unity Premium series
  - Coupling via the Ethernet TCP/IP connect module TSX ETY 410 for the Micro series
  - Coupling via the Ethernet TCP/IP Modbus Plus Bridge 174 CEV 200 40 to the Modbus Plus interface of the Compact, the TSX Quantum and the TSX Unity Quantum series

Via the TCP/IP Modbus Plus Bridge, 174 CEV 200 40, the PLCs can be accessed at their Remote Slave Address via the Ethernet interface of this bridge.

Note

Integration of the HMI device in a Modbus network via a bridge is not possible. The HMI device is the Modbus master.

Restrictions

The coupling of the HMI device to PLCs of other manufacturers who offer a Modbus TCP/IP interface is not system-tested and thus, not enabled.

However, if another PLC is to be used, observe the following instructions:

- Use the following CPU types, because these operate without address offset and in the usual bit count manner.
  - Unity, PL7: Premium, Micro, Quantum, M340
- The following function codes are used for the respective data areas:

Reading function codes		Address range	
01	ReadCoilStatus	0x / %M	DIGITAL_OUT
02	ReadInputStatus	1x / %I	DIGITAL_IN
03	ReadHoldingRegisters	4x / %MW	USERDATA

Reading function codes		Address range	
04	ReadInputRegisters	3x / %IW	ANALOG_IN
20 (14Hex)	ReadGeneralReference	6x / –	EXTENDEDMEMORY (not for all CPUs)

Writing function codes		Address range	
06 [1]	PresetSingleRegister	4x / %MW	USERDATA Single
16 (10Hex)	PresetMultipleRegisters	4x / %MW	USERDATA Multiple
05 [1]	ForceSingleCoil	0x / %M	DIGITAL_OUT with BIT
15 (0FHex)	ForceMultipleCoils	0x / %M	DIGITAL_OUT with 16 BIT GROUP
21 (15Hex)	WriteGeneralReference	6x / –	EXTENDEDMEMORY (not for all CPUs)

[1] Select use with "Use single write".

Connectable PLCs

Connections can be implemented for the following Modicon Modbus PLCs:

Modicon Modbus PLC	Supported protocol	
Modicon Modbus RTU [2]	Modicon Modbus TCP/IP	
TSX Compact	x	x [1]
TSX Quantum	x	x
Momentum	x	x
Premium	-	x
Micro	-	x
M340 20x0 (without 2010)	-	x

[1] Only via Ethernet TCP/IP Modbus Plus Bridge

[2] Communication via RS 232 is tested and enabled for the PLC. In the HMIs that only have a RS 422/485 interface, the RS 422/232 converter with the order number 6AV6 671-8XE00-0AX0 was tested and enabled.

Performance features of communication

Permissible data types for Modicon Modbus TCP/IP

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Note

If you change the Modicon Modbus RTU communication driver to Modicon Modbus TCP/IP, the string in the "String" data type may be different.

Permitted data types for CPU type "Unity, PLC: Premium, Micro, Quantum M340"

Data type	Operand type	Length
+/- Double	%MW	4 bytes
+/- Int	%MW, %IW	2 bytes
16-bit group	%MW, %I	2 bytes
ASCII	%MW	0 to 80 characters
Bit	%MW, %IW, %M, %I	1-bit
Double	%MW	4 bytes
Float	%MW	4 bytes
Int	%MW, %IW	2 bytes

Note

The ranges "%I" and "%IW" are not supported for the following CPU types:

- Premium
- Micro
- M340

Permitted data types for CPU type "Concept, ProWORX: Compact, Quantum, Momentum"

Data type	Operand type	Length
+/- Double	4x, 6x	4 bytes
+/- Int	3x, 4x, 6x	2 bytes
16-bit group	0x, 1x	2 bytes
ASCII	4x, 6x	0 to 80 characters
Bit	0x, 1x, 3x, 4x, 6x	1-bit

Data type	Operand type	Length
Double	4x, 6x	4 bytes
Float	4x, 6x	4 bytes
Int	3x, 4x, 6x	2 bytes

Bit counting method

The usual bit counting method "16 LSB - 1 MSB" in the following CPU types is only used in the "HMI tags" editor with the selected "Bit" data type:

- Concept, ProWORX: Compact, Quantum, Momentum

The following bit location assignment applies:

	Left byte								Right byte							
Counting with tags	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

Format for "Signed"

The placeholder "+/-" stands for the data types "Signed Int" and "Signed Double".

Supported CPU types for Modicon Modbus TCP/IP

CPU types

The following CPU types are supported for configuring the Modicon Modbus TCP/IP communication driver.

- Compact
- Momentum
- Quantum
  - Concept Quantum
  - Unity Quantum
- Micro
- Premium
- Modicon M340
  - 20x0 (except 2010)

Address areas for Modicon Modbus TCP/IP

Unity, PI7

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	DInt	+/- DInt	Float	ASCII
%1	%I0 - %I65535	%I65535 %I0 - %I65520	--	--	--	--	--	--
%M	%M0 - %M65535	%M65535 %M0 - %M65520	--	--	--	--	--	--
%IW	%IW0.0 - %IW65535.15	--	%IW0 - %IW65535	%IW0 - %IW65535	--	--	--	--
%MW	%MW0.0 - %MW65535.15	--	%MW0 - %MW65535	%MW0 - %MW65535	%MW0 - %MW65534	%MW0 - %MW65534	%MW0 - %MW65534	%MW0 - %MW65535

Concept, ProWORX

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	DInt	+/- DInt	Float	ASCII
0x	0x1 - 0x65535	0x1 - 0x65520	--	--	--	--	--	--
1x	1x100001 - 1x165535	1x100001 - 1x165520	--	--	--	--	--	--
3x	3x300001.1 - 3x365535.16	--	3x300001 - 3x365535	3x300001 - 3x365535	--	--	--	--
4x	4x400001.1 - 4x465535.16	--	4x400001 - 4x465535	4x400001 - 4x465535	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465535
6x	6x60000.1:1 - 6x69999.16:10	--	6x60000:1 - 6x69999:10	6x60000:1 - 6x69999:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69999:10

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Modicon Modbus RTU

Configuring a connection via Modicon Modbus RTU

Introduction

You configure a connection to a PLC with a Modicon Modbus RTU communication driver in the "Connections" editor of the HMI device.

The interfaces are named differently depending on the HMI device.

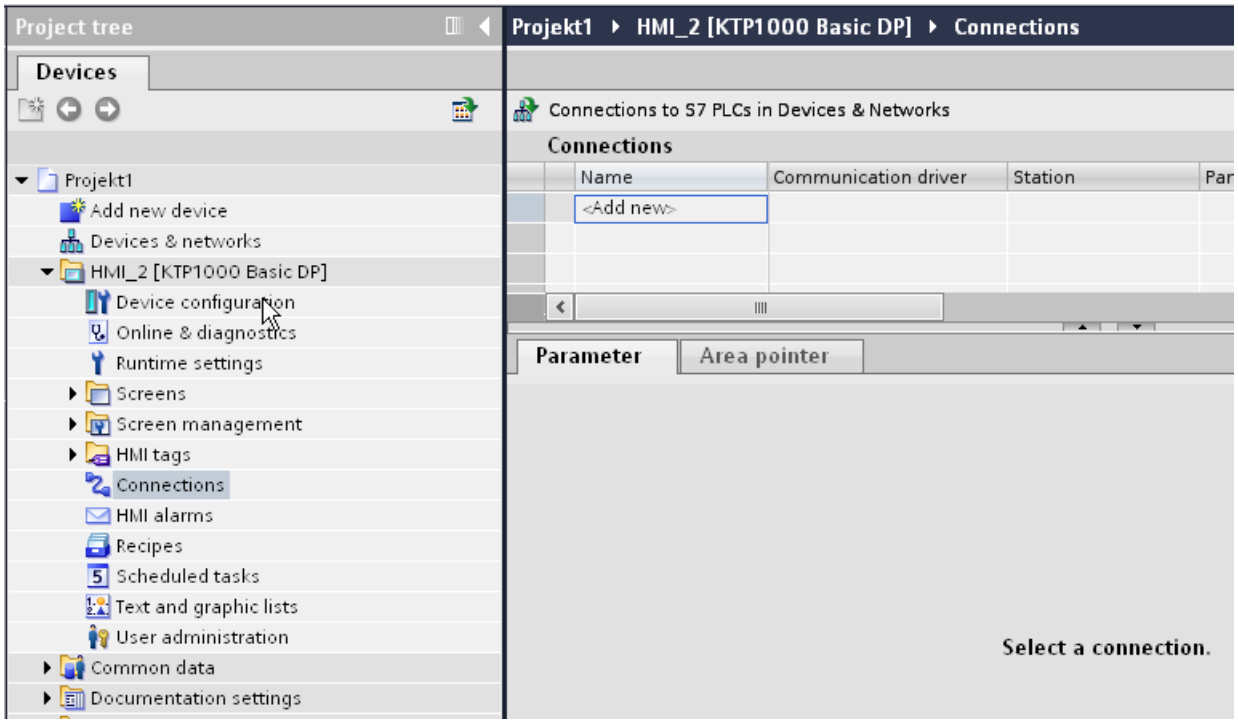
Requirements

- A project is open.
- An HMI device has been created.

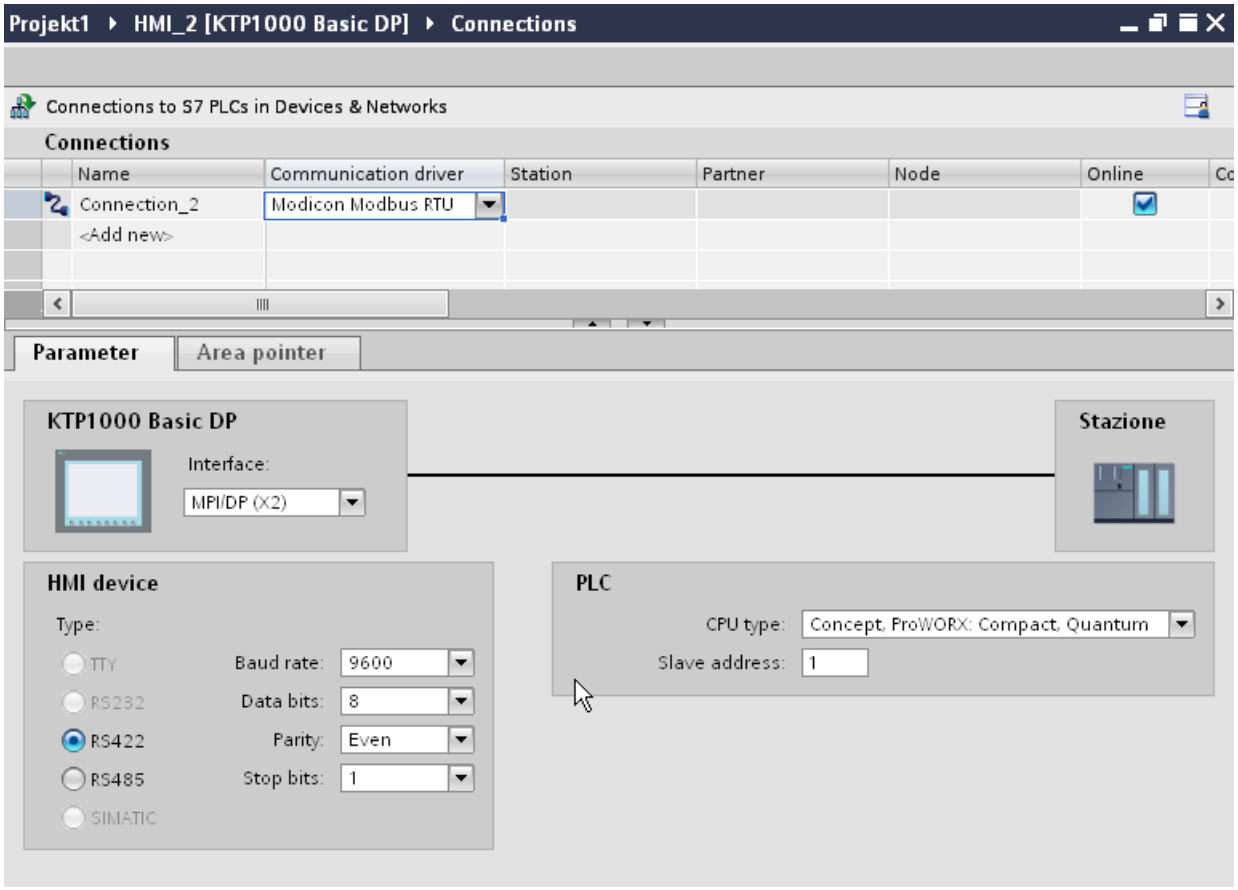
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. In the "Communication drivers" column, select the "Modicon Modbus RTU" driver.



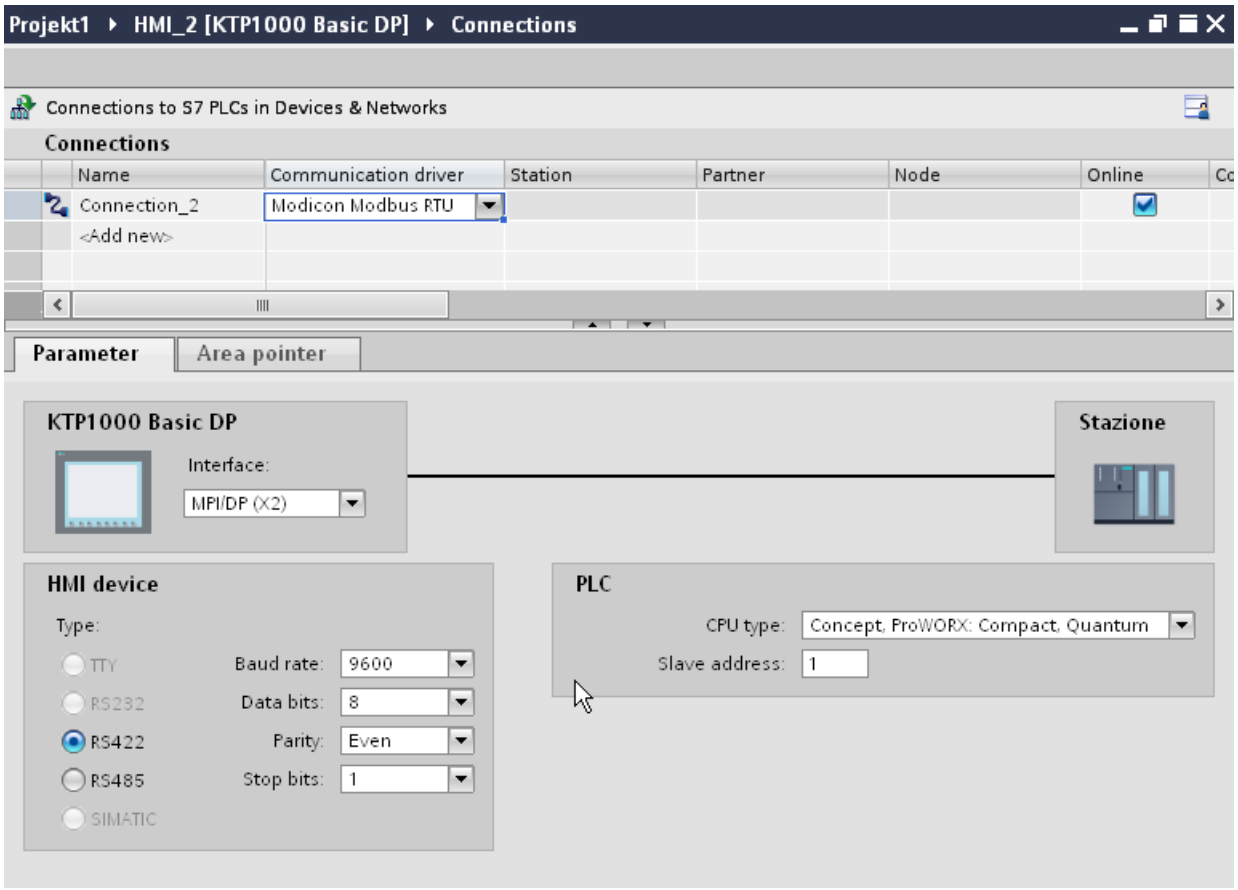
5. Select all necessary connection parameters for the interface in the Inspector window under "Parameters".

Parameters for the connection (Modicon Modbus RTU)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- Type
  Only RS 232 is system-tested.
  No warranty is given for RS 485.

  Note

  RS 422 is only approved in combination with the RS 422-RS 232 converter.

  Order number: 6AV6 671-8XE00-0AX0

  Note

  If you use the IF1B interface, you must switch over the RS422 receive data additionally by 4 DIL-switches on the back of the HMI device.

- Baud rate
  For "Baud rate", select the transmission speed between the HMI device and Modicon PLC.
  A baud rate of 19200 or 9600 can be selected for the communication.
  A baud rate of 4800 can be selected for certain HMI devices.

- Data bits
  For "Data bits", only the value "8" can be selected.
- Parity
  For "Parity", you can choose from "None", "Even", and "Odd".
- Stop bits
  For "Stop bits", you can choose between 1 and 2 bits.

Parameters for the PLC

- CPU type
  For "CPU type", you set the Modicon PLC to which the HMI device is connected.
  You can select the following CPUs:
  – Concept, ProWORX: Compact, Quantum
- Slave address
  Under "Slave address" you set which slave address the CPU has.

Connecting HMI device to PLC

Connections via Modicon Modbus RTU

Connection

Connect the HMI device to the Modicon Modbus RTU interface of the Modicon Modbus RTU slave.

The connection of the HMI device to Modicon is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Connection cable

The following connecting cables are available to connect the HMI device to Modicon Modbus.

Interface to the HMI device	Modicon PLC		
	directly via Modbus interface (RS232) 9-pin Sub D male connector	Via MB Bridge (RS 232)	directly via Modbus interface (RS232) 8-pin RJ45 connector
RS 232, 9-pin	PP1	PP1	PP2

The cable pin assignments can be found in Section "Connecting cables for Modicon Modbus RTU".

Communication types

Approved communication types

The following communication types are system-tested and approved:

- Ppoint-to-point connection only via the RS-232 interface.
- Multipoint connection from a HMI device (Modbus-Master) with up to 4 PLCs: The HMI device must be connected with a Modbus Plus Bridge or a Compact, Momentum CPU or TSX Quantum CPU which is configured as a Modbus Plus Bridge.
- You connect the other PLCs via the Modbus Plus connection on the first PLC. The PLCs can be reached under their address via the bridge functionality of the first PLC.

Note

It is not possible to integrate the HMI device into a Modbus network because the HMI device is Modbus-Master.

- Integration of the HMI device into a Modbus Plus network via the "bridge mode" of the Compact, Momentum or Quantum (logical point-to-point communication of the HMI device with a Compact, Momentum or Quantum).

Restrictions

The connection of the HMI device to PLCs of other manufacturers which offer a Modicon Modbus interface is not system-tested and therefore not approved.

If you use another PLC nevertheless, observe the following information:

- These drivers only work for tags with the bit counting method typical for Modicon PLCs from left (bit1 = most significant bit) to right (bit16 = least significant bit in data type INT).
- The address offset displayed in the configuring is subtracted at protocol level in the message frame. E.g. in Holding Register 4x the offset "40001". The configured address "40006" therefore becomes address "5" in the message frame. The address (e.g. "5") transferred in the message frame is transformed to the PLC-specific address range in the different Non-Modicon PLCs.
- A reply message frame without "ExceptionCode" is expected within 500 ms.
- The following function codes are used for the respective data areas:

Reading function codes		Address range	
01	ReadCoilStatus	0x	DIGITAL_OUT
02	ReadInputStatus	1x	DIGITAL_IN
03	ReadHoldingRegisters	4x	USERDATA
04	ReadInputRegisters	3x	ANALOG_IN
20 (14Hex)	ReadGeneralReference	6x	EXTENDEDMEMORY (not for all CPUs)

Writing function codes		Address range	
06	PresetSingleRegister	4x	USERDATA Single
16 (10Hex)	PresetMultipleRegisters	4x	USERDATA Multiple
05	ForceSingleCoil	0x	DIGITAL_OUT with data type Bit
15 (0FHex)	ForceMultipleCoils	0x	DIGITAL_OUT with data type 16 bit group
21 (15Hex)	WriteGeneralReference	6x	EXTENDEDMEMORY (not for all CPUs)

Connectable PLCs

Connections can be implemented for the following Modicon Modbus PLCs:

Modicon Modbus PLC	Supported protocol	
Modicon Modbus RTU [2]	Modicon Modbus TCP/IP	
TSX Compact	x	x [1]
TSX Quantum	x	x
Momentum	x	x
Premium	-	x
Micro	-	x
M340 20x0 (without 2010)	-	x

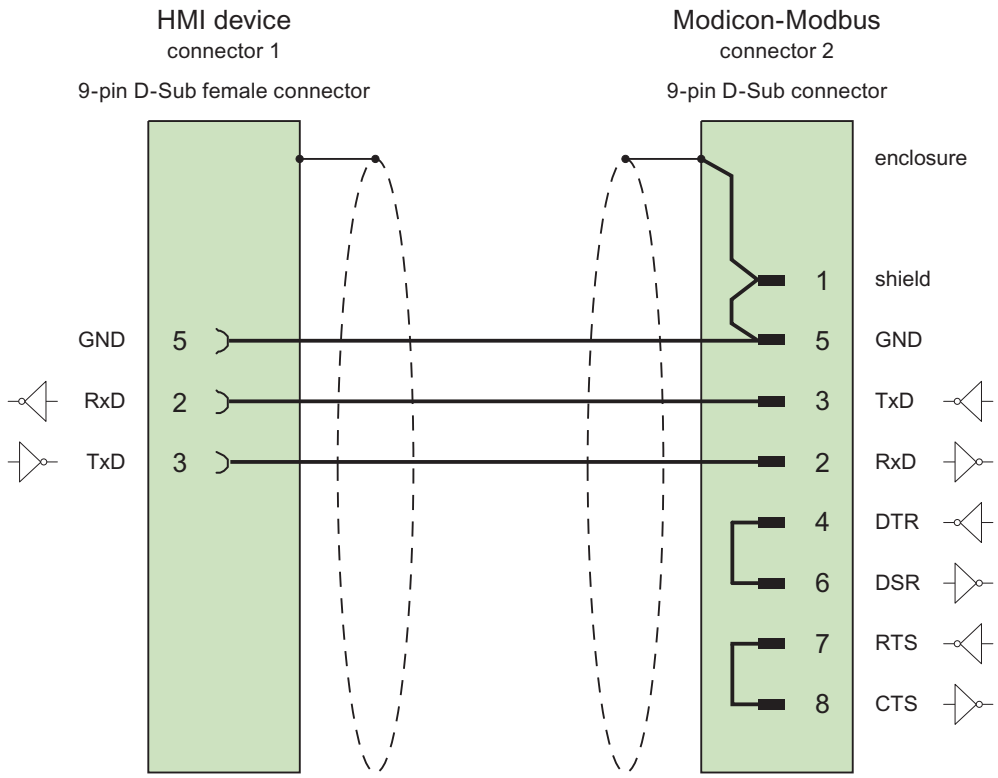
[1] Only via Ethernet TCP/IP-Modbus Plus Bridge

[2] Communication via RS 232 is tested and enabled for the PLC. In the HMI devices which only have an RS 422/485 interface, the RS 422/232 converter with the order number 6AV6 671-8XE00-0AX0 was tested and approved.

Connecting cables for Modicon Modbus RTU

Connecting cable PP1, RS-232, for Modicon

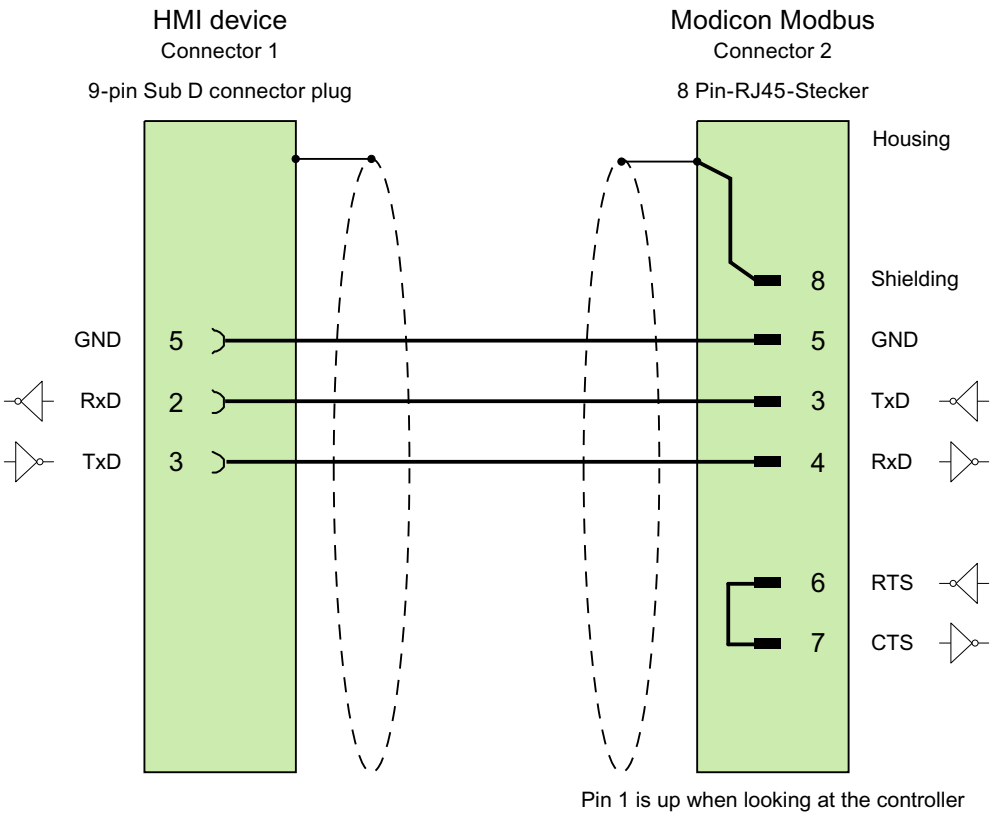
Point-to-point cable 1: PLC > PC ...



Cables: 3 x 0.14 mm^2, shielded,
max. length 15 m

Connecting cable PP2, RS-232, for Modicon

Point-to-point cable 2: PLC (TSX Compact) > PC...



Cables: 3 x 0.14 mm^2, shielded,
max. length 15 m

Performance features of communication

Permitted data types for Modicon Modbus RTU

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
+/- Double	4x, 6x	4 bytes
+/- Int	3x, 4x, 6x	2 bytes
16-bit group	0x, 1x	2 bytes
ASCII	4x, 6x	0 to 80 characters
Bit [1)]	0x, 1x, 3x, 4x, 6x	1-bit
Double	4x, 6x	4 bytes
Float	4x, 6x	4 bytes
Int	3x, 4x, 6x	2 bytes

1) Note the following for write accesses:

For data type "Bit" with the operand types "4x" and "6x", the entire word is written back to the PLC following a change to the specified bit. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

The usual bit counting method (16 LSB - 1 MSB) in the following CPU types is only used in the "HMI tags" editor with the selected "Bit" data type:

- Concept ProWORX: Compact, Quantum

The following bit location assignment applies:

	Left byte								Right byte							
Counting with tags	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

Format for "Signed"

The placeholder "+/-" stands for the data types "Signed Int" and "Signed Double".

Supported CPU types for Modicon Modbus RTU

CPU types

The following CPU types are supported in the configuration of the Modicon Modbus RTU communication driver.

- Compact
- Momentum
- Quantum

Address areas for Modicon Modbus RTU

Concept, ProWORX

Address areas	Data types							
	Bool	16 Bit Group	Int	+/- Int	DInt	+/- DInt	Float	ASCII
0x	0x1 - 0x65535	0x1 - 0x65520	--	--	--	--	--	--
1x	1x100001 - 1x165535	1x100001 - 1x165520	--	--	--	--	--	--
3x	3x300001.1 - 3x365535.16	--	3x300001 - 3x365535	3x300001 - 3x365535	--	--	--	--
4x	4x400001.1 - 4x465535.16	--	4x400001 - 4x465535	4x400001 - 4x465535	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465534	4x400001 - 4x465535
6x	6x60000.1:1 - 6x69999.16:10	--	6x60000:1 - 6x69999:10	6x60000:1 - 6x69999:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69998:10	6x60000:1 - 6x69999:10

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.
- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Data exchange

Area pointers for Modicon Modbus

Area pointers for connections via Modicon Modbus communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section "Data exchange using area pointers".

Special considerations for connections via Modicon communication drivers

You can configure the following area pointers

Area pointers	Modicon Modbus TCP/IP	Modicon Modbus RTU
Screen number	Yes	Yes
Date/time	Yes	Yes
Date/time PLC	Yes	Yes
Coordination	Yes	Yes
Project ID	Yes	Yes
Job mailbox	Yes	Yes
Data record	Yes	Yes

Restrictions Modicon Modbus TCP/IP

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
Concept, ProWORX: Compact, Quantum, Momentum	+/- Int, Int	4x, 6x
Unity, PL7: Premium, Micro, Quantum, M340	+/- Int, Int	%MW

Modicon Modbus RTU restrictions

The following restrictions apply for configuring area pointers.

CPU type	Data types	File types
Concept, ProWORX: Compact, Quantum, Momentum	+/- Int, Int	4x, 6x

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3237)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

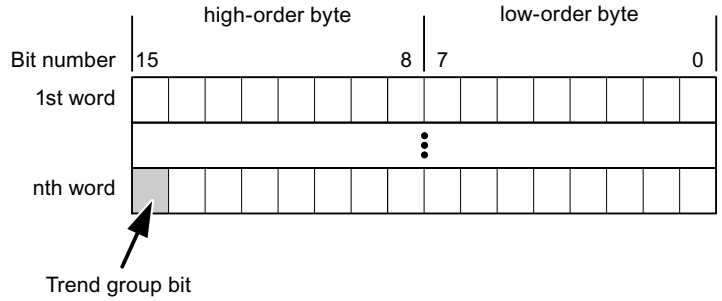
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Permitted data types for trend control

Modicon Modbus TCP/IP

Tags of the following operand types are permitted for CPU type "Concept, ProWORX: Compact, Quantum, Momentum".

- "4x"
- "6x"

Tags of the following operand types are permitted for CPU type "Unity, PL7: Premium, Micro, Quantum, M340".

- "%MW"

The tags for trend control must have data type "Int" or "+/- Int" or be an array tag with data type "Int" or "+/-Int".

You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

Modicon Modbus RTU

Tags of the following operand types are permitted for CPU type "Concept, ProWORX: Compact, Quantum".

- "4x"
- "6x"

The tags for trend control must have data type "Int" or "+/- Int" or be an array tag with data type "Int" or "+/-Int".

You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

Alarms

Configuring alarms

Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3260)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with a Modicon Modbus communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
All Modicon series	Int, +/-Int	16 Bit Group, Int, +/-Int, Double, +/-Double, Float

Arrays and array tags cannot be used for discrete alarms.

How the bit positions are counted

For connections with a Modicon Modbus communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In WinCC you configure:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

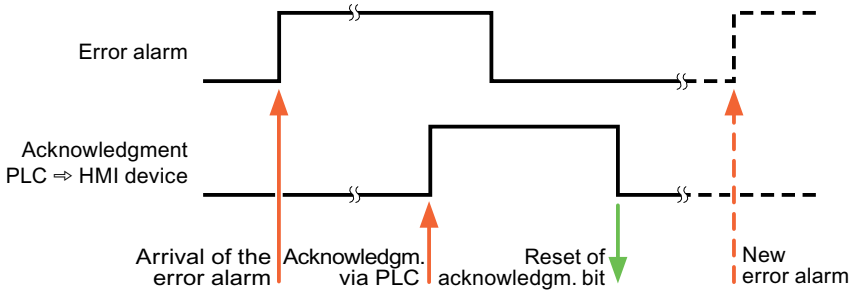
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment

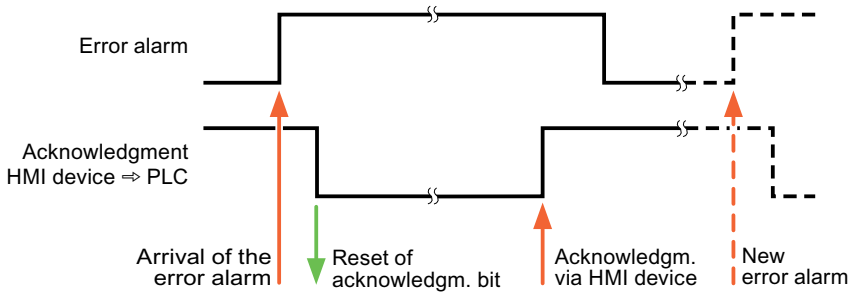
tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels	Panel PCs:
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

Omron

Omron communication drivers

Introduction

This section describes the communication between an HMI device and PLCs that use Omron communication drivers.

The following communication drivers are supported:

- Omron Host Link

Data exchange

Data is exchanged by means of tags or area pointers.

- Tags
  The PLC and the HMI device use process values for data exchange. You create tags in the configuration that point to addresses in the PLC. The HMI device reads the value from the defined address, and then displays it. The operator may also enter values on the HMI device, which are then written to the address in the PLC.
- Area pointers
  Area pointers are used to exchange specific data and are only set up when these data are used.

Omron Host Link

Configuring a connection via Omron Host Link

Introduction

You configure a connection to a PLC with an Omron Host Link communication driver in the "Connections" editor of the HMI device.

Note

Connection with Omron Host Link

A connection will not automatically be established when runtime is started if you have configured a connection via Omron.

A tag which is in the valid PLC memory area must be configured in the runtime start screen.

The connection will otherwise only be established once a corresponding screen has been selected.

This tag will be accessed when runtime is started and a connection will then be established.

The interfaces are named differently depending on the HMI device.

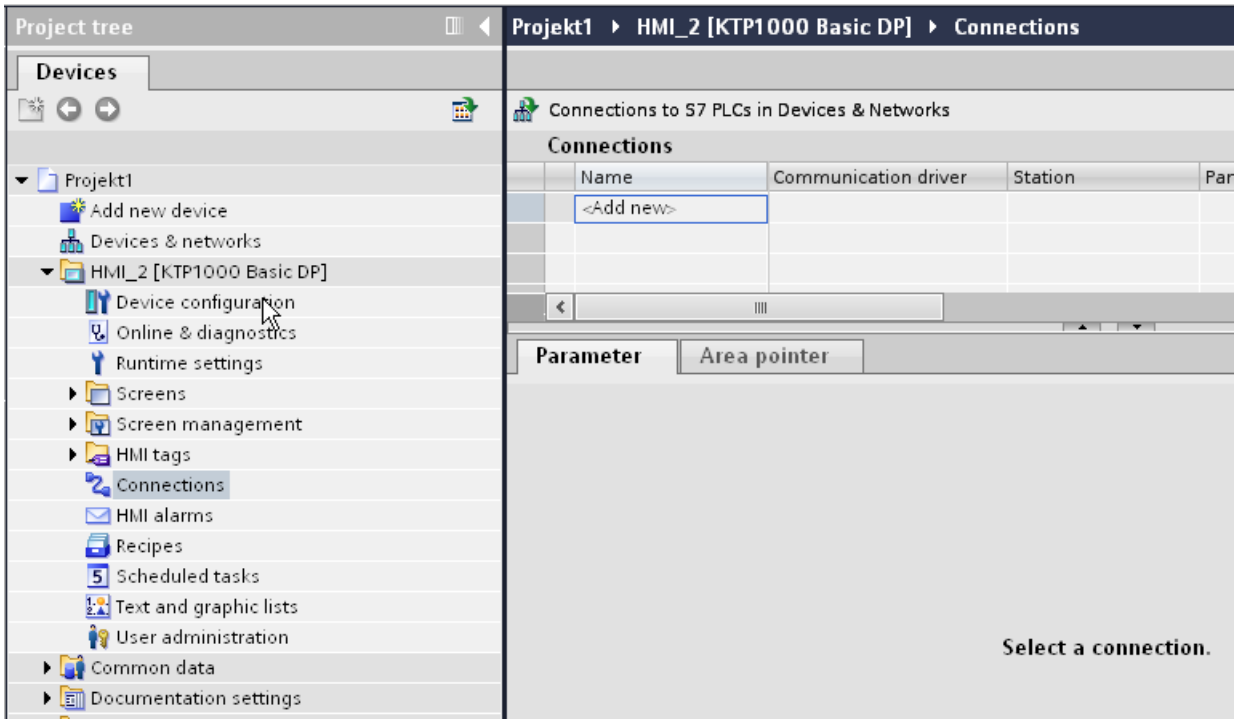
Requirements

- A project is open.
- An HMI device has been created.

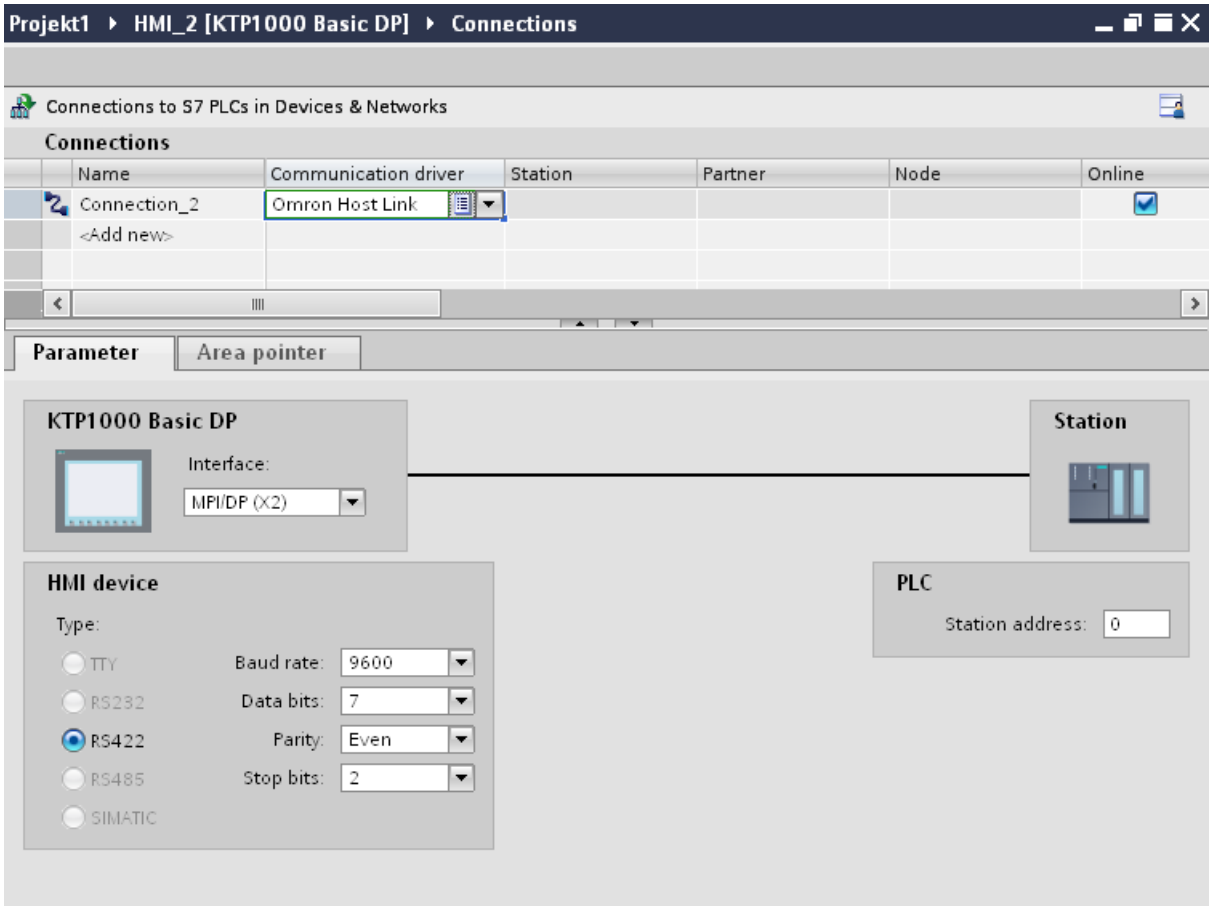
Procedure

1. Double-click the HMI device under "Devices" in the project tree.
2. Double-click the "Connections" item.

3. Double-click "<Add>" in the "Connections" editor.



4. Select the "Omron Host Link" driver in the "Communication driver" column.



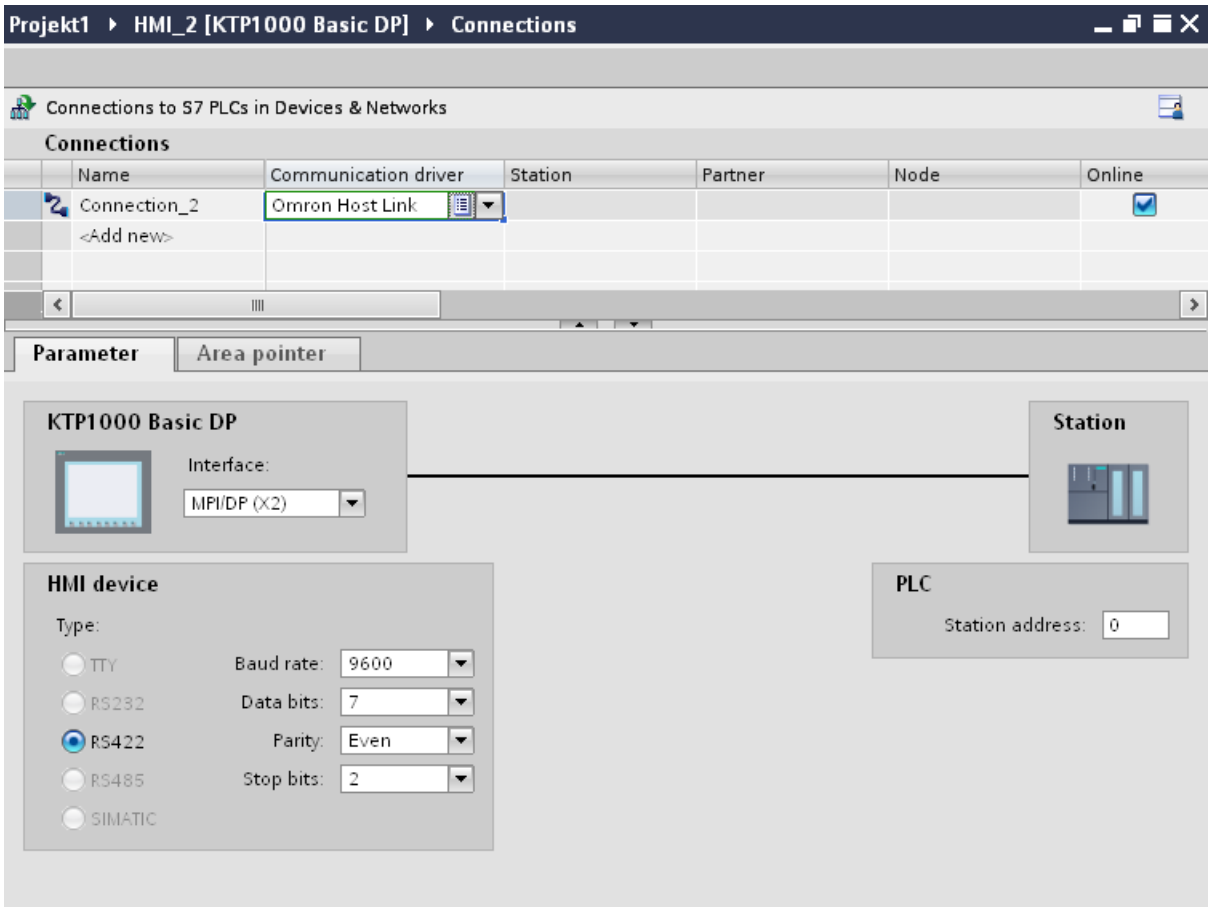
5. Select all necessary connection parameters for the interface in the inspector window under "Parameters".

Parameters for the connection (Omron Hostlink)

Parameters to be set

To set the connection parameters, such as addresses and profiles, click the connection that you have created in the "Connections" editor.

The communication partners are displayed schematically in the Inspector window under "Parameters". The "HMI device" and "PLC" areas are available for assigning parameters according to the interface used.



Parameters for the HMI device

You can select an interface for the HMI device in the Inspector window under "Parameters". Depending on the HMI device, there are several interfaces available.

- Type
  Specifies the physical connection used.
- Baud rate
  For "Baud rate", you set the transmission speed of the HMI device to OMRON. A baud rate of 19200 or 9600 can be selected for the communication.
- Data bits
  For "Data bits", you can choose between "7 bits" and "8 bits".
- Parity
  For "Parity", you can choose from "None", "Even", and "Odd".
- Stop bits
  For "Stop bits", you can choose between 1 and 2 bits.

Parameters for the PLC

- Station address
  For "Station address", set the station number of the connected PLC.

Connecting HMI device to PLC

Connections via Omron Host Link

Connection

The connection of the HMI device to an OMRON PLC is limited primarily to the physical connection of the HMI device. Special blocks for the connection are not required in the PLC.

Connection cable

The following connecting cables are available to connect the HMI device to an Omron PLC.

Interface to the HMI device	Omron PLC			
	RS232, 9-pin	RS232 I/O port	RS422, 9-pin	RS422, terminals/ pins
RS232, 9-pin	PP1	Programming cable (standard cable of Omron)	—	—
RS232 via converter	—	—	—	Multi-point cable 1
RS422, 9-pin	—	—	PP2	Multi-point cable 2

Refer to the relevant device manual to determine which HMI device interface is to be used.

Communication types

Approved communication types

The connection from a HMI device to an OMRON-CPU with the Omron Host Link protocol via RS232 and via RS 422 is system-tested and approved by Siemens AG.

This concerns the following CPU types:

- CP1x (CP1L, CP1H, CP1E)
- CJ1x (CJ1M, CJ1H, CJ1G)
- CJ2H

- CS1x (CS1G, CS1H, CS1D)
- CPM2C

Note

Only the following CPU types have been tested and released for Basic Panels, TP 177A and OP 77A:

- CP1x (CP1L, CP1H, CP1E)
- CJ1x (CJ1M, CJ1H, CJ1G)

Multipoint connection

A multipoint connection to the up to 4 approved OMRON PLCs in a RS422-four-wire connection can be implemented with communication modules on the PLCs and is system-tested and approved by Siemens AG.

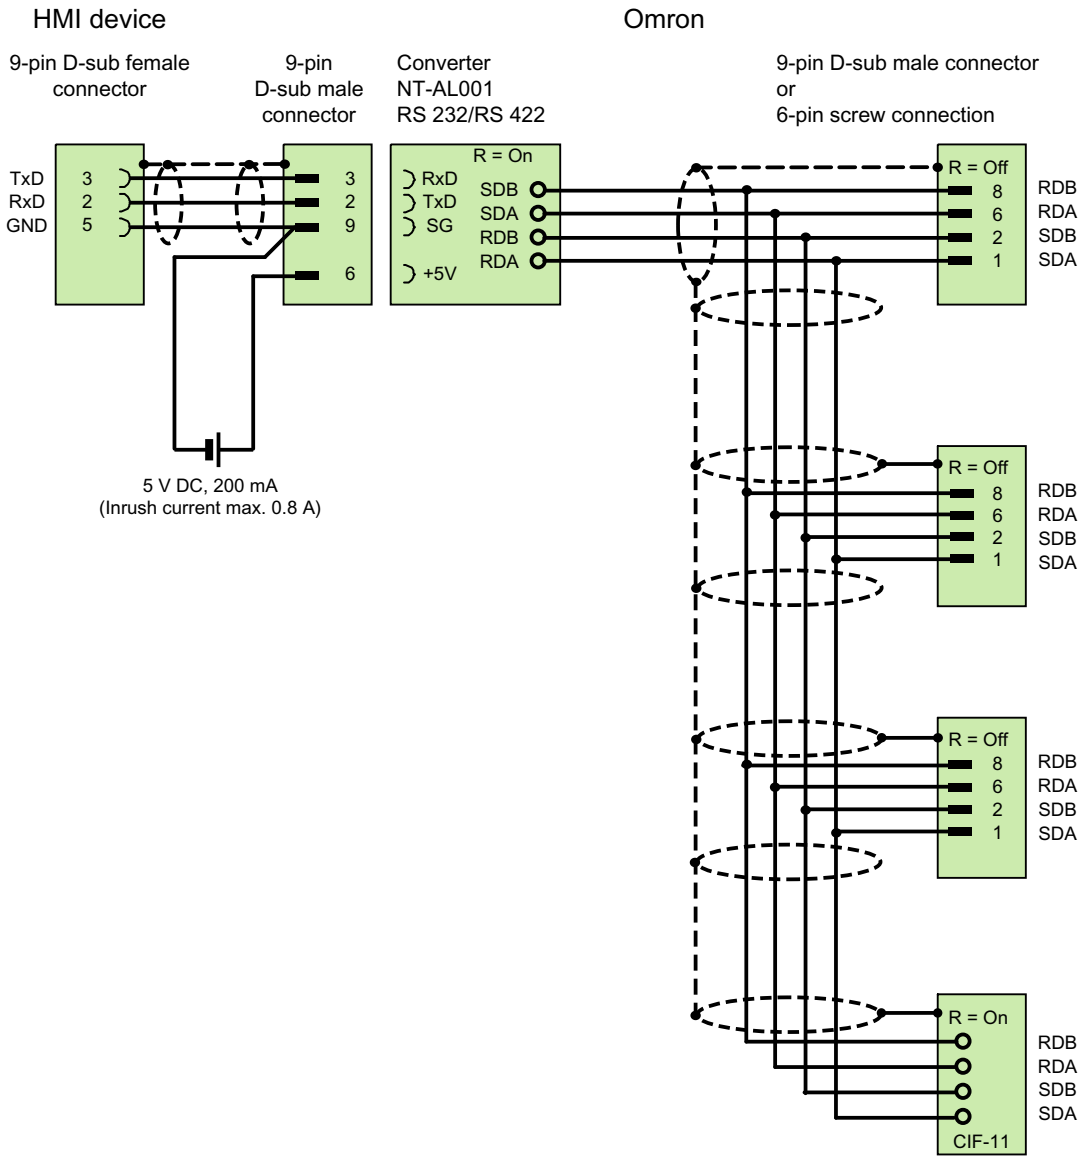
Note

The HMI device can only be operated as a master. Exactly one master is possible in the RS422-four-wire-Multidrop connection.

Connecting cables for Omron Host Link

Connecting cable MP1, RS-232, over converter, for Omron

Multipoint cable 1: MP/TP/PC > PLC

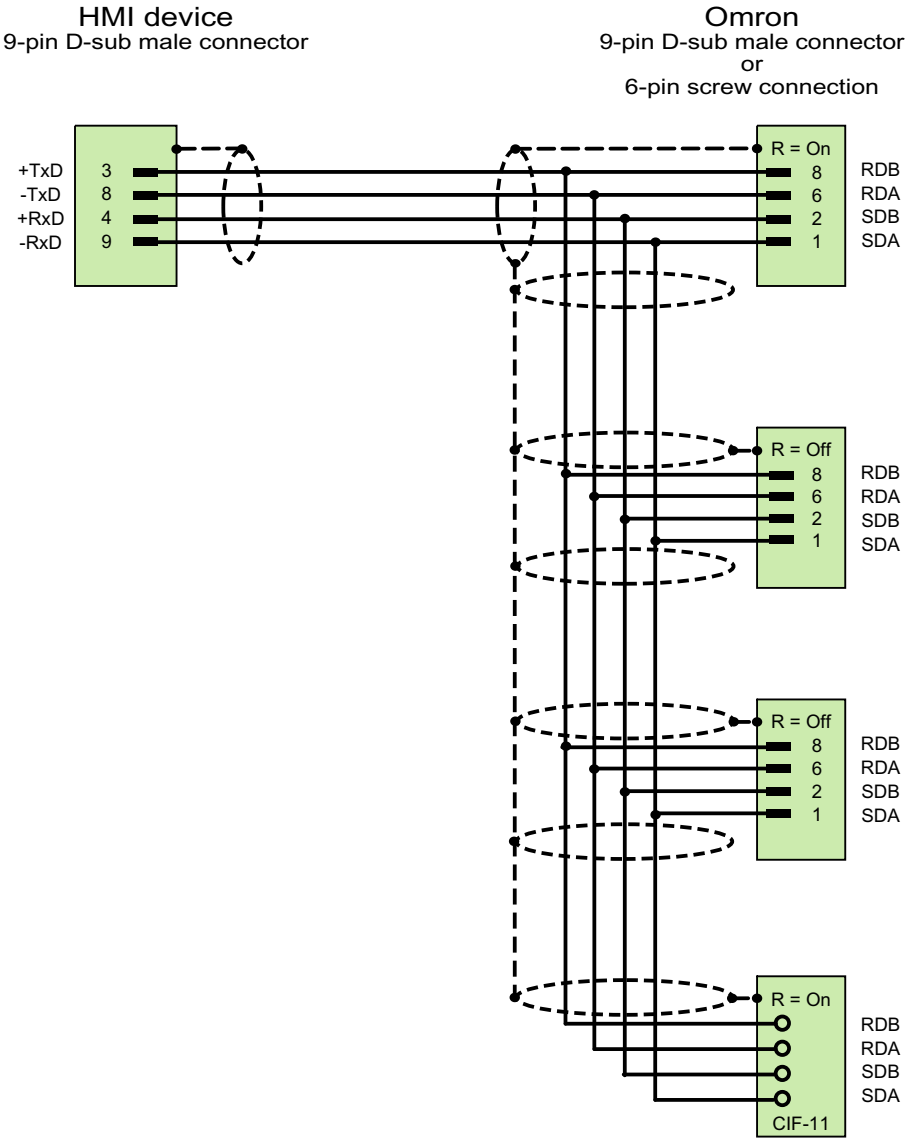


[1] Inrush current max. 0.8 A

shielded, max. length 500 m

Connecting cable MP2, RS-422, for Omron

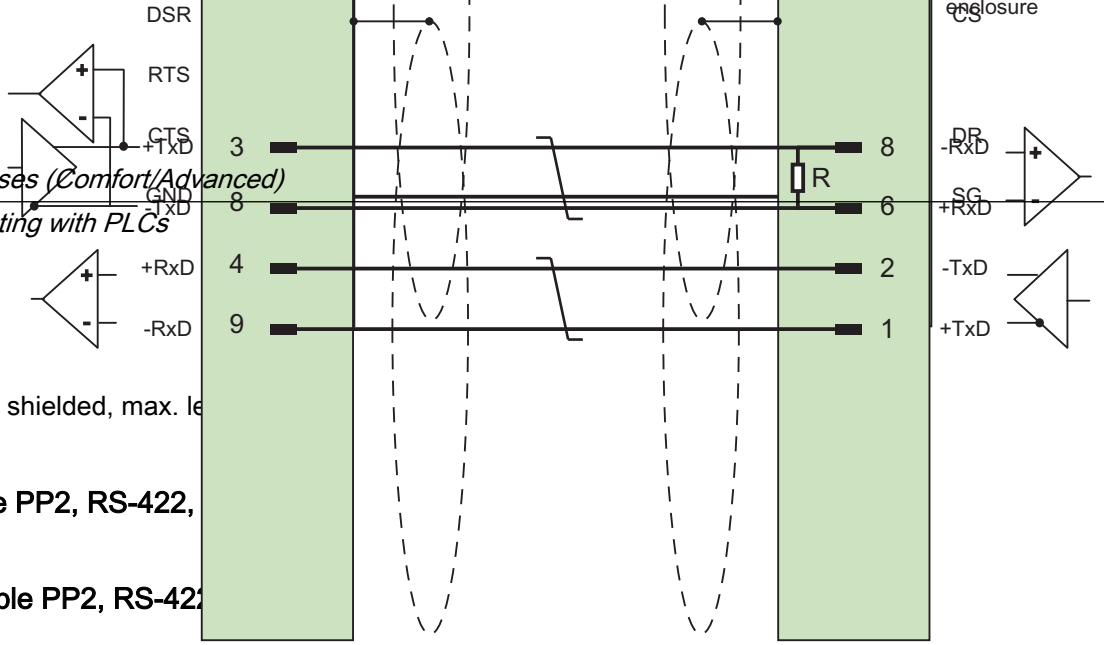
Multipoint cable 2: RS422, MP/TP/PC > SPS_



shielded, max. length 500 m

Connecting cable PP1, RS-232, for Omron

Point-to-point cable PP1, PC/TP/OP - PLC



Insert resistor 220 ohms / > 150 mW

Performance features of communication

Permissible data types for Omron Host Link

Permitted data types

The table lists the data types that can be used when configuring tags and area pointers.

Data type	Operand type	Length
Bool	I/O, HR, AR, LR, DM, T/C bit, CPU status	1-bit
Byte	CPU type	1 byte
DInt	HR, AR, LR, DM	4 bytes
Int	I/O, HR, AR, LR, DM, T/C Val	2 bytes
Real	HR, DM	4 bytes
String	HR, AR, LR, DM	0 to 80 characters
UDInt	HR, AR, LR, DM	4 bytes
UInt	I/O, HR, AR, LR, DM, T/C Val	2 bytes

Note

Read and write operations of all data areas in the OMRON PLC can only be reliably carried out in "STOP" or "MONITOR" mode.

"I/O" refers either to the IR/SR area or the CIO area depending on the PLC series. The operand types "LR", "HR" and "AR" are not available in all PLC series.

Note

Note the following for write accesses:

For the "Bool" data type with the operand types "I/O", "HR", "AR", "LR" and "DM", the entire word is written back into the PLC when the specified bit is changed. There is no check to determine whether any other bits in the word have changed. As a result, the PLC only has read access to the specified word.

Operand type old PLC	Operand type CS and CJ PLC
CPU Status	CPU Status
I/O	CIO
HR	H Range 0-511
AR	A
LR	n/a 1)
DM	D
T/C	T/C
CPU type	CPU type

1) You do not get an error message when you read or write the LR area in the following PLCs
   - CS
   - CJ
   - CP

Supported CPU types for Omron Host Link

CPU types

The following CPU types are supported in the configuration of the Omron Host Link communication driver.

- CP1
  - CP1L
  - CP1H
  - CP1E
- CJ1
  - CJ1M
  - CJ1H
  - CJ1G

- CJ2
  - CJ2H
- CS1
  - CS1G
  - CS1H
  - CS1D
- CPM
  - CPM2C

Addressing in Omron Host Link

Addressing of PLCs in Omron Host Link

In PLCs of the series CS, CP and CJ, the timers 0-4095 are addressed with T/C 0-2047.

The counters 0-4095 must be addressed with an offset of 2048 (T/C 2048-4095 correspond to the counters 0-2047). Counters and timers with addresses > 2047 cannot be addressed via Host Link.

Counters and timers with addresses > 2047 cannot be addressed via Host Link.

Example:

If you want to address counter C20, you must address T/C 20+2048 = T/C 2068.

Address areas for Omron Hostlink

Omron

Address areas	Data types							
	Bool	Byte	UInt	Int	UDInt	DInt	Real	String
I/O	I/O 0.0 - I/O 9999.15	--	I/O 0 - I/O 9999	I/O 0 - I/O 9999	--	--	--	--
HR	HR 0.0 - HR 9999.15		HR 0 - HR 9999	HR 0 - HR 9999	HR 0 - HR 9998	HR 0 - HR 9998	HR 0 - HR 9999	HR 0 - HR 9999
AR	AR 0.0 - AR 9999.15		AR 0 - AR 9999	AR 0 - AR 9999	AR 0 - AR 9998	AR 0 - AR 9998		AR 0 - AR 9999
LR	LR 0.0 - LR 9999.15		LR 0 - LR 9999	LR 0 - LR 9999	LR 0 - LR 9998	LR 0 - LR 9998		LR 0 - LR 9999
DM	DM 0.0 - DM 9999.15		DM 0 - DM 9999	DM 0 - DM 9999	DM 0 - DM 9998	DM 0 - DM 9998	DM 0 - DM 9999	DM 0 - DM 9999
T/C Bit	T/C Bit 0 - T/C Bit 4095							

Address areas	Data types							
	Bool	Byte	UInt	Int	UDInt	DInt	Real	String
T/C Val			T/C Val 0 - T/C Val 4095	T/C Val 0 - T/C Val 4095				
CPU Status	RUN, MONITOR							
CPU type		CPU type						

Commissioning components

Transferring a project to the HMI device

1. Switch the HMI device to "transfer mode".
2. Set all necessary transfer parameters.
   - Interface
   - Transfer parameters
   - Target storage location
3. Start the project transfer.
   The project is compiled automatically.
   All compilation and transfer steps are logged to a message window.

Interconnecting the PLC with the HMI device

1. Interconnect the PLC with the HMI device using a suitable cable.
2. The message "Connection to PLC .... is established" is output to the HMI device.

Optimizing the configuration

Acquisition cycle and update time

The acquisition cycles for the "Area pointers" and of the tags defined in the configuration software are decisive in terms of the update times which can actually be achieved.

The update time is equivalent to the acquisition cycle + transmission time + processing time.

Items to observe when optimizing the update times in configuration data:

- Optimize the maximum and minimum size of the data areas.
- Acquisition cycles which are too short lead to unnecessary load on overall performance. Set the acquisition cycle according to the rate of change of the process values. The rate of temperature changes at a furnace, for example, is significantly slower compared to the speed rate of an electrical drive. A time of approx. 1 second is a benchmark for the acquisition cycle.

- Avoid any gaps when entering the alarm or screen tags in a data area.
- Changes in the PLC can only be detected reliably if these are available at least within the actual acquisition cycle.

Screens

The refresh rate of screens is determined by the type and volume of data to be visualized.

Only configure short acquisition cycles for objects which actually require shorter refresh cycles. This procedure reduces update times.

Trends

The HMI device always updates all bit-triggered trends whose group bit is set in the "Trend transfer area". It resets the bits in the next cycle.

The group bit in the PLC program can only be set again after the HMI device has reset all bits.

Job mailboxes

A high rate and volume of job mailboxes transferred may lead to overload in communication between the HMI device and the PLC.

The HMI device confirms acceptance of the job mailbox by entering the value zero in the first data word of the job mailbox. The HMI device now processes the job for which it requires a certain time slice. It may take the HMI device some time to process a new job mailbox which is transferred in immediate succession to the job mailbox. The next job mailbox is only accepted if sufficient computing resources are available.

Data exchange

Area pointers for Omron

Area pointers in connections via Omron communication drivers

You use an area pointer to access a data area in the PLC.

For more detailed information on area pointers and their configuration, refer to Section:

"Data exchange using area pointers".

Special features of connections via Omron Host Link

Area pointers can only be created in the following "File types": "DM", "I/O", "HR", "AR", and "LR".

Trends

General information on trends

Trends

A trend is the graphical representation of one or more values from the PLC. The value is read out either time- or bit-triggered, depending on the configuration.

For additional information see:

Displaying tags with Runtime Advanced and Panels (Page 3237)

Note

The value is read out time-triggered for Basic Panels.

Time-triggered trends

The HMI device reads in the trend values cyclically at an interval specified in the configuration. Time-triggered trends are suitable for continuous curves, such as the operating temperature of a motor.

Bit-triggered trends

Through a trigger bit set in the trend request tag, the HMI device either reads in a trend value or an entire trend buffer. This setting is defined in the configuration. Bit-triggered trends are normally used to represent fast changing values. One example might be the injection pressure in the production of plastic parts.

To trigger bit-triggered trends, appropriate external tags must be created in the "HMI tags" editor and connected to trend areas during configuration. The HMI device and PLC then communicate with each other via these trend areas.

The following areas are available for trends:

- Trend request area
- Trend transfer area 1
- Trend transfer area 2 (required only with switch buffers)

Trend request and trend transfer

Trend request area

The HMI device sets corresponding bits in the trend request area when you open a screen which contains one or more trends on the HMI device. After closing the screen, the HMI device resets the relevant bits in the trend request area.

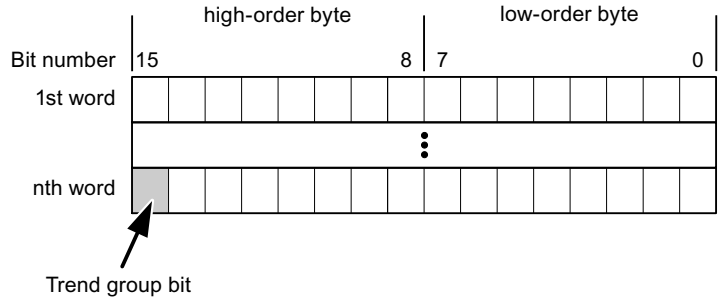
The trend request area can be used for evaluation purposes in the PLC to determine which trend is currently being displayed on the HMI device. Trends can also be triggered without evaluation of the trend request area.

Trend transfer area 1

This area is used to trigger trends. You must set the bit assigned to the trend in the trend transfer area and set the trend group bit in your control program. The trend group bit is the last bit in the trend transfer area.

The HMI device detects the trigger. The HMI device reads either a value or the entire buffer from the PLC. It then resets the trend bit and the trend group bit.

The following picture shows the structure of a trend transfer area.



The trend transfer area must not be modified by the PLC program until the trend group bit has been reset.

Trend transfer area 2

Trend transfer area 2 is required for trends configured with a switch buffer. The trend transfer areas 1 and 2 have a similar structure.

Switch buffer

The switch buffer is a second buffer for the same trend that can be set up during configuration.

The PLC writes to Buffer 2 while the HMI device reads values from Buffer 1, and writes to Buffer 1 when the HMI device is reading Buffer 2. This prevents the PLC from overwriting trend values while the trend is being read by the HMI device.

Restrictions to the trend control

For Omron Host Link communication drivers

Tags of "Operand type" "DM", "I/O", "HR", "AR" or "LR" are permitted.

They must be data type "UInt", "Int" or an array tag of data type "UInt", "Int". You assign a bit to a trend during configuration. This sets a defined bit assignment for all areas.

Alarms

Configuring alarms

Configuring alarms for non-integrated connections

Several steps are necessary to configure alarms such as warnings, error messages and acknowledgement.

- Step 1: Create tags
- Step 2: Configure alarms
- Step 3: Configure acknowledgment

You can find additional information in the section:

Working with Alarms (Page 3260)

Distinctive features when configuring alarms

If you are configuring connections of HMI devices to PLCs of other manufacturers, note the following distinctive features when configuring:

- Data types of the tags
- Addressing of tags
- How the bit positions are counted

Data types

For connections with an Omron communication driver, the following data types are supported:

PLC	Permitted data types	
	Discrete alarms	Analog alarms
CP1, CJ1, CJ2, CS1, CPM	Uint, int	UInt, Int, UDInt, DInt

How the bit positions are counted

For connections with an Omron communication driver, the following counting method applies:

How the bit positions are counted	Left byte								Right byte							
In Omron PLCs	15							8	7							0
In WinCC you configure:	15							8	7							0

Only tags for the "DM", "I/O", "HR", "AR", and "LR" file types are allowed for use as a trigger tag for discrete alarms.

Configuring discrete alarms

Use arrays for discrete alarms and append each individual alarm to one bit of the array tags themselves and not to the individual subelements.

Only tags for the "DM", "I/O", "HR", "AR", LR" areas and the "Int" and "UInt" file types are permitted for discrete alarms and arrays.

Acknowledgment of alarms

Procedure

Create suitable tags on the PLC to acknowledge an error alarm. You assign these tags to an alarm in the "Bit messages" editor. You make the assignment in "Properties > Acknowledgment".

Distinction in terms of acknowledgment:

- Acknowledgment by the PLC
- Acknowledgment on the HMI device

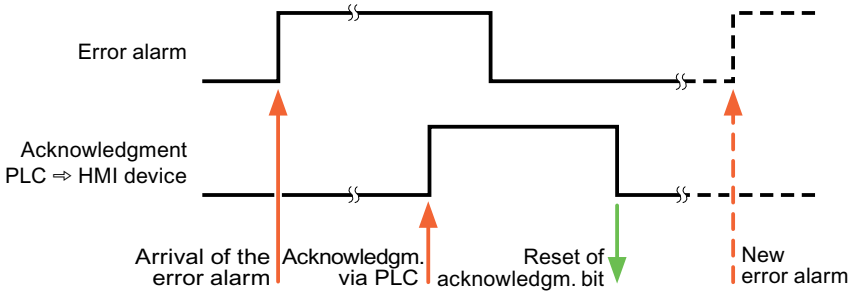
Acknowledgment by the PLC

In "PLC acknowledgment tag", configure the tag or array tag and the bit number that the HMI device uses to identify a PLC acknowledgment.

A bit set in the tag triggers acknowledgment of the assigned error alarm bit at the HMI device. This tag bit returns a function similar to acknowledgment on the HMI device which is triggered by pressing the "ACK" button, for example.

The acknowledgment bit must be located in the same tag as the bit for the error alarm.

Reset the acknowledgment bit before setting the bit in the alarm area again. The figure below shows the pulse diagram.



Acknowledgment on the HMI device

In the "HMI acknowledgment tag" area, configure the tag or array tag as well as the bit number that the HMI device writes to the PLC after acknowledgment. Make sure when you use an array tag that it is not longer than 6 words.

To always create a signal change when setting an assigned acknowledgment bit of a discrete alarm that must be acknowledged, the HMI device will reset the acknowledgment bit assigned to the alarm as soon as it detects an alarm subject to acknowledgment and write the acknowledgment tag in the PLC. There will be a certain delay between detecting the message and writing the acknowledgment tag in the PLC because the HMI device has to process the operations.

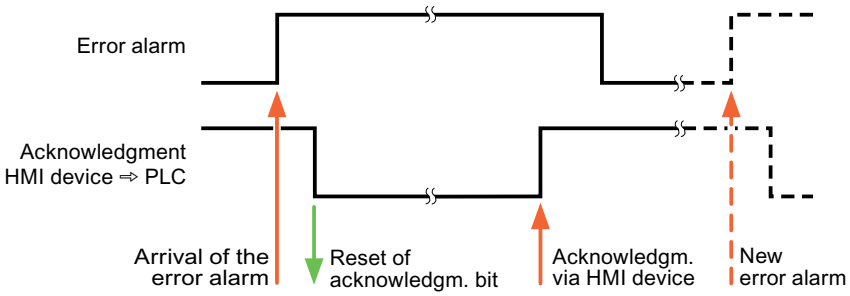
If a discrete alarm subject to acknowledgment is acknowledged by the HMI device, then the corresponding bit in the assigned acknowledgment tag will be set. The entire acknowledgment tag is then written to the PLC by the HMI device. This allows the PLC to recognize that a certain alarm message has been acknowledged at the HMI device.

Note

All alarm bits acknowledged since the last Runtime start will remain in the acknowledgment tag until a new incoming of the respective discrete alarms is detected.

This area should only be read by the PLC because the entire section of the HMI device will be overwritten once the next acknowledgment tag is written.

The figure below shows the pulse diagram.



LED mapping

Function

Keyboard devices have LEDs in the function keys. These LEDs can be activated from the PLC. Thus, it is possible, for example, to signal to the user which key he should press in a given situation by lighting up an LED.

Note

The LED function cannot be configured for Basic Panels.

Requirements

In order to activate an LED, an LED tag or an array tag must be set up in the PLC and specified as an LED tag during configuration.

LED assignment

The assignment of the individual LEDs to the bits in the LED tags is specified when the function keys are configured. In this process, the "LED tag" and the assigned "Bit" are specified for each function key in the "General" group of the properties window.

The "Bit" bit number designates the first of two consecutive bits that control the following LED statuses.

Bit n+ 1	Bit n	LED function	
		All Mobile Panels, all Operator Panels, all Multi Panels	Panel PCs:
0	0	Off	Off
0	1	Rapid flashing	Flashing
1	0	Slow flashing	Flashing
1	1	On permanently	On permanently

10.11.17. Data exchange using area pointers 5

General information on area pointers

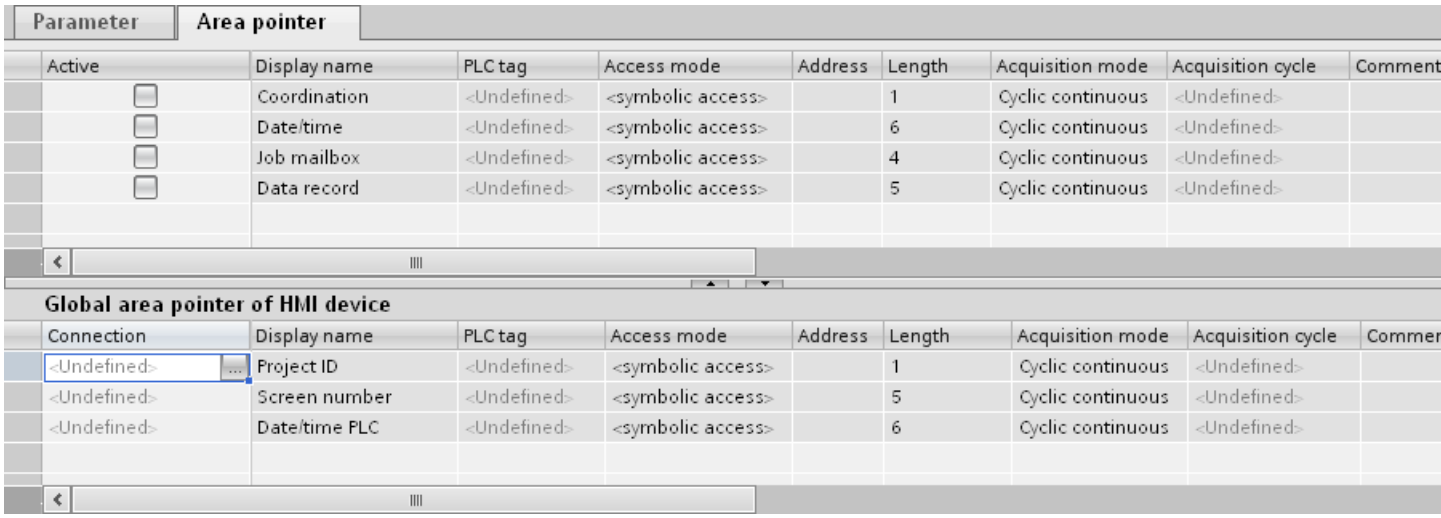
Introduction

You use an area pointer to access a data area in the PLC. During communication, the PLC and the HMI device alternately access these data areas for read and write operations.

The PLC and the HMI device trigger defined interactions based on the evaluation of stored data.

Configuration of area pointers

Before you use the area pointer, you enable it in "Connections ▸ Area pointers". You then assign the area pointer parameters.



- Active
  Enables the area pointer.
- Pointer name
  Name of the area pointer specified by WinCC.
- PLC tag
  Here you select the PLC tag or the tag array that you have configured as the data area for the area pointer.
- Address
  No address is entered into this field because of the symbolic access.
- Length
  WinCC specifies the length of the area pointer.
- Acquisition cycle
  You specify the acquisition cycle in this field for area pointers that are read by the HMI device. Note that a very short acquisition time may have a negative impact on HMI device performance.
- Comment
  Enter a comment, for example, to describe the purpose of the area pointer.

Accessing data areas

Accessing data areas

The following table shows how HMI devices and PLCs access individual data areas for read (R) or write (W) operations.

Data area	Required for	HMI device	PLC
Screen number	Evaluation by the PLC in order to determine the active screen.	W	R
Data record	Transfer of data records with synchronization	R/W	R/W
Date/time	Transfer of the date and time from the HMI device to the PLC	W	R
Date/time PLC	Transfer of the date and time from the PLC to the HMI device	R	W
Coordination	Requesting the HMI device status in the PLC program	W	R
Project ID	Runtime checks for consistency between the WinCC project ID and the project in the PLC	R	W
Job mailbox	Triggering of HMI device functions by the PLC program	R/W	R/W

"Screen number" area pointer

Function

The HMI device saves information about the screen called on the HMI device to the "Screen number" area pointer.

This allows the transfer of the current screen contents from the HMI device to the PLC. The PLC can trigger specific reactions such as the call of a different screen.

Use

Configure and enable the area pointer in "Communication > Connections" before you put it into use. You can create only **one** instance of the "Screen number" area pointer and only on **one** PLC.

The screen number is always transferred to the PLC when a new screen is activated or when the focus within a screen changes from one screen object to another.

Structure

The area pointer is a data area in the memory of the PLC with a fixed length of 5 words.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1. word	Current screen type															
2. word	Current screen number															
3. word	Reserved															
4th word	Current field number															
5. word	Reserved															

- Current screen type
  "1" for root screen or
  "4" for permanent window
- Current screen number
  1 to 32767
- Current field number
  1 to 32767

"Date/time" area pointer

Function

This area pointer is used to transfer the date and time from the HMI device to the PLC.

The PLC writes control job "41" to the job mailbox.

When it evaluates the control job, the HMI device writes its current date and the time in the data area configured in the "Date/time" area pointer. All definitions are coded in BCD format.

The "Date/Time" area pointer when used in a project which contains multiple connections must be enabled for each configured connection.

Note

You cannot use the "Date/Time PLC" area pointer if you have configured the "Date/Time" area pointer.

The date/time data area has the following structure:

Data word	Left byte								Right byte								
	15							8	7							0	
n+0	Reserved								Hour (0 to 23)								Time
n+1	Minute (0 to 59)								Second (0 to 59)								
n+2	Reserved								Reserved								
n+3	Reserved								Weekday (1 to 7, 1=Sunday)								Date
n+4	Day (1 to 31)								Month (1 to 12)								
n+5	Year (80 to 99/0 to 29)								Reserved								

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Date/time PLC" area pointer

Function

This area pointer is used to transfer the date and time from the PLC to the HMI device. Use this area pointer if the PLC is the time master.

The PLC loads the data area of the area pointer. All definitions are coded in BCD format.

The HMI device reads the data cyclically within the configured acquisition cycle and synchronizes itself.

Note

Set an acquisition cycle of sufficient length for the Date/time area pointer in order to avoid any negative impact on HMI device performance.
Recommended: Acquisition cycle of 1 minute if your process can handle it.

"Date/Time PLC" is a global area pointer and may be configured only once per project.

Note

You cannot use the "Date/Time" area pointer if you have configured the "Date/Time PLC" area pointer.

The "Date/time PLC" data area has the following structure:

Data word	Left byte			Right byte		
	15	. . . . .	8	7	. . . . .	0
n+0	Year (80 to 99/0 to 29)			Month (1 to 12)		
n+1	Day (1 to 31)			Hour (0 to 23)		
n+2	Minute (0 to 59)			Second (0 to 59)		
n+3	Reserved			Reserved		Weekday (1 to 7, 1=Sunday)
n+4 [1)]	Reserved			Reserved		
n+5 [1)]	Reserved			Reserved		

1) The two data words must exist in the data area to ensure that the data format matches WinCC and to avoid reading false information.

Note

When making entries in the "Year" data area, you should note that values 80 to 99 result in years 1980 through 1999, while the values 0 to 29 result in the years 2000 through 2029.

"Coordination" area pointer

Function

The "Coordination" area pointer is used to implement the following functionality:

- Detecting the startup of the HMI device in the control program
- detection in the control program of the current HMI device operating mode
- detection in the control program of the HMI devices ready to communicate state

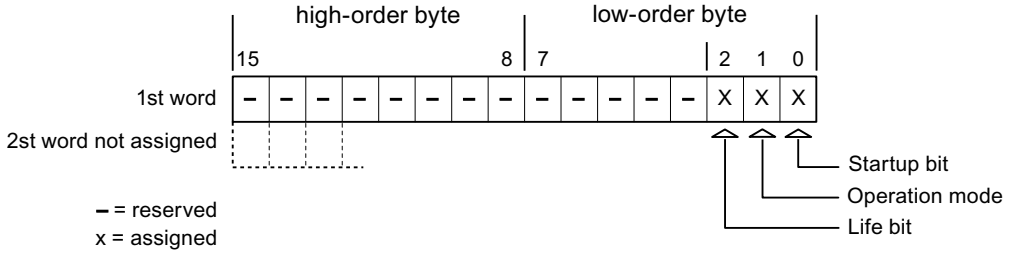
The "Coordination" area pointer has a length of one word.

Use

Note

The HMI device always writes the entire coordination area when updating the area pointer. The control program may not make changes to the coordination area for this reason.

Assignment of bits in the "Coordination" area pointer



Startup bit

The startup bit is set briefly to "0" by the HMI device during startup. It sets the bit permanently to "1" when startup is completed.

Operating mode

The operating mode bit is set to 1 as soon as the user switches the HMI device offline. The state of the operating mode bit is "0" during normal operation of the HMI device. You can determine the current operating mode of the HMI device by reading this bit.

Life bit

The HMI device inverts the life bit at intervals of approximately one second. You can check whether or not the connection to the HMI device is still up by querying this bit in the control program.

"Project ID" area pointer

Function

You can check whether the HMI device is connected to the correct PLC at the start of runtime. This check is important when operating with several HMI devices.

The HMI device compares a value stored on the PLC with the value specified in configuration. This ensures compatibility of configuration data with the control program. If discrepancy is detected, a system event is displayed on the HMI device and runtime is stopped.

Use

To use this area pointer, set up the following during the configuration:

- Define the version of configuration. Possible values between 1 and 255.
  You enter the version in the editor "Runtime settings > General" in the "Identification" area.
- Data address of the value for the version that is stored in the PLC:
  You enter the data address in the editor "Communication > Connections".

Connection failure

A connection failure to a device on which the "project ID" area pointer is configured results in all the other connections in the project being switched to "offline".

This behavior has the following prerequisites:

- You have configured several connections in a project.
- You are using the "project ID" area pointer in at least one connection.

Causes which may set connections "offline":

- The PLC is not available.
- The connection has been switched offline in the engineering system.

"PLC job" area pointer

Function

The PLC can use the job mailbox to transfer jobs to the HMI device to trigger corresponding actions on the HMI device. These functions include, for example:

- Display screen
- Set date and time

Data structure

The first word of the job mailbox contains the job number. Depending on the job mailbox, up to three parameters can be transferred.

Word	Left byte	Right byte
n+0	0	Job number
n+1	Parameter 1	
n+2	Parameter 2	
n+3	Parameter 3	

The HMI device evaluates the job mailbox if the first word of this job is not equal to zero. This means that the parameters must be entered in the job mailbox first, followed by the job number.

When the HMI device accepts the job mailbox, the first word is set to 0 again. The execution of the job mailbox is generally not completed at this point in time.

Job mailboxes

All job mailboxes and their parameters are listed below. The "No." column contains the job number of the job mailbox. Job mailboxes can only be triggered by the PLC when the HMI device is online.

Note

Please note that not all HMI devices support job mailboxes.

No.	Function	
14	**Setting the time (BCD coded)**	
	Parameter 1	Left byte: - Right byte: hours (0-23)
	Parameter 2	Left byte: minutes (0-59) Right byte: seconds (0-59)
	Parameter 3	-
15	**Setting the date (BCD coded)**	
	Parameter 1	Left byte: - Right byte: weekday (1-7: Sunday-Saturday)
	Parameter 2	Left byte: day (1-31) Right byte: month (1-12)
	Parameter 3	Left byte: year
23	**User logon**	
	Logs the user on with the name "PLC user" at the HMI device with the group number transferred in Parameter 1. The logon is possible only when the transferred group number exists in the project.	
	Parameter 1	Group number 1 to 255
	Parameter 2, 3	-

No.	Function	
14	**Setting the time (BCD coded)**	
24	**User logoff**	
	Logs off the current user. (The function corresponds to the "logoff" system function)	
	Parameter 1, 2, 3	-
40	**Transfer date/time to PLC**	
	(in the S7 format DATE_AND_TIME) An interval of at least 5 seconds must be maintained between two successive jobs to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
41	**Transfer date/time to PLC**	
	(In OP/MP format) An interval of at least 5 seconds must be maintained between successive jobs in order to prevent overload of the HMI device.	
	Parameter 1, 2, 3	-
46	**Update tags**	
	Causes the HMI device to read the current value of the tags•from the PLC whose update ID matches the value transferred in parameter 1. (Function corresponds to the "UpdateTag" system function.)	
	Parameter 1	1 - 100
49	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Warnings" class from the alarm buffer.	
	Parameter 1, 2, 3	-
50	**Delete alarm buffer**	
	Deletes all analog alarms and discrete alarms of the "Errors" class from the alarm buffer.	
	Parameter 1, 2, 3	-
51	**Screen selection** [1]	
	Parameter 1	Screen number
	Parameter 2	-
	Parameter 3	Field number
69	**Read data record from PLC**	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	0: Do not overwrite existing data record 1: Overwrite existing data record
70	**Write data record to PLC**	
	Parameter 1	Recipe number (1-999)
	Parameter 2	Data record number (1-65535)
	Parameter 3	-

[1] OP 73, OP 77A and TP 177A HMI devices also execute the "Screen selection" job mailbox if the on-screen keyboard is active.

"Data record" area pointer

"Data mailbox" area pointer

Function

When data records are transferred between the HMI device and PLC, both partners access common communications areas on the PLC.

Data transfer types

There are two ways of transferring data records between the HMI device and PLC:

- Transfer without synchronization
- Transfer with synchronization over the data record

Data records are always transferred directly. That is, the tag values are read from an address or written to an address configured for this tag directly, without redirecting the values by means of interim memory.

Initiating the transfer of data records

There are three ways of triggering the transfer:

- Operator input in the recipe view
- Job mailboxes
  The transfer of data records can also be triggered by the PLC.
- Triggering by configured functions

If the transfer of data records is triggered by a configured function or by a job mailbox, the recipe view on the HMI device remains operable. The data records are transferred in the background.

Simultaneous processing of several transfer requests is, however, not possible. In this case, the HMI device rejects the other transfer requests with a system event.

Transfer without synchronization

If you select asynchronous transfer of data records between the HMI device and PLC, there is no coordination over the common data areas. It is therefore unnecessary to set up a data area during configuration.

Asynchronous data record transfer can be a useful alternative, for example, when:

- The system is capable of excluding the risk of uncontrolled overwriting of data by the communication peer.
- The PLC does not require information about the recipe number and data record number.
- The transfer of data records is triggered by the operator of the HMI device.

Reading values

When a read job is triggered, the values are read from the PLC addresses and transferred to the HMI device.

- Triggering by the operator in the recipe view:
  The values are downloaded to the HMI device. You can then process, edit, or save these values, for example.
- Triggering by a function or job mailbox:
  The values are saved immediately to the data volume.

Writing values

When a write job is triggered, the values are written to the PLC addresses.

- Triggering by the operator in the recipe view:
  The current values are written to the PLC.
- Triggering by a function or job mailbox:
  The current values are written to the PLC from the data medium.

Transfer with synchronization

If you select synchronous transfer, both communication partners set status bits in the common data area. You can use this mechanism to prevent uncontrolled overwriting of data in either direction in your control program.

Application

Synchronous data record transfer can be a useful solution, for example, when:

- The PLC is the "active partner" in the transfer of data records.
- The PLC evaluates the information about the recipe number and data record number.
- The transfer of data records is triggered by means of a Job mailbox.

Requirements

In order to synchronize transfer of data records between the HMI device and the PLC, the following requirements must be met during configuration:

- An area pointer has been set up: "Communication > Connections" editor in "Area pointer".
- The PLC with which the HMI device synchronizes transfer of data records is specified in the recipe:
  "Recipes" editor in the inspector window the option "Coordinated transfer of data records" under "General > Synchronization > Settings"

Structure of the data area

The data area has a fixed length of 5 words. Structure of the data area:

	15		0
1. Word	Current recipe number (1 - 999)		
2. Word	Current data record number (0 - 65535)		
3. Word	Reserved		
4. Word	Status (0, 2, 4, 12)		
5. Word	Reserved		

- Status
  The status word (word 4) can adopt the following values:

Value		Meaning
Decimal	Binary	
0	0000 0000	Transfer permitted, data record free
2	0000 0010	Transferring.
4	0000 0100	Transfer completed without error
12	0000 1100	Transfer completed with error

Sequence of a transfer started by the operator in the recipe display

Reading from the PLC started by the operator in the recipe view

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe number to be read and the status "Transferring" in the data record and sets the data record number to 0.	Abort with system event.
3	The HMI device reads the values from the PLC and displays them in the recipe view. If the recipes have synchronized tags, the values from the PLC are also written to the tags.	
4	The HMI device sets the status "Transfer completed."	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC started by the operator in the recipe view

Step	Action	
	Check: Status word = 0?	
1	Yes	No
	The HMI device enters the recipe and data record number to be written and the status "Transferring" in the data record.	Abort with system event.
2	The HMI device writes the current values to the PLC. If the recipes have synchronized tags, the changed values are synchronized between the recipe view and tags and then written to the PLC.	
3	The HMI device sets the status "Transfer completed."	
4	If required, the control program can now evaluate the transferred data.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Sequence of the transfer triggered by a PLC job

The transfer of data records between the HMI device and the PLC can be initiated by either one of these stations.

The two job mailboxes No. 69 and No. 70 are available for this type of transfer.

No. 69: Read data record from PLC ("PLC → DAT")

Job mailbox no. 69 transfers data records from the PLC to the HMI device. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	69
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	Do not overwrite existing data record: 0 Overwrite existing data record: 1	

No. 70: Write data record to PLC ("DAT → PLC")

Job mailbox No. 70 transfers data records from the HMI device to the PLC. The job mailbox is structured as follows:

	Left byte (LB)	Right byte (RB)
Word 1	0	70
Word 2	Recipe number (1-999)	
Word 3	Data record number (1 to 65535)	
Word 4	—	

Sequence when reading from the PLC with job mailbox "PLC → DAT" (no. 69)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device reads the values from the PLC and saves these to the data record defined in the job mailbox.	
4	• If "Overwrite" was selected in the job, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "Do not overwrite" was selected in the job, and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data record.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Sequence of writing to the PLC with job mailbox "DAT → PLC" (no. 70)

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the job and the status "Transferring" in the data record.	Abort without return message.
3	The HMI device fetches the values of the data record specified in the function from the data medium and writes the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Sequence of the transfer when triggered by a configured function

Reading from the PLC using a configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data record.	Abort with system event.
3	The HMI device reads the values from the PLC and stores them in the data record specified in the function.	
4	• If "Yes" was selected for the "Overwrite" function, an existing data record is overwritten without any prompt for confirmation. The HMI device sets the status "Transfer completed." • If "No" was selected for the "Overwrite" function and the data record already exists, the HMI device aborts the job and enters 0000 1100 in the status word of the data record.	
5	The control program must reset the status word to zero in order to enable further transfers.	

Writing to the PLC by means of configured function

Step	Action	
1	Check: Status word = 0?	
	Yes	No
2	The HMI device enters the recipe and data record number specified in the function and the status "Transferring" in the data record.	Abort with system event.
3	The HMI device fetches the values of the data record specified in the function from the data medium and transfers the values to the PLC.	
4	The HMI device sets the status "Transfer completed."	
5	The control program can now evaluate the transferred data. The control program must reset the status word to zero in order to enable further transfers.	

Possible causes of error when transferring data records

Possible causes of error

The section below shows possible error causes which lead to the cancellation of data record transfer:

- Tag address not set up on the PLC
- Overwriting data records not possible

- Recipe number does not exist
- Data record number does not exist

Note

The status word may only be set by the HMI device. The PLC may only reset the status word to zero.

Note

The PLC may only evaluate the recipe and data record numbers when data inconsistency is detected if one of the conditions outlined below has been met:

- The data mailbox status is set to "Transfer completed".
- The data mailbox status is set to "Transfer completed with error".

Reaction to an aborted transfer due to errors

If the transfer of data records is aborted due to errors, the HMI device reacts as follows:

- Triggering by the operator in the recipe view
  Information in the status bar of the recipe view and output of system alarms
- Triggered by function
  Output of system alarms
- Triggering by job mailbox
  No return message on the HMI device

You can nonetheless evaluate the status of the transfer by querying the status word in the data record.

10.11.18 Special features of WinAC MP

10.11.18. WinAC MP basics 1

WinAC MP basics

WinAC MP is a software package for HMI devices. WinAC MP integrates a software PLC compatible with SIMATIC S7 in WinCC Runtime.

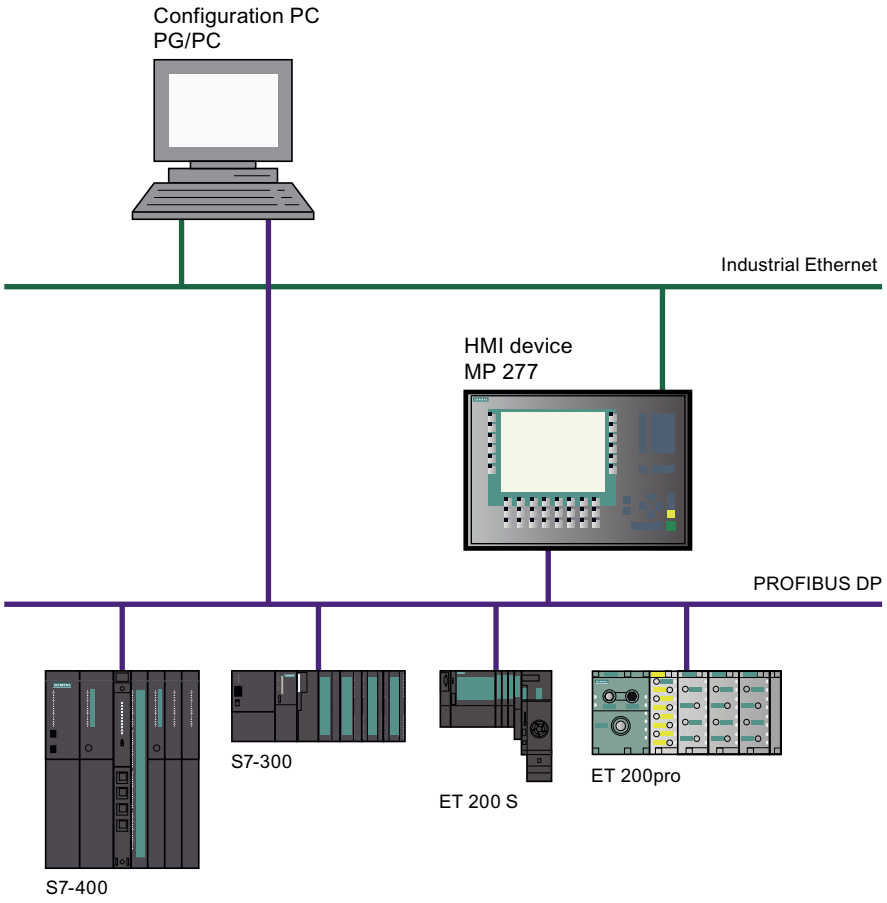
Using WinAC MP you can execute STEP 7 programs on the HMI device.

The common use of WinAC MP and WinCC provides process control and visualization on one HMI device.

The communications driver for WinAC MP supports the following protocols for controlling the process components:

- Industrial Ethernet
- PROFIBUS DP

The following screen shows the principal connection of the process components on the PROFIBUS DP example.



If you wish to control your process using an HMI device and WinAC MP, then you must install WinAC MP on your configuration PC. Then transfer WinAC MP and the project to your HMI device.

Note

Notes about instructions

The following describes how to install WinAC MP and transfer WinAC MP to an HMI device.

To transfer a STEP 7 project with a WinAC MP controller to an HMI device, you require experience with STEP 7.

10.11.18. Communication options with WinAC MP 2

Definition of "routing"

If there are stations in an automation system that are not connected to the same bus, these stations cannot be accessed directly online. To establish a connection to these devices, a router must be included between them.

An MP x77 HMI device with WinAC MP can function as the router. As a router, it connects the Ethernet and PROFIBUS networks.

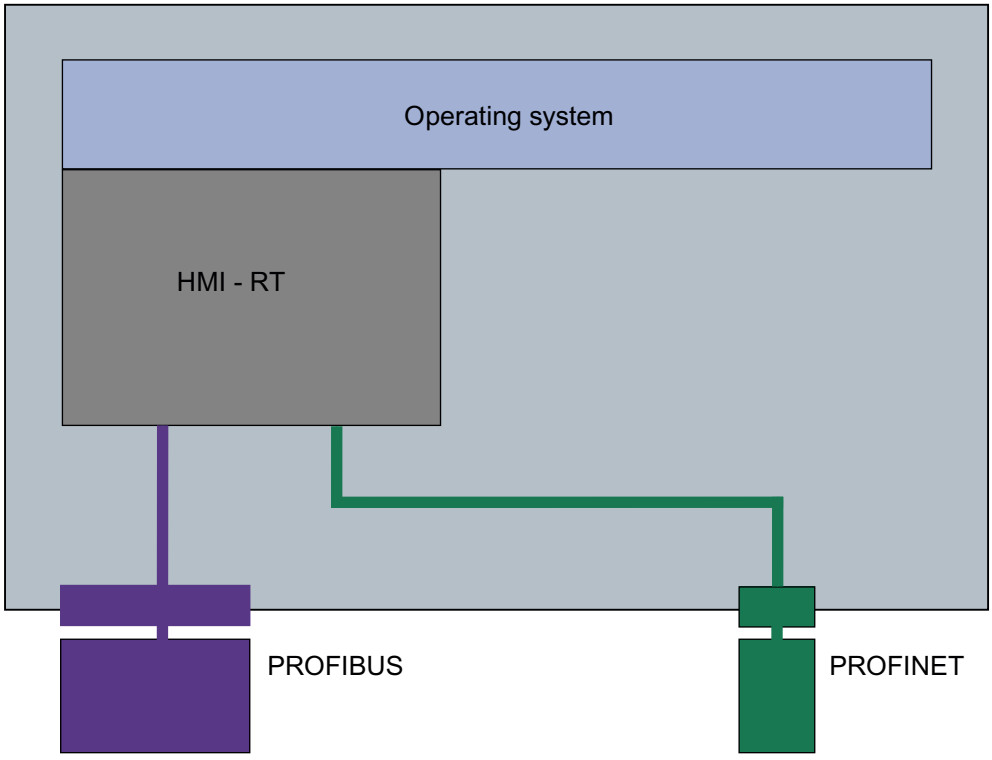
You can use routing, for example, to do the following:

- Download STEP 7 user programs
- Download a hardware configuration
- Execute testing and diagnostics functions

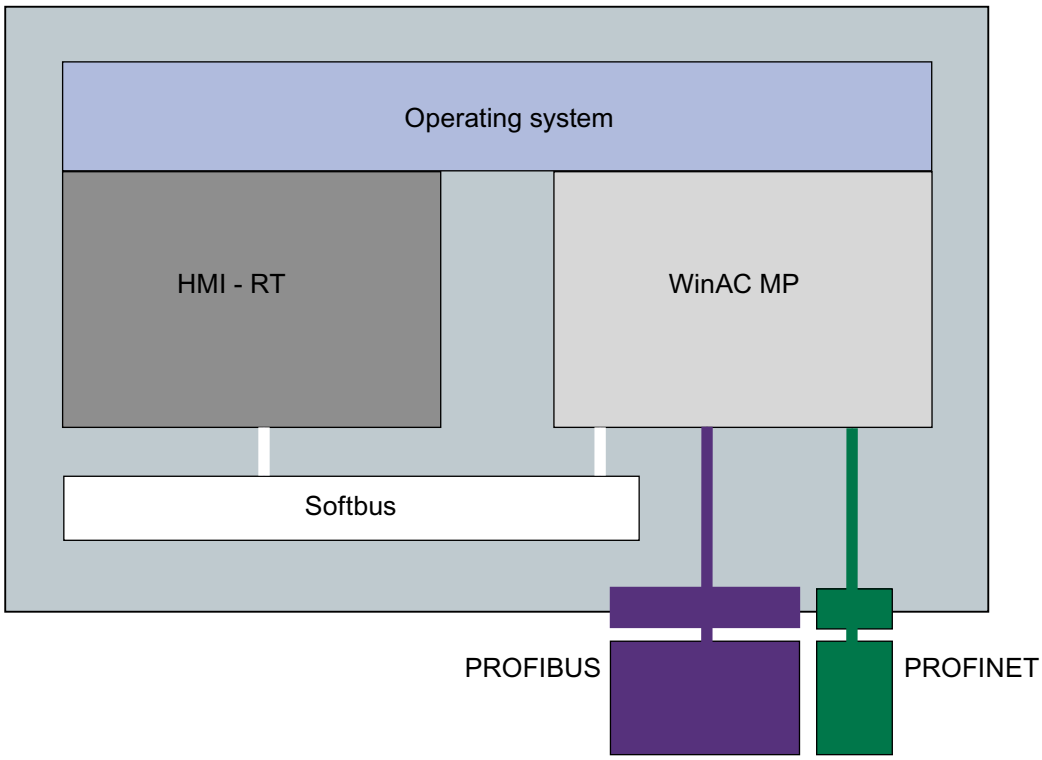
Definition of "Softbus"

Virtual bus that allows data exchange between WinCC Runtime and WinAC MP. This bus is also installed when you install WinCC . After installing WinAC MP, S7 connections from WinCC Runtime to external stations on PROFIBUS or Ethernet are routed over Softbus.

Prior to installation of WinAC MP (without Softbus)



After installation of WinAC MP (with Softbus)



Routing from Ethernet to PROFIBUS DP with WinAC MP

With STEP 7 on Industrial Ethernet, you can access all nodes on PROFIBUS DP from the HMI device. With WinCC, you can access the HMI device but not the nodes connected over PROFIBUS DP.

If the configuration PC is not connected directly to PROFIBUS DP, the nodes on PROFIBUS can nevertheless be reached because the MP x77 HMI device serves as a router.

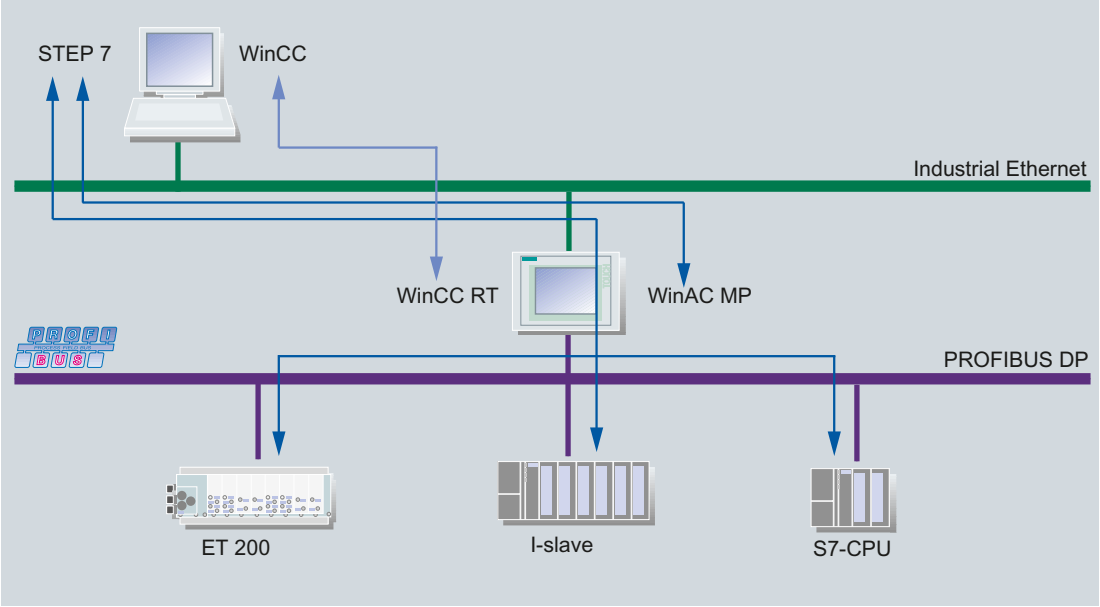


Figure 10-3 Routing from Ethernet to PROFIBUS DP with WinAC MP

Routing from PROFIBUS DP to Ethernet with WinAC MP

With STEP 7 on PROFIBUS DP, you can access all nodes on Industrial Ethernet from the HMI device. With WinCC on PROFIBUS DP, you have access to the HMI device and to OPs connected over PROFIBUS DP.

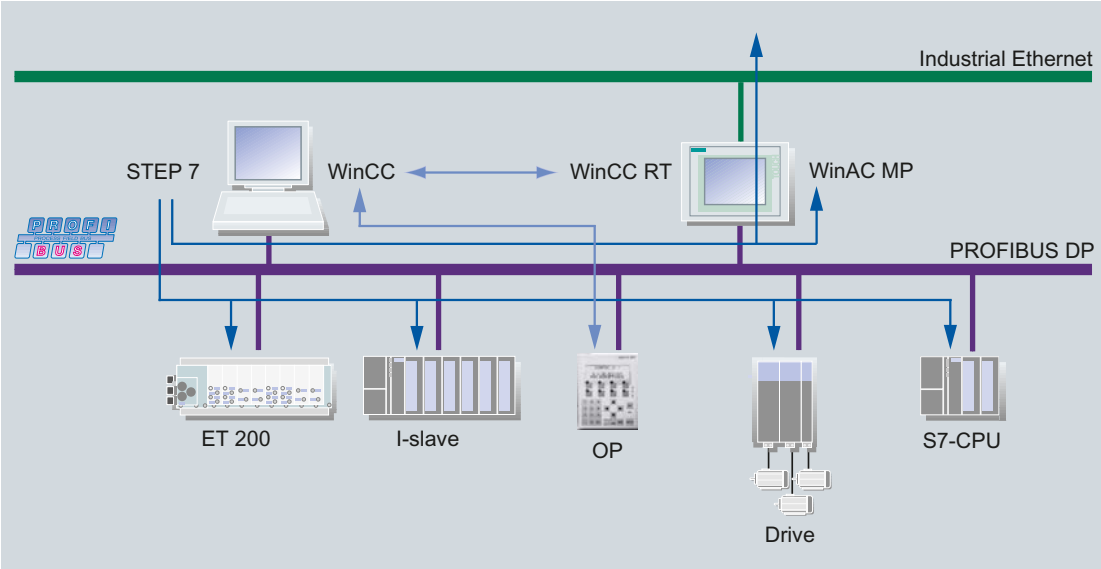

Figure 10-4 Routing with WinAC MP over PROFIBUS

Visualization over WinAC MP

Visualization over the HMI device between Industrial Ethernet and PROFIBUS DP is possible with WinCC.

It is not necessary to program the communication links. A PC serves as the visualization platform.

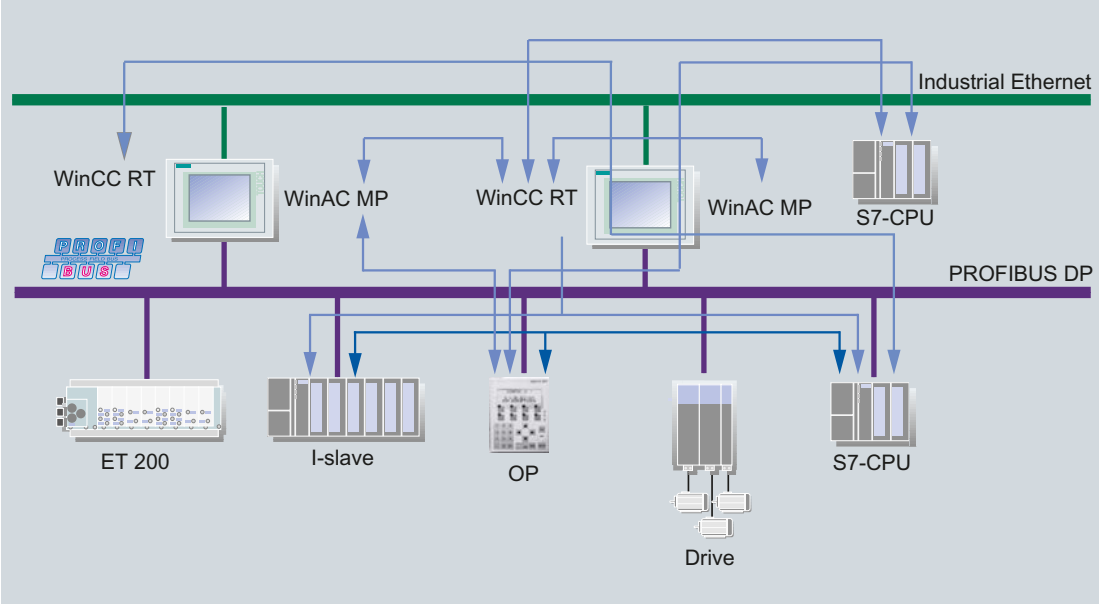

Figure 10-5 Visualization over WinAC MP

CPU-CPU communication over WinAC MP

CPU-CPU communication is possible with the HMI device.

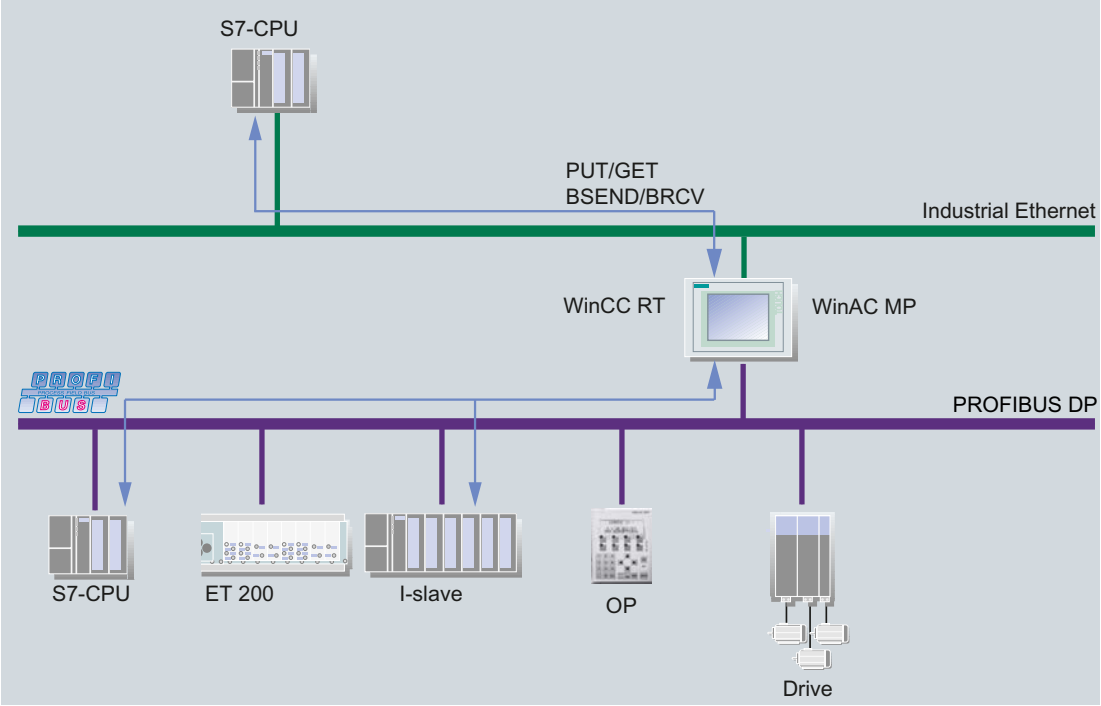

Figure 10-6 CPU-CPU communication over WinAC MP

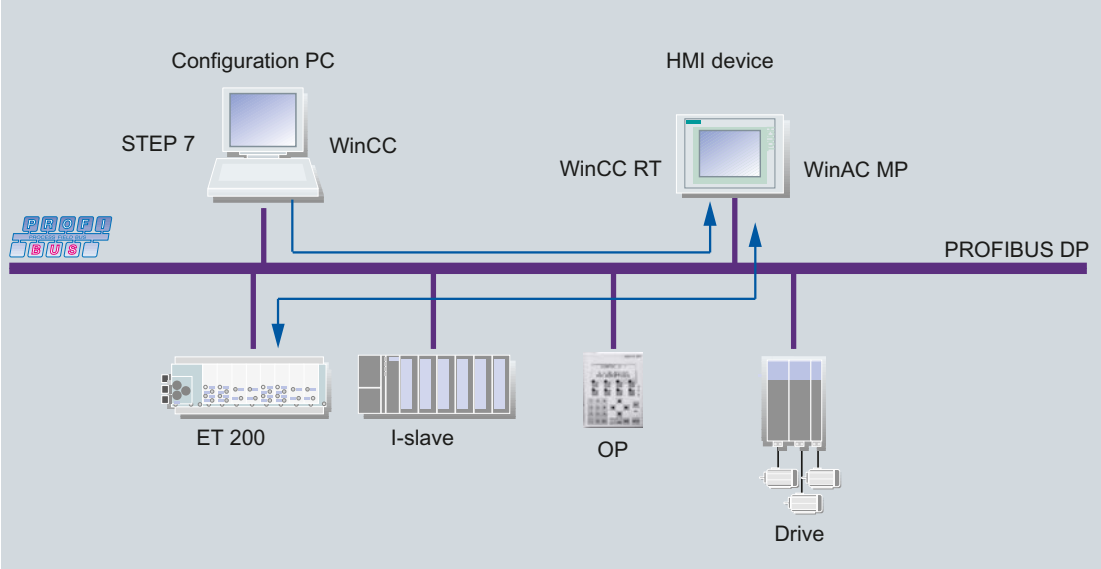
10.11.18. Standard procedure for communication with WinAC MP 3

Overview

The section below shows how to configure WinAC MP in a SIMATIC HMI station using a configuration PC on which STEP 7 and WinCC are installed.

The configuration PC and WinAC MP in a SIMATIC HMI station are interconnected via PROFIBUS DP. Configuration via Ethernet is also possible. A description of the procedure can be found in the "WinAC MP" manual.

You can integrate DP slaves for WinAC MP in the STEP 7 project.



Procedure

The basic steps are as follows:

1. Configure WinAC MP in STEP 7.
2. Create a connection between WinAC MP and WinCC Runtime.
3. In STEP 7, download the configuration to WinAC MP.
4. Configure (visualization) HMI objects with WinCC .
5. Download the (visualization) configuration (for example, visualization with histogram) from WinCC to the HMI device.

10.11.18. Configuring the WinAC MP communications driver 4

Requirements for the use of WinAC MP

Requirements

In order to use WinAC MP in the process control, you must perform the installation and development steps on your configuration PC. Transfer the necessary components to the HMI device.

Basic procedure

The following steps are described in more detail in the following:

1. Check that your system meets the system requirements:
   - STEP 7 and the authorization are installed on the configuration PC.
   - WinCC and the authorization are installed on the configuration PC.
     WinCC Runtime and ProSave were installed along with WinCC.
2. When WinCC is installed, the WinAC MP option is also automatically installed. Authorization of the WinAC MP is carried out via separate licenses.
   The following components are installed alongside WinAC MP:
   - WinAC MP Runtime files
   - WinAC MP system library
3. Develop a STEP 7 project for controlling your process with WinAC MP on the HMI device.
4. Develop a WinCC project for operating and visualizing your controller.
5. Connect the process components via the PROFIBUS network and configure the hardware.
6. Transfer the WinAC MP Runtime files from the configuration PC to the HMI device.
   Use ProSave for this.
7. Transfer the WinAC MP authorization from its storage location to the HMI device.
   Use the Automation License Manager for this.
8. Transfer the STEP 7 project to the HMI device.
9. Transfer WinCC Runtime and the WinCC project to the HMI device.
   To do this, use the "Transfer" function.

Changing the device type

Introduction

There are different ways to create a SIMATIC HMI-station with an HMI device and a configured WinAC MP controller.

Procedure 1

Create an HMI device in a SIMATIC HMI-station in the device and network view. Then add the corresponding variant of WinAC MP.

The advantage of this procedure is that you can choose the device type (MP 177, MP 277 or MP 377) and the design of the device type (monitor size and touch or key) directly on selection in the hardware catalog.

Procedure 2

Insert the desired variant of WinAC MP directly in the device and network view.

This procedure creates, by default, the largest touch design of the selected HMI device in the device and network view.

Changing the device type

Select a device. You can change the device type using the shortcut menu command "Change device". When the device type MP277 is changed to MP377 and MP 177 or vice versa with a configured WinAC MP controller in a SIMATIC HMI station, the WinAC MP controller is automatically moved to the storage location of the non slotted modules. It can therefore not be used in the new HMI device. If the the device type is changed, the WinAC MP-configuration must be created again.

Connecting the configuration PC and HMI device

Procedure for creating a connection via Ethernet or PROFIBUS DP

Basic procedure

WinAC MP supports the communication between the configuration PC and the HMI device via the following connections:

- Industrial Ethernet
- PROFIBUS DP
- USB

To achieve successful communication, follow these steps:

1. Connect the configuration PC to the HMI device.
2. Make the parameter settings for data transfer on the control panel.
3. Make the parameter settings for data transfer on the configuration PC.
4. Set the communications parameters in ProSave.
   With ProSave you can load the WinAC MP Runtime files in the HMI device. Therefore, you must set the communication parameters both in ProSave as well as on the HMI device.
5. Set the communications parameters in WinCC.
   Use WinCC to download your project to the HMI device using the "Download" function.

Establishing a connection over Ethernet

Connect the configuration PC to the HMI device (Ethernet)

In order to communicate via an Ethernet network you can either use a direct connection or a networked connection.

To connect a configuration PC to an HMI device via Ethernet, follow these steps:

1. Connect the interfaces of the configuration PC and the HMI device with an Ethernet cable.

Note

Use a crossover cable to create a direct connection between the configuration PC and the HMI device.

To connect the configuration PC and the HMI device to an Ethernet (LAN) use a 1 to 1 cable with RJ45 connector.

The interface to be used on the HMI device can be established from the operating instructions of your HMI device.

Configuring the transmission settings in the Control Panel (Ethernet)

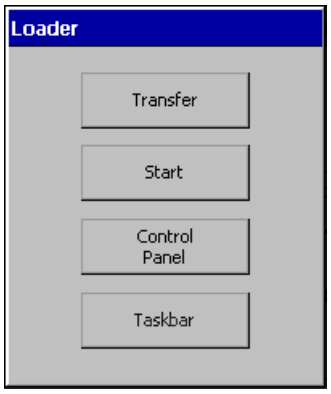
Requirements

The configuration PC and HMI device are connected to each other over an Ethernet cable.

Setting up an IP address on the control panel

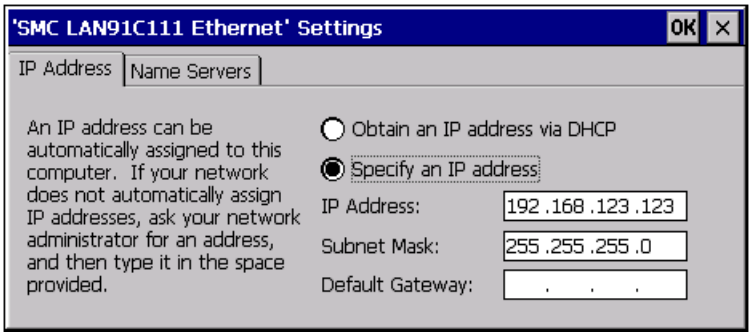
The set up the IP address on the control panel, follow these steps:

1. Switch on the HMI device.
   Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Select "Control Panel".



3. Double click on the "Network and Dial-up Connection" symbol.
4. Double-click on the LAN connection.
5. Select the "IP Adress" tab.

6. Select "Specify an IP address".

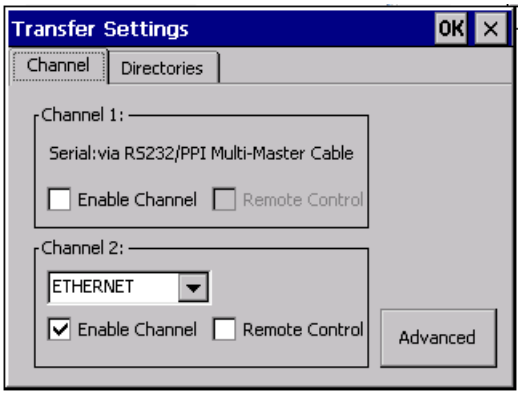


7. Enter the IP address and the subnet mask that you were given by your network administrator.
8. Confirm your entries with "OK".

Entering transfer settings

To make the data transfer settings, follow these steps:

1. In the control panel, double click on the "Transfer" symbol.
2. Select the "Channel" tab.
3. Select the "Ethernet" option in the "Channel 2" area.
4. Enable "Enable Channel" and confirm your entries.



5. Click "OK" and end the dialog "Transfer Settings".

The transmission settings are configured on the configuration PC

Requirement

- The configuration PC and HMI device are connected to each other over an Ethernet cable
- The data transfer settings have been made on the control panel

Procedure

To make the data transfer settings on the configuration PC, follow these steps:

1. Open the network settings of your PC.
2. Select the "Internet Protocol (TCP/IP)".
3. Enable the "General" tab.
4. Select the "Use the following IP address" check box in the protocol properties.
5. Enter an "IP address".
6. Enter a "subnetwork mask".
7. Confirm your entries.

Note

The IP addresses of the configuration PC and the HMI device must not be the same.

The subnet mask must be the same for the configuration PC and the HMI device.

Set the communication parameters (Ethernet)

Requirement

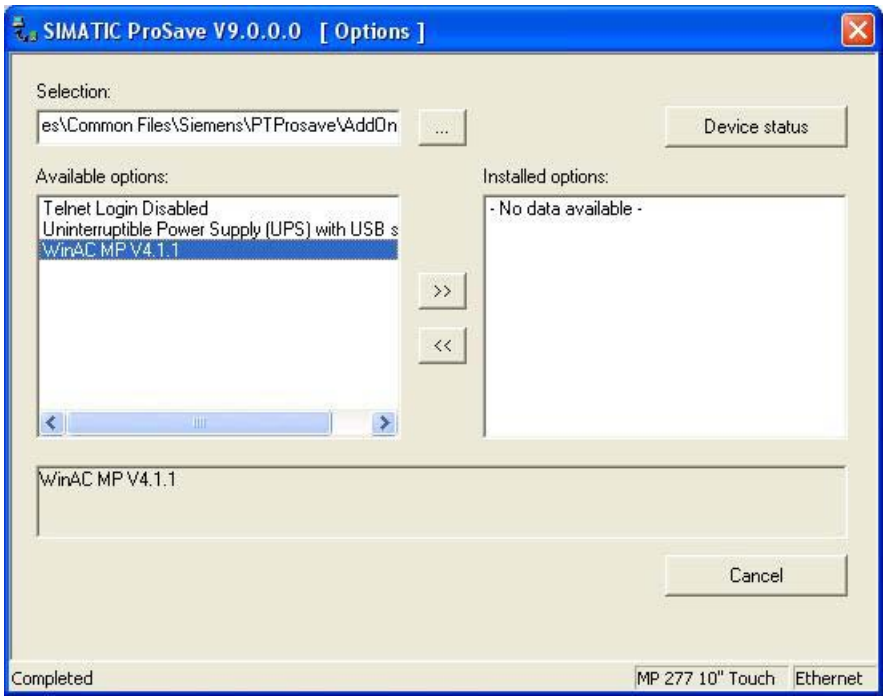
- The configuration PC and HMI device are connected to each other over an Ethernet cable
- The data transfer settings have been made on the control panel
- The data transfer settings have been made on the configuration PC

Procedure

To make the communications parameter settings in ProSave, follow these steps:

1. Make the transfer settings first.
2. To do this, select the desired component in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
   - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "Options" command from the "Online > HMI device maintenance" menu to start ProSave .

5. Select an element under "Available options".
6. Click ">>".



Setting the communication parameters in WinCC (Ethernet)

Requirement

- The configuration PC and HMI device are connected to each other over an Ethernet cable.
- The data transfer settings have been made on the control panel.
- The data transfer settings have been made on the configuration PC.

Procedure

To make the connection settings in WinCC, follow these steps:

1. Open the transfer settings.
2. Select the desired HMI device in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
   - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.

4. Select the "Ethernet" mode.
5. Specify the IP address or the computer name of the HMI device.
6. Switch the HMI device to "transfer" mode.
7. Transfer the WinCC project to the HMI device.

WARNING

Death, serious bodily harm and / or damage to property from unexpected process or machine behavior.

If you use DHCP it is not guaranteed that every time the same IP address will be issued if a node is switched on.

Nodes could lose the connection in the Industrial Ethernet or be connected with incorrect nodes. Always enter a static IP address for the HMI device. Contact your network administrator for address allocations.

Establishing a connection via PROFIBUS DP

Connect the configuration PC to the HMI device (PROFIBUS DP)

1. Connect the interfaces from the configuration PC and the HMI device with an PROFIBUS DP cable.

Note

To communicate via an PROFIBUS DP network you must create a direct connection.

Check if your configuration PC has a suitable interface for connection to the PROFIBUS DP.

If this interface is missing, you must perform the following steps:

- Build a card into the configuration PC, e.g. CP 5611 for desktop PCs.
- Install the respective drivers.

Configuring the transmission settings in the Control Panel (PROFIBUS DP)

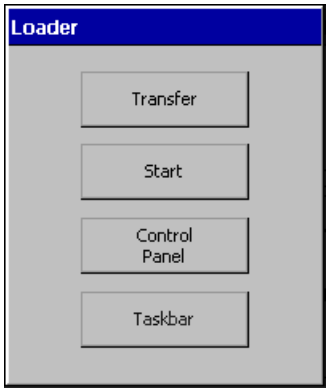
Requirement

- The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.

Procedure

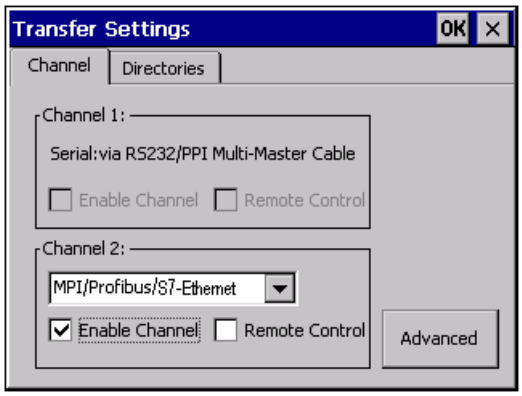
Perform the following steps on the HMI device:

1. Switch on the HMI device.
   Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Select "Control Panel".



3. Double click on "Transfer".
4. Select the "MPI/PROFIBUS" option from the "Channel 2" selection list under the "Channel" tab.

5. Select "Enable Channel".



6. Confirm with "OK".
7. "Transfer Settings" End the dialog.

Setting the communication parameters in ProSave (PROFIBUS DP)

Requirement

The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.

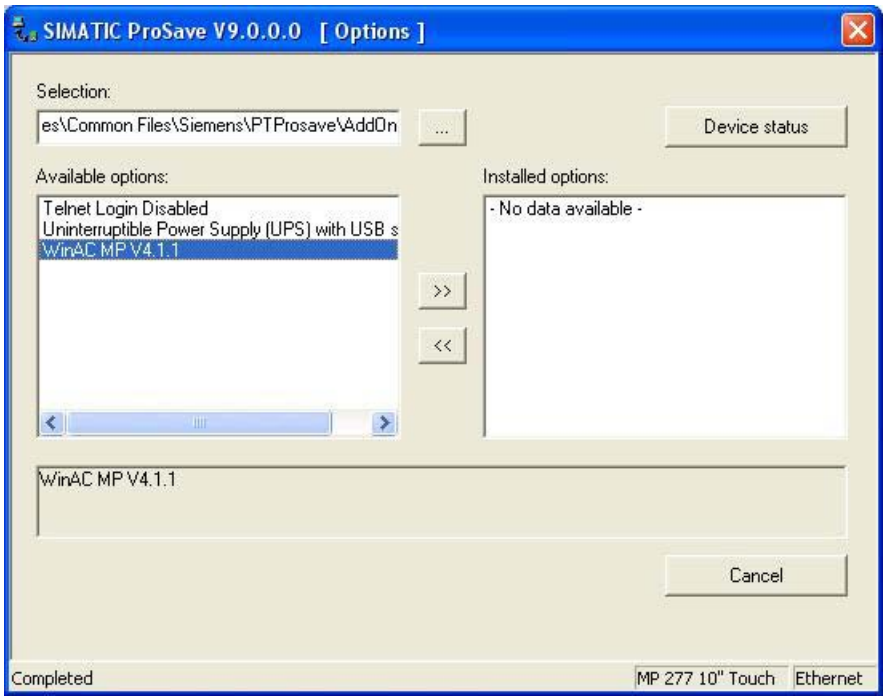
The data transfer settings have been made on the control panel.

Procedure

To make the communications parameter settings in ProSave, follow these steps:

1. Make the transfer settings first.
2. To do this, select the desired component in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
   - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "Options" command from the "Online > HMI device maintenance" menu to start ProSave .

5. Select an element under "Available options".
6. Click ">>".



Set the communication parameters in WinCC (PROFIBUS DP)

Requirement

- The configuration PC and HMI device are linked with each other via a PROFIBUS DP cable.
- The data transfer settings have been made on the control panel.

Procedure

To make the connection settings in WinCC, follow these steps:

1. Open the transfer settings.
2. Select the desired HMI device in the project tree.
3. Select the "Download to device > Software" command in the shortcut menu.
   - If you have not already established an online connection, the "Extended download to device" dialog will automatically open. In this case, set all the necessary parameters for the connection and click "Load".
   - If you have already defined an online connection, the project data will be compiled immediately and the "Load preview" dialog will open. This dialog displays messages and proposes actions necessary for uploading.
4. Select the "MPI / PROFIBUS DP" mode.

5. Specify the PROFIBUS address that is assigned to the HMI device.
   The PROFIBUS address is the station address and corresponds to the address configured for the WinAC MP controller.
6. Switch the HMI device to "transfer" mode.
7. Transfer the WinCC project to the HMI device.

Note

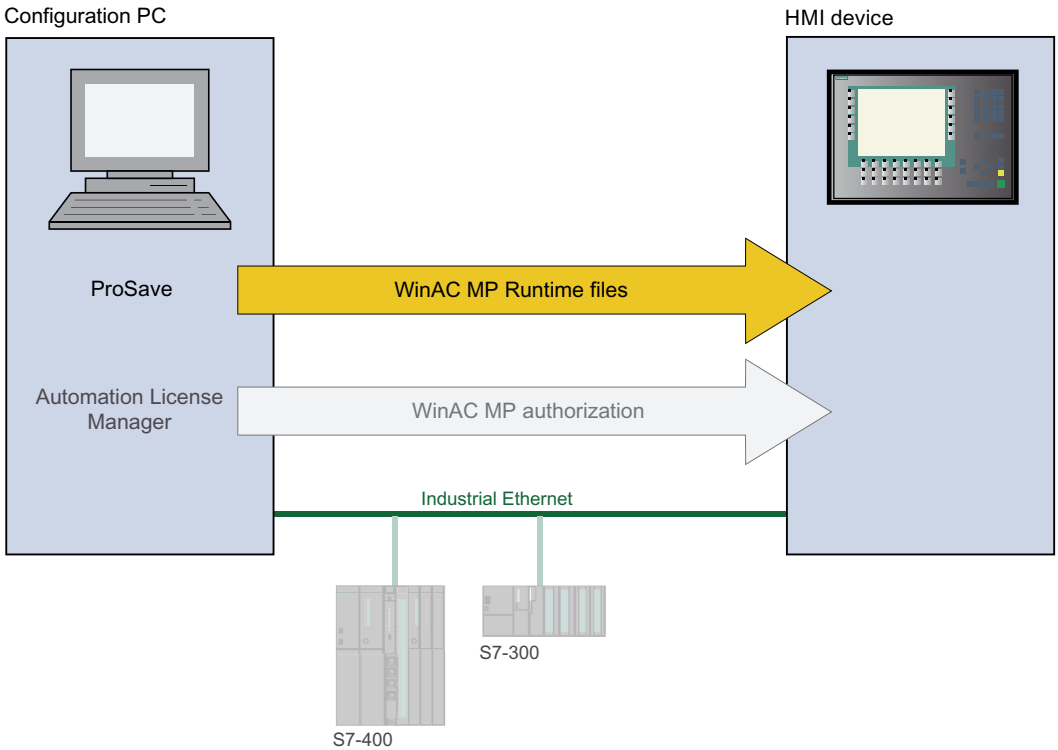
For PROFIBUS DP transmission the WinAC MP control must be started on the HMI device.

10.11.18. Transferring WinAC MP to the HMI device 5

Procedure for transferring WinAC MP

Introduction

If you want to execute WinAC MP on the HMI device you must transfer the WinAC MP Runtime files from the configuration PC to the HMI device. For the transfer there must be a data connection between the configuration PC and the HMI device. The following screen shows the arrangement using example Industrial Ethernet.



Basic procedure

To transfer WinAC MP Runtime files to an HMI device, follow these steps:

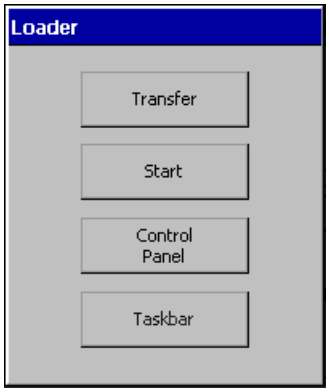
1. Setting up the HMI device.
2. Configure the ProSave on the configuration PC.
3. Start transfer.

Switch the HMI device to transfer mode

Procedure

For the transfer of data you must switch the HMI device to "Transfer":

1. Switch on the HMI device.
   Before the HMI device opens an existing project, the "Loader" selection field appears.
2. Click on the "Transfer" button.
   The dialog window displays the message "Connecting to host ...".



Configuring ProSave on the configuration PC

Requirement

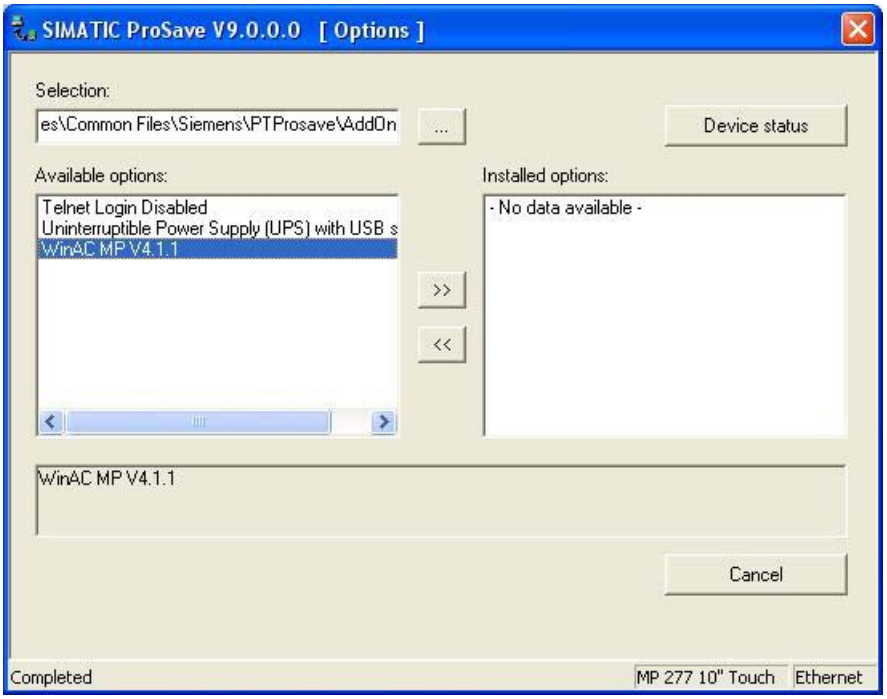
The HMI device was switched to transfer mode.

Procedure

To set up a configuration PC to transfer WinAC MP, proceed as follows:

1. Start ProSave.
2. Select the "General" tab.
3. Select the device type of your HMI device.

4. Select the "Ethernet" connection type.
5. Specify the IP address or the computer name of the HMI device.
6. Start the transfer of WinAC MP.



Start transfer

Requirement

- The HMI device was switched to transfer mode.
- ProSave is set up on the configuration PC.

Procedure

To start the transfer of WinAC MP files, follow these steps:

1. Open the "Options" tab in transfer mode and click the "Device status" button. If no error message is shown then the communication connection is valid.

   Note

   If there is a communication error, then you must check the following circumstances:

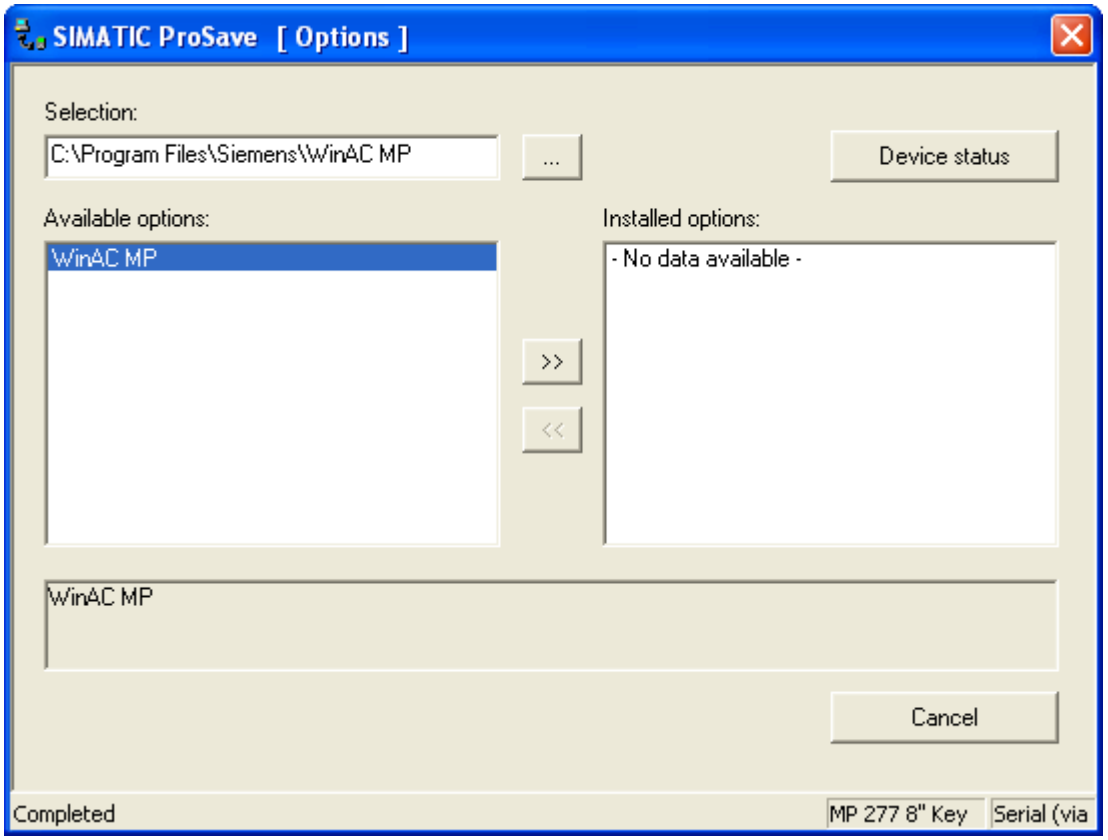
   • The HMI device must be in Transfer mode.

   • Check the cable connections for a correct and firm connection.

   • The settings in ProSave and on the HMI device must be correctly defined for the connection.

2. In the "Options" tab, select "WinAC MP" below "Available options".

3. To transfer WinAC MP to the HMI device, click the >> button.



ProSave then starts to load the software of the WinAC MP control to the HMI device. While the files are being transferred the configuration PC shows the progress of the transfer. The following messages are displayed on the HMI device in the "Transfer" dialog box:

- Progress of the file receipt on the HMI device.
- Unzip data in the Flash file system.
- Save data in the Flash file system.

At the end of the transfer, a message confirms a successful transfer.

4. When transfer is complete, you will be asked to restart the device. Restart the device.

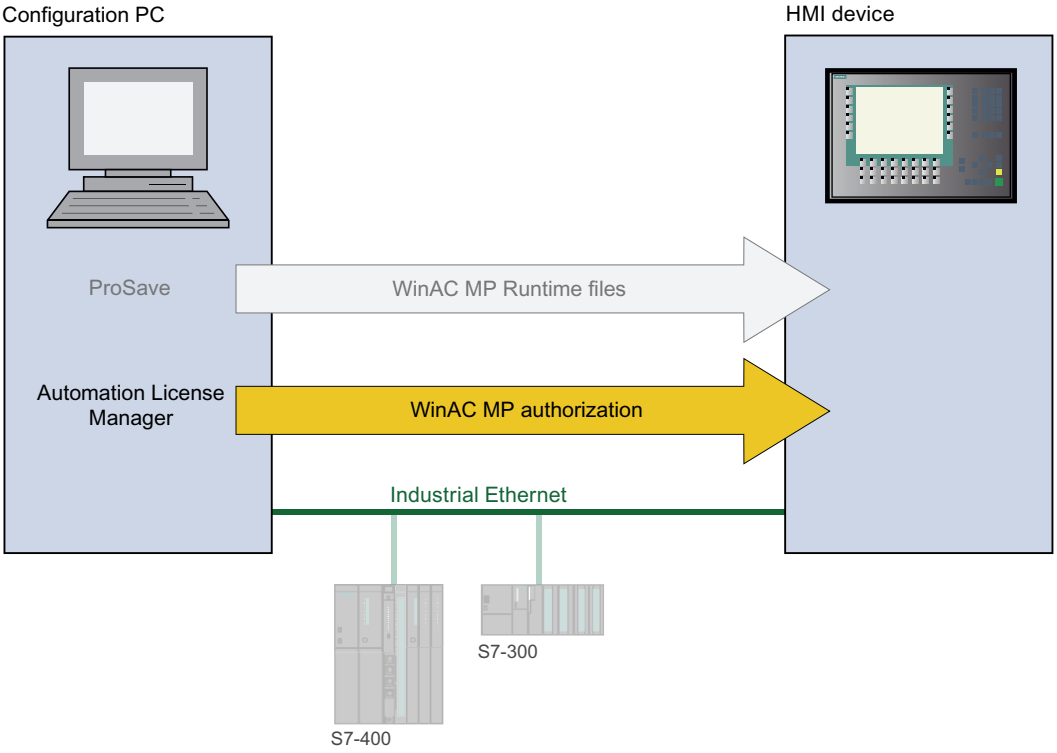
Result

The WinAC MP control is now installed on the HMI device. Now, transfer the authorization for WinAC MP to the HMI device.

10.11.18. Transferring authorization to the HMI device 6

Introduction

You need a license key to operate WinAC MP. The license key is transferred with the Automation License Manager to the HMI device.



Requirements

The storage location of the license key can be called from the configuration PC.

Procedure

To transfer the WinAC MP authorization to an HMI device, follow these steps:

1. Select the "Authorize/License" command from the "Online > Device maintenance" menu to start WinAC MP authorization.
   Automation License Manager is launched.
2. Select the "Connect HMI device" menu command.
3. Select the device type of the HMI device.
4. Select the type of connection and set the parameters for the connection.
   The connection to the HMI device is established. The connected HMI device is displayed.
5. Select the source drive.

6. Drag one or more license keys to the HMI device.
   The license keys are then transferred to the HMI device.
7. Close the Automation License Manager after a successful transfer.

10.11.18. WinAC MP system library 7

Screens from the system library

The screens from the system library are optimized for a 6' display with a resolution of 320 x 240. If you use a display of a different size, you can adapt the screens for your display in WinCC.

Standard screens and tags

The WinAC MP-system library offers you the standard screens "WinAC_MP_Home" and "WinAC_MP_Tuning" and the tags "WinAC_MP_Tags". To use the standard screens, move them to the "Screens" folder in the project tree.

In addition to the standard screens, the tags must be copied separately. To do this, drag "WinAC_MP_Tags" from the WinAC MP-system library to the "HMI_Tags" folder in the project tree.

10.12 Using global functions

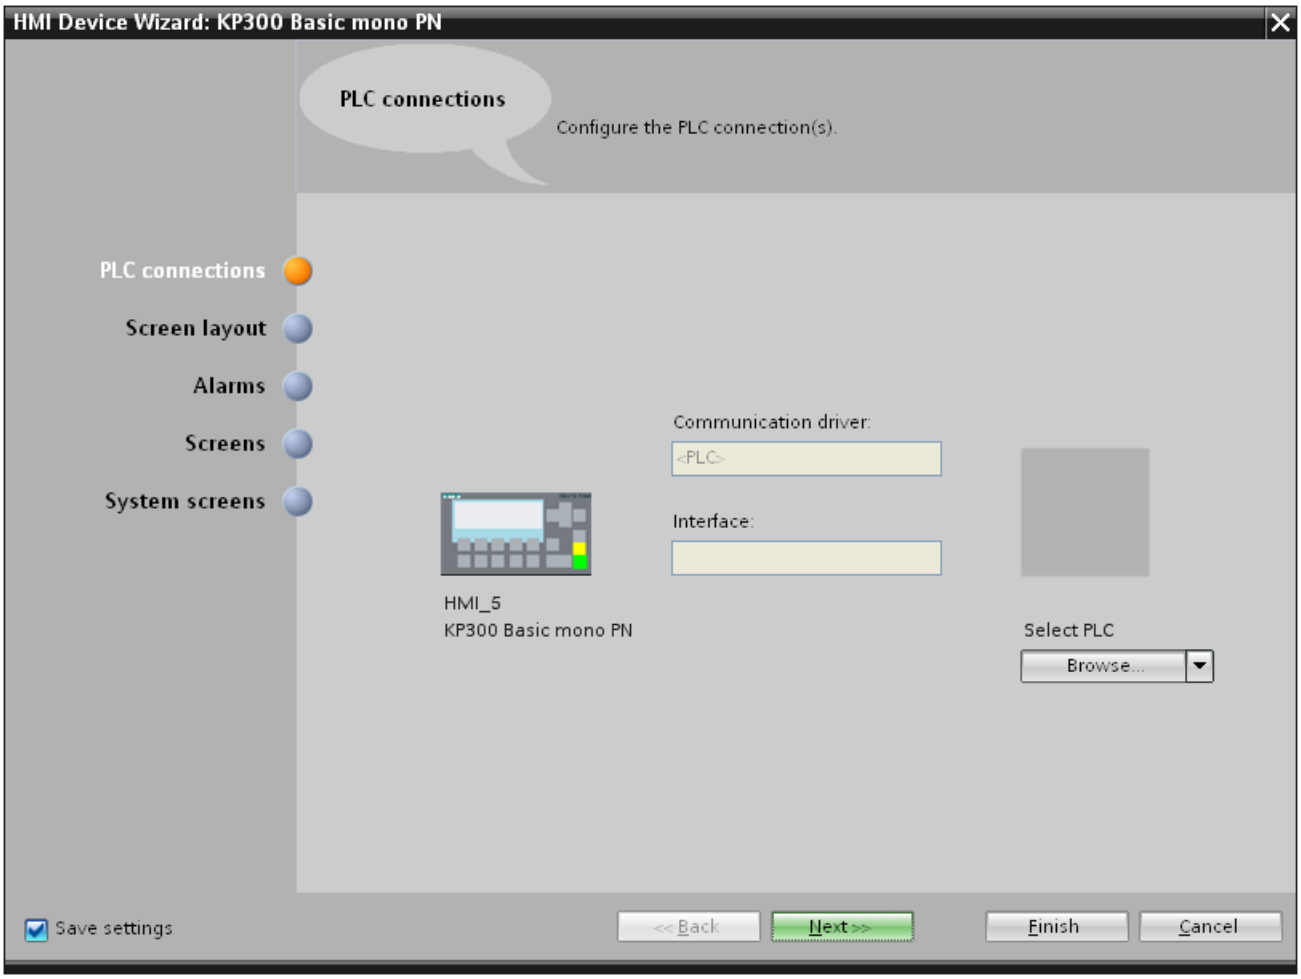
10.12.1 HMI device wizard basics

Introduction

The HMI device wizard will automatically start when you create a new HMI device in your project.

HMI device wizard

The HMI device wizard will guide you through each dialog step by step and help you set up a device. You use the HMI device wizard to specify the basic settings for your HMI device, such as screen layout and the connection to your PLC.



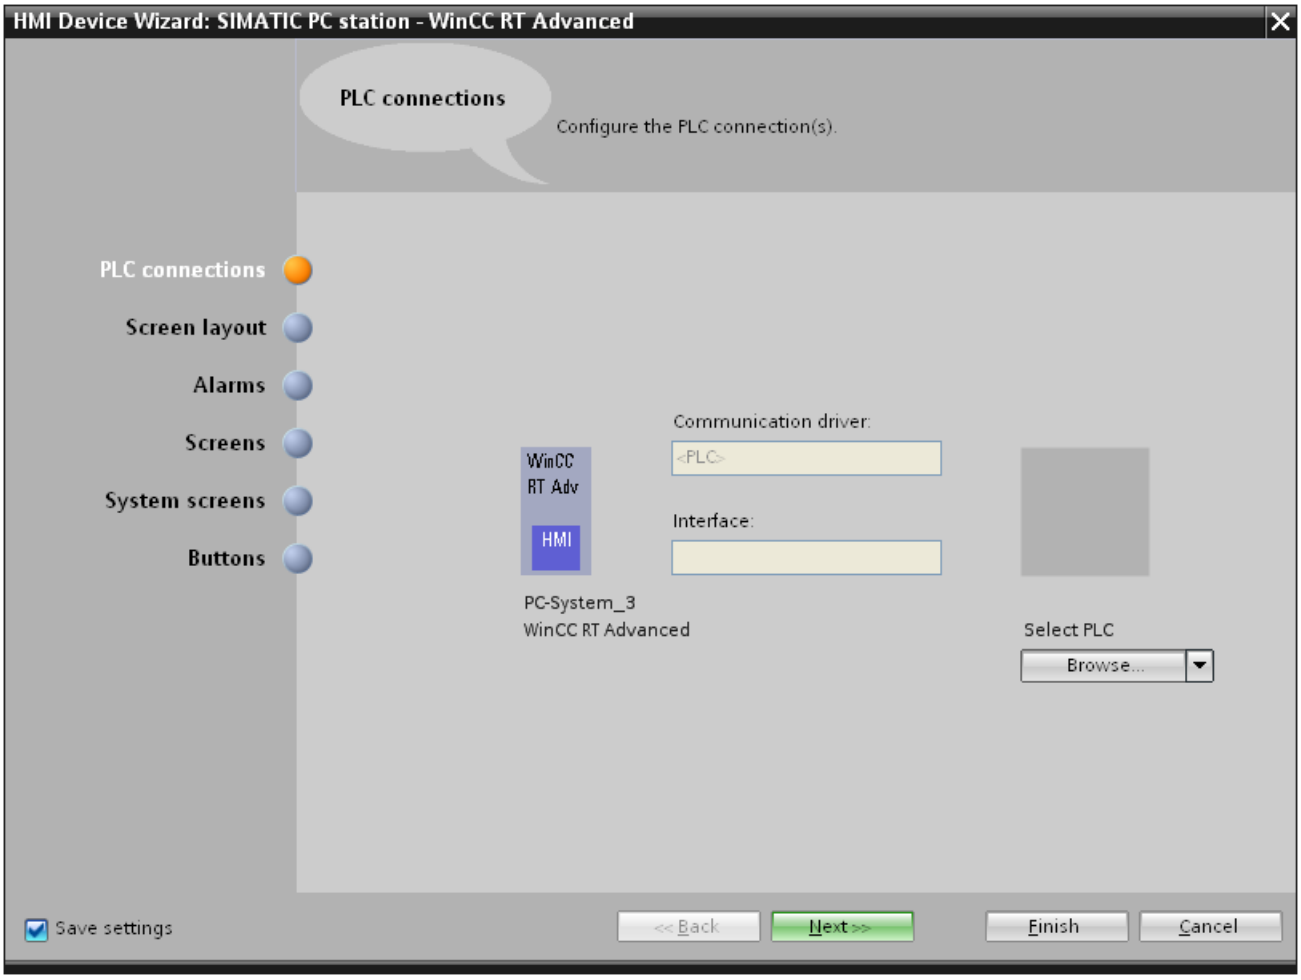
See also

HMI device wizard basics (Page 5487)

10.12.2 HMI device wizard basics

Introduction

The HMI device wizard will guide you through each dialog step by step and help you set up a device. You use the HMI device wizard to specify the basic settings for your HMI device, such as screen layout and the connection to your PLC.



Opening the HMI device wizard

1. Add a new device to your project, for example, RT Advanced.
2. Click on the device in the project tree.
3. Select "Start the HMI device wizard" in the shortcut menu. The "HMI device wizard" opens.

Note

If you make changes after adding the device, such as adding a new screen, the HMI device wizard will not open again.

HMI device wizard basics (Page 5484)

10.12.3 Working with libraries

10.12.3.1 Basics on libraries

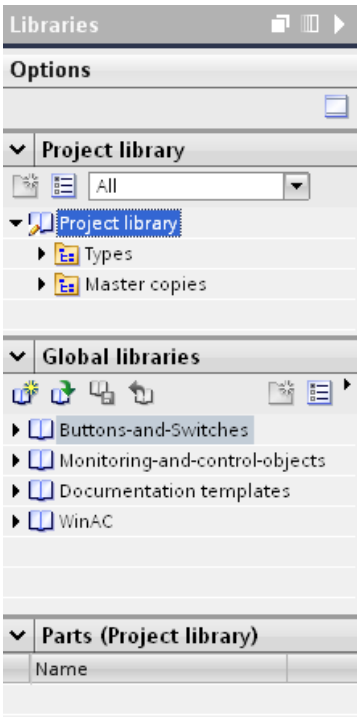
Introduction

Store all objects you need frequently in the libraries. An object that is stored in the library only has to be configured once. It can then be used repeatedly as often as required. Library objects extend the number of available screen objects and increase the effectiveness during configuration through the multiple usage of ready-to-use objects.

Your WinCC software package is supplied with comprehensive libraries that contain, for example, "Motor" or "Valve" objects. You may, however, define your own library objects.

You manage libraries in the "Libraries" task card or library view. The following libraries are available:

- Project library
- Global libraries



Note

There is a symbol library in the "Tools" task card in the "Graphics" palette.

Project library

There is one library for each project. Objects of the project library are stored alongside with the project data and are available only for the project in which the library was created. If the project is moved to another PC, any project library created in it is also moved.

To use the library object of the project library in other objects, move or copy the object into a global library.

Global libraries

A global library is saved independently of the project data in its own file with the extension *.al12.

A project can access several global libraries. A global library may be used concurrently in several projects.

When a library object is changed by a project, this library will be changed in all projects in which these libraries are open.

Library objects

A library can contain all WinCC objects. Examples:

- Complete HMI device
- Screens
- Display and control objects including tags and functions
- Graphics
- Tags
- Alarms
- Text and graphics lists
- Faceplates
- User data types

Screen basics (Page 2931)

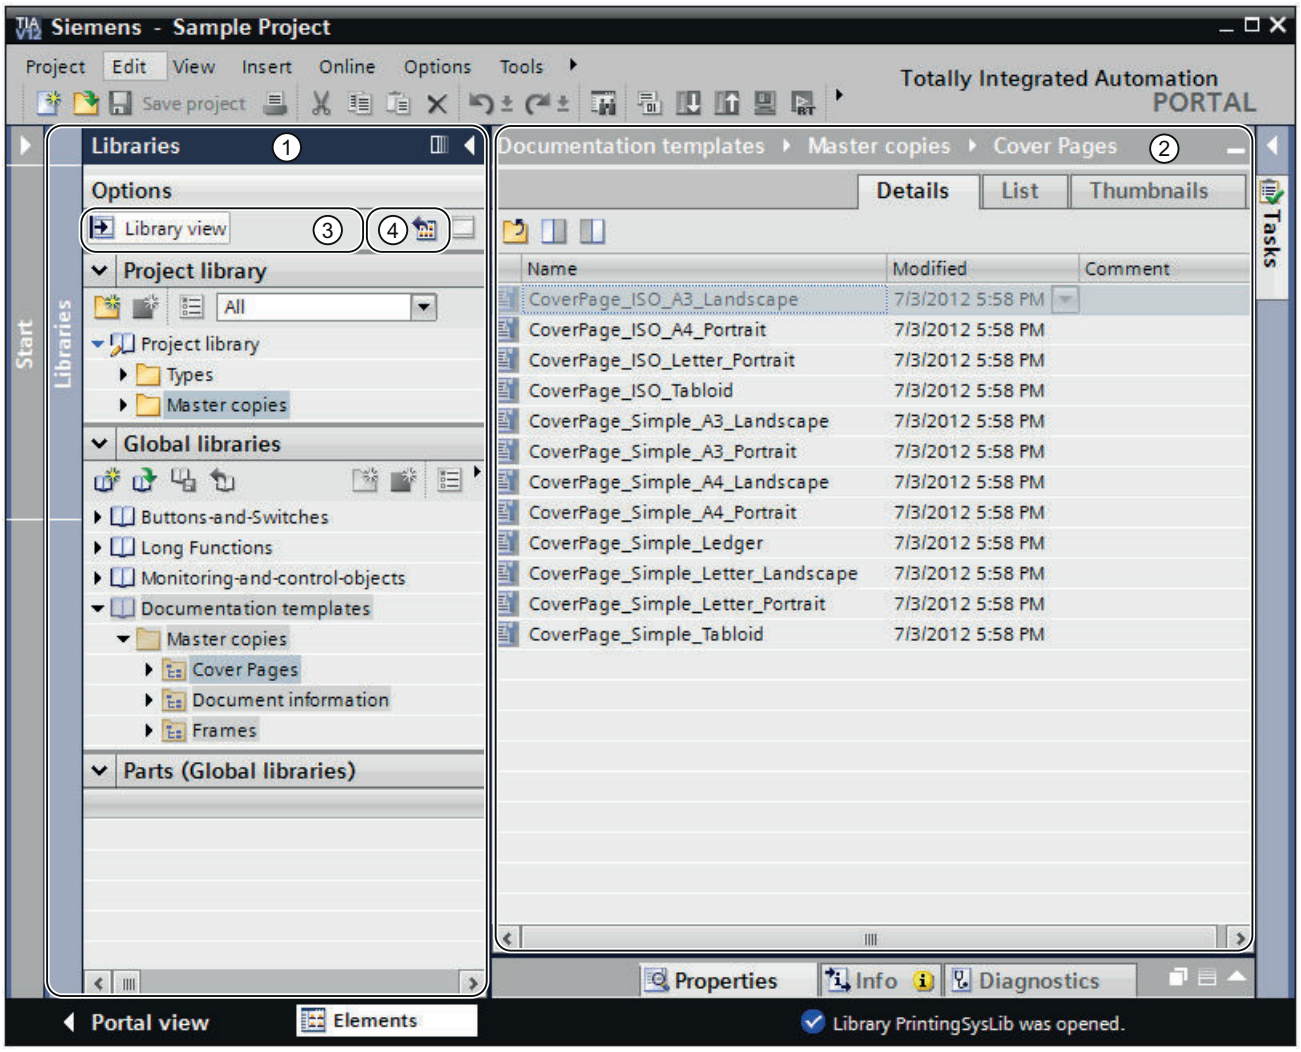
10.12.3.2 Overview of the library view

Function of the library view

The library view combines the functionality of the "Libraries" task card and the overview window. In the library view, the elements of a library are displayed in various views. In the details view, for example, you see additional properties of the individual elements. You can also edit and version the types in the library view.

Layout of the library view

The following figure shows the components of the library view:



1 Library tree

2 Library overview

3 "Library view" button

4 "Open or close library overview" button

Library tree
